# GUIDE TO COUNTRY ARTICLES

All information contained within a country article is uniformly keyed by means of small superior numerals to the left of the subject headings. A heading such as "Population," for example, carries the same key numeral (6) in every article. Thus, to find information about the population of Albania, consult the table of contents for the page number where the Albania article begins and look for section 6 thereunder. Introductory matter for each nation includes coat of arms, capital, flag (descriptions given from hoist to fly or from top to bottom), anthem, monetary unit, weights and measures, holidays, and time zone.

# AFGHANISTAN

Transitional Islamic State of Afghanistan

*Dowlat-e Eslami-ye Afghanistan*

**CAPITAL:** Kabul

**FLAG:** Three equal vertical bands of black (hoist), red, and green, with a white emblem centered on the red band; the emblem features a temple-like structure encircled by a wreath on the left and right and by a bold Islamic inscription above.

**ANTHEM:** *Eslabte Arzi (Land Reform)*, beginning “So long as there is the earth and the heavens.”

**MONETARY UNIT:** The afghani (AF) is a paper currency of 100 puls. There are coins of 25 and 50 puls and 1, 2, and 5 afghanis, and notes of 10, 20, 50, 100, 500, and 1,000 afghanis. Af1 = \$0.0211 (or \$1 = Af47.3) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, although some local units are still in use.

**HOLIDAYS:** Now Rooz (New Year’s Day), 21 March; May Day, 1 May; Independence Day, 18 August. Movable religious holidays include First Day of Ramadan, ‘Id al-Fitr, ‘Id al-‘Adha’, ‘Ashura, and Milad an-Nabi. The Afghan calendar year begins on 21 March; the Afghan year 1376 began on 21 March 1997.

**TIME:** 4:30 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Afghanistan is a landlocked country in Central Asia with a long, narrow strip in the northeast (the Wakhan corridor). Afghanistan is slightly smaller than the state of Texas, with a total area of 647,500 sq km (250,001 sq mi), extending 1,240 km (770 mi) NE–SW and 560 km (350 mi) SE–NW. Afghanistan is bounded on the N by Turkmenistan, Uzbekistan, and Tajikistan, on the extreme NE by China, on the E and S by Pakistan, and on the W by Iran, with a total boundary length of 5,529 km (3,436 mi). Afghanistan’s capital city, Kabul, is located in the east central part of the country.

## <sup>2</sup>TOPOGRAPHY

Although the average altitude of Afghanistan is about 1,200 m (4,000 ft), the Hindu Kush mountain range rises to more than 6,100 m (20,000 ft) in the northern corner of the Wakhan panhandle in the northeast and continues in a southwesterly direction for about 970 km (600 mi), dividing the northern provinces from the rest of the country. Central Afghanistan, a plateau with an average elevation of 1,800 m (6,000 ft), contains many small fertile valleys and provides excellent grazing for sheep, goats, and camels. To the north of the Hindu Kush and the central mountain range, the altitude drops to about 460 m (1,500 ft), permitting the growth of cotton, fruits, grains, ground nuts, and other crops. Southwestern Afghanistan is a desert, hot in summer and cold in winter. The four major river systems are the Amu Darya (Oxus) in the north, flowing into the Aral Sea; the Harirud and Morghab in the west; the Helmand in the southwest; and the Kabul in the east, flowing into the Indus. There are few lakes.

## <sup>3</sup>CLIMATE

The ranges in altitude produce a climate with both temperate and semitropical characteristics, and the seasons are clearly marked throughout the country. Wide temperature variations are usual from season to season and from day to night. Summer temperatures in Kabul may range from 16° C (61° F) at sunrise to 38° C (100° F) by noon. The mean January temperature in Kabul is 0° C

(32° F); the maximum summer temperature in Jalalabad is about 46° C (115° F). There is much sunshine, and the air is usually clear and dry. Rainfall averages about 25 to 30 cm (10 to 12 in); precipitation occurs in winter and spring, most of it in the form of snow. Wind velocity is high, especially in the west.

## <sup>4</sup>FLORA AND FAUNA

There are over 3,000 plant species, including hundreds of varieties of trees, shrubs, vines, flowers, and fungi. The country is particularly rich in such medicinal plants as rue, wormwood, and asafetida; fruit and nut trees are found in many areas. Native fauna include the fox, lynx, wild dog, bear, mongoose, shrew, hedgehog, hyena, jerboa, hare, and wild varieties of cats, asses, mountain goats, and mountain sheep. Trout is the most common fish. There are more than 100 species of wildfowl and birds.

## <sup>5</sup>ENVIRONMENT

Afghanistan’s most significant ecological problems are deforestation, drought, soil degradation, and overgrazing. Neglect, scorched earth tactics, and the damage caused by extensive bombardments have destroyed previously productive agricultural areas, and more are threatened by tons of unexploded ordnance. Afghanistan has responded to the fuel needs of its growing population by cutting down many of its already sparse forests. Consequently, by late 2002, between 1 and 2% of Afghanistan’s land area was forest land. That represented a 33% decrease from 1979. A four-year drought in 2002 emptied rivers and irrigation canals. Another environmental threat is posed by returning refugees to Afghanistan, of which there were over 4 million in Pakistan, Iran, and other countries in 2002, who have migrated to Kabul and other larger cities instead of returning to destroyed villages and fields. This migration has placed stress on the infrastructure of those cities, causing increased pollution and worsening sanitation conditions.

By 2002, 11 species of mammals, 13 species of birds, and 4 plant species of were endangered. Endangered species in Afghanistan included the snow leopard, long-billed curlew, Argali sheep, musk deer, tiger, white-headed duck, Afghani brook salamander,

Kabul markhor, and the Siberian white crane. There were thought to be fewer than 100 snow leopards in 2002. The country's Caspian tigers have virtually disappeared. In 2002, there was one pair of Siberian white cranes, with one chick.

## 6 POPULATION

The population of Afghanistan in 2003 was estimated by the United Nations at 23,897,000, which placed it as number 46 in population among the 193 nations of the world. In that year approximately 3% of the population was over 65 years of age, with another 43% of the population under 15 years of age. There were 107 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 3.88%, with the projected population for the year 2015 at 35,473,000. The population density in 2002 was 42 per sq km (110 per sq mi).

It was estimated by the Population Reference Bureau that 22% of the population lived in urban areas in 2001. The capital city, Kabul, had a population of 2,454,000 in that year. Other major population centers include Kandahār, 339,200; Mazār-e Sharif, 239,800; and Herāt, 166,600. According to the United Nations, the urban population growth rate for 2000–2005 was 6.9%. These figures are unreliable, however, because many city dwellers have left their urban homes for refuge in rural areas. Approximately 20% of the population is nomadic.

Two decades of near constant warfare make Afghanistan's population—never certain in any case—even more difficult to assess. As many as three million Afghans are estimated to have died, and an additional six million sought refuge in Pakistan, Iran, and elsewhere in the world during the worst of the fighting when thousands of Soviet troops were present. The last official census was taken in 1988.

## 7 MIGRATION

Due to the U.S.-led bombing campaign in 2001–2002 carried out against the Taliban regime, a large Afghan refugee population was created in surrounding countries. The Afghan refugee population in Pakistan in 2002 was approximately 3.7 million, and, in Iran and the west, an additional 1.6 million. In 2002, there were approximately 1 million internally displaced persons (IDP) within the country. Since early-2002, there were many spontaneous returnees, but the UN High Commissioner for Refugees (UNHCR) began assisting refugees to repatriate in February 2002. As of October, more than over 1.5 million had returned to their homes.

In mid-2002, there was a daily influx of homeless migrants into Kabul, approximately 300–400 families a day. Seventy percent of Kabul's population was living in illegal structures.

In the summer of 2001, the majority of the over 1 million internally displaced persons in Afghanistan had been driven off their land and into refugee camps by ongoing conflict and four years of drought. After September 11, 2001, the International Organization for Migration (IOM) began to deliver shelter and non-food supplies to help the IDPs survive the Afghan winter. It dispatched road convoys from Iran, Tajikistan, and Turkmenistan to destinations in Afghanistan, carrying blankets, winter clothing, tents, and other essential items. Following the winter, with the defeat of the Taliban and the beginning of the spring planting season, the IOM worked to return the IDPs to their villages from the refugee camps. The IDP families were offered wheat, seeds, blankets, soap, agricultural tools, and other items. In addition to the IOM and the UNHCR, the International Committee of the Red Cross and UNICEF have been heavily involved in repatriating refugees.

Underway in the country is also the Return of Qualified Afghans program, designed to bring back Afghan professionals living abroad to participate in rebuilding the country. The program had returned 227 people by mid-2002. A further 343 peo-

ple were identified to fill key jobs in ministries and nongovernmental organizations (NGOs).

## 8 ETHNIC GROUPS

About the middle of the second millennium BC, Indo-Aryans began to move into and through the present area of Afghanistan. Much later came other tribal groups from Central Asia—Pactyes (from whom the present-day name “Pashtoons” derives), Sakas, Kushans, Hephthalites, and others—and a procession of Iranians and Greeks. In the 7th century AD, Arabs arrived from the south, spreading the new faith of Islam. In the same century, Turks moved in from the north, followed in the 13th century by Mongols, and, finally, in the 15th century by Turko-Mongols. This multiplicity of movements made Afghanistan a loose conglomeration of racial and linguistic groups.

All citizens are called Afghans, but the Pashtoons (the name may also be written as “Pushtun” or “Pukhtun,” and in Pakistan as “Pathan”) are often referred to as the “true Afghans.” Numbering about 38% of the population in 2001, they are known to have centered in the Sulaiman range to the east; it is only in recent centuries that they moved into eastern and southern Afghanistan, where they now predominate. They have long been divided into two major divisions, the Durrani and the Ghilzais, each with its own tribes and subtribes.

The Tajiks, of Iranian stock, comprise nearly 25% of the population and are mainly concentrated in the north and northeast. In the central ranges are found the Hazaras (about 19%), who are said to have descended from the Mongols. To the north of the Hindu Kush, Turkic and Turko-Mongol groups were in the majority until 1940. Each of these groups is related to groups north of the Amu Darya and within the former USSR; among them are the Uzbeks, who number about 6% of the population. Other groups include the Aimaks, Farsiwans (Persians) and Brahiu. In the northeast are the Kafirs, or infidels. After their conversion to Islam at the end of the 19th century, they were given the name of Nuristanis, or “people of the light.”

## 9 LANGUAGES

Both Pashtu (or Pushtu) and Dari (Afghan Persian) are the official languages of the country. Pashtu is spoken by about 35% of the population while approximately 50% speak Dari. Although Pashtu has a literature of its own, Dari, the language spoken in Kabul, has been the principal language of cultural expression, of the government, and of business. Both Pashtu and Dari are written primarily with the Arabic alphabet, however, there are some modifications. The Hazaras speak their own dialect of Dari. The Turkic languages, spoken by 11% of the population, include Uzbek and Turkmen, and the Nuristanis speak some seven different dialects belonging to the Dardic linguistic group. There are about 30 minor languages, primarily Balochi and Pashai, spoken by some 4% of the population. Balochi belongs to the same linguistic group, as do several languages spoken in the high Pamirs. Bilingualism is common.

## 10 RELIGIONS

Almost all Afghans are Muslims. Approximately 84% are Sunnis; 15% are Shi'is; others comprise only 1%. The Pashtuns, most of the Tajiks, the Uzbeks, and the Turkmen are Sunnis, while the Hazaras are Shi'is. The country's small Hindu and Sikh population is estimated at less than 30,000. Before the 1978 Communist coup, Islam was the official religion of Afghanistan; in an effort to win over religious leaders, the Marxist regime set up a Department of Islamic Affairs in 1981 and began providing funds for new mosques and for the maintenance of old ones. Following the overthrow of the Communist regime, an Islamic State was again proclaimed.

In 1994 the Islamic militants who called themselves the Taliban—literally “the Seekers,” a term used to describe religious stu-

LOCATION: 29°28' to 38°30' N; 60°30' to 74°53' E. BOUNDARY LENGTHS: China, 76 kilometers (47 miles); Iran, 936 kilometers (582 miles); Pakistan, 2,430 kilometers (1,511 miles); Tajikistan, 1,206 kilometers (750 miles); Turkmenistan, 744 kilometers (463 miles); Uzbekistan, 137 kilometers (85 miles).

dents—began to impose their strict form of Islam observance in the areas that they controlled. The Taliban, composed mostly of Pashtoons, were puritanical zealots. Women were ordered to dress in strict Islamic garb and were banned from working or from going out of their houses unless accompanied by a male relative. Some men were forced to pray five times a day and grow full beards as a condition of employment in the government. Under the Taliban, repression of the Hazara ethnic group, who were predominantly Shi'is, was severe.

Since the fall of the Taliban in 2001, the 1964 constitution has been used as a basis for the definition of religious freedom and practices. The 1964 constitution proclaims Islam the "sacred religion of Afghanistan" and states that religious rites of the state shall be performed according to Hanafi doctrine. Religious toler-

ation for non-Muslims has been granted, according to the 1964 constitution and the 2001 Bonn Agreement.

### 11 TRANSPORTATION

Many roads were built in the years prior to 1979 to connect the principal cities and to open up formerly isolated areas. As of 2002, Afghanistan had an estimated 21,000 km (13,000 mi) of roads, of which 2,793 km (1,736 mi) were paved. Roads connect Kabul with most provincial capitals and with Peshawar in Pakistan through the Khyber Pass. The road from Herat to Mashhad in Iran was completed in 1971. The Salang Tunnel through the Hindu Kush, completed with Soviet assistance in 1964, considerably shortened the travel time between Kabul and northern Afghanistan. The tunnel was modernized in the mid-1980s. However, in May 1997 the Tajik leader, Ahmad Shah Masud, blew up

the southern entrance of the tunnel in an effort to trap the invading Taliban forces. It was reopened in January 2002. The Kandahar-Torghundi highway in the south was completed in 1965. In 2002 there were 35,000 passenger cars and 32,000 trucks and buses in use.

The Khyber Pass in Pakistan is the best known of the passes providing land access to Afghanistan. Transit arrangements with Iran provide an alternative route for its commercial traffic. However, the great bulk of the country's trade moves through the former USSR. At the same time, Afghanistan's highways are badly damaged from years of warfare and neglect. Land mines are buried on the sides of many roads. Over \$1.2 billion in international aid was pledged to rebuilding Afghanistan's highways in 2002.

The only railways in the country in 2001 were a 9.6-km (6-mi) spur from Gushgy, Turkmenistan to Towrghondi, a 15 km (9.3 mi) line from Termez, Uzbekistan to the Kheyderabad transshipment point on the south bank of the Amu Darya, and a short span into Spin Baldak in the southeast. There are no navigable rivers except for the Amu Darya, on Turkmenistan's border, which can carry steamers up to about 500 tons. In 2002, there were 46 airports, 10 of which had paved runways, and 2 heliports. Ariana Afghan Airlines is the national carrier. Most of Ariana Airlines planes were destroyed during the civil war in Afghanistan. Ariana lost six of its eight planes in US-led air strikes against the Taliban. Kabul's international airport reopened to international humanitarian and military flights in late January 2002 after the UN's Security Council lifted the ban early that month, and it began international flight service to Delhi soon after.

## <sup>12</sup>HISTORY

Afghanistan has existed as a distinct polity for less than three centuries. Previously, the area was made up of various principalities, usually hostile to each other and occasionally ruled by one or another conqueror from Persia and the area to the west or from central Asia to the north, usually on his way to India. These included the Persian Darius I in the 6th century BC, and 300 years later, Alexander the Great. As the power of his Seleucid successors waned, an independent Greek kingdom of Bactria arose with its capital at Balkh west of Mazar-i-Sharif, but after about a century it fell to invading tribes (notably the Sakas, who gave their name to Sakastan, or Sistan). Toward the middle of the 3rd century BC, Buddhism spread to Afghanistan from India, and for centuries prior to the beginning of the 9th century AD, at least half the population of eastern Afghanistan was Buddhist.

Beginning in the 7th century, Muslim invaders brought Islam to the region, and it eventually became the dominant cultural influence. For almost 200 years, Ghazni was the capital of a powerful Islamic kingdom, the greatest of whose rulers, Mahmud of Ghazni (r.997-1030), conquered most of the area from the Caspian to the Ganges. The Ghaznavids were displaced by the Seljuk Turks, who mastered Persia and Anatolia (eastern Turkey), and by the Ghorids, who, rising from Ghor, southeast of Herat, established an empire stretching from Herat to Ajmir in India. They were displaced in turn by the Turko-Persian rulers of the Khiva oasis in Transoxiana, who, by 1217, had created a state that included the whole of Afghanistan until it disintegrated under attack by Genghis Khan in 1219. His grandson Timur, also called "Timur the Lame" or Tamerlane, occupied all of what is now Afghanistan from 1365 to 1384, establishing a court of intellectual and artistic brilliance at Herat. The Timurids came under challenge from the Uzbeks, who finally drove them out of Herat in 1507. The great Babur, one of the Uzbek princes, occupied Kabul in 1504 and Delhi in 1526, establishing the Mughal Empire in which eastern Afghanistan was ruled from Delhi, Agra, Lahore, or Srinagar, while Herat and Sistan were governed as provinces of Persia.

In the 18th century, Persians under Nadir Shah conquered the area, and after his death in 1747, one of his military commanders, Ahmad Shah Abdali, was elected emir of Afghanistan. The formation of a unified Afghanistan under his emirate marks Afghanistan's beginning as a political entity. Among his descendants was Dost Muhammad who established himself in Kabul in 1826 and gained the emirate in 1835. Although the British defeated Dost in the first Afghan War (1838-42), they restored him to power, but his attempts and those of his successors to play off Czarist Russian interests against the British concerns about the security of their Indian Empire led to more conflict. In the second Afghan War (1877-79), the forces of Sher Ali, Dost's son, were defeated by the British, and his entire party, ousted. Abdur Rahman Khan, recognized as emir by the British in 1880, established a central administration, and supported the British interest in a neutral Afghanistan as a buffer against the expansion of Russian influence.

Intermittent fighting between the British and Pushtun tribes from eastern Afghanistan continued even after the establishment, in 1893, of a boundary (the Durand line) between Afghanistan and British India. An Anglo-Russian agreement concluded in 1907 guaranteed the independence of Afghanistan (and Tibet) under British influence, and Afghanistan remained neutral in both World Wars. Afghan forces under Amanullah Khan, who had become emir in 1919, briefly intruded across the Durand Line in 1919. At the end of brief fighting—the third Afghan War—the Treaty of Rawalpindi (1919) accorded the government of Afghanistan the freedom to conduct its own foreign affairs.

Internally, Amanullah's Westernization program was strongly opposed, forcing him to abdicate in 1929. After a brief civil war, a tribal assembly chose Muhammad Nadir Shah as king. In his brief four years in power, he restored peace while continuing Amanullah's modernization efforts at a more moderate pace. Assassinated in 1933, he was succeeded by his son, Muhammad Zahir Shah, who continued his modernization efforts, governing for 40 years, even though sharing effective power with his uncles and a first cousin, who served as his prime ministers.

In the 1960s, there was considerable tension between Pakistan and Afghanistan as a result of Afghanistan's effort to assert influence among, and ultimately responsibility for, Pushtu-speaking Pathan tribes living on both sides of the Durand Line under a policy calling for the establishment of an entity to be called "Push-tunistan." The border was closed several times during the following years, and relations with Pakistan remained generally poor until 1977.

In 1964, a new constitution was introduced, converting Afghanistan into a constitutional monarchy, and a year later the country's first general election was held. In July 1973, Muhammad Daoud Khan, the king's first cousin and brother-in-law, who had served as prime minister from 1953 until early 1963, seized power in a near-bloodless coup, establishing a republic and appointing himself president, and prime minister of the Republic of Afghanistan. He exiled Zahir Shah and his immediate family, abolished the monarchy, dissolved the legislature, and suspended the constitution. Daoud ruled as a dictator until 1977, when a republican constitution calling for a one-party state was adopted by the newly convened Loya Jirga (Grand National Assembly), which then elected Daoud president for a six-year term.

### Afghanistan Under Communist Rule

On 27 April 1978, Daoud was deposed and executed in a bloody coup (the "Saur Revolution" because it took place during the Afghan month of Saur), and the Democratic Republic of Afghanistan emerged. Heading the new Revolutionary Council was Nur Muhammad Taraki, secretary-general of the communist People's Democratic Party of Afghanistan (PDPA), assisted by Babrak Karmal and Hafizullah Amin, both named deputy prime ministers. The former Soviet Union immediately established ties with

the new regime, and in December 1978, the two nations concluded a treaty of friendship and cooperation. Soon after the coup, rural Afghan groups took up arms against the regime, which increasingly relied on Soviet arms for support against what came to be known as mujahidin, or holy warriors.

Meanwhile, the Khalq (masses) and Parcham (flag) factions of the PDPA, which had united for the April takeover, became embroiled in a bitter power struggle within the party and the government. In September 1979, Taraki was ousted and executed by Amin, who had beat out Karmal to become prime minister the previous March and who now assumed Taraki's posts as president and party leader. Amin was himself replaced on 27 December by Karmal, the Parcham faction leader. This last change was announced not by Radio Kabul but by Radio Moscow and was preceded by the airlift of 4,000 to 5,000 Soviet troops into Kabul on 25–26 December, purportedly at the request of an Afghan government whose president, Hafizullah Amin, was killed during the takeover.

The Soviet presence increased to about 85,000 troops in late January 1980, and by spring, the first clashes between Soviet troops and the mujahidin had occurred. Throughout the early and mid-1980s, the mujahidin resistance continue to build, aided by Afghan army deserters and arms from the United States, Pakistan, and the nations of the Islamic Conference Organization (ICO). Much of the countryside remained under mujahidin control as the insurgency waged on year by year, while in Kabul, Soviet advisers assumed control of most Afghan government agencies.

By late 1987, more than a million Afghans had lost their lives in the struggle, while the United Nations High Commission for Refugees (UNHCR) estimated that some 5 million others had sought refuge in Pakistan, Iran, and elsewhere. Soviet sources at the time acknowledged Soviet losses of between 12,000 and 30,000 dead and 76,000 wounded. Soviet troop strength in Afghanistan at the end of 1987 was about 120,000, while according to Western sources, Afghan resistance forces numbered nearly 130,000.

In early 1987, Babrak Karmal fled to Moscow after being replaced as the head of the PDPA in May 1986 by Najibullah, former head of the Afghan secret police. Najibullah offered the mujahidin a ceasefire and introduced a much publicized national reconciliation policy; he also released some political prisoners, offered to deal with the resistance leaders, and promised new land reform. The mujahidin rejected these overtures, declining to negotiate for anything short of Soviet withdrawal and Najibullah's removal.

International efforts to bring about a political solution to the war—including nearly unanimous General Assembly condemnations of the Soviet presence in Afghanistan—were pursued within the UN framework from 1982 onward. Among these efforts were “proximity talks” between Afghanistan and Pakistan conducted by a Special Representative of the UN Secretary General, Under Secretary-General Diego Cordovez. After a desultory beginning, these talks began to look promising in late 1987 and early 1988 when Soviet policymakers repeatedly stated, in a major policy shift, that the removal of Soviet troops from Afghanistan was not contingent on the creation of a transitional regime acceptable to the former USSR. On 14 April 1988, documents were signed and exchanged in which the USSR agreed to pull its troops out of Afghanistan within nine months, the US reserved the right to continue military aid to Afghan guerrillas as long as the USSR continued to aid the government in Kabul, and Pakistan and Afghanistan pledged not to interfere in each other's internal affairs.

The Russians completed the evacuation of their forces on schedule 15 February 1989, but in spite of continuing pressure by the well-armed mujahidin, the Najibullah government remained

in power until April 1992, when Najibullah sought refuge at the UN office in Kabul as mujahidin forces closed in on the city.

### Afghanistan After the Soviet Withdrawal

With the fall of the Najibullah government, the Seven-Party Alliance (SPA) of the Islamic groups based in Pakistan moved to consolidate its “victory” by announcing plans to set up an Interim Afghan Government (AIG) charged with preparing the way for elections. Meanwhile, they moved to assert their control of Afghanistan, but their efforts to establish the AIG in Kabul failed when within ten days of Najibullah's departure from office, well-armed forces of the Hizb-i-Islami and Jamiat-i-Islami—two of the seven SPA parties—clashed in fighting for the control of the capital. In July, Jamiat leader Burhanuddin Rabbani replaced Sibghatullah Mojaddedi as president of the AIG, as previously agreed by all the SPA parties but the Hizb-i-Islami.

Continued fighting between Jamiat and Hizb-i-Islami militias halted further progress, and Rabbani's forces, under Commander Ahmad Shah Masoud, dug in to block those under the control of interim “Prime Minister” Gulbuddin Hekmatyar's Hizb-i-Islami and his ally, General Rashid Dostum (a former PDPA militia leader turned warlord from northern Afghanistan), from taking control of Kabul. In a 24-hour rocket exchange in August 1992 in Kabul, an estimated 3000 Afghans died, and before the end of the year, upwards of 700,000 Afghans had fled the city. Deep differences among the SPA/AIG leadership, embittered by decades of bad blood, ethnic distrust, and personal enmity, prevented any further progress toward creating a genuine interim government capable of honoring the 1992 SPA pledge to write a constitution, organize elections, and create a new Afghan polity. Despite UN attempts to broker a peace and bring the warring groups into a coalition government, Afghanistan remained at war.

### Rise of the Taliban

By the summer of 1994 Rabbani and his defense minister, Ahmed Shah Masoud, were in control of the government in Kabul, but internal turmoil caused by the warring factions had brought the economy to a standstill. It was reported that on the road north of Kandahar a convoy owned by influential Pakistani businessmen was stopped by bandits demanding money. The businessmen appealed to the Pakistani government, which responded by encouraging Afghan students from the fundamentalist religious schools on the Pakistan-Afghan boarder to intervene. The students freed the convoy and went on to capture Kandahar, Afghanistan's second-largest city. Pakistan's leaders supported the Taliban with ammunition, fuel, and food. The students, ultra-fundamentalist Sunni Muslims who called themselves the Taliban (the Arabic word for religious students, literally “the Seekers”) shared Pashtun ancestry with their Pakistani neighbors to the south. The Taliban also found widespread support among Afghan Pashtuns hostile to local warlords and tired of war and economic instability. By late 1996, the Taliban had captured Kabul, the capital, and were in control of 21 of Afghanistan's 32 provinces. When Rabbani fled the capital, Pakistan and Saudi Arabia officially recognized the Taliban government in Kabul. In areas under Taliban control, order was restored, roads opened, and trade resumed. However, the Taliban's reactionary social practices, justified as being Islamic, did not appeal to Afghanistan's non-Pashtun minorities in the north and west of the country, nor to the educated population generally. The opposition, dominated by the Uzbek, Tajik, Hazara, and Turkoman ethnic groups, retreated to the northeastern provinces.

In May 1997 the Taliban entered Mazar-i-Sharif, Afghanistan's largest town north of the Hindu Kush and stronghold of Uzbek warlord Rashid Dostum. In the political intrigue that followed, Dostum was ousted by his second in command, Malik Pahlawan, who initially supported the Taliban. Dostum reportedly fled to Turkey. Once the Taliban were in the city, however, Pahlawan

abruptly switched sides. In the subsequent fighting, the Taliban were forced to retreat with heavy casualties. The forces of Ahmad Shah Masoud, Tajik warlord and former defense minister in ousted President Rabbani's government, were also instrumental in the defeat of the Taliban in Mazar. Masoud controlled the high passes of the Panjshir Valley in the east of the country. The opposition alliance was supported by Iran, Russia, and the Central Asian republics, who feared that the Taliban might destabilize the region.

By early 1998, the Taliban militia controlled about two-thirds of Afghanistan. Opposition forces under Ahmad Shah Masoud controlled the northeast of the country. Taliban forces mounted another offensive against their opponents in August-September 1998 and nearly sparked a war with neighboring Iran after a series of Shiite villages were pillaged and Iranian diplomats killed. Iran, which supplied Masoud's forces, countered by massing troops along its border with Afghanistan. Although the crisis subsided, tensions between the Taliban and Iran remained high. Masoud's opposition forces became known as the United Front or Northern Alliance in late 1999.

Despite attempts to broker a peace settlement, fighting between the Taliban and opposition factions continued through 1999 and into 2000 with the Taliban controlling 90% of the country. In March 1999, the warring factions agreed to enter a coalition government, but by July these UN-sponsored peace talks broke down and the Taliban renewed its offensive against opposition forces. By October, the Taliban captured the key northern city of Taloqan and a series of northeastern towns, advancing to the border with Tajikistan. Fighting between the Taliban and Northern Alliance forces was fierce in early 2001.

In April 2001, Masoud stated that he did not rule out a peace dialogue with the Taliban, or even of setting up a provisional government jointly with the Taliban, but that Pakistan would have to stop interfering in the conflict first. He stated that elections would have to be held under the aegis of the UN and the "six plus two" countries, including Iran, China, Pakistan, Tajikistan, Turkmenistan, as well as Russia and the US. The Northern Alliance was receiving financial and military assistance from its old enemy Russia as well as from Iran. In addition to Pakistan, the Taliban was recognized as the legitimate government of Afghanistan by Saudi Arabia and the United Arab Emirates. Masoud was assassinated on 9 September 2001, by two men claiming to be Moroccan journalists. His killers are thought to have been agents of al-Qaeda acting in concert with the plotters of the 11 September 2001 attack on the World Trade Center in New York and the Pentagon in Washington, D.C.

### Post-11 September 2001

The 11 September 2001 attacks carried out against the US by members of al-Qaeda marked the beginning of a war on terrorism first directed against the Taliban for harboring Osama bin Laden and his forces. On 7 October 2001, US-led forces launched the bombing campaign Operation Enduring Freedom against the Taliban and al-Qaeda in Afghanistan. On 13 November the Taliban were removed from power in Kabul, and an interim government under the leadership of Hamid Karzai, a Pashtun leader from Kandahar, was installed on 22 December. The campaign continued, however, into 2002. In June 2002, a Loya Jirga, or Grand Assembly of traditional leaders, was held, and Karzai was elected head of state of a transitional government that would be in place for 18 months until elections could be held. More than 60% of the cabinet posts in the government went to Ahmed Shah Masoud's Northern Alliance. Masoud was officially proclaimed the national hero of Afghanistan on 25 April 2002. A special committee collected signatures to award the Nobel Prize to Masoud posthumously. Among those who signed the petition were Czech President Vaclav Havel, American writer Elie Wiesel, and deputies of the European Parliament. On 5 September 2002,

Karzai survived an assassination attempt, and another plot against him was thwarted on 22 November. As of April 2003, more than 10,000 coalition forces, led by 8,000 US troops, were engaged in fighting remnants of the Taliban, al-Qaeda forces, and former mujahidin commander Gulbuddin Hekmatyar, in the eastern and southern regions of Afghanistan.

## 13 GOVERNMENT

Between 1964 and 1973, Afghanistan was a constitutional monarchy, for the first time in its history. The head of government was the prime minister, appointed by the king and responsible to the bicameral legislature. This system gave way to a more traditional authoritarian system on 17 July 1973, when Afghanistan became a republic, headed by Muhammad Daoud Khan, who became both president and prime minister. A new constitution in 1977 created a one-party state with a strong executive and a weak bicameral legislature. The communist PDPA abrogated this constitution after they seized power in April 1978.

Between 1978 and 1980, a communist-style 167-member Revolutionary Council exercised legislative powers. The chief of state (president) headed the presidium of that council, to which the 20-member cabinet was formally responsible. A provisional constitution, introduced in April 1980, guaranteed respect for Islam and national traditions, condemned colonialism, imperialism, Zionism, and fascism, and proclaimed the PDPA as "the guiding and mobilizing force of society and state." Seven years later, a new constitution providing for a very strong presidency was introduced as part of the PDPA's propaganda campaign of "national reconciliation." Najibullah remained as president until April 1992 when he sought refuge at the UN office in Kabul as mujahidin forces closed in on the city.

With the fall of the Najibullah government a Seven Party Alliance (SPA) of the Islamic groups announced plans to set up an Interim Afghan Government (AIG) charged with preparing the way for elections. However, Professor Burhanuddin Rabbani co-opted the process by forming a leadership council that elected him president. Subsequent fighting among warring factions plunged the country into anarchy and set the stage for the emergence of the ultra-conservative Islamic movement, Taliban, which ousted the Rabbani government and as of mid-2000 controlled all but the northern most provinces of the country. No new constitution was drafted since the end of the Najibullah government.

The Taliban, led by Mullah Mohammed Omar, formed a six-member ruling council in Kabul which ruled by edict. Ultimate authority for Taliban rule rested in the Taliban's inner Shura (Assembly), located in the southern city of Kandahar, and in Mullah Omar.

With the fall of the Taliban in December 2001, an interim government was created under the leadership of Hamid Karzai by an agreement held in Bonn, Germany. He was elected head of state in June 2002 of the "Islamic Transitional Government of Afghanistan (ITGA)," by the Loya Jirga convened that month. He named an executive cabinet, dividing key ministries between ethnic Tajiks and Pashtuns. He also appointed three deputy presidents and a chief justice to the country's highest court. Elections for a new government were scheduled for 2003.

## 14 POLITICAL PARTIES

Political parties have usually been illegal in Afghanistan, forcing most political activity—influenced by ideological, linguistic, and ethnic considerations—to operate underground or from abroad (or both). The 1964 constitution provided for the formation of political parties. However, since the framers of the constitution decided that political parties should be permitted only after the first elections, and since the Parliament never adopted a law governing the parties' operation, all candidates for the parliamentary elections of August and September 1965 stood as independents. Because a law on political parties was not on the books four years

later, the 1969 elections were also contested on a non-party basis. Throughout the 1964–1973 period, however, the de facto existence of parties was widely recognized. Subsequently, the framers reversed their plan to allow political parties. Under the 1977 constitution, only the National Revolutionary Party (NRP), the ruler's chosen instrument, was allowed.

The 1978 coup was engineered by the illegal People's Democratic Party of Afghanistan (PDPA) which had been founded in 1965. During its brief history, this Marxist party had been riven by a bloody struggle between its pro-Soviet Parcham (flag) faction and its larger Khalq (masses) faction. Babrak Karmal was the leader of the Parcham group, while the Khalq faction was headed until 1979 by Nur Muhammad Taraki and Hafizullah Amin. The factional struggle continued after the 1978 coup, prompting the Soviet intervention of 1979. Factional bloodletting continued thereafter also, with repeated purges and assassinations of Khalq adherents as well as bitter infighting within Parcham, this last leading to Babrak Karmal's replacement as PDPA secretary-general in May 1986 by Najibullah.

The Islamic resistance forces opposing the PDPA government and its Soviet backers in Afghanistan represented conservative, ethnically-based Islamic groups which themselves have had a long history of partisan infighting (and repression by successive Kabul governments). They came together in the early 1980s to fight the common enemy, the communist PDPA and the Soviet invaders and, in 1985, under pressure from Pakistan and the United States, they were loosely united into a Seven Party Alliance (SPA), headquartered in Peshawar, Pakistan. By 1987, commando groups affiliated with one or more of these seven parties controlled more than 80% of the land area of Afghanistan.

With arms flowing in from outside the country—a flow not halted until the end of 1991—the fighting continued, but with the final withdrawal of Soviet troops in February 1989, the SPA stepped up its military and political pressure on the communist PDPA government. However, President Najibullah proved to have more staying power than previously estimated, using Soviet arms supplies, which continued until the end of 1991 to buttress his position, while playing upon divisions among the resistance, embracing nationalism and renouncing communism, and even changing the name of the PDPA to the Wattan (Homeland) Party. It was only in April 1992, with the Soviet Union now history, his army defecting from beneath him, and the mujahidin closing on Kabul that he sought refuge at the UN office in the capital, leaving the city in the hands of the rival ethnic and regional mujahidin militias.

The leaders of the mujahidin groups agreed to establish a leadership council. This council quickly came under the control of Professor Burhanuddin Rabbani who was subsequently elected President by the council. Fighting broke out in August 1992 in Kabul between forces loyal to President Rabbani and rival factions. A new war for the control of Afghanistan had begun.

On September 26–27, 1996, the Pashtun-dominated ultra-conservative Islamic Taliban movement captured the capital of Kabul and expanded its control to over 90% of the country by mid-2000. The Taliban were led by Mullah Mohammed Omar. Ousted President Rabbani, a Tajik, and his defense minister Ahmad Shah Masoud relocated to Takhar in the north. Rabbani claimed that he remained the head of the government. His delegation retained Afghanistan's UN seat after the General Assembly deferred a decision on Afghanistan's credentials. Meanwhile, the Taliban removed the ousted PDPA leader Najibullah from the UN office in Kabul, tortured and shot him, and hung his body prominently in the city. General Rashid Dostum, an ethnic Uzbek, controlled several north-central provinces until he was ousted on 25 May 1997 by his second in command Malik Pahlawan. Dostum fled to Turkey, but he returned that October. The Shia Hazara community, led by Abdul Karim Khalili, retained control of a small portion of the center of the country.

After the fall of the Taliban, various warlords, leaders, and political factions emerged in Afghanistan. Dostum, as head of Jumbish-e Melli Islami (National Islamic Movement), consolidated his power in Mazar-i-Sharif. He was named interim deputy defense minister for the transitional government in 2002. Rabbani, as nominal head of the Northern Alliance, is also the leader of Jamiat-e-Islami, the largest political party in the alliance. Ismail Khan, a Shiite warlord of Tajik origin earned a power base in the western city of Herat by liberating it from Soviet control, and for a time in the '90s, kept it from Taliban control. Khan is thought to be receiving backing from Iran. Abdul Karim Khalili is the leader of the Hezb-e-Wahdat (Unity Party) and the top figure in the Shia Hazara minority. Wahdat is the main benefactor of Iranian support, and the second most-powerful opposition military party. Gulbuddin Hekmatyar, the most notorious of the warlords who emerged from the fight against Soviet occupation, leads the party Hezb-e Islami. Pir Syed Ahmed Gailani is a moderate Pashtun leader and wealthy businessman who is also the spiritual leader of a minority Sufi Muslim group. Gailani is supported by pro-royalist Pashtuns and Western-educated elites of the old regime. He has called for an Islamic constitutional republic. Former King Zahir Shah, who said he had no intention of returning to power, volunteered to help build a power-sharing administration for the country. Shah is a Pashtun. Younis Qanooni, an ethnic Tajik, who was named Interior Minister for the interim government, was also the interior minister in the country's previous interim administration, in 1996, before the Taliban came to power, and has opposed the presence of U.N. peacekeepers in Afghanistan. And Abdullah Abdullah, of the Northern Alliance, was a close friend of Ahmad Shah Masoud. Like Masoud, Abdullah is from the Tajik heartland of the Panshir Valley, but his mother is Pashtun. He has been seen as less willing to relinquish the Northern Alliance's grip on power.

## 15 LOCAL GOVERNMENT

Afghanistan was traditionally divided into provinces governed by centrally appointed governors with considerable autonomy in local affairs. There are currently 32 provinces. During the Soviet occupation and the development of country-wide resistance, local areas came increasingly under the control of mujahidin groups that were largely independent of any higher authority; local commanders, in some instances, asserted a measure of independence also from the mujahidin leadership in Pakistan, establishing their own systems of local government, collecting revenues, running educational and other facilities, and even engaging in local negotiations. Mujahidin groups retained links with the Peshawar parties to ensure access to weapons that were doled out to the parties by the government of Pakistan for distribution to fighters inside Afghanistan.

The Taliban set up a *shura* (assembly), made up of senior Taliban members and important tribal figures from the area. Each *shura* made laws and collected taxes locally. The Taliban set up a provisional government for the whole of Afghanistan, but it did not exercise central control over the local *shuras*.

The process of setting up the transitional government in June 2002 by the Loya Jirga took many steps involving local government. First, at the district and municipal level, traditional *shura* councils met to pick electors—persons who cast ballots for Loya Jirga delegates. Each district or municipality had to choose a predetermined number of electors, based on the size of its population. The electors then traveled to regional centers and cast ballots, to choose from amongst themselves a smaller number of loya jirga delegates—according to allotted numbers assigned to each district. The delegates then took part in the Loya Jirga.

The warlords who rule various regions of the country exert local control. The transitional government is attempting to integrate local governing authorities with the central government, but it lacks the loyalty from the warlords necessary to its governing

authority. More traditional elements of political authority—such as Sufi networks, royal lineage, clan strength, age-based wisdom, and the like—still exist and play a role in Afghan society. Karzai is relying on these traditional sources of authority in his challenge to the warlords and older Islamist leaders. The deep ethnic, linguistic, sectarian, tribal, racial, and regional cleavages present in the country create what is called “Qawm” identity, emphasizing the local over higher-order formations. Qawm refers to the group to which the individual considers himself to belong, whether a subtribe, village, valley, or neighborhood. Local governing authority relies upon these forms of identity and loyalty.

## 16 JUDICIAL SYSTEM

Under the Taliban, there was no rule of law or independent judiciary. Ad hoc rudimentary judicial systems were established based on Taliban interpretation of Islamic law. Murderers were subjected to public executions and thieves had a limb or two (one hand, one foot) severed. Adulterers were stoned to death in public. Taliban courts were said to have heard cases in sessions that lasted only a few minutes. Prison conditions were poor and prisoners were not given food. Normally, this was the responsibility of the prisoners’ relatives who were allowed to visit to provide them with food once or twice a week. Those who had no relatives had to petition the local council or rely on other inmates.

In non-Taliban controlled areas, many municipal and provincial authorities relied on some form of Islamic law and traditional tribal codes of justice. The administration and implementation of justice varied from area to area and depended on the whims of local commanders or other authorities, who could summarily execute, torture, and mete out punishments without reference to any other authority.

As of 2002, Afghanistan's judicial system was fragmented, with conflicts between such core institutions as the Ministry of Justice, Supreme Court, and attorney general's office. In addition, the judicial system's infrastructure was destroyed; the absence of adequate court or ministry facilities, basic office furniture, and minimal supplies made substantive progress difficult. There are also tensions between religious and secular legal training with regard to appointments of new judicial personnel. Until Afghanistan's new constitution is adopted, the country's basic legal framework will consist of its 1964 constitution and existing laws and regulations to the extent that they accord with the Bonn Agreement of 2001 and with international treaties to which Afghanistan is a party. The Ministry of Justice is charged with compiling current Afghan laws and assessing their compatibility with international standards. However, texts of Afghan laws are largely unavailable, even among attorneys, judges, law faculty, and government agencies such as the Ministry of Justice. While in power, the Taliban burned law books. There was no adequate law library in the country as of June 2002.

## 17 ARMED FORCES

Weapons information dates back to 1992, at which time there were SU-17, MiG21, and Mi-8 combat aircraft in the country. In 1998, defense spending was estimated at \$250 million or 14.7% of GDP. In 2002, the US was leading the efforts in creation of a national army. The international community as a whole made commitments to helping Afghanistan build security institutions. In 2002, Afghanistan requested \$235 million from the UN for 60,000 men for the land army, 8000 for the airforce, and 12,000 border guards. Most of the army's infrastructure, barracks, and depots were destroyed along with the Taliban.

## 18 INTERNATIONAL COOPERATION

Afghanistan has been a member of the UN since 19 November 1946. Afghanistan also belongs to the Asian Development Bank, the Colombo Plan, the Economic and Social Commission for Asia

and the Pacific (ESCAP), the G-77, the Islamic Development Bank (IDB), and the Organization of the Islamic Conference.

## 19 ECONOMY

Afghanistan's economy has been devastated by over 20 years of war. Hampered by an unintegrated economy until relatively late in the post-World War II period, only in the 1950s did the building of new roads begin to link the country's commercial centers with the wool and fruit-producing areas. Largely agricultural and pastoral, the country is highly dependent on farming and livestock raising (sheep and goats). In Afghanistan, 85 percent of the people are engaged in agriculture. Industrial activity includes small-scale production of textiles, soap, furniture, shoes, fertilizer, cement, and handwoven carpets. The country has valuable mineral resources, including large reserves of iron ore at Hajigak discovered before the 2-decade old war, but only coal, salt, lapis lazuli, barite, and chrome are available to be exploited. The discovery of large quantities of natural gas in the north, for which a pipeline to the former USSR was completed in 1967, increased the country's export earnings, at least until escalation of civil strife in the late 1970s and 1980s.

Since the outbreak of war in the late 1970s, economic data have been contradictory and of doubtful reliability. In September 1987, the Afghan foreign minister asserted that 350 bridges and 258 factories had been destroyed since the fighting began in 1979. By the early 1990s, two-thirds of all paved roads were unusable, and the countryside appeared severely depopulated, with more than 25% of the population—twice the prewar level—residing in urban areas. What little is left of the country's infrastructure has been largely destroyed due first to the war, and then to the US-led bombing campaign. Severe drought added to the nation's difficulties in 1998-2001. The majority of the population continues to suffer from insufficient food, clothing, housing, and medical care, problems exacerbated by military operations and political uncertainties. The presence of an estimated 10 million land mines has also hindered the ability of Afghans to engage in agriculture or other forms of economic activity. Inflation remains a serious problem.

Opium poppy cultivation is the mainstay of the economy. Major political factions in the country profit from the drug trade. In 1999, encouraged by good weather and high prices, poppy producers had increased the area under cultivation by 43 percent and harvested a bumper crop—a record 4,600 tons, compared with 2,100 tons the year before. A ban on poppy production cut cultivation in 2001 by 97% to 1695 hectares (4188 acres), with a potential production of 74 tons of opium. Afghanistan is a major source of hashish, and there are many heroin-processing laboratories throughout the country.

International efforts to rebuild Afghanistan were addressed at the Tokyo Donors Conference for Afghan Reconstruction in January 2002, when \$4.5 billion was collected for a trust fund to be administered by the World Bank. Priority areas for reconstruction included the construction of education, health, and sanitation facilities, enhancement of administrative capacity, the development of the agricultural sector, and the rebuilding of road, energy, and telecommunication links.

## 20 INCOME

The US Central Intelligence Agency (CIA) reported that in 2000 Afghanistan's gross domestic product (GDP) was estimated at \$21 billion. The per capita GDP was estimated at \$800. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 60% of GDP, industry 20%, and services 20%. Foreign aid receipts amounted to about \$15 per capita.

## 21 LABOR

Afghanistan's labor force is estimated at 10 million. As of 2002, 85% of the economically active population was engaged in agriculture. The textile industry is the largest employer of industrial labor; weaving of cloth and carpets is the most important home industry. In 1978, the government established the Central Council of Afghanistan Trade Unions in order to develop the trade union movement. In the mid-1980s, the council had some 285,000 members. Under the Taliban, the government did not have the means to enforce worker rights, as there was no functioning constitution or legal framework that defined them. Little was known about labor laws and practices under Taliban rule. There is no information pertaining to minimum wages or work hours and conditions. The vast majority of workers are in the informal economy. Children as young as six years old are reportedly working to help sustain their families.

## 22 AGRICULTURE

About 12% of the land is arable and less than 6% currently is cultivated. Normally, Afghanistan grew about 95% of its needs in wheat and rye, and more than met its needs in rice, potatoes, pulses, nuts, and seeds; it depended on imports only for some wheat, sugar, and edible fats and oils. Fruit, both fresh and preserved (with bread), is a staple food for many Afghans. Agricultural production, however, is a fraction of its potential. Agricultural production is constrained by an almost total dependence on erratic winter snows and spring rains for water; irrigation is primitive. Relatively little use is made of machines, chemical fertilizer, or pesticides.

The variety of the country's crops corresponds to its topography. The areas around Kandahar, Herat, and the broad Kabul plain yield fruits of many kinds. The northern regions from Takhar to Badghis and Herat and Helmand provinces produce cotton. Corn is grown extensively in Paktia and Nangarhar provinces, and rice mainly in Kunduz, Baghlan, and Laghman provinces. Wheat is common to several regions, and makes up 80% of all grain production. Aggregate wheat production in 2002 was estimated at 2.69 million tons, some 67 percent more than was achieved in 2001. Following wheat, the most important crops in 2000 were barley (74,000 tons) corn (115,000 tons), rice (232,800 tons), potatoes (235,000 tons), and cotton. Nuts and fruit, including pistachios, almonds, grapes, melons, apricots, cherries, figs, mulberries, and pomegranates are among Afghanistan's most important exports.

Agricultural products accounted for about 53% of Afghanistan's exports in 2001, of which fruits and nuts were a large portion. In some regions, agricultural production had all but ceased due to destruction caused by the war and the migration of Afghans out of those areas. A law of May 1987 relaxed the restrictions on private landowning set in 1978: the limit of permitted individual holding was raised from 6 to 18 hectares (from 15 to 45 acres). Opium and hashish are also widely grown for the drug trade. Opium is easy to cultivate and transport and offers a quick source of income for impoverished Afghans. Afghanistan was the world's largest producer of raw opium in 1999 and 2000. In 2000 the Taliban banned opium poppy cultivation but failed to destroy the existing stockpile and presumably benefited substantially from resulting price increases. Later, in 2001, the Taliban reportedly announced that poppy cultivation could resume. Much of Afghanistan's opium production is refined into heroin and is either consumed by a growing South Asian addict population or exported, primarily to Europe. Replacing the poppy industry is a goal of the Karzai administration.

## 23 ANIMAL HUSBANDRY

The availability of land suitable for grazing has made animal husbandry an important part of the economy. Natural pastures cover

some 3 million hectares (7.4 million acres) but are being overgrazed. The northern regions around Mazar-i-Sharif and Maymanah were the home range for about 6 million karakul sheep in 1998.

The output of livestock products in 1998, as projected by the FAO, included 300,000 tons of cows' milk, 201,000 tons of sheep's milk, 41,000 tons of goats' milk, 18,000 tons of eggs, 16,000 tons of wool (greasy basis), and 16,000 tons of sheep- and goatskins. Much of Afghanistan's livestock was removed from the country by early waves of refugees who fled to Pakistan and Iran. Total meat output in 2000 was 356,840 tons.

In 2001, the livestock population in Afghanistan had declined by about 40 percent since 1998. In 2002, this figure was estimated to have declined further to 60 percent. An FAO survey done in the Northern Regions during the spring of 2002 showed that in four provinces (Balkh, Juzjan, Saripol and Faryab), there was a loss of about 84 percent of cattle (1997/98: 224,296 head; 2002: 36,471 head) and around 80 percent of sheep and goats (1997/98: 1,721,021 head; 2002: 359,953 head).

## 24 FISHING

Some fishing takes place in the lakes and rivers, but fish does not constitute a significant part of the Afghan diet. Using explosives for fishing or so-called dynamite fishing is a trend that has become very popular since the 1980's and is common practice in the country. The annual catch was about 1,000 tons in 2000.

## 25 FORESTRY

Afghanistan's timber has been greatly depleted, and since the mid-1980s, only about 3% of the land area has been forested, mainly in the east. Significant stands of trees have been destroyed by the ravages of the war. Exploitation has been hampered by lack of power and access roads. Moreover, the distribution of the forest is uneven, and most of the remaining woodland is presently found only in mountainous regions in the southeast and south. The natural forests in Afghanistan are mainly of two types: (1) dense forests, mainly of oak, walnut and other species of nuts that grow in the southeast, and on the northern and northeastern slopes of the Sulaiman ranges; and (2) sparsely distributed short trees and shrubs on all other slopes of the Hindu Kush. The dense forests of the southeast cover only 2.7% of the country. The destruction of the forests to create agricultural land, logging, forest fires, plant disease and insect pests are all causes of the reduction in forest coverage. However, the most important factor in this destructive process is illegal logging and clear-cuttings by timber smugglers. According to a report in 1997, two and half million cubic feet of lumber were smuggled out of Afghanistan between 1995 and 1996, and sold in Pakistan with permission from the Pakistani Government of that time. However, the unofficial numbers for the amount of lumber smuggled into Pakistan from Afghanistan is estimated to be much higher than this.

## 26 MINING

Afghanistan has valuable deposits of barite, beryl, chrome, coal, copper, iron, lapis lazuli, lead, mica, natural gas, petroleum, salt, silver, sulfur, and zinc. Reserves of high-grade iron ore, discovered years ago at the Hajigak hills in Bamyan Province, are estimated to total 2 billion tons.

On average, some 114,000 tons of coal were mined each year during 1978-84. It is estimated that the country has 73 million tons of coal reserves, most of which is located in the region between Herat and Badakhshan in the northern part of the country. Production in 2000 amounted to 200,000 tons. In 2000, Afghanistan produced 13,000 tons of salt, 3,000 tons of gypsum, 5,000 tons of copper, and 120,000 tons of cement. Deposits of lapis lazuli in Badakhshan are mined in small quantities. Like other aspects of Afghanistan's economy, exploitation of natural resources has been disrupted by war. As well, the remote and rug-

ged terrain, and an inadequate transportation network usually have made mining these resources difficult.

## 27 ENERGY AND POWER

Two decades of warfare have left Afghanistan's power grid badly damaged. As of October 2002, only 6% of the population had access to electricity. In 2000, net electricity generation was 0.4 billion kWh, of which 36% came from fossil fuel, 64% from hydropower, and none from other sources. In the same year, consumption of electricity totaled 453.8 million kWh. Total installed capacity at the beginning of 2001 was 0.497 million kW. Three hydroelectric plants were opened between 1965 and 1970, at Jalalabad, Naghlu, and Mahi Par, near Kabul; another, at Kajaki, in the upper Helmand River Valley, was opened in the mid-1970s. In addition to the Naghlu, Mahi Par, and Kajaki plants, other hydroelectric facilities that were operational as of 2002 included plants at Sarobi, west of Kabul; Pol-e Khomri; Darunta, in Nangarhar province; Dahla, in Kandahar province; and Mazar-i-Sharif. In 1991, a new 72-collector solar installation was completed in Kabul at a cost of \$364 million. The installation heated 40,000 l of water to an average temperature of 60°C (140°F) around the clock. Construction of two more power stations, with a combined capacity of 600 kW, was planned in Charikar City. The drought of 1998–2001 negatively affected Afghanistan's hydroelectric power production, which resulted in blackouts in Kabul and other cities. Another generating turbine is being added to the Kajaki Dam in Helmand province near Kandahar, with the assistance of the Chinese Dongfeng Agricultural Machinery Company. This will add 16.5 megawatts to its generating capacity when completed. The Dahla Dam in Kandahar province was restored to operation by 2001, along with the Breshna-Kot Dam in Nangarhar province, which has a generating capacity of 11.5 MW. The 66-MW Mahipar hydro plant is operating as well.

Natural gas was Afghanistan's only economically significant export in 1995, going mainly to Uzbekistan via pipeline. Natural gas reserves were once estimated by the Soviets at 140 billion cu m. Production started in 1967 with 342 million cu m but had risen to 2.6 billion cu m in 1995. In 1991, a new gas field was discovered in Chekhcha, Jowzjan province. Natural gas was also produced at Shiberghan and Sar-i-Pol. As of 2002, other operational gas fields were located at Djarquduk, Khowaja Gogerdak, and Yatimtaq, all in Jowzjan province. As of 1997, natural gas production was 543,000 cu m (19 million cu ft). It was used domestically for urea production, power generation, and at a fertilizer plant.

In August 1996, a multinational consortium agreed to construct a 1,430 km (890 mi) pipeline through Afghanistan to carry natural gas from Turkmenistan to Pakistan, at a cost of about \$2 billion. However US air strikes led to cancellation of the project in 1998, and financing of such a project has remained an issue because of high political risk and security concerns. As of 2002 interim president Hamid Karzai was attempting to revive the pipeline project.

A very small amount of crude oil is produced at the Angot field in the northern Sar-i-Pol province. Another small oilfield at Zomrad Sai near Shiberghan was reportedly undergoing repairs in mid-2001. Petroleum products such as diesel, gasoline, and jet fuel are imported, mainly from Pakistan and Turkmenistan. A small storage and distribution facility exists in Jalalabad on the highway between Kabul and Peshawar, Pakistan. Afghanistan is also reported to have oil reserves totaling 95 million barrels and coal reserves totaling 73 million tons.

## 28 INDUSTRY

As with other sectors of the economy, Afghanistan's already beleaguered industries have been devastated by over two decades of civil strife and war that left most of the country's factories and even much of the cottage industry sector inoperative. Still in an

early stage of growth before the outbreak of war, industry's development has been stunted since; those few industries that have continued production remain limited to processing of local materials. The principal modern industry is cotton textile production, with factories at Pol e Khomri, Golbahar, Begram, Balkh, and Jabal as Saraj, just north of Charikar. Important industries in 2000 included textiles, soap, furniture, shoes, fertilizer, cement, handwoven carpets, natural gas, coal, and copper.

Carpet making is the most important handicraft industry, but it has suffered with the flight of rug makers during the civil war and since the 2001 US-led bombing campaign. Carpet-making is centered around the north and northwest regions of the country. Afghan carpets are made of pure wool and are hand-knotted, and much of the work is done by women. Production has fluctuated widely from year to year, increasing somewhat during the early 1990s with the establishment of selected "zones of tranquility" targeted for UN reconstruction assistance. Other handicrafts include feltmaking and the weaving of cotton, woolen, and silk cloth. Wood and stone carving have been concentrated in the northeastern provinces, while jewelrymaking has been done in the Kabul area. The making of leather goods has also been a handicraft industry.

## 29 SCIENCE AND TECHNOLOGY

The Afghanistan Academy of Sciences, founded in 1979, is the principal scientific institution. As of 2002, it had about 180 members. Prospective members of the Academy must take a written exam, present samples of their work, and pass a proficiency exam in one of the official languages of the UN. Many Afghan scientists migrated to Europe, the US, and Pakistan during over two decades of war. Under the Taliban, professors who did not teach Islamic studies were relieved of their duties.

The Department of Geology and Mineral Survey within the Ministry of Mines and Industries conducts geological and mineralogical research, mapping, prospecting and exploration.

The Institute of Public Health, founded in 1962, conducts public health training and research and study of indigenous diseases, has a Government reference laboratory, and compiles statistical data.

Kabul University, founded in 1932, has faculties of Science, Pharmacy, Veterinary Medicine, and Geo-Sciences. Its faculty numbers close to 200. The University of Balkh has about 100 faculty members. Bayazid Roshan University of Nangarhar, founded in 1962, has faculties of Medicine and Engineering—its faculty numbers close to 100. The Institute of Agriculture, founded in 1924, offers courses in veterinary medicine. Kabul Polytechnic College, founded in 1951, offers post-graduate engineering courses. Kabul Polytechnic was the site of the June 2002 Loya Jirga, and the international community spent over \$7 million to refurbish part of the campus for the assembly. Buildings on campus had suffered heavy bomb damage. During the 1990s, the campus was shelled and looted by mujahidin groups who fought amongst themselves for control of the capital. Boarding students studying under the rule of the Taliban lived in makeshift dormitories.

## 30 DOMESTIC TRADE

Kabul, Kandahar, Mazār-e-Sharif, and Herāt are the principal commercial cities of eastern, southern, northern, and western Afghanistan, respectively. The first two are the main distribution centers for imports arriving from the direction of Pakistan; the latter two, for materials arriving from Iran and the former USSR. Hours of business vary. The destruction of paved roads has severely constrained normal domestic trade in most rural parts of the country. Heavy fighting in Kabul has completely destroyed the city's infrastructure.

### 31 FOREIGN TRADE

Although the Taliban had brought a repressive order to the 90% of the country under its rule, it was unable to attract foreign investment as long as it was unable to gain international recognition. Hyperinflation had increased the number of Afghani (the country's currency) needed to equal one US dollar from 50 in the early 1990s to a virtually worthless 42,000 in 1999. On October 7, 2002, the first anniversary of the start of the US-led bombing campaign in Afghanistan, a new Afghan currency came into use. Also called the Afghani, the new notes were worth 1000 of the old notes, which were phased out. The government will exchange the dostumi currency, which is used in northern Afghanistan and named after the region's warlord Abdul Rashid Dostum, into new Afghani at half the value of old Afghani. Around 1800 tons of old Afghani were due to be burned or recycled.

The value of exports, including fruits and nuts, carpets, wool, cotton, hides and pelts, and gems totaled an estimated \$1.2 billion in 2001. Imports, including food, petroleum products, and most commodity items totaled an estimated \$1.3 billion.

Principal trading partners in 2000 (in percentages) were as follows:

COUNTRY	EXPORTS	IMPORTS
Pakistan	27.8	23
India	7.7	
Turkmenistan		7.1
Japan		9.9
China (inc. Hong Kong)	4.9	
Kenya		8
Belgium	13	
Finland	6.8	
Kazakhstan		10.9

### 32 BALANCE OF PAYMENTS

Between 1951 and 1973, Afghanistan's year-end international reserves were never lower than \$38 million or higher than \$65 million. Development of the natural gas industry and favorable prices for some of the country's agricultural exports led to increases in international reserves, to \$67.5 million in 1974 and to \$115.4 million as of 31 December 1975. Exploitation of natural gas also freed Afghanistan from extreme dependence on petroleum imports and from the rapid increases in import costs that most countries experienced in 1973 and 1974. Increased trade with the former USSR and Eastern Europe in the late 1970s and 1980s resulted in a reduction of foreign exchange earnings, since trade surpluses are counted as a credit against future imports. Foreign exchange reserves declined from \$411.1 million at the close of 1979 to \$262 million as of 30 May 1987. The public foreign debt in 1997 stood at \$5.49 billion. Reliable statistics are not available for the ensuing years. However, the US Central Intelligence Agency (CIA) reports that in 2001 the purchasing power parity of Afghanistan's exports was \$1.2 billion while imports totaled \$1.3 billion resulting in a trade deficit of \$100 million.

### 33 BANKING AND SECURITIES

The government central bank, the Bank of Afghanistan, was founded in 1939. In 1999, the UN Security Council passed a resolution placing the Bank of Afghanistan on a consolidated list of persons and entities whose funds and financial resources should be frozen, due to the fact that the bank was controlled by the Taliban regime. The Interim Administration of Afghanistan requested in January 2002 that the bank be removed from the consolidated list, and the Security Council agreed.

All banks in Afghanistan were nationalized in 1975. In the early 1980s there were seven banks in the country, including the Agricultural Development Bank, the Export Promotion Bank, the Industrial Development Bank, and the Mortgage and Construction Bank.

There is no organized domestic securities market.

### 34 INSURANCE

The fate of the Afghan National Insurance Co., which covered fire, transport, and accident insurance, is unknown as of 2002.

### 35 PUBLIC FINANCE

The fiscal year ends 20 March. Budget breakdowns have not been available since 1979/80, when revenues totaled Af15,788 million and expenditures Af16,782 million. In 2002, the Interim and Transitional governing authorities were working with donor aid agencies to finance the rebuilding of Afghanistan's infrastructure and society. The Interim Administration was supported by the Asian Development Bank, the Islamic Development Bank, UNDP, and the World Bank. An Implementation Group was established to operate an "Operational Costs Trust Fund" for Afghanistan, to be effective when the UNDP "Start-up Fund" ceased, to cover expenditures normally financed by domestic revenue. The Operational Costs Trust Fund will cease to operate when the situation in Afghanistan would approach fiscal normality, estimated by 2006, when the government would be able to finance most or all of its own costs.

The US Central Intelligence Agency (CIA) estimates that in 2000 Afghanistan's external debt totaled \$5.5 billion.

### 36 TAXATION

In the early 1980s, direct taxes accounted for about 15% of government revenues. The share provided by indirect taxes declined from 42% to 30%, as revenues from natural gas and state enterprises played an increasing role in government finance. Tax collection, never an effective source of revenue in rural areas, was essentially disabled by the disruption caused by fighting and mass flight. Under the Taliban, arbitrary taxes, including those on humanitarian goods, were imposed.

### 37 CUSTOMS AND DUTIES

Before the turmoil of the late 1970s, customs duties, levied as a source of revenue rather than as a protective measure, constituted more than one-fourth of total government revenue. As of 1993, both specific and ad valorem duties of 20–35% were levied on imports. Other costs included service and Red Crescent charges; monopoly and luxury taxes; authorization and privilege charges, and a commission-type duty.

After the fall of the Taliban, Afghanistan's warlords collected customs duties for themselves rather than transferring the funds to the Interim and Transitional authorities in Kabul. In May 2002, it was estimated that between \$6 and \$7 million in customs duties were paid each month at Afghanistan's borders with Pakistan, Iran, and Uzbekistan, very little of which went into the government treasury.

### 38 FOREIGN INVESTMENT

A 1967 law encouraged investment of private foreign capital in Afghanistan, but under the PDPA government, Western investment virtually ceased. Between 1979 and 1987, the former USSR provided technical and financial assistance on more than 200 projects, including various industrial plants, irrigation dams, agricultural stations, and a new terminal at the Kabul airport. After 1990, reconstruction investments from Russia, Japan, and the US were channeled through the United Nations. The Taliban called for Western support to help reconstruct Afghanistan, but Western donors—already reluctant to support UN programs in the country—did not respond. After the fall of the Taliban, head-of-state Hamid Karzai encouraged foreign countries for direct investment in Afghanistan, first to reach the people in the provinces who require salaries and owe taxes, and then to invest in businesses that would lead to industrial and technological development.

### **39**ECONOMIC DEVELOPMENT

As of 2002, the World Bank was managing an Afghan Reconstruction Trust Fund (ARTF) to assist the Interim Administration in funding physical reconstruction projects, including in the health sector, as well as managing expenses such as salaries for state employees. The ARTF began in May 2002, as a joint proposal of the World Bank, the UN Development Program (UNDP), the Asian Development Bank, and the Islamic Development Bank. It was set up to streamline international support to Afghanistan by organizing aid pledges within a single mechanism. Contributions to the ARTF are anticipated to total more than \$60 million in the first year, and \$380 million over 4 years. As of November 2002, pledges of funding for Afghanistan reached more than \$4.5 billion for the first 30 months.

### **40**SOCIAL DEVELOPMENT

Social welfare in Afghanistan has traditionally relied on family and tribal organization. In the villages and small towns, a tax is levied on each man to benefit the poor. Disabled people are cared for in social welfare centers in the provincial capitals. Most other welfare activities are still unorganized and in private hands. In the early 1990s, a social insurance system provided old age, disability, and survivors' pensions, sickness and maternity benefits, and workers' compensation.

Women have traditionally had few rights in Afghanistan, with their role limited largely to the home and the fields. Advances in women's rights were made from 1920 onward, and by the time of the communist coup, women attended school in large numbers, voted and held government jobs—including posts as cabinet ministers, and were active in the professions. The Communist regime also promoted women's rights, but the victory of the extremely conservative Taliban in 1996 reversed this trend. Strict limits on the freedoms of women were put in place. Women were only allowed to appear in public if they were dressed in a chadri, or burka, a long black or blue garment with a mesh veil covering the face, and only if accompanied by a male. The Taliban also banned girls from attending school, and prohibited women from working outside the home. Certain restrictions on women were reportedly lifted in 1998. Women were allowed to work as doctors and nurses as long as they treated only women, and were able to attend medical schools. Widows with no means of support were allowed to seek employment.

The human rights record of the governing Taliban was extremely poor. Taliban forces were responsible for disappearances and political killings, including massacres and summary executions. In areas controlled by the Taliban, Islamic courts and religious police imposed strict order based on conservative interpretations of Islamic law that mandated, among other measures, public execution for adultery and amputation for theft. Homes were burned and livestock destroyed in a military offensive in the summer of 1999 that resulted in the forcible relocation of many civilians. Basic freedoms of speech, assembly, religion, and association were abridged under Taliban rule.

With the end of the Taliban, women and girls were permitted to attend schools and universities, and the enforced wearing of the burka was ended. Men were allowed to shave, music and television were permitted, and a host of Taliban-imposed restrictions on society ended. A broad-based, pluralistic society is being fostered, with a high degree of respect for human rights and basic freedoms.

### **41**HEALTH

Starvation, disease, death, war, and migration had devastating effects on Afghanistan's health infrastructure in the 1990s. According to the World Health Organization, medication was scarce. Infectious diseases accounted for more than half of all hospital admissions (mostly malaria and typhoid) in 1994. Even

before the war disrupted medical services, health conditions in Afghanistan were inadequate by western standards. A national medical school was established in 1931 and, in the following year, the first tuberculosis hospital was built. In 1990, for every 100,000 people, 278 were stricken with tuberculosis.

Efforts to take medical services to war-ravaged areas of Afghanistan and to areas left without public health programs due to the termination of services were waged by volunteer medical programs from France, Sweden, the US, and other countries.

In 1991, there were 2,233 doctors, 510 pharmacists, 267 dentists, 1,451 nurses, and 338 midwives. Between 1985-1995 only 29% of the population had access to health services. During those same years, few of the population had access to safe water (10%) and adequate sanitation (8%). For children under one the immunization rates were as follows: tuberculosis (44%), diphtheria, pertussis, and tetanus (18%), polio (18%), and measles (40%) between 1990-94.

In 2002, estimated life expectancy was 46.6 years—one of the lowest in the world—and infant mortality was estimated at 145 per 1,000 live births, which makes the country have the world's fourth highest mortality rate for children under age 5. The maternal mortality rate in 2002 was one of the highest in the Central Asia region with 1,600 maternal deaths per 100,000 live births. The death rate in 2002 was 17 per 1,000 people. Cholera reached epidemic proportions with 19,903 cases reported in 1995. In 2002, 80,000 children a year were dying of diarrheal disease. From 1978 to 1991, there were over 1,500,000 war-related deaths. It is estimated that 3767 civilians died because of US bombs in Afghanistan between October 7 and December 7 of 2001. Approximately 300-400 civilians were killed between October 2001 and July 2002.

As of 2002, Afghanistan had an average of four hospital beds for every 10,000 people. Most of the country's facilities are in Kabul, and those needing treatment must traverse the countryside to get there. Health care is being provided by the international community primarily. Some military field hospitals were set up as a result of the US-led coalition war. There are some medical facilities supported by the Red Cross operating in the country. In 24 of 31 provinces there are no hospitals or medical staff. For every 10,000 people in the country, there is an average of 1.8 physicians. Primary care physicians are most needed for pediatrics, women's health, internal medicine, and ob-gyn. Afghan physicians need training and retraining to upgrade their skills and knowledge base.

### **42**HOUSING

Houses in farming communities are built largely of mud brick and frequently grouped within a fortified enclosure, to provide protection from marauders. The roofs are flat, with a coating of mixed straw and mud rolled hard above a ceiling of horizontal poles, although in areas where timber is scarce, separate mud brick domes crown each room. Cement and other modern building materials are widely used in cities and towns. Every town has at least one wide thoroughfare, but other streets are narrow lanes between houses of mud brick, taller than those in the villages and featuring decorative wooden balconies. The war and bombing campaign has severely damaged or destroyed countless houses. According to an official report, there were 200,000 dwellings in Kabul in the mid-1980s. The latest available figures for 1980-88 show a total housing stock of 3,500,000 with 4.4 people per dwelling.

In 2002, over 100,000 shelters were needed throughout Afghanistan for returning refugees, internally displaced persons, and the extremely poor who had very limited covered space, in both rural and urban areas. The UN High Commissioner for Refugees (UNHCR) is the leader in the field of shelter. Other funders include the UN Development Program, the International Organization for Migration, and CARE International, while the agencies

implementing the programs are the Ministry for Rural Rehabilitation and Development (MRRD) in Afghanistan, the United Nations Human Settlement Program (Habitat), the International Rescue Committee (IRC) as well as an assortment of international and local nongovernmental organizations (NGOs).

### 43 EDUCATION

Adult illiteracy for the year 2002 for males was 49%; females, 79%. This is the highest illiteracy rate in Asia. Education is free at all levels. Primary education lasts for six years and is theoretically compulsory for 6 years, but only 53% of boys and 5% of girls were enrolled in elementary school in 2002. Boys and girls are schooled separately. A teacher has on average 58 pupils in an elementary school classroom, but only 28 students in a secondary school classroom. Only 32% of the males and 11% of females graduating from elementary school continue into secondary education. Vocational training is provided in secondary schools and senior high schools, and six percent of students are enrolled in the vocational system. Secondary education lasts for another six years. Children are taught in their mother tongue, Dari (Persian) or Pashtu (Pashto), during the first three grades; the second official language is introduced in the fourth grade. Children are also taught Arabic so that they may be able to read the Koran (Qur'an). The school year extends from early March to November in the cold areas and from September to June in the warmer regions. The school-aged population in Afghanistan is 6,650,000.

In addition to the secular public education system, the traditional Islamic madrasa school system is functioning. At the madrasas, children study the Koran, the Hadith (Sayings of the Prophet Mohammad), and popular religious texts.

Under the Taliban regime, girls were not allowed to have education at all levels. All teachers have civil service status. The educational system is totally centralized by the state.

The University of Kabul, which is now coeducational, was founded in 1932. In 1962, a faculty of medicine was established at Jalalabad in Nangarhar Province; this faculty subsequently became the University of Nangarhar. By 2002 a total of 8 universities had been established in Afghanistan along with 9 pedagogical institutes. The number of Afghans enrolled in higher education was expected to double from 26,000 to 52,000 by 2003. An estimated one thousand women throughout Afghanistan participated in university entrance examinations in 2002.

### 44 LIBRARIES AND MUSEUMS

For centuries, manuscript collections were in the hands of the rulers, local feudal lords, and renowned religious families. Printing came fairly late to Afghanistan, but with the shift from the handwritten manuscript to the printed book, various collections were formed. Kabul has a public library (1920) with 60,000 volumes, and the library of the University of Kabul has 250,000 volumes. There is a library at Kabul Polytechnic University with 6,000 volumes and a government library, at the ministry of education, also in Kabul, with 30,000 volumes.

Prior to the devastating civil war, the Kabul Museum (founded in 1922) possessed an unrivaled collection of stone heads, bas-reliefs, ivory plaques and statuettes, bronzes, mural paintings, and Buddhist material from excavations at Hadda, Bamian, Bagram, and other sites. It also contained an extensive collection of coins and a unique collection of Islamic bronzes, marble reliefs, Kushan art, and ceramics from Ghazni. In nearly a decade of warfare, however, the museum was plundered by the various armed bands, with much of its collection sold on the black market, or systematically destroyed. As of 2003, the Kabul museum is slowly beginning some restoration. Also in Kabul, is the Kabul University Science Museum, with an extensive zoological collection and a museum of pathology. There are provincial museums at Bamiyan, Ghazni, Herat, Mazar-i-Sharif, Maimana, and Kandahar. Major religious shrines have collections of valu-

able objects. Due to the chaotic political situation in the 1990s, it is impossible to determine the state of any of its collections.

In March 2001, the Taliban dynamited the Bamiyan Buddhas and sold the debris and the remains of the original sculpture. Small statues of the Buddhas in Foladi and Kakrak were destroyed. Most of the statues and other "non-Islamic art" works in the collections of the Kabul Museum were destroyed, including those stored for security reasons in the Ministry of Information and Culture. UNESCO has undertaken a plan to conserve the archaeological remains and the minaret at Jam, and to make it a World Heritage site. The minaret was built at the end of the 12th century and at 65 meters is the second tallest in the world after the Qutub Minar in New Delhi.

### 45 MEDIA

Limited service to principal cities and some smaller towns and villages is provided by the government-operated telegraph and telephone services. Prior to 2001, there were some 30,000 telephones currently in use. Local telephone networks were not operating reliably in 2002. There is no commercial satellite telephone service locally. The first television broadcast took place in 1978. As of 1997, there were 63 radios and 4 television sets per 1,000 population.

Prior to the fall of the Taliban, the major newspapers, all headquartered in Kabul, (with estimated 1999 circulations) were *Anis* (25,000), published in Dari and Pashto; *Hewad* (12,200), and *New Kabul Times* (5,000), in English. In January 2002, the independent newspaper *Kabul Weekly* was published after having disappeared when the Taliban seized power. The first issue carried news in Dari, Pashto, English, and French. UNESCO is providing aid to journalists and technical media staff, including those of national television. It works to strengthen the Afghan News Agency by training journalists, and has projects for the development of public service broadcasting. More than 100 high-quality television productions from all over the world were sent to Radio Television Afghanistan in 2002. That year, an Internet-equipped computer training center was established within the Ministry of Education in Kabul.

### 46 ORGANIZATIONS

Organizations to advance public aims and goals are of recent origin and most are sponsored and directed by the government. The National Fatherland Front, consisting of tribal and political groups that support the government, was founded in June 1981 to bolster the PDPA regime and to promote full and equal participation of Afghan nationals in state affairs.

The Women's Welfare Society carries on educational enterprises, provides training in handicrafts, and dispenses charitable aid, while the Maristun, a social service center, looks after children, men, and women and teaches them crafts and trades. The Revolutionary Association of the Women of Afghanistan (RAWA), established in Kabul, Afghanistan, in 1977, is an independent political organization of Afghan women focusing on human rights and social justice.

With political changes in the country throughout the past decade, a number of new women's groups have developed. These include the Afghan Women Social and Cultural Organization (AWSCO, est. 1994), the Afghan Women's Educational Center (AWEC, est. 1991), the Afghan Women's Network (AWN, est. 1995), the Educational Training Center for Poor Women and Girls of Afghanistan (ECW, est. 1997), the New Afghanistan Women Association (est. 2002 as a merger of the Afghan Women Journalist Association and the Afghan Feminine Association), and the World Organization for Mutual Afghan Network (WOMAN, est. 2002).

The Union of Afghanistan Youth is a national non-government organization representing the concerns of the nation's youth and young adults in the midst of transition and reconstruction. The

organization serves as a multi-party offshoot of the Democratic Youth Organization of Afghanistan (DYOA), which has worked closely with the People's Democratic Party of Afghanistan. Though the Scouting Movement of Afghanistan was disbanded in 1978, the World Organization of the Scout Movement (WOSM) began conducting seminars in July 2003 to encourage and support the rebirth of scouting programs.

The Red Crescent, the equivalent of the Red Cross, is active in every province, with a national chapter of Red Crescent Youth also active. An institute called the Pashto Tolanah promotes knowledge of Pashto literature and the Historical Society (Anjuman-i-Tarikh) amasses information on Afghan history. The Afghan Carpet Exporters' Guild, founded in 1987, promotes foreign trade of Afghan carpets and works for the improvement of the carpet industry.

#### 47 TOURISM, TRAVEL, AND RECREATION

The tourism industry, developed with government help in the early 1970s, has been negligible since 1979 due to internal political instability. A passport and visa are required for entrance into Afghanistan. In 1999, the UN estimated the daily cost of staying in Kabul at \$70. Approximately 61% of these costs were estimated to be the price of a room in a guest house. As travel was highly restricted in the country due to the US-led campaign against the Taliban and al-Qaeda, it is unknown what the daily cost of staying in the country was in 2002.

#### 48 FAMOUS AFGHANS

The most renowned ruler of medieval Afghanistan, Mahmud of Ghazni (971?–1030), was the Turkish creator of an empire stretching from Ray and Isfahan in Iran to Lahore in India (now in Pakistan) and from the Amu Darya (Oxus) River to the Arabian Sea. Zahir ud-Din Babur (1483–1530), a Timurid prince of Ferghana (now in the former USSR), established his base at Kabul and from there waged campaigns leading to the expulsion of an Afghan ruling dynasty, the Lodis, from Delhi and the foundation of the Mughal Empire in India.

Many eminent figures of Arab and Persian intellectual history were born or spent their careers in what is now Afghanistan. Al-Biruni (973–1048), the great Arab encyclopedist, was born in Khiva but settled in Ghazni, where he died. Abdul Majid Majdud Sana'i (1070–1140), the first major Persian poet to employ verse for mystical and philosophical expression, was a native of Ghazni. Jalal ud-Din Rumi (1207–73), who stands at the summit of Persian poetry, was born in Balkh but migrated to Konya (Icönium) in Turkey. The last of the celebrated Persian classical poets, Abdur Rahman Jami (1414–92), was born in Khorasan but spent most of his life in Herat. So did Behzad (1450?–1520), the greatest master of Persian painting.

The founder of the state of Afghanistan was Ahmad Shah Abdali (1724–73), who changed his dynastic name to Durrani. He conquered Kashmir and Delhi and, with his capital at Kandahar, ruled over an empire that also stretched from the Amu Darya to the Arabian Sea. Dost Muhammad (1789–1863) was the founder of the Muhammadzai (Barakzai) dynasty. In a turbulent career, he both fought and made peace with the British in India,

and unified the country. His grandson, Abdur Rahman Khan (1844–1901), established order after protracted civil strife. Amanullah Khan (1892–1960), who reigned from 1919 to 1929, tried social reforms aimed at Westernizing the country but was forced to abdicate. Muhammad Nadir Shah (d.1933), who was elected king by a tribal assembly in 1929, continued Amanullah's Westernization program. His son, Muhammad Zahir Shah (b.1914), was king until he was deposed by a coup in July 1973. Lieut. Gen. Sardar Muhammad Daoud Khan (1909–78), cousin and brother-in-law of King Zahir, was the leader of the coup and the founder and first president of the Republic of Afghanistan. Leaders in the violent years since the 1978 "Saur Revolution" have been Nur Muhammad Taraki (1917–79), founder of the PDPA; Hafizullah Amin (1929–79), Taraki's successor as president of the Revolutionary Council and secretary-general of the PDPA; Babrak Karmal (1929), leader of the pro-Soviet Parcham group of the PDPA and chief of state from December 1979 until May 1986; and Dr. Najibullah (1947–96), former head of the Afghan secret police who was brutally executed by the Taliban militia after they seized control of Kabul.

#### 49 DEPENDENCIES

Afghanistan has no territories or colonies.

# AUSTRALIA

Commonwealth of Australia

**CAPITAL:** Canberra

**FLAG:** The flag has three main features: the red, white, and blue Union Jack in the upper left quarter, indicating Australia's membership in the Commonwealth of Nations; the white five-star Southern Cross in the right half; and the white seven-pointed federal star below the Union Jack. The flag has a blue background. Of the five stars of the Southern Cross, four have seven points and one has five points.

**ANTHEM:** *God Save the Queen* is reserved for regal and state occasions and whenever singing is appropriate; the national tune is *Advance Australia Fair*.

**MONETARY UNIT:** The Australian dollar (A\$) is a paper currency of 100 cents. There are coins of 5, 10, 20, and 50 cents and 1 and 2 dollars, and notes of 5, 10, 20, 50 and 100 dollars. A\$1 = US\$0.6173 (US\$1 = A\$1.62) as of May 2003.

**WEIGHTS AND MEASURES:** Metric weights and measures are used. The Australian proof gallon equals 1.37 US proof gallons.

**HOLIDAYS:** New Year's Day, 1 January; Australia Day, last Monday in January; Anzac Day, 25 April; Queen's Birthday, second Monday in June; Christmas, 25 December; Boxing Day, 26 December. Numerous state holidays also are observed. Movable religious holidays include Good Friday, Easter Saturday, and Easter Monday.

**TIME:** Western Australia, 8 PM = noon GMT; South Australia and Northern Territory, 9:30 PM; Victoria, New South Wales, Queensland, and Tasmania, 10 PM. Summer time is 1 hour later in all states except Western Australia, Queensland, and the Northern Territory.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Lying southeast of Asia, between the Pacific and Indian oceans, Australia, the world's smallest continent, is almost completely surrounded by ocean expanses. Australia is slightly smaller than the United States, with a total area of 7,686,850 sq km (2,967,909 sq mi). The five mainland states are New South Wales, 801,600 sq km (309,500 sq mi); Queensland, 1,727,200 sq km (666,900 sq mi); South Australia, 984,000 sq km (379,900 sq mi); Victoria, 227,600 sq km (87,900 sq mi); and Western Australia, 2,525,500 sq km (975,100 sq mi). The island state of Tasmania has an area of 67,800 sq km (26,200 sq mi); the Northern Territory, 1,346,200 sq km (519,800 sq mi); and the Australian Capital Territory, 2,400 sq km (900 sq mi). The country, including Tasmania, extends about 4,000 km (2,500 mi) E-W and 3,180 km (1,980 mi) N-S.

Australia is bounded on the N by the Timor and Arafura seas, on the NE by the Coral Sea, on the E by the Pacific Ocean, on the SE by the Tasman Sea, and on the S and W by the Indian Ocean, with a total coastline of 25,760 km (16,007 mi). Neighboring areas include Irian Jaya (part of Indonesia) and Papua New Guinea to the north, New Zealand to the southeast, and Indonesia to the northwest.

Australia's capital city, Canberra, is located in the southeastern part of the country.

## <sup>2</sup>TOPOGRAPHY

The continent of Australia is divided into four general topographic regions: (1) a low, sandy eastern coastal plain; (2) the eastern highlands, ranging from 300 to more than 2,100 m (1,000–7,000 ft) in altitude and extending from Cape York Peninsula in northern Queensland southward to Tasmania; (3) the central plains, consisting largely of a north-south series of

drainage basins, including the Great Artesian Basin, which underlies about 1,751,480 sq km (676,250 sq mi) of territory and is the most extensive area of internal drainage in the world; and (4) the western plateau, covered with great deserts and "bigger plains" (regularly spaced sand ridges and rocky wastes), rising 300 to 600 m (1,000–2,000 ft) high and constituting most of the western half of the continent.

Australian mountains have eroded over recent geological periods, and only about 6% of the continent is above 600 m (2,000 ft); the average elevation is less than 300 m (1,000 ft). The highest point is Mt. Kosciuszko, 2,228 m (7,310 ft), in the Australian Alps of the southeastern corner of New South Wales; the lowest point is Lake Eyre in South Australia, 15 m (49 ft) below sea level. In 1983, grains of rock from Western Australia were dated at 4.1–4.2 billion years old, making them the oldest ever found on earth.

The most important river system, and the only one with a permanent, year-round flow, is formed by the Murray, Darling, and Murrumbidgee rivers in the southeast. The Murray River, Australia's largest, rises in the Australian Alps of New South Wales and flows some 2,600 km (1,600 mi) west and southwest to empty into the sea below Adelaide, South Australia. Several other rivers are important, but for the most part they carry great amounts of water in the wet season and are dry for the rest of the year. The largest lakes have no outlet and are usually dry. The coastline is smooth, with few bays or capes. The two largest sea inlets are the Gulf of Carpentaria in the north, between Arnhem Land and the Cape York Peninsula, and the Great Australian Bight in the south. The Great Barrier Reef, the longest coral reef in the world, extends for about 2,000 km (1,243 mi) off the east coast of Queensland.

### 3 CLIMATE

Although it has a wide diversity of climatic conditions, Australia is generally warm and dry, with no extreme cold and little frost, its temperatures ranging from comfortably mild in the south to hot in the central interior and north. July mean temperatures average 9°C (48°F) in Melbourne in the southeast and 25°C (77°F) in Darwin in the north. January mean temperatures average 20°C (68°F) in Melbourne and 30°C (86°F) in Darwin. Summer readings often reach 38°C (100°F) or more in almost any area of the continent and may exceed 46°C (115°F) in interior regions. Winds are light to moderate, except along the coasts, where cyclones have occurred.

The continent is subject to great variations in rainfall, but except for a few areas rainfall is insufficient, and the rate of evaporation is high. Mean annual rainfall is 42 cm (17 in), much less than the world mean of 66 cm (26 in). About 18% of the land area is desert. Only about 20% has more than 76 cm (30 in) of rain annually, but these areas suffer from a long dry season, while others have too much rain. Only Tasmania, Victoria, and parts of New South Wales have enough rainfall all year round. Droughts and floods occur irregularly but frequently over large areas. On 25 December 1974, a cyclone and flood devastated most of Darwin; at least 49 people were killed, and some 20,000 were left homeless. Drought conditions became very severe in the early 1980s, leading to dust storms, fires, and multibillion-dollar crop losses. Again in 1994–95, a severe drought devastated eastern agricultural regions.

### 4 FLORA AND FAUNA

Many distinctive forms of plant and animal life are found, especially in the coastal and tropical areas. There are some 500 species of eucalyptus and 600 species of acacia (wattle). Other outstanding trees are the baobab, blackwood, red cedar, coachwood, jarrah, Queensland maple, silky oak, and walnut. Native trees shed bark instead of leaves. Numerous types of wild flowers grow in the bush country, including boronia, Christmas bush, desert pea, flanner flower, Geraldton wax plant, kangaroo paw, pomaderris, and waratah. There are 470 varieties of orchids. About 200 kinds of mammals, 200 kinds of lizards, and 350 kinds of birds are indigenous. Apart from marsupials (bandicoots, kangaroos, koalas, possums, Tasmanian devils, tree kangaroos, and wallabies), the most unusual animals are the dingo, echidna, flying fox (fruit bat), platypus, and wombat. Birds include the anhinga, bellbird, bowerbird, cassowary, emu, galah, kookaburra (laughing jackass), lyrebird, fairy penguin, rosella, and many types of cockatoos, parrots, hawks, and eagles.

Many species of trees, plants, and domestic animals have been imported, often thriving at the expense of indigenous types. Herds of wild buffalo, camels, donkeys, horses, and pigs, descendants of stock that strayed from herds imported by pioneers, roam the sparsely settled areas. The proliferation of rabbits resulted in a menace to sheep, and in 1907, a thousand-mile-long fence was built to keep rabbits out of Western Australia. Subsequently, a similar fence was erected in the east to prevent the incursion of dingos.

### 5 ENVIRONMENT

The principal government institutions responsible for environmental matters are the Department of Home Affairs and Environment, the Australian Environment Council, and the Council of Nature Conservation Ministers. A national conservation strategy, developed by the states, the Northern Territory, and the federal government, in cooperation with the International Union for the Conservation of Nature and Natural Resources, the World Wildlife Fund, and the UNEP, became national policy in 1980.

The Environment Protection (Impact of Proposals) Act of 1974 establishes procedures for ensuring that environmental impact is considered in governmental decision making. The Whale Protection Act of 1981 prohibits killing, capturing, injuring, or interfering with a whale, dolphin, or porpoise within Australia's 200 mi economic zone or, beyond the zone, by Australian vessels and aircraft and their crews. The Environment Protection (Nuclear Codes) Act of 1978 mandates the development of uniform safety standards for uranium mining and milling and for the transport of radioactive materials. The Protection of the Sea (Discharge of Oil from Ships) Act of 1981 and the Protection of the Sea (Prevention of Pollution from Ships) Act of 1983 prevent or limit pollution from oil or noxious substances.

Water being a scarce resource in Australia, problems of water quality and availability are a constant concern. As of 2001, the country had only 352 cu km of renewable water resources, although safe drinking water was available to all urban and rural dwellers. A cause for concern has been the increased salinity in the Murray Valley, caused by diverting water inland from the coast for irrigation, as well as the rise in saline water tables in Western Australia, due to excessive land clearing for dry-land farming. Another significant environmental problem is inland damage due to soil erosion. The quality of the soil is also affected by salinization. As of 1993, Australia had 145 million ha of forest and woodland and had the third most extensive mangrove area in the world, covering over one million ha. In the mid-1990s Australia was among the top 20 world producers of carbon dioxide emissions from industry, which totaled 267.9 million tons per year, or 15.24 tons per capita.

In 2001, 58 species of mammals, 45 species of birds, and 1,871 species of plants were threatened. Endangered species include the banded anteater, greater rabbit-eared bandicoot, Leadbeater's opossum, northern hairy-nosed wombat, woylie, bridled nail-tail wallaby, five species of turtle (western swamp, green sea, hawksbill, leatherback, and olive ridley), Tasmanian freshwater limpet, granulated Tasmanian snail, African wild ass, western ground parrot, paradise parakeet, helmeted honey eater, noisy scrub-bird, western rufous bristlebird, Lord Howe wood rail, Lord Howe currawong, small hemiphysalis damselfly, Otway stonefly, giant torrent midge, and Tasmanian torrent midge. Lord Howe stick insect, Gray's marble toadlet, the dusky flying fox, the Tasmanian wolf, and the banded hare wallaby are among the country's 42 extinct species.

### 6 POPULATION

The population of Australia in 2003 was estimated by the United Nations at 19,731,000, which placed it as number 52 in population among the 193 nations of the world. In that year approximately 12% of the population was over 65 years of age, with another 20% of the population under 15 years of age. There were 99 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 0.96%, with the projected population for the year 2015 at 21,747,000. The population density in 2002 was 3 per sq km (7 per sq mi).

It was estimated by the Population Reference Bureau that 85% of the population lived in urban areas in 2001. The 2000 population totals of the six state capitals were estimated as follows: Sydney, New South Wales, 3,665,000; Melbourne, Victoria, 3,094,000; Brisbane, Queensland, 1,450,000; Perth, Western Australia, 1,220,000; Adelaide, South Australia, 1,039,000; and Hobart, Tasmania, 183,838. Three other large cities are Newcastle, New South Wales, 433,000; Gold Coast, Queensland, 274,000; Wollongong, New South Wales, 240,000; and Geelong, Victoria, 153,000. According to the United Nations, the urban population growth rate for 2000–2005 was 0.9%.

LOCATION:(including Tasmania): 113°09' to 153°39' E; 10°41' to 43°39' S. TERRITORIAL SEA LIMIT: 3 miles.  
 NOTE: Dotted outlines indicate lake beds that are dry except during rainy seasons.

One-third of Australia is virtually uninhabited; another third is sparsely populated. The total population is quite small compared to the large land mass. Most of the cities are located in the east and southeast, with many inhabitants living on the coast.

### 7 MIGRATION

Since World War II, the government has promoted immigration of the maximum number of persons Australia can absorb without

economic disequilibrium. In 1979, however, with the unemployment rate rising, the government tightened immigration requirements so that Australians would not lose jobs to the newcomers. Under the new system, assessments of applications are based on such factors as age, skills, and family ties, with priority given to reunion of families sponsored by Australian residents. In 2001 The Migration Program allowed 80,610 entry visas, most granted under the family and skill based categories.

Most of the 4.2 million immigrants to Australia between 1945 and 1985 were of working age, but although the government encouraged rural settlement, many immigrants had skills in short supply and preferred to work in the cities. The main countries of origin of such workers were the United Kingdom, Italy, and Greece. The number of permanent settlers arriving in 1991 was 116,650, up from a postwar low of 52,748 in 1975–76. The record high for new settlers was 185,099, in 1969–70. From World War II to 1991, over 460,000 refugees settled in Australia. These included more than 130,000 Indochinese.

As of 2002, Australia had 57,800 refugees and 13,015 asylum-seekers, primarily from Afghanistan, Iraq, China and Indonesia. The majority of illegal immigrants are those who entered the country legally but remained beyond the expiration of their visas. The government is undertaking more stringent measures to identify and remove illegal aliens. Australia has also set up programs to assist the integration of migrants and refugees by providing services and education. As of 2000 the net migration rate was 5.1 per thousand. The government views the migration levels as satisfactory.

## **<sup>8</sup>ETHNIC GROUPS**

Most Australians are of British or Irish ancestry. In 1999, approximately 92% of the population was Caucasian. The Asian-born population tally stood at 7% while aboriginal and other groups comprised only 1% of the population.

After the coming of the Europeans, the aboriginal population declined drastically, from about 300,000–1,000,000 to some 60,000 by the early 1920s. By the 1950s, however, the decline was reversed. In the 1991 census 265,492 people identified themselves as being of aboriginal or Torres Strait Islander origin, or 1.5% of the population. (Of these, the latter numbered 26,902.) Many of them live in tribal conditions on government reservations in the north and northwest; some 39,918 were in the Northern Territory in the 1991 census and 41,792 in Western Australia. Queensland had 70,130, and New South Wales, 70,020. Their social organization is among the most complex known to anthropologists. They do not cultivate the soil but are nomadic hunters and food gatherers, without settled communities. Anthropologists believe the aboriginals, also known as Australoids, are relatively homogeneous, although they display a wide range of physical types. Their serological, or blood-group, pattern is unique, except for a faint affinity with the Paniyan of southern India and the Veddas of Sri Lanka. The aboriginals probably originated from a small isolated group subject to chance mutation but not to hybridization. There seems to be a sprinkling of Australoid groups in India, Sri Lanka, Sumatra, Timor, and New Guinea. In 1963, aboriginals were given full citizenship rights, although as a group they continued to suffer from discrimination and a lower living standard than European Australians generally.

Beginning in the 1960s, the government abandoned its previous policy of “assimilation” of the aboriginals, recognizing the uniqueness of aboriginal culture and the right of the aboriginals to determine their own patterns of development. From the passage of the Aboriginal Land Rights (Northern Territory) Act in 1976 to mid-1990, aboriginals in the Northern Territory were given ownership of about 34% of territorial lands (461,486 sq km or 178,180 sq mi). The South Australia state government and its aboriginals also signed a land-rights agreement, and similar legislation was developed in other states during the 1980s. In all, aboriginals held 647,772 sq km (250,104 sq mi) of land under freehold in mid-1989 and another 181,800 sq km (70,193 sq mi) under leasehold. A reservation in Western Australia consisted of 202,223 sq km (78,078 sq mi). By the mid-1990s, however, more than two-thirds of the aboriginals had left rural lands to settle in urban areas.

## **<sup>9</sup>LANGUAGES**

More than 99% of the population speaks English. There are no class variations of speech, and few if any local dialects.

Many languages or dialects are spoken by the aboriginal tribes, but phonetically they are markedly uniform. There is no written aboriginal language, but the markings on “letter sticks,” sometimes carried by messengers from one tribe to another, are readily understood by tribal headmen. Aboriginal languages are in use in certain schools in the Northern Territories and, to a lesser extent, in schools of other states.

## **<sup>10</sup>RELIGIONS**

According to the 2001 census, 67% of citizens considered themselves Christians, including 26% Roman Catholic and 20% Anglican. About 15% of Australians consider themselves to have no religion, an increase of over 35% from 1991. Less than 0.03% of those responding claimed to practice aboriginal religions. A 1996 census indicated that almost 72% of Aborigines practiced some form of Christianity while 16% subscribed to no religion; the 2001 census did not provide comparable updated information on. By 2002, increased immigration from southeast Asia and the Middle East resulted in growth in the numbers of those practicing Buddhism, Islam, Hinduism, and Judaism.

Constitutionally, there can be no state religion or state aid to any religion; the exercise of any religion cannot be prohibited, and a religious test as qualification for public office is forbidden. However, in a 1998 report on freedom of religion in Australia by the federally funded but independent Human Rights and Equal Opportunity Commission (HREOC), the Commission stated that “despite the legal protections that apply in different jurisdictions, many Australians suffer discrimination on the basis of religious belief or non-belief, including members of both mainstream and non-mainstream religions and those of no religious persuasion.” Many non-Christians have reportedly complained to the HREOC that the dominance of traditional Christianity in civic life has the ability to marginalize large numbers of citizens. Since then the HREOC and a Parliamentary Committee have been working of anti-discrimination measures and legislation.

## **<sup>11</sup>TRANSPORTATION**

As of 2002, government-operated railways totaled about 33,819 km (21,015 mi). There are also some private railways, mainly for the iron ore industry in Western Australia. Australian railway systems do not interconnect well, and rail travel between principal cities involves changing trains. Modern equipment is gradually replacing older stock. As of August 1991, all interstate freight movements by rail were brought under the control of the National Rail Corporation (NRC).

Inland water transport is negligible, but ocean shipping is important for domestic and overseas transport. Most overseas trade is carried in non-Australian ships, while most coastwise vessels are of Australian registry. Although the fine natural harbors of Sydney and Hobart can readily accommodate ships of 11 m (36 ft) draft, many other harbors have been artificially developed. Other international shipping ports include Adelaide, Brisbane, Cairns, Darwin, Devonport, Fremantle, Geelong, Launceston, Mackay, Melbourne, and Townsville. All main ports have ample wharfage, modern cargo-handling equipment, and storage facilities. There are some 70 commercially significant ports. The nation’s merchant marine in 2001 included 55 vessels of 1,000 GRT or over, with a combined GRT of 1,767,387. Highways provide access to many districts not served by railroads. As of 2001, there were 913,000 km (567,338 mi) of roads, about 353,331 km (219,560 mi) of which were paved. Motor vehicles in 2000 totaled about 10,618,744, including 8,310,244 passenger cars and 2,308,500 commercial trucks and buses.

Australia had 421 airports in 2001, 294 of which had paved runways. Principal airports include Adelaide, Brisbane, Cairns, Darwin, Melbourne International at Melbourne, Perth International at Perth, and Kingsford International at Sydney. In 1997, the government began privatizing many of the country's airports. The first round of such sales early in 1997 included the Melbourne, Brisbane, and Perth airports, which raised A\$3.34 billion (US\$2.5 billion)—far exceeding government projections. The main Sydney airport was explicitly excluded from the privatization plan. Domestic air services are operated primarily by the privately owned Ansett Airlines. The Australian overseas airline, Qantas, carries more than three million passengers per year to and from Australia, nearly 40% of the total carried by all airlines serving Australia. The airline was owned by the Commonwealth government until it was privatized in 1995. In 2001 Australian air carriers had 33,477,400 passengers and carried 1,678,000 freight ton km (1,042,709 freight ton mi).

## 12 HISTORY

Stone objects that were found in 1978 but are still only tentatively dated suggest that human beings may have inhabited what is now Australia as long as 100,000 years ago. The Aboriginals migrated to Australia from Southeast Asia at least 40,000 years before the first Europeans arrived on the island continent. In 1999, scientists estimated a male skeleton found at Mungo Lake in 1974 to be between 56,000 and 68,000 years old. Covered in red ochre, this skeleton presents the first known use of pigments for religious or artistic purposes. Living as hunters and gatherers, roaming in separate family groups or bands, the Aboriginals developed a rich, complex culture, with many languages. They numbered approximately 300,000 by the 18th century; however, with the onset of European settlement, conflict and disease reduced their numbers.

Although maps of the 16th century indicate European awareness of the location of Australia, the first recorded explorations of the continent by Europeans took place early in the 17th century, when Dutch, Portuguese, and Spanish explorers sailed along the coast and discovered what is now Tasmania. None took formal possession of the land, and not until 1770, when Capt. James Cook charted the east coast and claimed possession in the name of Great Britain, was any major exploration undertaken. Up to the early 19th century, the area was known as New Holland, New South Wales, or Botany Bay.

The first settlement—a British penal colony at Port Jackson (now Sydney) in 1788—was soon enlarged by additional shipments of prisoners, which continued through the mid-1800s, until approximately 161,000 convicts had been transported. With the increase of free settlers, the country developed, the interior was penetrated, and six colonies were created: New South Wales in 1786, Van Diemen's Land in 1825 (renamed Tasmania in 1856), Western Australia in 1829, South Australia in 1834, Victoria in 1851, and Queensland in 1859.

Sheep raising and wheat growing were introduced and soon became the backbone of the economy. The wool industry made rapid progress during the period of squatting migration, which began on a large scale about 1820. The grazers followed in the wake of explorers, reaching new pastures, or "runs," where they squatted and built their homes. Exports of wool increased from 111 kg (245 lb) in 1807 to 1.1 million kg (2.4 million lb) in 1831. With the increased flow of immigrants following the Ripon Land Regulations of 1831, the population grew from about 34,000 in 1820 to some 405,000 in 1850. The discovery of gold in Victoria (1851) attracted thousands, and in a few years the population had quadrupled. Under the stimulus of gold production, the first railway line—Melbourne to Port Melbourne—was completed in 1854. Representative government spread throughout the continent, and the colonies acquired their own parliaments.

Until the end of the 19th century, Australia's six self-governing colonies remained separate. However, the obvious advantages of common defense and irrigation led to the federation of the states into the Commonwealth of Australia in 1901. (The British Parliament had approved a constitution in the previous year.) The Northern Territory, which belonged to South Australia, became a separate part of the Commonwealth in 1911. In the same year, territory was acquired from New South Wales for a new capital at Canberra, and in 1927, the Australian Parliament began meeting there. Liberal legislation provided for free and compulsory education, industrial conciliation and arbitration, the secret ballot, female suffrage, old age pensions, invalid pensions, and maternity allowances (all before World War I). Child subsidies and unemployment and disability benefits were introduced during World War II.

Australian forces fought along with the British in Europe during World War I. In World War II, the Australian forces supported the UK in the Middle East between 1940 and 1942, and played a major role in the Pacific theater after the Japanese attack on Pearl Harbor. After the war, a period of intense immigration began. The Labour government was voted out of office in 1949, beginning 23 years of continuous rule by a Liberal-Country Party (now known as the National Party) coalition. During that period, Australian foreign policy stressed collective security and support for the US presence in Asia. Australian troops served in Vietnam between 1965 and 1971.

When Labour returned to power in December 1972, it began the process of dissociating Australia from US and UK policies and strengthening ties with non-Communist Asian nations; in addition, it established diplomatic relations with the People's Republic of China. In 1975 a constitutional crisis resulted when Senate opposition successfully blocked the Labour Party's budgetary measures, thereby threatening the government with bankruptcy. The governor-general dismissed the Labour Prime Minister, Gough Whitlam, and called for new elections. The Liberal-National Party coalition swept back into power, where it remained until 1983. The Australian Labour Party (ALP) returned to power in 1983, following a campaign in which such economic issues as unemployment and inflation predominated.

In 1993, the Mabo Ruling on Native Title recognized the land rights of the indigenous people (Aborigines) inhabiting Australia prior to the arrival of the Europeans. The Mabo Ruling did not void existing leases, but could allow the Aborigines to reclaim land when the leases granted by the national or state governments expired. The Mabo Ruling applied only to non-pastoral leases, but the Wik Judgment of 1996 extended the land rights of indigenous people to include their use of pastoral land for religious purposes.

In the March 1996 elections, the ALP was unseated by a coalition of the Liberal Party and the National Party, who chose Liberal MP John Howard to be Prime Minister. The newcomer Howard pledged to change the government, to make it more "rational." To that end, he cut ministries and cabinet posts, made budget cuts affecting higher education, Aborigine affairs, and jobs, and instituted an A\$15 billion privatization program. Many government employees opposed these changes; violent demonstrations took place when the budget was made public. While the revised budget was less radical, social unrest continued through 1997–1998, and the October 1998 election found Howard's coalition party's majority greatly reduced, while the ALP gained in influence, winning 18 more seats than it did in the 1996 election.

In July 1998, after twice being rejected by the Senate, the government passed amendments to the 1993 Native Title Act. The amendments removed the time limit for lodging native claims, but weakened the right of Aboriginal groups to negotiate with non-Aboriginal leaseholders concerning land use. In 1999 the government issued an official expression of regret for past

mistreatment of Aborigines, but has opposed issuing the formal national apology sought by Aborigine leaders, fearing that would encourage claims for compensation.

In September 1999, Australian troops led the United Nations-sanctioned peacekeeping forces into East Timor, to protect civilians and control the militia violence following East Timor's referendum decision to seek full independence from Indonesia. Australian civilian and military personnel form part of the United Nations Mission of Support in East Timor (UNMISSET), which was established to ensure the security and stability of East Timor after it became an independent nation-state on 20 May 2002.

Parliamentary elections held on 10 November 2001 saw Howard's coalition increase its strength by over 3%. The ALP recorded its lowest primary vote since 1934. The Australian Greens recorded a substantial increase in strength. Two events stood out in the election campaign that swung the vote to the Liberal Party-National Party coalition. The first was the controversy over refugees and asylum-seekers. In August 2001, a Norwegian freighter which had rescued a boatload of asylum-seekers was denied permission to land the human cargo in Australia. The Howard government also tightened its border protection laws since then, making it nearly impossible for any asylum-seeker landing in the remote island outposts of Australia to claim refugee status. Instead, the would-be refugees are either turned back to Indonesian waters or transported to detention centers on Pacific nations such as Nauru or Papua New Guinea. John Howard declared, "We will decide who comes to this country and under what circumstances." The ALP criticized the government for this policy, which remained a major campaign issue. The terrorist attacks on the United States on 11 September 2001, and the subsequent US-led bombing campaign on the Taliban and al-Qaeda forces in Afghanistan, also were issues that dominated the Australian election campaign.

On 12 October 2002, two popular nightclubs in Kuta on the Indonesian island of Bali were bombed, killing more than 180 people, 88 of them Australians. The bombings have been linked to the terrorist organization Jamaal Isayah. They have been referred to as "Australia's September 11th."

### 13 GOVERNMENT

The Commonwealth of Australia, an independent, self-governing nation within the Commonwealth of Nations, has a federal parliamentary government. The federation was formed on 1 January 1901 from six former British colonies, which thereupon became states. The constitution combines the traditions of British parliamentary practice with important elements of the US federal system. Powers of the federal government are enumerated and limited.

The government consists of the British sovereign, represented by a governor-general, and the Australian Parliament. The Reverend Dr. Peter John Hollingsworth became the new Governor-General in June 2001, succeeding Sir William Deane, who had held the post since 1996. Nominally, executive power is vested in the governor-general and an executive council, which gives legal form to cabinet decisions; in practice, however, it is normally exercised by a cabinet chosen and presided over by a prime minister, representing the political party or coalition with a majority in the House of Representatives. The number of cabinet ministers is variable.

Legislative power is vested in the Parliament, which is composed of a 76-member Senate, representing the states and territories, and a 150-member House of Representatives, representing electoral districts. Members must be Australian citizens of full age, possess electoral qualification, and have resided for three years in Australia. Twelve senators are elected by proportional representation from each state voting as a single electorate, and two senators each from the Northern Territory and Capital Territory. They are elected for six years, with half the

members retiring at the end of every third year. House membership is not quite double that of the Senate, with a minimum of five representatives for each state. House members are elected according to population by preferential voting in specific electoral districts; they serve for three years, unless the House is dissolved sooner. There are two members each from the Australian Capital Territory and the Northern Territory; they have been able to vote on all questions since 1968. Parliament must meet at least once a year. Taxation and appropriation measures must be introduced in the lower house; the Senate has the power to propose amendments, except to money bills, and to defeat any measure it may choose.

The parties in the House elect their leaders in caucus. The party or coalition with a majority of seats forms the government. The leader of the majority party becomes prime minister and selects his cabinet from members of his party who are members of Parliament, while the leader of the principal minority party becomes leader of the official opposition. The party in power holds office as long as it retains its majority or until the governor-general decides that new elections are necessary; he exercised this inherent constitutional power during the 1975 crisis when he dismissed Prime Minister Whitlam and called for new elections.

In the 1990s, the Labour Government, under the leadership of Prime Minister Paul Keating, proposed a referendum to change Australia to a republican form of government. The idea gained wide support. After the 1996 federal elections, the coalition majority decided to host a constitutional convention to decide the issue. The constitutional convention met in February 1998, and voted in favor of replacing the British monarch as the head of Australia's government (73 voted in favor, 57 against), and Australia becoming a republic by the year 2001 (89 voted in favor, 52 against). But in November 1999's popular referendum, the proposal to convert Australia to a republic failed to carry even a single state.

Suffrage is universal for all persons 18 years of age and older, subject to citizenship and certain residence requirements. Voting is compulsory in national and state parliamentary elections.

### 14 POLITICAL PARTIES

Since most Australians have been shaped by the same language and by a similar cultural and religious heritage, their internal differences are largely based on economic issues. Attachments to the UK are compounded of sentiment, tradition, and economic advantage. Australian nationalism has been associated more closely with the Australian Labour Party (ALP) than with its rivals, who tend to regard Australian interests as almost identical with those of the UK. Because of Australia's geographical position as a "European people on an Asian limb," the economic element in its nationalism has been mixed with the fear of external conquest or domination.

Except in 1929-31, when a Labour government was in office, interwar governments were dominated by non-Labour groupings. When war seemed certain in 1939, the government was resolutely imperial, considering Australia to be at war automatically when the UK went to war. The Laborites challenged this view. While they did not oppose a declaration of war on Germany, they wanted the step to be taken so as to show Australia's independence.

Labour was in office from 1941 to 1949. The Liberal and Country Parties were in office as a coalition for a long period afterward, from 1949 to 1972, and again beginning in December 1975 (by that time, the Country Party had become the National Country Party, and it later became the National Party).

In the general elections of 13 December 1975, a caretaker government, formed the preceding month by the Liberal-National Country Party coalition after the dismissal of the Labour government of Prime Minister Gough Whitlam, obtained large majorities in both houses of the legislature. Although its

majorities were eroded in the elections of December 1977 and October 1980, the coalition remained in power until March 1983, when Labour won 75 out of 147 seats in the House of Representatives. Robert Hawke, leader of the Labour Party, took office as prime minister; he was reelected in 1984, 1987, and 1990. Paul Keating replaced Hawke as Labour's leader, and as prime minister, in December 1991. This was the first time an Australian prime minister had been ousted by his own party. Keating led the ALP to an unprecedented fifth consecutive election victory in the 1993 general election, increasing both its percentage share of the vote and its number of seats in the legislature. In 1996, a Liberal-National Party coalition headed by John Howard ousted the ALP from the majority, with the Liberal-National coalition winning 94 seats compared to the ALP's 49 seats. John Howard was reelected prime minister in 1998 and 2001.

A direct descendant of the governments of the 1920s and 1930s, the Liberal-National coalition is principally linked with business (Liberal) and farming (National) and is officially anti-socialist. In economic and foreign affairs, its outlook is still involved with the Commonwealth of Nations, but it supports the UN, as well as the alliance with the United States in the ANZUS pact. It is sympathetic toward the new Asian countries and values the link with these countries afforded by the Colombo Plan. The Labour Party is a trade-union party, officially socialist in policy and outlook. It initially maintained an isolationist posture, but since the early 1940s, its policy has been a mixture of nationalism and internationalism.

Smaller parties include the Democratic Labour Party, the Communist Party, the Australian Democrats Party, the Green Party, and the One Nation Party. Since its formation in 1997, the One Nation Party's platform has featured racial issues. In the 1998 Queensland state elections, it won 11 of 89 seats. In the federal elections of that same year, the One Nation Party called for an end to Asian immigration and a restriction to Aboriginal welfare programs, but failed to win any seats. The Green Party increased its strength by 2.3% in the 2001 elections, while the One Nation Party lost 4.1% of its strength.

## 15 LOCAL GOVERNMENT

Powers not specifically granted to the federal government in the constitution are reserved to the states, although some powers (such as health, labor, and social services) are held concurrently. Each state has an appointed governor who serves as the representative of the sovereign. Except for Queensland, which has a unicameral legislature, the parliament in each state is composed of two houses. The lower houses—the dominant legislative bodies—are popularly elected; the upper houses are elected by franchise limited to property holders and to those with certain academic or professional qualifications. The state prime minister achieves office and selects his cabinet in the same fashion as does the Commonwealth prime minister. The Australian Capital Territory and the Northern Territory have unicameral legislative assemblies.

Local communities (variously designated as boroughs, cities, district councils, municipalities, road districts, shires, and towns) have limited powers of government, but they are responsible for some health, sanitation, light, gas, and highway undertakings. Even the largest cities do not provide their own police protection, nor do they conduct or support education; these are state functions. Local aldermen or councilors ordinarily are elected on a property franchise, and mayors are elected annually or biennially by the aldermen from among their own number or by taxpayers. State departments of local government regulate the organization of local government. State governments directly control some large interior areas.

## 16 JUDICIAL SYSTEM

The constitution vests federal jurisdiction in a High Court of Australia which consists of a chief justice and six associate justices appointed by the general governor. The High Court has the authority to conduct constitutional review of state and federal legislation and is the supreme authority on constitutional interpretation. The High Court also has original jurisdiction over interstate and international matters.

Until 1985, in certain cases involving state law, appeals from courts below the High Court could be taken to the Privy Council in the United Kingdom, the final court of the Commonwealth of Nations. Special cases may be referred to a 25-member federal court that deals with commercial law, copyright law, taxation, and trade practices. There is also a family court.

States and territories have their own court systems. Cases in the first instance are tried in local or circuit courts of general and petty sessions, magistrates' courts, children's courts, or higher state courts. Capital crimes are tried before state supreme courts.

The state and federal courts are fully independent. The High Court has recently ruled that indigent defendants have a right to counsel at state expense. Criminal defendants are presumed innocent, and a plethora of due process rights include the right to confront witnesses and the right to appeal.

The law provides for the right to a fair trial. In local courts, the magistrates sit alone. In the higher courts, trials are usually conducted by judge and jury. The law prohibits arbitrary interference with privacy, family, home, or correspondence.

## 17 ARMED FORCES

The Australian armed forces numbered 50,920 active personnel in 2002, including 6,364 women. The army consisted of 25,150; the navy, 12,570; and the air force, 13,200. Reserve forces numbered 20,300 for all three services. Military weapons systems included 71 battle tanks, 6 submarines, and 156 airforce combat aircrafts. Australia contributed to peacekeeping missions in East Timor, Ethiopia/Eritrea, Egypt, and the Middle East.

Australia's estimated defense expenditure in 2001–02 was \$9.3 billion, 2% of GDP.

## 18 INTERNATIONAL COOPERATION

Australia is a charter member of the UN, to which it gained admission on 1 November 1945. It belongs to ESCAP and all the nonregional UN specialized agencies and is a signatory to the Law of the Sea and a member of the WTO. Australia also participates in the Commonwealth of Nations and ANZUS, as well as the Asian Development Bank, Colombo Plan, OECD, South Pacific Commission, South Pacific Forum, and other intergovernmental organizations.

## 19 ECONOMY

Australia has a prosperous Western-style capitalist economy with a high per capita GDP, estimated in purchasing power parity (PPP) terms by the US Central Intelligence Agency (CIA) at \$24,000 for 2001. Since the late 1980s, the government has been engaged in a program to transform the economy's orientation from import substitution industrialization (ISI) to export-driven, high-tech globalization. This helped introduce an economic expansion from September 1991 that as of March 2002 had continued uninterrupted for 43 quarters, despite slowdowns occasioned by the 1997 Asian financial crisis and the 2001 global economic downturn.

Home processing industries that rely on Australian surpluses of raw material inputs of wool, food and minerals (particularly coal) beyond domestic needs still comprised about 55% of merchandise exports in 2000. Traditional exports accounted for about half of Australia's foreign exchange earnings, down from two-thirds in the mid-1990s, mainly due to the increased earnings

from tourism and an increasing share of high tech exports. Australia's flexible exchange rate regime has helped the economy rapidly adjust to the vicissitudes of international commodity markets. It is the world's largest wool-producing country. Faced with competition from synthetics, the wool exports experienced a decade of decline until the recent recovery in 2000/01, as world prices jumped 21%. The country, also one of the great wheat exporters, experienced an estimated 3% loss in wheat production in 2000/01 due to the weather which was turned to gain as returns increased due to higher prices. Australia also exports large quantities dairy and meat products. Live cattle exports for the past four years have been outperforming more traditional cotton and sugar production. In minerals, Australia is also a major world supplier of iron ore, bauxite, lead, zinc, and copper; coal, beach sand minerals, and nickel have become major industries as well. Since the 1960s manufactured goods have provided an ever-increasing share of the country's exports, with elaborately transformed manufactures (ETMs), like automobiles, high-speed ferries, and telecommunications equipment, making up 23% of exports in 2001.

Heavy-industry expansion took place from 1960 to 1970, with steel output more than quadrupling during this period. By the 1980s, however, Australian steel was facing stiff competition from abroad, and production stagnated. In 2001, steel production fell and world steel prices dipped below 70% of their 1994 level, but Australian productivity rose, and due to a combination of the low value of the Australian dollar, and the United States offering around 85% of Australian steel imports exemptions from the steel tariffs and quotas it had imposed in March 2001, net returns on steel exports actually improved in 2001. The Asian financial crisis in 1997, however, had a more serious impact on export revenues from heavy industry, which declined in 1998 an average of -5%.

Australia's last economic recession was in 1990, from which it began to recover in mid-1991. Economic growth, supported by rising consumption and higher export demand, reached 4% in the fourth quarter of 1993. However, the unemployment rate of about 11% was near a postwar record. From this high point, however, unemployment has been on a steady decline in Australia—to 8.5% unemployment in 1995, 7.5% in 1999, and 6.3% in 2000, albeit with an increase in 2001 to 6.7%. IMF figures predict a return to the downward trend in 2002 and 2003, with a projection of 6.3% and 6% unemployment, respectively. Real GDP growth fell to 3.7% in 1997, but recovered in 1998 and 1999 to an average of 5%, helped by reforms that included currency depreciation and a redirection of exports to non-Asian countries. By IMF estimates, real GDP growth fell to 3.1% in 2000 and 2.6% in 2001, but its projections are for real growth rates to recover to about 4% in 2002 and 2003, Australia's long-term average.

Australia's economy was not immune from the impact of the 2001 global slowdown and the aftershocks from the 11 September 2001 terrorist attacks on the United States, as real growth declined, growth in exports plummeted from 10.9% in 2000 to 0.8% in 2001, imports fell 4.7% in 2001, and several major businesses collapsed into bankruptcy. The Australian dollar continued its slide against the US dollar that took it from A\$1.34/US\$1 in 1997 to A\$1.94/US\$1 by January 2002. The benefit of the currency depreciation, however, was to make Australian exports increasingly competitive, and the decline in imports in 2001 helped maintain Australia's remarkably steady current account surplus, which has remained unchanged at 0.2% of GDP from 1997 through 2001. During the 1990s Australia recorded an average annual economic growth rate of nearly 4% a year, the second-fastest growth rate among developed countries, behind only Ireland.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2002 Australia's gross domestic product (GDP) was estimated at \$528 billion. The per capita GDP was estimated at \$27,000. The annual growth rate of GDP was estimated at 3.6%. The average inflation rate in 2002 was 2.8%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 3% of GDP, industry 26%, and services 71%.

The World Bank reports that in 2000 per capita household consumption (in constant 1995 US dollars) was \$14,105. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 2%. The richest 10% of the population accounted for approximately 25.4% of household consumption and the poorest 10% approximately 2.0%.

## 21 LABOR

As of 2001, the Australian workforce numbered 9.42 million people. In 1997, the occupational pattern was as follows: services 73%, industry 22%, and agriculture 5%. The unemployment rate stood at 6.3% in 2002.

As in many other highly developed industrial nations, union membership has declined significantly: from around 53% of the workforce in 1980 to 25% as of 2000. The drop has resulted in a consolidation of labor unions: there were 300 unions in 1989, but only 188 in 1993. The traditionally de facto right to strike was legalized in 1994. The Federal Workplace Relations Action puts limits on strikes and unfair dismissal.

Although there is a standard minimum wage, 80% of workers have their pay determined by minimums that apply to their particular industry or profession. All of these wages are sufficient to support a family. The standard workweek is under 40 hours, generally from Monday through Friday. Nearly all Australian workers receive four weeks of annual vacation, many at rates of pay 17.5% above regular pay. There is no nationally mandated minimum age for employment, but education is compulsory which precludes children under 16 years old from full-time work.

## 22 AGRICULTURE

Australia is an important producer and exporter of agricultural products and a major world supplier of cereals, sugar, and fruit. Arable land in 1998 comprised about 53.1 million ha (131.2 million acres), representing about 6.9% of total land area. However, approximately 90% of the utilized land area is in its natural state or capable of only limited improvement and is used largely for rough grazing. Droughts, fires, and floods are common hazards. The area actively cultivated for crops is 6.9% of all land area. Lack of water is the principal limiting factor, but unsuitable soil and topography are also important determinants. As of 1998, some 2,700,000 ha (6,672,000 acres) of land were irrigated. Agriculture has declined from 20% of GDP in the 1950s to about 3% in 2001. Agricultural exports, which accounted for 60% of Australia's exports in the 1960s, now account for 25%. Gross farm product in 1999/2000 was A\$28.5 billion. New South Wales and Queensland account for half of the total crop value.

Grain crops have been cultivated since the first year of European settlement. In November 1790, plantings around Sydney of wheat, barley, and corn totaled 34 ha (84 acres). Today, winter cereals are cultivated in all states. Three cereals are often grown on one farm for grain, green fodder, and hay for livestock. Most wheat, barley and about half the oats are grown

for grain. The estimated wheat area sown for grain increased from 11,135,000 ha (27,515,000 acres) in 1986/87 to 12,200,000 ha (30,150,000 acres) in 1999/2000. Production of wheat in 1999/2000 was an estimated 24.8 million tons. Western Australia and New South Wales are the chief wheat-producing states. In 1999, Australia produced 4,360,000 tons of barley, 1,503,000 tons of oats, and 1,410,000 tons of rice. In 1999/2000, 1.2 million tons of potatoes were produced.

Sugarcane is grown along a 2,000 km (1,200 mi) stretch of coastal land in New South Wales and Queensland. About 95% of sugar production comes from Queensland. A normal crushing season is from June to December. The estimated 1999 harvest from 415,000 ha (1,025,000 acres), yielded about 36.9 million tons of sugar cane. The industry faces problems of excessive supply and price elasticity; sugar is sold primarily to Japan, the United States, Canada, South Korea, Malaysia, China, and Singapore. Although tobacco growing is a relatively small industry, it is important in some areas. In 1999, some 3,000 ha (7,400 acres) were planted with tobacco, and about 7,000 tons were produced.

Cotton has been grown in the coastal river valleys of Queensland for more than a century but on a limited scale, and it has provided only a small percentage of Australia's lint requirements. In the 1980s, however, successful development of cotton-growing areas in New South Wales and Western Australia has resulted in spectacular production increases. In 1985/86, 685,000 tons of cotton were produced (almost triple the amount in 1979/80); in 1999, production amounted to 716,000 tons.

Australia's wide climate differences permit the cultivation of a range of fruits, from pineapples in the tropical zone to berry fruits in the cooler areas of temperate zones. Orchard fruit trees included orange, 7.8 million; apple, 9.7 million; pear, 1.5 million; and peach, one million. About 12.2 million ha (30.1 million acres) are cultivated for bananas and 4.8 million ha (11.9 million acres) for pineapples. Production of fruit in 1999 included (in thousands of tons): oranges, 470; bananas, 230; pineapples, 123; pears, 165; peaches, 90; tangerines, 61; lemons and limes, 31; apricots, 20; grapefruit, 18; mangoes, 37; and plums, 27. Australia's wine industry is also growing; viticulture engaged 99,000 ha (245,000 acres) and produced 1,112,000 tons of grapes for winemaking, drying, and other uses in 1999.

## 23 ANIMAL HUSBANDRY

About 54% of Australia's land is used in stock raising. Animal husbandry is concentrated in the eastern highlands, but it spreads across the wide interior spaces and even to low-rainfall areas, in which up to 12 ha (30 acres) are required to support one sheep and from which cattle must be taken overland hundreds of miles to coastal meat-packing plants.

Sheep raising has been a mainstay of the economy since the 1820s, when mechanization of the British textile industry created a huge demand for wool. In 1800, there were 6,124 sheep in Australia; by 1850 there were 17.5 million; by 1894, some 100 million; and in 1970, a record high of some 180 million. Sheep numbers fell to 120 million in 1994/95 (the lowest since 1953/54) due to severe drought. Australia's flocks, some 119.6 million in 1999, now constitute approximately 11% of the world's sheep but produce about 30% of the world's wool supply. Wool production, the largest in the world, was an estimated 931,000 tons in 1999. About 95% is exported (mostly to China); nevertheless, wool, which represented 50% of Australia's merchandise exports (by value) in 1957/58, constituted only 6% by the mid-1990s. Since 1990, wool production has fallen by 35%, due in part to declining world demand. Australia produces about one-third of the world's wool, and accounts for 75% of the world's exports of wool apparel. During periods of great drought, such as the early 1980s, the number of sheep has diminished by 40 million or more. (A drop of 60 million occurred in the

droughts of 1993/94.) In the better lands, however, animal husbandry ranks high on a world scale. Large, scientifically managed stations have produced some of the world's finest stock. Sheep of the Merino breed, noted for its heavy wool yield, make up about three-quarters of Australian flocks.

In 1999 there were an estimated 2.7 million hogs and 26.7 million head of cattle. In the same year, meat production totaled an estimated 3,606,000 tons. Of these, beef and veal constituted 2,009,000 tons; poultry, 603,000 tons; mutton and lamb, 608,000 tons; and ham, pork, and bacon, 362,000 tons. Butter production in 1999 (in factories) amounted to an estimated 161,000 tons; whole milk was estimated 9.7 million tons; and cheese (factory production) was about 308,000 tons. In 2000, the government implemented a dairy deregulation plan removing price supports. Egg production is around 190,000 tons per year, predominantly for domestic consumption. Australia produces some 25,000 to 30,000 tons of honey per year, half of which is exported. Beef exports in 2001 were \$2.38 billion. Nearly 60% of total beef production is exported annually, most of it going to the United States, South Korea, and Taiwan.

## 24 FISHING

Fishing is relatively unimportant, even though the Australian Fishing Zone is the third largest in the world. Even with a low per capita fish consumption, Australia must import about half its normal requirements. Pearl and other shell fishing are relatively significant. The 2000 catch of fish, crustaceans, and mollusks totaled 211,391 tons, 99% from marine waters. Exports of fishery products in 2000 were valued at \$1 billion.

## 25 FORESTRY

Forests and woodlands cover 165.9 million ha (410 million acres), or about 22% of the total land area; most timberland is neither exploited nor potentially exploitable. Native forests cover 43.2 million ha (106.7 million acres), of which 26.6% is state forest, 26.2% is privately owned, 24.5% is crown land, and 22.7% is in permanent national parks or reserves. About 60% of the state forest areas are available for sustainable logging; crown lands are mostly leased for cattle grazing with limited timber production. Native forests consist principally of hardwood and other fine cabinet and veneer timbers; eucalyptus dominates about 35 million ha (86.5 million acres). Limited softwood resources had become seriously depleted, but new plantations were established in the 1980s at a rate of 33,000 ha (81,500 acres) annually. Softwood plantations supply more than half the timber harvested annually. Plantation forests are 77% publicly owned and cover 1,484,740 ha (3,668,792 acres), of which 65% is softwood. Although Australia is a net importer of forest products, the forest and wood products industries contribute 2% to GDP.

Roundwood production in 2000 totaled about 30.5 million cu m (1.08 billion cu ft), with exports of 969,000 cu m (34.2 million cu ft). There was a 3% increase in roundwood production in 2000–01. Some 12.9 million metric tons of forest products were produced in 2001. Australia's leading forest products are softwood logs and chips. Whereas all of the softwood log production is consumed at home, all commercial woodchip production is exported. National parks and wildlife preserves occupy about 3.8 million ha (9.4 million acres), or 9% of the total forestlands. Extensive reforestation—62,000 ha (153,000 acres) annually during the 1980s—has been undertaken to combat soil erosion. Since hardwoods grow slowly, Australia will probably have to import a great deal of lumber in future years to meet its timber needs.

## 26 MINING

Australia continued as the world's third-largest producer of minerals and metals. Its mineral industry, flourishing in all six

states and the Northern Territory, served as a leading catalyst for the economy, which grew 4% in 2000. The country had the world's largest economic demonstrated resources (EDR) of lead, mineral sands, nickel, silver, tantalum, uranium, and zinc, and its EDR ranked in the top six for bauxite, black coal, brown coal, cobalt, copper, gem and near-gem diamonds, gold, iron ore, lithium, manganese ore, rare-earth oxides, and vanadium. The country is virtually self-sufficient in mineral commodities, commercially producing more than 60 minerals and metals. Successful exploration in the late 1960s led to a long-term mineral boom and a sharp increase in exports. Australia is the world's leading exporter of alumina, bauxite, coal, diamond, ilmenite, iron ore (the country's fourth-largest minerals earner), refined lead, rutile, and zircon. Export earnings increased to about \$9.46 billion in the fourth quarter of 2000, a 42% increase over the same period in 1999.

Gold production in 2000 was 296,410 kg, a 4% decrease from 1999. Gold accounted for \$2.73 billion of the country's \$30.56 billion in total mineral export value, and reserves were estimated at 5,018 tons. Western Australia produced 75% of the country's 300 ton per year output. The largest producer in 2000 was Australian Gold Refineries, whose Perth Refinery, at Newburn, had an annual capacity of 95,000 kg and whose Kalgoorlie Refinery had an annual capacity of 46,000 kg. A feasibility study for the Granny Smith Mine anticipated about 10 tons of gold during the 6-year life of the opencut operation beginning in 2002. Mining also began in 2000 at the Carosue Dam opencut mine, with production planned at 3.4 to 4.4 tons per year of gold during a mine life of 8 to 10 years. In 2000, the country was the world's leading producer of alumina, bauxite (for the 30th consecutive year), chrysoprase, ilmenite, mined lead, precious opal, rutile, and zircon; ranked second in iron ore (with 15% of world production), mined cobalt, and mined zinc; ranked third in mined gold (with 10% of the world's output) and mined nickel; and was fourth in mined copper. Metallic minerals contributed 40% of the country's \$25 billion in mineral and energy production in 2000, and industrial minerals contributed another 5%.

Australia produced 2,060 tons of silver in 2000, doubling 1996's output of 1,013 tons; reserves were estimated at 31,000 tons. Texas Silver Mines increased its indicated resources at Twin Hills, in southern Queensland, from 300 tons to 450 tons of silver equivalent (silver and gold). BHP Minerals and MIM Holdings are the two largest producers, with annual capacities of 750,000 and 375,000 kg, respectively.

In 2000, Australia produced 14.7 million carats of gem diamond (18.4 million in 1998), and 12 million carats of industrial diamond (22.5 million in 1998). Reserves were estimated at 82.4 million carats of gem and near-gem diamond, and 85.5 million of industrial diamond. Argyle's principal diamond ore body, the AK-1 lamproite pipe, near Kununurra, Western Australia, produced nearly twice the amount of diamond as any other in the world, able to supply 42 million carats a year, including some of the highest diamond grades—about 5% was of gem quality, including a small number of very rare pink diamonds; 40% was of near gem quality; and 55% was of industrial quality. Argyle's alluvial operations were scheduled to close in 2001.

The value of opal produced in 2000 was \$152 million, up from \$110 million in 1997. Lightning Ridge, in New South Wales, was the world's major source of black opal. Australia also produced 30% of the world's rough sapphire, valued at \$40 million in 2000, down from \$60 million in 1997; commercial production came from alluvial deposits. Jade was discovered in the form of nephrite, at the world's largest identified resource, in the Eyre Peninsula. Australia produced most of the world's chrysoprase, known as Australian jade. Other gemstones produced in the country include agate, amethyst, chiastolite, emerald

(aquamarine), garnet (25,000 tons in 2000), rhodonite, topaz, tourmaline, turquoise, and zircon. The value of gemstones produced in 2000 other than opal and sapphire was \$16 million, up from \$1.5 million in 1996.

Iron ore production in 2000 was 171 million tons, a 13% increase over 1999, following an average 3% decline in the 1990s; 97% percent of iron ore came from the Pilbara region. Reserves were estimated to be 15,500 million tons. BHP Iron Ore's Mining Area C—its next generation of greenfields mines, with a 4-billion-ton iron ore resource—anticipated an initial capacity of 5 million tons per year of ore throughput, with the potential to increase to 20 million tons per year. Perth-based Portman expected to quadruple iron ore production at its Koolyanobbing Mine to 8 million tons per year, and it was scheduled to produce 1.2 million tons per year of remnant premium-grade (68.5% iron) hematite fines on Cockatoo Island over two years. Hamersley Iron received government approval in 2000 to expand its Yandicoogina iron ore mine from 15 million tons per year to 20 million tons per year, to meet demand for its low-alumina, pisolitic, goethite-hematite fines ore.

Australia produced 5.38 million tons of bauxite in 2000, representing 40% of world output, with reserves of 3,800 million tons. Bauxite deposits in northern Queensland were among the world's largest; those in the Northern Territory were also in production.

The country produced 830,000 tons of contained copper in 2000, a 12% increase from 1999 and up from 560,000 in 1997. Reserves were estimated to be 22.2 million tons. WMC's Olympic Dam underground mine, in South Australia, was the country's largest copper mine, and a \$1.1 billion expansion program was expected to increase production from 200,000 tons per year to 245,000. Production of gold and silver at the mine in 1999 was 2,426 kg and 26,438 kg, respectively.

Zinc output in 2000 was 1.4 million tons, 16% of world output, with reserves of 32 million tons. The McArthur River base-metal mine, in the Northern Territory, had record-setting tonnages of bulk concentrate.

In 2000, the country produced 1.6 million tons of manganese ore (48% manganese content), with reserves of 134 million tons. Groote Eylandt Mining Co. mined about 10% of the world's manganese at its 2.4-million-ton capacity Eylandt open cut operations, in the Gulf of Carpentaria. Other 2000 production figures in tons were: alumina, 15.7 million; lead, 678,000 (23% of world production, and reserves of 14.6 million tons); nickel, 168,000, all from Western Australia, with reserves of 10.6 million tons; and tin, 9,146, 5% of the world's tin, all by Australia's only producer, Renison Bell Mine, in Tasmania, with reserves of 100,900 tons.

Australia had a substantial portion of the world's mineral sand resources—about 29% for ilmenite, 31% for rutile, and 46% for zircon—and in 2000 produced 28% of the world's ilmenite (2.2 million tons, with reserves of 180.9 million), 55% of the world's rutile (237,000 tons, with reserves of 19.8 million), and 42% of the world's zircon, with reserves of 26.3 million tons. The dominant producer of zircon was Iluka Resources, with a capacity of 300 tons per year. Australia was also one of the world's leading producers of titanium and zirconium (373,000 tons in 2000). Gwalia Consolidated was the world's largest producer of lithium minerals (spodumene) and of tantalum in the form of concentrates, supplying a quarter of the world's annual tantalum requirements. Reserves were estimated at 156,000 tons lithium and 24,700 tons of tantalum. In 2000, the Greenbushes Mine, south of Perth, was the world's largest and highest-grade resource for spodumene, 64,983 tons of which was produced in the country, down from 117,094 in 1996. Gwalia controlled the world's largest stock of tantalum resources and produced 415 tons from two operations in Western Australia.

Other industrial minerals produced in Australia in 2000 included clays, diatomite, gypsum (3.8 million tons), limestone (12 million tons), magnesite (350,000 tons, up from 281,000 the previous year, with reserves of 246 million tons), phosphate rock (805,000 tons, up from 1,200 in 1999), salt, sand and gravel, silica (2.5 million tons), and dimension stone (100,000 tons).

## 27 ENERGY AND POWER

Between 1982/83 and 1993/94, energy consumption increased 36% for industrial, commercial, and residential use, according to the Australian Bureau of Statistics. Because of its relatively scant hydroelectric resources and only recently discovered oil, Australia has had to rely on coal-burning steam plants for about three-quarters of its public power requirements. The remainder has been supplied by hydroelectricity, gas turbines, and internal combustion generators. In 2000, net electricity generation was 200 billion kWh, of which roughly 90% came from fossil fuels, 8% from hydropower, none from nuclear energy, and 2% from other sources. In the same year, consumption of electricity totaled 188.5 million kWh. Total installed capacity at the beginning of 2001 was 42.7 million kW.

Major electric power undertakings, originally privately owned and operated, were by 1952 under the control of state organizations. In the early 1990s however, many of the Australian state governments began privatizing sections of their energy utilities. Manufacturing has been developed most extensively in or near coal areas, and distribution of electricity to principal users is therefore relatively simple. All major cities except Perth use 240-volt, 50-cycle, three-phase alternating current; Perth has 250-volt, 40-cycle, single-phase alternating current.

The Snowy Mountains hydroelectric scheme in southeast New South Wales, Australia's most ambitious public works project, comprises 7 power stations, a pumping station, 16 large and many smaller dams, and 145 km (90 mi) of tunnels and 80 km (50 mi) of aqueducts. It provides electricity to the Australian Capital Territory, New South Wales, and Victoria. The project took 25 years to complete and has a generating capacity of 3,740 MW (about 10% of Australia's total generating capacity). The Snowy Mountains scheme and other large power projects in New South Wales, Victoria, and Tasmania have greatly increased the nation's aggregate installed capacity. The only state with water resources sufficient for continuous operation of large hydroelectric power stations is Tasmania, which possesses about 50% of Australia's hydroelectric energy potential. Production and use of such power is on the increase throughout the country, however.

As of 2002 Australia was the world's fourth-largest coal producer. Since 1986, it has been the world's largest exporter of coal. In that time exports have doubled, reaching 162 million tons by 1997. Exports of black coal alone totaled about 85 million tons in 2001. In that year exports account for more than half of total coal production. The major market is Japan, which imports about 50% of Australia's coal exports. At home, coal supplied 44% of the country's energy as of 2002. Production in 2000 amounted to 337.2 million tons; around 80% of Australia's coal was bituminous and 20% was lignite. New South Wales and Queensland account for more than 95% of Australia's black coal production and virtually all its exports. Australia has over 55 billion tons of recoverable reserves of bituminous coal, an amount that could satisfy production levels for about 260 years at current levels of demand.

In early 1983, Alcoa Australia signed a contract with the Western Australian State Energy Commission, at an estimated cost of A\$11.2 billion, to supply natural gas from the Northwest Shelf (the North West Gas Shelf Project—NWGSP). In 1985, eight Japanese companies agreed to buy 5.84 million tons of liquefied natural gas (LNG) a year from 1989 to 2009. Capacity

has continued to increase thanks to completion of additional offshore platforms and onshore facilities. The A\$4 billion expansion of the North West Shelf LNG Project added seven million tons to LNG production when it began operation in 2003. Natural gas reserves were estimated at 2.5 trillion cu m (88 trillion cu ft) at the beginning of 2002 (more than double the figure for 2001). In early 1992, petroleum exploration began in the Timor Sea; the area had been off limits for over a decade in order to establish a zone of cooperation with Indonesia. In 2001 Australia, Phillips Petroleum, and the newly independent state of East Timor renegotiated arrangements for development of the Bayu Undan oil field in the Timor Sea, with 90% of the royalties going to East Timor.

Oil production, which began in 1964, totaled 633,000 barrels per day in 2001; reserves in 2002 were estimated at 3.5 billion barrels, a 20% increase over the figure for 2001, thanks to a record amount of exploration activity and the resulting new discoveries. Commercially exploitable uranium reserves are estimated at 474,000 tons. Rapid increases in demand for oil have outpaced supply, leaving Australia with a growing oil deficit. It is estimated that self-sufficiency in oil could plummet to only 40%.

## 28 INDUSTRY

In proportion to its total population, Australia is one of the world's most highly industrialized countries. The manufacturing sector has undergone significant expansion in recent years and turns out goods ranging from traditional textiles and processed foodstuffs to automobiles, chemicals, specialty steels and plastics, to elaborately transformed manufactures (ETMs), such as high speed ferries, telecommunications equipment and motor vehicles, which in 2001 made up about 23% of its total exports. According to the Australian Bureau of Statistics, the leading manufacturing industries on the basis of sales in 2001 were food and beverage manufacturing (22%); machinery and equipment manufacturing (20%); metal product manufacturing (18%), and petroleum, coal, chemical and associated product manufacturing (15%). In 2002 and 2003 other strong performers are expected to be printing, publishing, food processing, petroleum products, and machinery and equipment industries. In 1995, manufacturing accounted for \$48.8 billion, or about 15% of GDP. By 2000, the value of manufactures had fallen in absolute and relative terms, to \$45.5 billion, or about 13% of GDP, continuing 20 years of post-industrial transformation to a services-dominated economy. In 2000, however, manufacturing grew by 4%, above the overall economy's rate of 3.2%. Industry as a whole, which accounted for 31% of the GDP, grew by an annual average of 1.3% between 1987 and 1997. The Asian crisis caused metals and machinery and equipment sales to fall by about 5% in 1998; but the food and beverages, petrochemicals, and printing industries averaged growth of 6%.

Australia is self-sufficient in beverages, most foods, building materials, many common chemicals, some domestic electrical appliances, radios, plastics, textiles, and clothing; in addition, most of its needed communications equipment, farm machinery (except tractors), furniture, leather goods, and metal manufactures are domestically produced. Recent years have seen the rapid growth of high-tech industries including aircraft, communications and other electronic equipment, electrical appliances and machinery, pharmaceuticals, and scientific equipment, and the government has supported the growth of these new sectors. High-tech industry contributes a substantial amount to the economy, with an annual growth rate of 20% expected until 2010. Many manufacturing companies are closely connected—financially and technically—with manufacturers in the European Union, the United States, or Asia.

## 29 SCIENCE AND TECHNOLOGY

Two organizations support most of Australian government research and development. The Commonwealth Scientific and Industrial Research Organization (CSIRO), headquartered in Melbourne and founded in 1926, is an independent government agency that supports research and development in all fields of the physical and biological sciences except defense science, nuclear energy, and clinical medicine. The Defense Science and Technology Organization (DSTO), headquartered in Canberra, supports military research and development by providing scientific and technological assistance to the Australian Defence Force and Department of Defence.

Several issues dominate current Australian science and technology policy: the concentration of research and development in national research centers; tensions among and between university researchers over allocation of research and development funding resources; effective communication between industry, government, and university researchers; the growing role which industry is playing in support of national research and development; and the role which Australia is playing in international science and technology collaboration. High-technology exports totaled \$1.5 million in 1998.

Government funds about 55% of all research and development and industry about 40%. In 1996, there were 73 agricultural, medical, scientific, and technical professional associations and societies, the foremost of which is the Australian Academy of Science, founded in 1954 by royal charter. The Australian Academy of Technological Sciences and Engineering was founded in 1976. The Australian Science and Technology Council (ASTEC) provides an independent source of counsel for the Australian Prime Minister; its role was augmented in 1986 by the creation of a post for a Minister Assisting the Prime Minister with portfolio for science and technology.

In 1996, Australia had 36 universities offering courses in basic and applied science. In 1987–97, science and engineering students accounted for 24% of college and university enrollments. The Powerhouse Museum in Sydney, the largest museum complex in Australia, has 25 exhibitions in the areas of science, technology, social history, and decorative arts.

## 30 DOMESTIC TRADE

There are many small specialty shops, but in the larger cities department stores sell all kinds of items. Supermarkets have been widely established and telephone shopping and delivery services are becoming popular. The number of franchise companies is growing. Reports indicate that in 1988, there were about 184 business-format franchised companies in the country. By 2002, there were about 747. These franchised businesses are about 2.5 times more successful than non-franchised businesses. Installment selling, called hire purchase, is used in the sale of many products. In the past few years, direct marketing has grown at an annual rate of about 7%. Reliable commercial credit agencies cover all the main cities and many smaller towns.

The usual business hours are from 9 AM to 5 PM, Monday–Friday, with some businesses also open from 9 AM to noon on Saturday. Retail shops generally stay open later, usually with evening hours at least one day a week. Restaurants and convenience stores are generally open to later hours. Many retail establishments are open on Saturday and Sunday. Travelers checks and credit cards are widely accepted. A 10% goods and services tax (GST) replaced wholesale and state sales taxes as of July 1, 2000. The GST applies to most goods and services with a few exceptions, including basic foods, education, and health care.

Most advertising is done through the press, radio, and television. Principal advertising agencies are in Sydney and Melbourne.

## 31 FOREIGN TRADE

Measured by foreign trade volume per capita, Australia is one of the great trading nations, and it continues to show a steady rise in trade volume. Throughout the 1970s, exports regularly exceeded imports. In the early 1980s, however, there was a deficit, which has continued into the 1990s.

Australia is mainly an exporter of primary products and an importer of manufactured and semi-finished goods, although the export of manufactured goods increased by 10% per year during the 1990s. Exports of primary goods accounted for almost 60% of total exports in 1998. Transport or re-export trade is negligible. In recent years, Australia's foreign trade has tended to shift from European markets to developing Asian nations, which now account for nearly 60% of Australia's exports, compared with about 10% in 1975.

Australia's commodity exports are dominated by fossil, mineral, and plant fuels, including coal, lignite, and peat (11%). Wool may only amount to a small percentage (2.5%) of Australia's exports, but Australia supplies the world with almost half of its imported wool. Food products such as wheat, sugar, and meat exports tie with fuel exports as one of the top commodities leaving the country. The top exports in 2000 were as follows:

	% OF COUNTRY TOTAL
Coal, lignite, and peat	8.5
Crude petroleum	6.8
Base metal ores	6.5
Gas, natural and manufactured	5.9
Meat	4.6
Gold	4.5
Aluminum	4.0
Wheat	3.5
Road vehicles	3.0

In 2000 Australia's imports were distributed among the following categories:

Consumer goods	19.5%
Food	4.2%
Fuels	8.4%
Industrial supplies	20.6%
Machinery	28.4%
Transportation	18.4%
Other	0.6%

Principal trading partners in 1998 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
Japan	12,600	9,413	3,187
United States	6,344	14,255	-7,911
China (inc. Hong Kong)	5,538	5,569	-31
Korea	5,230	2,937	2,293
New Zealand	3,798	2,739	1,059
Singapore	3,386	2,234	1,152
United Kingdom	2,169	4,175	-2,006
Indonesia	1,673	1,682	-9
Malaysia	1,367	2,591	-1,224
Germany	752	3,583	-2,831

## 32 BALANCE OF PAYMENTS

The US Central Intelligence Agency (CIA) reports that in 2002 the purchasing power parity of Australia's exports was \$66.3 billion while imports totaled \$68 billion resulting in a trade deficit of \$1.7 billion. Australia's current account deficit reached a high of \$20 billion in 1995; the figure was down to \$18 billion in 1998, or 6% of GDP. Australia's exports in the early 2000s had reflected the increasingly value-added direction of Australian industry. From 1993 to 2000, manufactured exports grew at an average rate of around 8% per year. Primary products remain the

dominant export sector in value terms, however. Exports of mineral and agricultural products accounted for 55% of total merchandise exports in 2000. Nearly half of services credits are accounted for by tourism, while services debits are dominated by transportation services and outbound tourism.

The International Monetary Fund (IMF) reports that in 2001 Australia had exports of goods totaling \$63.7 billion and imports totaling \$61.8 billion. The services credit totaled \$16.2 billion and debit \$16.8 billion. As of 2001, Australia's trade deficit was forecast to improve, with global commodities prices rising, a lower Australian dollar making exports more competitive, and a slowdown in economic growth lowering the demand for imports.

The following table summarizes Australia's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	-8,876
Balance on goods	1,912
Balance on services	-515
Balance on income	-10,294
Current transfers	21
<b>Capital Account</b>	591
<b>Financial Account</b>	8,003
Direct investment abroad	-11,611
Direct investment in Australia	4,394
Portfolio investment assets	-8,690
Portfolio investment liabilities	19,034
Other investment assets	-144
Other investment liabilities	4,416
<b>Net Errors and Omissions</b>	1,378
<b>Reserves and Related Items</b>	-1,096

### 33 BANKING AND SECURITIES

The Reserve Bank of Australia, the central bank, reconstituted in 1960, functions as a banker's bank and financial agent of the federal and some state governments, issuing notes, controlling interest and discount rates, mobilizing Australia's international reserves, and administering exchange controls and government loans. It was formerly connected with the Commonwealth Trading Bank—a general bank—the Commonwealth Savings Bank, and the Commonwealth Development Bank. The banking system has undergone progressive privatization and foreign investment since the deregulation of financial markets in the 1980s under the Wallis Inquiry into the Australian financial system of 1981. In 1996, the government privatized the Commonwealth Banks in the Reserve Bank Act, separating the Commonwealth Banks from the Reserve Bank. Rural credits, mortgage banking, and industrial financing are now administered wholly by private-owned banks. Fifty banks operate in Australia, 35 of which are foreign-owned; the largest banks include National Australia Bank, ANZ, Commonwealth Bank, and Westpac. The Australian Prudential Regulation Authority (APRA) regulates the banks and other financial institutions.

The Australian currency has floated freely since 1983, and was allowed to fall dramatically from 1984 to 1987. The Reserve Bank pointed to an expected upturn in economic activity in 1997 and anticipated a continuation of low inflation. It also indicated that firming economic growth, together with the uncertainties surrounding wage outcomes, made changes to monetary policy settings unlikely. Interest rate cuts were not on the bank's policy agenda, as it waited to see the impact of reductions made in late 1996. From 1996 to 2000, the Australian dollar fell by almost 30% against the US dollar; losing 12% in the first half of 2000 alone. The Reserve Bank increased interest rates a number of times in order to stave off inflation, but the introduction of the 10% GST in July threatened to raise inflation despite monetary policies. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known

as M1—were equal to \$85.3 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$258.7 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 5.06%.

The Australian stock market is where equity (shares), units in listed trusts, options, government bonds, and other fixed-interest securities are traded. It is operated on a national basis by the Australian Stock Exchange (ASX), which is responsible for the day-to-day running and surveillance of stock market trading. The ASX was established on 1 April 1987, with the passage of the Australian National Guarantee Fund Act through the Commonwealth Parliament. This Act converted the six former capital city Stock Exchanges into state subsidiaries of the ASX.

### 34 INSURANCE

Australia has one of the most competitive insurance markets in the world, with a large number of insurers competing for business from a small population base. Established in 1987, the Insurance and Superannuation Commission (ISC) was the ultimate regulatory authority for the insurance industry in Australia. It was replaced by the Australian Prudential Regulation Authority. Life insurance firms, through premiums on policies and interest earned on accumulated funds, account for substantial annual savings. The companies invest in government securities, in company securities (including shares and fixed-interest obligations), and in mortgage loans and loans against policies in force. Most loans (to individuals and building societies) are for housing.

At the end of 1998, total assets of the 172 private general insurance companies amounted to approximately A\$56.2 billion. Total assets of the public general life insurance industry for the same time was around A\$25 billion, managed by 17 public insurers. Forty-three life insurance companies were managing A\$175 billion in assets.

### 35 PUBLIC FINANCE

The fiscal year begins 1 July and ends 30 June. After World War II, the Commonwealth government assumed greater responsibility for maintaining full employment and a balanced economy, as well as for providing a wide range of social services. Social security and welfare payments are the largest category of government expenditure. The central government has financed almost all its defense and capital works programs from revenue and has made available to the states money raised by public loans for public works programs. Deficits are common. In the latter half of the 1980s, however, five consecutive years of significant surpluses occurred as a result of expenditure restraints. The late 1990s also saw consistent surpluses. In 2000, the government implemented a 10% goods and services tax (GST) on all items, while income tax and corporate tax rates were cut.

The US Central Intelligence Agency (CIA) estimates that in 2000/2001 Australia's central government took in revenues of approximately \$86.8 billion and had expenditures of \$84.1 billion. Overall, the government registered a surplus of approximately \$2.7 billion. External debt totaled \$176.8 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	86,800
Tax revenue	91.0%	78,983
Non-tax revenue	8.1%	7,044
Capital revenue	0.9%	773
EXPENDITURES	95.2%	80,088
General public services	6.7%	5,651
Defense	6.7%	5,606
Public order and safety	0.8%	697
Education	7.3%	6,118
Health	14.1%	11,862
Social security	33.8%	28,403
Housing and community amenities	1.2%	974
Recreation, cultural, and religious affairs	0.9%	780
Economic affairs and services	5.8%	4,878
Other expenditures	12.5%	10,544
Interest payments	5.4%	4,575

### 36 TAXATION

The main taxes (personal and corporate income, payroll, and goods and services tax (GST) are levied by the federal government, but the states and municipalities impose other levies. Federal rates are determined in legislation that is foreshadowed in the budget, presented each August; rates apply to the fiscal year beginning in July, except for company tax rates, which apply to the previous year's income.

In July 2000, the Australian government implemented a complete tax system overhaul with the introduction of a 10% GST on most goods and services, with the exception of basic foods, education, health and some other sectors. The GST replaced most sales taxes and was followed in 2001 by a cut in the corporate tax rate to 30% for both public and private firms. Undistributed profits of private firms are taxed at a higher rate. Nonresident companies pay an additional tax of 5%. Both the federal government and states can levy land taxes, and states levy both stamp duties on various documents and payroll taxes. Excise taxes are levied on alcoholic beverages, tobacco products, luxury cars, coal, kerosene, liquefied petroleum gas, and indigenous crude oil.

As part of the new tax system, federal, state, and territorial governments agreed to fund a First Home Owners Scheme (FHOS) to offset the impact of the new GST on first-time home buyers. A grant of A\$7000 was made available for first-time purchases of new and existing housing. On 9 March 2001 the grant was extended to contracts entered into before 1 January 2002. In December 2001 the additional grant was extended to June 2002 but reduced to A\$3000, but in July 2002, the grant reverted to its original amount of A\$7000 as it was again extended.

Personal taxation is levied by the Commonwealth on a sharply progressive basis. The pay-as-you-earn system (called PAYE) is used. As of 2000, individual tax rates ranged from zero on income up to A\$6,000 to 47% on income over A\$60,001. Social security taxes are included as part of income taxes. Deductions are allowed for dependents, donations, medical expenses, and children's educational expenses, and for payment of life insurance or pension premiums. There is also a pensioner rebate that varies depending on income.

In early 1990, the Australian Taxation Office and the US Internal Revenue Service (IRS) formalized a simultaneous audits agreement to investigate suspected noncompliance with tax laws in both countries.

### 37 CUSTOMS AND DUTIES

Before the 1980s, federal policy was to use the tariff to protect local industries (especially the automobile industry), but a three-decade long program of tariff reduction led to tariff rates of 5% or below in 2000. Textiles and clothes (25%), shoes (15%), and automobile products (15%) had higher duties, but those will be

reduced to 17.5%, 10%, and 10%, respectively, in 2005. The GST of 10% applies for most imports and exports. Tariffs on industrial machinery and capital equipment ordinarily are low where they do not compete with Australian enterprise and machinery and equipment required by new industries may be imported duty-free or at concessional rates under the Project-By-Law Scheme (PBS).

As a contracting party to GATT, Australia consented to a number of tariff reductions after 1947. Under the South Pacific Regional Trade and Economic Cooperation Agreement (SPARTECA), which went into effect on 1 January 1981, Australia and New Zealand offered the other South Pacific Forum members duty-free or concessional access to their markets. The Australia New Zealand Closer Economic Relations Trade Agreement (ANZCERTA, abbreviated to CER) opened bilateral trade between the two countries in 1983. Australia is also a member of the Asia Pacific Economic Cooperation (APEC) forum.

The only free-trade zone is the Darwin Trade Development Zone (TDZ), located in the Northern Territory. There is a Manufacturing-in-Bond (MIB) site in Newcastle and several others were on the way in 2000.

### 38 FOREIGN INVESTMENT

Total foreign investment in Australia in 1997/98 stood at A\$587,231 million (about US\$390,098 million at the prevailing exchange rate), according to the Australian Bureau of Statistics (ABS). Two years later, 1999/2000, it had increased 23% to A\$722,250 million (US\$479,498 million), after increases of about 8% in 1998/99 and 15% in 1999/2000. In 2000/01, the nominal increase in total foreign investment was 12%, to A\$809,377 million, but because of the depreciation in Australian dollar, this constituted a decline of 9.8% in US dollar terms, to US\$450.4 billion. Of the total, about 57% is portfolio investment, 26% foreign direct investment (FDI), 2.8% financial derivatives, and 14.3% other investment liabilities. According to figures at June 2000 (the latest available), the United States accounts for the biggest share of total foreign investment, at 30%, including 34% of FDI. The UK is second with 24.8% of total foreign investment, and a 26.5% share of FDI. Countries whose share of FDI in Australia were greater than 2% as of June 2000 are Japan (8.1%), the Netherlands (4.4%), Germany (2.7%), and France (2.6%), all of which had lower total shares than their FDI. For other substantial foreign investors, their share of the total foreign investment—Hong Kong at 3.4%; Singapore at 2.8%, New Zealand at 1.8%, Benelux at 1.3%—exceeded their share of FDI. In all, OECD countries in June 2000 accounted for 88.7% of FDI in Australia, and 73.5% of total foreign investment.

Almost half of total foreign investment, 48.1% as of June 2000, has been in finance and insurance, with investments in manufacturing (13.4%), other industries (11.4%) and mining (8%) making up another third. The most recent focus of foreign investment has been the booming tourist industry, and commercial and residential property development. Hotels and resorts on the north New South Wales and Queensland coasts are attracting capital from abroad, as are large office block and hotel projects in the capital cities.

Australia prefers the inflow of long-term development capital to that of short-term speculative capital. It also welcomes the technical competence usually accompanying foreign investment. Investment incentives include tariff protection, and bounties for the manufacture of certain products. Total foreign ownership is permitted, but ownership in certain sectors is subject to restrictions. In April 2001 the government rejected Royal Dutch/Shell's \$10 billion bid for Woodside Petroleum, Australia's largest-listed oil and gas company, causing some concern that it was retreating from its liberalization policies. The Federal Department of the Treasury regulates foreign investment with the

assistance of the Foreign Investment Review Board (FIRB), which screens for conformity with Australian law and policy. The major legislation governing foreign investment is the Foreign Acquisitions and Takeovers Act of 1975, as amended in 1989, and administered according to regulations issued in 1991, as the country was embarking on its program of economic liberalization. Across the period, foreign investment has risen from below 2% of GDP to over 9%. It is estimated that about 34% of shares traded on the Australian stock exchange are foreign owned.

The IMF estimates that Australia's outward investments have exceeded inward investments by a small amount since 1999/2000 and 2000/01, when net capital outflows amounted to -0.2% of GDP for both years. The preliminary estimate for 2001/02 is net capital flows amounting to -0.1 of GDP.

### 39 ECONOMIC DEVELOPMENT

Commonwealth and state governments devoted special attention to the production and marketing of main primary products, and after 1920, legislation provided subsidies or other marketing aids to certain commodities. Federal and state aid was given to industries established in approved fields of manufacture during the 1970s. The Export Market Development Grant Acts of 1974 provided government assistance in the development of export markets. Recipients were eligible for up to 50% reimbursement for expenses incurred establishing foreign markets for domestic goods. In 1975, the government set up the Export Finance and Insurance Corp. (replacing the Export Payments Insurance Corp.) to provide Australian exporters with insurance and other financial services not readily available commercially, to provide insurance against political risk.

The government endeavors to prevent undue fluctuation in the economy. Price controls were in effect during World War II and part of the postwar period and are now imposed on a few essential household items. As an alternative to price controls, the Commonwealth government, in mid-1975, introduced a policy of wage indexation, allowing wages to rise as fast as, but no faster than, consumer prices. Major labor unions, however, opposed this restraint, which was ended in as world wide 1981, in the wake of the second oil shock and the on-set of global recession. Monetary policy supported recovery from the recession of the early 1980s by holding to a low inflation rate. From the mid-1980s, Australia's government embarked on a basic re-orientation of the economy from inward-looking import substitution industrialization (ISI) to outward-looking export-led growth and liberalization. Key reforms have been unilateral reduction of high tariffs and other protective barriers; letting the Australian dollar float; deregulating the financial services sector; rationalizing and reducing the number of trade unions; privatizing many government-owned services and public utilities, including establishing a fully competitive electricity market, one of only two (with the United Kingdom) among economically developed countries. The transformation and opening of the economy is credited with helping produce, as of March 2001, 43 quarters of uninterrupted expansion (although some data show a decline in 4th quarter, 2000), exceeding in duration the expansions of the 1960s-1970s and the 1980s, which each lasted about 30 quarters. After August 1993, the focus of fiscal policy shifted towards deficit reduction. During this period, the national debt declined from a peak of 19% of GDP in 1995-96, to less than 7% of GDP in 2000/01.

Energy has been a principal growth sector. However, four years' experience with the deregulated electricity market has not all been satisfactory, as the sector has been beset by blackouts, shortages and higher prices. Nevertheless, the Australian government has continued to innovate in this sector. On April 2, 2002, a new and unique market in renewable energy was introduced. Renewable energy from accredited power stations

can earn renewable energy credits (RECs) that can be traded as a new form of currency.

The government has also been particularly aggressive in promoting Australia as an "information economy." It is second in the world after the United States in PC use. In November 2000, it was estimated that 40% of house holds and 56% of businesses have PC's. Research by the Economist Intelligence Unit ranked Australia as second (only to the United States) among 60 countries surveyed in terms of providing an environment conducive to the development of e-business opportunities. In 2000, the new tax system aimed at increasing the government budget while stimulating economic growth in such sectors as tourism/services and high technology.

### 40 SOCIAL DEVELOPMENT

Social Security measures have been in effect since 1908 and cover all residents. Old age pensions are payable to men 65 years of age and over, and to women 61.5 years of age and over, who have lived in Australia continuously for at least 10 years at some stage in their lives. The continuous-residence requirement may be waived for those who have been residents for numerous shorter periods. Disability pensions are payable to persons 16 years of age and older who have lived at least five years in Australia and have become totally incapacitated or permanently blind. The family allowance legislation provides for weekly payments to children under 16 years of age. Widows' pensions are also provided. Employed persons are covered by workers' compensation, and unemployment assistance is provided for those aged 20 to 65. Youths aged between 16 and 20 are eligible for the youth training allowance, administered by the Department of Employment, Education and Training. Work-related sickness and maternity benefits are provided, as well as medical benefits for all residents.

The Sex Discrimination Act of 1984 bars discrimination on the basis of sex, marital status or pregnancy, and in 1992 the Parliament passed amendments that strengthened it significantly. The Office of the Status of Women was created to monitor the position of women in society. Sexual harassment is specifically prohibited by law. Domestic violence remains a problem, particularly in Aboriginal communities. The government has a strong commitment to the welfare of children.

Discrimination on the basis of race, color, descent or national or ethnic origin was prohibited in the Racial Discrimination Act of 1975. Despite these measures, aboriginal Australians have poorer standards of living, are imprisoned more often, and die younger than white Australians.

### 41 HEALTH

Australia is one of the healthiest countries in the world. The common cold and other respiratory infections are the most prevalent forms of illness; arteriosclerosis is the most common cause of death. Water in most cities is good and safe for household purposes and garbage and trash are collected in cities and towns.

All levels of government are concerned with public health, with the municipalities functioning largely as agents for the administration of state policies. State health departments are responsible for infant welfare, school medical and dental services (provided free of charge), treatment and eradication of infectious and contagious diseases and tuberculosis, industrial hygiene programs, maintenance of food and drug standards, public and mental hospitals, and the regulation of private hospitals. The Commonwealth government makes grants for medical research, coordinates state health programs, and maintains specialist medical research institutions and laboratories.

Public sector funding accounts for over two-thirds of health care expenditure in Australia; some is allocated via the central government and some via local authorities. Since the introduction

of Medicare (the national health insurance program) in 1984, the share of funding provided by the federal government has risen. Under the Medicare system, all Australians have access to free care at public hospitals. The plan also meets three-fourths of the bill for private hospital treatment, while patients pay the remainder (and can take out private health insurance to cover this, although comprehensive private medical insurance was abolished in the 1984 act). Total health care expenditure was estimated at 8.6% of GDP as of 1999.

Since 1950, certain drugs have been provided free of charge when prescribed by a medical practitioner. All patients other than pensioners must pay a set amount for every prescription supplied under the scheme; the remainder is met by the government. For those not eligible for free public health care and who have basic medical insurance, the government pays 30% of the scheduled benefit fee for each medical service. Such insurance, including the government contribution, covers 85% of scheduled fees. The federal government provides grants to the states and aboriginal organizations for the development of special health services for aboriginals. As of 1992, aboriginals and Torres Strait Islanders had unacceptably low levels of health. Though, they have access to the same health care system as any other Australian, they are often reluctant to take full advantage of it. Unemployed persons, recent immigrants and refugees, and certain low-income persons are entitled to health care cards that entitle the bearer and dependents to free medical and hospital treatment.

Health services are efficient. Hospitals are generally modern and well equipped, but space often is at a premium. In 1998, there were more than 1,015 acute-care hospitals, of which 734 were public hospitals. As of 1999, there were an estimated 8.5 hospital beds per 1,000 people. Most private hospitals tend to be fairly small and there are a large number of private hospitals run by religious groups. Hospital facilities are concentrated in the states of New South Wales and Queensland, which together account for about half the country's hospitals and hospital beds.

In 1998, Australia had 48,934 employed physicians, of which 20,852 were primary care providers. As of 1999, there were an estimated 2.5 physicians per 1,000 people. In the mid-1990s, there were more than 6,000 dentists and in 1996 there were 218,172 employed nurses, or 9.5 per 1,000 people. Competent general physicians and specialists are available in most cities and the Royal Flying Doctor Service provides medical care and treatment to people living in remote areas.

In 2002, the estimated death rate was 7.25 per 1,000 people. Infant mortality in 2000 was 5 per 1,000 live births. The under-five mortality rate has steadily decreased from 24 in 1960 to 7 in 2000. Between 1980 and 1993, 67% of married women (ages 15-49) used contraception. The 1999 birth rate was 13.2 per 1,000 inhabitants, and the fertility rate in 2000 was 1.8 per woman. The maternal mortality rate was 6 per 100,000 live births in 1995. The estimated life expectancy in 2000 was 79 years. As of 1999, estimated immunization of one-year-old children was as follows: diphtheria, pertussis, and tetanus, 88%; and measles, 89%. In 1999, the incidence of tuberculosis was 6.2 per 1,000 people.

The HIV-1 prevalence in 1999 was 0.15 per 100 adults. As of 1999 the number of people living with HIV/AIDS was estimated at 14,000.

## 42 HOUSING

According to 2001 national census figures, there were about 7,810,352 dwellings in the nation. About 90.5% were occupied private dwellings. Central heating, formerly available only in the most modern and expensive homes and apartments, is now generally available in the coldest areas of the country. Most apartments and houses are equipped with hot-water service, refrigeration, and indoor bath and toilet facilities.

## 43 EDUCATION

Illiteracy is virtually nonexistent except among the aboriginals. Education is compulsory for children from the age of 6 to 15 (16 in Tasmania). Primary education generally begins at six years of age and lasts for six or seven years, depending on the state. Free education is provided in municipal kindergartens and in state primary, secondary, and technical schools. In 1997 primary schools enrolled 1,855,789 students in 8,123 schools, with 103,774 teachers. Secondary schools enrolled 2,367,692 students and employed approximately 104,000 teachers in the same year. Secondary education lasts for five or six years, four years of lower secondary, followed by another one or two years of upper secondary. There are also state-regulated private schools, which are attended by approximately one-third of Australian children. Correspondence courses and educational broadcasts are given for children living in the remote "outback" areas and unable to attend school because of distance or physical handicap. One-teacher schools also satisfy these needs. Although most aboriginal and Torres Strait Islander students use the regular school system, there are special programs to help them continue on to higher education.

Although each state controls its own system, education is fairly uniform throughout Australia. As of 1999, public expenditure on education was estimated at 4.8% of GDP. Education is the joint responsibility of the federal government and each state government and territory. The federal government directly controls schools in the Northern Territory and in the Australian Capital Territory.

Australia has approximately 20 universities in addition to more than 200 technical institutes. There is a state university in each capital city and each provincial area; a national postgraduate research institute in Carberra and a university of technology in Sydney with a branch at Newcastle. There are also a number of privately funded higher-education institutions including theological and teacher training colleges. Adult education includes both vocational and non-vocational courses. Most universities offer education programs for interested persons. In 1997, there were a total of 1,041,648 students and 26,407 teachers in higher-level educational institutes.

## 44 LIBRARIES AND MUSEUMS

The National Library of Australia traces its origins back to 1902, but it was not until 1961 that it was legislatively separated from the Commonwealth Parliamentary Library and made a distinct entity. The National Library is now housed in modern facilities in Canberra and has over 4.7 million volumes. Three other libraries in Australia of comparable size are the library of the University of Sydney (over three million volumes), founded in 1852; the State Library of New South Wales (over 1.9 million volumes), founded in 1826; the State Library of Victoria (over 1.5 million), founded in 1854, and the Library Information Service of Western Australia (2.7 million). The state capital cities have large noncirculating reference libraries, as well as municipal public circulating libraries. The university libraries of Adelaide, Brisbane, Canberra, Melbourne, Monash, New South Wales, and Queensland all have sizable collections. Recent years have seen programs with increased cooperation between libraries, which has resulted in increased service. The Australian Institute of Aboriginal Studies in Acton has a specialized collection of 15,000 volumes, and dozens of museums and cultural centers house other specialized collections.

There are about 2,000 museums in Australia, of which over 200 are art museums. A national art collection has been assembled in the Australian National Gallery at Canberra, which was opened to the public in October 1982. The National Museum of Australia, founded 1980 in Canberra, exhibits Australian history and social history. In 2001 the museum opened

new facilities in a stunning architectural structure on the shores of Lake Burley Griffin. There are eight other major museums, two each in Sydney and Melbourne and one in each of the other state capitals. Of note in Melbourne are a Performing Arts Museum (1978); the Ancient Times House (1954); and the Jewish Museum of Australia. The Melbourne Museum, completed in 2000, became the largest museum in the southern hemisphere. Sydney houses the Australian National Maritime Museum (1985), the Museum of Contemporary Art (1979) and the Nicholson Museum of Antiquities (1860). Some of the smaller cities also have museums. The National Gallery of Victoria in Melbourne has a fine collection of paintings and other artworks, and the South Australian Museum in Adelaide has excellent collections relating to Australian entomology, zoology, and ethnology. Botanical gardens are found in every capital city.

#### 45 MEDIA

On 1 July 1975, responsibility for the nation's postal service was vested in the Australian Postal Commission, and for telecommunications in the Australian Telecommunications Commission; previously these functions had been administered by the Department of the Postmaster General. Local and long-distance telephone services are rated highly. As of 2000 there were 10 million mainline telephones in use, about one for every two Australians. The same year, there were about 8.6 million cellular phones in use nationwide. Nearly 99% of the total service is automatic.

The government administers and supervises broadcasting through the Australian Broadcasting Commission, which operates a nationwide noncommercial radio and television service; the Australian Broadcasting Tribunal, which licenses and regulates commercial broadcasters; and the Special Broadcasting Service, which prepares and broadcasts multilingual radio and television programs. Federal government stations are financed from budget revenues, and the private commercial stations derive their income from business advertising. As of 1999 there were 262 AM and 345 FM radio stations and 104 television stations. In 2000, there were 1,908 radios and 738 television sets for every 1,000 people. In 2001, there were 603 Internet service providers serving 10 million subscribers.

In general, news is presented straightforwardly, and political criticism is considered fair and responsible. The *Australian*, one of only two national newspapers, was established in 1964 and is published in all state capitals. It is independent and had an estimated daily circulation in 1999 of 153,000. The other national daily, the *Australian Financial Review*, had a Monday–Friday average circulation of 78,000 in the same year.

Other leading dailies and their estimated 2002 circulation figures are listed in the following table:

	ORIENTATION	CIRCULATION
<i>Herald-Sun</i> (Melbourne)	Conservative	575,320
<i>Daily Telegraph-Mirror</i> (NSW)	NA	442,000
<i>Sydney Morning Herald</i>	Conservative	231,510

Major Sunday newspapers include the *Sun-Herald* (613,000) and the *Sunday Telegraph* in Sydney, and the *Sunday Mail* in Brisbane (598,070).

The major news agency is the Australian Associated Press, founded in 1935; it has been associated with Reuters since 1946. Many international news services have bureaus in Sydney.

Though the Australian constitution does not have specific guarantees of freedom of expression, the High Court has, in two decisions, declared that freedom of political discourse is implied. The government is said to respect all such rights in practice.

#### 46 ORGANIZATIONS

Chambers of commerce and chambers of manufacture are active throughout Australia, especially in the state capital cities; the

Australian Chamber of Commerce (1091) coordinates their activities. The Australia Council (founded in 1943) encourages amateur activities in the arts and sponsors traveling exhibitions of ballet, music, and drama. Theatrical, musical, and dance organizations are present in the larger cities and towns. There are professional associations or scholarly societies in the fields of architecture, art, international affairs, economics, political and social science, engineering, geography, history, law, literature, medicine, philosophy, and the natural sciences. Many publish scholarly journals. Several sports organizations are present. Skiing and tobogganing clubs function in the mountainous areas. Sydney, Melbourne, Hobart, and several other cities have large yacht clubs. Every state capital city has swimming and surfing clubs.

There are numerous youth organizations. One of the most prominent is the National Union of Students of Australia (NUSA), which was founded in 1987 by uniting the existing student unions in the Australian states. It now represents the concerns and interests of over 250,000 students. The President of NUSA has a position on the Higher Education Council, which advises the Australian Minister for Employment, Education, and Training. Other youth groups include the Australian Youth Hostel Association, Student Services of Australia, Tertiary Catholic Federation of Australia, the YMCA and YWCA, Young Liberal Movement, Young National Party, and Young Socialist League. Scouting organizations are also active throughout the country.

#### 47 TOURISM, TRAVEL, AND RECREATION

Among Australia's natural tourist attractions are the Great Barrier Reef, a mecca for scuba divers; the varied and unusual flora and fauna; and the sparsely inhabited outback regions, which in some areas may be toured by camel. Other attractions include Ballarat and other historic gold-rush towns near Melbourne; wineries, particularly in the Barossa Valley, 55 km (34 mi) northeast of Adelaide; Old Sydney Town, north of Sydney, a recreation of the Sydney Cove Settlement as it was in the early 19th century; and the arts festivals held in Perth every year and in Adelaide every two years, featuring foreign as well as Australian artists.

Among the sports that lure tourists are surfing, sailing, fishing, golf, tennis, cricket, and rugby. Melbourne is famous for its horse racing (Australia's most celebrated race is the Melbourne Cup) and for its 120,000-capacity cricket ground, reputedly the biggest in the world.

Except for nationals of New Zealand and certain other Commonwealth countries, visitors must have valid passports issued by an Australian or British consul or passport officer. They must also be in possession of sufficient funds to maintain themselves while in Australia and hold tickets for travel to a destination outside Australia. Immunizations are required only of tourists coming from an infected area.

The government actively promotes tourism. In 2000, Australia attracted 4,946,200 foreign visitors. Typically, most visitors come from East Asia and the Pacific region. That year there were 194,926 hotel rooms with 567,546 beds and an occupancy rate of 58%. Tourist receipts that year totaled over US\$8 billion. In 2002, the US Department of State estimated the daily cost of staying in Melbourne at US\$233 and in Sydney, at US\$175.

#### 48 FAMOUS AUSTRALIANS

The most highly regarded contemporary Australian writer is Patrick White (1912–90), author of *The Eye of the Storm* and other works of fiction and winner of the 1973 Nobel Prize for literature. Other well-known novelists are Henry Handel Richardson (Henrietta Richardson Robertson, 1870–1946), Miles Franklin (1879–1954), Christina Stead (1902–83), and Thomas Michael Keneally (b.1935). Henry Lawson (1867–1922)

was a leading short-story writer and creator of popular ballads. Germaine Greer (b.1939) is a writer on feminism. A prominent Australian-born publisher of newspapers and magazines, in the United Kingdom and the United States as well as Australia, is Keith Rupert Murdoch (b.1931).

Three renowned scholars of Australian origin are Sir Gilbert Murray, O.M. (1866–1957), classicist and translator of ancient Greek plays; Samuel Alexander, O.M. (1859–1938), influential scientific philosopher; and Eric Partridge (1894–1979), authority on English slang. An outstanding bacteriologist was Sir Frank Macfarlane Burnet, O.M. (1899–1985), director of the Melbourne Hospital and co-winner of the 1960 Nobel Prize for medicine. Elizabeth Kenny (1886–1952) made important contributions to the care and treatment of infantile paralysis victims. Sir John Carew Eccles (1903–1997) shared the 1963 Nobel Prize for medicine for his work on ionic mechanisms of the nerve cell membrane. John Warcup Cornforth (b.1917) shared the 1975 Nobel Prize for chemistry for his work on organic molecules.

Among Australia's most prominent film directors are Fred Schepisi (b.1939), Bruce Beresford (b.1940), George Miller (b.1943), Peter Weir (b.1944), and Gillian Armstrong (b.1950); film stars have included Australian-born Errol Flynn (1909–50), Paul Hogan (b.1940), and US-born Mel Gibson (b.1956). Leading Australian-born figures of the theater include the actors Dame Judith Anderson (1898–1992) and Cyril Ritchard (1898–1977) and the ballet dancer, choreographer, and stage actor and director Sir Robert Murray Helpmann (1909–86). Musicians of Australian birth include the operatic singers Dame Nellie Melba (1861–1931), John Brownlee (1901–69), Marjorie Lawrence (1907–79), and Dame Joan Sutherland (b.1926) and the composers Percy Grainger (1882–1961), Arthur Benjamin (1893–1960), Peggy Glanville-Hicks (1912–1990), and Peter Joshua Sculthorpe (b.1929). Popular singers include Helen Reddy (b.1941) and Olivia Newton-John (b.UK, 1948). Alfred Hill (1870–1960) is regarded as the founder of the art of musical composition in Australia. Albert Namatjira (1902–59), an Aranda aboriginal, achieved renown as a painter, as has Sir Sidney Robert Nolan (b.1917). The aviator Sir Charles Edward Kingsford-Smith (1897–1935) pioneered flights across the Pacific Ocean. A popular figure of folklore was the outlaw Ned (Edward) Kelly (1855?–80).

In recent decades, the tennis world was dominated by such Australian players as Frank Sedgman (b.1927), Lewis Hoad (1934–94), Kenneth Rosewall (b.1934), Rod (George) Laver (b.1938), John David Newcombe (b.1944), and Evonne Goolagong Cawley (b.1951). Sir Donald George Bradman (b.1908) was one of the outstanding cricket players of modern times. Record-breaking long-distance runners include John Landy (b.1930) and Herb Elliott (b.1938). Jon Konrads (b.1942) and his sister Ilsa (b.1944) have held many world swimming records, as did Dawn Fraser (b.1937), the first woman to swim 100 meters in less than a minute, and Murray Rose (b.1939).

The principal modern Australian statesman is Sir Robert Gordon Menzies (1894–1978), who served as prime minister from 1939 to 1941 and again from 1949 to 1966. Subsequent prime ministers have included Edward Gough Whitlam (b.1916), who held office from 1972 to 1975; John Malcolm Fraser (b.1930), who succeeded Whitlam late in 1975; and Robert James Lee Hawke (b.1929), who served from 1983–91.

## 49 DEPENDENCIES

Since 1936, Australia has claimed all territory in Antarctica (other than Adélie Land) situated south of 60°s and between 45° and 160°E, an area of some 6.1 million sq km (2.4 million sq mi), or nearly 40% of the continent. Three scientific and exploratory bases are now in operation: Mawson (established February

1954), Davis (established January 1957), and Casey (established February 1969).

### Ashmore and Cartier Islands

The uninhabited, reef-surrounded Ashmore Islands, three in number, and Cartier Island, situated in the Indian Ocean about 480 km (300 mi) north of Broome, Western Australia, have been under Australian authority since May 1934. In July 1938, they were annexed as part of the Northern Territory. Cartier Island is now a marine reserve.

### Christmas Island

Situated at 10°30' S and 105°40' E in the Indian Ocean, directly south of the western tip of Java, Christmas Island is 2,623 km (1,630 mi) northwest of Perth and has an area of about 135 sq km (52 sq mi). Until its annexation by the UK in 1888, following the discovery of phosphate rock, the island was uninhabited. The total estimated population in 2002 was 474, of whom 70% were Chinese and 10% were Malay. The only industry was phosphate extraction. The governments of Australia and New Zealand decided to close the mine in December 1987. Christmas Island was transferred from the UK to Australia on 1 October 1958. Abbott's booby is an endangered species on the island.

### Cocos (Keeling) Islands

The Territory of Cocos (Keeling) Islands is a group of coral atolls consisting of 27 islands with a total land area of 14 sq km (5 sq mi) in the Indian Ocean, at 12°5' S and 96°53' E, about 2,770 km (1,720 mi) northwest of Perth. The estimated population of the two inhabited islands was 632 in 2002. A British possession since 1857, the islands were transferred to Australia in 1955 and are administered by the minister for territories. In 1978, the Australian government bought out the remaining interests (except for personal residences) of the Clunies-Ross heirs on the islands. The climate is pleasant, with moderate rainfall. Principal crops are copra, coconut oil, and coconuts. The airport is a link in a fortnightly service between Australia and South Africa.

### Coral Sea Islands

The Coral Sea Islands were declared a territory of Australia in legislation enacted during 1969 and amended slightly in 1973. Spread over a wide ocean area between 10° and 23°30' S and 154° and 158°E, the tiny islands are administered by the minister for the Capital Territory and have no permanent inhabitants—although there is a manned meteorology station on Willis Island.

### Territory of Heard and McDonald Islands

Heard Island, at 53°6' S and 72°31' E, about 480 km (300 mi) southeast of the Kerguelen Islands and about 4,000 km (2,500 mi) southwest of Perth, is about 910 sq km (350 sq mi) in size. Bleak and mountainous, it is dominated by a dormant volcano, Big Ben, about 2,740 m (8,990 ft) high. There was a station at Atlas Cove from 1947 to 1955, but the island is now uninhabited and is visited occasionally by scientists. Just north is Shag Island, and 42 km (26 mi) to the west are the small, rocky McDonald Islands. The largest island of the group was visited for the first time, it is believed, on 27 January 1971, by members of the Australian National Antarctic Expedition. The territory was transferred from the UK to Australia at the end of 1947.

### Macquarie Island

Macquarie Island, at 54°30' S and 158°40' E, is about 1,600 km (1,000 mi) southeast of Hobart. The rocky, glacial island, 34 km (21 mi) long and about 3 to 5 km (2 to 3 mi) wide, is uninhabited except for a base maintained at the northern end since February 1948. Macquarie Island has been a dependency of Tasmania since the early 19th century. At the most southerly point, the island has what is believed to be the biggest penguin rookery in the world.

Two small island groupings are off Macquarie Island: Bishop and Clerk, and Judge and Clerk.

### Norfolk Island

Norfolk Island, with an area of 36 sq km (14 sq mi), is situated at 29°3' S and 167°57' E, 1,676 km (1,041 mi) east-northeast of Sydney. Discovered in 1774 by Capt. James Cook, it was the site of a British penal colony during 1788–1814 and 1825–55. In 1856, it was settled by descendants of the *Bounty* mutineers. As of 2002, the estimated permanent population was 1,866. Transport is almost exclusively by motor vehicle. The soil is fertile and the climate conducive to the growing of fruits and bean seed, as well as the famed Norfolk Island pine. Tourism is also important. As of 2003, endangered species on Norfolk Island included the gray-headed blackbird, Norfolk Island parakeet, the white-breasted silver-eye, the green parrot, the Morepork (Boobook owl), and the Bird of Providence (Providence Petrel). In 1996, Phillip Island was added to the Norfolk Island National Park.

# AZERBAIJAN

Azerbaijan Republic  
*Azərbaycan Respublikası*

**CAPITAL:** Baku

**FLAG:** Three equal horizontal bands of blue (top), red, and green; a crescent and eight-pointed star in white are centered in the red band.

**ANTHEM:** *Azerbaijan National Anthem*, composed by Uzeyir Hajibeyov.

**MONETARY UNIT:** The manat, consisting of 100 gopik, was introduced in 1992 and remains tied to the Russian ruble with widely fluctuating exchange rates. As of May 2003, 1 manat = \$0.000204 (or \$1 = 4,909 manat).

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** New Year's Day, 1 January; International Women's Day, 8 March; Novruz Bayrom (Holiday of Spring), 22 March; Day of the Republic, 28 May; Day of Armed Forces, 9 October; Day of State Sovereignty, 18 October; Day of National Revival, 17 November; Universal Azeri Solidarity Day, 31 December.

**TIME:** 4 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Azerbaijan is located in southeastern Europe/southwestern Asia between Armenia and the Caspian Sea. Comparatively, Azerbaijan is slightly smaller than the state of Maine with a total area of 86,600 sq km (33,400 sq mi). This area includes the Nakhichevan Autonomous Republic and the Nagorno-Karabakh Autonomous Oblast. Azerbaijan shares boundaries with Russia on the N, the Caspian Sea on the E, Iran on the S, Armenia on the W, and Georgia on the NW. Azerbaijan's boundary length totals 2,013 km (1,251 mi). Azerbaijan's capital city, Baku, is located on the Apsheron Peninsula that juts into the Caspian Sea.

## <sup>2</sup>TOPOGRAPHY

The topography of Azerbaijan features the large, flat Kura-Aras Lowland (much of it below sea level) surrounded on three sides by mountains. The Great Caucasus Mountains are to the north, the Lesser Caucasus Mountains are to the southwest, and the Talish Mountains are in the south along the border with Iran. The Karabakh Upland lies in the west. About 19% of Azerbaijan's land is arable with approximately 16% under irrigation.

The Nakhichevan exclave lies to the west, separated from the rest of Azerbaijan by Armenia. Nakhichevan also shares borders with Turkey and Iran.

## <sup>3</sup>CLIMATE

The country's climate is subtropical in the eastern and central parts. In the mountainous regions the climate is alpine-like. The southeastern section of the country has a humid subtropical climate. The average temperature in the capital, Baku, in July is 25°C (77°F). In January the average temperature is 4°C (39°F). Rainfall varies according to climate zones. The average rainfall for most of the country is only about 15 to 25 cm (6 to 10 in). However, at the highest elevations of the Caucasus and in the Lankaran lowlands, annual rainfall can exceed 100 cm (39 in).

## <sup>4</sup>FLORA AND FAUNA

The country's flora and fauna is rich and varied. There are 16 nature reserves and more than 28 forest reserves and hunting farms.

## <sup>5</sup>ENVIRONMENT

Azerbaijan's current environmental problems result in part from the effects of the economic priorities and practices of the former Soviet Union. General mismanagement of the country's resources has resulted in a serious threat to several areas of the environment. UN agencies report severe air and water pollution in Azerbaijan, which ranks among the 50 nations with the world's highest level of carbon dioxide emissions. In the mid-1990s, carbon dioxide emissions totaled 63.9 million metric tons per year, or 8.76 metric tons per capita. The combination of industrial, agricultural, and oil-drilling pollution has created an environmental crisis in the Caspian Sea. These sources of pollution have contaminated 100% of the coastal waters in some areas and 45.3% of Azerbaijan's rivers. In 2001, only 78% of the total population had access to safe drinking water. The pollution of the land through the indiscriminate use of agricultural chemicals such as the pesticide DDT is also a serious problem. Azerbaijan's war with Armenia has hampered the government's ability to improve the situation. Due to the severity of pollution on all levels, the country's wildlife and vegetation are also seriously affected. From the mid-1980s to mid-1990s, the amount of forest and woodland declined by 12.5%. As of 2001, 11 species of mammals, 8 species of birds, 5 species of fish, and 13 species of reptile were endangered. Endangered species include the Barbel sturgeon, beluga, the Azov-Black Sea sturgeon, the Apollo butterfly, and the Armenian birch mouse.

## <sup>6</sup>POPULATION

The population of Azerbaijan in 2003 was estimated by the United Nations at 8,370,000, which placed it as number 89 in population among the 193 nations of the world. In that year approximately 5% of the population was over 65 years of age,

with another 32% of the population under 15 years of age. There were 95 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 0.89%, with the projected population for the year 2015 at 9,450,000. The population density in 2002 was 94 per sq km (244 per sq mi).

It was estimated by the Population Reference Bureau that 57% of the population lived in urban areas in 2001. The capital city, Baku, had a population of 1,918,000 in that year. Other urban centers include Gyanja (formerly Kirovabad) with a population of about 294,000 people, and Sumgait with about 273,000. According to the United Nations, the urban population growth rate for 2000–2005 was 1.5%. There has been an additional influx of foreign refugees to the urban centers in recent years.

## 7 MIGRATION

As a result of the war with Armenia, which started in 1988, more than 1,000,000 people have been forced to leave the region. According to government estimates of Azerbaijan, there are 616,546 (8% of the total population) internally displaced persons as of 1999. Most of these persons were displaced between 1993 and 1994. Since May 1994, when the cease fire was enacted, only 60,000 persons have been able to return to their homes along the front line. Also as of 1999, Azerbaijan hosts 233,682 refugees. Most are Azeri refugees from Armenia. The Law on Citizenship allows for the automatic acquisition of Azerbaijani citizenship by refugees from Armenia. Also, there are some 48,000 Meshketians recently arrived from Central Asia. The Meshketians were originally deported from Georgia under the Stalin era.

Between 1989 and 1995, there was an emigration of Slavic peoples from Azerbaijan. These included 169,000 Russians, 15,000 Ukrainians, and 3,000 Belarusians as they emigrated back to their homelands. As of 2001 there were 148,000 migrants living in Azerbaijan, with less than 1% of these being refugees. However, as of that year the net migration rate was -0.8% per thousand with a total loss of 7,000 people. The government views this migration level as satisfactory.

## 8 ETHNIC GROUPS

In 1998 estimates, 90% of the population was Azeri; about 3.2% were Dagestani peoples; 2.5% were Russian; another 2% were Armenian; and 2.3% were of other ethnic origins. Almost all Armenians live in the separatist Nagorno-Karabakh region.

## 9 LANGUAGES

Azerbaijani (or Azeri) is a language related to Turkish and is also spoken in northwestern Iran. It is traditionally written in Arabic script. In 1995, an estimated 89% of the population spoke Azeri; 3% spoke Russian; 2% spoke Armenian; and 6% other. In 1939, the Soviets introduced a Cyrillic alphabet, with eight special characters.

## 10 RELIGIONS

For most of the 20th century, from 1920 to 1991, the Azerbaijan Soviet Socialist Republic observed the restrictions in religious belief and practice common throughout the former Soviet Union. According to statistics available after the declaration of independence of 30 August 1991, the population was 87% Muslim (70% of whom were Shi'as, and 17% were Sunnis). Because of the Persian influence on Azerbaijan, most Azerbaijanis are Shiites, even though all the other Turkic groups of the former Soviet Union are Sunni Muslims. In 1995 estimates, 93.4% of the population were Muslim; 2.5% were Russian Orthodox; 2.3% were Armenian Orthodox; other religions accounted for only 1.8%.

Islam (both Shi'a and Sunni), Russian Orthodox, and Judaism are considered to be traditional religions of the country. There are small communities of Evangelical Lutherans, Roman Catholics,

Baptists, Molokans (an older branch of Russian Orthodox), Seventh-Day Adventists, Baha'is, Wahhabist Muslims, Jehovah's Witnesses, and Hare Krishnas.

## 11 TRANSPORTATION

Railroads in Azerbaijan (not including industrial lines) extend some 2,125 km (1,320 mi), with Baku as the hub. In 2002, the highway system totaled 36,700 km (22,805 mi), of which 31,800 km (19,760 mi) were paved. Azerbaijan's major port is at Baku. In 2002 the merchant marine had 54 ships (1,000 GRT or over), totaling 246,051 GRT. Ships from the Caspian fleet have called at some 125 ports in over 30 countries. In 2001 airports numbered 52, of which 9 had paved runways. There are flights from Baku's Bina Airport to more than 70 cities of the former Soviet Union. In 2001, 543,800 passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

The territory of present-day Azerbaijan has been continuously inhabited since the Paleolithic era. The first evidence of tribal alliances date to the first millennium BC, when such peoples as the Mannaian, the Medes, the Cadusii, the Albanoi, and the Caspian appeared. In the 7th century BC, the state of Media appeared in what now is southern Azerbaijan, growing to cover large portions of the Near East. The Medians were displaced by the Persian dynasty of Achaemenids, who in turn were defeated by Alexander the Great. In the 4th century BC, another state arose which Greek sources called Atropatena, or "Land of the Fire Keepers"; it is this name, reflecting the predominance of Zoroastrianism, which may have given the present state its name. Around the beginning of the common era Atropatena was succeeded by a state called Albania, which the Romans attempted to conquer.

In the 3rd and 4th centuries AD, Azerbaijan existed with fluid boundaries between the Sassanid state in Persia and the Romans, whose battles inflicted great damage, leaving Azerbaijan open to raids by Turkic nomadic tribes from the north, including Khazars and Huns. Outside influence reappeared in the 7th and 8th centuries, when Arabs conquered much of Transcaucasia. As their influence receded, a number of small local states were established, the best known of which was the Shirvanshahs.

In the 11th century Azerbaijan was invaded by Oguz Turks, of the Seljuk dynasty. By the 13th century the gradual displacement of pre-Turkic local languages was complete, although many traces of non-Turkic predecessors remain in the Azerbaijani language. Persian, however, remained the language of art, science, and education.

In the 1230s Azerbaijan was conquered by Genghiz Khan, whose power remained in the Il-Khanid state, which at the end of the 14th century was displaced by the armies of Tamerlane. In the 16th century, the Safawid state emerged, coming to control most of the land between the Syr Darya and the Euphrates, and reestablishing agriculture and commerce destroyed under the Mongols. In the 17th century, the Safawids became Persianized, which made present-day Azerbaijan decline in importance.

In the 18th century Azerbaijan became the intersection of the Turkish, Persian, and Russian empires, as well as the focus of British and French attempts to block Russian expansion. The northern part of the territory was incorporated into Russia in the first third of the 19th century, but the area did not become important until the 1880s, when the area's abundant oil gained commercial importance. The southern portion of what was originally Azerbaijan has remained in Iran, except for the period 1941–46, when it was occupied by Soviet troops.

When the 1917 Russian revolution came, Ottoman Turkish troops moved into Azerbaijan, and later British forces controlled the capital, Baku. The Azerbaijani Musavat, or Equality Party, established a government, declared Azerbaijan's independence,

LOCATION: 40°30' N; 47°0' E BOUNDARY LENGTHS: Total boundary lengths, 2,013 kilometers (1,251 miles); Armenia (west), 566 kilometers (352 miles); Armenia (south), 221 kilometers (137 miles); Georgia, 322 kilometers (200 miles); Iran (south), 432 kilometers (268 miles); Iran (southeast), 179 kilometers (111 miles); Russia, 284 kilometers (177 miles); Turkey, 9 kilometers (6 miles).

and received diplomatic recognition from several states. Azerbaijan was invaded by the Russian Bolsheviks' Red Army in April 1920, and Azerbaijan was declared a Soviet state. In 1922 it was made part of the Transcaucasian Federated Socialist Republic, along with Georgia and Armenia. That was dissolved in 1936, when the three states were each made into separate Soviet Socialist Republics.

In 1988, calls by ethnic Armenians living in Azerbaijan's Nagorno Karabakh (NK) region to be incorporated into the Armenian republic led to open conflict which lasted until 1994. This predominantly Armenian area had been unsuccessfully claimed by the Armenians in the 1920s, at the time of the creation of Soviet Azerbaijan. Inability to solve the NK conflict was one of the problems which ultimately brought down Mikhail Gorbachev and broke apart the USSR. Ethnic and civil violence in January 1990 prompted the occupation of Baku by Soviet armed forces and Moscow's replacement of Abdulrahman Vezirov with Ayaz Mutalibov as republic head. During this period of martial law, the legislature elected Mutalibov as president in May 1990. Independence was declared on 30 August 1991, and Mutalibov

was reaffirmed as president in a popular, uncontested election in September 1991.

In December 1991, NK's Armenians held a referendum (boycotted by local Azerbaijanis) that approved NK's independence and elected a Supreme Soviet, which on 6 January 1992, declared NK's independence and futilely appealed for world recognition. Following a late February 1992 massacre of Azerbaijani civilians in the town of Khojaly in NK, Mutalibov was accused of failing to protect Azeri citizens and forced by the nationalist oppositionist Azerbaijani Popular Front (APF) and others to resign as president. His replacement, legislative head Yakub Mamedov, was also forced to resign in May 1992, in the face of further Azerbaijani military defeats in NK. Mutalibov was then reinstated by loyalists in the Supreme Soviet, but he had to flee two days later, when the APF seized power. Former Soviet dissident and APF leader Abulfaz Elchibey, was elected president in a popular contest in June 1992.

The nationalist government took several moves to cut its ties to Russia, including demanding the withdrawal of Russian troops, refusing to participate as a member of the Commonwealth of Independent States, negotiating with Western firms to develop its oil resources, and improving relations with Turkey. However, military losses in NK increased. In 1993, Heydar Aliyev, who had been the Communist Party leader of the republic from 1971–85 but then was ousted and disgraced by Soviet leader Mikhail Gorbachev, began to press for Elchibey's dismissal.

An abortive attempt by the Elchibey government in June 1993 to disarm paramilitary forces in the town of Ganja precipitated the fall of the government and provided the opportunity for Aliyev to regain power. These forces were led by Suret Huseynov, formerly in charge of troops in NK, who had been fired by Elchibey. Huseynov's forces, supplied with Russian equipment, defeated an Azerbaijani Army attack and began to march on Baku. His government in chaos, Elchibey invited Aliyev to come to Baku, and on 15 June, he endorsed Aliyev's election by the legislature as its new speaker. Elchibey fled to the Nakhchivani Autonomous Republic (NAR) on 17 June. On 24 June 1993, a bare quorum of legislators met and formally stripped Elchibey of presidential powers, transferring them to Aliyev. Huseynov demanded and was given the post of prime minister.

On 3 October 1993, Aliyev was elected president with 98.8% of the vote. The referendum and election were viewed as not "free and fair" by many international observers because of suppression of APF and other opposition participation. In late September 1994, police and others in Baku launched a purported coup attempt. Aliyev darkly hinted at Russian involvement. After defeating the coup attempt, Aliyev also accused Prime Minister Huseynov of major involvement, and Huseynov fled the country. Other coup attempts were reported in 1995 and 1999. All of the alleged coup attempts triggered mass arrests of Aliyev's opponents.

On 11 October 1998, incumbent President Aliyev defeated five other candidates and was elected to a second five-year term, receiving over 76% of 4.3 million votes cast. The major "constructive opposition" candidate running was Etibar Mamedov of the National Independence Party (NIP), who received 11.6% of the vote. Most international observers judged the vote not "free and fair," citing myriad irregularities, though also noting that the election marked some improvement in political pluralism.

The conflict with Armenian separatists over its Nagorno-Karabakh region continues to plague Azerbaijan. Azerbaijan asserts that NK forces occupy over 20% of Azerbaijan's territory both in and around NK. The conflict has resulted in about 30,000 casualties on both sides and over 840,000 Azerbaijani refugees and displaced persons (and over 300,000 Armenians). The Organization for Security and Cooperation in Europe (OSCE) began the "Minsk Group" peace talks in June 1992. A

Russian-mediated cease-fire was agreed to in May 1994 and was formalized by an armistice signed by the ministers of defense of Armenia and Azerbaijan and the commander of the NK army on 27 July 1994 (and reaffirmed a month later). Moscow talks were held by the sides, with token representation by the OSCE, along with Minsk Group talks. With strong US backing, the OSCE at its Budapest meeting agreed in December 1994 to send OSCE peacekeepers to the region under UN aegis if a political settlement could be reached. Russia and the OSCE assented to merge their mediation efforts. France was nominated as a cochair in 1996. This elicited criticism from Azerbaijan that the French had appeared pro-Armenian, leading to the seating of US, French, and Russian cochairs. (Many Azerbaijanis also have voiced reservations about Russia's objectivity as a mediator, citing its defense ties to Armenia.) Direct Armenian-Azerbaijani contacts by the presidents and advisors have also occurred.

Prospects for a negotiated settlement remain elusive because the sides remain far apart on most substantive issues such as the placement and composition of a peacekeeping force and NK's ultimate political status. Personal meetings by the two presidents raised hopes that a statement of intention could be issued at the November 1999 OSCE Summit, but events such as resignations of some Azerbaijani officials apparently opposed to NK proposals, Aliyev's infirmity, and October 1999 assassinations in Armenia (apparently unrelated to the NK talks) appeared to set back progress.

Peace talks between Armenia and Azerbaijan were held in Paris and Florida in 2001, but by December 2002, Lieutenant General Seyran Ohanian, commander-in-chief of the armed forces of NK, warned Azerbaijan that the enclave's army was "better prepared than ever before" and "ready to repulse the enemy" and carry out a successful counteroffensive should conflict begin. President Aliyev in September 2002 told representatives of the Minsk Group that "the people's mood is changing. They are starting to lose hope in a peaceful solution and are coming to the view that we have to recover our land ourselves by whatever means necessary....It has been...nearly ten years since the Minsk Group was created. How much longer can we go on talking about a peace settlement?"

In 2001, the United States lifted a ban on aid imposed during the NK conflict after Azerbaijan provided airspace and intelligence to the United States following the 11 September 2001 terrorist attacks.

In September 2002, construction began on a multibillion-dollar pipeline to carry Caspian oil from Azerbaijan to Turkey via Georgia. The government held a referendum on 24 August 2002 to approve 39 changes to the constitution. Some of the major articles at issue were the abolishment of the proportional system of election of deputies to the national parliament; making the prime minister, not the speaker of the parliament, a caretaker president in case the president is not able to carry out his duties; and giving lower level courts the right to ban political parties. Opposition leaders argued that abolishment of the proportional system would damage the multi-party system in the country and further strengthen the ruling elite. In addition to this, the opposition claimed that President Aliyev intended to appoint his son Ilham prime minister and then retire, thus paving the way for his son to become the next president. President Aliyev also approved adding a provision to the Law on State Secrets, which would make editors and journalists of local mass media accountable for disseminating state secrets. The government claimed that there was nearly 100% support for the constitutional changes with 88% voter turnout, while opposition groups stated turnout was closer to 15%, which would render the vote invalid. Demonstrators called for the resignation of President Aliyev and for holding free and fair elections. Supporters of more than 30 opposition parties, including the major parties Musavat, the Popular Front, the Azerbaijan

Democratic Party and the Azerbaijan National Independence Party, held marches on 14 September 2002 urging the authorities to cancel the results of the referendum. On 27 October and again on 24 November of that year, the opposition parties marched again under the banner of the United Opposition Movement, claiming that over 50,000 people participated in the marches.

### 13 GOVERNMENT

Azerbaijan is a republic with a presidential form of government. Heydar Aliyev assumed presidential powers after the overthrow of his popularly elected predecessor and was elected president in 1993. Aliyev and his supporters from his home region of Nakichevan and elsewhere dominate the government and the legislature. Presidential elections are due to take place in October 2003.

The Azerbaijani constitution was approved by 91.9% of voters in a referendum held in November 1995. It establishes a strong presidency, sets up a new 125-member legislature (the Milli Mejlis), declares Azerbaijani the state language, proclaims freedom of religion and a secular state, stipulates ownership over part of the Caspian Sea, and gives Nakhchiveni Autonomous Republic (NAR) quasi-federal rights. The president appoints and removes cabinet ministers (the Milli Mejlis consents to his choice of prime minister), submits budgetary and other legislation that cannot be amended but only approved or rejected within 56 days, and appoints local officials. It is extremely difficult for the Milli Mejlis to impeach the president. According to the US State Department, corruption is endemic in the government. It also reports that the judicial branch effectively functions as part of the executive branch and is corrupt and inefficient. In practice, the Milli Mejlis too exercises little legislative initiative, with most of its legislation and agenda dictated by the executive branch. The transition to democracy has been impeded by government efforts to hinder the opposition. In NK, political turmoil and war damage have slowed development, and ethnic Azerbaijanis are prevented from returning to the region and surrounding areas by the lack of a peace settlement.

In June 2002, the Constitutional Court ruled that changes to the constitution proposed by President Aliyev did not conflict with the principles of Azerbaijan's basic law. One major change in the constitution concerns what happens if the president retires or becomes incapacitated. Prior to the 24 August 2002 referendum, under the constitution's Article 105, the speaker of parliament assumed the president's duties. Under the new rule, the prime minister, who is appointed by the president and is responsible to him, not the legislature, assumes presidential powers. An amendment to Article 101 changed the threshold for a candidate to be elected president in the first round of voting, from two-thirds to a simple majority. Members of the Milli Mejlis were previously elected on the basis of majority and proportional election systems under Article 83 of the constitution. Under the new provisions, proportional party lists were eliminated and deputies are elected only through winning majorities in districts. Changes to Article 3 forbid holding a referendum on issues that fall under the scope of executive institutions, such as taxes, the state budget, amnesties, elections and appointments to executive positions.

In the November 1995 election, 25 of the seats were allocated through a proportional party list vote and 100 through single-member district balloting. Eight parties were allowed to take part in the party list voting in the legislative elections, but only the Azerbaijani Popular Front (APF) was clearly an anti-Aliyev party. These were the New Azerbaijan (NAP), APF, Azerbaijan Democratic Independence (ADIP), National Independence (NIP), Azerbaijan Democratic Proprietors (ADPP), Motherland, Azerbaijan National Statehood (NSPA), and Alliance for Azerbaijan parties. Aliyev's NAP won most seats in the legislative races. The elections were marred by the harassment and exclusion

of most opposition parties and candidates from participation and by rampant irregularities such as the open stuffing of ballot boxes, according to international observers. Some observers stressed that the elections marked some progress in holding a multi-party vote. Aliyev's NAP candidates ran unopposed in many electoral districts because of the exclusion of opposition candidates. Campaign advertising by most parties was severely restricted on state-owned television, while Aliyev received extensive positive coverage. Legislative elections held in November 2000 saw the NAP and its allies win 108 out of 125 seats in the Milli Mejlis in elections that were criticized by international observers. The APF took the next highest number of seats with 6.

## 14 POLITICAL PARTIES

Nearly three dozen parties are registered, but some opposition parties have been arbitrarily refused registration. Some parties that are deemed explicitly ethnic or religiously based also have been refused registration. Under election legislation passed since Aliyev's accession, a party must have at least 1,000 members to be legally registered. Party membership is forbidden to government officials in agencies of the judiciary, law enforcement, security, border defense, customs, taxation, finance, and the state-run media. Six pro-Aliyev parties participated in the 1995 legislative party list vote, including New Azerbaijan (NAP; formed in November 1992), Azerbaijan Democratic Independence (ADIP; broke off from NIP in late 1993), Motherland (formed in 1990), and the Democratic Entrepreneurs' Party (formed in 1994). Only the NAP gained enough votes to win seats in the party list vote (though these other parties won seats in constituency balloting). Two centrist or opposition parties participated and won seats in the party-list voting: the Azerbaijan Popular Front (APF—formed in 1988) and National Independence Party (NIP; broke off from APF in early 1992). Opposition parties excluded from the party list ballot included Musavat (formed in 1912). All parties are small; NAP is the largest with approximately 100,000 members claimed. NAP, formed by Aliyev, encompasses many of his former Azerbaijani Communist Party (ACP) supporters. The APF was at the forefront of the nationalist and anticommunist movement and its chair, Abulfaz Elchibey, was elected president in 1992. With Aliyev's return to power, APF members and officials have been arrested and harassed. NIP views itself as a moderate nationalist party in "constructive opposition" to Aliyev. Musavat has supported close ties with Turkey and has cooperated on some issues with the APF. The pro-Iranian Islamic Party was stripped of its registration in 1995. Preparing for the 1998 presidential race, in March 1998 46 pro-government political parties and groups formed the Center for Democratic Elections (CDE). Five prominent opposition political leaders and others formed the Movement for Democratic Elections and Electoral Reform (MDEER) in May 1998: Elchibey (the AFP), Isa Gambar (Musavat), Lala Shovkat Hijyeva (Azerbaijan Liberal Party or ALP), former speaker Rasul Guliyev, and Ilyas Ismayilov (Democratic Party of Azerbaijan). The Democratic Party finally achieved registration in early 2000, but co-leader Guliyev remained in forced exile.

Other political parties include the Civil Solidarity Party (CSP), Civic Union Party, Compatriot Party, Justice Party, Liberal Party of Azerbaijan, and the Social Democratic Party of Azerbaijan (SDP).

## 15 LOCAL GOVERNMENT

Soviet-era Azerbaijan was subdivided administratively into one autonomous republic, Nakhichevan, an area separated from the rest of Azerbaijan by a thin strip of Armenian territory, which had its own parliament of 110 members; and an autonomous region, Nagorno-Karabakh (NK). Azerbaijan dissolved NK's

status as an autonomous region in November 1991 in an attempt to reassert central control. NK has claimed an independent existence since December 1991, and a swath of territory around it has been occupied by NK Armenian forces. Azerbaijan has 59 districts (*rayons*) and 11 cities, whose executive heads or mayors are appointed and dismissed by the president. Although the constitution called for the local election of legislative assemblies (councils) by the end of 1997, these elections did not take place until December 1999 (with runoffs in some municipalities in March 2000). In these races, nearly 2,700 municipal and district assemblies were formed. Some 36,000 candidates contested for 22,087 seats in these assemblies. Of these candidates, 18,000 were sponsored by 26 political parties, while others run as independents. The election was not viewed by many international monitors as "free and fair" because of government interference in the electoral process, including the stacking of territorial and precinct electoral commissions with members of the ruling party and other local government supporters, the harassment or disqualification of opposition candidates, and ballot box stuffing. Many of the local assemblies found it difficult to begin work because their roles were somewhat unclear and local executive heads, appointed by Aliyev, proved somewhat reluctant to share power.

## 16 JUDICIAL SYSTEM

The old Soviet court system has been essentially retained, consisting of district courts and municipal courts of first instance and a Supreme Court which usually performs the function of appellate review. However, the Supreme Court also performs the function of court of first instance for some serious cases. District courts consist of one judge and two lay assessors and hear criminal, civil, and juvenile cases. Criminal defendants have the right to an attorney and to appointed counsel, the right to be present at trial, to confront witnesses, and to a public trial.

The 1995 Constitution provides for public trials in most cases, the presumption of innocence in criminal cases, and a defendant's right to legal counsel. Both defendants and prosecutors have the right of appeal. In practice, however, the courts are politically oriented, seeming to overlook the government's human rights violations. In July 1993, Aliyev ousted the Supreme Court chief justice because of alleged political loyalties to the opposition. The president directly appoints lower level judges. The president also appoints the Constitutional Court and Supreme Court judges with confirmation by the legislature.

Prosecutors (procurators) are appointed by the president with confirmation by the legislature. The minister of justice organizes prosecutors into offices at the district, municipal, and republic levels. The constitution provides equal status for prosecutors and defense attorneys before the courts, but in practice the arrest and investigatory powers of the prosecutors have dominant influence before the courts. Judges will often remand a case for further prosecutory investigation rather than render an innocent verdict. Investigations often rely on obtaining confessions rather than on gathering evidence.

According to the US State Department's *Report on Human Rights Practices for 2001* and human rights organizations, the Azerbaijan government's human rights record is poor, although some public policy debate is allowed and human rights organizations operate. The government restricts freedom of assembly, religion, and association. Numerous cases of arbitrary arrest, beatings (some resulting in deaths), unwarranted searches and seizures, and other human rights abuses were reported. Political oppositionists are harassed and arrested, and there are dozens of political prisoners in Azerbaijan, according to the US State Department. There is a moratorium on carrying out death sentences, but prisoners sentenced to death are subject to harsh treatment. The conflict between NK Armenians and Azerbaijanians has contributed to widespread human rights violations by both

sides. Some opposition newspapers are allowed to exist. In the run-up to the October 1998 presidential race, the Aliyev government ordered an end to censorship as a gesture to encourage opposition participation, but cracked down again after the election. Ethnic Lezgins and Talysh have complained of human rights abuses such as restricted educational opportunities in their native languages.

## 17 ARMED FORCES

Azerbaijan had 72,100 active personnel in its armed forces in 2002. Reserves included 300,000 members who had been in the military within the past 15 years. The navy numbered 2,200 and had six patrol craft. The army consisted of 62,000 personnel with equipment including 220 main battle tanks. The Air Force and Air Defense had 7,900 active personnel with 15 attack helicopters and 48 combat aircraft.

Azerbaijan also had an estimated 15,000 people serving in two separate paramilitary units. The defense budget for 1999 was \$121 million, or 2.6% of GDP.

## 18 INTERNATIONAL COOPERATION

Azerbaijan was admitted to the UN on 2 March 1992. The country is also a member of the Black Sea Cooperation Group (BSEC), Council of Europe, USCE, EBRD, Economic Cooperation Organization (Turkey, Iran, Pakistan, Russia, the Central Asian states, and Afghanistan), IMF, Organization of the Islamic States, and UNCTAD. The country is also a member of the CIS and has observer status in the WTO. Foreign relations with Azerbaijan are dictated by the country's continued sovereignty over Nagorno-Karabakh, which would like to become part of Armenia. The United States recognized Azerbaijan's sovereignty on 25 December 1991, and the two countries established diplomatic relations in 1992.

## 19 ECONOMY

Azerbaijan is one of the oldest oil-producing regions of the world. Here in ancient times the Zoroastrians, for whom fire was a sacred symbol, built temples around the "eternal fires" of burning gas vents. At the beginning of the 20th century, as international competition increased in the first great era of economic globalization, Azerbaijan was supplying almost half of the world's oil. As a constituent republic of the USSR it was a leading supplier to the rest of the Union until the focus of Soviet oil development efforts shifted to the Ural mountains and western Siberia during the 1970s and 1980s. Remaining oil reserves are estimated in the BP statistical review of world energy for 2002 to be about 7 billion barrels. For oil, its reserve to production ratio (R/P ratio) of 64.3 is topped only by Sa'udi Arabia and Iran. Proven reserves of natural gas are estimated at 440 billion cu m (15.5 trillion cu ft). In addition, the country is endowed with ample deposits of iron, aluminum, zinc, copper, arsenic, molybdenum, marble, and fire clay.

Azerbaijan boasts a diversified industrial sector that accounts for approximately a third of GDP (2000 est.) up from less than a fifth in 1998, and 15% of employment (including construction), a figure that has remained unchanged. Agriculture, which employs about 40% of the labor force and accounts for 20% of GDP (including forestry), also rests on a relatively diversified base, producing cotton, tobacco, grapes, and a variety of foodstuffs. The transport sector is well developed, integrating the country's various regions and facilitating both domestic and external trade.

Despite its economic potential, Azerbaijan has been slow in making the transition from a command to a market economy. Large state companies continue to dominate the economy and below-market price controls still cover many key commodities. The war with Armenia has also slowed economic growth by disrupting trade ties and draining government revenues. In 1992, Azerbaijan implemented an economic blockade against both

Armenia and the enclave of Nagorno-Karabakh, which is still in effect despite the cease-fire reached in 1994. In 1992 the United States passed Section 907 of the Freedom Support Act, restricting assistance to Azerbaijan until "demonstrable steps" were taken to lift the embargo and cease offensive actions. In January 2002, however, US president George W. Bush waived Section 907 purportedly due to Azerbaijan's support of the US-proclaimed War on Terror. In August 2002, CCC, a Greek-based construction and project management firm, won the tender for laying pipes for the Baku-Tbilisi-Ceyhan (BTC) oil pipeline officially approved September 2002 and scheduled to go into operation in 2005. Trade has traditionally been with Russia and the former Soviet republics and the economy is still greatly affected by events in those countries.

In 1994, Russia, citing its own conflict in Chechnya, closed all rail and road borders with Azerbaijan. Cut off from its major source of production inputs and main outlet for manufactured projects, Azerbaijan's industrial production fell by more than 20% in 1995. Overall, it is estimated that from 1991 through 1995 the economy declined by about 60%. Recently, Azerbaijan has begun to shift trade to Iran and Turkey and away from Russian and Ukraine. The BTC pipeline is designed to avoid Russia. Foreign investment, the majority in hydrocarbons, began a period of steady growth in the late 1990s, and in 2001 the economy registered its fifth straight year of real GDP growth. For 1999 to 2001, based on data supplied by the government of Azerbaijan, growth rates were 7.2%, 11.1% and 8.5%, respectively, with a forecast of about 9% (US State Department estimate) for 2002. Nevertheless, the country's GDP is not expected to reach its 1991 level until 2007.

Localized fighting with Armenia broke out in the spring of 1997 and in the summer of 1999, and efforts to reach a peace agreement have failed to date. The prospects for long-term economic growth have been significantly enhanced in 2002, however, by the cutting of one Gordian knot: the official sanctioning in September 2002 of the BTC pipeline from Baku to the Turkish Mediterranean, which has been pending since the under the country's first production sharing contract (PSC) was agreed to in 1994 with the Azerbaijan International Operating Company (AOIC). The AOIC is an international consortium of companies headed by British Petroleum (BP) as operator with a plurality share of 34.1% share. Actual construction on the BTC pipeline is to begin in March 2003. Azerbaijan's second PSC, signed and ratified in 1996, for the Shah Deniz gas pipeline involving another consortia headed by BP (with 25.5% and also designated operator) and Norway (Statoil with 25.5%) more typically failed to be sanctioned in October 2002 as planned due to problems sorting out finance. Final sanctioning is in 2003. Azerbaijan's economic development will ultimately depend on the diversification of its production for export, but in the near future the prospect is for the increasing dominance of the hydrocarbon sector as a percent of GDP and as a percent of exports.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2002 Azerbaijan's gross domestic product (GDP) was estimated at \$27 billion. The per capita GDP was estimated at \$3,300. The annual growth rate of GDP was estimated at 6.1%. The average inflation rate in 2002 was 2.6%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 20% of GDP, industry 33%, and services 47%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$57 million or about \$7 per capita and accounted for approximately 1.1% of GDP. Worker remittances in 2001 totaled \$104.1 million. Foreign aid receipts

amounted to about \$28 per capita and accounted for approximately 4% of the gross national income (GNI).

Approximately 51% of household consumption was spent on food, 16% on fuel, 9% on health care, and 2% on education. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. The richest 10% of the population accounted for approximately 27.8% of household consumption and the poorest 10% approximately 2.8%. It was estimated that in 2002 about 49% of the population had incomes below the poverty line.

## 21 LABOR

In 2001, there were an estimated 3.7 million workers in the labor force. Agriculture and forestry accounted for 40% of employment; industry, 7%; and services 53%. As of 2001, the estimated unemployment rate stood at 16%.

The constitution provides for the right to form labor unions, but in practice this right is limited and unions are generally not effective in wage negotiations. Collective bargaining is at a rudimentary level; wages are still set by government ministries for organizations within the budget. Most major industries are state-owned and the government runs the largest industrial and white-collar unions. Police, military, and customs are prohibited from forming unions, and trade unions may not participate in political activity.

Although the minimum wage alone is far below the level needed to support a worker and family, the reliance on outside income sources and the structure of extended families generally ensure a decent living. In addition, most workers earn in excess of the minimum wage. The legal workweek is 40 hours. There is a minimum working age of 16 with exceptions for children as young as 14 to work during vacations.

## 22 AGRICULTURE

Some 20% of Azerbaijan's area was cultivated or considered arable in 1998. There are currently 59 agricultural regions in 10 geographic zones; the principal crops are grapes, cotton, and tobacco. Agriculture accounted for 20% of GDP in 2001.

Wheat production in Azerbaijan suffers from a number of problems common in the former Soviet Union, including inadequate production credit and lack of inputs. Most wheat is still produced on state farms, as privatization is only beginning. Production in 1999 amounted to 810,000 tons from 515,000 ha (1,273,000 acres). Seed cotton production amounted to 101,000 tons in 1999, from a harvested area of 156,000 ha (386,000 acres). Cotton production has been stagnant due to low producer prices, lack of incentives, and a shortage of both inputs and operating capital. Tobacco was grown on about 8,000 ha (19,800 acres) in 1999; production totaled 9,000 tons.

During the Soviet period, some 1,200 state and cooperative farms existed. Since independence, former state-owned farms have become more productive, and private fruit and vegetable farming is increasing. Of the total crop production of 1999, grapes totaled 140,000 tons; cotton (lint), 39,000 tons; fruits, 390,000 tons; vegetables, 816,000 tons; and grains, 932,000 tons.

Grapes were grown across 50,000 ha (124,000 acres) in 1999; wine production amounted to 65,000 tons that year. Azerbaijan has an expanding wine-producing industry whose wines have frequently won awards at international exhibitions.

## 23 ANIMAL HUSBANDRY

Azerbaijan has some 2.2 million ha (5.4 million acres) of permanent pasture. The livestock population in 1999 included 13,000,000 chickens, 5,132,000 sheep, 1,900,000 cattle, 371,000 goats, 26,000 pigs, and 56,000 horses. Meat production in 1999 amounted to 103,000 tons, almost three-fourths of

which was beef and mutton. In 1999, about 991,000 tons of cow's milk, 29,000 tons of eggs, and 10,000 tons of greasy wool were produced.

## 24 FISHING

The Caspian Sea is Azerbaijan's principal fishing resource. Commercial fishing traditionally centered on caviar and sturgeon. The total catch was 18,797 tons in 2000, primarily Azov sea sprat.

## 25 FORESTRY

About 13% of the land area consisted of forests and woodlands in 2000. Soviet-era policies gave priority to high production and rapid growth at the expense of the environment. The State Committee for Ecology and Use of Natural Resources has recently introduced new regulations to protect forest resources. Roundwood production in 2000 totaled 14,000 cu m (494,000 cu ft).

## 26 MINING

Besides significant reserves of natural gas and petroleum, Azerbaijan has iron ore reserves near the disputed Nagorno-Karabakh region, and lead-zinc and copper-molybdenum deposits in the Nakhichevan area. Production of metallic and industrial minerals in 2000 included alunite (no figure was available for 2000, but 100,000 and 50,000 tons were produced in 1996 and 1997, respectively, and none was produced in 1998 and 1999), alumina (200,000 tons, up from 76,100 in 1999, 6,600 in 1998, and 1,000 in 1996), bromine, clays, gypsum (60,000 tons), iodine (300,000 kg), limestone, marble, sand and gravel, decorative building stone, and precious and semiprecious stones.

## 27 ENERGY AND POWER

At the turn of the 20th century, Azerbaijan accounted for half of the world's oil production. Oil wells have been operating in Baku since the 1840s. As of the early 21st century, almost all production came from offshore in the Caspian Sea. Azerbaijan was one of only four former Soviet republics (along with Russian, Kazakhstan, and Turkmenistan) to be self-sufficient in petroleum. However, production declined following the 1991 breakup of the Soviet Union until foreign investment provided the capital for new development, turning this trend around in 1998. Production rose from 194,000 barrels per day in 1998 to 311,200 in 2001 and remained roughly stable in 2002.

Proven oil reserves at the beginning of 1998 totaled between 3.6 and 12.5 billion barrels. The State Oil Company of Azerbaijan (SOCAR) has planned for joint development of the offshore fields (which are now largely untapped) and has entered into several agreements to build oil pipelines. For instance, a project with the Caspian Pipeline Consortium would carry oil from the Caspian Sea to the Russian Black Sea port of Novorossiysk. Another deal with Turkey involved the construction of a 1,760-km (1,090-mi) pipeline, the symbolic first length of which was installed in September 2002, to carry crude oil from Baku to Ceyhan, Turkey. In 1995 Azerbaijan had 17 offshore oil fields in production. Guneshli, about 60 mi (96 km) off the Azeri coast, currently accounts for more than half the annual production. By the end of 2002, 33 companies in 15 foreign countries had signed agreements to develop 21 major oil fields in Azerbaijan. As of 2003 disputes over offshore oil rights in the Caspian Sea continued to hinder development of those reserves.

Natural gas production has become more important in recent years, especially in Baku, where some of the oil wells have been exhausted. Estimated reserves amount to 440 billion cu m (15.5 trillion cu ft). Production of natural gas in 2000 totaled 5.7 billion cu m (201 billion cu ft). Ukraine and Iran are interested in

running a natural gas pipeline through Azerbaijan en route to Eastern Europe.

In 2000, net electricity generation was 17.7 billion kWh, of which 91.4% came from fossil fuels and 8.6% from hydropower. In the same year, consumption of electricity totaled 16.7 million kWh. Total installed capacity at the beginning of 2001 was 5.1 million kW. Eight thermal plants supply more than 80% of capacity, and the rest comes from hydroelectric plants. The main power plants (both thermal) were near Ali-Bayramy (1,100 MW) and Mingechaur (2,100 MW).

Petroleum and natural gas resources are the basis for an extensive system of refineries which produce gasoline, herbicides, fertilizers, kerosene, synthetic rubber, and plastics.

## 28 INDUSTRY

The oil and gas industry has traditionally been pivotal to the economy; in 1891, Azerbaijan produced more than half of the world's total oil production. In 2001 refinery production accounted for over 14.9% of total industrial production, second only to the 58.6% accounted for by the extraction of crude oil and natural gas, according to the Azeri government statistics. Oil refining is concentrated in the Azerineftiyag (Baku) refinery, with a capacity of 230,000 bpd, and the Azerneftyanajag (New Baku) refinery, with a capacity of 212,000 bpd. The total domestic production of oil in 2001 was 311, 200, of which an estimated 175,200 bpd (56%) was exported, which left the two refineries were operating well below capacity, with overall utilization rates as low as 40%. Both refineries are in need of modernization, which the government estimates, will cost \$600 million to \$700 million. The US Trade and Development Agency financed a \$600,000 feasibility study, awarded to ABB Lumas in January 2002, on up-grading the refineries and the specialized oil port of Dubendi. Failure to replace worn and outdated technology as well as falling demand in the rest of the former USSR resulted in a steady decline in the production of oil products since the early 1980s. Total output averaged 185,000 bpd in 1995, as compared to 285,000 bpd in 1987, and has declined further since. Output of refined products in 2001 included heating oil (approximately 50%), diesel fuel (28%), gasoline (10%), motor oil (7%), kerosene (3%), and other products (3%). Petroleum production is situated in 40 deposits on land and 12 offshore deposits in the Caspian Sea. The offshore Gunashli petroleum mining operation supplies half of the country's petroleum. As of June 2002, Azerbaijan had entered into 23 production-sharing agreements (PSAs) involving about 30 companies from about 15 countries involving 13 offshore fields, and 10 onshore fields. Only six—the off-shore Azeri, Chirag and deepwater Gunashli (ACG) field being developed by the AIOC consortium for connection to the Baku-Tbilisi-Ceyan (BTC) pipeline, and five relatively small onshore fields—were actually producing measurable daily output in 2002.

In line with the historic importance of the oil sector for the Azeri economy, the fabrication of equipment related to petroleum production had been one of the country's major industries. As a source of 70% of the former Soviet Union's oilfield equipment, it also held great importance for other oil-producing post-Soviet republics in the early years of the transition from Communism. Azerbaijan's petroleum equipment manufacturing industry comprised the second-largest concentration of such industries in the world (behind that of the US). Like most other of the country's economic sectors, however, the industry was plagued by plant obsolescence. Industrial production and export statistics for 2001 indicate no manufacturing or export of oilfield equipment. On the contrary, the US Commercial Service has issued bulletins pointing to upwards of \$10 billion in procurement opportunities in Azerbaijan for foreign suppliers of oil field equipment in the period 2002–2005. In August 2002, CCC, a Greece-based

construction and project management firm, won the contract for laying the pipeline for the Azeri portion of the BTC pipeline.

Other important industrial sectors in the Azeri economy include electrical power production (12.1% of total industrial production in 2001), chemicals (3.4%), food processing (3.2%), cars and other transport equipment (2.9%), and tobacco goods (1.6%), as well as various kinds of light manufacturing. As with fuel and oilfield equipment production, however, output in almost all of these sectors declined or stagnated in the 1990s due to the conflict with Armenia.

In aggregate terms, the real value of total industrial production in Azerbaijan dropped 21% in 1995, following already steep declines of 31% in 1992, 8% in 1991, and 17% in 1990. In 1998 total industrial production index registered its first year-on-year increase in the decade, moving from 28% of the 1990 to 29%. By 2001 the index stood at 34% of the 1990 level, and it is estimated that pre-transition levels industrial output will not be achieved until 2007. Manufacturing, the main component in the industrial production index, is lagging the most. In 2001 it stood at only 24% of the 1990 level, whereas other components, namely, the extraction industry and utilities (electric, gas, and water), had reached 83% and 69%, respectively, of 1990 levels of output. A structural change is evidenced in the relative weights of production and refining activities in industrial production between 1997 and 2001. Refining declined from 34% to 14.9% of the total, while extraction increased from 31.2% to 58.6% in 2001. In 2001 total industrial production rose 5.1% over 2000.

## 29 SCIENCE AND TECHNOLOGY

The Azerbaijan Academy of Sciences in Baku has departments of physical engineering and mathematical sciences, chemistry, earth sciences, and biology; as of 1997, 19 science and technology-related research institutes were attached to it. The country has numerous other institutes conducting research in agriculture, medicine, and technology.

The Azerbaijan Technical University in Baku, founded in 1920, has faculties in automation and computing technology, electrical engineering, machine-building, automechanics, metallurgy, radio-engineering, robotics, and transport. Baku State University, founded in 1919, has faculties of mathematics, physics, chemistry, biology, geology, and geography. Azerbaijan also has five higher institutes offering courses in agriculture, medicine, petroleum engineering, engineering, and technology. In 1987–97, science and engineering students accounted for 37% of college and university enrollments. The Azerbaijan Scientific and Technical Library is located in Baku.

## 30 DOMESTIC TRADE

Despite the government's claims that it is moving towards a free market economy, government ownership is still common among large industries. Since independence, there has been an informal privatization of the trading sector as many small shops have sprung up throughout Azerbaijan. Private traders now handle most retail sales. Private business people see trade as relatively low risk in an environment where private ownership rights do not exist. Business and retail hours can vary according to the owner's preference; however, most businesses are open from 9 AM to 6 PM, Monday through Friday. Many businesses and offices also have Saturday hours. Private transactions are primarily in cash. Credit cards are not generally accepted, except in major hotels and restaurants. An 18% value added tax applies to all goods and services.

## 31 FOREIGN TRADE

Like other post-Soviet economies, Azerbaijan is highly trade-dependent; however, it is endowed with a more diversified export structure than many other former USSR countries, especially in neighboring Central Asia. While the centrally planned state

ordering system is steadily losing its place as the basis for trade in the former Soviet Union, the Azeri Ministry of Foreign Economic Relations still controls the export of all products considered to be of strategic importance to the national economy.

Key to Azerbaijan's trade future will be the development and operations of a major oil pipeline out of the Caspian Sea. Currently, the construction of a major export pipeline to the Mediterranean is under way and scheduled for completion in 2005.

Exports include oil and gas (84%), chemicals, oilfield equipment, textiles, and cotton. Imports include machinery and parts (32%), consumer goods, food, and textiles.

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
Italy	763	28	735
France	205	19	186
Israel	135	6	129
Turkey	105	129	-24
Russia	98	249	-151
Georgia	75	10	65
Switzerland	46	56	-10
Ukraine	24	36	-12
United Kingdom	19	59	-40
Germany	8	68	-60
United States	8	118	-110
Iran	8	57	-49

### 32 BALANCE OF PAYMENTS

The war with Armenia in and around Nagorno-Karabakh had facilitated Azerbaijan's trade deterioration, which was further exacerbated by the collapse of the local currency. Reviving ruble-related trade links with Russia was a key reason for Azerbaijan's entry into the Commonwealth of Independent States in September 1992. In 1995 inflation fell and the currency was stable until it was devalued in 1999, causing inflation of 10% to 15%. The current account deficit was over one-third of GDP in 1998.

The US Central Intelligence Agency (CIA) reports that in 2002 the purchasing power parity of Azerbaijan's exports was \$2 billion while imports totaled \$1.8 billion resulting in a trade surplus of \$200 million.

The International Monetary Fund (IMF) reports that in 2001 Azerbaijan had exports of goods totaling \$2.08 billion and imports totaling \$1.47 billion. The services credit totaled \$290 million and debit \$665 million. The following table summarizes Azerbaijan's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	<b>-52</b>

### 33 BANKING AND SECURITIES

The National Bank of Azerbaijan is the central bank of Azerbaijan. The central bank is charged with regulating the money supply, circulating currency, and regulating the

commercial banks of the country. However, the banking system in Azerbaijan is minimal and ineffective. An estimated \$1 billion is held in cash or outside the banking sector, a considerable amount in comparison with the scope of the country's entire economy.

There are approximately 70 foreign and local banks in Azerbaijan. Of the four state-owned banks, only the International Bank of Azerbaijan (IBA) was solvent in 1999. The IBA was in the process of being privatized in that year. Major commercial banks include the Promtekhbank, Azakbank, Azerdemiryolbank, Bacobank, Gunay International Bank, Halgbank, ILKBANK, and the Universal Bank. Most businesses use the IBA, or the British Bank of the Middle East, Baku.

The central bank increased the minimum bank capital to \$1.5 million in 1999, and expected to increase the figure to \$3 million in 2001, effectively consolidating the sector. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$363.6 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$738.5 million. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 10%.

The Baku Stock Exchange, known as the BSE, opened in 2001 trading short-term treasury bonds and the common stock of recently privatized state-owned enterprises. Trading volume in the first six months was just under \$1 million. A regulatory framework for the new exchange is under development and is expected to conform to international transparency standards.

### 34 INSURANCE

As of 1995, at least 14 insurance companies were doing business in Azerbaijan.

### 35 PUBLIC FINANCE

Since 1996, the Azerbaijani government has emphasized privatization as a means towards consolidation of the public debt and revitalization of the economy. Over 70% of all parastatals are set to be privatized; more than 20,600 companies were privatized during 1997 and 1998. Foreign investment was encouraged, especially in the oil sector, however the diversification needed for long-term growth is lacking. The budget deficit in 2001 was a mere 0.5% of GDP.

The US Central Intelligence Agency (CIA) estimates that in 2001 Azerbaijan's central government took in revenues of approximately \$786 million and had expenditures of \$807 million. Overall, the government registered a deficit of approximately \$21 million. External debt totaled \$1.4 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

<b>REVENUE AND GRANTS</b>	<b>100.0%</b>	<b>786</b>
Tax revenue	92.8%	729
Non-tax revenue	5.3%	42
Grants	1.9%	15
<b>EXPENDITURES</b>	<b>100.0%</b>	<b>821</b>
General public services	6.0%	48
Defense	11.1%	89
Public order and safety	11.3%	91
Education	3.2%	26
Health	0.8%	7
Social security	33.1%	267
Recreation, cultural, and religious affairs	1.3%	10
Other expenditures	24.4%	197
Economic affairs and services	8.5%	69
Interest payments	1.9%	15

### 36 TAXATION

On 1 January 2001, a new tax code went into effect. Personal income rates remained the same, at rates ranging from 12–35%, as did the corporate tax rate, at 27%. The revised depreciation schedule for corporate assets favors investments in high-tech equipment and oil and gas exploration. Depreciation rates are 10% a year for buildings, 25% a year for equipment and computers, 25% for geological and exploratory cost and 20% a year for all other assets. The value-added tax (VAT) was reduced from 20% to 18%, while the property tax was raised from .5% to 1% of assessed value. A .05% Road Fund Tax on turnover was abolished, but there is a highway tax imposed on foreign-registered vehicles collected by customs authorities. There are payroll taxes paid by the employer amounting to 32%, 30% going to the Social Protection Fund, and 2% going to the Employment Fund. There are excise taxes, but excise paid for good used of production can be offset against excise charged for the finished product. In 2001, total government revenue came to an estimated 21.4% of GDP, while total expenditures, including net lending, amounted to only 20% of GDP, producing positive fiscal balance equal to 1.4% of GDP.

### 37 CUSTOMS AND DUTIES

Tariffs are set at 15%, 5%, 3%, or 0.5%. Most goods carry the 15% import customs duty. Capital goods and some primary goods are exempt. There is also a 20% value-added tax on certain imports. A dividend withholding tax of 15% is applicable to monies sent abroad.

In 1992, Azerbaijan signed trade agreements with all the republics of the former USSR except Armenia and Russia. Azerbaijan joined the Commonwealth of Independent States (CIS) in September 1993 and acceded to the CIS economic union treaty the same year. Azerbaijan is a member of the Economic Cooperation Organization. In 1999, Azerbaijan entered into a Partnership and Cooperation Agreement with the European Union and was seeking membership in the World Trade Organization, but as of 2003 has not yet received it.

### 38 FOREIGN INVESTMENT

Foreign investment plays a major role in financing the development of much of Azerbaijan's industrial sector, especially the oil and gas-related industries. The 1992 Law on Foreign Investment provided many basic guarantees to foreign investors, including nondiscriminatory treatment, the repatriation of profits, guarantees against expropriation, and dispute settlement. The Privatization Law passed in 1995 allowed foreign investors to acquire shares in state companies and purchase real estate jointly. Starting in 1997, foreign tax privileges were revoked. As of 1999, foreign investors were required to obtain a license and pay a fee in order to open business in Azerbaijan.

Only about 100 joint venture projects were registered by mid-1992; these were dominated by Turkish firms and involved primarily trade and textiles. In the oil sector, preliminary agreements were signed with US, Scottish, British, and other foreign companies for the exploration and development of several major oil fields in the Caspian Sea. In 1992, Azerbaijan joined a consortium with Oman, Kazakhstan, and Russia aimed at constructing a pipeline through Armenia, Iran and Turkey, or Georgia. Little action was taken on these agreements, due to heightened political tensions. The Azerbaijan International Operating Company (AIOC), led by BP Amaco, signed an \$8 billion contract in 1994 to exploit oil reserves at Azeri, Chirag, and Guneshli (ACG). Foreign direct investment leapt from only \$30 million in 1994 to over \$1 billion in 2002 (about 17% of GDP), with approximately 90% of FDI concentrated in the hydrocarbons sector. Although the US government had banned public aid to Azerbaijan in 1992, US investors played a large role

in exploiting Azerbaijani oil reserves, increasingly so since January 2002 when the Bush administration waived the ban on public assistance (due to Azerbaijan's trade embargo against Armenia and Nagorno-Karabakh) because of Azerbaijan's support in the War on Terror. In the energy sector, by June 2002, the government had concluded Production Sharing Agreements (PSAs) with over 30 companies representing 15 countries. Over 90 US energy-related companies are currently resident in Baku pursuing investment opportunities. Significant foreign investors in the energy sector included British Petroleum (BP)—the designated operator for both the ACG oil field and the Shah Deniz natural gas field—Unocal, ExxonMobil, Devon Energy (Pennzoil), Chevron, Conoco, Moncrief Oil, TPAO (Turkish Oil Company), Statoil (Norway), Lukoil (Russia), Itochu (Japan), Agip (Italy), and TotalfinaELF (France). The US State Department projects that as work on the BTC pipeline proceeds and development of Azerbaijan's oil and gas resources intensifies, foreign investment should increase from present levels of 15% to 25% of GDP to 50% of GDP in 2004. The US State Department also noted that data from Azerbaijan is not reliable, and only rough estimates can be made. On this basis, it reported that foreign investments in 2000 amounted to about \$927 million, of which \$546.1 million (58.9%) was in the energy sector. For the period 1994–1999, as reported by EC-TACIS, the main sources of FDI have been the United States (28%), the UK (15%), Turkey (15%), Russia (6%), Norway (6%), Japan (3%), Germany (3%), Iran (2%), and France (2%).

### 39 ECONOMIC DEVELOPMENT

Rapid development of the Azeri economy in the former USSR was based on the expansion of both its industrial sector, led by oil-related industries, and its agricultural sector, led by grape, tobacco, and cotton production. With grape and wine production weakened by the effects of Gorbachev's anti-alcoholism campaign in the 1980s, and much of the country's industrial sector afflicted by technological obsolescence, overall economic growth in the republic had already begun to decline by 1989, when NMP dropped 6%. Real gross domestic product (GDP) contracted by almost 60% from 1990 to 1995. However, in late 1990s, foreign investment in the country's oil and natural gas sectors opened a period of steady growth. Key strategies of the Azeri government to bring about economic revitalization have included both an economic restructuring program as well as efforts to expand its economic ties to countries beyond the former Soviet Union. To the latter end, Azerbaijan joined the Economic Cooperation Organization set up by Iran, Pakistan, and Turkey to promote trade among Muslim countries. It was also the first of the former Soviet republics to become a member of the Islamic Development Bank, which provides potential access to financing for programs related to agriculture, construction, training, and food aid. In 2002, economy's prospects brightened considerably with progress made on its two major pipeline projects designed to connect the Caspian Sea to the Turkish Mediterranean to provide oil and gas for the European and North American markets, the Baku-Tbilisi-Ceyhan Export Oil Pipeline (BTC) and the Baku-Tbilisi-Erzrum Gas Pipeline. The BTC particularly received an important impetus when the Azeri government came out as a strong ally of the United States in its War on Terror.

The restructuring program in Azerbaijan has been similar to those of other countries in the former USSR. Its main points include stabilization measures (price liberalization, introduction of national currency, and establishment of an exchange rate stabilization fund); introduction of new legislation regarding privatization, foreign investment, and employment; fiscal and monetary reform (including introduction of a VAT and controls on government expenditures); civil service reform; and development of the banking sector. Four committees on antitrust, support for enterprises, state property, and land reform have been

established to oversee the implementation of reform legislation. Privatization of the state enterprise sector is moving at a slow pace. Particular attention is being directed at modernizing those strategic sectors of the economy with the greatest potential for export growth, particularly the oil industry and, to a lesser extent, textile production; the role of foreign investment is seen as pivotal in these areas.

With construction on the BTC pipeline scheduled to begin in March 2003, and the real prospect of an increase in the country's oil production by a factor of almost 350% by 2005, clear progress can be seen on the strategy to develop into oil and gas resources in partnership with foreign investment.

Since 1994, the Azerbaijan parliament has ratified 22 other PSCs, 19 of which were still operative in 2003. Virtually every major oil company in the world is a player in Azerbaijan, including over 90 American companies resident in Baku in 2002. The US State Department estimates that for the period 2002–2005 opportunities for sales of upwards of \$10 billion will be available in association with the expansion of AIOC's offshore oil and gas production. Macroeconomic stability has also been a clear achievement with the government's tight fiscal and monetary policies producing low consumer price inflation rates in 2000 and 2001 of 1.8% and 1.5%, respectively, according to IMF staff reports, after two years of actual declines in the price level in 1998 and 1999, of -0.8% and -8.5%, respectively.

Economic reforms in Azerbaijan have come increasingly under the supervision of increasingly under the conservative supervision of the IMF and the World Bank, which have also taken aim at the problem of pervasive corruption in the administration of taxes and custom duties. In 2002, Azerbaijan was under a three-year Poverty Reduction and Growth Facility (PRGF) program with the IMF, the objectives of which include establishing financial discipline in the energy sector, and increasing efficiency and transparency in the operations of the Ministry of Taxation and the State Customs Committee, and developing a comprehensive anticorruption program.

In March 2002, Azerbaijan reached agreement with the World Bank for a second Structural Adjustment Credit (SAC-II) program, funded at \$60 million. If implemented, the IMF and World Bank programs would greatly improve the investment climate in Azerbaijan. Azerbaijan's two privatization programs since its transition to a free market economy have faltered on the lack security and market transparency. The first, from 1996 to 1998, focused on small and medium-sized enterprises was hindered by lack of resources to properly prepare assets for privatization and insufficient information about these enterprises. A presidential decree of August 2000 opened up case-by-case sales of some of the country's largest enterprises, and in March 2001 additional decrees were issued identifying about 450 enterprises to be privatized during the second privatization program. Progress continues to be slow, however. Attempts to privatize large state enterprises, such as the Azerboru pipe facility, failed for lack of qualified bidders, although by January 2002 the government had succeeded in placing the Baku electrical distribution network under the long-term private management of a Turkish firm, Barmek Holdings. There has been no substantial progress in privatizing the important telecommunications sector. The private sector's contribution to the economy does continue to grow due to both the first privatization program and to land reform. Official statistics placed the private sector's contribution to GDP at over 70% for 2002, although independent economic observers estimate this share at closer to 50 to 60%, according to the US State Department.

The pursuit of development plans remains hampered by ongoing political conflicts in the country. The border between Azerbaijan and Armenia, still closed in 2003, limits vital trade with Turkey, not to mention the overall economic benefits of a lasting peace between the two countries. Azerbaijan's potential

for economic development based on both its natural and human resources remains high, but the challenges posed by both external and external politics which have eaten at the supporting infrastructure, tangible and intangible, remain quite formidable.

## 40 SOCIAL DEVELOPMENT

The disintegration of the Soviet economy led to economic decline in Azerbaijan, with falling living standards and rising unemployment. The minimum wage was raised several times, but it still does not provide adequately for a worker and family. A decent living can only be assured by the "safety net" of the extended family structure. Health and safety standards are often ignored in the workplace.

Unemployment benefits were introduced in 1991. Contributions in the amount of 2% of payroll are made by employers. Unemployment benefits are paid for 26 weeks, with additional weeks provided for every year worked over 25 years. The maximum allowable time period to receive benefits is 52 weeks. The amount of benefits provided ranges from 55% to 75% of average earnings. Benefits are suspended if the applicant refuses two job offers. Old age and disability pension and survivor benefits are provided. Workers' compensation provides both short-term disability benefits and pensions.

Women nominally enjoy the same legal status as men and are underrepresented in government and higher levels of the work force. Although women receive opportunities for education, work, and political activity, social traditions tend to keep them in subordinate positions. Violence against women is a serious problem especially in rural areas. The government is committed to protecting the rights of children.

Ethnic tensions and anti-Armenian sentiment are still strong. Many Armenians have either been expelled or emigrated. It is estimated that only 10,000–20,000 Armenians continue to reside in Azerbaijan. Other minorities, such as the Kurds and the Turks, also report problems of discrimination. The constitution provides for freedom of assembly, religion, and speech, but these rights are often restricted by the government. Azerbaijan's human rights record remains poor. Excessive force was used by police, and the judicial system was inefficient and corrupt. Prison conditions remain harsh.

## 41 HEALTH

As part of the former Soviet Union, Azerbaijan has had to develop and maintain its own health care system and standards. As of 1999, there were an estimated 3.6 doctors and 9.7 hospital beds per 1,000 people. In 1999, the total expenditure on health was estimated at 1.8% of GDP.

Azerbaijan's infant mortality rate for 2000 was 13 per 1,000 live births and the total fertility rate was 2.0 per woman. In 1998 the maternal mortality rate was 43 per 100,000 live births. As of 1999, the country immunized an estimated 99% of one-year-old children against diphtheria, pertussis, and tetanus and 99% against polio.

The overall death rate in 2002 was estimated at 10 per 1,000 inhabitants. Thousands of lives were lost between 1989 and 1992 when the country was at war with Armenia. Few cases of AIDS have been reported in the last few years. In 1996, two cases were reported; the total number of people living with AIDS/HIV was under 500 in 1999. Diphtheria, tuberculosis, hepatitis A, and diarrheal and acute respiratory infections have been serious public health problems. There have also been outbreaks of anthrax, botulism, cholera, tetanus, and malaria. Measles and tuberculosis still remain in this country despite a high incidence of vaccination for one-year-old children. In 1999, the incidence of tuberculosis was 62 per 100,000 people.

## 42 HOUSING

As of 1996, over 1.3 million people were living in houses that were considered to be structurally dilapidated and dangerous. About 66.5% of all housing is privately owned, with 96.5% of rural dwellings and 45.7% of urban dwellings under private ownership. About 67% of current dwellings were built within the period from 1981–1996. In 1996, there were about 60,000 refugees or other displaced persons living in tent communities. Another 300,000 were residing in public, non-residential buildings. At least 5% of homeless families had been waiting for housing for 10 years or more. From 1991–1995, construction of new housing fell by nearly 50% due to poor economic conditions and the government estimated that a total of about 107,000 homes had been lost due to the conflict over Nagorno-Karabakh.

## 43 EDUCATION

The educational system is extensive and illiteracy is practically unknown. In 1995, the adult illiteracy rate was estimated at 0.4% (males, 0.3%; females, 0.5%). The usual language of instruction is Azerbaijani, although Russian, Armenian, and Georgian are also offered by some schools. In 1997 primary schools enrolled 719,013 students in 4,454 schools, with 35,514 teachers. In the same year, secondary schools enrolled 819,625 students taught by approximately 85,000 teachers. In 1998, the pupil-teacher ratio at the primary level was reported as 19 to 1.

Russian is more commonly used at higher-level institutions, but this is slowly changing with a growing demand for the use of Azerbaijani. Education is free. As of 1999, public expenditure on education was estimated at 3.4% of GDP.

Azerbaijan's most important institutes of higher learning are the Azerbaijan Polytechnic Institute, located in Baku, with seven departments and an enrollment of 12,000 students; and the State University, also located at Baku and founded in 1919. It has an enrollment of over 15,000 students in 11 departments. Other institutions include the Medical University, Technological University, the Economic Institute, and the Oil and Chemistry Academy. In total, 15,929 teachers were employed and 115,116 students were enrolled in institutions of higher learning in 1997.

Baku is sometimes referred to as an "oil academy" because of its ongoing research in the areas of turbine drilling, cementation of oil wells, and the development of synthetic rubber from natural gas.

## 44 LIBRARIES AND MUSEUMS

Azerbaijan has a National Library in Baku with 4.4 million volumes. There are 115 recognized museums in the country, 27 of which are art museums, and there are 20 theaters. The country also has 6,571 monuments and historic sights. The Ichari Shahar, or Old Town, in Baku has the Shirvanshah Palace, an architectural monument from the 15th and 16th centuries which has been restored and is now a museum. Other museums are the Museum of History of Azerbaijan (1920), which exhibits archeological, ethnographic, and other relics; the Rustam Mustfayev Azerbaijan State Arts Museum, displaying works of Azerbaijani, Russian and West European artists from the 15th–19th centuries along with the works of modern Azerbaijani artists; the State Museum of Azerbaijani Carpets and Folk and Applied Art; and the Nizami State Museum of Azerbaijani Literature, depicting the stages of literary development. The Gobustan Museum features prehistoric dwellings and cave paintings over 10,000 years old. Baku, the capital, remains an important cultural and intellectual center in Transcaucasia.

## 45 MEDIA

Azerbaijan is connected to other former Soviet republics by land-line or microwave, and to other countries through Moscow. In 1998, there were 1.4 million telephones in use. Service is said to

be of poor quality and inadequate. In 1997, there were about 40,000 cellular phones in use nationwide.

In 2002 there were several newspapers, most of them published in Azerbaijani. *Azerbaijan Ganjlari (Youth of Azerbaijan)* had a circulation of 161,000 in 2002. Over 100 periodicals are published, more than half in Azerbaijani. As of 1999, there were 10 AM and 17 FM stations and two television stations. Domestic and Russian television programs are received locally, while Iranian television is received from an Intelsat satellite through a receive-only earth station. In 2000, there were 22 radios and 259 television sets for every 1,000 people. In 2001, 12,000 Internet subscribers were served by about two service providers.

The Constitution of Azerbaijan specifically outlaws press censorship; however, it is said that the government does not always respect freedom of the press in practice.

## 46 ORGANIZATIONS

Important political associations in the Republic of Azerbaijan include the Helsinki Group, a human rights group, the National Democratic Movement, and Musavat (Equality). The Committee of Democracy and Human Rights in Azerbaijan, founded in 1993, is made up of both individuals and organizations focusing on promoting respect for human rights. The group publicizes human rights abuses and offers legal assistance to victims. The Red Crescent Society is also present.

A number of groups promote and protect civil rights and humanitarian needs for women and children. These include: the Association for the Defense of Rights of Azerbaijan Women, the Azerbaijan Women's Association, Azerbaijan Women's Intelligence Organization, Azerbaijani League for the Defense of the Rights of Children, and the Shout of Mothers Society.

There are over 20 youth organizations united and coordinated in part by the National Assembly of Youth Organizations of Azerbaijan (NAYORA), which was established in 1995. The Azerbaijan Union of the Democratic Youth (AUDY), established in 1994, is an independent group seeking to unite youth of all languages, religions, and nationalities into a single cause of patriotism for an independent and democratic Azerbaijan society. A scouting organization is also present as is an organization of the Special Olympics.

## 47 TOURISM, TRAVEL, AND RECREATION

The capital city of Baku is one of the prime tourist destinations of the Caucasus region. Its Old Town, with the Shirvanshah palace dating back to the 15–16th centuries, is especially popular with sightseers. Other attractions include the Museum of History and the State Arts Museum, as well as museums of folk art and literature. Elsewhere in Azerbaijan, the Gobustan Museum displays prehistoric dwellings and cave paintings, and the village of Surakhani attracts visitors to the Atashgah Fire-Worshipper's Temple. Visitors are also welcome at the carpet-weaving factory in the village of Nardaran, the Wine-making State Farm in the Shamakhi area, the Fruit and Vegetable State Farm around the town of Guba, and the Mashtagha Subtropical Fruit State Farm.

There were approximately 681,000 tourist arrivals in Azerbaijan in 2000, with about 50% of visitors coming from Europe. Tourism receipts that year reached about \$63 million.

In 2002, the US Department of State estimated the cost of staying in Baku at \$282 per day. The cost of staying outside of Baku can be much lower, even around \$64 per day.

## 48 FAMOUS AZERBAIJANIS

Heydar Aliyev has been acting president since June 1993. The poet Nizami Ganjavi (1141–1204) is celebrated for his *Khamisa*, a collection of five epic poems. Muhammed Fizuli (1438–1556) based his poems on traditional folktales, and his poetic versions provide the bases for many 20th century plays and operas.

Satirical poet Sabir (1862–1911) was openly critical of the clergy at a time when their influence controlled much of society. Abul Hasan Bakhmanyar, an 11th century scientist, wrote respected books on mathematics and philosophy. Hasan Shirvani wrote a book on astronomy.

The composer Uzeyir Hajibeyov (1885–1948) wrote the first Azerbaijani opera, and also founded the Azerbaijani Symphonic Orchestra and composed Azerbaijan's National Anthem. Other famous composers from Azerbaijan include Gara Garayev (1918–82), Haji Khanmammadov (b.1918), Fikrat Amirov (1922–84), and Vasif Adigozal (b.1936). Vagif Mustafa Zadeh (1940–79) is considered the founder of the Azerbaijani music movement of the 1960s that mixed jazz with the traditional style known as *mugam*. His daughter, Aziza Mustafa Zadeh (b.1969), is a noted jazz pianist.

Prominent modern Azerbaijani scientists include Lofti Zadeh (b.1921), pioneer of the “fuzzy logic” concept, and Ali Javan (b. Iran, 1928), inventor of the gas laser.

#### 49 DEPENDENCIES

Azerbaijan has no territories or colonies.

# BAHRAIN

State of Bahrain  
*Dawlat al-Bahrayn*

**CAPITAL:** Manama (Al-Manamah)

**FLAG:** Red with a white serrated band (five white points) on the hoist side.

**ANTHEM:** Music without words.

**MONETARY UNIT:** The Bahrain dinar (BD) is divided into 1,000 fils. There are coins of 5, 10, 25, 50, and 100 fils and notes of 500 fils and 1, 5, 10, and 20 dinars. BD1 = \$2.6596 (or \$1 = BD0.376) as of January 2003.

**WEIGHTS AND MEASURES:** The metric system is used; local measures also are used.

**HOLIDAYS:** New Year's Day, 1 January; National Day, 16 December. Movable Muslim religious holidays include Hijra (Muslim New Year), 'Ashura, Prophet's Birthday, 'Id al-Fitr, and 'Id al-'Adha'.

**TIME:** 3 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in the western Persian Gulf, 29 km (18 mi) NW of Qatar, the State of Bahrain consists of a group of 33 islands (6 inhabited) with a total area of 620 sq km (239 sq mi), extending 48 km (30 mi) N-S and 19 km (12 mi) E-W. Comparatively, Bahrain occupies slightly less than 3.5 times the area of Washington, D.C. Bahrain, the main island, is linked by causeways and bridges to Muharraq and Sitra islands and to Sa'udi Arabia; other islands include the Hawar group, Nabih Salih, Umm an-Nasan, and Jidda. The total coastline is 161 km (100 mi). Bahrain's capital city, Manama, is located on the northeastern coast.

## <sup>2</sup>TOPOGRAPHY

A narrow strip of land along the north coast of Bahrain is irrigated by natural springs and artesian wells. South of the cultivable area, the land is barren. The landscape consists of low rolling hills with numerous rocky cliffs and wadis. From the shoreline the surface rises gradually toward the center, where it drops into a basin surrounded by steep cliffs. Toward the center of the basin is Jabal ad-Dukhan, a rocky, steep-sided hill that rises to 122 m (400 ft). Most of the lesser islands are flat and sandy, while Nabih Salih is covered with date groves.

## <sup>3</sup>CLIMATE

Summers in Bahrain are hot and humid, and winters are relatively cool. Daily average temperatures in July range from a minimum of 29°C (84°F) to a maximum of 37°C (99°F); the January minimum is 14°C (57°F), the maximum 20°C (68°F). Rainfall averages less than 10 cm (4 in) annually and occurs mostly from December to March. Prevailing southeast winds occasionally raise dust storms.

## <sup>4</sup>FLORA AND FAUNA

Outside the cultivated areas, numerous wild desert flowers appear, most noticeably after rain. Desert shrubs, grasses, and wild date palms are also found. Mammalian life is limited to the jerboa (desert rat), gazelle, mongoose, and hare; some 14 species of lizard and 4 types of land snake are also found. Bird life is

especially varied. Larks, song thrushes, swallows, and terns are frequent visitors, and residents include the bulbul, hoopoe, parakeet, and warbler.

## <sup>5</sup>ENVIRONMENT

Bahrain's principal environmental problems are scarcity of fresh water, desertification, and pollution from oil production. Population growth and industrial development have reduced the amount of agricultural land and lowered the water table, leaving aquifers vulnerable to saline contamination. In recent years, the government has attempted to limit extraction of groundwater (in part by expansion of seawater desalination facilities) and to protect vegetation from further erosion. In 1994, 100% of Bahrain's urban dwellers and 57% of the rural population had pure water. Bahrain has developed its oil resources at the expense of its agricultural lands. As a result, lands that might otherwise be productive are gradually claimed by the expansion of the desert. Pollution from oil production was accelerated by the Persian Gulf War and the resulting damage to oil-producing facilities in the Gulf area, which threatened the purity of both coastal and ground water, damaging coastlines, coral reefs, and marine vegetation through oil spills and other discharges.

A wildlife sanctuary established in 1980 home to threatened Gulf species, including the Arabian oryx, gazelle, zebra, giraffe, Defassa waterbuck, addax, and lesser kudu. Bahrain has also established captive breeding centers for falcons and for the rare Houbara bustard. The goitered gazelle, the greater spotted eagle, and the green sea turtle are considered endangered species.

## <sup>6</sup>POPULATION

The population of Bahrain in 2003 was estimated by the United Nations at 724,000, which placed it as number 156 in population among the 193 nations of the world. In that year approximately 3% of the population was over 65 years of age, with another 28% of the population under 15 years of age. There were 135 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.17%, with the projected population for the year 2015 at

900,000. The population density in 2002 was 971 per sq km (2,515 per sq mi).

It was estimated by the Population Reference Bureau that 92% of the population lived in urban areas in 2001. The capital city, Manama, had a population of 162,000 in that year. Manama is connected by causeway with the other major city, Al-Muharraq, population 75,906. According to the United Nations, the urban population growth rate for 2000–2005 was 1.6%.

The vast majority of the population lives on the main island of Bahrain. There are approximately 230,000 foreign workers living in the country.

## 7 MIGRATION

The proportion of aliens increased from 20% of the total population in 1975 to an estimated 40% in 2000. Most of them are temporary workers from other Arab countries, Iran, Pakistan, India, and the Republic of Korea. Many skilled workers are Europeans. In 2000, the net migration rate was 6.6 migrants per 1,000 population. The government views these migration levels as satisfactory requiring no intervention.

## 8 ETHNIC GROUPS

In 2002, 63% of the population consisted of indigenous Bahrainis, the vast majority of whom were of northern Arab (Adnani) stock, infused with black racial traits. Asians accounted for 19% of the population; other Arab groups (principally Omanis) 10%; Iranians 8%; and other ethnic groups 6%.

## 9 LANGUAGES

Arabic is the universal language; the Gulf dialect is spoken. English is widely understood, Farsi and Urdu less so.

## 10 RELIGIONS

In 2002, an estimated 98% of the population was Muslim, with about two-thirds practicing the Shi'a branch and the others Sunni. Foreigners make up 38% of the total population; roughly half are non-Muslim, including Christians, Jews, Hindus, Buddhists, Sikhs, and Baha'is. All are free to practice their own religions, keep their own places of worship, and display the symbols for their religions. Islam, however, is the official religion.

## 11 TRANSPORTATION

The outline of the present road network was traced in the early 1930s, soon after the discovery of oil. The four main islands and all the towns and villages are linked by excellent roads. There were 3,164 km (1,996 mi) of roadways in 2002, of which 2,433 km (1,512 mi) were paved. A four-lane, 2.8-km (1.7-mi) causeway and bridge connect Manama with Al-Muharraq, and another bridge joins Sitra to the main island. A four-lane highway atop a 24-km (15-mi) causeway, linking Bahrain with the Sa'udi Arabian mainland via Umm an-Nasan, was completed in December 1986 and financed by Sa'udi Arabia. In 2000, there were 172,684 passenger vehicles and 41,820 commercial vehicles.

Bahrain's port of Mina Sulman can accommodate 16 oceangoing vessels drawing up to 11 m (36 ft). In 2001, Bahrain had a merchant fleet of eight ships of 1,000 GRT or over, totaling 270,784 GRT. Also in 2001, there were four airports, three of which had paved runways. The international airport near Al-Muharraq can handle large jet aircraft and serves more than two dozen international airlines. In 1997, the airport was in the midst of a major expansion. Gulf Air, headquartered in Bahrain and owned equally by the governments of Bahrain, Oman, Qatar, and the United Arab Emirates (UAE), flies to other Gulf countries, India, and Europe. In 2001, 1,250,100 passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

The history of Bahrain has been traced back 5,000 years to Sumerian times. Known as Dilmun, Bahrain was a thriving trade center around 2000 BC; the islands were visited by the ships of Alexander the Great in the third century BC. Bahrain accepted Islam in the 7th century AD, after which it was ruled alternately by its own princes and by the caliphs' governors. The Portuguese occupied Bahrain from 1522 to 1602. The present ruling family, the Khalifa, who are related to the Sabah family of Kuwait and the Sa'udi royal family, captured Bahrain in 1782. Following an initial contact in 1805, the ruler of Bahrain signed the first treaty with Britain in 1820. A binding treaty of protection, similar to those with other Persian Gulf principalities, was concluded in 1861 and revised in 1892 and 1951. After World War II, Britain maintained at Bahrain its headquarters for treaty affairs in the lower Gulf. Claims to Bahrain pressed by Iran were abandoned in 1971 after a UN mission ascertained that the Bahrainis wished to remain independent of that nation.

Between 1968 and 1971, Bahrain participated in discussions aimed at forming a federation of the nine sheikhdoms of the southern Gulf. On 14 August 1971, Sheikh 'Isa bin Salman al-Khalifa declared that, in view of the failure of the larger federation to materialize, Bahrain would declare its independence. Its treaties with the United Kingdom were replaced by a treaty of friendship and cooperation, and on 15 August, the country became the sovereign State of Bahrain. Bahrain promulgated its first constitution in 1973, which occasioned the convening of an elective National Assembly; the legislature was dissolved in August 1975 amid charges of communist influence. The emir continued to set state policy, and his brother, Crown Prince Hamad bin 'Isa al-Khalifa, directed government administration. In 1993, Bahrain established an appointive Consultative Assembly (Majlis al-Shura). On 14 February 2001, a referendum was held that endorsed a return to constitutional rule. Under the constitution amended 14 February 2002, the country is no longer an emirate, but a constitutional monarchy. The emir was replaced by a king. A two-house National Assembly was established, along with an independent judiciary.

Owing to its small size, Bahrain generally takes its lead in foreign affairs from its Arab neighbors on the Gulf. A founding member of the Gulf Cooperation Council, it shares with the other five members a long-standing concern with pressures from Iran and Iraq. During the Iran-Iraq War, Bahrain joined most other Arab states in supporting Iraq. Subsequently, it has carefully tried to foster better relations with Iran through trade. When Iraq invaded Kuwait, Bahrain stood with the allies, contributing military support and facilities to the defeat of Iraq.

Bahrain has long assisted the American naval presence in the Persian Gulf. In 1977, a formal agreement for home-porting US naval ships was replaced by arrangements to continue ship visits and other security cooperation. Since the Gulf War, this cooperation has expanded with arms sales, plans for joint exercises and US pre-positioning of military material for future contingencies. In 1991, the United States signed an agreement giving the Department of Defense access to facilities on the island. The country is home to the US Navy's Fifth Fleet.

Since 1994, Bahrain, like several traditional emirates of the Gulf, experienced sometimes severe civil disturbances from a Shi'ite-led resistance opposed to the ruling family and supportive of establishing an Islamic democracy. In 1996, a band of 44 Bahraini Islamists were arrested for allegedly planning a coup to overthrow the ruling family. The emirate broke relations with Iran, which the former accused of fomenting its civil disturbances which between 1994 and 1996 had resulted in 25 deaths. In 1997, the United States disclosed that it had uncovered a plot to attack its military forces stationed in the country.

On 6 March 1999, Sheikh 'Isa bin Salman al-Khalifa, who had ruled his country since its independence in 1971, died of a heart attack. He was succeeded on the throne by his son, Sheikh Hamad bin 'Isa al-Khalifa. Over the following year, there were signs that while the new ruler would continue his father's pro-Western foreign-policy orientation, domestically he would take a more liberal approach to government. In April, Sheikh Hamad released high-profile Shi'ite dissident, Sheik Abdul Amir al-Jamri, from jail together with hundreds of other political prisoners. Another broad pardon of dissidents took place in November. By February 2001, the emir had pardoned and released all political prisoners, detainees, and exiles.

On 16 March 2001, the International Court of Justice (ICJ) resolved a territorial dispute between Bahrain and Qatar over the potential oil- and gas-rich Hawar Islands. The islands were controlled by Bahrain since the 1930s but were claimed by Qatar. Bahrain also claimed the town of Zubarah, which is on the mainland of Qatar. The dispute has lasted for decades and almost brought the two nations to the brink of war in 1986. In its judgment, the ICJ drew a single maritime boundary in the Gulf of Bahrain, delineating Bahrain and Qatar's territorial waters and sovereignty over the disputed islands within. The ICJ awarded Bahrain the largest disputed islands, the Hawar Islands, and Qit'at Jaradah Island. Qatar was given sovereignty over Janan Island and the low-tide elevation of Fasht ad Dibal. The Court reaffirmed Qatari sovereignty over the Zubarah Strip.

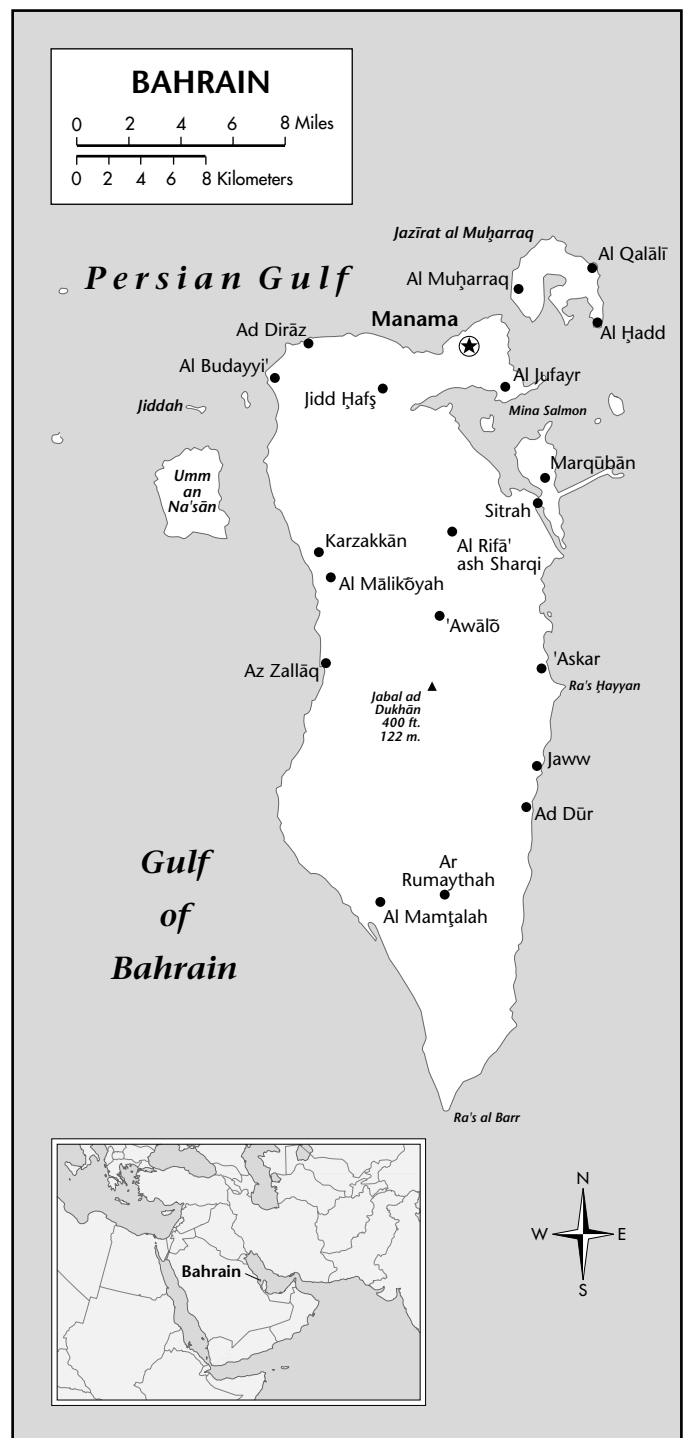

In August 2002, Hamad (now king) made the first state visit to Iran since the Islamic revolution in 1979. The two countries voiced their support for solidarity with the Iraqi people. Iraq was at that time under the threat of a military attack led by the United States for its possession of weapons of mass destruction. Bahrain and Iran urged Iraq to implement all UN resolutions then pending, so that Iraq's territorial integrity and sovereignty could be honored. President Mohammed Khatami of Iran and King Hamad also noted the importance of preserving security and stability in the region, and thus pledged to strengthen ties with one another. Several trade, taxation, and naval agreements were signed at the conclusion of the state visit. As well, both countries agreed to "open a new page" in their bilateral relations, previously strained due to Iran's support for Bahraini opposition movements, and Iran's criticism of the American military presence in Bahrain.

In January 2003, demonstrations took place in Bahrain in opposition to a potential US-led war with Iraq. By 13 January, there were approximately 150,000 US troops in the Gulf region, many of which were stationed in Bahrain, in addition to Kuwait, Qatar, Sa'udi Arabia, and Oman.

### 13 GOVERNMENT

Under its constitution, amended 14 February 2002, Bahrain is no longer an emirate but a constitutional monarchy. As a result of the change, the State of Bahrain became the Kingdom of Bahrain, and Sheikh Hamad bin 'Isa al-Khalifa became King Hamad, by his own decree. A referendum held on 14 February 2001 endorsed a return to constitutional rule by 98.4%.

The new legislature is called the National Assembly (Al-Majlis al-Watani). It consists of two houses, an appointed Consultative Council (Majlis al-Shura) and an elected Chamber of Deputies (Majlis al-Nawab). The Chamber of Deputies consists of 40 members, elected for a 4-year term. The Chamber of Deputies elects a president and two vice presidents. The Consultative Council consists of 40 members appointed by the king for a 4-year period. The king also appoints the Council speaker and the Shura Council elects two vice presidents. Both chambers must concur to pass legislation, which is then sent to the king for ratification. The king has the power to dissolve the Chamber of Deputies, but new elections are to be held within four months

LOCATION: 25°47' 10" to 26°17' 3"N; 50°22' 45" to 50°40' 20' E. TOTAL COASTLINE: 161 kilometers (100 miles). TERRITORIAL SEA LIMIT: 3 miles.

from the date of the dissolution; if they are not, the dissolved Chamber reassumes its constitutional powers and is reconvened.

The constitution specifies that *Shari'ah* is a principal source of legislation but also pledges freedom of conscience. It guarantees equality of women with men "in political, social, cultural and economic spheres, without breaching the provisions of *Shari'ah*." The constitution states that every citizen is entitled to health care. It protects private property, but states that "all natural wealth

and resources are state property.” Discrimination is banned on the basis of sex, national origin, language, religion or creed.

In the first parliamentary elections since 1973, 190 candidates ran for 40 seats in the Chamber of Deputies on 24 October 2002. In nearly half the races, runoff elections were held between the top two vote getters due to close election results. Under the new constitution, women have the right to vote and run for public office. Of the 8 women seeking election in the October parliamentary elections, two forced runoff elections by being among the top two vote getters. As in municipal elections held in May 2002, women constituted over half of those voting. Leaders of Bahrain’s Shi’a population and labor-oriented groups called for a boycott of the elections, claiming dissatisfaction with the structure of parliament. Voter turnout was 53.2%. Moderate Sunni Islamists and independents won 16 of 40 seats on 24 October. In a second round held on 31 October, the independents won 12 seats and the Islamists 9. In total, secular representatives or independents secured a total of 21 of the 40 seats, and Islamists 19.

#### 14 POLITICAL PARTIES

Political parties are illegal in Bahrain. Several underground groups, including branches of Hizbollah and other pro-Iranian militant Islamic groups, have been active. Anti-regime dissidents have frequently been jailed or exiled. However, Sheikh Hamad bin ‘Isa al-Khalifa in 1999 issued an amnesty for most political prisoners, ended the house arrest of Shi’ite opposition leader Sheikh Abdul Amir al-Jamri, and granted permission for the return of 108 people in exile. By February 2001, the emir had pardoned and released all political prisoners, detainees, and exiles. In addition, the reinstatement of dissidents fired from public sector jobs, the lifting of travel bans on political activists, and the abrogation of state security laws have all created a more open atmosphere for political expression.

Beginning with municipal elections in May 2002, candidates from a wide variety of political groups have formed a more pluralistic political culture in Bahrain. As of December 2002, these groups were not officially designated as political parties, but they had the attributes of democratic parties in the West: they can field candidates in elections, organize their activities, and campaign freely. There are seven main political groups: the Arab-Islamic Wasat (Center) Society (AIWS); the Democratic Progressive Forum (DPF); the Islamic National Accord (INA); the National Action Charter Society (NACS); the National Democratic Action Society (NDAS); the National Democratic Gathering Society (NDGS); and the National Islamic Forum (NIF).

In addition, numerous other non-governmental organizations were set up after the constitution was endorsed in February 2001, among them the Bahrain Human Rights Society, the Supreme Council for Bahraini Women, and the Organization Against Normalization with Israel. These organizations campaign on single-issue platforms, hold public discussions and meetings, consult with the government, and are members of Bahraini delegations to international forums.

#### 15 LOCAL GOVERNMENT

Under the new constitution, there are five municipal councils in Bahrain, each with 10 elected members and an appointed chairman. The first local elections since 1957 were held on 9 May 2002. Thirty of the fifty seats contested in the five new municipal councils were decided in the first round of voting, with the remaining twenty seats—where no candidate received an absolute majority—being decided in a second round of voting on 16 May. Candidates with links to Islamist groups won the majority of seats. There were 31 women among 306 candidates in the first round of voting, but none won. After the elections, some political figures suggested that a quota system should be set up to assure

that some women would obtain seats in the municipal councils. Out of the 50 municipal seats, 38 were won by candidates affiliated with Islamist parties. Voter turnout in the first round of voting was 51.3%.

The democratic municipalities are responsible for the provision of local goods and services, including transportation, waste disposal, street cleaning and beautification, and enforcing health and safety standards.

#### 16 JUDICIAL SYSTEM

The law of Bahrain represents a mixture of Islamic religious law (*Shari’ah*), tribal law, and other civil codes and regulations. The new constitution promises an independent judiciary. A Higher Judicial Council supervises the courts. Courts have been granted the power of judicial review.

The new reforms establish a constitutional court, consisting of a president and six members, appointed by the king for a specified period. Members are not liable to dismissal. The government, or either house of the National Assembly, may challenge the constitutionality of any measure before the court. The king may refer to the court draft laws prior to their adoption, to determine their constitutionality.

Military courts are confined to military offenses only, and cannot be extended to others without the declaration of martial laws.

*Shari’ah* governs the personal legal rights of women, although the new constitution provides for women’s political rights. Specific rights vary according to Shi’a or Sunni interpretations of Islamic law, as determined by the individual’s faith, or by the courts in which various contracts, including marriage, have been made. While both Shi’a and Sunni women have the right to initiate a divorce, religious courts may refuse the request. Women of either branch of Islam may own and inherit property and may represent themselves in all public and legal matters. A Muslim woman legally may marry a non-Muslim man if the man converts to Islam. In such marriages, the children automatically are considered to be Muslim.

#### 17 ARMED FORCES

In 2002 the Bahrain armed forces had 10,700 active members. The army consisted of 8,500; the naval force had 1,000; and the air force had 1,300. Paramilitary troops consisted of 10,160 personnel, including the police, national guard, and coast guard. Defense expenditures in 2001 were \$526.2 million, or 6.7% of GDP.

#### 18 INTERNATIONAL COOPERATION

Bahrain joined the UN on 21 September 1971 and is a member of ESCWA, all major regional organizations, and all the nonregional specialized agencies except IAEA, IDA, and IFAD. It also belongs to the Arab League and G-77, and is a signatory of the Law of the Sea and a member of the WTO. Bahrain was a founding member of the Gulf Cooperation Council, inaugurated in 1981.

#### 19 ECONOMY

For centuries, Bahrain depended almost exclusively on trade (or piracy), pearl diving, and agriculture. The discovery of oil on 1 June 1932 came at a time when the pearl trade was being drastically undercut by the development of cultured pearls. Although its economy has been based on oil for the last six decades, Bahrain’s development has been tempered by relatively limited reserves. Proven reserves are 125 million barrels, all from one diminishing oil field, the Awali field. At current production levels, the field has a life of less than 10 years. The oil industry accounted for 60% of export earnings, 60% of government revenues, and approximately 30% of GDP in 2001.

Significant progress has been made in enhancing Bahrain as an *entrepôt* (trade center) and as a service and commercial center for

the Gulf region. Bahrain provides ample warehousing for goods in transit and drydock facilities for marine engine and ship repairs. Bahrain also acts as a major banking, telecommunications, and air transportation center. Bahrain made the move to diversify its economy—moving to rely on services to a higher degree—after the Lebanese civil war in the late 1970s and early 1980s essentially ended that country's status as a safe, regulation-free banking environment. The strategy has worked to a large extent. Since establishing itself as an offshore banking center in 1975, the banking sector of the economy now has assets of \$99.5 billion, with \$85.7 billion (86%) in offshore banks. Services accounted for 64% of all economic activity in the country.

The Bahrain economy slowed down considerably after 1993, grinding to a halt in 1994. Average annual growth averaged 4% between 1988 and 1998, buoyed by investment during the early 1990s. In 1998, it experienced a contraction of 2% due to low world oil prices. Positive real growth returned in 1999, of 2.6%, and has improved to 3% in 2000 and 4% in 2001.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Bahrain's gross domestic product (GDP) was estimated at \$8.4 billion. The per capita GDP was estimated at \$13,000. The average inflation rate in 2001 was 1.5%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 1% of GDP, industry 35%, and services 64%.

Foreign aid receipts amounted to about \$27 per capita. Approximately 32% of household consumption was spent on food, 8% on fuel, 1% on health care, and 6% on education. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings.

## 21 LABOR

The Bahraini labor force in 1998 was estimated at 295,000, of whom some 44% were non-nationals. Employment by sector was as follows: industry, commerce, and services, 79%, government, 20%, and agriculture, 1%. Unemployment stood at 15%.

Although the constitution permits workers to organize, the government bans trade unions. With this absence of legitimate trade unions, no collective bargaining entities or collective agreements exist. Workers may express grievances through joint labor-management committees (JLCs). JLCs are generally created at each major company and have an equal number of labor and management representation. As of 2000, there were a total of 20 JLCs. There are no internationally affiliated trade unions, and foreign workers are underrepresented in the General Committee of Bahrain workers which coordinates the JLCs.

The government set minimum wage scales for public sector employees and this generally provides a decent standard of living for workers and their families. The minimum wage for public-sector wages were specified on a contract basis. All foreign workers must be sponsored by Bahrainis or Bahrain-based companies, which can revoke the residence permit of anyone under their sponsorship. Migrant workers from developing countries are often unwilling to report health and safety abuses for fear of forced repatriation. Nor do labor laws apply to foreign workers, who often work far in excess of official maximum hour laws. The minimum age for working is 14 years and until age 16, special work conditions and hour limits apply to workers. There is general compliance with this in the industrial sector, but there is rampant abuse outside it, especially in family-owned businesses.

## 22 AGRICULTURE

Only 2.9% of the land is arable. Agriculture accounts for only about 1% of the GDP. Ninety farms and small holdings produce fruit and vegetables, as well as alfalfa for fodder. The date palm industry has declined sharply in recent years due to heavy demands on the limited water supply, and dates have become a luxury item. In 1999, 12,000 tons of vegetables and 22,000 tons of fruit crops were produced. The government's goal is for output to meet 16% of demand, compared with the current 6%.

## 23 ANIMAL HUSBANDRY

Most domestic meat consumption is supplied through imports of live cattle, goats, and sheep. About 13,000 head of cattle, 17,000 sheep, and 16,000 goats were kept for milk and meat production in 1999. A thriving poultry industry provided 5,000 tons of meat and 3,000 tons of eggs in 1999. Dairy farming has recently been expanded, and a national dairy pasteurization plant has been established in order to centralize all milk processing and distribution. In 1999, milk production from 7,000 cows totaled 14,000 tons. An abattoir that opened in 1984 slaughters imported sheep and cattle.

## 24 FISHING

Although the more than 300 species of fish found in Bahraini waters constitute an important food source for much of the population, local fishing and pearl diving have declined because of industrial pollution. The catch totaled 11,718 tons in 2000. The government operates a fleet of seven trawlers. By encouraging traditional angling, giving incentives to fishermen, improving fishing and freezing equipment, and establishing cooperatives, the government is attempting to increase the annual catch. There is a modern fishing harbor at Al-Muharraq which provides docking and landing facilities, storage areas, an ice plant, and a water supply.

## 25 FORESTRY

There are no forests in Bahrain. In 2000, roundwood imports amounted to 32,000 cu m (1.1 million cu ft) and imports of wood-based panels totaled 20,000 cu m (700,000 cu ft). Bahrain's imports of forest products amounted to \$25.8 million that year.

## 26 MINING

Bahrain's oil-based economy produced few minerals other than crude oil and natural gas. Other minerals in 2000 accounted for \$211 million of the \$5.7 billion in export earnings, as compared to crude oil and refined petroleum products, which accounted for 70% of the total. Cement production was reported at 88,806 tons in 2000, down from 230,422 in 1998. Sulfur production was estimated at 66,400 tons in 2000.

## 27 ENERGY AND POWER

The Arabian Peninsula's first oil well was drilled in Bahrain in 1932, and production began in 1934. From the 1930s to the mid-1970s, oil development was a monopoly of the Bahrain Petroleum Co. (BAPCO), which in 1936 came under the ownership of Caltex, a corporation registered in Canada and jointly owned by Texaco and Standard Oil of California. In 1975, the Bahrain government acquired a 60% holding in BAPCO, and it later formed the Bahrain National Oil Co. (BANOCO) to take over full ownership. In 1980, BANOCO announced its acquisition of a 60% interest in Bahrain's main refinery, which had been wholly owned by Caltex.

Total daily crude petroleum production, after reaching a peak in 1970, has declined gradually. In 2001, total crude oil production was 35,000 barrels per day. Proven oil reserves in Bahrain were estimated at 125 million barrels in 2002. From

1972 until 1996, Bahrain shared revenues from the Abu Safa oil field, which lies halfway within Saudi Arabian territorial waters, with Saudi Arabia. In 1996, the Saudi government ceded the remainder of its share of the field to Bahrain, increasing the government's revenue by about \$200 million.

Bahrain gained the right to offer concessions in offshore oil fields in the Gulf of Bahrain after a territorial dispute with Qatar was settled by the International Court of Justice in March 2001 and Bahrain won control of the Hawar Islands. In November 2001 drilling rights were awarded to Petronas and Chevron Texaco, and oil exploration began in late 2002. As of early 2003 a \$900 million modernization was planned for Bahrain's only refinery, Sitra, which had a capacity of 248,900 barrels per day. Plans to build a second refinery, approved in 1999, had been delayed due to financing problems.

Bahrain's natural gas resources were estimated at 90 billion cu m (3.2 trillion cu ft) in late 2002. Production of gas was 8.5 billion cu m (300 billion cu ft) in 2000, most of which was associated with drilling in the Awali oil field.

The Directorate of Electricity operates plants at Manama, Sitra, and Riffaa. In 2000, net electricity generation was 5.9 billion kWh, of which 100% came from fossil fuels. In the same year, consumption of electricity totaled 5.4 billion kWh. Total installed capacity at the beginning of 2001 was 1.1 million kW. Power is principally derived from a municipal power station at Jufair, from the Sitra power and water station, from two gas turbines at Al-Muharraq, and from the power station at East Riffaa, which was completed in 1985 and is the largest and most modern. BANOCO produces its own electricity from a 60 MW plant. Phase One of the Hidd power project, completed in 1999, created an additional 280 MW of gas-fired generating capacity. Completion of Phase Two, which would add another 630 MW, was slated for 2004.

## 28 INDUSTRY

Petroleum refining, begun modestly in 1942, was Bahrain's first modern industrial enterprise. By 1976 the oil refinery at Sitra had reached its current capacity of about 250,000 barrels per day, far above local daily production rates of 35,000 barrels per day from the single active field at Awali, and about 86% of the oil is pumped from Saudi Arabia by sea and land lines. The refinery was owned and operated by the government-owned Bahrain Petroleum Company (BAPCO), which in a consolidation, which began in January 2000 and was completed on 1 June 2002, merged with the upstream state company, Bahrain National Oil Company to form Bahrain Petroleum Company (BSC). BSC will hence be charged with exploration, production, refining, marketing, and distribution of Bahraini oil for domestic use and the international market. Although modernization was delayed by the Gulf conflict, work began in 1992 to expand refining capacity to some 360,000 barrels per day. Much of the refurbishment has, however, been concentrated more on quality improvements than increases in quantity, and though in 1999 a record production rate was attained of 262,000 barrels per day, in January 2002 refinery capacity was estimated at 248,900 barrels per day by the US Department of Energy. Before it merged into the BSC, BAPCO announced a \$900 million modernization program that involves adding supplemental hydrocracking facilities. Achieving additional refinery capacity has shifted to the proposed construction of a second refinery, with a 500,000 barrels per day capacity, to be constructed by the Saudi firm Petroma. To date, however, the deal, though not formally cancelled, has been delayed for lack of financing. In 1999, a seven-year, \$800-million modernization plan started upgrading the refinery. Output was recorded at 260,000 barrels per day in 1999.

A government-controlled aluminum industry, Aluminum Bahrain BSC (ALBA), was launched in 1971 with an original

smelter capacity of 120,000 tons annually; the successful completion of a 1997 expansion project increased production to more than 500,000 metric tons in 1998. It is the world's second-largest aluminum smelter, and is 77%-owned by the government.

A gas liquefaction plant was opened by the Bahrain National Gas Co. (BANAGAS) in 1979. The Bahrain National Oil Company (BANACO) was planning to spend \$60 million in 1999 on new gas projects. The Arab Shipbuilding and Repair Yard, a pan-Arab industrial venture undertaken by OAPÉC, became operational in 1977. It is the Gulf's largest floating dock and repair facility, with expansion scheduled for 2000 involving up to \$200 million.

## 29 SCIENCE AND TECHNOLOGY

The economy depends heavily on advanced petrochemical technologies, and many Bahrainis have had or are receiving technical training. The University of Bahrain, at Isa Town, has a college of engineering and science. The Arabian Gulf University, founded in 1980 by the seven Gulf states, has colleges of medicine and applied sciences. The Bahrain Society of Engineers and the Bahrain Computer Society, in Manama, and the Bahrain Medical Society in Adliya, are leading professional groups. The College of Health Sciences, founded in 1976, had 528 students in 1996. The Bahrain Centre for Studies and Research, founded in 1981, conducts scientific study and research.

## 30 DOMESTIC TRADE

Bahraini shops have become increasingly modernized and specialized. American-style supermarkets are open in Manama and most supplies and services are available in shops throughout the country. Business hours for most shops are from 8:30 AM to 12:30 and from 4 to 8 PM, Saturday through Wednesday, with a half day on Thursday. Government offices and banks are generally open Saturday through Thursday. Of all the Gulf states, Bahrain offers the most scope for consumer advertising through its publications, cinemas, direct mail facilities, and radio and television stations.

## 31 FOREIGN TRADE

Petroleum products drive Bahrain's economy and export market (70%). Aluminum, which is manufactured in government-controlled enterprises, ranks as the country's second-largest export commodity (14%). Other exports include apparel (4.6%), iron (3.5%), and chemicals (2.5%).

In 2000 Bahrain's imports were distributed among the following categories:

Consumer goods	8.4%
Food	8.9%
Fuels	44.8%
Industrial supplies	22.4%
Machinery	10.3%
Transportation	3.6%

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	348	186	162
Saudi Arabia	244	2,273	-2,029
Japan	93	168	-75
United Arab Emirates	80	108	-28
Korea	66	74	-8
India	63	95	-32
Netherlands	44	37	7
Italy	38	96	-58
Germany	25	155	-130
China	25	115	-90
United Kingdom	11	167	-156

### 32 BALANCE OF PAYMENTS

Traditionally, Bahrain relied on a substantial influx of funds from Sa'udi Arabia, Kuwait, Abu Dhabi, and Iran to finance capital outlays. In recent years, however, increased income from tourism and financial services, have placed Bahrain in a favorable payments position.

The US Central Intelligence Agency (CIA) reports that in 2001 the purchasing power parity of Bahrain's exports was \$5.5 billion while imports totaled \$4.5 billion resulting in a trade surplus of \$1 billion.

The International Monetary Fund (IMF) reports that in 2001 Bahrain had exports of goods totaling \$5.55 billion and imports totaling \$4.01 billion. The services credit totaled \$950 million and debit \$744 million.

Although oil imports decreased in the first quarter of 2001, there was a slight increase in non-oil imports.

The following table summarizes Bahrain's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	157
Balance on goods	1,536
Balance on services	206
Balance on income	-322
Current transfers	-1,264
<b>Capital Account</b>	100
<b>Financial Account</b>	-417
Direct investment abroad	-216
Direct investment in Bahrain	80
Portfolio investment assets	-1,448
Other investment assets	5,623
Portfolio investment liabilities	-31
Other investment liabilities	-4,426
<b>Net Errors and Omissions</b>	283
<b>Reserves and Related Items</b>	-124

### 33 BANKING AND SECURITIES

Bahrain is considered the pre-eminent financial services center in the Middle East. The Bahrain Monetary Agency (BMA), Bahrain's equivalent of a central bank, issues and redeems bank notes, regulates the value of the Bahrain dinar, supervises interest rates, and licenses and monitors the activities of money changers. One factor contributing to Bahrain's growth as a Middle Eastern financial services center is that unlike some of its larger, richer neighbors, there is no serious religious opposition to western banking practices—especially the accrual of interest—which some Islamic scholars consider to be contrary to Muslim teachings. There are, however, several large banks in Bahrain classified as Islamic; they don't pay or charge interest, don't finance or otherwise support "un-Islamic" enterprises, and make a conscious effort to invest in socially productive enterprises. Another important factor influencing the growth of the financial sector is the tax-free environment.

The value of assets and liabilities held by Bahrain's commercial banks rose by 43%, and offshore banking units (DBUs) rose by 20%; between 1991 and 1995. The consolidated assets and liabilities of commercial and offshore banks in Bahrain reached over \$82 million in 1997. In 2000, Bahrain was home to 20 full commercial banks, 2 specialized banks, 52 offshore banks, 37 representative offices, 33 investment banks, 6 foreign exchange and money brokers, 8 investment and financial advisory services, and 18 money-changing companies. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$1.5 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$6.3 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 3.9%.

The Bahrain Stock Exchange (BSE) was planned in 1987 after the unofficial Kuwait Stock Exchange collapsed. The BSE has become an important Gulf center of share trading; volume or shares increased from its inception from 62 million in 1989 to almost 400 million in 1993. Beginning in 1995, the BSE listed foreign companies, bonds, and investment funds. Trading in foreign investment vehicles was made open to all Bahrainis, and resident and non-resident foreigners in late 1996. Between 2000 and 2001, the index fell about 2.5%. There were 34 funds and 41 companies listed on the BSE in 1999. The total value, volume, and number of transactions of shares traded in 1999 declined from 1998 by 23%, 13%, and 27% respectively. The top three firms, Investcorp, the Bahrain Telecommunications Company (BATELCO), and the Arab Banking Corporation, account for over one-half of the exchange's total market capitalization of \$7.3 billion in 1999.

### 34 INSURANCE

The total premiums underwritten in 1996 in Bahrain equaled approximately \$100 million. Over 100 insurance companies were operating in Bahrain in 2000. In 2001, life insurance premiums totaled \$34 million. In 1999, the total insurance expenditure for Bahrain was \$192 million, or 2% of its gross domestic product (GDP).

### 35 PUBLIC FINANCE

The budget is presented biennially and regularly updated, and represents a large section of economic activity. More than half of government revenues come from oil production and refining; the oil industry is completely controlled by the government. The public deficit is covered by internal borrowing, loans from Arab funds, and the IDB; although privatization has become increasingly important to controlling the budget. The oil and aluminum industries are still controlled by the government, although utilities, banks, financial services, and telecommunications have started to fall into private hands.

The US Central Intelligence Agency (CIA) estimates that in 2002 Bahrain's central government took in revenues of approximately \$1.8 billion and had expenditures of \$2.2 billion including capital expenditures of \$700 million. Overall, the government registered a deficit of approximately \$400 million. External debt totaled \$2.8 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

<b>REVENUE AND GRANTS</b>	<b>100.0%</b>	<b>1,800</b>
Tax revenue	21.4%	384
Non-tax revenue	74.9%	1,348
Capital revenue	<0.1%	1
Grants	3.7%	67
<b>EXPENDITURES</b>	<b>100.0%</b>	<b>2,200</b>
General public services	29.5%	648
Defense	15.2%	335
Public order and safety	12.3%	270
Education	13.3%	293
Health	7.8%	171
Social security	7.5%	166
Housing and community amenities	3.7%	81
Recreation, cultural, and religious affairs	0.5%	12
Economic affairs and services	3.9%	86
Interest payments	6.2%	137

### 36 TAXATION

The only taxes in Bahrain are an income tax on oil production and a municipal tax of 10% on residential rents; the rate is 7.5% on furnished rentals, office, and commercial rents. As an offshore tax haven, Bahrain allows foreign firms to remit accumulated profits and capital without taxation.

### 37 CUSTOMS AND DUTIES

Import licenses for items sold in Bahrain are issued only to local companies that are at least 51% Bahraini-owned. Principal prohibited items are arms, ammunition, liquor (except by authorized importers), and cultured pearls. Customs duties are 20% on corn and palm oil (duties for most foodstuffs were abolished in 2000); 10% on non-essential goods; 20% on cars and boats; 100% on tobacco and cigarettes; and 12.5% on authorized imports of liquor.

A free transit zone operates at the port of Mina Sulman. Free trade is available with Gulf Cooperation Council (GCC) countries if products have at least 40% local value-added content.

### 38 FOREIGN INVESTMENT

While continuing to encourage foreign investment, the government has acquired majority holdings in most of the country's principal enterprises that were formerly foreign held. The government offers substantial incentives for companies wishing to establish plants in Bahrain. With the exception of petroleum royalties, Bahrain does not tax either corporate or individual earnings.

As of 1999, the Bahraini government had no vehicle for reporting statistics on foreign investment. Some of the larger foreign-owned or controlled companies in 1999 included the following: Aluminum Bahrain and the Gulf Petrochemical Industries Complex, both joint investments controlled by several Gulf states; the Arab Shipbuilding and Repair Yard, owned by several Gulf states; and the Bahrain Telecommunications Company, 20%-owned by Cable and Wireless. There were at least 90 US companies operating in Bahrain in 1999, including Kimberly-Clark, Coca-Cola, Shaw Industries, and DHL.

### 39 ECONOMIC DEVELOPMENT

Since the late 1960s, the government has concentrated on policies and projects that will provide sufficient diversification in industrial, commercial, and financial activities to sustain growth in income, employment, and exports into the post-oil era. Despite diversification efforts, the oil and gas sectors remain the cornerstone of the economy.

### 40 SOCIAL DEVELOPMENT

Impoverished families receive subsistence allowances from the Ministry of Labor and Social Affairs. Free child guidance clinics—the first in the Gulf—and expanded benefit and pension provisions for government employees were introduced in 1975. A social security fund provides old age, disability, survivor, and accident insurance. Contributions amount to 5% of earnings by workers and 7% by employers. For accident insurance, the insured pays nothing and the employer contributes 3% of payroll. Work injury insurance exempts domestic servants, self-employed and agricultural workers.

Islamic law, either Shi'a or Sunni, dictates the legal rights of Bahraini women. Women may initiate divorce proceedings, own and inherit property, and represent themselves in legal matters. However, men retain legal rights over children, even in case of divorce. Custody of young children is granted to women, but fathers automatically regain custody when the children reach the age of 9 (for daughters) and 7 (for sons). Unlike other fundamentalist nations, women are permitted to work, drive cars,

and wear Western-style clothing. Women make up over 20% of the labor force, and their employment is encouraged by the government. However, the majority of working women are young and single, and most women cease working outside the home after marriage. Bahrain's labor law does not recognize the concept of equal pay for equal work. Spousal abuse is common and women rarely seek assistance from authorities.

A small group of Shi'a originally of Iranian origin have been refused full citizenship under the Citizenship Act of 1963. These residents are second or third generation residents of Bahrain, but are unable to obtain a passport and are prohibited from owning land.

Bahrain's government regularly violates citizens' human rights. There was a continuation of torture, arbitrary arrest, denial of the right to a fair trial, and restrictions on freedom of speech, press, assembly, association, and workers' rights.

### 41 HEALTH

In 1960, Bahrain inaugurated a free national health service, available to both foreign and indigenous segments of the population through a system of primary care health centers and modern hospital facilities. Bahraini patients who require sophisticated surgery or treatment are sent abroad at government expense.

Medical services are provided by the government and a small private sector. Health care centers are accessible to the population free of charge. In 1990, there were 4 government-operated hospitals (including a psychiatric hospital and a geriatric hospital), 5 maternity hospitals, 19 health centers, 6 environment health centers, and 16 maternity and child welfare centers. In 1991, Bahrain had 668 physicians, 123 pharmacists, and 66 dentists. In 1997, there were an estimated 1 physician, 2.8 nurses, 0.09 dentists, and 0.2 pharmacists per 1,000 people. The effects of the Gulf War have endangered the health of many of Bahrain's people. Acute asthmatic attacks increased during the years after the war (1991–1993).

Infant mortality was 14.8 per 1,000 live births in 1999. The 1999 birth rate was 21.9 per 1,000 people and the general mortality rate was 3.2 per 1,000 people. In 1994, 93% of the country's one-year-old children were vaccinated against measles. In 1990, 100% of the population had access to health care services and 93% had access to safe drinking water. Life expectancy in 1994 was 71 years. In Bahrain, there were 28 new cases of AIDS in 1996. Malaria was reported in 258 people while polio, measles, and neonatal tetanus were non-existent.

### 42 HOUSING

According to the 2001 government census, there were 105,686 housing units within the country. About 18% were private villas (single family, independent structure homes). There were 8,076 apartment buildings containing a total of about 36,320 flats. About 72% of all units were connected to the public water system. About 14.8% of homes used relied on bottled water. About 63,374 units were occupied by single (nuclear) families. The greatest number of housing units (32,538) were available in Manama.

### 43 EDUCATION

Bahrain introduced a free public education system to the Gulf region in 1919. The government aims to provide free educational opportunities for all children. Education was only recently made compulsory. As of 1999, public expenditure on education was estimated at 3.7% of GDP.

For the year 2000, adult illiteracy rates were estimated at 12.4% (males, 9.0%; females, 17.3%). Bahrain has the highest female literacy rate in the Arabian Gulf. As of 1999, the female share of primary enrollment was estimated at 48.7%. The official language is Arabic, but English is widely spoken. School

education is in three stages: primary lasts for six years, intermediate for three years, and secondary—general, industrial, or commercial—for three years. Primary and secondary curricula includes a nine-year course in Religious Study. Nearly 100% of primary-school-age children attend school, while 85% attend secondary school. In 1997 primary schools enrolled 72,876 students. Also in 1997 secondary schools enrolled 57,184 students, taught by approximately 3,200 teachers.

Bahrain's principal university is the University of Bahrain, established in 1986 after a merger between the University College and Gulf Polytechnic. It is comprised of five colleges and an English language center: colleges of arts, sciences, engineering, education, and business administration. The Arabian Gulf University (founded in 1980) has faculties in science, engineering and medicine, and is in fact a joint venture project among the six Gulf Cooperation Council members and Iraq. Each nation is allocated 10% of the seats (total 70%) and the remaining 30% are given to other countries. Also important is the Bahrain Training Institute, which currently has over 50% female students.

There are also 67 adult education centers in Bahrain, which have helped to reduce the illiteracy rate of the country. For promoting technical education, a "10,000 Training Plan" was launched in 1980. Nearly 6,500 students have participated in this program since its inception and scholarships are given to students to pursue higher studies at Bahrain or abroad. In 1994 all institutions of higher learning had 655 teachers and enrolled 7,147 students.

#### 44 LIBRARIES AND MUSEUMS

The Central Public Library in Isa Town has 124,000 volumes. The University of Bahrain in Manama (1978) holds 140,000 volumes, while the Manama Central Library holds 155,000 volumes. In 2003, the first specialized law library opened at the University's Sakhir campus. Bahrain National Museum in Manama holds art, archaeological and historical exhibits, chronicling the rise of the Dilmun civilization.

#### 45 MEDIA

Modern telephone, cable, and telex systems are available; mainline telephones numbered 152,400 in 1997. The same year, there were about 58,543 cellular phones in use nationwide.

In 1998, there were 2 AM and 3 FM stations and 4 broadcast television stations. All of which were owned and operated by the government. In 1997 there were 499 radios and 420 television sets in use per 1,000 population. Internet service is provided through the national phone company, with 105,000 subscribers counted in 2001. Government control restricts access to some sites considered with content that is considered anti-Islamic or anti-government.

Bahrain's first daily newspaper in Arabic, *Akhbar al-Khalij* (circulation 17,000 in 2002), began publication in 1976, and the first English daily, the *Gulf Daily News* (50,000), was established in 1991. *Al Ayam*, an Arabic daily founded in 1989, had a 2002 circulation of 37,000.

Though the Bahraini Constitution has provisions for freedom of expression, press criticism of the ruling family or government policy is strictly prohibited.

#### 46 ORGANIZATIONS

In addition to the Chamber of Commerce and Industry, there are numerous Bahraini and multinational groups, including the Bahrain Red Crescent Society and the Children's and Mothers' Welfare Society. Youth organizations include those representing the Youth Hostel Federation, Red Crescent Youth, Boys and Girl Scouts, and Arab Student Aid International (ASAI). The Bahrain Olympic Committee coordinates activities for about 12 national youth sports federations.

#### 47 TOURISM, TRAVEL, AND RECREATION

Bahrain has been a fast growing destination in the Middle East since the early 1990s. Tourist attractions include archeological sites, notably Qal-at Al-Bahrain (The Portuguese Fort), the National Museum, and the Heritage Center. In 2000, there were 3,868,738 tourist arrivals, almost 3,000,000 from other Middle Eastern countries, and tourism receipts totaled \$469 million. Most visitors need a visa and valid passport.

The US State Department estimated the daily cost of staying in Bahrain at \$271 in 2001.

#### 48 FAMOUS BAHRAINIS

Sheikh 'Isa bin Salman al-Khalifa (b. 1933) ruled from 1961 until his death in 1999. He was succeeded by his son, Sheikh Hamad bin 'Isa al-Khalifa (b.1950).

#### 49 DEPENDENCIES

Bahrain has no territories or colonies.

# BANGLADESH

People's Republic of Bangladesh

*Gana-Prajatantri Bangladesh*

**CAPITAL:** Dhaka (formerly Dacca)

**FLAG:** The national flag is a red circle against a dark-green background.

**ANTHEM:** *Amar Sonar Bangla (My Golden Bengal)*.

**MONETARY UNIT:** The taka (T) of 100 poisha is a paper currency set on a par with the Indian rupee. There are coins of 1, 2, 5, 10, 25, and 50 poisha, and notes of 1, 5, 10, 20, 50, and 100 taka. T1 = \$0.0173 (or \$1 = T58.00) as of May 2003.

**WEIGHTS AND MEASURES:** Bangladesh adopted the metric system as of 1 July 1982. Customary numerical units include the lakh (equal to 100,000) and the crore (equal to 10 million).

**HOLIDAYS:** New Year's Day, 1 January; National Mourning Day (Shaheel Day), 21 February; Independence Day, 26 March; May Day, 1 May; Victory Day, 16 December; Christmas, 25 December; Boxing Day, 26 December. Movable religious holidays include Good Friday, Jamat Wida, Shab-i-Bharat, 'Id al-Fitr, 'Id al-'Adha', and Durga Puja.

**TIME:** 6 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in South Asia, Bangladesh, before it became an independent state, was the eastern province of Pakistan, known as East Bengal and, later, as East Pakistan. Bangladesh is slightly smaller than the state of Iowa with a total area of 144,000 sq km (55,598 sq mi), extending 767 km (477 mi) SSE–NNW and 429 km (267 mi) ENE–WSW. Bangladesh is bordered in the W, N, and E by India, on the SE by Myanmar (Burma), and on the S by the Bay of Bengal, with a total boundary length of 4,246 km (2,638 mi). A border demarcation agreement was signed with Myanmar in May 1979. Demarcation of the marine boundary with India remains unresolved. Bangladesh's capital city, Dhaka, is located near the center of the country.

## <sup>2</sup>TOPOGRAPHY

Bangladesh is a tropical country, situated mainly on the deltas of large rivers flowing from the Himalayas. The Brahmaputra River, known locally as the Jamuna, unites with part of the Ganges to form the Padma, which, after its juncture with a third large river, the Meghna, flows into the Bay of Bengal. Offshoots of the Ganges-Padma, including the Burishwar, Garai, Kobadak, and Madhumati, also flow south to the Bay of Bengal. No part of the delta area is more than 150 m (500 ft) above sea level, and most of it is but a meter or two (a few feet) above sea level. Its soil consists mostly of fertile alluvium, which is intensively farmed; mineral deposits are negligible. During the rainy season floodwater covers most of the land surface, damaging crops and injuring the economy. The northwestern section of the country, drained by the Tista (Teesta) River, is somewhat higher and less flat, but the only really hilly regions are in the east, notably in the Chittagong Hill Tracts to the southeast and the Sylhet District to the northeast. Near the Myanmar border, in the extreme southeast, is the Keokradong, which at 1,230 m (4,034 ft) is the highest peak in Bangladesh.

## <sup>3</sup>CLIMATE

Bangladesh has a tropical monsoon climate. Annual rainfall is high, averaging from about 119 cm (47 in) up to 145 cm (57 in). There are three distinct seasons. The winter, which lasts from October through early March, is cool and dry, with temperature ranges from 5°C to 22°C (41°F to 72°F); total winter rainfall averages about 18 cm (7 in) in the east and less than 8 cm (3 in) in the northwest. Temperatures rise rapidly in March, and during the summer season—March through May—average about 32°C (90°F). Rainfall also increases during this period. However, nearly 80% of the annual rainfall falls from May to September, the monsoon season, when moisture-laden winds blow from the south and southeast. Temperatures drop somewhat, seldom exceeding 31°C (88°F), but humidity remains high. In April through June and from October through November, tropical cyclones, accompanied by high seas and heavy flooding, are common. There were cyclones in May 1963, May and December 1965, October 1966, and most notably during the night of 12–13 November 1970, when a storm and resultant flooding killed more than 200,000 persons. A cyclone on 30 April 1991 left over 131,000 people dead and nine million homeless. Monsoon floods in 1974, 1980, and 1983 also devastated the country and caused many deaths, and a cyclonic storm on 24–25 May 1985 took more than 11,000 lives. The monsoon in August and September 1988 left three-fourths of the country flooded, 1,300 persons dead, and over three million people homeless, with damage to the country's infrastructure estimated at \$1 billion.

## <sup>4</sup>FLORA AND FAUNA

Bangladesh has the plant and animal life typical of a tropical and riverine swamp. The landscape, which for most of the year is lush green, is dotted with palms and flowering trees. The large forest area of the Sunderbans in the southwest is the home of the endangered Bengal tiger; there are also cheetahs, leopards, crocodiles, elephants, spotted deer, monkeys, boars, bears, pheasants, and many varieties of birds and waterfowl.

## 5 ENVIRONMENT

Overpopulation has severely strained Bangladesh's limited natural resources. Nearly all arable land is already cultivated and forestland has been greatly reduced by agricultural expansion and by timber and firewood cutting. Between 1983 and 1993, forest and woodland declined by 12.5% to 1.9 million ha (4.7 million acres). As of 1995, total forest area was only 1 million ha. Bangladesh's environmental problems have been complicated by natural disasters that add to the strain on an agricultural system which supports one of the world's most populous countries. Water supply is also a major problem because of population size, lack of purification procedures, and the spread of untreated contaminants into the usable water supply by flood waters. To ease these problems, the government has established drainage, irrigation, and flood protection systems, and has drilled thousands of tube wells to supply safe drinking water in villages. As of 2001, safe water was available to 100% of the population.

Despite passage of the Wildlife Preservation Act of 1973, wildlife continues to suffer from human encroachment. Only 0.7% of the country's total land area is protected. In 2001, 18 species of mammals, 30 species of birds and 18 plant species were considered endangered, including the Asian elephant, pygmy hog, Sumatran rhinoceros, Bengal tiger, estuarine crocodile, gavial, and river terrapin.

## 6 POPULATION

The population of Bangladesh in 2003 was estimated by the United Nations at 146,736,000, which placed it as number 7 in population among the 193 nations of the world. In that year approximately 3% of the population was over 65 years of age, with another 40% of the population under 15 years of age. There were 105 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.02%, with the projected population for the year 2015 at 181,428,000. The population density in 2002 was 928 per sq km (2,403 per sq mi).

It was estimated by the Population Reference Bureau that 25% of the population lived in urban areas in 2001, up from 11% in 1980. The capital city, Dhaka, had a population of 11,726,000 in 2002. Other large cities are Chittagong, Khulna, Rajshahi, Barisal, Rangpur, and Jessore. According to the United Nations, the urban population growth rate for 2000–2005 was 4.0%. The population is still heavily rural, with the great majority living in more than 85,000 villages.

Bangladesh is one of the world's most densely populated nations, and controlling population growth is a major government priority. The annual population growth declined from 3.4% in 1975 to 2.2% in 1991 to an estimated 1.9% in 1996. However, the growth rate is on the rise, and the country remains vastly impoverished. Life expectancy is 59 years, and infant mortality rates remain high.

## 7 MIGRATION

Since 1947 there has been a regular interchange of population between India and what is now Bangladesh, with Hindus migrating to India and Muslims emigrating from India. There was also substantial migration between Bangladesh (then East Pakistan) and West Pakistan until the 1971 war. Before and during the war, an estimated 8 to 10 million Bengalis fled to India; most of these refugees returned after the independence of Bangladesh was firmly established. Although more than 100,000 *Biharis* who had sided with Pakistan during the war later migrated to Pakistan, an estimated 238,000 *Biharis* were still living in 66 refugee camps in Bangladesh at the end of 1993, despite a repatriation agreement signed in 1992.

In 1993, repatriation began of an estimated 56,000 Chakma refugees from the Indian state of Tripura to the Chittagong Hill

Tracts of Bangladesh. They had fled unrest in this area. As of May 1997, 47,000 Chakma refugees still live in northeastern India. In 1991–92 about 265,000 Rohingyas—Muslims from Myanmar—fled to Bangladesh to escape repression. Beginning in 1994, over 200,000 of these refugees have returned home to Myanmar (Burma). However, as of 1999, around 22,000 Myanmar refugees still resided in southern Bangladesh in two camps. The repatriation process was suspended in 1997 but resumed in 1998. Nevertheless, the number of returns has been very limited (only 450 between 1998 and 1999) due to procedural difficulties. The UN has urged the governments of both Bangladesh and Myanmar to accelerate the process. Also, talks have been initiated regarding refugee self-reliance programs for those refugees who cannot or will not return. Reforestation and community support activities have been discussed as possible ways to lessen any adverse consequences of refugee presence. Bangladeshi authorities have not responded favorably to the proposed self-reliance programs for refugees, reiterating their position that all refugees must return to their homeland.

As of 2000, there were approximately 988,000 migrants living in Bangladesh. The net migration rate was -0.5 per 1,000 population. The government viewed the emigration level as too low, and the immigration level was deemed satisfactory.

## 8 ETHNIC GROUPS

Some 98% of the people are Bengalis (or Banglas). About 12 tribes inhabiting the Chittagong Hill Tracts, collectively totaling less than one million people, are ethnically distinct from the Bengalis; their facial features and language are closer to the Burmese. The government's policy of resettling Bengalis in the region, which is much less densely populated than Bangladesh as a whole, led to racial and religious disturbances and a small-scale tribal insurgency in the early 1980s. About 250,000 of the national population consists of *Biharis*, non-Bengali Muslims who migrated from India to what was then East Pakistan after the partition of the subcontinent in 1947. In the coastal areas of Bangladesh, Arab, Portuguese, and Dutch settlers have gradually come to adopt the Bengali life-style.

## 9 LANGUAGES

Bengali (Bangla), part of the Indo-European language family, is the official language of Bangladesh and is spoken by about 98% of the population. The successful move to make Bengali coequal with Urdu as an official language was a hallmark of Bengali nationalism in the early 1950s. Non-Bengali migrants from India still speak Urdu (and Hindi) today, and this language is widely understood in urban areas. A few tribal groups, notably the tribal peoples of the Chittagong Hill Tracts, also speak distinct Tibeto-Burmese languages, akin to Burmese and Assamese. Among those speaking Bangla there are differences of dialect according to region. The people of Chittagong, Noakhali, and Sylhet are known for their distinctive dialects. Although today Bangla is the official language, English is also used for official and legal purposes and widely used in business.

## 10 RELIGIONS

Nearly 88% of the people are believers in Islam (mostly Sunni), making Bangladesh one of the world's largest Muslim countries. Most of the remaining population, about 10% are Hindu; the remaining 1.2% are mainly Buddhist or Christian, the latter evenly divided between Roman Catholics and Protestants. There are small numbers of Shi'a Muslims, Sikhs, Baha'is, Ahmadis, and animists. Although Islam was established as the state religion in 1988, freedom of worship continues to be guaranteed under its constitution.

LOCATION: 20°34' to 26°38' N; 88°1' to 92°41' E. BOUNDARY LENGTHS: India, 4,053 kilometers (2,553 miles); Myanmar, 193 kilometers (122 miles); Bay of Bengal coastline, 580 kilometers (324 miles). TERRITORIAL SEA LIMIT: 12 miles.

## 11 TRANSPORTATION

The large number of rivers and the annual flooding hazard make it difficult to build and maintain adequate transportation facilities in Bangladesh. Railways and waterways are the chief means of transportation. The railways are managed by the government and reach most districts of the country. The Bangladesh Railway operated 2,745 km (1,706 mi) of track in 2002. The quality of service has declined because of the expense of importing new equipment. Enlarging and improving the railway system is also costly, partly because of the number of bridges needed.

The country has two deepwater ports: Chittagong, serving the eastern sector, and Chalna, serving the west. There are five main river ports—Dhaka, Nārāyanganj, Chandpur, Barisal, and Khulna—and more than 1,500 smaller ports. The inland water system has an estimated 5,150-8,046 km (3,200-5,000 mi) of navigable waterways, including 2,575-3,058 km (1,600-1,900 mi) of main cargo routes. The oceangoing merchant fleet in 2002 consisted of 34 ships of 1,000 GRT or over, with a combined capacity of 269,932 GRT.

Road connections are inadequate, but conditions have improved significantly in recent years. There were 201,182 km (125,014 mi) of roadways in 2002, of which 19,112 km (11,876 mi) were paved. A large part of the highway system becomes submerged in the rainy season; bridges, ferries, embankments, and dikes are therefore necessary to the inland transportation system. Because of the difficulties of land travel, the number of motor vehicles remains relatively small.

Bangladesh had 18 airports in 2001, 15 with paved runways. Zia International is the principal airport, located at Dhaka. Bangladesh Biman is the national airline. It has an extended network connecting major cities and operates international flights from Dhaka. In 2001, airlines carried 1,450,000 domestic and international passengers.

## 12 HISTORY

In ancient times, the area now known as Bangladesh was the eastern portion of a huge river delta region called Bang, where the Ganges and Brahmaputra River systems empty into the Bay of Bengal and the Indian Ocean. The region became known as Bengal in more modern times, but recorded history of the region can be traced to the 4th century BC when it was home to an apparently flourishing riverain civilization. The oldest surviving remains of this civilization are the ruins of the city of Mahasthan, the ancient Pundranagar, which continued to flourish for more than 1,500 years, even though the region was conquered by the Hindu Maurya empire that reached its height under Emperor Asoka around 207 BC. From this time onward, the history of Bengal was part of the wider historical experience of the Indian subcontinent, and during most of India's classical Hindu period—AD 320 to AD 1000—Bengal was a loosely incorporated outpost of empires centered in the Gangetic plain.

Islam came to South Asia in the years following AD 800 but did not reach Bengal until Muslim invaders from the west secured a foothold there around AD 1200. In the 13th and 14th centuries, after successive waves of Turkish, Persian, and Afghan invaders, Islam began to take a firm hold in the area that is now Bangladesh. The region was annexed by the Mughal Empire in 1576 under the Muslim Akbar and ruled by his successors into the 17th century. The fealty lesser Nawabs (or Nabobs) of the Bengal area paid to the Mughals ensured the political stability and economic prosperity of the region, which became known for its industries based on the weaving of silk and cotton cloth.

The arrival of the French and British East India Companies in the early 18th century coincided with Mughal decline, the death of Emperor Aurangzeb, and an intense period of competition and conflict between Britain and France. By the middle of the 18th century, the British emerged supreme in what they created as the Bengal Presidency, establishing themselves in Calcutta and expanding with alacrity into all of what is now Bangladesh, as well as the Indian states of West Bengal, Bihar, Assam and Orissa. From Calcutta, British traders and administrators successfully played off rivalries among the satraps of the late Mughal empire to gain control of most of the subcontinent in the years between the Battle of Plassey in 1756 and the assumption of the company's domain by the British Crown in 1859. Calcutta remained the seat of British power in the subcontinent and the center of British control over the Indian Empire until 1931 when

the capital was moved to the new city of New Delhi, adjacent to the traditional seat of Mughal power in old Delhi.

In general, Hindus in Bengal prospered under the British, apparently taking more easily to British ways and British law than the numerically dominant Muslims. The Muslim aristocracy of eastern Bengal—feudal barons under the Mughals—resisted British rule. By the turn of the 20th century, both communities had begun to develop a political-cum-cultural consciousness of their own in reaction to the Western culture brought by the British. They took offense at British efforts to impose western educational systems on local universities, reducing their independence. Hindus were further enraged by the British decision in 1905, in an effort to improve administration and to placate Muslims, to divide the overly large Bengal Presidency in two, with the Muslim-dominant area of eastern Bengal and Assam to be a separate province. The 1905 partition was the first acknowledgment of a sense of separateness among Muslims by the British and foreshadowed events of 42 years later when Bengal was divided between Muslim-majority and Hindu-majority districts to create East Pakistan.

The 1905 action was strongly opposed by Bengali Hindus and resulted in increasing acts of violence. This lasted until it was undone six years later in favor of reuniting Bengal and instead separating out what would become the provinces of Orissa and Bihar. But the agitation provoked by the 1905 partition and the Hindu-Muslim enmities it left behind continued to provoke terrorist actions against British rule until headed off by the evolution of nonviolence as a mode of political struggle, as later enunciated in the cause of Indian self-rule by Mohandas (Mahatma) Gandhi of the Indian National Congress.

British reforms in 1909 and 1919 expanded local self-rule in their Indian domains, but the pace fell short of the pace of demands put forth by the rising tide of nationalists espoused by the Indian National Congress, which in 1929 committed itself to the goal of complete independence. As the struggle gained momentum, the majority Hindu and minority Muslim communities in India as a whole began to divide on the eventual “end game.” While the majority Hindu community saw a single Indian polity committed to secularism and diversity as the goal of the independence movement, Muslims came to fear that their community would be a permanent electoral minority, an anxiety they saw borne out in the 1937 elections held under British auspices. To look after their unique cultural interests, they formed the All-India Muslim League, and under the Muslim League leadership, sentiment began to coalesce around the “two nation” theory propounded earlier by the poet Iqbal, a belief that South Asian Muslims and Hindus were and should be two separate nations, i.e. that Muslims required the creation of an independent nation of their own—Pakistan—in which they would predominate. In 1940, the Muslim League adopted this as its goal, under the leadership of Mohammad Ali Jinnah, a Mumbai (formerly Bombay) attorney who resisted all efforts at compromise through all the difficult days leading up to the grant of independence in 1947.

In language, culture, ethnic background, population density, political experience, and economic potential, East and West Pakistan were totally disparate—the main bonds being Islam and a fear of potential Indian (Hindu) revanchism. Pakistan’s early years as a nation were dominated by unsuccessful attempts—punctuated by bouts of authoritarian rule—to create a national polity that would somehow bridge these differences. Larger in population and in economic importance than the west wing, the Bengali east wing chafed under national policies effectively dominated by the leadership residing in the west wing. When its influence was further reduced under repeated bouts of martial law and by the reconstruction of West Pakistan as a single province, demands for autonomy in the east began to mount. This insistent demand for autonomy in East Pakistan proved

more than the fragile sense of Islamic nationhood could sustain. The new state of Pakistan, made up of Muslim-majority districts in both eastern and western reaches of formerly British India, was at best an unwieldy creation. It cut across long-established lines of trade and communication, divided families, provoked a mass movement of millions of refugees caught on the “wrong” side of the partition markers, and forced the creation of a new but divided polity. Pakistan consisted of two distinct territories, separated by 1,600 km (1,000 mi) of secular but predominantly Hindu India. West Pakistan, with a population of 34 million, consisted mainly of the former provinces of Baluchistan, Sindh, the Northwest Frontier, and (partially) Punjab (which, like Bengal, was also partitioned). East Pakistan, its 42 million people including nearly 9 million Hindus, encompassed the eastern half of Bengal province as shaped in 1912, plus the Sylhet District of Assam.

### Nationhood

After yet another round of martial law in Pakistan in 1969, national elections were scheduled for 1970. But when the popular verdict in those elections—even in the national assembly—supported greater autonomy for East Pakistan than the West Pakistan-dominated national leadership was prepared to accord, the results were set aside.

Subsequent civil unrest escalated quickly to civil war in East Pakistan. Swamped with a million refugees from the fighting, India intervened militarily in December 1971, tipping the scales in favor of the rebels and facilitating the creation of Bangladesh in 1972. Sheikh Mujibur (Mujib) Rahman, leader of the Awami League and of the fight for autonomy, was released from prison in West Pakistan (which became the Islamic Republic of Pakistan) and became prime minister of the new nation of Bangladesh.

The 1971 civil war was a disaster for Bangladesh, undoing much of the limited progress East Pakistan had made in recovering from the socioeconomic disruption of the 1947 partition. The charismatic Mujib faced a task for which his administrative and political experience was lacking. He fought and won a massive victory at the polls in 1973, but two years later, he suspended the political process and took power into his own hands. Bangla opinion turned against Mujib, coalescing two main opposition groups that otherwise shared little in common besides their opposition to Mujib and to Indian influence: they were the ultra conservative Islamic groups, led by the Jamaat-i-Islami, and the radical left, led by Maoists, who opposed both Indian and Soviet influence.

On 15 August 1975, a group of young military officers seized power, killing Mujib and many of his family members and imposing martial law. A counter-coup three months later produced a new military government with Gen. Zia-ur Rahman at its head. In 1978, with limited political activity permitted, he was elected president and lifted martial law. In February 1979, he restored parliamentary government after elections gave his new party, the Bangladesh National Party (BNP) a two-thirds majority in the National Assembly.

Zia’s assassination during an abortive military coup in May 1981 set back the progress he had made. He was succeeded in power by his vice president, Abdus Sattar, who was deposed the following March by his army chief, Gen. Hussain Mohammad Ershad. Declaring martial law, Ershad became Chief Martial Law Administrator (CMLA), suspended the 1972 constitution, and banned political parties.

Ershad gained support by cracking down on corruption and opening up the economy to foreign collaboration. In 1983, he assumed the presidency, and by January 1986, he had restored full political activity in which his own party, the Jatiya (People’s) Party took a prominent part. He retired from the army and was elected president without opposition in October 1986, but in July 1987, mounting opposition to his often dictatorial rule among

the united opposition parties led him again to declare a state of emergency, dissolve the assembly, and schedule new elections for March 1988. His Jatiya Party triumphed in those elections, due mainly to the refusal of the opposition parties to participate. At the end of 1990, in the face of widespread demonstrations and some Hindu-Muslim violence, his opposition had grown so strong that Ershad was forced to resign the presidency, turning the government over to Supreme Court Chief Justice Shahabuddin Ahmed, the unanimous choice of the opposition parties.

An interim government scheduled elections for February 1991, and the result—in what has been described as the fairest polling ever held in the country—was the election of an assembly in which the BNP, now headed by Begum Khaleda Zia-ur Rahman, Zia's widow, held a plurality. However, the BNP lost popular support by March 1994, when opposition parties walked out of Parliament and boycotted the government, claiming the BNP had rigged a regional election. The main opposition groups—the Awami League (AL), Jatiya Party, and the Jamaat-e-Islami—continued the protest for two years, boycotting February 1996 elections swept by the BNP. Amid further charges of vote-rigging, Khaleda Zia resigned, the BNP dissolved Parliament, and a caretaker government conducted new elections in June 1996. The Awami League, led by Sheikh Hasina Wajed, daughter of the Sheikh Mujid, gained control of Parliament in the elections, contested by all parties and monitored by international observers. Although initially dependent on the support of the Jatiya Party to form a government, by late September the Awami League held an absolute majority of seats in the legislature.

Prime Minister Sheikh Hasina had no easier time ruling Bangladesh than her predecessor. Her government faced continuing protests, strikes, and often violent demonstrations organized by the BNP and other opposition parties. Targets for such actions included the government's historic agreement with India in December 1996 over sharing the waters of the River Ganges, higher taxes imposed by the government in July 1997, and problems of law and order in the country. During September 1997, Islamic militants took to the streets demanding the arrest and execution of controversial Bangladeshi author Taslima Nasreen. November 1998 saw a general strike organized by the BNP over alleged government repression and clashes between police and protesters over alleged electoral fraud. Tensions were heightened by the conviction and death sentences passed on several people involved in the assassination of Sheikh Hasina's father, Sheikh Mujib.

In August 1998, Bangladesh also saw some of the worst flooding in the country's history. Over 1,000 people died and flood waters covered some 60% of the country. Loss of crops raised the specter of widespread famine, and the total damage to the country's economy and infrastructure was estimated at over US\$2 billion.

Among the AL government's achievements, however, were the Ganges water-sharing treaty, the December 1997 accord that ended the tribal insurgency in the Chittagong Hill Tracts (CHT) in southeastern Bangladesh, and a restructuring of local government to increase grassroots involvement in politics. On the international stage, Bangladesh was elected to serve a two-year term on the Security Council of the United Nations, effective 1 January 2000. Bill Clinton became the first US president to visit Bangladesh when he stopped there during his South Asia tour in March 2000.

In December 2000, Bangladesh expelled a Pakistani diplomat for stating that the number of dead in the 1971 war was 26,000, whereas Bangladesh holds that nearly three million were killed. Bangladesh wanted Pakistan to apologize for the alleged genocide it says Pakistani forces were guilty of during the 1971 war. In July 2002, Pakistan's President Gen. Pervez Musharraf visited Dhaka, and made an apology for excesses committed in Bangladesh's war

for independence. His visit was seen as an attempt to build bridges with a country that regards Pakistan as a former colonizer.

A series of bombings beset Bangladesh during 2001, in April, June, and September. In total, 155 people were killed and more than 2,500 were injured in violence leading up to the October 2001 parliamentary elections. In July, Prime Minister Hasina stepped down, handing power over to a caretaker authority that supervised the upcoming elections; she became the first prime minister in the country's history to complete a full five-year term. Former Prime Minister Khaleda Zia won a landslide victory on 1 October 2001, campaigning against lawlessness and corruption, in an election in which 75% of the registered voters went to the polls. The Awami League boycotted Parliament, protesting alleged rigging of elections and the persecution of religious minorities.

In March 2002, the government enacted tough laws to combat the use of corrosive acid to disfigure and sometimes kill individuals, mostly women. The death penalty was set as the maximum sentence in some cases. In 2001, 338 acid attacks were carried out in Bangladesh, 90% of them against women. Most of the acid victims have had sulphuric or hydrochloric acid splashed on their faces.

In June 2002, the Awami League ended its boycott of Parliament, and attended for the first time since losing in the October 2001 elections. Also in June 2002, President Badruddoza Chowdhury resigned, after being criticized for not visiting the grave of the BNP's founder, Zia-ur Rahman. That October, Prime Minister Zia called out the army to contain terrorist attacks throughout the country in the absence of adequate logistic support from the police. The army was also directed to curb crime and corruption. As many as 44 people died in custody in the drive lasting from 16 October 2002 to 9 January 2003. Zia granted immunity to the armed forces for their actions during that period, a decision that was highly criticized by the opposition Awami League.

Bangladesh's history of political violence continued in 2002, when bomb explosions in four cinemas killed 17 people and injured 300 among families celebrating the end of Ramadan. The government arrested 39 members of the Awami League in connection with the explosions.

### 13 GOVERNMENT

Bangladesh inherited the provincial government under which first the Dominion, then Republic, of Pakistan was governed, a parliamentary system based on the Westminster model with a unicameral legislature. Following this model, the constitution of December 1972 established a unitary, democratic republic, with an indirectly elected president as nominal head of state and a prime minister as head of government and chief executive. The prime minister and his government are responsible to a unicameral legislature—the National Assembly—elected no less frequently than every five years and composed of 300 members. (A constitutional amendment reserving 30 additional parliamentary seats for indirect election of women expired in May 2001.) The constitution incorporated four basic principles of state policy: nationalism, secularism, socialism, and democracy. With considerable controversy, because of its impact on the nearly 17% of the population which is non-Muslim, Islam replaced secularism as a state principle by constitutional amendment in 1977.

The constitution was amended in 1975, at the initiative of Prime Minister Mujibur Rahman, to abrogate most guarantees of civil liberties, to establish a one-party polity, and to make the presidency, rather than the prime ministership, the chief executive of the government. Mujib's assassination later that year, and the counter coup that occurred three months later resulted in a four-

year suspension of the constitution by Bangladesh's martial law ruler, Gen. Zia-ur Rahman.

Rahman himself was assassinated in 1981, and in the turmoil that ensued, General H. M. Ershad seized power. Ershad declared himself president in 1982, and held office until 1990, when increasing antigovernment protests and violence resulted in his resignation. He was later jailed on corruption charges. The interim government then conducted what most observers regard as the most free and fair elections ever held in Bangladesh, in 1991.

Among her first acts as prime minister (the first woman to hold that position in Bangladesh), Begum Khaleda Zia-ur Rahman, widow of General Rahman and the head of his Bangladesh Nationalist Party, reversed from her former position in favor of retaining a strong presidential system to restore the parliamentary system of 1972 and to return to the prime ministership the powers removed by Mujib in 1975. She led the campaign with strong Awami League support, which resulted in overwhelming parliamentary approval of a constitutional amendment. Khaleda Zia was forced to step down in March 1996, after two years of political turmoil following an opposition boycott of Parliament and elections. The opposition AL, which claimed the BNP had rigged two elections, was swept into power in the internationally monitored elections of June 1996. Sheikh Hasina Wajed then formed a coalition majority in Parliament with the Jatiya Party. By September 1996, with several victories in by-elections, the Awami League controlled an absolute majority of seats in Parliament. The government was thus unaffected by the Jatiya Party's withdrawal from the coalition in March 1997.

Parliamentary elections held 1 October 2001 resulted in a return of Hasina's bitter enemy Khaleda Zia to power. The BNP took 201 seats, the AL held 62, Jamaat-e-Islami held 18, and the Ershad faction of the Jatiya Party took 14 seats. The majority BNP government aligned with three of the smaller parties, Jamaat-e-Islami, Islami Oikya Jote, and the Naziur faction of the Jatiya Party. Elections are next to be held before October 2006. The Jamaat-e-Islami party is sympathetic to Osama bin Laden, a position that was controversial, especially after the 11 September 2001 terrorist attacks on the United States attributed to him. Zia attempted to quell domestic and international unease resulting from this position, asserting that Bangladesh would not become a fundamentalist Islamic state. However, her three coalition partners advocate replacing Bangladesh's secular laws with Islamic law, or *Shari'ah*.

## 14 POLITICAL PARTIES

From 1947 through the end of 1971, East Pakistan—now Bangladesh—was governed as a single province, one of the two wings of Pakistan. In all, there were more than 30 political parties operating in the east wing, most of them small, fractious, and with few elected members. The major parties at that time operated on the all-Pakistan level as well, and included the moderate Pakistan Muslim League (PML), a national movement that became the party of independence and the ruling party of Pakistan; the moderate socialist Awami (Freedom) League (AL), a spin-off from the Muslim League and the advocate of Bengali autonomy, with the bulk of its support in the east wing; the ultraconservative Islamic Jamaat-e-Islami (JI), grounded in Sunni Islamic orthodoxy (in Pakistan as in India) and initially opposed to the 1947 partition; and the leftist peasants and workers party, the Krishak Sramik Party (KSP) of Fazlul Haq. The Communist Party of Pakistan (CPP) was banned in 1952 and remained illegal until its east wing component became the Bangladesh Communist Party (BCP) after 1971.

The PML governed East Pakistan from 1947, but in elections in 1954, the Awami League and the Krishak Sramik, supported in a United Front by the Jamaat, ousted the Muslim League from office. After four years of political instability, however, the two

parties were displaced by the central government under "Governor's Rule," and the emergency provisions of the 1935 Government of India Act, then Pakistan's constitution. When the East Pakistan government was restored in August 1955, the KSP ruled in its own right until displaced by an AL government headed by Maulana Bhashani in 1956. Loss of Hindu support in 1958 cost the AL its majority in 1958, but "Governor's Rule" was again imposed, the provision having been carried over into the 1956 Pakistan Constitution. Martial law was imposed in Pakistan in 1965 and in elections held thereafter, under a limited political franchise, the Muslim League, now a shadow of its former self and the vehicle for General Ayub Khan's entry into elective politics, came to power briefly. Imposition of martial law in 1969 suspended political activity again until the scheduling of elections in 1970 restored political activity.

By 1970, the moderate-to-left populist Pakistan People's Party (PPP) of Zulfikar Bhutto, and the Awami League of Sheikh Mujibur Rahman, now advocating far-reaching autonomy for East Bengal, had become the dominant political forces, respectively, in West and East Pakistan. Elections confirmed this position, with the AL winning 167 of East Pakistan's 169 seats in the National Assembly and absolute control in East Pakistan. The AL was the only constituent in the Bangla Government-in-Exile in 1971, with leftist parties in support and Islamic parties in opposition. After independence, the Islamic party leaders were jailed, their parties having been banned, and in 1973, Mujib's Awami League elected 293 members of the 300-elective seats in the Assembly.

In January 1975, with his power slipping, President Mujib amended the constitution to create a one-party state, renaming his party the Bangladesh Krishak Sramik Awami League (BKSAL). After the coup later in 1975, the BKSAL was disbanded and disappeared. When Zia-ur Rahman lifted the ban on political parties in 1978, his presidential bid was supported by a newly formed Nationalist Front, dominated by his Bangladesh National Party (BNP), which won 207 of the assembly's 300 elective seats. All political activity was banned anew in March 1982 when Gen. Ershad seized power, but as he settled into power, Ershad supported the formation of the Jatiya (People's) Party, which became his vehicle for ending martial law and transforming his regime into a parliamentary government. In elections marked by violence and discredited by extensive fraud, Ershad's Jatiya Party won more than 200 of the 300 elective seats at stake. The Awami League, now under the leadership of Mujib's daughter, Sheikh Hasina Wajed, took 76 seats as the leading opposition party. Begum Khaleda Zia's BNP, heading an alliance of seven parties, boycotted the elections and gained considerable respect by this action. The BNP, the AL, and all other parties boycotted Ershad's 1988 election as well, discrediting the result that gave the Jatiya a two-thirds majority and fueling the fires of discontent that led to Ershad's resignation on 4 December 1990. Ershad was arrested on corruption charges eight days later by the interim government, convicted, and imprisoned on corruption charges.

A BNP plurality in the elections on 27 February 1991 enabled Begum Khaleda Zia to form a government with the support of 28 of the appointive members of the assembly and of the JI, which won 18 seats. The leader of the opposition is Sheikh Hasina Wajed of the Awami League (AL), which won 88 seats to claim the second ranking position in the assembly. However, Khaleda Zia resigned and Parliament was dissolved in March 1996 amid vote-rigging charges and a two-year government boycott by opposition parties. June 1996 elections brought Sheikh Hasina and the AL to a majority role in the new Parliament. The AL won 140 seats to the BNP's 116. New Prime Minister Hasina formed a cooperative government with the Jatiya Party, which won 32 seats. Although the Jatiya Party withdrew from the coalition in March 1997, the Awami League had by then acquired an

absolute majority in the legislature and continued as the party in power.

After October 2001 parliamentary elections swept Khaleda Zia's BNP to power, ousting the Awami League of Hasina Wajed, concern was raised over the political stance of one of Zia's coalition partners, the Jamaat-e-Islami party, which voices support for Osama bin Laden. Zia's three coalition partners in the government formed in 2001, Jamaat-e-Islami, Islami Oikya Jote, and the Naziur faction of the Jatiya Party, are all Islamic parties advocating a return to Islamic law, or Shari'ah. Zia, however, granted the US-led military coalition the use of Bangladesh air space and other help for its attacks on bin Laden and his al-Qaeda training camps in Afghanistan in 2001–2002, approving of the US-led war on terrorism. Hasina's Awami League supports secularism. From 1997 to 2001, the main opposition party, the BNP, hindered the work of the Jatiya Sangsad (Parliament) by repeatedly boycotting its proceedings. One such boycott, over issues ranging from restoration of a floating footbridge to Zia-ur Rahman's tomb to the dropping of criminal charges against BNP MPs, lasted for six months (August 1997–March 1998). Outside Parliament, the BNP continued to support public antigovernment demonstrations, and organized a three-day general strike (*hartal*) in November 1998 to protest alleged government repression. A month later, the opposition strengthened its position when the BNP and the Jamaat-e-Islami decided to accept Ershad and his Jatiya Party into the anti-government movement. In the spring of 2000, a four-party alliance of opposition parties (BNP, Jatiya Party, Jamaat-e-Islami, and Islami Oikyo Jote) announced it was considering plans to form an electoral coalition to oppose the Awami League in the next general elections.

## 15 LOCAL GOVERNMENT

As a unitary state, the key administrative unit in Bangladesh is the region (also referred to popularly as the district), of which there are 21 in all. For administrative convenience, regions are grouped into (and report through) six divisions (Barisal, Chittagong, Dhaka, Khulna, Rajshahi, and Sylhet), under a senior civil servant with the title of division commander (formerly commissioner).

Regions or districts are under the charge of a senior civil servant with the title of deputy commissioner; they are appointed by the national government and are vested with broad powers to collect revenues and taxes, assist in development activities, and maintain law and order. As of 1985, regions or districts were subdivided into *zilas*; in urban areas, these were further broken down into municipalities, wards, mohallas, and thanas, while in rural areas, the breakdown was into upazilas (sub-districts), unions, mouzas, and villages.

In 1997, Bangladesh reorganized its local government structure in rural areas. New legislation created a four-tier local government system: gram (village), union (collection of villages), upazila (subdistrict), and zila (district) councils. The purpose of this reorganization was to democratize government at the grass roots level in a process that, in theory at least, is nonpartisan. Elections for union parishads (councils) held in December 1997 created widespread interest, with particularly high levels of participation from women, both as candidates as well as voters. Other legislation made the upazila level the most important tier in local government, giving the upazila council power to collect revenue, prepare its own budget and hire its own employees. The restructuring of local government in Bangladesh is an ongoing process aimed at increasing popular participation in the governmental process.

## 16 JUDICIAL SYSTEM

The judicial system, modeled after the British system, is similar to that of neighboring countries. Besides the 1972 constitution, the

fundamental law of the land, there are codes of civil and criminal laws. The civil law incorporates certain Islamic and Hindu religious principles relating to marriage, inheritance, and other social matters.

The constitution provides for an impartial and independent judiciary. After the 1982 coup, the constitution was suspended, martial law courts were established throughout the country, and Lieut. Gen Ershad assumed the power to appoint judges. The constitution was reinstated in November 1986.

The judicial system consists of a Low Court and a Supreme Court, both of which hear civil and criminal cases. The Low Court consists of administrative courts (magistrate courts) and session judges. The Supreme Court also has two divisions, a High Court which hears original cases and reviews decisions of the Low Court, and an Appellate Court which hears appeals from the High Court. The upper level courts have exercised independent judgment, recently ruling against the government on a number of occasions in criminal, civil and even political trials. The trials are public. There is a right to counsel and right to appeal. There is also a system of bail. An overwhelming backlog of cases remains the major problem of the court system.

The government, with the help of the World Bank, has undertaken an ambitious project to reform the judicial system. Changes include the creation of "Legal Aid Committees" to provide assistance to the poor, as well as the establishing of Metropolitan Courts of Sessions in Dhaka and Chittagong. In March 2001, the World Bank announced the approval of a US\$30.6 million credit to assist Bangladesh in making its judicial system more efficient and accountable. A permanent Law Commission has been created to reform and update existing laws, and the government is committed to establishing a Human Rights Commission as well as an Office of the Ombudsman.

## 17 ARMED FORCES

In 2002, Bangladesh had an army of 120,000, a navy of 10,500, and an air force of 6,500. Paramilitary forces of border guards, armed police, and security guards totaled 63,200. Bangladesh is attempting to improve naval command primarily to combat piracy. The military budget in 1996–97 was \$559 million or 1.8% of GDP.

Bangladesh participated in eight UN peacekeeping missions.

## 18 INTERNATIONAL COOPERATION

Bangladesh joined the UN on 17 September 1974; it belongs to ESCAP and all the nonregional specialized agencies. A member of the Asian Development Bank, the Commonwealth of Nations, and G-77, Bangladesh participates in the nonaligned movement and in international Muslim organizations and conferences. The nation is a signatory to the Law of the Sea and a member of the WTO. In 1985, Bangladesh became one of seven constituent members of the SAARC, under which it is a signatory to the South Asia Preferential Trade Agreement. In 1997, Bangladesh signed an agreement with India on sharing water from the Ganges River.

Soon after independence, Bangladesh signed a friendship treaty with India, but the new leaders after the 1975 coup instituted a policy of equal cooperation with other neighboring countries. Pakistan recognized Bangladesh in February 1974, and the two have developed close relations, their past differences notwithstanding. Generally, Bangladesh follows a nonaligned foreign policy and in recent years has sought closer relations with other Islamic states, ASEAN, and China. Bangladesh also continues a healthy relationship with the United States, with which it has bilateral trade agreements. In 1995, the country's trade exporters association signed an agreement with the United Nations Children's Fund and the International Labour Organization (ILO) under which industry's rampant use of child labor would be eliminated.

In December 2002, Prime Minister Khaleda Zia travelled to China. One topic that was discussed during her visit was the idea of a “growth quadrangle” to promote accelerated economic exchanges between the Yunnan province of China, Myanmar, India’s Northeast, and Bangladesh. The “Kunming Initiative” was the source of this idea, an outgrowth of ASEAN.

## 19 ECONOMY

Bangladesh is situated on a river delta and has few natural resources beyond its very rich soil. With the highest population density of any country except city-states like Singapore, its cultivated land is overcrowded, undercapitalized, and dominated by subsistence farmers working uneconomically small plots. Over 60% of the country’s total land area is cultivated and about 63% of the economically active population derive their livelihood from farming. Growth rates have not been high enough to eliminate a substantial incidence of poverty, estimated at over a third of the population in 2000. Underweight children under five years old as a percent of the total dropped only 10%, from 66% to 56% between the period 1990–92 and 1998–99. Nevertheless, signs of modest improvement in the economy have been evident during the past decade, despite periodic weather disasters, to which Bangladesh remains vulnerable, and international market conditions. Agriculture still accounts for almost 30% of the GDP, although this proportion has dropped significantly from 50% in 1979/80, as services have grown from 34.4% to 52%. Industry’s share has increased only from 15.9% to 18%, according to CIA estimates.

The prospect of return to elected government in 1990 helped produce an upsurge in growth in 1989/90 of 6.6%, but in 1990/91 the combined effects of the Gulf War, domestic political disturbances, and a devastating cyclone resulted in a drop in GDP growth rate 3.4%. Pursuit of further stabilization and structural adjustment measures by the government in 1991 allowed Bangladesh to weather these crises, strengthen its revenue base, bring inflation to a record low of 1.4% in 1993, and maintain a good balance of payments position. However, political instability and a lack of continued economic reforms pushed inflation to 5.2% in 1995. Sluggish development investments, limited growth in value-added by manufacturing, and bureaucratic inefficiency in aid disbursement and project realization persisted. Still, with the election of the Awami League government calming the political waters, growth rates and export and tax revenues rebounded in 1996. GDP grew 4.7% in 1996, while inflation eased to 5.04%.

Though the indicators were promising as of 1997, the government’s delay in instituting needed reforms threatened to slow economic advances. Inflation rose to 7%, while GDP had slowed to 4%. The Awami League promoted the exploration, distribution and manufacture of oil and gas in Bangladesh in the late 1990s, but stalled on the details of contracts. As 2002 ended, exploration continued to be delayed by political squabbles over participation by foreign companies. The economy grew strongly during 1998, real growth reaching 5.4% as flooding, instead of devastating the economy, brought in some much needed foreign aid. Severe flooding also occurred in 1999, and growth slowed to 4.9%, and 3.4% in 2000. The global economic slowdown, and the after-effects of the 11 September 2001 terrorist attacks on the United States and the War on Terror in 2001, combined with continuing internal political turmoil are projected to have brought economic growth almost to a halt in Bangladesh, with an estimated growth rate of 1.6%.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Bangladesh’s gross domestic product (GDP) was estimated at \$230 billion. The per capita GDP was estimated at \$1,750. The annual growth rate of GDP was estimated at 5.6%. The average inflation rate in 2000 was 5.8%. The CIA defines GDP as the

value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 30% of GDP, industry 18%, and services 52%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$1.958 billion or about \$14 per capita and accounted for approximately 3.9% of GDP. Worker remittances in 2001 totaled \$1.882 billion. Foreign aid receipts amounted to about \$8 per capita and accounted for approximately 2% of the gross national income (GNI).

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$293. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 4%. Approximately 49% of household consumption was spent on food, 18% on fuel, 8% on health care, and 9% on education. The richest 10% of the population accounted for approximately 28.6% of household consumption and the poorest 10% approximately 3.9%. It was estimated that about 36% of the population had incomes below the poverty line.

## 21 LABOR

The labor force in 1998 was estimated at approximately 64 million workers. In 1996, approximately 11% of the civilian labor force was employed in the industrial sector. Agriculture accounted for 63% of workers, and service employees were 26% of the labor force. Statistics are unreliable because of a large, informal, unreported market. The unemployment rate in 2001 was estimated at 35%.

Although 1.8 million out of the five million workers in the formal sector of the economy were unionized, this represented only a small fraction of the economically active population. Most unions are affiliated with political parties. Strikes are a common form of workers protest. There are industrial tribunals to settle labor disputes. The government can impose labor settlements through arbitration, as well as by declaring a strike illegal. Unions have become progressively more aggressive in asserting themselves, especially on the political scene.

Public sector workers’ wages are set by the National Pay and Wages Commission and may not be disputed. In the private sector, wages are set by industry, and collective bargaining rarely occurs due to high unemployment and workers’ concerns over job security. The legal workweek is 48 hours, with one day off mandated. This law is rarely enforced, especially in the garment industry. Children under the age of 14 are prohibited by law to work in factories but may work (under restricted hours) in other industries. However, such restrictions are rarely enforced and children work in every sector of the economy. In 2002, the government estimated that 6.6 million children between the ages of five and 14 years were engaged in all types of employment activities, many that were harmful to their well-being.

## 22 AGRICULTURE

Agriculture accounted for 30% of GDP and engaged 63% of the economically active population in 1996. Most of the farmers own no more than a few acres of land, and their holdings are badly fragmented. The land is fertile, but yields are low because of a lack of capital for input.

Rice dominates the production of about 60% of all cropped land in Bangladesh. Of the varieties grown, aman rice, which can be raised in inundated land and saline soil, occupies nearly 60% of the total land under rice. Aus rice, which cannot be grown in flooded fields, is raised mostly in higher areas of Bangladesh. Boro rice is grown in the winter, mainly in the swamps and marshy areas, but government-supported irrigation projects have

encouraged its extension to other areas. To meet the challenge of the food shortages, the government of Bangladesh and international aid programs introduced a high-yielding variety of rice called IRRI with considerable success. Total rice production in 1999 was 29,857,000 tons. Before November 1992, the government artificially inflated rice prices by buying over one million tons per harvest. With subsidies gone, the subsequent fall in rice prices reflected an adjustment of the market after 20 years of prices propped up by government sales and purchases.

Jute is the main cash crop of Bangladesh, which produces about one-quarter of the total jute supply of the world. Grown in most parts of the country, jute is harvested from July to September. Its strong fibers are used to produce carpets, burlap bags, mats, upholstery, and other products. Jute is also used to manufacture textiles for clothes. The combined total export of jute and jute products represents about 13–15% of Bangladesh's annual export earnings. Although Bangladesh is the world leader in exports of jute, its prominence in the economy has slipped since the 1970s. The diminished role is due to mismanagement of the nationalized jute industry, labor strikes, and a drop in the worldwide use of jute for packing. In 1999, 813,000 tons of jute were produced (24% of world production).

Although tea is the second most important agricultural export, it accounted for only 1% of export earnings. Most tea plantations are in the Sylhet Region and the Chittagong Hill Tracts. Much of the tea is consumed domestically; total production in 1999 was 51,000 tons.

The agricultural economy, though disrupted by the 1971 war, largely recovered and grew by an average 2.7% annually during the 1980s and by an annual average of 2.9% during 1990–2000. Agricultural exports accounted for 1.1% of total exports in 2001. Frequent monsoons and cyclones keep the economy vulnerable. Crop output (in tons) in 1999 included sugarcane, 6,951,000; wheat, 1,908,000; potatoes, 1,702,000; sweet potatoes, 398,000; tobacco, 37,000; and barley, 6,000. Fruit production in 1999 included 625,000 tons of bananas, 187,000 tons of mangoes, and 149,000 tons of pineapples. Coconut productions totaled 89,000 tons that year; pulses, 668,000 tons.

### 23 ANIMAL HUSBANDRY

The livestock sector has made significant progress in the 1990s, rising from 1% of GDP in 1989 to 10% in 1996. Livestock provide most of Bangladesh's draft power, rural transportation, manure, and fuel, in addition to meat, milk, eggs, hides, and skins. Buffalo milk is an important item of consumption, especially in the form of clarified butterfat. Small dairy farms (with 5–20 crossbred cows) have been growing fast in recent years. Entrepreneurs are encouraged by high liquid milk prices as well as government incentives under which the farmers receive cash to purchase dairy cows. In 1996, there were an estimated 20,750 small dairies; total milk production in 1999 was 2.1 million tons. There were about 23.4 million head of cattle, 820,000 buffaloes, 33.5 million goats, 1,110,000 sheep and 138 million chickens in 1999.

Much of the cattle stock is smuggled from India because of the reduced local availability of cows and bulls, especially during the midyear Muslim holiday of Eid Ul Azha, when cattle are sacrificed throughout the country. The cattle brought in from India may account for up to 30% of beef production. The scarcity of cattle in recent years is the result of lack of vaccines and fodder, natural disasters, and an absence of farmer incentives.

### 24 FISHING

Fish is a staple food of Bangladesh and the main source of protein. There are hundreds of varieties, including carp, salmon, pomfret, shrimp, catfish, and many local varieties. Dried fish is considered a delicacy in many parts of the country. About 1,004,164 tons of fish (67% from inland waters) were produced

in 2000. While much of the fish is consumed domestically, Bangladesh exports a sizable quantity of freshwater fish to India and other neighboring countries, and freshwater shrimp and lobster are exported to a number of countries. Exports of fish products in 2000 amounted to \$371.5 million. It is also a major source of frogs' legs, which are "farmed" commercially. Fishermen's cooperatives foster the use of modern fish-catching trawlers in the Bay of Bengal, and the government has established a fisheries corporation to stimulate production of freshwater fish for export.

### 25 FORESTRY

Bangladesh has an estimated 1,010,000 ha (2,496,000 acres) of forests, covering some 7.8% of land area. In recent years, the pressure of population has led to enormous deforestation. The government-controlled Forest Industries Development Corp. supervises the development and exploitation of forest resources. Roundwood production in 2000 came to 28.5 million cu m (1 billion cu ft). Over 98% of timber cut is used for firewood.

The main forest zone is the Sunderbans area in the southwest, consisting mostly of mangrove forests. Two principal species dominate the Sunderban forests: sundari trees, which grow about 15–18 m (50–60 ft) high and are of tough timber, and gewa trees, a softer wood used for making newsprint. Teak and bamboo are grown in the central forests.

### 26 MINING

Aside from its large identified natural gas reserves, Bangladesh had few mineral resources. The Bay of Bengal area was being explored for oil, and in some offshore areas, drilling was being conducted by international companies. Bangladesh had reserves of good-quality coal in the northern districts, but extraction has been difficult since many deposits were located at a depth of more than 900 m. Production estimates of mineral commodities in Bangladesh in 2000 included hydraulic cement, 980,000 tons; marine salt, 350,000 tons; and limestone (mined in the Sylhet and Chittagong regions), 28,000 tons.

### 27 ENERGY AND POWER

A substantial portion of Bangladesh's electrical supply is met by the country's only hydroelectric plant, at Kaptai, which has a capacity of 230 MW; the rest of the country's power is produced by burning coal, gas, and oil. Except for a few private installations on the tea plantations and a few other industries, the power and energy sector is controlled by a government-managed corporation. In 2000, net electricity generation was 15 billion kWh, of which 92.5% came from fossil fuels and 7.5% from hydropower. In the same year, consumption of electricity totaled 12.5 billion kWh. Total installed capacity at the beginning of 2001 was 3.6 million kW. As of 2002, only about 18% of the population had access to electricity. In addition, the power supply is erratic, and blackouts are a chronic problem, as are delays in new plant construction.

In July 1997, Bangladesh contracted with four international power and refining companies for four new power plants with a combined capacity of 1,600 MW. The new plants were expected to double the country's electricity to 4,000 MW over five years. A large-capacity, gas-fired 360 MW plant at Haripur became operational in April 2001, and a second, similar plant was scheduled for completion at Meghnaghat in late 2002. In 2000 the United States agreed to provide technical assistance for construction of the planned Rooppur nuclear plant.

Bangladesh's major energy resource is natural gas, with reserves estimated at anywhere from 0.4 to 1.4 trillion cu m (14 to 49 trillion cu ft) in 2002; production totaled 9.048 million cu m (319 million cu ft) in 1999. With 20 natural gas fields throughout the country, the government controls the gas industry but began accepting private exploration bids in 1991. Foreign

companies active in the country's natural gas sector include Shell and Unocal. More than four-fifths of Bangladesh's natural gas is used to produce power and fertilizer.

Bangladesh has modest oil reserves of 56.9 million barrels; output was estimated at 1,600 barrels per day in 2002. The country has one oil refinery, located at Chittagong, with a capacity of 33,000 barrels per day. In 1991 Chinese consultants confirmed the existence of 300 million tons of good quality coal at the Boropukuria coal field in northern Dajipur District.

## 28 INDUSTRY

In 1972, the year after its establishment, Bangladesh nationalized most of its industries and set up nine corporate conglomerates to oversee the state-owned enterprises (SOEs). The lack of commercial orientation inhibited investment and growth, including in the traditional jute industry, and the emerging leader, the garment industry. From the mid-1980s, the government shifted to encouraging private investment, but the industrial sector remained closely regulated. In 1991, in the post-Cold War international environment, and with the end of military rule, the government inaugurated a new Industrial Policy planning investment liberalization, the interim restructuring of several large parastatals, as well as the gradual privatization of public enterprises in all but the airways, railways, and mining sectors. Political resistance to privatization was very strong, and in the early 1990s restructuring resulted in some output decline. With a new government, in the period 1996–2001, 33 SOEs were sold by the state, but the Economist Intelligence Unit reported that these were smaller operations, and that the divestments did not significantly lessen the government's dominance of the industrial sector. The flood of 1998, which covered about two-thirds of the country, accelerated confrontational politics over the SOEs. 1999 industrial growth only reached 2.5% due to flood disruption. The public sector employs about one-third of the formal labor force and accounts for over 40% of the country's manufacturing and utility assets. 1999 industrial growth only reached 2.5% due to flood disruption. The World Bank reports that for the two fiscal years to mid-2001, losses by SOEs rose seven fold, from \$80 million to \$591 million. According to the Asian Development Bank (ADB), the garment industry, which employs 1.5 million workers, about 80% of whom are women, has been adversely affected since 2000 by US grants of quotas and duty-free access to Sub-Saharan African countries. By ADB figures, Bangladesh garment exports declined 4% to 6% June to August 2001.

In fiscal 2000/01 the leading industrial goods produced and their increases or decreases by volume included jute products, 380,00 tons, up 11%; textile yarn (produced by SOEs), 58.5 million kg, up 2%; textile fiber products (produced by SOEs), 11.7 million kg, down 0.8%; paper, 55,000 tons, up 0.7%; petroleum products, 1.5 million tons, up 15%; fertilizers, 1.8 million tons, down 5%; cement, 157 million tons, up 13%; sugar, 177,000 tons, up 43%; ready-made garments, 68.2 million, up 2.3%; mild steel rod, 142,000 tons, up 7.6%; tea, 52,725 tons, down 2.7%; leather and leather products, 22.5 million sq m, up 7.8%; and soaps and detergents, 48.3 million tons, up 1.3%. By value of export receipts, the leading manufactured exports in 2000/01 were ready-made garments (\$3.3 billion), knitwear (\$1.4 billion), frozen food (\$370 million), leather products (\$234 million) and jute products (\$222 million). Raw jute exports brought in \$66 million and tea exports earned \$24 million in 2000/01.

Recent discoveries of large natural gas reserves and plans for new power plants throughout the country were slated to boost industrial growth in 2000 and beyond. However, as of late 2002, plans for the development of natural gas resources continue to be delayed by political rows over the participation of foreign companies.

## 29 SCIENCE AND TECHNOLOGY

Bangladesh lacks the trained personnel necessary for intensive technological development. The Bangladesh University of Engineering and Technology (founded in 1962) does, however, train some technicians. Other institutions offering scientific and technical education include the Bangladesh Agricultural University in Mymensingh, the University of Chittagong, the University of Dhaka, Jahangirnagar University in Dhaka, Khulna University, and the University of Rajshahi. In 1987–97, there were only 52 scientists engaged in research and development per million people.

The Bangladesh Council for Scientific and Industrial Research and headquartered in Dhaka, operates seven research institutes, and the Bangladesh Atomic Energy Commission, Founded in 1973, and also in Dhaka, operates two others. The Geological Society of Bangladesh, founded in 1972 at Dhaka, is a government organization under the Ministry of Energy and Natural resources. Leading professional groups are the Bangladesh Academy of Sciences, the Bangladesh Medical Association, and the Zoological Society of Bangladesh, all headquartered in Dhaka.

## 30 DOMESTIC TRADE

Except for jute, tea, paper, garments, frozen shrimp, and a few other items, most of the commodities produced in Bangladesh are consumed inside the country. Normally, the farmers or fishermen sell to the wholesalers and they in turn sell to distributors and retailers. Industrial commodities for domestic consumption are distributed through the same procedure. The middlemen in the distribution process have often benefited from excessive profits, creating hardships for farmers and consumers. To meet this situation, the government has introduced mechanisms by means of which farmers can sell directly to cooperative agencies acting on behalf of buyers. The government has also set up fair-price shops for consumers. Much domestic trade in rural areas is conducted in the marketplaces, where farmers sell directly to consumers. About 60% of the domestic development budget comes from foreign aid.

Foreign products are imported by large commercial concerns located in the capital city of Dhaka or in the ports, and are then distributed through wholesalers and retailers. Normal business hours are between 9 AM and 5 PM, Sunday through Thursday, but most retail stores are open until 8 PM. Many private businesses are open on Saturday as well. Limited advertising is done through the newspapers, movie houses, handbills, and television.

## 31 FOREIGN TRADE

Since independence, Bangladesh has had a strongly negative trade balance. Imports steadily ran more than double the value of exports between 1971 and 1991. With a surge in export growth since 1991, the trade deficit has improved; imports exceeded exports by about 56% in 1996, and by 62% in 1997 as opposed to more than 120% in 1989/90. Trade relations with the United States remain excellent. As a result of successful export promotion measures undertaken by the government during the 1980s, exports of ready-made-garments and knitwear are now Bangladesh's leading earner of foreign exchange.

The garment and textile industry garners the highest percentage of Bangladesh's export commodities, including undergarments, women's and men's outerwear, leather, hats, and yarn (85%). At the mouth of the Ganges, fish and crustaceans are also harvested and exported (5.6%).

In 1998 Bangladesh's imports were distributed among the following categories:

Consumer goods	4.6%
Food	14.3%
Fuels	7.4%
Industrial supplies	56.4%
Machinery	13.1%
Transportation	4.0%
Other	0.2%

Principal trading partners in 1998 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	1,993	303	1,690
Germany	449	182	267
France	448	97	351
United Kingdom	371	256	115
Italy	274	76	198
Netherlands	227	73	154
Canada	153	114	39
Japan	124	479	-355
China (inc. Hong Kong)	106	1,125	-1,109
Australia	33	194	-161
India	10	1,041	-1,031

### 32 BALANCE OF PAYMENTS

The continuing trade deficit has been offset in small part by private transfers, mainly from earnings of workers in the Middle East, but large amounts of foreign aid and heavy short-term borrowing are needed to handle the balance-of-payments problem. In FY 1991/92, the infusion of \$1.59 billion in foreign aid and transfers helped lessen a negative balance of payments. In 1995, the trade deficit widened and there was a stagnation in the growth of remittances from overseas workers. The rising trade deficit, coupled with a decline in international aid disbursements due to political turmoil, caused foreign exchange reserves to drop from a peak of \$3.4 billion in April 1995 to \$2.1 billion by the end of 1996, and \$1.7 billion by 1999.

During the 1990s, the manufacturing sector revived, due to export growth led by garments and knitwear. Bilateral quota systems with developed country markets, whose quota regimes limited the exports of many competing Asian suppliers, were a factor in the growth of garment exports starting from 1994. Other factors contributing to the success of the garment industry in Bangladesh include few governmental regulations; the provision of customs-bonded warehouses for imported cloth; and financial arrangements allowing foreign banks to finance raw materials inventories. Nevertheless, Bangladesh must diversify its export base in order to improve its trade imbalance—garments and knitwear continue to account for 75% of export earnings. Leather and shrimp are potential growth sectors. The elimination of the quota system on textiles and clothing under the WTO was due to expire in 2005, and Bangladesh will need to improve the performance and quality of its garment export sector.

By the end of July 2001, the country's foreign exchange reserves stood at \$1.05 billion, which was enough to pay for about a month of imports, the lowest level in a decade. Since the end of the 1990s, the level of worker remittances has increased at an average rate of 12.6%.

The US Central Intelligence Agency (CIA) reports that in 2001 the purchasing power parity of Bangladesh's exports was \$6.6 billion while imports totaled \$8.7 billion resulting in a trade deficit of \$2.1 billion. The International Monetary Fund (IMF) reports that in 2001 Bangladesh had exports of goods totaling \$6.09 billion and imports totaling \$8.13 billion. The services credit totaled \$751 million and debit \$1.47 billion.

The following table summarizes Bangladesh's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	<b>-490</b>
Balance on goods	-2,049
Balance on services	-722
Balance on income	-287
Current transfers	2,568

<b>Reserves and Related Items</b>	<b>144</b>

### 33 BANKING AND SECURITIES

Central banking is conducted by the Bangladesh Bank, which has its head office in Dhaka. It is responsible for the circulation of money, supervision of commercial banks, and control of credit and foreign exchange. There are four commercial government-owned banks, 6 development financial institutions, 27 domestic private banks, and 12 foreign bank branches operating in Bangladesh. The four major banks are all state-owned: Sonali Bank, Janata Bank, Agrani Bank, and Rupali Bank. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$4.3 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$16.9 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 6%.

Trade on the Dhaka Stock Exchange (DSE) was dormant until 1993. The fourth quarter of 1996 was marked by feverish activity on the DSE, and on the smaller Chittagong Stock Exchange (CSE). In September, October, and the first two weeks of November, records were broken daily as share prices soared. Prices soon bore little relation to the current profitability or future prospects of the companies concerned. Up to 300,000 first-time buyers joined in the bonanza, driving the limited number of stocks traded-210-to a peak on 16 November, 1996, when the all-share index reached 3,627, up from around 1,000 in June. By 4 November, market capitalization had reached an unsustainable \$6 billion, equivalent to some 20% of the country's GDP. The government began to cool down the market by selling off state-owned enterprises. In late December, the central bank announced that T2 billion (\$47 million) would be available to the state-run Investment Corporation of Bangladesh to buy shares and give some support to the market, but the market crashed despite these preventative measures. In 1997, 37 stock brokers were charged with market manipulation in the DSE boom and crash of 1996. In 2001, market capitalization reached \$1.15 billion, although very little foreign portfolio investment was recorded.

### 34 INSURANCE

The insurance business was nationalized in 1972, creating a government-controlled insurance corporation. The Ministry of Finance and Planning is the insurance regulatory body. Premiums are mainly in commercial or industrial fields. Life insurance remains limited to city dwellers and middle-class professionals. In 2001, there was \$129 million in life insurance premiums written.

### 35 PUBLIC FINANCE

The fiscal year runs from June to July. In 1993, Bangladesh successfully completed a three-year IMF structural adjustment program. This program resulted in growth in the money supply of 11% in 1993, 15% in 1994, and 16% in 1995. In addition, government spending was curbed by a decline in subsidies to money-losing parastatals and the value added tax (VAT) continued to generate higher than predicted revenues for the government, with collections up 18% over 1994. In 1996, the government reported that exports were up, GDP grew by 4.4%, and tax revenues climbed 9% to \$3.1 billion. Encouraged by the good news, the government proposed a 1997 budget that would reduce domestic taxes, further cut import duties, and provide special incentives for foreign investors. The government stressed, however, a continuing need for foreign aid. International aid disbursements in 1996 totaled \$1.5 billion, down from \$1.7 billion in 1995. Almost half of government revenues come from foreign aid. In 1999, primarily because of flooding, foreign aid increased by 19% from \$1.3 billion in 1998. The global economic downturn of the first few years of the new millennium has had devastating effects on Bangladesh's economy. Exports had been growing 18% a year prior to the recession; they are now growing only 8% a year. The World Bank and the IMF predict that GDP will grow approximately 4.5% in the next 5 years, well short of the 7–8% they believe it needs to lift itself out of poverty.

The US Central Intelligence Agency (CIA) estimates that in 1999/2000 Bangladesh's central government took in revenues of approximately \$4.9 billion and had expenditures of \$6.8 billion. Overall, the government registered a deficit of approximately \$1.9 billion. External debt totaled \$17 billion.

### 36 TAXATION

The principal direct taxes are personal income taxes and corporate income taxes, and a VAT of 15% levied on all-important consumer goods. The top income tax rate is 25% and the top corporate rate is 40%. Publicly traded companies registered in Bangladesh are charged a lower rate of 35%. Effective 1 July 2002, the VAT rate on computer hardware and software was reduced to 7.5%, and certain agricultural equipment and electricity supplied to the agricultural sector was exempted from VAT altogether. VAT on the transfer of land is also to be abolished. Essential agricultural implements and irrigation pumps had previously been excluded from certain taxes.

### 37 CUSTOMS AND DUTIES

Although it has made significant reforms in the past few years, Bangladesh remains one of the most restrictive trade regimes in Asia and gets a major portion of its current revenue from import duties and excise taxes. In 1999, tariff reform was accelerated by the compression of customs duty rates into a range of 0–37.5%, including a variety of products from raw materials to finished products. There is also a 2.5% infrastructure development surcharge on nearly all imports. Customs procedures are lengthy and burdensome and Bangladesh's list of prohibited imports is lengthy.

There are three export processing zones; one in Chittagong, one in Dakha, and one in Gazipur; three more are under construction in Comilla, Issardi, and Mongla. Bangladesh is a member of the South Asia Preferential Trade Agreement (SAPTA).

### 38 FOREIGN INVESTMENT

Bangladesh nationalized most industries in 1972 and set up nine corporations to oversee them. In the mid-1980s, the Bangladesh government began relaxing its policy toward foreign investment

and announced a program granting tax holidays to new foreign investors. In 1989 the Directorate of Industries was renamed the Board of Industries (BOI) and delegated the task of providing various forms of assistance to new investors. More recently, government industrial policies have liberalized conditions for foreign investment much further—100% foreign equity is now allowed on investments anywhere in the country, not simply in export processing zones, and many regulations discriminating between foreign and domestic investors have been abolished. Reflecting the more favorable policy environment, foreign direct investment (FDI) first flowed into the country in significant amounts, albeit still haltingly, in the late 1980s. A peak was reached in 1995/96, when the annual inflow of FDI was estimated at \$900 million. As of 1999, the total estimated foreign investment in Bangladesh was \$1.5 billion. The four largest investor nations were the US, Malaysia, Japan, and the UK. Total US investment was estimated to be \$700 million in 1999, up from \$25 million in 1997, due to massive investment in gas exploration and production, and power generation. The annual rate has slowed considerably from the mid-1990s, however.

For 2000/01 FDI was estimated at \$177.8 million, less than one-fifth the inflow in 1995/96. Expanding the flow of foreign investment to the country is likely to hinge upon further proof of government commitment to facilitating private business activity. The US State Department reports that “business people consider [Bangladesh] customs to be among the worst, a thoroughly corrupt organization in which official routinely exert their power to influence the tariff value of imports and to expedite or delay import and export processing at the ports.” Foreign investments are by law accorded national treatment, and 100% foreign ownership is allowed in most sectors. However, the IMF reports that most foreign investments require official approval. Most of the barriers to foreign investment in Bangladesh are informal, but formidable: bureaucratic corruption and inertia, poor infrastructure, labor militancy, and political unrest.

### 39 ECONOMIC DEVELOPMENT

The major objectives of planned development have been increased national income, rural development, self-sufficiency in food, and increased industrial production. However, progress in achieving development goals has been slow. Political turmoil and untamed natural hazards of cyclone and flooding have combined with external economic shocks to persistently derail economic plans. Bangladesh's first five-year plan (1973–78) aimed to increase economic growth by 5.5% annually, but actual growth averaged only 4% per year. A special two-year plan (1978–80), stressing rural development, also fell short of its projected growth target, as did the second five-year plan (1980–85), which targeted 7.2% annual growth. The third five-year plan (1985–90) had a 5.4% annual growth target though only 3.8% was actually achieved.

In 1991, with the reinstatement of elected government, a new economic program was initiated that included financial sector reform and liberalization measures to encourage investment, government revenue improvement efforts (realized largely through implementation of a value-added-tax), and tight monetary policy. Income transfer measures, Food-for-Work, and other programs were also implemented to help protect the poorest segments of the population from the transitional effects of structural reform. Political turmoil from 1994 to 1996 helped reduce the final average annual growth rate under the Fourth Five Year Plan (1990–1995) to 4.15% (short of the 5% target), albeit the best performance so far under an economic plan. The 1996 elections brought renewed economic stability. Exports grew 14% in 1996, and GDP growth for 1996/97 rose to 5.5% as the economy rebounded. Floods during 1998 and 1999 caused some economic slowdown but this was balanced by unprecedented growth in gas

production and electricity production sectors. Average annual GDP growth under the Fourth Five-Year Plan rose to 5.3%.

Fiscal year 2000 was marked by a sharp increase in monetary expansion due to unprecedented borrowing from the banking sector (though the sale of treasury bills) to cover budget shortfalls due. Domestic borrowing increased primarily due to the reduced availability of external concessional financing. Historically, Bangladesh has received foreign aid disbursements equivalent to about 6% of GDP, have lately declined to amount equaling 3–4% GDP. Moreover, according to the IMF, much of the domestic borrowing was being used to cover recurrent expenses such as wage and salary increases. The revenue to GDP ratio rose in 2001 from 8.5% to 9.4%, but this improvement was more than offset by expenditure to GDP ratios of 14.4% and 14.1%, creating budget deficits amounting to 5.9% and 5%, in 2000 and 2001 respectively. The drain on foreign reserves from domestic borrowing contributed to reducing the foreign exchange cover for imports to imprudent levels of two months in 2000 and one-and-a-half months in 2001.

For 2001/02, however, the IMF predicted a sharp decline to around 3.5% due to the global economic slowdown and the contractions after the terrorist attacks of 11 September 2001 on the United States.

#### 40 SOCIAL DEVELOPMENT

A system of pensions exists for public employees only, and there is a limited work injury and unemployment insurance system. These programs are financed entirely by employer contributions and cover only small percentage of the population. Sickness and maternity benefits are also offered on a limited basis.

While women have and exercise full voting rights, they receive unequal treatment in many areas, including education, employment, and family matters such as divorce and inheritance. While legislation has been passed in recent years to protect women, discrimination and spousal abuse continues to be a problem. The Cruelty to Women Law of 1983 and the Women Repression Law of 1995 have not been rigorously enforced. There are continued reports of women being disfigured by having acid flung at their faces—usually by rejected suitors.

Because of widespread poverty children are forced to work at a very young age, and are frequently abused. More than half of all children suffer from malnutrition. There is evidence that children are being sold to the Middle East, India, Pakistan, and Southeast Asia for their labor. The government is collaborating with nongovernmental organizations to put an end to this practice. Some estimates place the number of child laborers as high as 10 million, including—according to a UNICEF report—some 10,000 child prostitutes.

Although the government is secular, discrimination against minority Hindus has led in recent years to violence and conflict. The government's human rights record is poor, with many fundamental human rights restricted. Abuses include extrajudicial killings, torture, and violent suppression of demonstrators, and prison conditions are inhumane.

#### 41 HEALTH

Malaria, tuberculosis, and other serious diseases remain endemic and public health problems are aggravated by widespread malnutrition and periodic natural disasters. Between 1995 and 2000, the prevalence of malnutrition in children under five years old decreased from 84% to 55%. In 2000, 97% of the population had access to safe drinking water and 53% had adequate sanitation, up from 78% and 35%, respectively, in 1980. Because the lack of vitamin A plays a role in blindness and malnutrition, in 1993 the government of Bangladesh introduced a national system to distribute vitamin A capsules to children (with about 25% having been served at that time).

In 1990, there were 8,566 doctors (15 per 1,000 people), 2,630 pharmacists, 523 dentists, and 5,074 nurses. In the mid-1990s, only 45% of the population had access to health services. As of 1999, there were an estimated 0.2 physicians and 0.3 hospital beds per 1,000 people.

Average life expectancy at birth in 2000 was 61 years. The government pays the majority of vaccination costs, which has helped increase participation. As of 1999, estimated immunization rates for children under one year of age were 71% for measles and 72% for diphtheria, tetanus, and pertussis. The infant mortality rate was 60 per 1,000 live births in 2000. It was estimated that 54% of married women (ages 15–49) used contraception as of 1999. Maternal deaths were estimated at 440 per 100,000 live births in 1998, down from 850 in 1990.

A new strain of cholera was reported late in 1992. Only seven new cases of AIDS were reported in 1995. As of 1999 an estimated 13,000 people were living with HIV/AIDS and the prevalence rate was 0.02 for every 100 adults.

#### 42 HOUSING

Housing has long been a vital concern in Bangladesh. The government maintains an urban housing program but does not have any housing development program for villages. The House Building Finance Corp. lends money for private as well as public housing. Dhaka and Chittagong urban development is conducted under the guidance of town planning authorities, which develops land and allocates it for private dwelling and commercial purposes.

As of the 1991 census, the average household contained 5.5 people. About 79% of all dwellings were made of straw or bamboo walls, usually with roofs of the same material. About 28.5% of all dwellings were made with mud brick walls, 19.9% were built with wood sheets, and 62.6% had cement walls.

Since 1996, the government has launched a number of programs focusing on poverty and homelessness. The Asrayon (“shelter”) program provided group housing and agricultural plots on government land for about 50,000 families (2002est.). The Gahrey Phera (“return home”) program helps displaced rural families return to their villages. The Grihayan Tahabil (Housing Fund) was also established through the Bangladesh Bank as a way to provide loans to non-government organization who endeavor to build shelters for the urban poor.

#### 43 EDUCATION

For the year 2000, adult illiteracy rates were estimated at 59.2% (males, 48.3%; females, 70.5%). The government, as a matter of policy, is attempting to broaden the educational base to eradicate mass illiteracy. Primary education, extending over five years, is free and compulsory, although rural girls are exempted from this law. Secondary education covers six grades, divided into three two-year cycles. Most educational institutions are supported by the government either fully or partially. The language of instruction is Bangla.

In the mid-1990s, the number of primary schools was estimated at 46,000 with 190,000 teachers and 12,000,000 students. At the secondary level, there were 131,000 teachers and 3,600,000 students. There are seven universities, 10 medical colleges, and 10 teacher-training colleges. Research institutions include the Bangla Academy (which sponsors translations of scientific and literary works into Bangla), the Asiatic Society, and the National Institute of Public Administration's Institute of Law and International Affairs. In the mid-1990s, there were 23,000 teachers and 434,000 students in all higher-level institutions.

As of 2000, an estimated 70% of primary-school-age children attended school, while only 18% of those eligible were enrolled in secondary school. In 1996, approximately 2.9% of the GDP was allocated to education.

#### 44 LIBRARIES AND MUSEUMS

The largest library in Bangladesh is Dhaka University Library (1921; with 5.5 million volumes). It houses the university's collection and that of the former Public Library of East Pakistan. The National Library holds 200,000 volumes, and Dhaka's Central Public Library (1958) has over one million volumes. The Bangla Academy maintains an excellent research collection, as does the Bangladesh Institute of Development studies in Dhaka (100,000 volumes).

The Dhaka Museum contains a variety of sculptures and paintings from the Buddhist, Hindu, and Muslim periods. Both it and the Balda Museum have outstanding collections of Bengali art and ancient artifacts. Also in Dhaka are a science and technology museum and the National Museum of Bangladesh. The Ram Mala Museum at Comilla houses 7th-century archaeological finds, and the museum in Rajshahi contains many artifacts from the ruins of an 8th-century Buddhist monastery excavated nearby, as well as significant relics from the Kushon, Gupta, Pala, and Sena periods of Bengali history. There is a gallery of contemporary paintings as well as an ethnological museum in Chittagong.

#### 45 MEDIA

All postal and telecommunications services are controlled by the government. There were 500,000 mainline telephones in use in 2000, with an additional 283,000 cellular phones in use throughout the country. In 1999, Bangladesh had 12 AM and 12 FM radio broadcasting stations and 15 television stations, which were accessible to about 90% of the population. Color television was introduced in 1980. In 2000, there were 49 radios and 7 television sets for every 1,000 people. The same year, there were ten Internet service providers serving about 30,000 subscribers.

The major Bengali daily newspapers (with 2002 circulations), all in Dhaka, are *Ittefaq* (200,000), *Dainik Inqilab* (180,000), *Sangbad* (71,050), *Dainik Bangla* (65,000), and *Dainik Sangram* (45,000). The largest English dailies, also in Dhaka, are the *Bangladesh Observer* (43,000), *Bangladesh Times* (35,000), and *Daily Star* (30,000).

The government is said, with some exceptions, to generally respect freedom of speech and press. On occasion, the government has censored criticism of Islam.

#### 46 ORGANIZATIONS

Various associations for the Muslim, Hindu, Christian, and Buddhist communities have long been active in organizing religious festivals and social activities. Every town also has several cultural groups. The Bangladesh Women's Association is active in social life. There are about 39 national youth organizations and about two hundred regional and local youth organizations. These generally hold membership in one of two coordinating bodies: the Bangladesh Youth Council (BYC) and the National Federation of Youth Organizations in Bangladesh. There are about seven major student unions including the Bangladesh federation of University Women. A scouting organization is also present.

There are also many philanthropic organizations and workers' associations, including the Bangladesh Teachers' Federation, which was founded in 1990. The Red Crescent Society and Greenpeace have representative organizations within the country. The Bangladesh Medical Studies and Research Institute and the Bangladesh Academy of Sciences promote research and education in a number of medical and scientific fields.

#### 47 TOURISM, TRAVEL, AND RECREATION

The main tourist attractions include the old Mughal capital at Dhaka, nearby Sonargaon with its ancient architecture, the

Buddhist cultural center of Mainamati, and the beach resort of Cox's Bazar. At the end of the 1980s tourism declined due to political unrest. Throughout the 1990s, however, figures have slowly increased. In 1997, 171,961 foreign visitors arrived. But in 2000, 199,211 tourists visited the country, nearly half from South Asia. As of 2000 year, there were 4,550 hotel rooms with 9,789 beds with a 49% occupancy rate. Tourism revenues totaled \$50 million.

In 2001, the US government estimated the daily cost of staying in Dhaka at \$174. Expenses in other areas can be much lower.

#### 48 FAMOUS BANGLADESHIS

Many Bengalis distinguished themselves in political life before the creation of Bangladesh. A. K. Fazlul Huq (d.1962), the former premier of Bengal Province, moved the Lahore Resolution of 1940, calling for an independent Pakistan, and dominated Bengali politics for half a century. H. S. Suhrawardy (1895–1964), another former premier of Bengal, served for a time as premier of Pakistan and was a mentor to the next generation of Bengali leaders. Sheikh Mujibur Rahman (1920–75), a leader of the Awami League, led the successful fight for the independence of East Pakistan and was the first premier of Bangladesh (1972–75). Maj. Gen. Zia-ur Rahman (1936–81) was military ruler of the country from 1976 until his assassination.

#### 49 DEPENDENCIES

Bangladesh has no territories or colonies.

# BHUTAN

Kingdom of Bhutan

*Druk-Yul*

**CAPITAL:** Thimphu (Tashi Chho Dzong)

**FLAG:** The flag is divided diagonally into an orange-yellow field above and a crimson field below. In the center is a wingless white Chinese dragon.

**ANTHEM:** *Gyelpo Tenjur*, beginning “In the Thunder Dragon Kingdom, adorned with sandalwood.”

**MONETARY UNIT:** The ngultrum (N) is a paper currency of 100 chetrum. There are coins of 5, 10, 25, and 50 chetrum and 1 ngultrum, and notes of 1, 5, 10, and 100 ngultrum. The ngultrum is at par with the Indian rupee (R), which also circulates freely. N1 = \$0.0213 (or \$1 = N46.97) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but some traditional units are still in common use.

**HOLIDAYS:** King’s Birthday, 11–13 November; National Day, 17 December. Movable Buddhist holidays and festivals are observed.

**TIME:** 5:30 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Bhutan, a landlocked country in the Himalaya mountain range, has an area of 47,000 sq km (18,147 sq mi), extending 306 km (190 mi) E–W and 145 km (90 mi) N–S. Comparatively, the area occupied by Bhutan is slightly more than half the size of the state of Indiana. It is bordered on the E, S, and W by India and on the N and NW by China, with a total boundary length of 1,075 km (668 mi). The capital city of Bhutan, Thimphu, is located in the west central part of the country.

## <sup>2</sup>TOPOGRAPHY

Bhutan is a mountainous country of extremely high altitudes and irregular, often precipitous terrain, which may vary in elevation by several thousand feet within a short distance. Elevation generally increases from south to north. The mountains are a series of parallel north-south ranges. The loftiest peaks, found in the Himalayan chain that stretches along the northern border, include Kula Kangri (7,554 m/24,783 ft) and Chomo Lhari (7,314 m/23,997 ft). Great spurs extend south from the main chain along the eastern and western borders. In the rest of the country are mainly ranges of steep hills separated by narrow valleys. Bhutan is drained by many rivers flowing south between these ranges and for the most part ultimately emptying into the Brahmaputra River in India.

## <sup>3</sup>CLIMATE

Because of the irregular terrain, the climate varies greatly from place to place. In the outer foothills adjoining the Indian plains, rainfall ranges from about 150 cm to 300 cm (60–120 in) a year; the forests are hot and steaming in the rainy season, while the higher hills are cold, wet, and misty. Violent Himalayan thunderstorms gave rise to Bhutan’s Dzongkha name, Druk-Yul, which translates as “Land of the Thunder Dragon.” Rainfall is moderate in the central belt of flat valleys (which have an elevation of 1,100–3,000 m/3,500–10,000 ft). The uplands and high valleys (above 3,700 m/12,000 ft) are relatively dry. There is less rainfall in eastern Bhutan. In general, the mountainous areas

are cold most of the year. Temperatures there average 4°C (39°F) in January and 17°C (63°F) in July.

## <sup>4</sup>FLORA AND FAUNA

Dense jungle growth is characteristic at altitudes below 1,500 m (5,000 ft). Above that height the mountain slopes are covered with forest, including beech, ash, birch, maple, cypress, and yew. At 2,400–2,700 m (8,000–9,000 ft) are forests of oak and rhododendron. Above this level, firs and pines grow to the timber line. Primulas, poppies (including the rare blue variety), magnolias, and orchids abound.

The relative abundance of wild animals is attributed to the Buddhist reluctance to take life. In the lower parts of southern Bhutan, mammals include the cheetah, goral, sambar, bear, and rhinoceros; in the higher regions are snow deer, musk deer, and barking deer. Game birds include pheasants, partridges, pigeons, and quail.

## <sup>5</sup>ENVIRONMENT

The most significant environmental problems in Bhutan were soil erosion and water pollution. The erosion of the soil occurs because 50% of the land in Bhutan is situated on mountainous slopes which are subject to landslides during the monsoon season. Other contributing factors are overcutting of timber, road construction, and the building of irrigation channels. The nation has 95 cubic kilometers of renewable water resources, but only 86% of all city dwellers and 60% of people in rural areas have pure drinking water.

The Manas Game Sanctuary is located along the banks of the Manas River in southeastern Bhutan. Altogether, 21.2% of Bhutan’s total land areas was protected as of 2001. In the same year, there were 20 species of endangered mammals including the tiger, snow leopard, Asian elephant, and wild yak, and 14 bird species were threatened with extinction, as well as five threatened species of plants and one endangered reptile.

LOCATION: 26°42' to 28°21' N; 88°45' to 92°8' E. BOUNDARY LENGTHS: India, 605 kilometers (378 miles); China, 470 kilometers (290 miles).

## 6 POPULATION

The population of Bhutan in 2003 was estimated by the United Nations at 2,257,000, which placed it as number 139 in population among the 193 nations of the world. In that year approximately 5% of the population was over 65 years of age, with another 39% of the population under 15 years of age. There were 102 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.96%, with the projected population for the year 2015 at 3,043,000. The population density in 2002 was 20 per sq km (51 per sq mi).

It was estimated by the Population Reference Bureau that 7% of the population lived in urban areas in 2001. The capital city, Thimphu, had a population of 28,000 in that year. Phuntsholing had more than 10,000 people. According to the United Nations, the urban population growth rate for 2000–2005 was 6.0%.

Some 93% of the population was rural in 2001. The laboring population is not gathered into towns but lives in the countryside in the vicinity of fortresses called *dzongs*. A *dzong*, the official center of a region or district, often houses substantial numbers of Buddhist monks. Many place names incorporate the word *dzong*, which means “castle-monastery.”

## 7 MIGRATION

Bhutan opposes immigration and forbids the entry of new settlers from Nepal. Since 1959, when about 4,000 Tibetan refugees entered Bhutan, the border with Tibet has been closed to immigration. By 1980, most of the refugees had become citizens

of Bhutan; the rest migrated to India. The border between Bhutan and India is open, and citizens of Bhutan are free to live and work in India. The net migration rate for 2000 was -0.5 per 1000 population, or a loss of approximately 1,000 people. The total number of migrants residing in Bhutan was 10,000 in that year.

## 8 ETHNIC GROUPS

Bhutanese are mainly of Tibetan stock, and are also known as Buotias; they account for approximately 50% of the population. The Ngalop (also called Bhote) are people of Tibetan origin who live in northern and western Bhutan; the Sharchop inhabit the eastern regions and also have ethnic affinities with the people of China's Tibetan region. Aboriginal or indigenous tribal peoples live in villages scattered throughout Bhutan and account for approximately 15% of the population. The remaining peoples are Nepalese settlers (about 35% of the population), living mostly in the south. Some 85,000 were expelled to Nepal in 1992–93, and about 5,000–15,000 more moved to India.

## 9 LANGUAGES

Four main languages are spoken in Bhutan. The official language is Dzongkha, a Tibetan dialect spoken mainly by Ngalop in the northern and western parts of the country. Bumthangkha, an aboriginal language, is spoken in central Bhutan, while Sharchopkha is spoken in eastern Bhutan. Both of these are used in primary schools in areas where their speakers predominate. The Nepalese largely retain their own language, Nepali.

## 10 RELIGIONS

About 75% of the Bhutanese practice Buddhism and about 25% practice Indian- and Nepalese-influenced Hinduism. While the law provides for religious freedom, the Drukpa sect of the Kagyupa School, a branch of Mahayana Buddhism, is the state religion, and the law prohibits religious conversions. The Drukpa (people of the dragon) subsect of the Kagyupa sect of Buddhism, introduced from Tibet in the 12th century, dominates the collective life of the Bhutanese through a large clerical body estimated at more than 6,000 lamas or monks, centered in 8 major monasteries (*dzongs*) and 200 smaller shrines (*gompas*) scattered throughout the land. This sect incorporates both the ideology of the classical Buddhist scriptures and the indigenous pre-Buddhist animistic beliefs called Bon. Nigmapa school of Mahayana Buddhism is also practiced, primarily in the eastern regions.

Among Hindus, the Shaivite, Vaishnavite, Shakta, Ghanapath, Pauranic, and Vedic schools are all represented.

There are still a few Bon priests and followers in the country and there are small numbers of Christians.

## 11 TRANSPORTATION

Traditionally, Bhutan's communications have been mostly with Tibet, through several strategic mountain passes. Most travelers continue to journey on foot or mounted on hardy ponies bred to withstand great altitudes and steep slopes. Goods are transported by porters or on pack animals. Many of the rivers are still crossed by native cantilever bridges of excellent construction.

Prior to the 1961–66 development plan, there were no surfaced roads in Bhutan. Since then, a network of roads and suspension bridges has been built by India. In 2002, there were about 3,285 km (2,041 mi) of roads, including about 1,994 km (1,239 mi) of surfaced roads. Of the 186 suspension bridges projected in the 1981–87 economic plan, 102 were completed by 1985. There is bus service linking Paro Dzong and Tashi Gang Dzong with Indian border towns. In 2001 there were 2 airports, only 1 of which had a paved runway. The national air carrier, Druk Airlines, began operations in 1983 with regular flights between Calcutta and Paro Dzong, the site of Bhutan's main airfield. In

2001, 35,100 passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

Little is known of the history of Bhutan before the 17th century. Buddhism was originally introduced from India in the 8th century, although the Buddhism of today's Bhutan is very much Tibetan in character. The forebears of the Bhotes (or Bhotias) came from Tibet, probably in the 9th century, when Tibetans invaded the area and met little resistance from the indigenous Tephu tribe. In the middle of the fifteenth century, Shabdung Ngawang Nangyal, a Tibetan lama exercising temporal as well as spiritual power, united the country and built most of the fortified villages (*dzongs*). His successors in power established a dual system, separating the temporal ruler (*Desi* or *deb raja*) and the spiritual ruler (*Je Khempo* or *dharma raja*).

The first recorded contact with the West occurred in 1772, when the British East India Company repelled a Bhanesese invasion of the princely state of Cooch Behar in India; they concluded a peace treaty two years later. During the 18th century and most of the 19th, British efforts to open trade with Bhutan proved futile, with the Bhanesese frequently attacking the relatively level areas of Assam and Bengal along their southern border. In 1865, the British finally defeated the Bhanesese, and Bhutan formally accepted a British subsidy of ₹50,000 a year, which was dependent upon their keeping the peace.

With British approval, Ugyen Dorji Wangchuk became the first hereditary king in 1907, replacing the temporal ruler. In 1910, the Punakha Treaty was concluded between the British Indian Government and Bhutan, under which British India agreed explicitly not to interfere in Bhanesese internal affairs, while Bhutan accepted British "guidance" in handling external matters—a role independent India assumed after 1947. A formal Indo-Bhanesese accord concluded in 1949 reaffirmed and amplified the earlier Punakha Treaty. Besides increasing Bhutan's annual subsidy to ₹500,000 and returning to Bhutan 83 square kilometers (32 square miles) of territory around Dewangiri (wrested by the British in 1865), it made India responsible for Bhutan's defense and strategic communications, committing India to avoid interfering in Bhutan's affairs and affirming Bhutan's agreement to be "guided by the advice of" India in foreign affairs.

In 1959, China published maps of the Himalayan frontier with South Asia that showed as Chinese part of the territory claimed by Bhutan; Chinese representatives also asserted that Bhutan belonged to a greater Tibet. In response, Indian prime minister Jawaharlal Nehru warned that an attack on Bhutan would be deemed an act of war against India. Fighting between India and China in neighboring border regions in the fall of 1962 did not violate Bhutan's borders, although survivors from Indian army units decimated east of Bhutan straggled back to India through Bhutan.

In April 1964, the long-time prime minister, Jigme Dorji, was assassinated, revealing fissures among the ruling elite. The plotters who were caught were executed, including the deputy commander of the army; others fled to Nepal. In the 1960s, Bhutan's advance toward modernization and the end of its insularity were accelerated by economic plans prepared and underwritten by India.

Relations with Nepal have grown difficult in recent years, due to a dispute with Nepal concerning Bhanesese refugees of Nepalese descent. The mostly Hindu "Nepali Bhanesese," comprising approximately a third of Bhutan's population, were granted citizenship in 1958. However, Bhutan changed its citizenship laws in the late 1980s, making the Nepali Bhanesese illegal immigrants. In 1990, the Bhanesese government expelled 100,000 Nepali Bhanesese, who fled to refugee camps in eastern Nepal. In 1993, Bhutan and Nepal established a Joint Ministerial

Level Committee (JMLC) to address the issue of ethnic Nepalese refugees.

Nepalese activism, spearheaded by the Bhutan People's Party based in Nepal, continued through the early 1990s. It resulted in violence from both sides, and brought charges of violations of human rights against Bhutan's security forces. In 1996, "peace marches" of refugees from Nepal into Bhutan were met by force, and the marchers were deported by the Bhanesese police. The following year, the National Assembly adopted a resolution (later discarded) that prohibited family members of ethnic Nepalese refugees from holding jobs in the government or armed forces. The government also began resettling Buddhist Bhanesese from other regions of the country on land vacated by the refugees. In 1998, Foreign Minister Jigme Thinley took office with a mandate to settle the refugee issue. Although Bhutan and Nepal originally agreed in principle that the refugees be divided into four categories (1) bonafide Bhanesese; (2) Bhanesese emigres; (3) non-Bhanesese; and (4) Bhanesese who have committed crimes in Bhutan, the question of what to do with the more than 100,000 refugees living in the camps in Nepal remains unresolved. Talks between Bhutan and Nepal are ongoing.

At the Tenth JMLC round of talks held in December 2000, negotiators created a Joint Verification Team (JVT) to interview and verify the status of the Bhanesese refugees, but by the Eleventh round of JMLC talks held in August 2001, the verification process was moving at a rate of only 10 families per day. In addition to the JMLC talks, Foreign Secretary Level talks (FSLT) were held in November 2001, at which differences between the Nepali and Bhanesese positions on the issue of categorization of the refugees were clarified: Nepal proposed to reduce the four categories to two (Bhanesese and non-Bhanesese), a plan that was rejected by Bhutan. However, the two governments agreed that year to verify the identities of the refugees by family lineage, but the Bhanesese government did not give any indication of when these families may return to Bhutan. Further talks were held in August 2002.

There are also tensions between Bhutan and India's northeastern state of Assam. Two separatist groups from Assam—the United Liberation Front of Asom (ULFA) and the National Democratic Front of Bodoland (NDFB)—maintain well-entrenched bases in Bhutan. The separatist Kamatapur Liberation Organization (KLO) from West Bengal state is there as well. Bhutan refrained from taking direct action against the Indian separatists for fear of retaliatory attacks on its nationals, but in late December 2002, the Bhanesese government announced it would use military might to remove the separatists from bases within its borders. The Assam government has blamed Bhutan for the rise in militancy in the region, and welcomed the government's decision to launch a military response.

Reforms introduced by King Jigme Singye Wangchuck in June 1998 mark a milestone in Bhutan's political and constitutional history. Continuing his efforts toward modernization, the king issued a royal edict relinquishing some of the monarch's traditional prerogatives and giving a greater role in Bhutan's administration to elected government officials.

On 3 December 2002, the King of Bhutan issued a first draft of a constitution for Bhutan. The draft will be discussed in the country's 20 districts before it is presented to the National Assembly when it convenes in June 2003.

Bhutan in June 1999 took major steps toward modernization, legalizing television and the Internet. The first Internet cafe opened in Thimphu in 2000.

## 13 GOVERNMENT

Bhutan is an absolute monarchy, ruled by a hereditary king, the "Druk Gyalpo," who governs with the aid of a Royal Cabinet and a National Assembly (the Tshogdu). In the past, the king appointed members to a Royal Advisory Council and to a

Council of Ministers. Following the political reforms of 1998, however, these two councils were combined to form the cabinet. This body consists of six ministers elected by the National Assembly, six advisors also elected by the National Assembly, a member nominated by the king, and two representatives of the clergy.

The unicameral National Assembly (established in 1953), known as the Tshogdu, consists of 154 members. Of these, 37 are appointed by the king to represent government and other secular interests; 105 are elected to three-year terms by groups of village headmen, who are, in turn, elected by a one-family, one-vote system; and the remaining 12 are chosen by the lamas acting in concert. The Tshogdu meets twice a year at Thimphu, the capital (previously known as Punakha). Candidates file their own nominations. The assembly is charged with addressing the king on matters of national importance. It also enacts laws and approves senior government appointments. A simple majority is needed to pass a measure and is conducted by secret ballot. While the king may not veto legislation, he may return bills for further consideration; the king generally has enough influence to persuade the assembly to approve legislation he considers important or to withdraw proposals which he opposes. Since 1969, it has become a more active, independent influence on government policy through its power to overrule bills proposed by the king or his advisors.

During the 1960s, King Jigme Dorji Wangchuk (r.1952–72) was a prime mover behind political and administrative changes that took the country in the direction of constitutional monarchy. When Crown Prince Jigme Singye Wangchuk assumed the throne upon his father's death in July 1972 and was crowned in June 1974, he continued his father's policy of sharing authority with the Council of Ministers and the National Assembly. In 1998, the king announced ambitious political changes that moved Bhutan further down the road towards a true constitutional monarchy. He relinquished his role as Head of Government and assigned full executive powers to a cabinet consisting of ministers and advisors to be elected by the National Assembly (in reality, the National Assembly chooses from a list of nominees proposed by the king, who also retains authority relating to security issues). The Council of Ministers, a subgroup of the cabinet, elects one of its members on a rotational basis to serve a one-year term as chairman. It is this official who is the Head of Government. As part of his reforms, King Jigme Singye Wangchuk also introduced legislation by which any monarch would have to abdicate in favor of his hereditary successor if the National Assembly supported a vote of no-confidence against him by a two-thirds majority. And in December 2002, the king issued a draft for a first constitution for Bhutan, which is to be debated in the country's 20 districts before it is considered by the National Assembly in June 2003.

## 14 POLITICAL PARTIES

The government discourages political parties and none operate legally. Freedom of speech, the press, assembly, association and workers' rights are restricted by the government, and judicial processes are based on tradition rather than written criminal or civil procedure codes.

An opposition group known as the Bhutan State Congress (BSC) composed mainly of ethnic Nepalese has long maintained its headquarters in nearby India; other such groups, all very small and headquartered in either India or in Nepal, include the People's Forum for Democratic Rights and the Students' Union of Bhutan. A militant opposition group, operating under the banner of the Bhutan People's Party (BPP) and affiliated with the Bhutan National Democratic Party (BNDP) in Nepal, was founded in 1990 in Siliguri, India. It claims to represent the interests of the thousands of ethnic Nepalese who have migrated (or been forced to flee) from farming areas of southern Bhutan in recent years.

Allegedly supported by the Communist Parties of India (CPI) and Nepal (CPN), the BPP was responsible for demonstrations in September 1990 in Bhutan; it has charged the Bhutan government with human rights violations and "ethnic cleansing" in the area.

BPP tactics in 1991 and 1992 included hit-and-run terrorist raids into Bhutan, burning schools, census and land records, and health facilities and attacking ethnic Bhutanese (as well as loyal Nepalese) in national dress; BPP activists also organized camps for the tens of thousands of refugees in southern Nepal. In 1992, Bhutan government policy toward the terrorist attacks stiffened, with arrests and long prison sentences meted out to captured BPP activists. The conflict continued throughout the 1990s. On 9 September 2001, BPP leader R. K. Budhathoki was assassinated, weakening the BPP. The BPP in October 2002 requested that Bhutanese authorities dispense justice in the case.

## 15 LOCAL GOVERNMENT

The country is divided into four regions—East, Central, West, and South—each administered by a governor appointed by the king. As of 2002 there were 20 districts (*dzongkhas*) under the supervision of district commissioners (*dzongdas*), who are appointed by the Royal Civil Service Commission and are responsible for law and order. Districts are further subdivided into blocks (*gewog*), of which there are 202 in the country. As part of the king's efforts to encourage decentralization in decision-making, in 1991 the government began a program to establish Block Development Committees. This project allowed people to plan and implement development projects within their respective blocks (in the 1980s, a development plan was organized for the districts). The success of the district and block development programs encouraged citizens to form other types of associations, such as school management boards, village health development committees, and associations for different agricultural products, such as apples and potatoes, for example.

## 16 JUDICIAL SYSTEM

The legal system is based on English common law and Indian law. Local headmen and magistrates (*thrimpon*) hear cases in the first instance. Appeals may be made to an six-member High Court (also known as the Royal Court of Justice), established in 1968. From the High Court, a final appeal may be made to the king. Judges are appointed for life by the king. There is no written constitution, although a draft for one was submitted in December 2002. Criminal matters and most civil matters are resolved by application of the 17th century legal code as revised in 1957. Precedence is not used in the delivery of justice. Questions of family law are governed by traditional Buddhist or Hindu law. Minor offenses are adjudicated by village headmen. Criminal defendants have no right to court appointment of an attorney and no right to a jury trial. Under the 1979 Police Act, Police need a warrant to arrest a person and must bring the detainees before a court within 24 hours of arrest. Bhutan does not accept the compulsory jurisdiction of the International Court of Justice.

In keeping with the policies of modernization being pursued in Bhutan, the government formed a special committee in 1998 to review the country's laws and propose changes in the legal system. One of these changes saw the creation, in April 2000, of a Department of Legal Affairs to investigate and prosecute criminal and civil cases against civil servants. This may well turn out to be the forerunner of a fully fledged Attorney-General's Office or a Department of Justice. In 2001, a Civil and Criminal Procedure Code was enacted by the National Assembly, as a way of strengthening and reforming the legal system.

## 17 ARMED FORCES

The armed forces consist of the Royal Bhutan Army, the National Militia, the Royal Bhutan Police, body guards, and a paramilitary

force. The army is trained and equipped by India. In 2001 military expenditures were \$9.3 million, or 1.9% GDP.

## 18 INTERNATIONAL COOPERATION

Bhutan joined the Colombo Plan organization in 1962 and became a UN member on 21 September 1971; it participates in ESCAP, FAO, IBRD, ICAO, IDA, IFAD, IMF, ITU, UNESCO, UNIDO, UPU, and WHO. Bhutan also belongs to the Asian Development Bank and G-77 and is a signatory to the Law of the Sea. In addition, Bhutan is a member of the nonaligned movement and was a founding member of the South Asian Association for Regional Cooperation (SAARC). In 1978, its office in New Delhi was accorded the status of an embassy. Bhutan maintains full diplomatic relations with all of the South Asia countries, as well as several countries in the Middle East and Europe.

## 19 ECONOMY

Isolated Bhutan has one of the smallest, and poorest, economies in the world. Much of the population functions outside the cash economy; about 93% of the labor force lives by subsistence farming or herding. Agriculture and forestry together make up 45% of the country's GDP. Although the government has relaxed the emphasis on maintaining food self-sufficiency that characterized its most isolationist decade, 1988 to 1998, the country supplies most of its food needs through the production of grains, fruits, some meat, and yak butter. Services, with tourist-related business comprising a major share, account for a further 35% of GDP. By the mid-1970s, tourism had surpassed the sale of postage stamps as the chief source of Bhutan's limited foreign exchange revenue. In turn, since the completion the first mega hydroelectric project in 1988, power exports have become the leading source of a more comfortable hard currency position.

A series of five-year plans, initiated in 1961 and financed primarily by India, have begun to improve transportation, modernize agriculture, and develop hydroelectric power. Realization of several hydroelectric and industrial projects during the 1980s helped to increase industry's share of the GDP, and inflated overall GDP growth rates to 7.3% annually during 1985–90. A slowdown in government project investment in the early 1990s caused GDP growth to stabilize at an average of around 3%, although an upturn in economic activity in 1995 brought the rate back up to 6%, and 7.3% in 1998. In 1999, real GDP growth dropped to 5.5%, but recovered to around the long-term average of 6% in 2000 and 2001. Bhutan's extensive forests, mineral resources, and swift-running rivers offer great potential for future development, although preservation of the country's environment continues to rank high among the government's priorities. Concern over the environment has also led the government to impose a strict set of regulations on tourists, although they are no longer subject to strict quotas that in the past held tourists to 2,500 to 4,000 a year, and banned individual tourism altogether. In 2002, tourism had climbed to about 7,000 visitors a year.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Bhutan's gross domestic product (GDP) was estimated at \$2.5 billion. The per capita GDP was estimated at \$1,200. The annual growth rate of GDP was estimated at 6%. The average inflation rate in 2000 was 7%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 45% of GDP, industry 20%, and services 35%. Aid receipts amounted to about \$71 per capita and accounted for approximately 11% of the gross national income (GNI).

## 21 LABOR

About 93% of the economically active population consisted of agricultural workers in 2002, with 5% employed in services and the remaining 2% in industry and commerce. There is a severe shortage of skilled labor. The salaried labor market is predominantly in government service. Most of the industrial sector consists of home-based handicrafts and privately owned small or medium-scale factories producing consumer goods.

As of 2002, Bhutan had a government-set minimum wage of approximately \$2.50 per day, which provides a decent standard of living for a family. The government also mandates overtime pay for work in excess of eight hours per day. Laborers are also entitled to one day's paid leave for every six work days, if the worker is retained on at least a monthly basis. The minimum work age is 18 years for citizens (20 years for non-citizens) although UNICEF has found that children as young as 11 are employed. Trade unions are illegal, and workers do not have the right to strike. Labor regulations do not provide a worker with the right to remove themselves from hazardous conditions, although the government provides free medical care to workers.

## 22 AGRICULTURE

Only about 3.4% of the land area, comprising 160,000 hectares (395,000 acres), was used for seasonal and permanent crop production in 1998. In 2002, agriculture contributed about 45% to GDP, and engaged 93% of the economically active population. Nonetheless, Bhutan's near self-sufficiency in food permitted quantities of some crops to be exported to India, in exchange for cereals. Since there is little level space available for cultivation, fields are generally terraced. Stone aqueducts carry irrigation water. The low-lying areas raise a surplus of rice; in 1999, output of paddy rice was estimated at 50,000 tons. Other crops include wheat, maize, millet, buckwheat, barley, potatoes, sugarcane, cardamom, walnuts, and oranges. Part of the crop yield is used in making beer and chong, a potent liquor distilled from rice, barley, and millet. Paper is made from the daphne plant, which grows wildly. Walnuts, citrus fruits, apples, and apricots are grown in government orchards.

Agricultural holdings are restricted to 12 hectares (30 acres) per family; almost all farm families own their own land. Since the mid-1960s, the government has established demonstration farms, distributed fruit plants, and implemented irrigation schemes. High-yielding varieties of rice, wheat, and corn seeds have been introduced. Under the 1987–92 economic plan, farming cooperatives were introduced and apiculture was promoted.

## 23 ANIMAL HUSBANDRY

Yaks, cattle, and some sheep graze in the lowland forests and, during the summer, in the uplands and high valleys. In 1999 there were an estimated 435,000 head of cattle, 75,000 hogs, 59,000 sheep, and 42,000 goats. Draft animals that year included 30,000 horses, 18,000 donkeys, and 10,000 mules. Meat production in 1999 was estimated at 8,000 tons, 75% of it beef. Wool has been in short supply since its importation from Tibet was stopped by the government in 1960; sheep breeding is therefore encouraged. In 1999, one ton of hides was produced.

## 24 FISHING

The government has established a hatchery and started a program of stocking Bhutan's rivers and lakes with brown trout. Freshwater fish are found in most waterways. The total catch was 330 tons in 2000.

## 25 FORESTRY

About 64% of Bhutan's land area was covered with forests in 2000. Although lack of transportation facilities has hampered forest development, timber has become a major export.

Roundwood production in 2000 totaled 4.2 million cu m (148 million cu ft), about 99% of which was used for fuel.

## 26 MINING

The mineral industry of Bhutan was small and dominated by the production of cement, coal, dolomite, and limestone, and was insignificant to its economy, which grew by 6% in 2001. Estimated production totals, in tons, for 2001 were: limestone, 280,000; dolomite, 265,000; cement, 160,000; gypsum, 55,000; quartzite, 53,000; ferrosilicon, 16,000; and talc, 3,800. Marble and slate were quarried for use as a dimensional stone; production totals in 2001 were estimated at 4,000 and 9,000 sq m, respectively. Dolomite has constituted an important export to India since 1960, and almost all the ferrosilicon output is exported to India. For centuries, silver and iron have been mined in Bhutan for handicrafts. Deposits of beryl, copper, graphite, lead, mica, pyrite, tin, tungsten, and zinc have also been found. A graphite-processing plant was established at Paro Dzong.

## 27 ENERGY AND POWER

In 2000, 55% of Bhutan's commercial energy consumption (which totaled 380.7 million kWh) was provided by hydroelectric power, 24% from petroleum, and 21% from coal. Electric power was introduced in Bhutan in 1962; by the mid-1980s, six hydroelectric and six diesel power stations were in operation. The 336-MW Chukha hydroelectric project, in southwestern Bhutan, was completed in early 1987 and is connected to the Indian power grid; the project was funded by India, which is to receive all the electrical output not used by Bhutan. As of 2002 the major hydroelectric project under construction was the 1,020 MW Tala plant, slated for completion in 2004/05. In 2001, Bhutan's net installed capacity was 425,000 kW; in 2000 production totaled 1,900 million kWh, of which 99% was hydroelectric. Bhutan suffers frequent power outages and shortages.

## 28 INDUSTRY

Craft manufacture is the predominant industrial occupation, and homespun textiles—woven and embroidered cottons, wools, and silks—are the most important products. Other Bhutanese handicrafts include daphne paper; swords; wooden bowls; leather objects; copper, iron, brass, bronze, and silver work; wood carvings; and split-cane basketry.

The economy in the 21st century has become increasingly dominated by the hydroelectric sector, and the building of new power projects has led to double-digit growth in the transport and construction sectors, including a number of local cement operations. The country's first cement plant was completed in the border town of Penden in 1982 by India, to which the bulk of its output is exported. Bhutan's first mega power plant, the 336-MW Chukha hydroelectricity project (CHEP), came on line in early 1987, having been first agreed to as a turn-key operation with India in 1961, on what has become a standard arrangement of 60% grant and 40% concessional loan. 70% of the power generated by the CHEP is exported to India, and by 1996 export receipts were sufficient to produce a trade surplus with India. Nevertheless, it is estimated that only about 3% of Bhutan's hydroelectric potential has yet been exploited, and even less of its industrializing potential. The decade following the opening of the Chukha facility, 1988–1998, saw more government resistance to industrialization of Bhutan than support, and progress has been slow. In 1988, in conjunction with the country's sixth economic plan (1987–1992), the Bhutan Development Finance Corporation was established to promote small- and medium-scale businesses. A second cement plant was established in Nanglam by the late 1980s, and another, in 1995, in the same town, by an Indian investor, along with several manufacturing plants producing carbide, particleboard and other products destined for the Indian market, but Bhutan industrialization was hobbled by stridently

anti-foreign, anti-modernity policies. In fact, security problems in Nanglam have caused to government to close down the Project Office there and shift to a temporary office in Gelepu. There has been some renewed opening in the late 1990s, but by the end of 2002 only one rather small power plant and part of a second have been brought on line: the India-sponsored 60 MW Kurichhu hydroelectric project, and the first, smaller phase of the Austria-sponsored 65 MW Basochu hydropower project. The truly major, and fully India-funded, 1020 MW Tala Hydro-electric Project (THEP) was begun in 1998 with targets for completion in 2004 and 2005. Plans for the even more ambitious Sunkosh Multipurpose Project (SMP), with installed capacity envisioned at 4,060 MW, were developed by the India's Central Water Commission in 1997. It is expected to take 10 years to complete. Two other projects that have been submitted to government of India for consideration are a 360 MW plant at Mangdue Chu and a 870 MW plant at Puna Tsangchhu.

There are a large number of small, privately owned sawmills throughout Bhutan since most of its domestic energy actually comes from firewood, not electricity. A sawmill with a furniture-making unit has been established in Thimphu. Industrial estates have been set up at Phuntsholing and Geylegphug, and the Ninth Five Year Plan (2002 to 2006) calls for five to be located around the country.

Besides cement, there is a narrow range of other manufactures exported—ferro-alloys, calcium carbide, processed foods and particleboard—which tend to rely on energy- and capital-intensive methods and expatriate labor. Bhutan Ferro Alloys Ltd., which makes ferrosilicon and exports to India and Japan, began operations at a new plant at Pasakha in April 1995. Calcium carbide is produced at several private dolomite-mining operations, as well a private and joint public-private limestone mining operations. Manufacturing as a share of GDP has risen from 3.2% in 1980 to 8.2% in 1990 to 12% in 1998 to an estimated 20% in 2001. It is likely that with the emphases in the Ninth Five Year Plan on commercial and private sector development as means of achieving economic self-sufficiency and generating employment, this share will continue to grow.

## 29 SCIENCE AND TECHNOLOGY

Royal Bhutan Polytechnic College, founded in 1974 in Deothang, offers courses in civil, mechanical and electrical engineering. The Royal Technical Institute in Phuntsholing offers courses in electronics, mechanics, and motor mechanics. Sherubtse Degree College, founded in 1983 in Tashigang, offers science courses.

## 30 DOMESTIC TRADE

Over 90% of the population is employed in agriculture. Homemade handicrafts, cement, and food processing are the primary industries. Retail sales are carried out mainly in small, local bazaars. Bartering is common at the local level, with grains, butter, and cloth being the principal commodities of exchange, although Indian and Bhutanese currencies are increasingly being employed. Indian traders sell imported articles and buy a number of handicraft items for export to India. The Ninth Five Year Plan (2002–2006) for the first time envisions plans for each of Bhutan's 201 localities or geogs. Through this approach, the government hopes to enhance rural connectivity and economic activity while putting a check on rural to urban movement.

## 31 FOREIGN TRADE

After the 1960 government ban on trade with Tibet, Bhutan's external sector became almost exclusively oriented toward trade with India. With the completion in 2002 of the second hydroelectric power project financed by India—built largely with Indian migrant labor and designed to deliver the majority of its power outputs to India—India's dominance in terms of exports has remained over 90%. Import sources, however, have become

increasingly diversified, with non-Indian sources—particularly First World industrialized countries—accounting for nearly 30%, up from about 20% in 1998. The increased diversity in import sources corresponds roughly to the increased diversity in foreign aid sources, which in the 1960s had been virtually monopolized by India. For 2000 the US Central Intelligence Agency (CIA) identified the main export destinations as India (94%) and Bangladesh, and the main import sources as India (77%), Japan, United, Germany, and the United States.

Bhutan's merchandise trade balance has been persistently negative, although for three years, 1996, 1997, and 1998, the country registered a surplus in its trade with India due to the combination of power exports and the lack, until 1998, of major construction projects. With the start of construction on the Tala Hydroelectric Project (THEP) in 1998, scheduled to be online with a 1020 MW capacity in 2004 or 2005, Bhutan has incurred large and increasing trade deficits. As a percent of GDP, Bhutan's trade deficit has increased from a low of 4.3% in 1996 to ratios of 14.2% in 1999, 16.7% in 2000, and 22.6% in 2001. The 2001 trade deficit amounted to \$81.7 million, according to the IMF, 56% of which (\$45.7 million) was attributable to a trade deficit with India. Bhutan's principal exports include electric power (to India), cement, cardamom, timber, gypsum, dolomite, coal, handicrafts, cement, fruit, vegetables, precious stones, spices, ferrosilicon, calcium carbide, particle board, some preserved food, alcoholic beverages, yak tails for fly whisks, and yak hair. The country's principal imports are fuel and lubricants, grain, machinery and parts, vehicles, fabrics, and rice.

### **32 BALANCE OF PAYMENTS**

Bhutan's current account deficit was at a low of 11.1% of GDP in 1998, the year construction began on the Tala hydroelectric project. This ratio more than doubled the next year, to 24.1% of GDP in 1999, reflecting increased capital goods imports and rising factor service payments for the project dependent on foreign labor and expertise. The proportional deficit on the current account ranged even higher in 2000 and 2001, to 28.4% of GDP and 26.8% of GDP, respectively, and was expected to be yet higher for 2002. However, foreign aid increases, also largely attributable to the Tala project, which is financed by India, have, to date, more than compensated for the current account deficit. In 2000/01, according to the IMF, the current account deficit was at \$126.2 million while compensating grants came to \$129.1 million, including \$100.1 million (77.5% of total grants) from India. As a percent of GDP the overall balance of payments surplus in 2000/01 was 5.9%, a decrease from more comfortable ratios of 8.2% in 1999/2000, 11.0% in 1998/99, and 11.7% in 1997/98. The decline in the overall payments surplus reflects not just increased imports of goods and services, but also an increased share of concessional loans over grants in foreign aid received.

The US Central Intelligence Agency (CIA) reports that in 2000 the purchasing power parity of Bhutan's exports was \$154 million while imports totaled \$196 million resulting in a trade deficit of \$42 million.

### **33 BANKING AND SECURITIES**

Bhutan's central bank is the Royal Monetary Authority, established in 1982 to manage currency and foreign exchange. There are in addition four other major financial institutions. The Bank of Bhutan was founded in 1968 as a joint venture with India. A second commercial bank, the Bhutan National Bank (BNB), was established in 1997 as a public corporation, though the government retains 51%. The BNB's operations are computerized and it is connected with major foreign banks, unlike the Bank of Bhutan, which still uses hand-written ledgers. The Bhutan Development Finance Corporation (BDFC) was set up in 1988 to finance small and medium enterprises. The small

Royal Bhutan Stock Exchange (RBSE) currently trades about 13 companies.

In 2001 there was a reduction of interest rates in all lending categories and on large deposits. There are no ATMs, and banking hours are mostly restricted to 9 AM to 1 PM Monday to Friday, and 9 AM to 11 AM on Saturday, but there are some "evening banks" in Thimphu and Phuentsholing with hours between 1 to 5 PM Wednesday and Sunday, 1 to 3 PM on Monday, and closed on Tuesday. Gross foreign currency reserves reached \$300 million in 2001. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$107.2 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$227.1 million.

### **34 INSURANCE**

The Royal Insurance Corporation of Bhutan (RICB), founded by royal charter in January 1975, is the only insurance company in the kingdom and covers all classes of insurance. The government owns 39.25% while private and public shareholders own 60.25%. The RICB's 2000 shareholder are comprised primarily of civil servants and members of the business community. The Royal Insurance Corporation of Bhutan has reinsurance arrangements with ten companies in India, Japan, Thailand, Hong Kong, Nepal, Bangladesh, and Germany.

The use of insurance, however, is limited. In 2001, there were 15,259 policy holders of general insurance, and only 4,650 holders of life insurance, the latter figure up from 114 in 1975. Within the terms of its own business, the RICB has had a steady growth in profit and assets over its 27 years of operation, but it also manages, under a Memorandum of Understanding (MOU) with the government, the rural house insurance scheme which it operates as a social welfare program in accordance with the terms of the MOU. In 2001, the rural house insurance scheme covered 31,172 permanent rural houses and 21,407 semi-permanent houses for fire, earthquake, flood, landslide, and storm, all of which are common events in Bhutan. The scheme was revised in January 2000 to give compensation of N100,000 (about \$2,150) for a permanent house with an annual premium of N150 (about \$3.23), and N40,000 (about \$860) for a semi-permanent house with an annual premium of N60 (about \$1.30). Claims have increased considerably since the revision. In 1999, under the previously less generous scheme, claims were N2.425 million (about \$52,000) against premiums of N1.77 million (about \$25,312), where as by 2001 claims had risen to N11.292 million (about \$243,000) against premiums of N5.98 million (about \$128,000). The ratio of claims to premiums has somewhat improved, from 2 to 1 in 1999 to 1.89 to 1 in 2001.

### **35 PUBLIC FINANCE**

The largest category of annual current expenditure is public works, which presumably includes the maintenance of monasteries. Most of the annual budget deficit is covered by grants from India and from the UN and other international agencies. By 1996, Bhutan had achieved self-sufficiency in current expenses, thanks primarily to revenues from the Chhukha power project, Bhutan's largest hydro-electric plant.

The US Central Intelligence Agency (CIA) estimates that in 1995/1996 Bhutan's central government took in revenues of approximately \$146 million and had expenditures of \$152 million. Overall, the government registered a deficit of approximately \$6 million. External debt totaled \$245 million.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	146
Tax revenue	27.3%	40
Non-tax revenue	36.1%	53
Capital revenue	0.5%	1
Grants	36.2%	53
EXPENDITURES	100.0%	152
General public services	21.9%	33
Public order and safety	5.0%	8
Education	15.6%	24
Health	10.2%	15
Housing and community amenities	7.7%	12
Recreation, cultural, and religious affairs	1.8%	3
Economic affairs and services	37.1%	56
Interest payments	0.9%	1

### 36 TAXATION

The corporate income tax (CIT), excises taxes, taxes on real estate income, and non-tax revenues (particularly power tariffs on the export of electricity to India) were the main sources of domestic revenue in 2001. The power tariff, at Bhutan's insistence, was doubled to R1 (about \$0.028) per unit on 1 April 1997, and then raised 50% to R1.5 (about \$0.034) per unit 1 July 1999. The business income tax (BIT) accounted for only about 5% of revenue in 2001 because of the weakness of the private sector. In January 2003, the government introduced a personal income tax (PIT) for individuals with taxable incomes above N100,000. The PIT is expected to raise only N110 million (or about 1%) of the 2001–2003 budget of N11,184.6, but at this stage the government considers the social benefits of the PIT—reducing income disparities and instilling a sense of responsibility—to be more important than its revenue contribution. In July 2002, the government launched the Pension and Provident Fund Plan, a scheme converting the social security system to a pension plan to provide retirement benefits for civil servants, corporate employees, and the armed forces.

External assistance continues to provide the bulk of Bhutan's development budget, but since 1996 domestic revenues have covered current expenses. In 2001, domestic revenues also covered a portion of the capital budget. A major goal of the Ninth Five Year Plan (2002–2006) is the increase of domestic revenue through taxes. In 2002–2003, it is projected that for the first time tax revenues will exceed non-tax revenues. Tax revenues are expected to come to 12% of GDP and non-tax revenues to 8% of GDP.

### 37 CUSTOMS AND DUTIES

Under the Indo-Bhutanese Treaty of 1949, goods pass from one country to another without payment of customs duties. Bhutan currently has observer status with the World Trade Organization (WTO). In 1999, the WTO accepted Bhutan's application for accession. However, as of December 2002, Bhutan had not provided the WTO with the required memorandum on its foreign trade regime, the next step in the process of negotiating an accession. In 2002, the government identified a site in Phuentsholing for the construction of a dry port to expedite export and import formalities and revised some of its more restrictive import rules.

### 38 FOREIGN INVESTMENT

Foreign investment comes primarily from India, and is carried out within the context of Bhutan's special relationship with India. Bhutan's first two Five Year Plans in the 1960s were 100% financed by India. Since then, Bhutan has relied on an increasingly diverse set of countries—Australia, Austria, Finland, Denmark, Japan, the Netherlands, Norway, Canada, Switzerland, Germany, Italy, New Zealand, Italy, New Zealand, Sweden, South Korea, South Korea, United Kingdom and United States—and multilateral institutions—the UN, the World Bank and the Asian Development Bank (ADB)—to provide capital on a concessional basis, though India remains the dominant source. On private foreign investment, the government's stance is that foreign direct investment (FDI) it is becoming increasingly necessary to meet the country's employment and self-sufficiency goals. FDI is now permitted in certain sectors, including tourism where, in 2002, negotiations were being pursued for joint ventures with international hotel and resort chains. Concerns to preserve Bhutan's cultural heritage, its natural environment, and to prevent the emergence of large income inequalities can be expected to take precedence over any opening to foreign investment.

### 39 ECONOMIC DEVELOPMENT

Bhutan is on the UN's list of least developed countries (LDC) and its government has been shown no particular eagerness to graduate from this status. In 2002, it embarked on its Ninth Five-Year Plan (FYP) seeking to maximize what the King termed "gross national happiness," not gross national income. Bhutan's leaders have adopted a very cautious approach to economic development, putting preservation of the traditional Buddhist culture and the country's spectacular natural environment well ahead of ambitions for economic modernization. Bhutan is a country where immigration is forbidden and tourism is controlled under a strict regime to guard against corrupting influences. The greatest restraint imposed on development by the government in its non-recognition of the majority of the residents in Bhutan as citizens. While the government claims, by its own calculation of the UN's Human Development Index (HDI), counting only the country's 600,000 or so ethnic Bhutanese, to have achieved a medium income status (above 0.5 on the HDI), the UN, counting all the residents, continues to list Bhutan in the low-income group. The subsistence sector remains at over 90%. There are no railroads, helicopters, domestic airlines, or ATMs, and, though hydroelectric power is Bhutan's main export, 70% of the population do not have electricity and depend on firewood for energy (72% of the country is forested, and by law 60% must remain so). Under current plans, full rural electrification is not scheduled to be accomplished until 2020. The shortage of skilled labor and technical expertise is chronic and severe. In 2001, 40% of the government's budget was supplied by foreign grants, and the government, in turn, comprised 40% of the small cash economy.

Nevertheless, since the political reforms of 1998, when King Wangchuk relinquished some of his absolute power, there have been successive years of robust growth with moderate inflation, and the start of a number of potentially far-reaching structural reforms: the creation of a government department on telecommunications (access to foreign television and the internet was restored in 1999 after having been banned in 1990), the abolition of the state monopoly in petroleum distribution, the privatization of public enterprises in banking, trade and cement manufacture as well as the creation of several joint ventures, and the transformation, as of July 2002, of the government power department into Bhutan Power Corporation (BPC), currently the largest corporation in the country.

The driving force behind most economic growth in Bhutan has been India's support for the construction of hydroelectric projects to service its own market, with spinoffs in transportation improvements, the construction industry and energy-intensive manufactures. Since the power projects mainly relied on migrant Indian labor and expertise, the impact on Bhutan's labor force capabilities has been limited.

Under Bhutan's first four development plans, 1961 to 1981, considerable improvements were made in agriculture, irrigation, and forestry, as well as electric power generation and road transportation. Until 1974 when the first tourists were allowed into the country, the main source of foreign exchange was exotic postage stamps bought by collectors. The plans were funded 90% to 100% by India, which contributed more than \$197 million over the 20-year period.

Under the fifth economic plan (1981–87), priorities were agriculture and animal husbandry (14% of outlays) and public works (13%). The centerpiece was the construction of the 336 MW Chhukha hydroelectric project (CHEP), completed in 1987 and connected to the Indian power grid. Investments under the Fifth Plan were about 31% financed by India and 30% by UN agencies and other foreign sources. GDP grew briskly in this period, 6% to 8% annually according to the plan, but progress was hampered by the lack of local skills. The Sixth Fiscal Year Plan (1987–91), accordingly, emphasized the improvements in education and personnel training to develop the skills needed for trade and industry, and to reduce dependence on Indian expertise and labor. Other goals included expansion of the tax base to decrease the dependence on foreign grants, encouragement of the private sector to provide local employment, and decentralization to the district (*dzongkha*) level to check excessive rural to urban migration. GDP was targeted to grow at 6.9% a year, with priority given to industry, trade and commerce (20%) and power (13%). The Bhutan Development Finance Corporation (BDFC) was established in 1988 to promote small and medium state industries in various sectors of the economy.

However, by the end of 1988, the King and other traditional leaders had become thoroughly alarmed at the impacts the surge in economic activity was having in Bhutan, as well as in neighboring Nepal, where they witnessed its monarchy being pressured into democratic reforms. Bhutan was closed to individual tourists, who were accused of having desecrated holy places, defiled and stolen sacred objects and having a corrupting influence on the population. In 1989, the King issued edicts imposing a strict Buddhist dress and social code (the Driglam Manzha) and the Dzongka language of northern Bhutan. Bhutanese Hindus of Nepalese origin, just over half of the population, rejected these impositions in the name of a pro-democracy movement. In April 1990, the King ordered fines and imprisonment to enforce the Driglam Manzha, and banned foreign television networks. In late 1990, Hindu residents were essentially declared stateless as the government asserted that only ethnic Bhutanese were rightful citizens. By 1991, an estimated 50,000 ethnic Nepalese had fled the country, including several senior officials, high-level bureaucrats, and other trained personnel.

In the seventh economic plan (1992–1997) the government had shifted goals had to priorities on preserving national identity; preserving the pristine environment; economics, especially food, self-sufficiency; indigenous human resource development, and encouragement of privatization in manufacturing and services. Specific environmental objectives included the promotion of sustainable agriculture through soil erosion control as well as the setting aside of 20% of the country's land area as nature reserves and other areas protected from commercial timber extraction. The personnel problem soon became acute as many as 70,000 ethnic Nepalese joined the exodus to UN-supported refugee camps just outside the country, including the bulk of Bhutan's

technocrats, civil servants, police and army personnel. In 1993, GDP growth plummeted to 3%, well below the targets set in the plan. In 1995, however, growth had recovered to 7.4%. A goal to meet all recurrent expenditures from domestic revenues by the end of the planning period, thus reducing Bhutan's dependence on external grants, was achieved in 1996, thanks primarily to revenues from the Chhukha power project.

In the eighth fiscal year plan (1997 to 2002) priorities were on the expansion of the hydroelectric sector, education and training improvements, protection of the natural environment, and further development of the private sector. In 1997 a second commercial bank, the Bhutan National Bank (BNB), was founded, with computerized operations and 49% public participation. In 1998, with the start of construction on the 1020 MW Tala Hydroelectric Project (THEP), GDP growth jumped briefly from 6% to 7.3%, before proceeding at an average of about 6% for the rest of the planning period. Indeed, 6% has been the average growth rate for Bhutan across the last three economic plans, 1988 to 2002.

The ninth fiscal year plan (2002 to 2006) promises a continuation of the same moderate progress, although it calls for a 75% increase in outlays over the revised eighth FYP. A central strategy of the plan is to check what is seen as excessive urbanization, up to 21% in 2002, through, intensive rural development. For the first time the plan includes separate plans for each of the country's 201 local units or geogs. The four priorities of the plan are increasing domestic tax revenue, improving rural quality of life and income, geog-based planning, and enhancing the private sector. The prospect is for Bhutan to continue to proceed at its own restrained pace.

#### 40 SOCIAL DEVELOPMENT

There is no national social welfare system, although the government implemented a modest maternal and child welfare program in the early 1980s, including family planning. The sick, indigent, and aged are cared for within the traditional family structure.

Bhutan's culture does not isolate or disenfranchise women. Dowry is not practiced, and land is divided equally between sons and daughters. Girls receive nearly equal educational opportunities, and, while accorded a lower status than boys, they are cherished because they are the ones who care for parents in old age. Polygamy is legal, but only with the consent of the first wife. The law clarifies the definition of sexual assault and imposes harsh penalties. There is no societal pattern of spousal or child abuse.

A pattern of discrimination against the minority Hindus of Nepalese origin exists. Thousands of Nepalese were deported from Bhutan in the late 1980s, and many others fled to refugee camps in Nepal. The government launched an effort to promote the cultural assimilation of the remaining Nepalese. Nepali was no longer taught in schools, and national dress was required for official occasions. While this policy has led to the cultural repression of Hindus, it has also contributed to a growing number of Nepalese obtaining employment in the public sector and in government. Repatriation of the exiled Nepalese remains an unresolved issue, one that the government formed in 1999 has promised to address.

Human rights are restricted by the government. Abuses include violence against Nepalese refugees and arbitrary arrest and detention. The king exercises control over the government, security forces, and the judiciary.

#### 41 HEALTH

Bhutan suffers from a shortage of medical personnel with only 65% of the population having access to any form of medical care. In 1990, there were 141 doctors (113,110 people per physician), 5 pharmacists, 9 dentists, 233 nurses, and 70 midwives. In 1995

there were an estimated 0.2 physicians, 0.4 nurses, and 0.6 midwives per 1,000 people.

The average life expectancy in 1999 was only 52.8 years (52.3 years for females and 53.2 years for males) and the overall death rate was 14.3 per 1,000 people. The infant mortality rate was 109 per 1,000 live births. In 1994, 38% of children under five were underweight. In 1993, it was estimated that 2% of married women (15–49 years) were using contraception. The fertility rate was reported as 5.2 per woman in 1999.

Immunization rates between 1990 and 1992 for children up to one year old were: tuberculosis, 81%; diphtheria, pertussis, and tetanus, 79%; polio, 77%; and measles, 82%. Although smallpox has been wiped out, malaria, tuberculosis, and venereal disease remain widespread. Bhutanese refugees in the eastern Nepal region have high rates of measles, cholera, tuberculosis, malaria, diarrhea, beriberi, and scurvy. There were 25 new cases of cholera in this country in 1994.

## 42 HOUSING

Though a small number of urban settlements have been developed over the past few years, most of the population (80%, 2001 est.) lives in rural areas, many on small family farms. It is, however, expected that the urban population will grow by about 50% over the next two decades, an estimate that has the Beninese government taking a harder look at options for new and improved housing construction and utility services. The Municipal Act of 1999 was established to decentralize control of housing and utilities, resulting in greater service and improved plans for the future. As part of the government's socioeconomic development policy, all homeowners are eligible for assistance through subsidized timber purchases and group fire insurance. The government has also established the National Committee on Human Settlements to oversee projects for urban development. Traditional houses are built of stone set in clay mixed with small stones and made into blocks or layers. Roofs are gently inclined and formed of pine shingles kept in place by heavy stones. As of 2000, 80% of urban and 60% of rural dwellers had access to improved water supplies, while 65% of urban and 70% of rural dwellers had access to sanitation services.

## 43 EDUCATION

A modern educational system was introduced in Bhutan in the 1960s. Prior to that, education was provided only by monasteries. In the interim, more than 340 schools and institutions of higher education have been established, including over 150 community schools to serve remote rural areas. However, many of these schools have no sanitation facilities, electricity, or drinking water, and students may have to walk several hours a day to get to them. A growing number of children are attending school, but over 50% still do not attend.

Efforts have been made to improve the education of women, and girls account for 45% of primary school enrollment. However, the overall literacy rate for women is still very low and lags far behind that for men. Bhutan's estimated rate of adult illiteracy for the year 2000 stood at 52.7% (males, 38.9%; females, 66.4%). The official language is Dzongkha (written in the Tibetan script). However, English is widely used. Education is not compulsory. The educational system consists of seven years of primary schooling followed by four years of secondary school. In 1994, primary schools enrolled 60,089 pupils. In the same year, secondary schools enrolled 7,299 students. The pupil-teacher ratio at the primary level was 42 to 1 in 1999.

In 1991, Bhutan had 209 schools altogether, including 22 monastic schools, schools for Tibetan refugees, and six technical schools. There was at the highest-level one junior college, two teacher training colleges, and one degree college which was affiliated to the university at Delhi in India. Many teachers from India are employed in Bhutan.

## 44 LIBRARIES AND MUSEUMS

The largest library in Bhutan is the National Library at Thimphu, containing 105,000 volumes as of 2002. Located in Konglung, Sherbutse College Library holds 22,000 volumes. The National Institute of Education in Samtse, founded in 1968, holds 12,000 volumes, and the Royal Institute of Management in Thimphu holds 5,000 volumes.

The National Museum of Bhutan opened to the public in 1968 at Paro Dzong, in a seven-story 17th-century fortress, featuring religious art objects reflective of Bhutan's unique Northern Buddhist culture, as well as historical objects. Some monasteries have valuable collections of Buddhist manuscripts and art objects.

## 45 MEDIA

International postal service was inaugurated in 1963; there are direct postal, telex, and microwave links to India. In 1997, Bhutan had over 6,000 telephones. Telephone service is said to be very poor.

In 1998, there was only one radio station. It is government-owned and includes broadcasts in Dzongkha, Nepali, English, and Sharchop. From 1989 to 1999, the government had imposed a ban on private television reception. Television broadcasting was reintroduced to the country in 1999 through the government's creation of the Bhutan Broadcasting Service, which broadcasts locally produced and foreign programs. The same year, the government allowed for the licensing of cable companies. In 2001, there were about 10,000 cable subscribers. Druknet, the nation's first Internet service provider was also established in 1999. By the end of 2000, there were about 1,820 subscribers, including Internet cafés in three major cities. In 1997, the country had an estimated 11 radios per 1,000 population.

A weekly government-subsidized newspaper, *Kuensel*, publishes simultaneous editions in Dzongkha, English, and Nepali, with a total circulation of about 11,162 as of 2002. Indian and other foreign publications are also available.

There are no legal provisions for the right of free expression in Bhutan; the government is said to restrict criticism of the King and government policies of the National Assembly.

## 46 ORGANIZATIONS

There are about 125 youth organizations throughout the country, which are affiliated through the Bhutan Youth Welfare Association (BYWA), established in 1985. The objectives of the BYWA are to preserve and promote the cultural and religious heritage of Bhutan and its national integration through the representation of youth to governmental authorities. Youth groups include Youths and Students Alliance for Human Rights and Democracy in Bhutan (YSAHRDB) and the Youth Organization of Bhutan, both of which focus on interests of peace and human rights. Scouting programs are also available.

The National Women's Association of Bhutan is one of the few non-governmental organizations officially registered in Bhutan. Other women's organizations, such as Bhutan Women and Children Organization and Refugee Women and Children Welfare Society have formed in exile. All of these are focused on the promotion human rights.

## 47 TOURISM, TRAVEL, AND RECREATION

In 1974, Bhutan opened its door to tourists, but strict entry regulations, the remoteness of the country, and relatively limited transportation facilities have restricted the number of visitors. Tourists may only enter as a member of an established tour group. Passports and visas are required. The beautiful Thimphu, Paro, and Punakha valleys, with their many monasteries, are accessible to tourists. Archery is the national sport.

Income from tourism totaled approximately \$10 million in 2000 and there were 7,559 foreign visitors, including over 5,000 visitors from the US and Europe.

In 1999, the UN estimated the cost of staying in Thimphu at \$59. In rural areas, expenditures were estimated at \$48 per day.

#### 48 FAMOUS BHUTANESE

Jigme Dorji Wangchuk (1928–72) instituted numerous social reforms during his reign as king of Bhutan. He was succeeded by his son Jigme Singye Wangchuk (b.1955).

#### 49 DEPENDENCIES

Bhutan has no territories or colonies.

# BRUNEI DARUSSALAM

Nation of Brunei, Abode of Peace

*Negara Brunei Darussalam*

**CAPITAL:** Bandar Seri Begawan

**FLAG:** On a yellow field extend two diagonal stripes of white and black, with the state emblem centered in red.

**ANTHEM:** National Anthem, beginning *Ya Allah lanjutkan usia* (“God bless His Highness with a long life”).

**MONETARY UNIT:** The Brunei dollar (B\$, or ringgit) of 100 cents is valued at par with, and is interchangeable with, the Singapore dollar. There are coins of 1, 5, 10, 20, and 50 cents, and notes of 1, 5, 10, 50, 100, 500, 1,000, and 10,000 Brunei dollars. B\$1 = US\$0.5617; (or US\$1 = B\$1.78) as of May 2003.

**WEIGHTS AND MEASURES:** Imperial weights and measures are in common use, as are certain local units, but a change to the metric system is slowly proceeding.

**HOLIDAYS:** New Year’s Day, 1 January; National Day, 23 February; Anniversary of the Royal Brunei Armed Forces, 31 May; Sultan’s Birthday, 15 July. Movable holidays include the Chinese New Year and various Muslim holy days.

**TIME:** 8 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Brunei occupies 5,770 sq km (2,228 sq mi) on the northwestern coast of the island of Borneo. Comparatively, the area occupied by Brunei is slightly smaller than the state of Delaware. It comprises two small enclaves separated by the Limbang River Valley, a salient of the Malaysian State of Sarawak, which surrounds Brunei on the E, S, and W. Brunei’s total boundary length is 381 km (237 mi).

Brunei’s capital city, Bandar Seri Begawan, is located in the northern part of the country.

## <sup>2</sup>TOPOGRAPHY

Brunei’s western enclave contains most of the country’s population, as well as the capital; the thinly populated eastern zone is mainly dense forest. The land generally consists of primary and secondary tropical rain forest, with a narrow coastal strip on the western enclave. The eastern enclave is more hilly, rising to 1,850 m (6,070 ft) in the peak of Mt. Pagon in the extreme south.

## <sup>3</sup>CLIMATE

The country has a tropical climate, with uniform temperatures ranging from 23° to 32°C (73–89°F). Humidity is high—about 80% all year round—and annual rainfall varies from about 275 cm (110 in) along the coast to more than 500 cm (200 in) in the interior. Rainfall is heaviest during the northeast monsoon season (landas), especially in November and December.

## <sup>4</sup>FLORA AND FAUNA

The country is largely covered by mangrove and peat swamp, heath, montane vegetation, and dipterocarpaceous forest. The rain forest and swampland are inhabited by a plethora of small mammals, tropical birds, reptiles, and amphibians. Mammals include both wild and domesticated buffalo, honey bear, deer, and monkeys. Insects are abundant and sometimes harmful, in particular the malarial mosquito and biting midge.

## <sup>5</sup>ENVIRONMENT

The nation has an extensive oil industry with reserves that are estimated to last 20 years. The forests, which account for 79% of Brunei’s land area, are strictly protected by the government. Endangered species in 2001 included the black-faced spoonbill, Sumatran rhinoceros, the Siamese crocodile, and the painted batagur. Brunei is a party to international agreements on ozone layer protection, endangered species, whaling, and ship pollution and has signed but not ratified the Law of the Sea.

## <sup>6</sup>POPULATION

The population of Brunei in 2003 was estimated by the United Nations at 358,000, which placed it as number 166 in population among the 193 nations of the world. In that year approximately 3% of the population was over 65 years of age, with another 32% of the population under 15 years of age. There were 108 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.27%, with the projected population for the year 2015 at 453,000. The population density in 2002 was 61 per sq km (159 per sq mi).

It was estimated by the Population Reference Bureau that 72% of the population lived in urban areas in 2001. The capital city, Bandar Seri Begawan (formerly Brunei Town), had a population of 85,000 in that year. Other important towns are Seria, Kuala Belait, and Tutong. According to the United Nations, the urban population growth rate for 2000–2005 was 2.0%.

## <sup>7</sup>MIGRATION

There is little emigration except among the Chinese minority. The government is battling considerable illegal immigration, especially from Indonesia and Sarawak. In 2000, the net migration rate was 2.6 migrants per 1,000 population. In that year there were 104,000 migrants residing in Brunei, which was almost one-third of the total population.

## **8 ETHNIC GROUPS**

Malays formed 67% of the population in 2002. Minorities included an estimated 15% Chinese and 12% designated as other. There is a small Caucasian minority, chiefly of English, Dutch, American, and Australian stock.

## **9 LANGUAGES**

Malay is the official language. English is also widely spoken, as is Chinese. The principal Chinese dialect is Hokkien, with Hakka, Cantonese, and Mandarin dialects also in use. Many native dialects are spoken as well.

## **10 RELIGIONS**

Islam, the official religion, dominates everyday life. Religious practice is controlled by the influential Religious Affairs Department. According to unofficial estimates, 67% of the population are Muslim. About 13% practice Buddhism, 10% are Christian, and 10% are tribal folk-religionists and members of other religious groups. Primary Christian denominations include Anglicans, Catholics, and Methodists.

## **11 TRANSPORTATION**

Two seaports, at Muara and Kuala Belait, offer direct shipping services to Hong Kong, Singapore, and several other Asian ports. However, wharf facilities at the deepwater port of Muara, though expanded to about 550 m (1,800 ft) in the mid-1980s, remain inadequate. In 2002, Brunei had 7 liquefied gas tankers with a total capacity of 348,476 GRT. The Brunei River, which flows by the capital, is a major thoroughfare.

In 2002, there were 1,712 km (1,063 mi) of main roads, of which 1,284 km (798 mi) were paved. Links between the capital and the other western towns are good. Road connections between Brunei and Sarawak are being built. Buses are inexpensive but unreliable; river taxis and cars are for hire. In 2000, the sultanate had 70,427 passenger cars and 14,342 commercial vehicles registered.

A 13-km (8-mi) railway is operated by the Brunei Shell Petroleum Co. In addition, there were 2 airports in 2001, only 1 of which had a paved runway. The national carrier, Royal Brunei Airlines, operates regular flights to Singapore, Hong Kong, Manila, Bangkok, Jakarta, Kuala Lumpur, and other cities. Some foreign airlines serve Brunei International Airport at Barakas, outside the capital.

## **12 HISTORY**

From the 14th to the 16th century, Brunei was the center of a powerful native sultanate occupying what are now Sabah and Sarawak and extending northward through the Philippines almost to Manila. By the 19th century, much of this empire had been whittled away by war, piracy, and the colonial expansion of European nations. In 1847, the sultan concluded a treaty with Great Britain for the suppression of piracy and furtherance of commercial relations. In 1888, Brunei became a British protectorate, and in 1906 a resident British commissioner was established. By a 1959 agreement (amended in 1971), Brunei was recognized as fully self-governing, with Britain retaining responsibility for defense and foreign affairs. Brunei's first elections, held in 1962, resulted in a victory for the Brunei People's Party, militant nationalists who denounced Brunei's entry into a proposed federation with Malaysia, which had attained independence in 1957. Prevented from taking office, the nationalists, with Indonesian backing, revolted against Sultan Omar Ali Saifuddin in December 1962; the revolt was quickly put down with British assistance, but the sultan decided against federation in any case. From that time on, the sultanate has ruled by decree under a national state of emergency. In 1967, Sultan Omar abdicated in favor of his son, Muda Hassanal Bolkiah.

Sultan Omar, who after his abdication remained as defense minister and assumed the royal title of Seri Begawan, died in 1986.

During the 1970s, Brunei emerged as the richest state in Southeast Asia, profiting from its oil wealth and the steep increases in international oil prices. Much of this vast oil income has been expended by the state on modernization and social services. Brunei renegotiated its treaty with the United Kingdom in mid-1978 and, on 7 January 1979, concluded a new treaty providing for independence within five years.

On 1 January 1984, the country attained full independence and was also proclaimed a member of the British Commonwealth. On 7 January 1984 Brunei joined the Association of South-East Asian Nations (ASEAN) and joined the United Nations in the same year. Brunei is also a member of the Organization of Islamic Conference.

In 1985 a new political party was formed, the Brunei National Democratic Party (BNDP), comprised predominantly of businessmen loyal to the Sultan. However, government employees were forbidden by the Sultan to join. The Chinese community was also excluded from membership. In 1986 an offshoot of the BNDP was formed, the Brunei National United Party (BNUP), which emphasized greater cooperation with the government. The BNUP favored the establishment of an elected prime-ministerial system, however. The BNUP's membership was open to Muslims and non-Muslims, but still excluded Chinese. In 1986, Brunei was solicited by the US government to aid the Nicaraguan Contras, but the \$10 million donation was credited to the wrong bank account and never reached its intended destination. The donation was eventually traced and returned to Brunei with interest.

In 1988 the top two leaders of the BNDP, President Haji Abdul latif bin Abdul Hamid and Secretary-General Haji Abdul Latif bin Chuchu, were arrested as they were about to fly to Australia. They were held under the Internal Security Act, which allows detention for up to two years without charges being filed, and were detained until 1990. In May of that year, Haji Abdul latif bin Abdul Hamid died. In 1990 the government released six other political prisoners who had been detained since 1962.

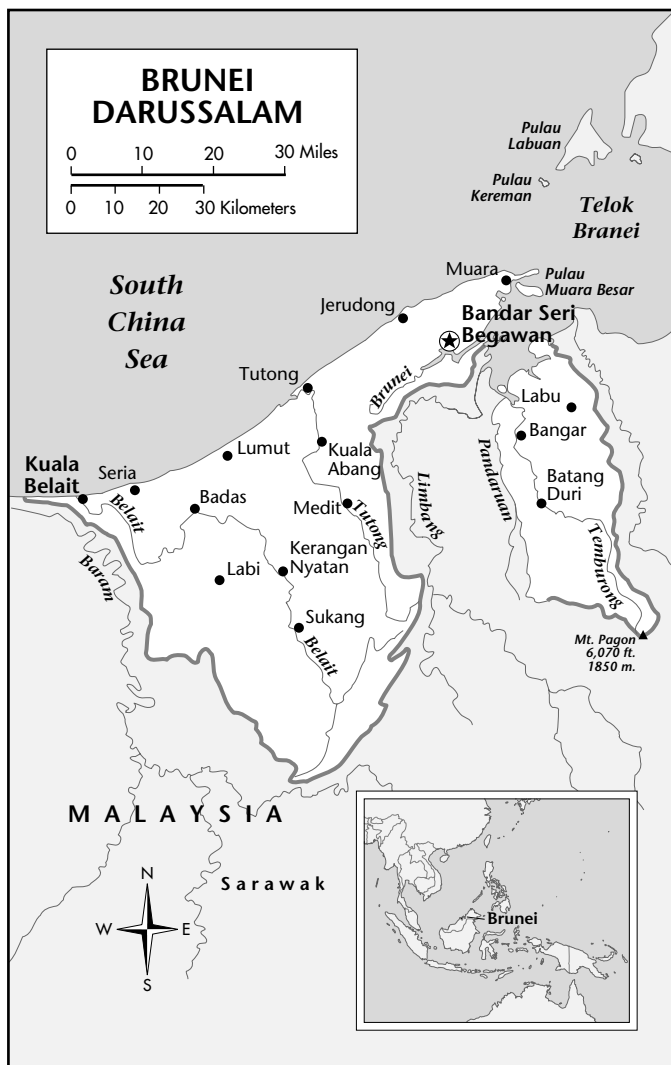

Increasing emphasis on Melayu Islam Beraja (MIB) as a state ideology has resulted in the affirmation of traditional values due to increasing concern about an affluent and worldly younger generation. In 1991 the import of alcohol and the public celebration of Christmas were banned. His Majesty Sultan Haji Hassanal Bolkiah Mu'izzaddin Waddaulah celebrated 25 years on the throne in October 1992. Once taken to be the richest man in the world, as of 2001, the Sultan was listed by *Forbes* magazine as one of the fifteen wealthiest individuals in the world, with US\$16 billion.

Brunei established diplomatic relations in 1993 with China, Vietnam and Laos.

In 1998 Brunei's economy was hit simultaneously by falling oil prices, regional currency depreciation stemming from the region's economic crisis, and the collapse of the multibillion-dollar Amedeo conglomerate run by the Sultan's brother, Prince Jefri Bolkiah, who was removed from his post as the country's finance minister. However, tensions persisted between the Sultan and his brother, who fled to London. Upon his return in early 2000, the government sued him and dozens of other persons for misuse of public funds.

As the new century began, Brunei was looking for ways to diversify its heavily petroleum-dependent economy as its oil and gas reserves waned.

In November 1999, Brunei and the nine other members of the Association of Southeast Asian Nations (ASEAN), agreed informally to create a free-trade zone by eliminating duties on most goods traded in the region by 2010. When ASEAN met in November 2002, the Southeast Asian leaders and China began

LOCATION: 4°2' to 5°3' N; 114° to 115°22' E. BOUNDARY LENGTHS: Malaysia, 381 kilometers (237 miles); South China Sea and Brunei Bay coastlines, 161 kilometers (100 miles). TERRITORIAL SEA LIMIT: 12 miles.

concrete talks to create what would be the world's largest free trade area, encompassing 1.7 billion people and trade valued at US\$1.2 trillion. The free trade area is expected to take 10 years to implement but tariffs on some agricultural products could be cut by early 2003. Products covered by the early package include live animals, meat, fish, dairy produce, other animal products, live trees, vegetables, fruit, and nuts. Talks for trade in goods, services, and investments were due to be held in 2003.

On 16 December 2002, the Sultan met with US president George W. Bush, to strengthen trade between the two countries and to coordinate antiterror efforts in the wake of the 11 September 2001 attacks on the United States. The terrorist attack on a nightclub in Bali, Indonesia, on 12 October 2002 was also a warning that the Southeast Asian region is susceptible to, and perhaps a breeding ground for, the activities of international terrorist organizations.

Brunei, along with the People's Republic of China, Vietnam, Malaysia, Taiwan, and the Philippines, is engaged in a regional dispute over claims to the Spratly Islands, situated in the South China Seas, which are strategically important and may have large oil and gas reserves. In one of the most recent cases of friction, in August 2002, Vietnamese troops based on one of the Spratly islets fired warning shots at Philippines military planes. On the

eve of the ASEAN summit held in November 2002, ASEAN leaders and China signed a declaration of conduct, agreeing not to attempt to occupy the Spratlys. The pact is not binding, but it is hoped that it will help ensure regional security.

### 13 GOVERNMENT

Brunei is an independent Islamic sultanate. The 1959 constitution (parts of which were suspended in 1962) confers supreme executive authority upon the sultan and provides for five Constitutional Councils: a Privy Council, Council of Ministers, Legislative Council, Religious Council, and Council of Succession to assist him. The members of these bodies are appointed by the sultan. The chief minister (*mentri besar*) is also appointed by the sultan and is responsible to him for the exercise of executive authority. An elected Legislative Council is being considered as part of constitutional reform, but elections are unlikely for several years. In August 2000, the foreign minister confirmed that a review of the constitution had been submitted to the sultan for approval, and that "an element of an election" was in this report.

At his 1992 Silver Jubilee celebration the sultan emphasized his commitment to preserving Brunei's political system based on the concept of Melayu Islam Beraja (MIB), or Malay Islam Monarchy, as the state ideology. MIB combines Islamic values and Malay culture within a monarchical political framework with the monarchy as defender of the faith.

### 14 POLITICAL PARTIES

Parties were organized shortly after self-government was achieved in 1959. However, when the Brunei People's Party won 98% of the legislative seats in the country's only election, held in 1962, the sultan barred its candidates from office and outlawed all political parties under a continuing state of emergency. Political parties reemerged in the 1980s, but in 1988 they were banned and many of their leaders were arrested. At that time, the political parties were: the Brunei National Democratic Party (BNDP), founded in 1985, and the Brunei National United Party (BNUP), founded in 1986 by an offshoot of the BNDP. In contrast to the BNDP, membership in the BNUP was open not to Brunei Malays only, but to other indigenous people, whether Muslim or not. The Chinese were left with the option of forming their own party. (Under Brunei's restrictive naturalization policies only 6,000 Chinese had been granted citizenship.)

In 1995, the Brunei National Solidarity Party (PPKB in Malay), one of the initial parties that had been banned in 1962, formally requested authorization to hold a convention and elected Abdul Latif Chuchu, the former secretary-general of the BNDP, as its president. As of 2002, its president was Mohd Hatta bin Haji Zainal Abidin.

### 15 LOCAL GOVERNMENT

There are four administrative districts: Brunei-Muara, Kuala Belait, and Tutong in the western enclave, and Temburong in the east. Government is centrally controlled, but allowance is made for local tribal customs. District officers responsible to the ministers of home affairs administer each district. As part of the MIB ideology, village consultative councils have been introduced, making direct elections unnecessary. Instead, popularly elected headmen would function as mediators between the people and the central government. In June 1993 the Sultan stated "Brunei will strictly adhere to the MIB concept without resorting to fruitless political culture."

### 16 JUDICIAL SYSTEM

There are five levels of courts with final recourse available through the Privy Council in London. Beginning with the courts of first instance, there are courts of Kathis that handle family matters such as marriage and divorce by applying Islamic law (*Shari'ah*). Lower courts called sultan's courts, presided over by

magistrates, hear other ordinary cases involving minor disputes. Such cases may be appealed to the High Court, a court of unlimited original jurisdiction in both civil and criminal matters. The High Court is presided over by a chief justice and justices appointed by the sultan. Decisions of the High Court can be taken to the Court of Appeal, presided over by the president and two commissioners appointed by the Sultan. The Supreme Court consists of the High Court and the Court of Appeal.

In 1995, the right to appeal to the Privy Council in London was terminated in criminal cases. This final recourse remains available only for civil cases.

In May 2002, a State Judiciary Department was established in Brunei, which is responsible for the administration of Brunei's judicial matters.

Certain provisions of the 1959 constitution have been suspended under the state of emergency since 1962.

## 17 ARMED FORCES

The Royal Brunei Armed Forces in 2002 consisted of an army of 4,900 (including 700 women), a navy of 1,000, and an air force of 1,100. Paramilitary forces include a Gurkha reserve unit of 2,000 and 1,750 members of the Brunei Royal Police. Brunei spent \$343 million for defense in 1998 or 5.1% of GDP.

## 18 INTERNATIONAL COOPERATION

Brunei was admitted to UN membership on 21 September 1984, and is a member of ICAO, IMF, IMO, ITU, UPU, WHO, WIPO, and WMO. It is also a member of the Commonwealth of Nations, ASEAN, and the Organization of the Islamic Conference, as well as a member of the WTO.

## 19 ECONOMY

Discovery of extensive petroleum and natural gas fields in the 1920s brought economic stability and modernization to Brunei. Today its economy, a combination of domestic and foreign entrepreneurship, government regulation, welfare programs, and village tradition, remains overwhelmingly dependent on the oil and gas sector. This sector accounts for almost 50% of GDP, almost 90% of exports, and 75 to 90% of government revenues, although, in 2002, for the first time, earnings from Brunei's overseas investments totaled more than its revenues from the petroleum exports. Brunei's per capita GDP is one of the highest in Asia, though sharply down from the peak reached in 1980. Brunei's oil production also peaked in 1980 at an estimated 270,000 barrels per day, but has been deliberately cut back since then to preserve the country's oil reserves, which are conservatively estimated to last another 20–25 years.

In early 2001, decrees designed to make investment in Brunei more attractive were promulgated, and in March 2001 an out-of-court settlement of the Amedeo Development Corporation scandal, done in the "Brunei way," was announced. The Sultan's younger brother, Prince Jefri, Finance Minister and head of the Brunei Investment Authority (BIA) had been accused of misappropriating as much as \$28 billion of public funds through the Amedeo corporation, which declared bankruptcy at the height of the Asian financial crisis. In all, 71 people were accused, including Prince Jefri's son, Prince Hakeem, suspected of receiving \$1.08 billion. By 2002, the Global Everygreen Corporation, revealed to be fully government-owned, had settled all of Amedeo's outstanding debts, taken over several of its projects with the intention of completing a number of them, a significant factor in a revival of the construction sector, Brunei's second-largest industrial sector. The government is increasing efforts to promote Brunei as a destination for upscale tourism and ecotourism. Meanwhile, attempts to diversify the economy pursuant to the national development plan have moved slowly. Manufacturing is estimated to have contributed a little over 3% to the GDP in 2001. Real GDP growth improved sharply in 2000,

to 3.5%, because of higher oil prices. With the global economic slowdown and lower oil prices in 2001, the GDP growth rate is estimated to have fallen to 3%.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Brunei Darussalam's gross domestic product (GDP) was estimated at \$6.2 billion. The per capita GDP was estimated at \$18,000. The annual growth rate of GDP was estimated at 3%. The average inflation rate in 1999 was 1%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 5% of GDP, industry 45%, and services 50%. Foreign aid receipts amounted to about \$1 per capita.

## 21 LABOR

In 1999, there were an estimated 143,400 members of the labor force, which included foreign workers and members of the military. Due to a labor shortage there was a large number of foreign workers who were temporary residents, many of them illegal immigrants from neighboring countries. In that year the government employed 48% of the workers, with 42% of employees in the production of oil, natural gas, services, and construction. The remaining 10% of workers were employed in agriculture, fishing, or forestry. The estimated unemployment rate in 2001 was 10%.

Although legal, conditions are not conducive to trade unions. Culture and tradition do not support the idea of trade unions, and most workers are not employed in industries that are traditionally union dominated. Even in the oil industry, only 5% of workers are unionized. Strikes are illegal.

Children under the age of 18 may only work with parental consent and the approval of the Labor Commission. The law prohibits employment of children under the age of 16. There are no reports of violations of these child labor laws. Although there is no minimum wage, most employees earn a generous living wage. The workweek is limited to 48 hours of work for five days, with two mandatory 24-hour rest days. The approximately 80,000 foreign workers do not receive the same conditions and wages.

## 22 AGRICULTURE

Temporary and permanent crops are actively cultivated on an estimated 7,000 hectares (17,300 acres), which represent 1.3% of total land area. Agriculture accounts for 5% of GDP and employs some 2% of the work force. Rice production is low (only about 1,000 tons per year), and Brunei imports more than 80% of its requirements. Urban migration and more profitable jobs in the oil industry have led to a shortage in farm labor. An agricultural training center, sponsored by Brunei Shell and the Department of Agriculture, was established in 1978 to encourage young people to return to the land. Crops for home consumption include bananas, sweet potatoes, cassava, coconuts, pineapples, and vegetables.

## 23 ANIMAL HUSBANDRY

Cattle, buffalo, hogs, goats, and fowl are raised. In 1978, McFarm (a Mitsubishi subsidiary) set up a cattle-breeding station in order to reduce meat imports. The government owns a cattle station in Australia that is larger in area than Brunei itself. Livestock within Brunei in 1999 included an estimated 6,000 head of buffalo, 3,000 goats, 5,000 pigs, 2,000 head of cattle, and five million chickens. Meat production that year was estimated at 10,000 tons, with poultry meat accounting for 80% of the total. The government also encourages livestock production through the Mitsubishi Cattle Breeding Project.

## 24 FISHING

Traditional fishing has declined in recent years, with only 60% of home consumption provided by local fishermen. The Fisheries Department has supplied a small trawling fleet, and continuing efforts are being made to develop both freshwater and saltwater aquaculture. Fish hatcheries are in operation on a six-hectare (15-acre) site near Muara. The annual fish harvest in 2000 totaled 2,487 tons, down from 7,405 tons in 1996.

## 25 FORESTRY

Forests cover and estimated 82% of the land area. Forest reserves constitute about 41% of the land area. Exports of timber are restricted. There is a small sawmill and logging industry for local needs. In 2000, Brunei produced about 229,000 cu m (8 million cu ft) of roundwood.

## 26 MINING

Brunei's mining industry was engaged primarily in the production and processing of crude oil and natural gas. Principal nonfuel mineral resources in 2001 were carbonate rocks, coal, kaolin, sand and gravel, and other varieties of stone. In 2000 construction started on a silica-processing plant to produce silica plates from the country's reserves of high-quality silica sands in Tutong District.

## 27 ENERGY AND POWER

Commercial oil production, which began in 1929, dominates the economy. Production of crude oil in 2000 amounted to 173,000 barrels per day; output of liquefied natural gas (LNG) was about 22,000 barrels per day. As of 2002, exports of crude oil and natural gas accounted for 80% to 90% of all exports and more than 50% of gross domestic product (GDP). Exploratory drilling for new reserves continues, and capital expenditure on petroleum development remains high. As of early 2002, proven reserves of oil totaled 200 million tons (1.3 billion barrels); at the current rate of extraction, known oil reserves will have been depleted by 2017. After peaking at 240,000 barrels per day in 1979, crude oil production was deliberately lowered in 1988, through a self-imposed conservation quota of 150,000 barrels of oil per day, to extend the life of Brunei's reserves. There are seven offshore fields belonging to Brunei, of which the largest is the Champion field, with about 40% of the country's total reserves. Brunei opened its first deepwater drilling areas in 2001 and accepted bids by two international consortia. There are plans to expand LNG production by 4 million metric tons by 2008. Brunei continues to be a major supplier of liquefied natural gas to Japan under 20-year contracts, the last renewed in 1993 by the then-newly established Brunei Oil and Gas Authority. The LNG plant at Lumut, Brunei is one of the largest in the world.

Electric power and natural gas supplies are readily available at low cost. Total installed capacity in 2001 was 763,000 kW, all of it in conventional thermal plants. In 2000, net electricity generation was 2.4 billion kWh, of which 100% came from fossil fuels. In the same year, consumption of electricity totaled 2.1 billion kWh.

## 28 INDUSTRY

Industry is almost entirely dependent on oil and natural gas production, and there has been little progress in the government's efforts at diversification. In 2001, Brunei's oil production accounted for only .3% of world total, but it is the third-largest oil producer in Southeast Asia, after Indonesia and Malaysia. Revenues from the petroleum sector account for almost 50% of GDP, although in 2002, overseas investment earnings for the first time exceeded these revenues. Lumut, Brunei has one of the world's largest liquefied natural (LNG) gas plants, operated by Brunei Shell Petroleum (BSP) a 50-50 joint venture partnership

between the government and Royal Dutch/Shell. Japan as the major customer under a 20-year contracts, the first in 1972, and the second renewed in 1993. Brunei is the fourth-largest LNG producer in the world, and the third largest producer of natural gas in Southeast Asia. Brunei's second-largest industry, construction, was given a boost in 2001 when the Global Everygreen Corporation, revealed as a government-owned enterprise, announced that it was taking over a number of the projects of the bankrupt Amedeo Development Corporation, such as the Empire Hotel and Country Club, the Berakus Power Station, the DST Corporate Tower, and the Jerudong Marina, with the intention of completing some of them. The construction industry was also stimulated by \$1 billion made available by the government for projects under its 8th National Development Plan, announced in late 2001 and early 2002. Local cement production was estimated to have increased 8.1% over the year before in the third quarter of 2002. Other domestic industrial sectors showed little progress, however. In the manufacturing and processing sector, production of garments, were estimated to have declined 4.3% in 2002.

Production of industrial goods included, in 2002, an estimated 10.8 million cu m (380 million cu ft) of LNG and, in 2001, 173,000 barrels of oil per day and 10.3 million tons oil equivalent of natural gas. The small manufacturing sector includes production for the construction sector, sawmills and brick and tile factories. Government support of small-scale projects in food and beverage processing, textiles, furniture making and specialist optics has had limited results. Small commercial enterprise is still carried on mainly by Chinese entrepreneurs. In 1976, the government set up the Economic Development Board to assist new industries by granting tax and import exemptions, and recent efforts are aimed at increasing the employment of the local Malay population in the private sector.

The industrial production growth rate was listed as 4% in 1997.

## 29 SCIENCE AND TECHNOLOGY

Advanced science and technology have been imported in connection with development of the oil industry. Foreign technology expertise is employed in communications and other infrastructural programs. The Ministry of Industry and Primary Resources conducts agricultural research. The University of Brunei Darussalam, founded in 1985, has a faculty of science. The Technological Institute of Brunei, located in Bandar Seri Begawan, and the Jefri Bolkaih College of Engineering in Kuala Belair, offer engineering courses. Brunei hosted the sixth ASEAN (Association of Southeast Asian Nations) Science and Technology week in Bandar Seri Begawan in September 2001.

## 30 DOMESTIC TRADE

The economy of Brunei is primarily based on oil exports. Crude oil, petroleum products, and natural gas constitute more than 99% of Brunei's export value. Most food products and other consumer goods come from Singapore, Japan and Malaysia. Most of Brunei's beef is supplied by a government-owned cattle ranch in Australia which is larger than Brunei itself.

Though foreign investment is encouraged, the government is making efforts to increase local participation in industry and commerce. All companies must be incorporated locally or registered as a branch of a foreign company. At least half of the directors of any company must be residents of Brunei. Public companies are required to have at least seven shareholders and private companies must have between two and 50 shareholders. There is no personal income tax or capital gains tax in Brunei.

## 31 FOREIGN TRADE

Brunei's huge trade surpluses have enabled it to maintain an enviable payments position. Foreign exchange reserves stood at

about US\$20 billion in 1986, or more than US\$87,000 per capita. In 1997, foreign reserves were estimated at \$40 billion.

Principal trading partners in 1998 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
Japan	1,225	101	1,124
Korea	414	22	392
United States	210	235	-25
Singapore	181	356	-175
Thailand	141	68	73
Malaysia	19	265	-246
United Kingdom	16	104	-88
Germany	13	50	-37
Indonesia	5	53	-48
China	4	91	-87

### 32 BALANCE OF PAYMENTS

The banking industry is controlled by the Association of Banks, in liaison with the government. In 1999 there were nine banks operating in Brunei. Of these, three were locally incorporated and six were foreign, among them the Hongkong Bank, Malayan Banking Berhad, and Citibank. The International Bank of Brunei, in which the sultan has a 51% stake, is the larger of the local banks. The other, the National Bank of Brunei, was seized in 1986 by the government, which charged the majority shareholders with irregularities, and later closed in the early 1990s. Other banks are the Baiduri Bank, Sime Bank, the Development Bank of Brunei, the Overseas Union Bank, and the Standard Chartered Finance (Brunei) Berhad. The managing director of the Brunei Investment Agency (BIA), Abdul Aziz Abdul Rahman, met France's Treasury director, Jean Lemierre, in mid-December 1996 to discuss the possibility of opening a BIA office in Paris. BIA's French investments are currently managed from the agency's offices in London and Brussels. Approximately half of the country's revenue is now derived from the income from these investments. The Brunei Investments and Commercial Bank, a subsidiary of the Brunei Investment Agency, acquired a 13.4% stake in the Australian Macquarie Bank in November 1996, making the BIA the single largest shareholder.

The US Central Intelligence Agency (CIA) reports that in 2000 the purchasing power parity of Brunei Darussalam's exports was \$3 billion while imports totaled \$1.4 billion resulting in a trade surplus of \$1.6 billion.

### 33 BANKING AND SECURITIES

The banking industry is controlled by the Association of Banks, in liaison with the government. In 1999, there were nine banks operating in Brunei. Of these, three were locally incorporated and six were foreign, among them the Hongkong Bank, Malayan Banking, Berhad, and Citibank. The International Bank of Brunei, in which the sultan has a 51% stake, is the larger of the local banks. The other, the National Bank of Brunei, was seized in 1986 by the government, which charged the majority shareholders with irregularities, and later closed in the early 1990s. Other banks are the Bairduri Bank, Sime Bank, the Development Bank of Brunei, the Overseas Union Bank, and the Standard Chartered Finance (Brunei) Berhad.

The managing director of the Brunei Investment Agency (BIA), Abdul Aziz Abdul Rahman, met France's Treasury director, Jean Lemierre, in mid-December, 1996 to discuss the possibility of opening a BIA office in Paris. BIA's French investments are currently managed from the agency's offices in London and Brussels. Approximately half of the country's revenue is now derived from the income from these investments.

The Brunei Investments and Commercial Bank, a subsidiary of the Brunei Investment Agency, acquired a 13.4% stake in the

Australian Macquarie Bank in November 1996, making the BIA the largest single shareholder.

### 34 INSURANCE

In 2003, Brunei had four companies providing general and life insurance: American International Assurance Co. Ltd., BALGI Insurance, General Accident and Life Assurance, and Simi AXA Assurance Berhad.

### 35 PUBLIC FINANCE

The US Central Intelligence Agency (CIA) estimates that in 1997 Brunei Darussalam's central government took in revenues of approximately \$2.5 billion and had expenditures of \$2.6 billion including capital expenditures of \$1.4 billion. Overall, the government registered a deficit of approximately \$100 million. External debt totaled \$0.

### 36 TAXATION

Citizens of Brunei pay no income taxes and are the beneficiaries of generous welfare subsidies. However, Chinese, who make up an estimated 16% of the population, are excluded from citizenship, and these benefits. They are either stateless or hold British protected persons passports. Only corporations are subject to taxation. Taxation on petroleum income is subject to special legal provisions, dating from 1963. Companies pay a 30% tax on earnings. There is a double-taxation agreement between Brunei and the United Kingdom. Exemption from taxes can be granted by the sultan in council to industries deemed essential for the country's development. By Income Tax Order 2001, companies granted a Pioneer Certificate, foreign or domestic, are exempted from the 30% tax for two to five years, depending on the size of their capital investment, specified in round dollar terms with an obvious eye to outside investors: for less than \$250,000 the exemption is for two years; for \$250,000 to \$500,000, three years; \$500,000 to \$1 billion, four years; and above \$1 billion, five years. Pioneer and export industries are exempt from customs duties on imports of raw materials and capital goods.

### 37 CUSTOMS AND DUTIES

Brunei levies tariffs ranging from zero to 30% on selected items including perfume, and has a single-column tariff structure. The country joined ASEAN in 1984 and has reduced trade barriers with member nations.

### 38 FOREIGN INVESTMENT

In July 1983, the sultanate withdrew its investment portfolio of more than B\$3 billion (about half of total investment) from agents of the British crown, who traditionally had handled investment banking for Brunei. The Brunei Investment Agency (BIA) was established in its place, charged with managing a substantial portfolio of assets invested around the world. The Sultan's younger brother, Prince Jefri, who was also finance minister, was head of the BIA, and he set up a conglomerate, Amedeo Development Corporation, to serve as a corporate umbrella for all non-petroleum sector investments. However, in the midst of the Asian financial crisis it in 1997 and 1998, Amedeo collapsed into bankruptcy, to the shock of most observers, including the Sultan who found out when he was forced to withdraw offers of aid he had made to other countries to help them through the crisis. It was subsequently revealed that as much as \$28 billion of public investment funds had been misallocated and lost. Over 200 creditors brought suits, and charges were brought against Prince Jefri, who was removed from his offices and went into exile in London, and 71 others, including Prince Jefri's son, Prince Hakeem, who was suspected of having received over \$1 billion. The Amedeo scandal shut off most foreign investment in Brunei in 1999 and 2000. In 2000, in

a bid to become an offshore international banking center, the government established the Brunei International Financial Center, but it was not under August 2002 that the first international bank, the Royal Bank of Canada, registered under this legislation. A report issued by the United Nations Conference on Trade and Development (UNCTAD) in 2001 ranked Brunei 128th out of 140 countries surveyed in terms of attractiveness to outside investors, measured as the size of foreign investments relative to the size of the economy (apparently not counting, however, Brunei's 50–50 joint venture arrangement with Royal Dutch/Shell in the country's near monopolistic oil company, Brunei Shell Petroleum (BSP), as involving foreign investment). By 2001, however, the government had reached some closure with the Amedeo matter and had taken some determined steps to make Brunei a more attractive environment for outside investment.

In January 2001, the Sultan issued two decrees, Investment Incentive Order 2001 and Income Tax (As Amended) Order 2001, that contained reforms designed to attract business. The first made application for tax incentives simpler for corporations, and the second broadened the tax incentives. Also in January 2001, the government took two steps that laid the basis for opening the oil and gas sector to increased foreign participation. First, it announced the creation of a new wholly government-owned national oil company, Brunei National Petroleum Company Sendirian Berhad (Petroleum BRUNEI), which would have dual functions as a regulatory agency and a commercial entity. Second, it announced that its mode of operation in the oil and gas sector would henceforth be through Production Sharing Contracts (PSCs) in place of the former concession system. Both steps pointed to greater opportunities for foreign oil countries, particularly given that two of Royal Dutch Shell's concessions are set to expire in 2003.

In late 2001, the government added \$1 billion to investment funds available for projects under its eighth National Development Plan. In 2002, earnings from Brunei's investments abroad for the first time exceeded its earnings from exports from its oil and gas sector. In 2002, the first exploration rights in deep-sea parcels in Brunei's Exclusive Economic Zone (EEZ) were awarded under the PSC regime.

### 39 ECONOMIC DEVELOPMENT

The two major themes that have guided Brunei's economic development plans have been the managed exploitation of its oil and gas resources, and diversification of the economy beyond the petroleum sector. Perennially, it has been more successful at the first than the second. In the recent years, the problem has been aggravated by the scandalous collapse in 1998 of the Amedeo Development Corporation, the country's largest non-petroleum conglomerate, with revelations that under the management of the Sultan's younger brother, Pince Jefri, who was also Finance Minister and head of the Brunei Investment Agency (BIA), as much as \$28 billion in public investment funds had been misallocated, and lost. What possibilities there were for economic diversification were per force put on hold for 1999 and 2000 while the government recovered not only from the loss of funds, but from the loss of confidence in its economic management. In 2001, however, the government announced a series of initiatives that indicated it had weathered the scandal, and was ready to revive its development efforts in both the petroleum and the non-petroleum sectors. In March, Global Everygreen, a government entity, announced that all outstanding debts of the Amedeo Corporation had been settled out-of-court, and that it was, further, taking over a number of the projects Amedeo had started with the intention of completing many of them. Later in 2001, the government created a new Brunei Economic Development Board (BEDB) charged expressly with implementing government policies to encourage domestic investment and attract foreign investment that would contribute to Brunei's economic

development. As head of the BEDB, effective July 2002, the government appointed John A. Perry, a British national who had most recently been a managing director for Totalfina Elf in Asia.

For years virtually all of Brunei's oil and gas exploration, development, processing and trading was conducted by Brunei Shell Petroleum Corporation (BSP), a 50–50 joint venture of the government and Royal Dutch/Shell. In November 2001, however, Sultan Bolkiah announced the creation of a wholly government-owned, national oil company, the Brunei National Petroleum Company Sendirian Berhad—Petroleum BRUNEI, for short—which would “play a more active role in both petroleum exploration and development.” The government also announced that in the future Production Sharing Contracts (PSCs) would replace concessions in the oil and gas sector. In 2002, two PSCs were reached with consortiums that included Australian, French, Japanese, and American companies, and only one of which included Royal Dutch/Shell, for the first two deep sea parcels opened in Brunei's Exclusive Economy Zone. Two of BSP's concessions are up for renewal in 2003, which the government may use as an opening for introducing more new players.

Brunei's economic development initiatives have been structured in terms of a series of National Development Plans. The two main traditional employers were the government, which absorbs about half the work force, and Brunei Shell Petroleum. Development efforts for a non-oil, non-state sector and the potential for increasing foreign investment have been limited by the small domestic market, a shortage of skilled manpower, and relatively high labor and transport costs. The national development plan for 1986–90 (the fifth) was, like the subsequent ones, concerned with diversification of the economy in order to prepare for the time when oil and gas reserves would run out. It emphasized development of the agricultural sector to lessen the country's reliance on imported foods. Industrial development projects focused on light industries, but also included plants for the production of cement and precast concrete. Service industries were encouraged, especially banking and finance, in the hope of developing Brunei into an international financial center. The establishment of a development bank also ranked high on the government's agenda. The sixth national development plan (1991–95) gave special emphases to stimulating growth of the private sector, to promoting human resources and industrial development. The largest budget allocation was for social services (29.3%), with equal percentages for public utilities and transport and communications (20% each), 10% allocated to trade and industry, and about 7% to security forces. The ambitious programs of the seventh national development plan for 1996 to 2000 to achieve diversification through increased privatization, and domestic and foreign investment were shattered in the double blow of the Asian financial crisis in 1997 and the scandalous collapse of the Amedeo Corporation, Brunei's flagship investment conglomerate, in 1998. Most of this rest of this plan period was spent recovering from the effects of the loss of funds and loss of business confidence. The eighth national development plan (2001 to 2005) has added a more aggressive and engaged exploitation of the oil and gas sector to the perennial concern with diversification beyond this sector. In late 2001, the government announced that an additional \$1 billion would be made available for development projects in 2002.

### 40 SOCIAL DEVELOPMENT

The state provides free medical care, and remote regions are served by mobile clinics and a flying doctor service; there is also a school health service. As of 1996, there were 8 hospitals (4 of which are run by the government). Medical personnel in 1991 included 197 physicians, and, in 1989, 8 pharmacists and 30 dentists. The death rate went from 4.2 per 1,000 population in 1974 to 5.2 per 1,000 in 1999. In 1999, the infant mortality rate was 22.8 per 1,000 live births. Life expectancy in 1999 was

estimated at 71.8 years. In 1990, 96% of the population had access to health care services, and 90% had access to safe drinking water. During 1994, 92% of the country's children were immunized against measles. Malaria has been eradicated from Brunei (although it remains a problem in adjacent Sarawak), and cholera is close to nonexistent. There is, however, still some risk of filariasis, tuberculosis, typhoid fever, and intestinal flu. In 1996, there were 6 new cases of AIDS reported.

#### 41 HEALTH

The state provides free medical care and remote regions are served by mobile clinics and a flying doctor service; there is also a school health service. As of 1996, there were eight hospitals (four of which are run by the government). Medical personnel in 1991 included 197 physicians. In 1989, there were 8 pharmacists and 30 dentists. The death rate went from 4.2 per 1,000 people in 1974 to 5.2 per 1,000 in 1999. In 1999, the infant mortality rate was 22.8 per 1,000 live births. Life expectancy in 1999 was estimated at 71.8 years. In 1990, 96% of the population had access to health care services and 90% had access to safe drinking water. During 1994, 92% of the country's children were immunized against measles. Malaria has been eradicated from Brunei (although it remains a problem in adjacent Sarawak) and cholera is close to nonexistent. There is, however, still some risk of filariasis, tuberculosis, typhoid fever, and intestinal flu. In 1996, there were six new cases of AIDS reported. As of 1999, the number of people living with HIV/AIDS was estimated at fewer than 100.

#### 42 HOUSING

Since the mid-1970s, the government has supported an ongoing housing program through the National Development Plan to encourage and support homeownership for all citizens. As of 2000, interest-free home loans were available to all citizens (there was no personal income tax within the country either), however, this may change as the government reconsiders the sustainability of its oil-based economy. Through the Landless Indigenous Citizens Housing Scheme (LICS), the government has constructed at least eight housing project sites to offer affordable, modern housing to low-income residents. From 1972–1997, over 4,000 new homes were built through the LICS.

#### 43 EDUCATION

The state provides free education from kindergarten up, including university training abroad. As of 1995, 93% of primary-school-age children were enrolled in school, while 68% of those eligible attended secondary school. In 1996 there were 160 primary schools, with 432,941 pupils. Secondary schools had 30,470 students and 2,961 teachers in the same year. The pupil-teacher ratio at the primary level was 13 to 1 in 1999. For the year 2000, adult illiteracy rates were estimated at 8.4% (males, 5.3%; females, 11.8%). Education is compulsory between the ages of 5 and 16. Six years of primary are followed by seven years of secondary education. The official policy is to promote bilingual education, Malay and English, in all government-supported schools. As of 1999, public expenditure on education was estimated at 4.4% of GDP.

Foreigners generally attend private mission schools, the International School, and the Chinese School. Brunei Shell also funds several schools, and there are numerous religious academies. There are two teacher-training colleges and five vocational technical schools, including an agricultural training center. Brunei also has a university, established in 1985, and institutes of education and technology. The University of Brunei Darussalam (founded in 1985) has faculties for education, arts and social sciences, science, and management and administration. In 1996, 1,270 students were enrolled in institutes of higher

education. Many students, however, continue their education in foreign universities at government expense.

#### 44 LIBRARIES AND MUSEUMS

The University of Brunei at Gadon holds 29,000 volumes, while the Brunei Museum houses 60,000. The Public Library Service has a total of 311,000 volumes.

Brunei has approximately nine museums, most of which are in the capital city of Bandar Seri Begawan. Notable are the Brunei Museum, which exhibits ethnology and the history of Borneo Island; the Malay Technology Museum; the Royal Regalia Gallery, a fine arts museum opened in 1992; and the Royal Brunei Armed Forces Museum, which features the world's fastest patrol boat.

#### 45 MEDIA

The powerful Religious Affairs Department permeates daily life; its activities include sponsoring Islamic pilgrimages and establishing village mosque committees. Sports facilities tend to be privately maintained. There are four chambers of commerce in the country.

#### 46 ORGANIZATIONS

The powerful Religious Affairs Department permeates daily life; its activities include sponsoring Islamic pilgrimages and establishing village mosque committees. Sports facilities tend to be privately maintained, with some athletic groups sponsored through the Brunei Amateur Athletic Association. There are four chambers of commerce in the country. The Council of Women of Negara Brunei Darussalam, founded in 1985, strives to improve the economic, cultural, and social status of women. Non-governmental youth movements in Brunei include the Brunei Youth Council, Boy Scouts, and Girl Guides. The Brunei National Olympic Committee coordinates activities for national youth sports federations.

#### 47 TOURISM, TRAVEL, AND RECREATION

Among Brunei's newest and most remarkable sights is the sultan's 1,788-room palace, built at a reported cost of US\$300 million and topped by two golf-leaf domes. Native longhouses are also a tourist attraction but are hard to reach, and trips up the Brunei and Tutong rivers are interesting but not yet well organized. Every visitor must have a valid passport; visas are normally required, but there are exemptions based on nationality and purpose and length of visit.

There were 984,093 visitor arrivals to Brunei in 2000. That year there were 2,412 hotel rooms with an occupancy rate of 63%.

In 2002, the US Department of State estimated that the cost of staying in Brunei was between US\$123 and \$235 per day.

#### 48 FAMOUS BRUNEIANS

Omar Ali Saifuddin (1916–86) was sultan from 1950 to 1967 and minister of defense from 1984 to 1986. His son, Muda Hassanal Bolkiah (Bolkiah Mu'izzuddin Waddaulah, b.1946), one of the wealthiest men in the world, has been sultan since 1967.

#### 49 DEPENDENCIES

Brunei has no territories or colonies.

# CAMBODIA

Kingdom of Cambodia

*Preahreacheanachakr Kampuchea*

**CAPITAL:** Phnom Penh

**FLAG:** The flag has a red center field with a white silhouette of the temple complex at Angkor Wat. The center field is bordered top and bottom by blue bands.

**ANTHEM:** *Nokoreach*, beginning "Heaven protects our King."

**MONETARY UNIT:** The new riel (CR) is a paper currency of 100 sen. CR1 = \$0.0002534 (or \$1 = CR3,946.00) as of May 2003.

**WEIGHTS AND MEASURES:** Both the metric system and traditional weights and measures are in general use.

**HOLIDAYS:** National Day, 9 January; New Year, April; Labor Day, 1 May; Feast of the Ancestors, 22 September; Independence Day, 9 November.

**TIME:** 7 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in the southwest corner of the Indochina Peninsula, Cambodia has an area of 181,040 sq km (69,900 sq mi), extending 730 km (454 mi) NE-SW and 512 km (318 mi) SE-NW. It is bounded on the NE by Laos, on the E and SE by Vietnam, on the SW by the Gulf of Thailand, and on the W, NW, and N by Thailand, with a total boundary length of 2,572 km (1,598 mi). Comparatively, the area occupied by Cambodia is slightly smaller than the state of Oklahoma. In 1982, the PRK signed an agreement with Vietnam on their mutual maritime frontier. A treaty delineating the land border was signed in December 1985.

Cambodia's capital city, Phnom Penh, is located in the southcentral part of the country.

## <sup>2</sup>TOPOGRAPHY

Cambodia is a country of forested mountains and well-watered plains. The central part of the country forms a gigantic basin for the Tonle Sap, or Great Lake, and the Mekong River, which flows down from Laos to the southern border with Vietnam. Between the Tonle Sap and the Gulf of Thailand lie the Cardamom Mountains and the Elephant Range, which rise abruptly from the sea and from the eastern plains. In the north, the Dangrek Mountains, 320 km (200 mi) long and 300 to 750 m (1,000–2,500 ft) high, mark the Thailand frontier. The short coastline has an important natural harbor, Kompong Som Bay (Chhâk Kâmpóng Saôm), where the port of Kompong Som (Kâmpóng Saôm, formerly Sihanoukville) is located.

The Mekong and the Tonle Sap dominate the life and economy of Cambodia. The Mekong overflows during the rainy season, deposits vast quantities of alluvial soil, and, backing toward the Tonle Sap, causes that lake to increase in size from about 2,590 sq km (1000 sq mi) to almost 24,605 sq km (9,500 sq mi).

## <sup>3</sup>CLIMATE

The climate is tropical, with a wet season from May through November and a dry season from December to April. Temperatures range from 10° to 38°C (68–97°F), and humidity is consistently high. Average rainfall varies from about 127 to 140

cm (50 to 55 in) in the central basin to about 508 cm (200 in) in the southwestern mountains.

## <sup>4</sup>FLORA AND FAUNA

Cambodia, covered in its mountainous areas with dense virgin forests, has a wide variety of plant and animal life. There are palm, rubber, coconut, kapok, mango, banana, and orange trees, as well as the high sharp grass of the savannas. Birds, including cranes, pheasants, and wild ducks, and mammals such as elephants, wild oxen, panthers, and bears abound throughout the country. Fish, snakes, and insects also are present in abundance.

## <sup>5</sup>ENVIRONMENT

Deforestation and the resulting soil erosion cause significant environmental problems in Cambodia. By 1985, logging activities, the clearing of the land for agricultural purposes, and the damage from the Vietnam war resulted in the destruction of 116 square miles of forest land. Between 1983 and 1993, the nation's forest and woodland were reduced by an additional 11.3% to 11.7 million ha. In 1995, there were only 9 million ha. The nation has 120.6 cubic km of renewable water resources with 94% used for farming activity and 1% used for industrial purposes. Most rural dwellers do not have access to pure water. Cambodia's cities produce 0.2 million tons of solid waste per year. Three-fourths of Cambodia's wildlife areas have been lost through the destruction of its forests, and strip mining for gems in the western part of the country poses an additional threat to the nation's biodiversity and wildlife habitats. Natural fisheries have been endangered by the destruction of Cambodia's mangrove swamps. As of 2001, 23 of Cambodia's mammal species and 18 of its bird species were endangered. Endangered species in Cambodia include 3 species of gibbon (pileated, crowned, and caped), several species of wild dog and wild cat, leopard, tiger, Asian elephant, Sumatran rhinoceros, Thailand brow-antlered deer, kouprey, giant catfish, Indian python, Siamese crocodile, and estuarine crocodile.

## 6 POPULATION

The population of Cambodia in 2003 was estimated by the United Nations at 14,144,000, which placed it as number 62 in population among the 193 nations of the world. In that year approximately 4% of the population was over 65 years of age, with another 43% of the population under 15 years of age. There were 95 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.40%, with the projected population for the year 2015 at 18,421,000. The population density in 2002 was 68 per sq km (176 per sq mi).

It was estimated by the Population Reference Bureau that 16% of the population lived in urban areas in 2001. The capital city, Phnom Penh, had a population of 938,000 in that year. According to the United Nations, the urban population growth rate for 2000–2005 was 4.2%. A great majority of the people live in rural areas, with 90% of the rural population living in the plains of the central third of the country.

Estimates of Cambodia's population vary with the assessment of the impact of the 1970–75 war and the millions killed in its tumultuous aftermath. At the war's end, in April 1975, the population of the capital, Phnom Penh, had swollen to nearly 3 million because of a mass influx of refugees. The new government immediately embarked on a forced evacuation of all urban areas, and by March 1976, only 100,000–200,000 were thought to remain in Phnom Penh. After the installation of the PRK in 1979, the population of Phnom Penh began to increase. Other cities include Batdambang, Kampong Cham, Kampot, Siemreab, Kampong Saom, and Kracheh.

## 7 MIGRATION

The first migration of persons in independent Cambodia took place during the 1950s and 1960s, when ethnic Chinese were permitted to settle in the mountainous and wasteland areas and cultivate land that otherwise would have remained useless. After 1970, about 200,000 Vietnamese living in Cambodia were repatriated to the RVN, ostensibly as a security measure. With the insurgent victory in April 1975, most of the country's remaining Vietnamese were reported to have emigrated to Viet Nam. In addition, thousands of refugees, including many former officials and military personnel, fled across the Thai border or were evacuated by US aircraft.

The new government launched a sweeping nationwide resettlement program under which some 2.5–3 million persons were moved from Phnom Penh and other cities into the countryside, where they were organized into work brigades. The food shortage in rural areas was only slightly less critical than in the cities, and widespread starvation led to the deaths of probably over one million people during the transition. After the installation of the PRK in January 1979, continued fighting and political instability resulted in a new exodus of refugees. About 630,000 Cambodians left the country between 1979 and 1981, of which about 208,000 were able to resettle in other countries, including 136,000 in the United States. Most of the rest remained in camps on the border with Thailand, but they were repatriated to Cambodia in May 1993.

Between 1979 and 1987 there was a new migration of ethnic Vietnamese into Cambodia. Official sources insisted that the total number was under 60,000, and was comprised, for the most part, of residents who had left in the early 1970s, but opposition groups contended that the number totaled over 500,000 and was intended to consolidate Vietnamese control over the country.

In 1997, the conflicts between government forces and the National Army of Democratic Kampuchea (Khmer Rouge) drove rural populations from their homes. In 1997 and 1998, UNHCR assisted up to 60,000 Cambodian refugees who had fled fighting in Northwest Cambodia. Also in 1997, the UNHCR

helped several thousand ethnic Vietnamese fisher families return to their Cambodian homes after having camped on the Vietnam border. Following the peace settlement between the government of Cambodia and resistance forces in December 1998, the repatriation of approximately 36,000 refugees remaining in camps in Thailand was rapidly implemented. By April 1999, all of the camps were closed, and by June 1999 some 47,000 refugees had returned home. The net migration rate for Cambodia in 2000 was 0.7 per 1,000. In that year there were 211,000 non-citizen residents living in Cambodia. The government continues to view the emigration level as too high.

## 8 ETHNIC GROUPS

Over 90% of the entire population in 1999 were ethnic Khmers, descendants of the original population in the area. The largest minority groups were the Vietnamese, estimated at 5% of the population, and the Chinese, estimated at 1%. Groups designated as other comprised the remaining 4% of the population. National minorities are the Cham and a number of small tribal groups.

## 9 LANGUAGES

Khmer, the national language, is spoken by most inhabitants. Unlike Thai or Vietnamese, Khmer is a non-tonal language; most words are monosyllabic. French, the second language, is often used in commercial and official circles. The Vietnamese and the Chinese use their own languages, as do other minorities. English is also spoken.

## 10 RELIGIONS

Buddhism has been the state religion since 1989 and according to a 2002 report, about 93% of the inhabitants practice either Hinayana or Theravada Buddhism. It is believed that some practices of animism are adhered to by most people as well. The Chinese and most Vietnamese in Cambodia practice a traditional mixture of Mahayana Buddhism, Taoism, Confucianism, ancestor worship, and animism. In 2002, there were about 700,000 Muslims, representing the four branches: Shafi, Wahabi, Iman-San, and Kadiani. Less than 1% of the population is Christian, with over 100 separate organizations represented. There are also small groups of the Vietnamese Cao Dai religion and the Baha'i Faith.

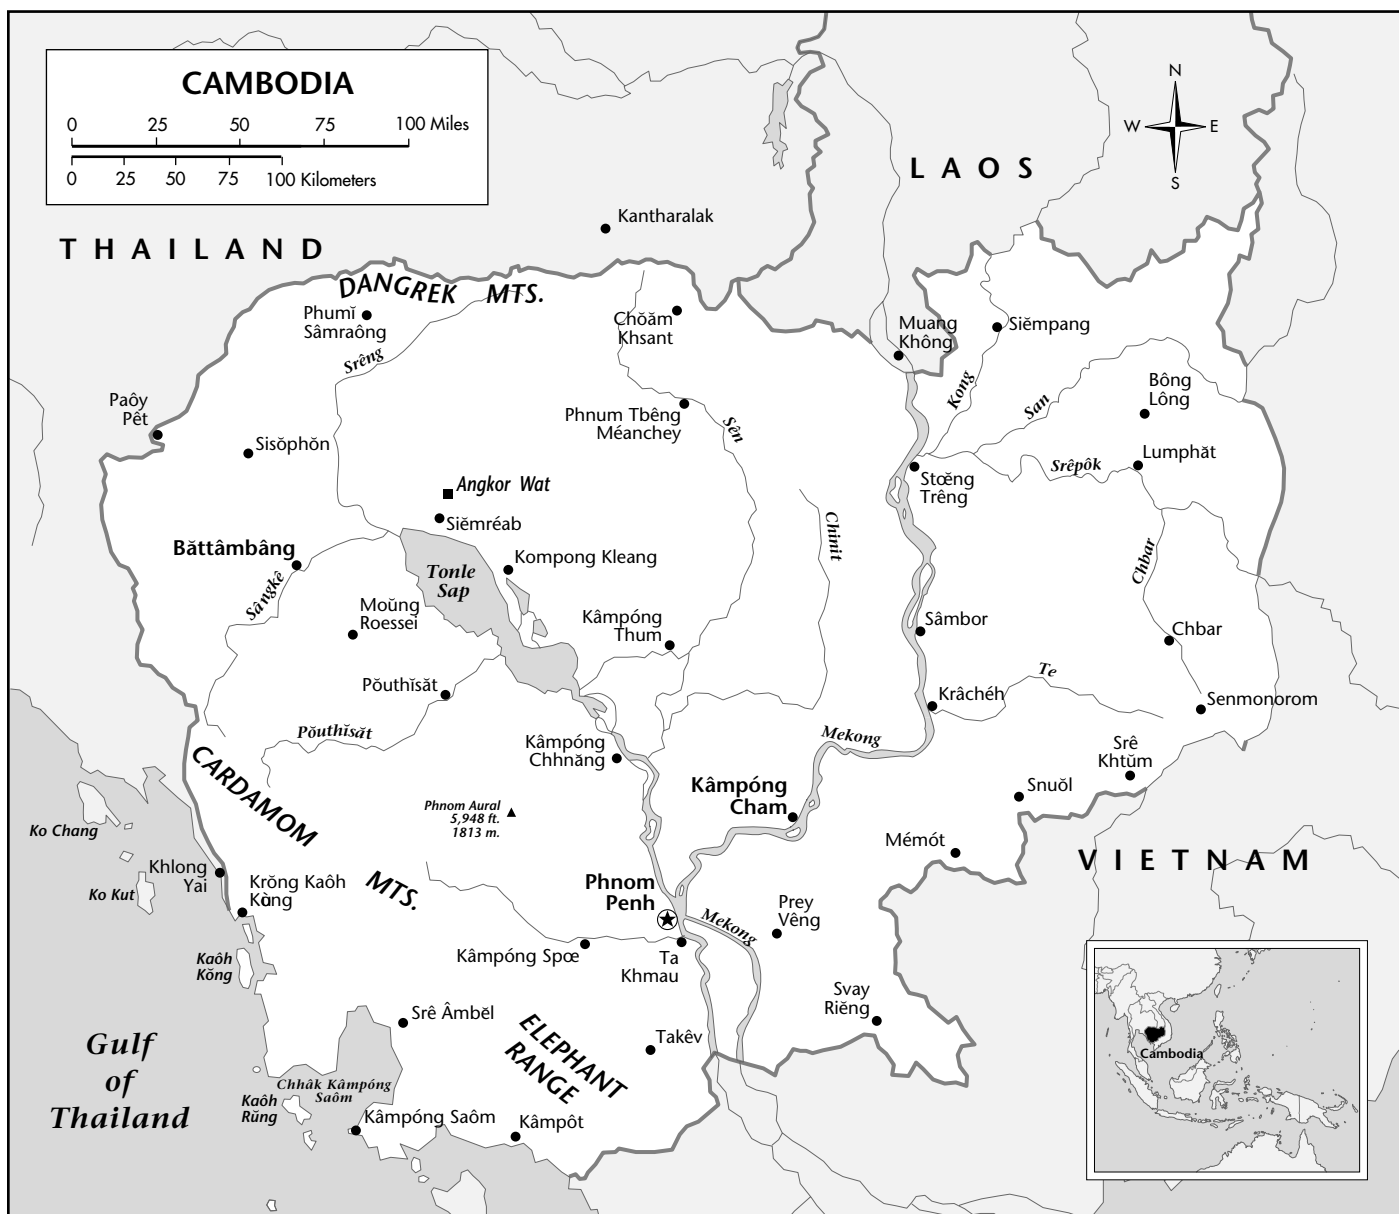

The government that took power in 1975 virtually abolished Buddhism, defrocking some 70,000 monks and turning pagodas into warehouses. Islamic spokesmen have claimed that 90% of Cambodia Muslims were massacred after 1975. Of some 6,000 Roman Catholics left in Cambodia at the time of the revolution, only a few survived. All mosques and Catholic churches were razed. The PRK regime that came to power in 1979 permitted the return of religious practice, and hundreds of pagodas were reopened. In insurgent areas controlled by the Khmer Rouge, Buddhism was allowed after 1979, and in non-Communist resistance camps there reportedly was full freedom of religion.

As of 1999 the constitution provides for freedom of religion, and the government reportedly respects this right in practice.

## 11 TRANSPORTATION

Land transport facilities suffered wholesale destruction during the 1970–75 war. Cambodia's first railway, a 385-km (239-mi) single track from Phnom Penh to Paoy Pet, was badly damaged in the fighting; moreover, a just-completed 262-km (163-mi) line from Phnom Penh to Kampong Sam was also disabled. The line to Kampong Sam was restored in November 1979, and a Phnom Penh-Battambang railway was reopened in February 1980. Rail service has been periodically disrupted by guerrilla operations. In 2002, rail trackage totaled 603 km (375 mi).

All major cities and towns are connected with Phnom Penh by highway, and from there roads connect to Vietnam, Laos, and Thailand. The US-built 214-km (133-mi) Khmer-America

LOCATION: 102°31' to 108°E; 10° to 15° N. BOUNDARY LENGTHS: Laos, 541 kilometers (336 miles); Vietnam, 1,228 kilometers (763 miles); Gulf of Thailand coastline, 443 kilometers (275 miles); Thailand, 803 kilometers (499 miles). TERRITORIAL SEA LIMIT: 12 miles.

Friendship Highway links Phnom Penh with Kampong Sam. As of 2002, Cambodia had an estimated 35,769 km (22,226 mi) of main roads, of which only 4,165 km (2,588 mi) were paved; most are in poor condition.

The Mekong is the most important inland waterway. Total length of navigable waterways is 3,700 km (2,300 mi) for craft drawing 0.6 meters, but only 282 km (175 mi) for craft with a draft of 1.8 meters. The river port of Phnom Penh has been upgraded. Until 1975, Saigon was the major transshipment point for outgoing and incoming Cambodian goods; the opening of the deepwater port of Kompong Som made Cambodia largely independent of Vietnam for oceangoing shipping. In 2002, Cambodia's merchant fleet totaled 404 ships (1,000 GRT or over) with a capacity of 1,889,404 GRT. The fleet includes ships of 44 countries under a flag of convenience registry.

Cambodia had 20 airports in 2001, 5 of which had paved runways. The main airport is at Phnom Penh; there are regular

flights between Phnom Penh, Hanoi, Vientiane, and Ho Chi Minh City.

## 12 HISTORY

Most Cambodians are descendants of the Khmers, who in the 6th century established the Indian-influenced Angkor Empire, and for the next 900 years ruled the area of present-day Cambodia. According to legend, the founder of the Khmer dynasty was Kampu Svayambhuva, from whose name "Kampuchea" derives. From the 10th to the 14th century, after years of military expansion, the Khmers reached their apogee. Their empire extended over most of Southeast Asia (from central Vietnam south-west into the Malay Peninsula, and from Thailand north to the border of Burma, now known as Myanmar). Angkor, the capital city, was a flourishing complex of great temples, palaces, and shrines. In the subsequent centuries, however, continuing attacks by the Thai (who captured Angkor in 1431) and the Vietnamese weakened the empire, and by the end of the 18th

century much of Cambodia had become a Thai and Vietnamese condominium. In 1863, the king of Cambodia placed the country under French protection. The French, joining Cambodia to Laos and Vietnam to form French Indochina, ruled the protectorate until the end of World War II. Cambodian nationalism received its greatest impetus during the World War II period, while Japan controlled Indochina. King Norodom Sihanouk, who had ascended the throne in 1941 and had been held a virtual prisoner under the Japanese occupation, proclaimed Cambodia independent in 1945, but yielded before a temporary resumption of the French protectorate, enforced by Allied troops, which occupied Phnom Penh. Cambodia became a constitutional monarchy on 6 May 1947, and was granted nominal independence within the French Union on 9 November 1949. King Sihanouk, meanwhile, had assumed leadership of Cambodia's growing nationalist movement. On 17 October 1953, during the height of the Franco-Indochinese war, he was granted full military control of his country by France. Sihanouk, a skilled politician, abdicated in March 1955 in favor of his father and mother, King Suramarit and Queen Kossamak, and then emerged as prime minister with the unanimous support of the national legislature. King Suramarit died on 31 April 1960, but Prince Sihanouk, although retaining the title of chief of state, did not return to the throne. During the Franco-Indochinese war, Communist-controlled Viet-Minh troops from Vietnam operated in Cambodia (1954), and gave support to a small Khmer Communist movement.

The Geneva agreements of July 1954, which ended the Franco-Indochinese war, secured the withdrawal of French and Viet-Minh troops from Cambodia and the surrender of most of the Khmer rebels. During the next 15 years, Sihanouk sought to keep Cambodia neutral in the deepening Vietnam conflict. This proved increasingly difficult, however, as the National Liberation Front (also known as the Viet-Cong) used Cambodian border areas as bases from which to launch attacks on the Republic of Vietnam (RVN, or South Vietnam), and as the United States in 1969 launched an undeclared air war against the guerrilla sanctuaries. On 18 March 1970, Marshal Lon Nol, prime minister and army chief, overthrew the chief of state, Prince Sihanouk, while the prince was on a visit to the USSR; the right-wing coup ended 1,168 years of rule by Khmer monarchs. Sihanouk thereupon took up residence in Beijing, where, on 5 May, he announced formation of the Royal Government of National Union of Kampuchea (GRUNK) under the political auspices of the National United Front of Kampuchea. In the interim, on 30 April, US president Richard M. Nixon announced an "incursion" into Cambodia of 30,000 US and 40,000 Vietnamese troops, with the object of destroying their opponents' strongholds along the Vietnam border. The operation was terminated on 30 June with its military objectives apparently unfulfilled, and bombing of the region continued, to devastating effect on Cambodia's economy.

Formal diplomatic relations with the United States, severed by Sihanouk in 1965, were resumed on 2 July 1970, and Sihanouk was condemned to death (in absentia) three days later. On 9 October, the Lon Nol government in Phnom Penh abolished the monarchy and changed Cambodia's name to the Khmer Republic. In elections held during June 1972, Lon Nol was elected president of the republic. Pressures from GRUNK insurgents continued to mount, especially following the conclusion of a cease-fire in Vietnam in January 1973 and the withdrawal of the last US troops from that country in March. US aid to the Lon Nol government had been substantial, totaling \$1.18 billion in military supplies and \$503 million in economic assistance for the whole of the 1970-75 period, but with most of the aid concentrated in the early years of direct involvement. With the reversal of US policy in Vietnam, however, support for the Khmer Republic began to taper off, and by the start of 1975, the Lon

Nol government was plunged into a struggle for survival. In January, GRUNK military forces, generally referred to as the Khmer Rouge, launched a major offensive aimed at gaining control of the Mekong River and isolating Phnom Penh. Fierce and costly fighting ensued over the next three months, with the United States undertaking a massive airlift to Phnom Penh in February to fend off starvation and military collapse. On 1 April, the strategic Mekong ferry crossing at Neak Luong fell to the insurgents, clearing the way to a direct, final assault on the capital. On that day, Lon Nol fled the country, to be followed by much of the ruling hierarchy. On 17 April, the Khmer Republic government officially capitulated to GRUNK forces, commanded by Khieu Samphan.

The GRUNK government reported in March 1976 that the war had resulted in 1 million casualties, including 800,000 killed. On 5 January 1976, the country was officially renamed Democratic Kampuchea (DK). On 20 March, the first general elections were held for a new 250-member People's Assembly. The Assembly on 14 April named Khieu Samphan chairman of the State Presidium, replacing Prince Sihanouk, who had returned to the country in September 1975, as head of state. Pol Pot was named prime minister. Even before these political reforms were undertaken, the GRUNK government had undertaken a massive—and perhaps unprecedented—reorganization of the country's economic and social life. As an initial step, the new government ordered the near-total evacuation of Phnom Penh, where food, shelter, and medical resources had been stretched to the limit by the press of some 2.5 million refugees. The country was thereupon plunged into almost complete isolation, even from its neighbors in Vientiane and Hanoi. Currency was abolished, social relations completely overhauled, religion almost eradicated, education suspended, and families divided. From two million to three million people may have died from starvation, exhaustion, disease, or massacre under the Pol Pot (Cambodian Communist leader Saloth Sar) regime.

Meanwhile, tensions with Vietnam (traditional enemy of Cambodia until 1976 and again after 1989) were growing, and there were border clashes during 1977 and 1978. In December 1978, Vietnam invaded Cambodia with a force of more than 100,000 troops; by January 1979, they had installed a pro-Vietnamese government, the People's Republic of Kampuchea (PRK), headed by Heng Samrin, a former division commander in the GRUNK army. The PRK had to contend with resistance from the very beginning, and the Khmer Rouge rebels, who had fled to the jungles in the west and south, continued to harass the government despite Vietnamese counteroffensives. In order to improve its international standing, the Khmer Rouge began in 1981 to pursue a united-front strategy; Pol Pot, branded with the 1975-79 atrocities, reportedly withdrew into the background, and Khieu Samphan, supposedly the most moderate of the Khmer Rouge leaders, emerged as chief spokesman. In 1982, the Khmer Rouge formed the Coalition Government of Democratic Kampuchea (CGDK), with two non-communist factions led by Prince Sihanouk and a former politician, Son Sann. The fighting during 1982-83 reflected a pattern of PRK and Vietnamese dry-season offensives alternating with an upsurge of guerrilla operations during the wet season. Militarily, the PRK and Vietnam appeared firmly in control at the end of 1987; diplomatically, however, the PRK had won recognition only from Vietnam, the former USSR, and their allies, with most nations joining the United States and China in giving qualified support to the CGDK. In March 1986, an eight-point plan to settle the Cambodian conflict was issued by the leaders of the coalition.

Progress towards a peaceful settlement had an uneven course in 1988. Prince Sihanouk resigned, retracted his resignation, and resigned again as president of the Democratic Kampuchean Government-in-exile. Informal meetings in Indonesia, one in July shunned by Prince Sihanouk and the other in October ignored by

the Khmer Rouge, made no progress on peace plans. However, a subsequent announcement supported the creation of an international peacekeeping force. A conciliatory statement made in August of 1988 indicated the Khmer Rouge was ready to reduce its armed forces to the level of the other Cambodian factions. Vietnam announced the repatriation of 50,000 troops from Cambodia in 1988 and the complete withdrawal of troops by late 1989, or early 1990. In January of 1989 Heng Samrin pledged that, if a political settlement could be achieved, all Vietnamese troops would be repatriated by September. Further encouraging gestures were made by Vietnam, China and Thailand: Thai and Vietnamese officials met in Hanoi; Vietnamese and Chinese ministers met in Beijing; and, Thailand abandoned its policy of isolating the Heng Samrin government and invited talks with them. In 1989 Prince Sihanouk resumed leadership of the Democratic Kampuchean Government-in-exile, later resigning from leadership of the National Front for an Independent, Neutral, Peaceful and Co-operative Cambodia (FUNCINPEC). In protest of Thailand's contact with the Heng Samrin government, Sihanouk refused to attend a second "informal meeting" in Jakarta. This meeting still failed to resolve two outstanding major issues: the make-up of an international force to oversee troop withdrawals and the composition of an interim government before elections. As a further sign of its commitment to change, in April 1989 an extraordinary session of Cambodia's National Assembly ratified amendments to the Constitution: the name of the country was changed to the State of Cambodia (SOC), a new national flag, emblem and anthem were introduced; Buddhism was reinstated as the state religion; and the death penalty abolished. Hun Sen met in Bangkok with the Thai Prime Minister who appealed for a cease-fire among the four Cambodian factions [The government of the Kampuchean People's Revolutionary Party (KPRP) installed by the Vietnamese (the Heng Samrin government), and three antigovernment groups that comprised the umbrella organization, the national Government of Cambodia (NGC): FUNCINPEC, the Khmer Rouge, and the Khmer People's National Liberation Front (KPNLF)]; the Khmer Rouge rejected this suggestion. In July 1989 Hun Sen and Prince Sihanouk met in Paris prior to the Paris International Conference on Cambodia (PICC). In September 1989 Vietnam completed the timely withdrawal of its forces from Cambodia. Throughout 1988 and 1989 the Khmer Rouge forces continued to make military gains in Cambodia. The UN adopted a resolution supporting the formation of an interim government that included the Khmer Rouge, although past atrocities of the Khmer Rouge were alluded to indirectly.

In January 1990 the UN Security Council approved an Australian peace initiative—UN monitored cease-fire, the temporary assumption of executive powers by the UN secretary-general, formation of a national supreme council, and the holding of internationally supervised elections. Prince Sihanouk resigned as Supreme Commander of the High Council of National Defense and leader of the resistance coalition, but retained his position as President of Democratic Kampuchea. In February 1990 the Government-in-exile of Democratic Kampuchea was formally renamed by Sihanouk as the National Government of Cambodia and restored the traditional flag and anthem. This change distanced the coalition from association with the Khmer Rouge's former regime, Democratic Kampuchea (DK). (The DK had been named the Khmer Rouge by Sihanouk.) In a third meeting held in Jakarta in February the four Cambodian factions as well as representatives of Vietnam, Laos, ASEAN, France, and Australia met and agreed to the main principles of the UN plan. Prince Sihanouk resumed the presidency of the resistance coalition in May and in June he and Hun Sen signed a conditional cease-fire in Bangkok. In June a meeting in Tokyo was attended by representatives of all four Cambodian factions including Hun Sen and Prince Sihanouk. The Khmer Rouge, however, refused to sign

a cease-fire agreement and proposed that each faction should have equal representation on a supreme national council. Prince Sihanouk offered support for the Khmer Rouge proposal, despite his previous agreement with Hun Sen; the discussions collapsed. In June and July reformist political allies of Hun Sen were dismissed or arrested for alleged attempts to establish a new party. Supporters of conservative Chea Sim, Chairman of the National Assembly, replaced them. Also in July the United States withdrew its support for the National Government of Cambodia's occupation of Cambodia's seat at the UN and indicated willingness to provide humanitarian assistance for the Phnom Penh regime. The UN Security Council in late August endorsed a plan for a comprehensive settlement in Cambodia: UN supervision of an interim government, military arrangements for the transitional period, free elections, and guarantees for the future neutrality of Cambodia. In addition, a special representative of the UN secretary-general would oversee the proposed United Nations Transitional Authority in Cambodia (UNTAC). The UN would also assume control of government ministries. Both China and the former USSR subsequently pledged to cease providing supplies of military equipment to their respective allies, the Khmer Rouge and the Phnom Penh regime. In reversals of previous policy the United States announced it would hold talks with the Phnom Penh regime, and the USSR declared that it would hold talks with Prince Sihanouk. The four Cambodian factions accepted the UN proposals at an "informal meeting" in Jakarta in September 1990. In addition, they agreed to the formation of the Supreme National Council (SNC), with six representatives each from the National Government of Cambodia and Phnom Penh regime. The SNC was to occupy the Cambodian seat at the UN General Assembly. At its first meeting in September the SNC failed to elect a chairman. The Khmer Rouge heightened military action in the northern provinces. Even as the final draft of the peace plan was prepared by the UN Security Council the Phnom Penh regime continued to oppose the principal provisions of the plan. In December all 12 members of the SNC attended another meeting of the PICC and all factions endorsed most components of the UN plan.

The SOC replaced three of its six SNC members in February 1991. In May a temporary cease-fire was agreed upon by the four factions in order to facilitate discussions. In June the Khmer Rouge refused to discuss SNC leadership issues, requiring the Phnom Penh regime's prior acceptance of the full terms of the UN peace plan, and the Khmer Rouge refused to comply with a proposed extension of the temporary cease-fire. Prince Sihanouk became an ordinary member of the SNC chairing a meeting in Thailand where all four factions resolved several issues: implementation of an indefinite cease-fire, pledges not to receive further foreign military aid, approval of a flag and anthem for the SNC, and establishment of Phnom Penh as the headquarters for the SNC. Prince Sihanouk was elected to the chairmanship of the SNC and resigned as leader of the resistance coalition and as President of the National Government of Cambodia. His replacement in both positions was Son Sann. From August through October the SNC worked out the details of the armed forces reduction and election procedures. Elections would be held to establish a constituent assembly comprised of 120 seats, which would subsequently become a legislative assembly. The electoral system would be proportional representation based on the 21 provinces. The constituent assembly would be empowered to adopt a new constitution. In October the SOC released hundreds of political prisoners including associates of Hun Sen arrested in 1990 for starting a political party. The Kampuchean (or Khmer) People's Revolutionary Party (KPRP), the communist party aligned with the Vietnamese communist movement, changed its name to the Cambodian People's Party (CPP), removed the hammer and sickle from the party emblem, and replaced Heng Samrin as Chairman of the Central Committee with the

conservative Chea Sim. Reformist Hun Sen was elected Vice-Chairman of the CPP.

On 23 October 1991 what was hoped to be an end to thirteen years of war in Cambodia was achieved with the signing of the Comprehensive Political Settlement for Cambodia by the four Cambodian factions and 19 participating countries. The agreement called for the creation of a United Nations Transitional Authority in Cambodia (UNTAC) to carry out the peacekeeping operations which included the demobilization of 70% of each faction's army and enforcement of a cease-fire; verifying the withdrawal of foreign forces; administering the country until an election in 1993 by taking over certain portfolios; assuring that human rights were maintained; and the repatriation of 600,000 refugees and internally displaced people. In November a threat to the tenuous peace process occurred when a mob attacked Khmer Rouge leaders Khieu Samphan and Son Sen in a Phnom Penh villa. The SNC government's response was slow, and it was alleged that Hun Sen sanctioned this incident and that Vietnamese officials were involved in it. In December violent student demonstrations protesting against high-level corruption and in support of human rights were suppressed by the armed forces and in later demonstrations several protestors were killed. Several high-level government officials were dismissed based on the corruption charges.

In January 1992 the four factions approved the formation of political associations and the promotion of freedom of expression. However, on 22 January Tea Bun Long, minister for religious affairs and an outspoken critic of corruption was killed, and on 28 January Oung Phan, organizer of a new political party emphasizing anti-corruption was shot, but survived. These and other arrests, threats, and disappearances were viewed as intimidation by the secret police geared at undermining the peace process and free elections, and served to intimidate government critics. Yasushi Akashi, the Japanese UN Under Secretary-General for Disarmament Affairs, was appointed as the UN Special Representative to Cambodia in charge of UNTAC. The UN Security Council authorized mine clearing operations, the dispatch of a 22,000 member peace keeping force to establish UNTAC, at an estimated cost of \$2 billion.

In September 1991 approximately 5% of the Cambodian population was in refugee camps along the Thai-Cambodian border, 340,000 refugees in border area camps, and another 190,000 refugees within Cambodia. The plan was to move refugees to transit camps in Thailand, then on to six reception centers in Cambodia, and finally to villages. In October the Khmer Rouge began to forcibly repatriate tens of thousands of civilians in UN refugee camps to areas under its control in Cambodia. International reaction prevented the Khmer Rouge from forcibly repatriating inhabitants of the Khmer Rouge controlled camp, Site 8, just one of the eight refugee camps. The UNTAC refugee repatriation program began in March, in spite of cease-fire violations between the Khmer Rouge and the State of Cambodia forces. Throughout 1992 the Khmer Rouge denied free access to the zones it controlled, refused to comply with the disarmament phase, violated the cease-fire agreement, played upon long-standing racial/ ethnic tensions by contending that Vietnamese soldiers were concealed in Cambodia, complained that the UN peacekeepers were not impartial to them, failed to attend meetings, and demanded the dismantling of the Phnom Penh regime as a precondition for the implementation of the peace accords, amongst other demands.

In May 1992 the Khmer People's National Liberation Front (KPNLF), the political and military party formed by Son Sann for the purpose of resisting the Vietnamese, was transformed into a political party called the Buddhist Liberal Democracy Party (BLDP) and still headed by Son Sann. FUNCINPEC also became a party, headed by Prince Ranariddh. At a Ministerial Conference on the Rehabilitation and Reconstruction of Cambodia held in

Tokyo in June, the application of economic sanctions against the Khmer Rouge was considered and 33 donor nations and 12 non-governmental organizations attending the conference pledged \$880 million to finance the peacekeeping operation. In August Akashi, the head of UNTAC, approved elections, and the registration of parties began. He also affirmed that the elections would proceed without the participation of the Khmer Rouge if it continued to refuse to co-operate. The demands of the Khmer Rouge were impossible to meet and were viewed as efforts to gain territory in order to increase its representation in the proposed national assembly, perhaps with as much as 35% of the population (a tactic laid down by Pol Pot in a 1988 speech). In September the Khmer Rouge made two new demands: the resignation of Akashi and a redrawn border between Cambodian and Vietnam. This latter demand referred to territory allegedly annexed by Vietnam that would make the elections incomplete if not returned to Cambodia. The Khmer Rouge protested an electoral law drafted by UNTAC that enfranchised citizens aged more than 18 years whose parents or grandparents were born in Cambodia, effectively permitting Vietnamese immigrants to take part in the election.

October 1992 UNTAC began voter registration. The Khmer Rouge boycotted voter registration and escalated destruction of bridges and roads, effectively cutting off its territory in the northeast from the rest of the country. The UN Security Council set a November deadline for the Khmer Rouge's compliance with the terms of the peace accord, but eventually extended the deadline to 31 January 1993 as the Khmer Rouge's last chance to participate in the elections. The Security Council also approved an embargo on supplies of petroleum products to the Khmer Rouge and a ban on timber exports (a principal source of income for the Khmer Rouge). The Khmer Rouge announced the formation of the Cambodian National Unity Party to contest the elections on the day the UN resolution was adopted. Ethnic and racial tensions were increasing as the Khmer Rouge incited and escalated actions against the Vietnamese based on deep-rooted Cambodian sentiments towards the Vietnamese. In December the KPNLF joined the Khmer Rouge in the ethnic cleansing of the "Vietnamese germs." Six members of the UN peacekeeping forces were seized and held for a few days by the Khmer Rouge in December 1992.

In January Prince Sihanouk ceased cooperation with UNTAC and suggested that a presidential election be held prior to the legislative election, but in February he reversed his position. Voter registration was completed in February; registered voters numbered 4.5 million and 20 political parties were registered. The election was set for May 23-25, 1993. The CPP intimidated its political rivals with attacks and stopped the gradual expansion of the Khmer Rouge into Phnom Penh government territory. In a dry season offensive the SOC attacked three of four of the Khmer Rouge's most important zones.

In early 1993 the Khmer Rouge refused to disarm and attacked UN offices, cars, helicopters, and personnel. In addition to the Khmer Rouge's accusations of collusion between UNTAC and the SOC, the presence of the UN forces was a source of growing tension and dissatisfaction in Cambodia. Inflation, official corruption, and crime were increasing and UNTAC's presence and policies were blamed. The Khmer Rouge issued their own currency, thus emphasizing steps toward further partition. In a secret speech a year earlier (6 February 1992), Pol Pot had set out an incremental approach by which the Khmer Rouge could gain popular strength which he considered more important than land: develop local autonomy; set up a money economy with their own banks which would hold the surplus earnings of farmers (projected to be 30% of earnings); distribute land, sell land in order to support the army, and continue to fight the "yuon" (savage), or Vietnamese. As the Khmer Rouge again refused to disarm and take part in the elections, it appeared to follow this

program as it also increased attacks on Vietnamese fishermen and their families, killing 34 and injuring 29 in March at the floating village of Chong Kneas. Furthermore, citing its allegations that UNTAC colluded with the Vietnamese aggressors and rubber stamped the Vietnamese occupation, the Khmer Rouge refused to cooperate with the peace process. The UN goal was to have all refugees back in Cambodia by mid-April for elections. By 19 March 330,000 refugees were repatriated. A cash inducement had been added as incentive (\$50/adults and \$25 for children), and this rapidly accelerated the process. Roughly 87% had taken the cash option, nearly one-third going to Phnom Penh; 80–85% of the returnees chose areas under Phnom Penh government (Hun Sen) control, (about 85% of the country's) territory; 10% chose areas controlled by the Khmer People's National Liberation Front; 2% chose zones controlled by forces loyal to Prince Sihanouk; and 1% chose Khmer Rouge areas. In April the Khmer Rouge closed its office in Phnom Penh and slipped out of the city; it pledged to prevent the planned elections. A Japanese UN worker was killed and eventually 30 of the 460 volunteers for the election work resigned. In May the Khmer Rouge mounted its boldest offensives yet with targets defined for maximum political impact including major cities; they took briefly the Siem Reap airport. Under these pressures UNTAC abandoned 400 of its 1800 polling places.

The election took place May 23–28, 1993; four million Cambodians or 85% of those registered voted. FUNCINPEC won the election with 45% of the vote, or 58 of 120 seats in the constituent assembly; the CPP took 38% of the votes, or 51 seats in the assembly; the BLDP had over 3% of the votes, which gave them 10 seats; and, MOULINAKA (Movement for the Liberation of Kampuchea, a pro-Sihanouk group formed in 1979 by Kong Sileah, considered an offshoot of FUNCINPEC) took one seat. The constituent assembly had three months within which to draft a constitution and form a new government. To the CPP its political defeat was an unacceptable surprise and it demanded a revote and threatened riots; the Khmer Rouge denounced the CPP for contesting the election. The CPP's 51 assemblymen were technocrats and education officials (people who never wielded power within the party); this supported the belief that the CPP paid only lip service to constitutional arrangements as it maintained its grip on power. The CPP's two leaders, hardliner Chea Sim and reformer Hun Sen, were foci of an internal struggle. In a move towards cooperation FUNCINPEC leader Prince Norodom Ranariddh and CPP Primer Minister Hun Sen served as co-chairmen of the government, and control of the major ministries was divided, with FUNCINPEC getting the finance and foreign affairs portfolios while the CPP retained the Information Ministry. The CPP had 200,000 armed forces and 40,000 national police; FUNCINPEC's armed forces numbered 5,000. In August for the first time the three government factions, royalist FUNCINPEC, former Phnom Penh ruling regime CPP, and the BLDP, agreed to joint military operations. The Khmer Rouge would not be allowed to enter the political mainstream until it agreed to unconditionally join the unified armed forces and open up areas under its control, estimated to be 20% of Cambodia.

Cambodia's new constitution was adopted on 21 September 1993. Prince Norodom Sihanouk was crowned king, resuming the title first bestowed on him in 1941. In an attempt to restore central control of the economy to the government on December 28 the National Assembly passed a national budget and financial laws. These new laws stripped individuals of the power to collect taxes independently and by law all revenue would be channeled to the national treasury. Minister of Economics and Finance Sam Rainsy set about to root out official corruption and centralize Cambodia's budget. The entrenched businesses protested, but Rainsy received the backing of Sihanouk and international lending institutions. The two co-prime ministers, First Premier

Norodom Ranariddh and Second Premier Hun Sen, asked King Sihanouk for sanction to fire Rainsy, but instead received a statement praising Rainsy, who was becoming a popular hero. King Sihanouk also urged the government to grant total freedom to the domestic and foreign press.

Within the SOC there was significant difference of opinion on how to deal with the Khmer Rouge. FUNCINPEC's Ranariddh counted on diplomacy to isolate the Khmer Rouge while using development aid and investment for poverty reduction and infrastructure improvement. On the other hand, many of his counterparts in Hun Sen's CPP sought a military solution to the Khmer Rouge problem. There was consensus, however, that Cambodia should look to Malaysia's experience with the Malayan Communist Party, which consisted of marginalizing the Malaysian communists. UNTAC's failure to disarm the Khmer Rouge was a burden for the new government. The Khmer Rouge was emerging with its prestige enhanced, territory expanded, and weaponry intact. Cambodia had been critical of the role Thailand played in supporting the Khmer Rouge, and renewed its appeals to Thai neutrality. The Khmer Rouge presence benefited Thailand by aiding in securing its border, and with lucrative trade in gems, timber, and armaments. The Khmer Rouge radio station was located inside Thai territory. In early 1994 while the new government sought to consolidate and to gain control of the economy, military activity continued between government forces and the Khmer Rouge. Cambodian currency, the riel, was stabilized and tax revenues increased. International donors pledged an extra \$773 million in aid. Corruption and a free press were major issues. King Sihanouk was seriously ill with cancer. The government captured Pailin, official headquarters of the Khmer Rouge on 19 March, but the Khmer Rouge retook it one month later. The dry season campaign by the government against the Khmer Rouge was a failure. Both sides were scheduled to resume peace negotiations on May 2–7. The Khmer Rouge looked to its military successes as leverage for a power sharing compromise with the government; Sihanouk sought to make deals that gave the Khmer Rouge some key posts in return for laying down its arms and opening areas under its control. One year after the elections major problems were security, corruption, and the economy. Security issues included demobilized unpaid soldiers turning to banditry, new mines being laid, Westerners being kidnapped, villagers fleeing the fighting, and closed schools. It was unsafe to farm. Corruption included national assembly members keeping their seats while serving in other branches of government; parties swelling the number of senior officers and civil servants as they vied to match each other in number and in rank; and the National Assembly voting themselves a raise equal to 100 times that of a typical soldier. The economy was undermined by continuing military activity, and privatization was stalled by lack of capital and skilled workers, and political instability.

On 3 July 1994 there was a coup attempt. Less than 300 troops were involved and it was directed against FUNCINPEC, and possibly Hun Sen as well, by hard line figures at the highest levels of the CPP attempting to take over the government. After the coup attempt the National Assembly voted to outlaw the Khmer Rouge and seize its assets, a move that was partly directed at Thailand. The Khmer Rouge's response was to announce the formation of a parallel government, with its headquarters in northern Cambodia and Khieu Samphan as president.

In July 1994, it was estimated that 55,000 Cambodians were again fleeing Khmer Rouge attacks in the western provinces. For the first time since the 1970s, the United States provided military aid to Cambodia. The need to remove the land mines infesting the fields of Cambodia became a high priority. Mines may have inflicted more wounds than any other weapon, and Cambodia has the world's highest percentage of physically disabled persons. As foreign advisors sought to strengthen the country's human

rights laws, ethnic considerations were raised. Cambodia's constitution fails to guarantee basic rights for racial groups other than ethnic Cambodians. The definition of Cambodians does include ethnic minority Chams and Chinese, but excludes ethnic Vietnamese.

The Khmer Rouge began to weaken in 1995, with mass defections of guerrilla fighters. The government remained worried by the hard core of dedicated Khmer Rouge rebels and their leaders, who remained at large in northern and western strongholds. Tensions continued within the fragile coalition government, with the CPP fighting off royalist political movements wherever they cropped up. There were also factional disputes within each of the coalition parties. Sam Rainsy's role as an opponent of foreign aid to Cambodia's "undemocratic" government earned him the condemnation of FUNCINPEC and the CPP. The Khmer National Party, formed by Sam Rainsy, was officially unrecognized. Internal rivalries essentially disbanded the government's third partner, the Buddhist Liberal Democratic Party.

Marginalization of the Khmer Rouge continued in 1996, as the group split between the leadership of ailing Pol Pot and a breakaway faction headed by Ieng Sary. In late 1996, Ieng Sary received a royal pardon, and his force became the object of courtship by CPP and FUNCINPEC. The government parties sought the votes and arms of Ieng Sary's supporters, plotting against each other in the process. This jockeying for position, accompanied by political violence and rumors of coups, continued into 1997.

In February 1997, FUNCINPEC's Ranariddh began an alliance with Sam Rainsy in strong opposition to Hun Sen's CPP. Hun Sen announced in March that he would seek to amend the constitution to prevent members of the royal family from involvement in politics, a direct hit at Ranariddh, Prince Sihanouk's son. Hints of negotiations between Ranariddh and the Khmer Rouge fueled Hun Sen's fears about his government "partner." A demonstration on 30 March, by Sam Rainsy's supporters, was attacked with hand grenades, which killed several protesters and wounded scores. The violence and tensions came to a head on 2 July, with open fighting between forces loyal to FUNCINPEC and CPP. A brief coup d'état set up Hun Sen as the sole power in charge. Ranariddh fled Cambodia and Hun Sen's forces killed many of Ranariddh's party leaders and supporters in the days immediately following the coup.

Hun Sen moved to establish CPP legitimacy, with the party winning a flawed national election in July 1998 with 41.4% of the vote to FUNCINPEC's 31.7%. Ranariddh was able to return as an opposition leader, and he, along with Sam Rainsy, whose party gained 14.3% of the vote, condemned the election as rigged. Foreign aid, suspended due to the coup, resumed. Throughout 1998, the Khmer Rouge continued to disintegrate, as Pol Pot, the architect of their genocidal regime died on 15 April, and other leaders surrendered or were captured.

With the entire top echelon of living Khmer Rouge leaders in custody, Cambodian government concerns from 1999 through 2001 centered on how to bring them to justice. Hun Sen's preference was for a series of trials conducted within Cambodia's own legal system, while the UN, fearing mere "show trials," called for an international tribunal. Compromises involving foreign judges participating in the Cambodian trials were proposed.

In August 2001, King Sihanouk signed legislation creating a special tribunal to prosecute the Khmer Rouge members responsible for the deaths of an estimated 1.7 million people through execution, torture, starvation, and hard labor. The trials were to be presided over by three Cambodian judges and two foreign judges, but further negotiations with the UN were necessary to finalize the details of the court. The UN insists that international standards of justice are met for the Khmer Rouge

leaders living freely in Cambodia. In February 2002, the UN concluded that the independence, impartiality, and objectivity of the proposed court could not be guaranteed, and pulled out of the negotiations. The Cambodian government indicated it would proceed with plans for the tribunal, with or without support from the UN. The issue of the trials is divisive in Cambodia, with some fearful that they will reopen old wounds and set the country back on the path of civil war. In December 2002, the UN passed a resolution authorizing negotiations on the tribunal to begin again, and in January 2003, talks resumed.

In December 2002, Prime Minister Hun Sen declared that he wished to rule for another 10 years. He announced that October that he would be the sole candidate for prime minister of the CPP if it wins the general election scheduled for 27 July 2003.

### 13 GOVERNMENT

Cambodia was a constitutional monarchy from 6 May 1947 until 9 October 1970, when Marshal Lon Nol formally established the Khmer Republic. On 30 April 1972, a new constitution was passed by a national referendum. It provided for a directly elected president and a bicameral legislature consisting of an elective 126-member National Assembly and 40-member Senate. Upon the surrender of the Lon Nol government to insurgent forces on 17 April 1975, rule by the Royal Government of National Union of Kampuchea (Gouvernement Royal de l'Union Nationale de Kampuchea—GRUNK) was installed in Phnom Penh, with Prince Norodom Sihanouk as titular head of state. A new constitution, effective 5 January 1976, provided for a unicameral, 250-member People's Assembly, elected for a five-year term by universal suffrage of citizens over age 18. The PRK government, installed in January 1979, enacted a new constitution in June 1981. Under this constitution, an elected National Assembly was the supreme organ of state power; it was headed by a 7-member Council of State, which the Assembly elected from among its own members.

On 23 October 1991 the UN peace accord was signed by Cambodia's four factions. From May 23–28, 1993 a six-day election, the first multiparty election in more than 20 years, was held to determine the 120 members of the National Assembly. FUNCINPEC took 45.5% of the votes amounting to 58 seats in the assembly; the Cambodian People's Party (CPP), formerly the Kampuchean People's Revolutionary Party (KPRP), received 38.2% of the votes equaling 51 assembly seats; and Buddhist Liberal Democratic Party (BLDP) had 3% of the votes giving them 10 seats; and Moulinaka (Movement for the Liberation of Kampuchea, a pro-Sihanouk group formed in 1979 by Kong Sileah, considered an offshoot of FUNCINPEC) took one seat. This newly elected National Assembly was authorized to draft a constitution. In June 1993 FUNCINPEC and the Cambodian People's Party agreed to joint control of the defense and interior ministries, while FUNCINPEC controlled the foreign and finance ministries; Hun Sen and Prince Ranariddh served as co-chairmen of the interim government. The National Assembly ratified a new constitution on 21 September 1993. The monarchy was re-established and commitments to liberal democracy, the rule of law, and women's rights were included. Prince Norodom Sihanouk ratified the constitution and again became King of Cambodia. The government of the State of Cambodia was an extremely fragile coalition after the elections, with enormous rivalries between Hun Sen's CPP, and Ranariddh's FUNCINPEC, as well as opposition from Sam Rainsy's unrecognized Khmer Nation Party. Much of the tension centered on attempts to win over factions of the Khmer Rouge, which were "coming out of the cold" en masse, their fighters and votes up for grabs by the rival political parties. In July 1997 Hun Sen's forces defeated FUNCINPEC in a brief but violent coup d'état. In 1998, the number of seats in the National Assembly was increased to 122. July 1998's national election legitimized Hun Sen's CPP dominance of the nation, but FUNCINPEC won a high

percentage of seats as well, and Ranariddh became Speaker of the National Assembly. The CPP took 64 seats, FUNCINPEC held 43, and the Sam Rainsy Party (SRP) took 15 seats in the National Assembly.

In March 1999, amendments to Cambodia's 1993 constitution allowed the formation of an unelected 61-seat Senate. Two Senate seats are appointed by the king, two elected by the National Assembly, and 57 are elected by "functional constituencies." Members serve five-year terms. Parliamentary elections were set for 27 July 2003.

## 14 POLITICAL PARTIES

Under Sihanouk, the People's Social Community Party (Sang Kam) was the most important political group. In the 1955, 1958, 1962, and 1966 elections, with a platform of nonalignment, economic aid, and development, it captured all seats in the National Assembly. Exiled in Beijing following his overthrow by Lon Nol in March 1970, Sihanouk allied himself with Cambodia's leftist insurgents under a group called the National United Front of Kampuchea (Front National Uni de Kampuchea—FNUK). Under the Khmer Republic government headed by Lon Nol, five political groups came to the fore. The Socio-Democratic Party (SDP), Lon Nol's own group, was quickly established as the most powerful political organization. Centrist opposition groups included the Republican Party and the Democratic Party. In the presidential elections held in June 1972, Lon Nol, the SDP's candidate, won by a relatively narrow margin of 55%.

With the victory of their forces in April 1975, leaders of the pro-communist FNUK became the dominant political power in Kampuchea. The leading element in FNUK was the Khmer Communist Party (KCP), founded in 1951 and now dominated by radicals Pol Pot (previously known as Saloth Sar) and Khieu Samphan. Khieu Samphan was named prime minister of the new regime, while Pol Pot remained party head. During the next few years the Pol Pot faction systematically purged all suspected pro-Vietnamese members of the party organization. In late 1978, opposition elements, headed by Heng Samrin, formed the Kampuchean National United Front for National Salvation (KNUFNS) in an effort to overthrow the Pol Pot regime. Following a Vietnamese invasion in December, Heng Samrin became the head of the pro-Vietnamese PRK government installed in January 1979. In 1981, the KNUFNS was renamed the Kampuchean United Front for National Construction and Defense, the primary mass organization in the PRK. Popularly known as the Khmer Rouge, the movement allied during the 1980s with two non-Communist factions, the Sihanoukists and Son Sann's KPNLF.

The Coalition Government of Democratic Kampuchea (CGDK), the tripartite, anti-Vietnamese resistance group formed in June 1982, changed its name to the National Government of Cambodia (NGC) in 1990. Autonomous coalition members were the Sihanoukist FUNCINPEC, the KPNLF, and the Khmer Rouge. Prince Sihanouk's main political organization, formed in 1981, was known as the National United Front for an Independent, Neutral, Peaceful, and Cooperative Cambodia, or its French acronym, FUNCINPEC; he resigned as its head in 1989. In 1992 the Front was registered as a political party for the 1993 elections and Prince Norodom Ranariddh was elected president.

In 1992 the Khmer People's National Liberation Front (KPNLF), headed by Son Sann, formed the Buddhist Liberal Democratic Party (BLDP), also headed by Son Sann. The military wing of the KPNLF was the KPNLAF, the Khmer People's National Liberation Army formed under Son Sann in 1979. Although it boycotted the elections and attempted to undermine the peace process, the Khmer Rouge had also formed a party to

contest the elections, the Cambodian National Unity Party, headed by Kieu Samphan and Son Sen.

The Kampuchean People's Revolutionary Party (KPRP), the Communist Party originally installed by Vietnam in 1979 as the People's Republic of Kampuchea (PRK), was also known as the Heng Samrin Government in the late 1980s. In 1991 the KPRP dropped the word "Revolutionary" from the party name, becoming the Khmer People's Party or Cambodian People's Party (CPP). Hun Sen remained Chairman of the Council of Ministers of the government of the State of Cambodia a position he had held since 1985. At an extraordinary party congress, 17–18 October 1991, Chea Sim was elected party president, replacing Heng Samrin, and Hun Sen was elected party vice president; these events signaled a shift from hardline communist ideology to a reformist position prior to the UN-supervised elections. Chea Sim remained president of the National Assembly.

In the coalition government following the 1993 election, Hun Sen was made Second Premier, and FUNCINPEC's Ranariddh became First Premier. Hun Sen was able to push Ranariddh out of that position with 1997's brutal coup d'état, and the CPP won enough seats in the 1998 election to establish Hun Sen as sole prime minister.

Perennial opposition leader and anti-corruption crusader Sam Rainsy transformed his unrecognized Khmer Nation Party into the eponymous Sam Rainsy Party, which won significant Assembly seats in the 1998 election. Sam Rainsy has repeatedly stooped to race-baiting directed against Cambodia's Vietnamese population during his political career. At the same time, he is an eloquent spokesman for increased democratization and openness in Cambodia, and a persistent anti-authoritarian thorn in Hun Sen's side. In early 2000, Sam Rainsy brought the question of royal succession into the open, which seems to provoke Hun Sen's fear that his arch rival, Prince Ranariddh of FUNCINPEC, could possibly follow his aged, ailing father, Prince Sihanouk, to the throne of Cambodia's constitutional monarchy.

In May 2002, Prince Ranariddh's half-brother formed a new party, the Prince Norodom Chakrapong Khmer Soul party, to contest the national elections to be held in July 2003. Prince Ranariddh warned that the new party would split the royalist vote and ensure continued dominance by Hun Sen. Prince Norodom Chakrapong offered to form an alliance with the Sam Rainsy Party.

## 15 LOCAL GOVERNMENT

Under the Lon Nol government, Cambodia was divided into 20 provinces (*khet*), 7 sub-provinces (*anoukhet*), 147 districts (*srok*), and more than 1,200 townships (*sangkat* or *khum*) and villages (*phum*). Under the Pol Pot regime, administration was essentially decentralized into several major regions. Regions were divided into 41 districts, and the population as a whole was organized in massive rural communes. Under the PRK regime, the pre-1975 system of administration has been restored. Based on the People's Republic of Kampuchea's new constitution of June 1981 Local Assemblies, popularly elected by the respective localities—province, district, sub-district, ward—were instituted with the number of representatives fixed by law, and People's Revolutionary Committee's chosen by the respective assemblies. In 1987 Cambodia was divided into 18 provinces, two special municipalities (*krong*), and Phnom Penh and Kampong Saom, which were under direct central government control. The provinces were subdivided into about 122 districts, 1,324 communes, and 9,386 villages. Municipalities were subdivided into wards (*sangkat*). The same system of assemblies and committees remains in place. The new constitution of the State of Cambodia was adopted on 21 September 1993. People's Committees established in all provinces, municipalities, districts, communes, and wards were responsible for local administration, public security, and local order. Within this system provincial

officials and the governor effectively controlled the armed forces and security services, tax collection, civil service—and through them 80% of the Cambodian population. The country's provinces remained under the sway of the Cambodian People's Party (CPP) and responded to the old political loyalties rather than the central authority of the State of Cambodia. To alter this system the National Assembly passed laws to secure central control of the economy. Effective 1 January 1994 a national budget and financial laws were enacted to try to ensure that all revenues came totally and directly to the national treasury. Provincial corruption and lawlessness remain severe problems, as communications and infrastructure are extremely underdeveloped within Cambodia and smuggling is rife.

In February 2002, Cambodia held its first local elections in 23 years. The CPP claimed victory in all but 23 of the 1,621 communes. FUNCINPEC won only seven of the village communes. At least 20 political activists, mostly from opposition parties, were killed in the run-up to the elections. The proportion of female candidates in the elections was 16%.

As of January 2003, there were 20 provinces (*khett*) and 4 municipalities (*krong*).

## 16 JUDICIAL SYSTEM

The 1993 constitution of the Kingdom of Cambodia provides due process protections such as presumption of innocence and also guarantees an independent judiciary. Efforts are still being made to train judicial personnel to implement these principles, and to ensure basic human rights for Cambodians.

Prior to 1989, the constitution of 1976 provided for a supreme judicial tribunal whose members were to be appointed by a People's Assembly. Because of the civil and military turmoil, however, this system was never fully implemented. The judicial system that was outlined in the constitution of 1989 provided for provincial court judges named by state officials. In practice, the judiciary was controlled by the government.

The current legal system consists of lower courts, an appeals court and a Supreme Court. There is also a military court system. The 1993 constitution provides for a Constitutional Council, and a Supreme Council of Magistrates, which appoints and disciplines judges. With low revenues and high crime rates plaguing Cambodia, the justice system is burdened by substandard police procedures. Many serious crimes, notably political killings, go unsolved. Police corruption and abusive imprisonment conditions remain endemic.

## 17 ARMED FORCES

Cambodia has approximately 125,000 active personnel in the armed forces. The army consists of around 75,000 with over 100 main battle tanks. The navy numbers around 3,000 and the air force has 2,000 personnel with 24 combat aircraft. Provincial forces number some 45,000. There is a paramilitary of 67,000 police including gendarmerie. Defense expenditures in 2001 were \$112 million or 3% of GDP.

## 18 INTERNATIONAL COOPERATION

Cambodia has been a member of the UN since 14 December 1955 and participates in ESCAP and all the nonregional specialized agencies. Cambodia is also a member of the Asian Development Bank, FAO, IBRD, ILO, IMF, and G-77. As of January 2003, Cambodia was an applicant to the WTO.

China is the major ally of Cambodia. Cambodia was accepted as the tenth member of the Association of Southeast Asian Nations (ASEAN) in May 1998.

## 19 ECONOMY

Cambodia's economy has been based traditionally on agriculture. About 85% of the cultivated area is devoted to the production of rice, while rubber trees account for a major part of the remainder.

Prior to the war years, Cambodia's rice crop was usually ample enough to permit exports. The Tonle Sap is one of the major fishing reservoirs in Asia, and its products have played a key role in the Cambodian economy and diet. Cattle breeding is another important source of income. During the 1970–75 period, Cambodia's economy came to rely critically on US assistance, as the expansion of the war caused widespread damage and limited economic activity. The Pol Pot regime, which came to power in April 1975, was determined to emphasize the growth of agriculture and restore national self-sufficiency. The entire population was mobilized in a mass labor campaign to improve agricultural production through massive irrigation projects in the countryside. The cities were virtually emptied, and industrial production drastically declined. Private ownership of land was disallowed, and landholdings were transferred to the state or to state-organized cooperatives. All industrial enterprises were similarly transferred to state ownership. Sparse food supplies were distributed through a system of government food rationing and other forms of allotment.

When the PRK government took over in 1979, it was faced with a major challenge in restoring the national economy. The first problem was to end the threat of famine. A massive international campaign to feed the population took place during 1979–82. In the meantime, similar efforts were undertaken to stimulate the industrial sector and expand exports in order to obtain needed foreign exchange. Reliable sources note that the infrastructure was so severely degraded that it had only 40–50% of prewar capacity. By the mid-1980s, the economy had essentially returned to the level of the pre-1975 period, although the regime was still vitally dependent on foreign aid, chiefly from Vietnam and the former USSR. In July 1986, the PRK issued an emergency appeal to international organizations for rice.

Rule by the Khmer Rouge, 20 years of civil war, economic isolation, and a centrally planned economy imposed heavy burdens on Cambodia. Serious damage to basic infrastructure, industrial and agricultural production, and human resources required massive rehabilitation and reconstruction. Market-oriented reforms have been introduced which dismantle the centrally planned economy. Since 1989 Cambodia passed legislation to restore the right to own and inherit property, freed prices, passed a liberal foreign investment code, began to privatize state assets, and property, decontrolled the official exchange rate, and liberalized foreign trade. Reforms generated increased agricultural production and foreign investment. Phnom Penh and other urban areas received the greatest benefit from this economic activity.

In the 1990s Cambodia remained predominantly agricultural with more than 80% of workers employed in agriculture. Inflation rose steadily, the price of domestic commodities increased at least 140% in 1990, but by only 15% in 1998. In 1991 Cambodia halted the free trade of gold as part of an effort to stabilize the value of the currency, the riel. Triple-digit inflation made currency worthless in 1992 and it was pulled from circulation. In 1994 the riel was stabilized at 2,400–2,600 riel to one US dollar. In 1991–1993, the transition period from a command to a market-driven system, the presence of 22,000 UN personnel aided the Cambodian economy, although the growth was mainly urban, barely affecting rural areas. Western consumer goods such as motor vehicles, tinned food, alcohol, and cigarettes, were readily available in Phnom Penh and other cities. In 1990 GDP was negative, increasing to 13.5% in 1991 and estimated of 6–8% in 1992. On 4 January 1992 President Bush announced the lifting of the US trade embargo against Cambodia shortly after the signing of the Paris Peace Agreement on Cambodia in 1991.

One outcome of the May 1993 elections was a division of government portfolios between the winning party, FUNCINPEC, and the surprised runner-up, the Cambodian People's Party

(CPP). FUNCINPEC took over the financial and economic portfolios. An aggressive campaign was mounted to restructure tax, investment, banking and currency laws. As part of the battle against official corruption some contracts signed by the previous government were revised or abrogated. The government moved to strengthen the currency and provide new banking legislation. Effective 1 January 1994 were Cambodia's national budget and financial structure laws aimed at establishing central control of the economy. In August 1994, the government adopted a new liberalized foreign investment law with protections against nationalization and guarantees of national treatment except in matter of land ownership. The economy propelled into a period of strong growth, with real GDP increasing at an average annual rate of 7.2% 1993–97. The peak was reached in 1995, when real growth reached 8.4%. Inflation was only 3% in 1995, falling from 17.9% in 1994. During the next year two years, real growth declined, to 3.5% and 3.7%, respectively, while inflation rose, to 9% for both years. A more serious slowdown occurred in 1998 the Asian financial crisis; drought, civil violence, and political squabbles all conspired to slow growth to a barely discernable 1%, while inflation surged to 13.5%.

Cambodia's admission into ASEAN (Association of Southeast Asian Nations), scheduled for 1998, ended up being delayed until April 1999 due to a breakdown into factional violence in July 1997. The after-effects of the Asian financial crisis were also felt, reducing GDP growth to 1% in 1998, and spiking inflation to 12.6%. Recovery in 2000 was propelled by a 29% growth in industrial production, but moderated by a contraction in agricultural output of -2.7% due to the worst flooding in 70 years. Services grew 3.1% in 2000, producing an overall GDP growth rate of 5.4%. Inflation was completely eliminated as prices showed a slight decline of -0.8%. Flooding continued to be a problem in 2001, keeping agricultural growth to 4.4%, while growth in services slumped to 2.4% primarily due to a decline in tourism. Industrial growth was again the main propellant, growing 12.5%, producing an overall GDP growth of 5.3% in 2001. Estimates for 2002 were a 3% growth in GDP with 3% inflation, up from a -0.6% rate in 2001. In November 2001, Cambodia was removed for the US list of Major Drug-Transit Countries by executive action of President George W. Bush because of lack of evidence in recent years of any heroin transiting Cambodia coming to the United States.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Cambodia's gross domestic product (GDP) was estimated at \$18.7 billion. The per capita GDP was estimated at \$1,500. The annual growth rate of GDP was estimated at 5.3%. The average inflation rate in 2000 was 1.6%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 50% of GDP, industry 15%, and services 35%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$17 million or about \$1 per capita and accounted for approximately 0.5% of GDP. Worker remittances in 2001 totaled \$15.20 million. Foreign aid receipts amounted to about \$33 per capita and accounted for approximately 12% of the gross national income (GNI).

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$226. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. The richest 10% of the population accounted for approximately 33.8% of household consumption and the poorest 10% approximately 2.9%. It was

estimated that in 1997 about 36% of the population had incomes below the poverty line.

## 21 LABOR

In 1998, the economically active population was estimated at six million, of which 52% were female, due in large part to the holocaust of the Khmer Rouge. The estimated unemployment rate in 1999 was 2.8%. In 2001, approximately 80% of the population was agricultural workers, primarily engaged in subsistence rice farming.

The labor law provides the right for workers to form unions, prohibits forced or compulsory labor, sets a minimum wage, and set the minimum legal working age at 15 (unless employment is within a family enterprise). However, enforcement remains inconsistent. Unions are concentrated in the garment and footwear industries where around 28% of workers are union members. Strikes are protected by law.

A 48-hour workweek and minimum safety and health standards are provided by law. However, these rules are not effectively enforced. Separate minimum wages are established for each sector of the economy and average wages are so low that second jobs and subsistence agriculture are usually necessary. The minimum wage in the garment industry is \$45.00 per month. Many children are engaged in work activity, generally within the agricultural sector.

## 22 AGRICULTURE

Because of the lack of natural resources and the primitive industrial base in Cambodia, agriculture is the key sector in the economy. Arable land amounted to 3,807,000 hectares (9,007,000 acres) in 1998, or 22% of the total land area. In 2001, agriculture accounted for 50% of GDP and engaged 80% of the economically active population.

Rice provides the staple diet and prior to 1970 was Cambodia's major export, along with rubber. Production peaked at 3,200,000 tons in 1968; it began falling because of the expansion of the war and by 1974 had declined to 635,000 tons, but had risen back to 2,155,000 tons in 1990. Production in 1999 totaled 3,800,000 tons from 1,961,000 ha (4,846,000 acres).

Upon coming to power in April 1975, the Pol Pot regime embarked on a major rice production program, but the highest output achieved was only 1,800,000 tons in 1976 and in 1977; civil war, holocaust, and the Vietnamese invasion lowered the rice harvest in 1979 to one million tons. During the 1980s, rice production gradually increased, from about 1,564,000 tons in 1980–81 to an estimated 1,680,000 tons in 1985/86. During the mid-1980s the Khmer Rouge government attempted to stimulate production by delaying its plans for collectivization of the countryside. In 1989, the new government returned agricultural land to the tiller, which significantly boosted food production; average annual production in 1989–91 was 2,524,000 tons.

Rubber has traditionally been the second most important agricultural crop. However, rubber plantings, which covered 48,000 hectares (119,000 acres) in 1969, were almost completely destroyed by the end of 1971. Production, up to 51,100 tons in 1969, declined to virtually nil in 1971, recovering to about 16,000 tons in 1974. The Pol Pot and Khmer Rouge governments continued efforts to revive the rubber industry, the latter with aid from the former USSR and GDR. Recovery has been uneven and slow, however, and reached 40,000 tons in 1999. Other crops, with 1999 production levels, are: coconuts (56,000 tons), corn (50,000 tons), soybeans (28,000 tons), sweet potatoes (25,000 tons), dry beans (11,000 tons), cassava (68,000 tons), tobacco (10,000 tons), and peanuts (7,000 tons).

### 23 ANIMAL HUSBANDRY

Livestock, raised primarily by private households, traditionally supplied an important supplement to the Cambodian diet. The Pol Pot regime placed heavy stress on cattle and poultry breeding, but thousands died during the chaotic years of the late 1970s. Estimated livestock levels in 2001 were cattle, 2,868,000 (as compared with 700,000 in 1979), and pigs, 2,114,000 (as compared with 100,000 in 1979). Cambodia also had 626,000 head of buffalo, 15.2 million chickens, and 4.6 million ducks in 2001. In 2001, Cambodia produced an estimated 205,000 tons of meat, with pork accounting for 52%; poultry, 12% beef, 25%; and other meats, 11%.

### 24 FISHING

Production of freshwater fish, the main protein element in the Cambodia diet, traditionally ranked next to rice and rubber in the national economy. About half of Cambodia's freshwater catch came from the Tonle Sap. Offshore fishing grounds present a potential resource not yet fully exploited.

Marine fishing developed significantly during the 1980s; the saltwater catch totaled 3,015 tons in 1982 and 39,368 tons in 2000. In 2000, inland fishing amounted to 245,600 tons, up from 72,640 tons in 1994.

### 25 FORESTRY

About 53% of the country was forested in 2000. Forestry has been limited because of transportation difficulties and damage from war. The main products of the forest industry are timber, resins, wood oil, fuel, and charcoal. Production of roundwood, averaging about 4 million cu m (141 million cu ft) in the late 1960s, fell off sharply during the 1970–75 war, but increased to over 10.9 million cu m (385 million cu ft) in 2000. Exports of sawn wood were valued at \$10.5 million. Fuel wood production was 10.1 million cu m (357 million cu ft) in 2000.

### 26 MINING

Cambodia's mineral resources, though limited, had not been extensively explored and developed in the past two decades because of war, internal conflict, and the lack of appropriate legislation and policy to attract foreign investors. The mining sector, the smallest in the economy, contributed 0.16% to the country's GDP in 2001 and employed 4,000 people in 2000. In 2001, the country produced modest quantities of clinker cement, laterite blocks, phosphate rock, quartz sand, sand and gravel, crushed stones, sandstone, and salt; clay, gemstones, gold, iron ore, and lime were presumably produced as well. Cement and gem mining were leading industries in 2002. Other metallic minerals identified in the country were antimony, bauxite, chromium, copper, lead, manganese, molybdenum, silver, tin, tungsten, and zinc. In addition, Cambodia had resources of such industrial minerals as carbonate rocks, fluorite, quartz, silica sand, and sulfur. Iron deposits and traces of gold, coal, copper, and manganese have been reported in the Kampong Thum area. Substantial deposits of bauxite, discovered in the early 1960s north of Battambang and southeast of Phnom Penh, have yet to be worked. Potter's clay was common, and deposits of phosphates, used for fertilizer, existed in southern Kampot province and near Phnom Sampou. Precious gems were mined in the Pailin area and smuggled to Thailand. High-quality cornflower-blue sapphires have been the most valued gemstone produced to date, and high-quality rubies also have been found. It was unlikely that exploitation of the nation's mineral resources could be undertaken without continued removal of landmines.

### 27 ENERGY AND POWER

Several new power-generating facilities were installed in the mid-1960s, but total capacity was reduced by about one-third in the

course of the 1970s war, reaching 41,000 kW by 1973/74; in that period, production stood at 150 million kWh. Total generating capacity was 35,000 kW in 2001; net production in 2000 was 100 million kWh, of which 62.1% was from fossil fuels and 37.9% from hydropower. Electricity consumption was 122.8 million kWh in 2000.

Offshore oil was reportedly discovered by a French firm in August 1974 in the vicinity of the Wai Islands. In 1995 a total of 17 foreign companies submitted bids to explore for oil and gas both onshore and offshore; the offshore areas are near Sihanoukville on the Gulf of Thailand.

### 28 INDUSTRY

Industrial activity has traditionally centered on the processing of agricultural and forestry products and on the small-scale manufacture of consumer goods. Rice milling has been the main food-processing industry. Industrial expansion came to a virtual halt in 1970 with the outbreak of war. A few sectors (such as textiles and beverages) enjoyed a short wartime boom due to military orders, but losses in territory and transport disruptions had caused a rapid decline in activity by 1973. The Pol Pot government placed all industries under state control in 1975. In the course of the next four years, some 100 industries were abolished or destroyed. When the PRK took over in 1979, industrial plants began to reopen. By late 1985 there were a reported 60 factories in the state sector producing household goods, textiles, soft drinks, pharmaceutical products, and other light consumer goods. Most plants operate below capacity because of poor management and shortages of electricity, raw materials, and spare parts. There is little information on the small Cambodian private sector. The overall value of local and handicrafts industries in 1984 was estimated at about 50% of the output value in state industry.

Efforts at recovery continued in the early 1990s, but were hampered by dilapidated equipment and shortages that continued to affect industrial production, principally textiles and rubber production. For instance, following the cutback of assistance from the former Soviet Union in 1990, Cambodia's primitive industrial sector suffered from raw material shortages; three of six government-owned textile mills shut down because of shortages of cotton. When major Soviet oil supplies were depleted local companies imported oil, but the cash-strapped state companies suffered electricity brownouts daily. Major industries include rice milling, fishing, wood and timber products, rubber (largely abandoned since 1975), cement, and gem mining. Cambodia has significant mineral deposits of gold, silver, iron, copper, marble, limestone and phosphate, and a gem industry. Construction in urban areas boomed with the signing of the Paris peace accords in 1991. After Cambodia opened oil fields to foreign investors in February 1991, sixteen companies expressed interest in oil exploration. In January 1994 it was reported that five oil companies were conducting offshore oil and gas exploration.

In 1996, clothing industry exports more than doubled. Some 36 factories employed around 20,000 people. The average annual industrial growth rate for 1988 through 1998 was 8.5%. Growth slumped to 7.7% in 1998 due to the effects of the Asian financial crisis, civil, drought, and political disruptions. However, recovery was rapid in the industrial sector as it posted growth output of 12%, 29%, and 12.5% for 1999 to 2001. The garment industry grew by 50% during this period. In 2000, industry constituted 20% of total GDP.

### 29 SCIENCE AND TECHNOLOGY

Since 1979, foreign technicians have been helping to revive the economy. Aside from a School of Medicine and Pharmacy, there is virtually no opportunity within Cambodia to pursue scientific training or research. In 1987–97, science and engineering

students accounted for 13% of college and university enrollments.

### 30 DOMESTIC TRADE

Phnom Penh has traditionally been Cambodia's principal commercial center. Formerly, most wholesale and retail business was in the hands of French, Chinese, and Vietnamese. In April 1975 all private shops in the country were closed and virtually all domestic trade fell under the control of the state. Official currency was abolished in favor of barter. Following the installation of the PRK, currency was reestablished and some private trade resumed with official encouragement. Since 1983, private shops have resumed operation in Phnom Penh. Most of these shops are owned directly or subsidized by wholesalers. Goods are also sold from traveling vans or through newspaper advertisements.

In 1986, the government began collecting license fees, rents, and utility fees from private businesses and substantially increased their taxes. In the early 1990s the Heng Samrin government fell behind in its payments to government troops and bureaucrats, printing more money to meet these obligations. Without revenue this vicious cycle peaked in triple-digit inflation by 1992, when the currency was rendered worthless and pulled from circulation. Market prices rose as the currency value dropped meaning poorer Cambodians could not afford their staple food, rice. The United Nations Transitional Authority in Cambodia (UNTAC) introduced imported rice and sold it at a fixed price in an effort to halt the inflationary spiral.

Despite the economic benefits of the UN presence, political disruptions and violence in 1997 and 1998 reversed economic growth. In Cambodia depressed economic output is supplemented by goods smuggled in from Thailand and Singapore. Economic reforms became in earnest in 1999, which marked the first full year of peace for the nation in about 30 years.

As of 2001, about 80% of the population was employed in agriculture; however, the service sector is beginning to grow as the nation attempts to expand tourism. The economy is still heavily reliant on international aid.

### 31 FOREIGN TRADE

Cambodia has traditionally been an exporter of primary products and an importer of finished goods. The country's normal trade patterns virtually disintegrated during the war as exports declined, and Cambodia was largely sustained by US-subsidized imports. Under the Pol Pot regime, foreign trade virtually ceased. According to Western estimates, total trade (excluding trade with China) was \$3 million in exports and \$22 million in imports in 1977. With the installation of the PRK government, foreign trade began to rise in volume. The value of total exports rose from an estimated \$3–4 million in 1982 to approximately \$10 million in 1985; imports in that year came to about \$120 million. Almost all foreign trade has been with the former USSR and its allies, and most imports are in the form of grants. In 1985 Cambodia imported R100.2 million of goods from the USSR, compared to R18.8 million in 1984. Cambodia exported R14.9 million worth to the USSR in 1985, up from R3.9 million in 1984. The main import categories are food, vehicles, fuels, and raw materials. Cereal imports dropped from 223,000 tons in 1974 to 60,000 tons in 1985. Foreign trade is legally restricted to licensed private-sector firms and government agencies, although there is considerable smuggling between Cambodia and Thailand. In 1985, Cambodia and Vietnam signed an agreement to double their mutual trade in 1986.

In 1986 major export trading partners with Cambodia were Vietnam, the former USSR, Eastern Europe, Japan, and India. For imports major trading partners were the same countries. Soviet Union and CMEA assistance to Cambodia ceased in 1991. The

US trade embargo against Cambodia was lifted in January 1992 by President Bush. As of 1992 Cambodian exports were mostly agricultural, comprised of timber mainly and rubber. Logging is a ready source of badly needed export revenues for both the government and the other political factions. The United Nations Development Program (UNDP) estimated that the forest cover had fallen to as little as 40% of the land area by 1992. Cambodia's own forestry department figured that in 1969 forests covered 73% of the country's land area. The UNDP concluded that deforestation was a major threat to Cambodia's development.

In 1996, a textiles factory opened. In 2000, major export commodities were timber, garments, rubber, rice, and fish. Major import commodities were cigarettes, gold, construction materials, petroleum products, machinery, and motor vehicles.

Principal trading partners in 1998 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	293	39	254
Singapore	133	96	37
Thailand	77	169	-92
Germany	72	11	61
China (inc. Hong Kong)	69	226	-157
Vietnam	42	91	-49
Taiwan	21	126	-105
France	12	41	-29
Japan	8	71	-63
Malaysia	6	47	-41
Korea	1	68	-67

### 32 BALANCE OF PAYMENTS

Cambodia's balance-of-payments position showed a deficit every year during the period 1954–74. Payments transactions with other countries virtually ceased under the Pol Pot regime, when China conducted Kampuchea's external financial dealings. From 1979, Kampuchea continued to run a substantial trade deficit, much of which had been financed by grant aid and credits extended by the former USSR and Vietnam. To reduce the current account deficit Cambodia needs to reform its military and civil service. The current account deficit, which stood at 11.5% of GDP in 1999, was mainly financed by official development assistance grants and loans, and foreign direct investment. The country's official reserves at the end of 1999 were able to cover the equivalent of 3.5 months of imports.

In 2000, the country's foreign debt stood at approximately \$1.3 billion, the majority of which it owed to Russia; as of that date, it had yet to reach agreement with the Russian Federation on repayment of the debt.

The US Central Intelligence Agency (CIA) reports that in 2000 the purchasing power parity of Cambodia's exports was \$1.05 billion while imports totaled \$1.4 billion resulting in a trade deficit of \$350 million.

The International Monetary Fund (IMF) reports that in 2001 Cambodia had exports of goods totaling \$1.38 billion and imports totaling \$1.73 billion. The services credit totaled \$257 million and debit \$244 million. The following table summarizes Cambodia's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	-105

<b>Reserves and Related Items</b>	-73

### 33 BANKING AND SECURITIES

All banking institutions were nationalized by the Sihanouk government on 1 July 1964. The National Bank of Cambodia, a semi-autonomous government agency functioning as the sole currency authority, was charged with central banking responsibilities, including the control of credit. The decision by then Premier Lon Nol to permit foreign banks to do business in the country in early 1970 was a factor leading to his break with Prince Sihanouk and to the latter's overthrow in March 1970.

In April 1975, the Pol Pot government assumed control of the National Bank, and virtually all banking operations in Kampuchea were liquidated. The PRK government reintroduced a money economy, and by 1983 the National Bank of Cambodia (NBC) and a Foreign Trade Bank had been established. In 1991 the government created a state commercial bank to take over the commercial banking operations of the national bank. Banks in Cambodia include the Cambodian Commercial Bank, Cambodian Farmers Bank, and the Cambodian Public Bank. There were at least 50 commercial banks operating in 2001. The NBC has implemented new regulations for licensing banks, causing two banks to be closed. There is no securities trading in Cambodia.

The riel resumed its fall against the dollar in January and February of 1997 after briefly strengthening in December of 1996. It fell about 2% against the dollar in 2000 alone, trading at about 3,916.3 riels per dollar in 2001. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$155.7 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$562.7 million.

### 34 INSURANCE

All insurance companies were “Cambodianized” in 1960; 16 companies were in operation prior to 1975. Under the Pol Pot government, normal insurance operations were suspended. No current information is available concerning insurance in the PRK.

### 35 PUBLIC FINANCE

All government budgets of the two decades preceding 1975 were marked by an excess of expenditures over domestic revenues; foreign aid and treasury reserves made up the difference. There probably was no domestic public finance system during 1975–78; any public funds in that period came from China. During the 1980s, public expenditures were financed by the former USSR, either directly or through Vietnam.

From 1989–91, the public deficit nearly tripled as a result of falling revenue collection. As assistance from the Soviet bloc ceased after 1990, monetary expansion soared to cover the deficit. By the middle of 1992, with hyperinflation imminent, the government began a series of stabilization efforts to halt the fiscal deterioration. With only limited international aid, however,

public expenditures for the necessary reconstruction and development of Cambodia have been restricted.

The US Central Intelligence Agency (CIA) estimates that in 2000 Cambodia's central government took in revenues of approximately \$363 million and had expenditures of \$532 million including capital expenditures of \$225 million. Overall, the government registered a deficit of approximately \$169 million. External debt totaled \$829 million.

### 36 TAXATION

Until 1975, indirect taxes were the most profitable source of domestic revenue, especially such monopoly excises as the sales tax on salt. Other indirect taxes included those on alcohol, tobacco, sugar, radios, and livestock. Taxes ceased to exist with the abolition of currency during the Pol Pot regime and were replaced by payments in-kind. In 1984, the PRK introduced an agricultural tax to soak up profits earned by private farmers. The tax reportedly amounted to about 10% of total output. In 1986, taxes on private business were increased, which forced some shopkeepers out of business. In 2002, there was a general corporate tax of 9%, except for in the fields of resource exploitation.

### 37 CUSTOMS AND DUTIES

Cambodia has simplified its tariff system in recent years and eliminated most non-tariff barriers to trade. Customs duties are now divided into four simple categories: luxury goods, such as automobiles, alcohol, tobacco, and cosmetics have a rate of 70%; finished products such as electronics, paint, and furniture carry a tariff of 35%; machinery and capital equipment have a rate of 15%; and raw materials carry a tariff of 7%. A few products, such as agricultural equipment and pharmaceutical products, are exempt from import tariffs, but are still subject to the 10% value-added tax (VAT). The United States resumed diplomatic ties with Cambodia in September 1993. Cambodia joined ASEAN in 1998.

### 38 FOREIGN INVESTMENT

There was little private foreign capital in pre-1975 Cambodia. French capital in rubber plantations represented more than half of the total investment. Foreign investment was prohibited under the Pol Pot regime and was not resumed under its successor, the People's Republic of Kampuchea (PRK). As part of Cambodia's economic reforms the July 1989 Foreign Investment Law and the regulations implementing the law contained in the May 1991 sub-decree on foreign investment created a favorable foreign investment climate in Cambodia. From 1989 to 1991 there were over 200 investment applications, 20 being granted and 70 given tentative approval. Foreign investors from Thailand, Singapore, Taiwan, Hong Kong, France, and the US accounted for over half these applications; overseas Khmers accounted for 30%, and 10% were from local investors. By 1993 it was reported that final contracts had been signed for 45 of these 200 applications. The value of these proposals is small, \$1–5 million, and the proposals are concentrated in services, tourism, and textiles. The most visible projects are the 380-room Cambodiana Hotel in Phnom Penh, a satellite earth station project that provides international direct dial service, and a cellular telephone system in Phnom Penh. The primary hindrance to foreign investment is the lack of infrastructure—roads are in dismal condition, bandits roam, power outages are common, and phone service is inadequate.

The new foreign investment law was adopted by the National Assembly on 4 August 1994. It guarantees that investors shall be treated in a non-discriminatory manner, except for land ownership; that the government shall not undertake a nationalization policy which adversely affects private properties of investors; that the government shall not impose price controls on the products or services of an investor who has received prior

approval from the government; and that the government shall permit investors to purchase foreign currencies through the banking system and to remit abroad those currencies as payments for imports, repayments on loans, payments of royalties and management fees, profit remittances, and repatriation of capital.

In October 1999, the government entered into a three-year IMF-monitored program that included as a priority goal making the country more attractive for foreign direct investment. In February 2000 this program was complemented by a World Bank program aimed at revising Cambodia's 1994 Law on Investment (LOI). Foreign investment commitments averaged over \$800 million in the period 1996 to 1998, but fell to \$482 in 1999. Actual foreign investment in 1999, the latest data available, was \$160 million. In 2002, over 100 US companies and companies representing US products and services were active in Cambodia.

### 39 ECONOMIC DEVELOPMENT

Until 1975, Cambodian governments sought aid from public and private foreign sources and attempted to improve the climate for private foreign capital investment, although the volume of investment was small. Both Sihanouk and Lon Nol also increased local control of economic activities within the country. Aliens were prohibited from engaging in 18 professions or occupations, including those of rice merchant and shipping agent. The Sihanouk government promoted economic development through two five-year plans designed to improve the nation's light industrial sector and its educational and technological infrastructure. Progress was mixed. Strained economic conditions were a factor leading to the overthrow of Sihanouk in 1970. The outbreak of war following his fall brought almost all major production to a halt. The economic objectives of the 1975–79 Pol Pot regime were centered almost entirely on agriculture and the improvement of the irrigation network. Self-sufficiency was stressed, and foreign aid was almost nil except for an estimated \$1 billion from China. When the PRK government took over, it inherited a shattered economy and a depleted population. The 1986–90 five-year plan stressed growth in the agricultural sector, the restoration of light industry (which faces shortages of raw materials and electrical supply), gradual socialist transformation of ownership, dependence upon the former USSR and its allies for foreign assistance, and an increase of economic cooperation with its Indochinese neighbors. The PRK signed a number of aid, trade, and cooperation agreements with the former USSR and other Eastern European countries and was receiving substantial technological aid from neighboring Vietnam. Development assistance from the CMEA bloc totaled an estimated \$700 million between 1980 and 1984.

The PRK moved slowly on its plan to transform the Cambodian economy to full socialist ownership, in recognition of the relatively low socialist awareness of the population. A small private manufacturing and commercial sector was recognized by the constitution in 1981, and farmers were being introduced to collectivization through the formation of low-level "solidarity groups" which combined socialist and private ownership. PRK plans were to advance more rapidly toward socialist transformation during the 1990s. However, since the mid-1980s the emphasis has been placed on private sector economic activities. Newly introduced market-oriented reforms dismantled the old central planning regime. However, the structural underpinnings of a capitalist system—legal, financial, and institutional—exist only in rudimentary form. Many of Cambodia's nationalized industries were allowed to operate with limited autonomy from the state planning system, but the lack of capital and management expertise, as well as institutionalized corruption and bureaucratic red tape have mired this recovery process. In 1991 at the Tokyo Conference on the Rehabilitation and Reconstruction of Cambodia, \$880 million in assistance was pledged to Cambodia by donor countries and multilateral

institutions. An additional \$80 million in aid was pledged by the Asian Development Bank, and the World Bank planned a \$75-million assistance program. Under Sam Rainsy, Minister of Finance and Economy, the national assembly passed a budget and new Financial Structure Laws effective 1 January 1994. The government's aim was to establish central control of the economy and at the same time strike out at corrupt practices. About 48% of the budget was made up of international assistance; there was no land or income taxes with tax revenues providing only 6% of GDP, and customs duties provided 54% of total revenue. In October 1999, after the disruptions caused by civil unrest and the Asian financial crisis, the government entered into a three-year arrangement with the IMF under its Poverty Reduction and Growth Facility (PRGF). The program focused on bank restructuring; reform of the Foreign Trade Bank; reform of forestry policy; and strengthening the public sector accounting and expenditure management. Concurrently, a Structural Adjustment Credit (SAC) loan program under the World Bank was approved in February 2000. The SAC program included conditionals related to the pilot military demobilization program, public expenditure management, forestry policy and revisions to the 1994 Law on Investment (LOI). Development in Cambodia is inextricably linked to the government's ability to maintain peace.

### 40 SOCIAL DEVELOPMENT

The Sihanouk and Lon Nol governments enacted limited social legislation regulating hours of work, wages, and workers' compensation. During the Pol Pot period, the social fabric of the country was severely damaged. Although installation of the PRK government brought an end to the wide-ranging trauma of 1975–79, overall social conditions in Cambodia remain among the worst in southeast Asia. Unstable conditions have also limited improvement in the standard of living, still one of the lowest in the region.

Cambodia's 1993 constitution provides equal rights for women in areas including work and marriage. Women have property rights equal to those of men, and have equal access to education and certain jobs. However, traditional views of the roles of women act to prevent women from reaching senior posts in government and business. Domestic violence against women remains a widespread problem.

In 1993, widespread racial violence led many ethnic Vietnamese to flee the country. Some of these refugees have now returned to Cambodia, but they continue to face considerable official and social discrimination.

Cambodia's human rights record includes a number of abuses, including extrajudicial killings, and other uses of excessive force by security forces. Impunity for such abuses remains a problem.

### 41 HEALTH

One of the most impoverished countries in Southeast Asia, Cambodia is prey to the health problems that arise from malnutrition and inadequate sanitation, including diarrhea, respiratory infections, and dengue fever, as well as those that could be prevented by an adequate vaccination program, such as tuberculosis. The 1970–75 war and the 1975–79 upheaval exacerbated many of these problems. Malnutrition became widespread among the millions driven to Phnom Penh in the wake of the fighting and who were driven out of that city when the Khmer Rouge took over. Tens of thousands died from shortages of food and medical facilities and supplies. Cambodia had only 50 physicians in 1979.

In 1995 the government mapped out a new public health program, which was only partly implemented as of 2000. As of 1999, total health care expenditure was estimated at 6.9% of GDP.

Life expectancy in Cambodia in 2000 was 54 years and the 1999 birth rate was 41 per 1,000 people. The infant mortality

rate was 88 per 1,000 live births in 1999 and the maternal death rate was high as well; 470 women died in childbirth or pregnancy per 100,000 live births (as of 1998). The general mortality rate was estimated at 11 per 1,000 in 2002. Dysentery, malaria, tuberculosis (in 1999, 560 reported cases per 100,000 people), trachoma, and yaws are widespread. In 2000, 30% of the population had access to safe drinking water and only 18% had adequate sanitation. Prior to 1975 there were 3 hospitals, with 7,500 beds (about 1 bed for every 893 persons). During 1979–81, 7 large hospitals and 3 pharmaceutical factories opened. As of 1999, there were an estimated 0.3 physicians and 2.1 hospital beds per 1,000 people.

AIDS spread rapidly in Cambodia during the latter half of the 1990s. The HIV prevalence rate rose from 0.1% in 1991 to 4% in 1999. As of 1999, the number of people living with HIV/AIDS was estimated at 220,000 and deaths from AIDS that year were estimated at 14,000. Eighty percent of the urban population and only 50% of the rural population had access to health services between 1985 and 1995. As of 2000, an estimated 53% of children under five were malnourished. The 1999 immunization rates for children up to one year old were diphtheria, pertussis, and tetanus, 49%, and measles, 55%.

## 42 HOUSING

Cambodia's housing traditionally compared favorably with that of other countries in Southeast Asia. The most common type of dwelling consists of one or more rooms raised on mangrove piles some three m (10 ft) above the ground; it is generally crowded. Many houses in the cities are larger and of better quality.

Mass emigration from the cities during 1975–76 resulted in many dwellings being left vacant, in contrast to the dire overcrowding that occurred in the last years of the war. In the countryside, meanwhile, the waves of new migrants placed inordinate pressures on existing facilities, with much of the transplanted population forced to reside in improvised shelters. By the early 1980s, this pattern had been reversed somewhat and Phnom Penh was once again experiencing population growth.

In 1998, there were about 2,188,663 households with an average of 5.2 people per household. Only 12.% of all dwellings were linked to public electrical lines; 80% of dwellings used kerosene for lighting and 90% burned wood for cooking fuel. About 40% of dwellings receive water from dug wells. Nearly 29% go to local rivers and streams for their water supply.

## 43 EDUCATION

Under the Pol Pot regime, education was virtually abolished, as all children were sent to work in the fields; education was limited to political instruction. Most of the educated class had been killed by 1979. According to PRK sources, only 50 of 725 university instructors and 307 of 2,300 secondary-school teachers survived the Pol Pot era.

Currently, the educational system is being rebuilt and is recovering. As of 1999, public expenditure on education was estimated at 5.5% of GDP. Adult illiteracy was estimated at 31.5% (males, 20%; females, 43%) in 2000. The number of teachers at the primary school level increased from 30,316 in 1980 to 43,282 in 1998, while the number of students increased from 1,328,053 to 2,011,772. At the secondary level, there were 19,135 teachers and 191,135 students in 1998. As of 1999, 89% of primary-school-age children were enrolled in school, while 16% of those eligible attended secondary school. In the same year, the pupil-teacher ratio at the primary level was 50 to 1. A total of 8,901 students were enrolled in post-secondary education in 1998, with 1,001 teachers.

All schooling is public, and six years of primary education (ages 6–12) is compulsory. Following this, children may go through six years of secondary education, of which only the first

three are compulsory. Most students continue their higher education at foreign universities.

## 44 LIBRARIES AND MUSEUMS

Library facilities before the war were limited largely to the National Library (33,000 volumes, mostly French) in Phnom Penh. Also in the capital are the libraries of the University of Phnom-Penh (10,000 volumes) and Buddhist Institute (25,000 volumes). The École Française de l'Extrême-Orient, which previously had charge of all archaeological research in the country, also had its own research library in Phnom Penh.

Cambodia, in effect, is a museum of the cultural achievements of the Khmer Empire. Surviving stone monuments, steles, temples, and statuary attest to a formidable and unique artistic heritage. Particularly imposing are the world-famous temple of Angkor Wat and the Bayon of Angkor Thom. In the chaotic years of the 1980s and early 1990s, there were many press reports of pillaging of these historic sites. The PRK government established museums in what it portrayed as GRUNK death camps, with exhibits on atrocities committed during 1975–79. The National Museum of Phnom-Penh (1917), an excellent repository of national art, has an extensive collection of Khmer art from the 5th through 13th centuries.

## 45 MEDIA

As of 2002, the telephone service was said to be adequate for government needs and for residents of Phnom Penh and other main provincial cities. Rural areas generally had very little access to landline phone service. In 1998, there were about 21,800 mainline phones in use. In 2000, there were an additional 80,000 cellular phones in use throughout the country.

TV-Kampuchea began color transmission in 1986. As of 1999, there were 7 AM and 3 FM radio stations. In 2001, there were six government-owned television stations. In 2000 there were 119 radios and 8 television sets for every 1,000 people. In 2001, there were 6,000 Internet subscribers served by two service providers.

There are two daily newspapers, *Rasmei Kampuchea* (2002 circulation 15,000) and *The Cambodia Daily* (2,000). The *Phnom Penh Post* is a weekly publication. There are over 50 newspapers in all, including weeklies, bi-weeklies, and monthlies, mostly in the Khmer language. The official news agency is the Agence Khmer de Presse (AKP). Most newspapers are nominally independent, but many receive significant funding from political parties and the government. English language weeklies were launched in July 1997.

The Constitution provides for freedom of speech and press, but the government is said to sometimes limit the press in practice. The intimidation of journalists is said to be declining. The government, political forces and the military dominate the broadcast media.

## 46 ORGANIZATIONS

In 1975, cooperative organization became a central tenet of the GRUNK government's social and economic reorganization policy. By 1976, cooperative ownership had become a countrywide phenomenon, playing a major role in both agriculture and industry. Virtually all other social and commercial organizations, including chambers of commerce, were disbanded by mid-1975; however, a number of new groups have formed since the 1990s. The Khmer Youth Association, founded in 1992, has been very active in promoting education and job training, as well as the championing the rights of women and children. The Cambodian Human Rights and Development Association, established in 1991, promotes respect for human rights and the rule of law by providing legal services and educational materials to the public.

#### 47 TOURISM, TRAVEL, AND RECREATION

Until the encroachments of war in the late 1960s, Angkor Wat and other remains of the ancient Khmer Empire were the major attractions for visitors to Cambodia. Under the Pol Pot regime, tourism was nonexistent, and it was not substantially revived under the PRK. However, since the 1992 UN peace plan, tourism has rebounded, spurred by the opening of hundreds of new facilities and scores of new diplomatic missions. In 2000, 351,661 tourists visited Cambodia and tourist receipts totaled \$228 million. There are two government-run tourist agencies and a number of new private tour groups. Dozens of hotels have opened in the capital. As of 1999 the country had 9,105 hotel rooms with 14,805 beds and an occupancy rate of 44%.

In 1999, the UN estimated the cost of staying in Phnom-Penh at \$87 to \$156, depending upon the choice of hotel. Travel outside the capital is significantly less expensive, with estimates as low as \$37 per day.

#### 48 FAMOUS CAMBODIANS

Foremost among ancient heroes were Fan Shihman, greatest ruler of the Funan Empire (150–550), and Jayavarman II and Jayavarman VII, monarchs of the Khmer Empire who ruled between the 10th and 13th centuries. Prince Norodom Sihanouk (b.1922), who resigned the kingship and won Kampuchea's independence from France, is the best-known living Cambodian. In exile in China during 1970–75, he founded the GRUNK government, from which he resigned in April 1976. In July 1982, he became president of the CGDK. Khieu Samphan (b.1931), a former Marxist publisher and leader of the insurgency in Kampuchea, was named chairman of the State Presidium in the GRUNK government in April 1976, replacing Sihanouk as chief of state. The de facto head of the GRUNK regime during 1975–79 was Pol Pot, the nom de guerre of Saloth Sar (1925–98), who presided over the drastic restructuring of Kampuchean society that left as many as 2–3 million dead in its wake. Heng Samrin (b.1934) became president of the Council of State of the PRK in 1979. Photographer Dith Pran (b. 1943), whose ordeal with the Khmer Rouge was portrayed in the film *The Killing Fields*, helped chronicle the atrocities of the Pol Pot regime.

#### 49 DEPENDENCIES

Cambodia has no territories or colonies.

# CHINA

People's Republic of China  
*Zhonghua Renmin Gongheguo*

**CAPITAL:** Beijing (Peking)

**FLAG:** The flag is red with five gold stars in the upper left quadrant; one large star is near the hoist and four smaller ones are arranged in an arc to the right.

**ANTHEM:** *March of the Volunteers.*

**MONETARY UNIT:** The renminbi, or “people’s money,” denominated in yuan (Y), is equivalent to 10 jiao or 100 fen. There are coins of 1, 2, and 5 fen, 1, 2, and 5 jiao, and 1 yuan, and notes of 1, 2, and 5 fen, 1, 2, and 5 jiao, and 1, 2, 5, 10, 50, and 100 yuan. Y1 = \$0.12097 (or \$1 = Y8.266) as of January 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but some Chinese units remain in common use.

**HOLIDAYS:** New Year’s Day, 1 January; Spring Festival (Chinese New Year), from the 1st to the 3d day of the first moon of the lunar calendar, usually in February; International Women’s Day, 8 March; May Day, 1 May; Army Day, 1 August; Teachers’ Day, 9 September; and National Day, 1–2 October.

**TIME:** 8 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

The People’s Republic of China (PRC), the third-largest country in the world after the former USSR and Canada and the largest nation in Asia, claims an area of 9,596,960 sq km (3,705,406 sq mi), including Taiwan, which the PRC claims as a province; the major administrative divisions, excluding Taiwan and the offshore islands, cover 9,444,292 sq km (3,646,448 sq mi). Comparatively, the area occupied by China is slightly larger than the United States. The mainland has an extension of 4,845 km (3,011 mi) ENE–WSW and 3,350 km (2,082 mi) SSE–NNW. The mainland’s 5,774 km (3,588 mi) coastline, extending from the mouth of the Yalu River in the northeast to the Gulf of Tonkin in the south, forms a great arc, with the Liaodong and Shandong peninsulas in the north protruding into the Yellow Sea and the Leizhou Peninsula in the south protruding into the South China Sea. China’s territory includes several large islands, the most important of which is Hainan, off the south coast. Other islands include the reefs and islands of the South China Sea, extending as far as 4° N. These reefs and islands include Dongsha (Pratas), to which Taiwan has also laid claim. China’s claims to the Xisha (Paracel) and Nansha (Spratly) archipelagoes are also in dispute. In 1986, the United Kingdom agreed to transfer Hong Kong to the PRC in 1997; in March 1987, the PRC and Portugal reached an agreement for the return of Macau to the PRC on 20 December 1999.

China is bordered on the N by Mongolia (Mongolian People’s Republic–MPR) and Russia; on the NE by the Democratic People’s Republic of Korea (DPRK); on the E by the Yellow and the East China seas; along the southern border are Hong Kong, Macau, the South China Sea, the Gulf of Tonkin, Vietnam, and Laos; on the SW by Myanmar, India, Bhutan, and Nepal; on the W by India, Jammu and Kashmir (disputed areas), Pakistan (west of the Karakoram Pass), and Afghanistan; and on the NW by Tajikistan, Kyrgyzstan, and Kazakhstan. China’s total boundary length, including the coastline (14,500 km/9,010 mi) is 36,647 km (22,771 mi). China’s capital city, Beijing, is located in the northeastern part of the country.

## <sup>2</sup>TOPOGRAPHY

China may be divided roughly into a lowland portion in the east, constituting about 20% of the total territory, and a larger section consisting of mountains and plateaus in the west. The principal lowlands are the Manchurian (Dongbei) Plain, drained by the Songhua (Sungari) River, a tributary of the Amur (Heilongjiang), and by the Liao River, which flows to the Yellow Sea; the North China Plain, traversed by the lower course of the Yellow (Huang He) River; the valley and delta of the Yangtze (Chang Jiang) River; and the delta of the Pearl (Zhu) River surrounding Guangzhou (Canton). West of these lowlands, the country’s topography rises to plateaus of 1,200–1,500 m (about 4,000–5,000 ft): the Shanxi and Shaanxi loess plateaus, in central China, and the Mongolian Plateau, in the north.

Beyond lie the high plateaus of Tibet, with an average elevation of 4,600 m (15,000 ft), and the great mountain ranges. The highest mountains are the Kunluns and the Himalayas. North of Tibet are two plateau basins of Central Asia, the Tarim and the Junggar, which are separated from each other by the Tian Mountains. The Chinese portion of the Tian range, which also extends into the former USSR, rises above 7,000 m (23,000 ft).

The great rivers of China flow eastward toward the Pacific. In the northeast, the Amur drains a great part of the Manchurian Basin as it winds along its 4,350 km (2,719 mi) course. Other northeastern rivers include the Liao, the Tumen, and the Yalu, the last two both rising in Mt. Paaktu, flowing respectively northeast and southwest, and forming the boundary between China and the DPRK. The main river of north China, and the second largest in the country, is the Yellow River (Huang He). From Gansu it winds about 4,671 km (2,903 mi) eastward to Shandong Province, where it empties into Bo Hai (Gulf of Zhili, or Chihli). The valley of the Yellow River covers an area of 1,554,000 sq km (600,000 mi).

Central China is drained mainly by the Yangtze and its tributaries. The largest river in China, the Yangtze travels 5,525 km (3,434 mi) and drains 1,808,500 sq km (698,300 sq mi) of land. As China’s only long river with no natural outlet, the

Huai River, flowing between the Yangtze and the Yellow and roughly parallel to them, is subject to frequent flooding. To the southwest are the upper courses of the Mekong (Lancang) and Brahmaputra (Yarlung Zangbo) rivers.

Northern China is in a major earthquake zone; on 28 July 1976, a tremor measuring 8.2 on the Richter scale struck the city of Tangshan (145 km/90 mi east of Beijing), causing widespread devastation and the deaths of over 650,000 people.

### 3 CLIMATE

Although most of China lies within the temperate zone, climate varies greatly with topography. Minimum winter temperatures range from  $-27^{\circ}\text{C}$  ( $-17^{\circ}\text{F}$ ) in northern Manchuria to  $-1^{\circ}\text{C}$  ( $30^{\circ}\text{F}$ ) in the North China Plain and southern Manchuria,  $4^{\circ}\text{C}$  ( $39^{\circ}\text{F}$ ) along the middle and lower valleys of the Yangtze, and  $16^{\circ}\text{C}$  ( $61^{\circ}\text{F}$ ) farther south. Although summer temperatures are more nearly uniform in southern and central China, with a July mean of about  $27^{\circ}\text{C}$  ( $81^{\circ}\text{F}$ ), northern China has a shorter hot period and the nights are much cooler.

Rain falls mostly in summer. Precipitation is heaviest in the south and southeast, with Guangzhou receiving more than 200 cm (80 in), and diminishes to about 60 cm (25 in) in north and northeast China, and to less than 10 cm (4 in) in the northwest. Approximately 31% of the total land area is classified as arid, 22% as semiarid, 15% as subhumid, and 32% as humid.

### 4 FLORA AND FAUNA

Much of China's natural vegetation has been replaced or altered by thousands of years of human settlement, but isolated areas still support one of the world's richest and most varied collections of plants and animals. Nearly every major plant found in the tropical and temperate zones of the northern hemisphere can be found there. In all, more than 7,000 species of woody plants have been recorded, of which there are 2,800 timber trees and over 300 species of gymnosperms. The rare ginkgo tree, cathaya tree, and metasequoia, long extinct elsewhere, can still be found growing in China. Among flowering plants, 650 of the 800 known varieties of azalea occur in China, while 390 of the 450 known varieties of primrose and about 230 of the 400 known varieties of gentian are also found there. The tree peony, which originated in Shandong Province, appears in 400 varieties.

The richest and most extensive needle-leaf forests occur in the Greater Hinggan ling (Khingan) Mountains of the northeast, where stands of larch, Asian white birch, and Scotch pine flourish, and in the Lesser Hinggan ling (Khingan) Mountains, with stands of Korean pine and Dahurian larch. In the Sichuan (Szechuan) Basin, vegetation changes with altitude to embrace a variety of conifers at high levels, deciduous trees and cypresses at middle elevations, and bamboo in lower elevations. Farther south, in subtropical Fujian and Zhejiang provinces, broadleaf evergreen forests predominate. Forests give way to natural grasslands and scrub in drier western and northwestern areas, especially in the semiarid regions of Shanxi and Shaanxi, in the steppes of Inner Mongolia, and along the desert margins of the Tarim and Junggar basins.

China's most celebrated wild animal is the giant panda, a rare mammal now found in the wild only in remote areas of Sichuan, Gansu, and Shanxi provinces; as of 1994, just over 500 wild pandas were still in their natural state. Other fauna unique to China include the golden-haired monkey, found in remote parts of Shaanxi, Gansu, Sichuan, Guizhou, and Yunnan; the northeast China tiger, found in the Lesser Hinggan ling and Changbai mountains along the Korean border; the Chinese river dolphin and Chinese alligator, both found along the middle and lower Yangtze River; the rare David's deer and the white-lipped deer, the latter found mainly in Qinghai Province and Tibet; a rare kind of white bear found in Hubei Province; and the lancelet, an ancient species of fish representing a transitional stage between

invertebrate and vertebrate development, now found only in Fujian Province. In addition, more than 1,000 species of birds have been recorded. Among the rarer kinds are the mandarin duck, the white-crowned long-tailed pheasant, golden pheasant, Derby's parakeet, yellow-backed sunbird, red-billed leiothrix, and red-crowned crane.

### 5 ENVIRONMENT

It is estimated that China has lost one-fifth of its agricultural land since 1957 due to economic development and soil erosion. Since 1973, China has taken significant steps to rectify some of the environmental damage caused by rampant use of wood for fuel, uncontrolled industrial pollution, and extensive conversion of forests, pastures, and grasslands to grain production during the Cultural Revolution. Reforestation, including construction of shelter belts, has emphasized restoration of the erosion-prone loesslands in the middle reaches of the Yellow River. In 1979, the Standing Committee of the Fifth National People's Congress adopted an Environmental Protection Law and a Forestry Law. In 1989, China began a nationwide program called the Great Green Wall of China which began to accelerate the rate of reforestation. In 1995, China had 133,323 ha of forest land.

Water supplies are limited—per capita consumption in China's cities is about 34 gallons a day, less than half that in many developing countries—and conservation, reclamation, and redistribution of water constitute major national priorities. Safe drinking water is unavailable to much of the population (as much as one-third, according to some estimates). By 1989, 436 of 532 rivers were polluted. In 1994, the World Health Organization reported that Chinese cities pollute water supplies more than those of any other country in the world. Legislation provides for the protection of aquatic resources, including water quality standards for farmland irrigation and fisheries. To alleviate water shortages in the heavily populated Beijing-Tranjin region, a massive water transfer project from the Yangtze River to the north by means of a dam, first proposed in the 1930s, has been seriously reconsidered in recent years. The project has aroused considerable controversy because hundreds of thousands of people would be uprooted, prime farmland flooded, many archaeological treasures submerged, and the ecology of the river area damaged.

The use of high-sulfur coal as a main energy source causes air pollution and contributes to acid rain. In the mid-1990s, China had the world's second highest level of industrial carbon dioxide emissions, totaling 2.67 billion metric tons per year, a per capita level of 2.27 metric tons per year. Investment in pollution-reducing technology is required of all industrial enterprises. Penalties are imposed for noncompliance, and incentives, in the form of tax reductions and higher allowable profits, are available for those enterprises that meet environmental standards. Beijing has implemented programs for controlling discharges of effluents, smoke and soot emissions, and noise pollution. Special success has been claimed for the recovery of oil from effluents of the Daqing oil field in Heilongjiang, refineries, and other oil-processing establishments; use of electrostatic precipitators and bag collectors by the cement and building industries; recovery of caustic soda and waste pulp from effluents of the pulp and paper industries; introduction of nonpolluting processes into the tanning and depilating of hides; use of nonmercuric batteries; recovery of fine ash from coal-burning power plants for use in the manufacture of bricks, tiles, cement, and road-surfacing materials; and development of new methodologies for recycling coal wastes and marine oil discharges.

To protect the nation's botanical and zoological resources, a program was adopted in 1980 to establish 300 new reserves, with a total area of 9.6 million ha (23.7 million acres). That goal was achieved by the end of 1985, one year ahead of schedule. The largest reserve, covering 800,000 ha (1,980,000 acres), is the

LOCATION: (not including islands south of Hainan): 18°9' to 53°34' N; 78°38' to 135°5' E. BOUNDARY LENGTHS: Afghanistan, 76 kilometers (47 miles); Bhutan 470 kilometers (292 miles); Myanmar 2,185 kilometers (1,358 miles); Hong Kong, 30 kilometers (19 miles); India 3,380 kilometers (2,100 miles); Kazakhstan 1,533 kilometers (953 miles); North Korea 1,416 kilometers (880 miles); Kyrgyzstan 858 kilometers (533 miles); Laos, 423 kilometers (263 miles); Macau, 0.34 kilometers (0.21 miles); Mongolia 4,673 kilometers (2,904 miles); Nepal, 1,236 kilometers (768 miles); Pakistan, 523 kilometers (325 miles); Russia (NE) 3,605 kilometers (2,240 miles); Russia (NW) 40 kilometers (25 miles); Tajikistan 414 kilometers (257 miles); Vietnam, 1,281 kilometers (796 miles); total coastline, 14,500 kilometers (9,009 miles). TERRITORIAL SEA LIMIT: 12 miles.

Changbai Mountain Nature Reserve, in the northeast. Others include the Wolong reserve in Sichuan Province, covering 200,000 ha (494,000 acres) and famous for its research on the giant panda; the Dinghu Mountain reserve in Guangdong Province, where a subtropical evergreen broadleaf monsoon forest that has remained virtually untouched for four centuries provides opportunities for ecological studies; and the Nangun River area in Yunnan Province, where the principal focus of protection is the tropical rain forest.

Endangered species in China include Elliot's pheasant, Cabot's tragopan, yarkand deer, Shansi sika deer, South China sika, North China sika, the Chinese alligator, the Amur leopard, Javan

rhinoceros, Thailand brow-antlered deer, the white-lipped deer, Bactrian camel, the giant panda, and the Siberian white crane.

In 2001, 75 species of mammals out of 400 were endangered along with 90 species of birds and 113 plant species. Trade in endangered species has been reported.

## 6 POPULATION

China is the most populous country in the world, accounting for 21% of the estimated world population. Until recently, it was also the only one to have attained the status of demographic billionaire, but India has also reached a one billion population. Government policy in the 1990s called for an extensive family planning program to limit population growth. The population of

China in 2003 was estimated by the United Nations at 1,289,697,000. According to the UN, the annual population growth rate for 2000–2005 is 0.73%, with the projected population for the year 2015 at 1,402,321,000. Approximately 7% of the population was over 65 years of age, with another 31% of the population under 15 years of age. There were 106 males for every 100 females in the country in 2003. The average population density in 2002 was 134 per sq km (347 per sq mi), but the distribution of the population throughout China is extremely uneven. The most densely populated areas near the coast have a population density of more than 400 people per sq km (1,036 per sq mi). The western plateaus are sparsely populated.

It was estimated by the Population Reference Bureau that 32% of the population lived in urban areas in 2001. The capital city, Beijing, had a population of 10,825,000 in that year. Government policy has sought to limit the growth of the large eastern cities, especially Beijing, Shanghai, and Tianjin, and to promote the growth of smaller cities away from the coast. China has over 60 metropolitan areas with populations greater than 750,000. The largest urban centers were Shanghai, 14,173,000; Beijing, 12,033,000; and Tianjin, 10,239,000. Other large metropolitan areas included Shenyang, 5,681,000; Guangzhou, 5,162,000; Harbin, 5,475,000; Chengdu, 5,293,000; Wuhan, 4,750,000; Hangzhou, 6,389,000; Changchun, 5,566,000; Chongqing, 3,896,000; Jinan, 4,789,000; Qingdao, 4,376,000; Xi'an, 3,352,000; and Dalian, 3,153,000. According to the United Nations, the urban population growth rate for 2000–2005 was 2.3%.

## 7 MIGRATION

The overseas migration of millions of Chinese reached its peak in the 1920s, when thousands of farmers and fishermen from the southeastern coastal provinces settled in other countries of Southeast Asia. Chinese constitute a majority in Singapore and Hong Kong, are an important ethnic group in Malaysia, and make up a significant minority in the Americas. In 1949, after the Communist victory, some two million civilians and 700,000 military personnel were evacuated to Taiwan.

Since in many places abroad the Chinese population has been growing at a rate faster than that of the local non-Chinese population, most countries have been trying to curtail the entrance of new Chinese immigrants. Emigration from China under the PRC government was once limited to refugees who reached Hong Kong, but is now denied only to a few political dissidents, if the state is reimbursed for postsecondary education costs. Immigration is for the most part limited to the return of overseas Chinese. At the end of 1999, the UNHCR reported 285,000 Vietnamese refugees in China, 91% of whom are of Chinese ancestry.

During the Cultural Revolution of the 1960s and 1970s, more than 60 million students, officials, peasant migrants, and unemployed were sent “down to the countryside” in a gigantic rustication movement. The goals of this program were to relocate industries and population away from vulnerable coastal areas, to provide human resources for agricultural production, to reclaim land in remote areas, to settle borderlands for economic and defense reasons, and, as has been the policy since the 1940s, to increase the proportion of Han Chinese in ethnic minority areas. Another purpose of this migration policy was to relieve urban shortages of food, housing, and services, and to reduce future urban population growth by removing large numbers of those between 16 and 30 years of age. Most relocated youths eventually returned to the cities, however.

Efforts to stimulate “decentralized urbanization” have characterized government policy since the late 1970s. Decentralized urbanization and the related relocation of industries away from established centers has also been promoted

as a way for China to absorb the increasing surplus labor of rural areas, estimated at 100 million for the year 2000.

On 1 July 1997, the sovereignty of Hong Kong reverted back to China. As of 1999, 1,562 ex-CPA refugees and screened-out non-refugees still remained in the Hong Kong Special Administrative Region (SAR). In 2000, the net migration rate for China was -0.3 migrants per 1,000 population. This amounted to a loss of approximately 381,000 people. In that same year there were 513,000 migrants living in China, including some 294,000 refugees. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

According to the latest estimates, the largest ethnic group, accounting for 91.9% of the total population, is the Han. The Han form a majority in most of the settled east and south but remain a minority, despite continuing immigration in the west.

The remaining 8.1% of the population is comprised of minority groups. Because of their predominance in strategically sensitive border areas, they hold a political and economic importance disproportionate to their numbers. The largest minority, at last estimate was the Zhuang, a Buddhist people, related to the Thai, who are primarily concentrated in Guangxi, Yunnan, and Guangdong. Other large minorities were the Manchu, concentrated in Heilongjiang, Jilin, and Liaoning; the Hui, a Chinese-speaking Muslim people concentrated in Ningxia, Gansu, Henan, and Hebei; the Uygur, a Muslim Turkic people of Xinjiang; the Yi, formerly called Lolo, a Buddhist people related to the Tibetans and concentrated in Yunnan, Sichuan, and Guizhou; the Miao, in Guizhou, Hunan, Yunnan, and Guangxi; and the Tibetans, concentrated in Xizang (Tibet), Qinghai, and Sichuan. Other minority nationalities, with estimated populations of more than one million, included the Mongolians; Tujia; Buyi; Koreans; Dong; Yao; Bai; Hani; Li; and the Kazaks, concentrated in Xinjiang, Gansu, and Qinghai.

The ethnic minorities have been exempt from nationally imposed birth limits; the 1990 census recorded an increase in the minority population of 24.7 million, or 37.1%, since 1982, compared with an increase of 10.9% among the majority Han during the same period. Two or more children per minority couple are generally allowed instead of the one-child norm promoted among the Han.

## 9 LANGUAGES

Chinese, a branch of the Sino-Tibetan linguistic family, is a monosyllabic tone language written by means of characters representing complete words. The Chinese script is not phonetic and remains constant throughout China, but the spoken language has regional phonetic differences. Spoken Chinese falls into two major groups, separated roughly by a northeast-southwest line running from the mouth of the Yangtze River to the border of Vietnam. North and west of this line are the so-called Mandarin dialects, based on the Beijing dialect and known as *putonghua* (“common language”). The most important dialect south of the linguistic divide is that of Shanghai, the Wu dialect spoken in the Yangtze River Delta. Hakka and Hokkien are dialects of the southeastern coastal province. Cantonese, the Yue dialect spoken in southern China, is the language of the majority of Chinese emigrants. Others include the Minbei or Fuzhou dialect, the Xiang, and Gan dialects. Mandarin Chinese was adopted as the official language of China in 1955.

To communicate in written Chinese, thousands of Chinese characters must be memorized. Since the establishment of the PRC in 1949, reform of the written language has been a major priority. A simplified system of writing, reducing the number of strokes per character, has been adopted, and the language restructured so that anyone familiar with the basic 2,000–3,000

characters is functionally literate (defined as being able to read a newspaper).

A number of systems have been developed to transcribe Chinese characters into the Latin alphabet. The principal romanization scheme was the Wade-Giles system until 1979, when the PRC government adopted Pinyin, a system under development in China since the mid-1950s. Inside China, Pinyin is used in the schools to facilitate the learning of Chinese characters, in minority areas where other languages are spoken, and on commercial and street signs. Pinyin has replaced the Wade-Giles system in all of China's English-language publications and for the spelling of place names. In general, pronunciation of Pinyin follows standard American English, except that among initial sounds, the sound of *q* is like the sound of *ch* as in *chart*, the sound of *x* like the sound of *sh* as in *ship*, and the sound of *zh* like the sound of *j* as in *judge*, and among final sounds, the sound of *e* is like the sound of *oo* as in *look*, the sound of *eng* like the sound of *ung* as in *lung*, the sound of *ui* like the sound of *ay* as in *way*, and the sound of *uai* like the sound of *wi* as in *wide*.

Of the 55 recognized minority peoples in China, only Hui and Manchus use Chinese as an everyday language. More than 20 minority nationalities have their own forms of writing for their own languages. Minority languages are used in all state institutions in minority areas and in all newspapers and books published there.

## 10 RELIGIONS

Three faiths—Confucianism, Buddhism, and Taoism—have long been established in China. The religious practice of the average Chinese traditionally has been an eclectic mixture of all three. Confucianism has no religious organization but consists of a code of ethics and philosophy; filial piety, benevolence, fidelity, and justice are among its principal virtues. Taoism, a native Chinese religion that evolved from a philosophy probably founded in the 6th century BC by Lao-tzu (Laozi), and Buddhism, imported from India during the Han dynasty, both have elaborate rituals. Tradition-minded Chinese base their philosophy of life on Confucianism, but such old habits of thought came under strong attack during the Cultural Revolution.

Suppression of religion and the introduction of programs of antireligious indoctrination began in 1949 and intensified, with the closure of temples, shrines, mosques, and churches, from the mid-1960s through the mid-1970s. Overt antireligious activity eased in 1976, and the government reactivated its Bureau of Religious Affairs. The Constitution of 1982 provides for freedom of belief and worship. According to 2002 estimates, Buddhists make up the largest body of organized religious believers, with more than 100 million followers, most of whom are from the dominant Han ethnic group.

Islam claims an estimated 20 million followers, or 2–3% of the population, nearly all are members of the ethnic minority nationalities; most belong to the Sunni branch, but the Tajiks are Shi'as. The tiny Jewish minority has virtually disappeared through emigration and assimilation. It is estimated that when the PRC was founded in 1949 there were up to three million Roman Catholics and 700,000 Protestants in China. As late as 1981, only small numbers of Christians were attending the approximately 80 Protestant and 40 Roman Catholic churches open in urban areas. By the mid-1990s, however, interest in religion was exploding and the number of Christians was increasing rapidly. The increase in the number of Christians has resulted in an increase in the demand for Bibles. In 1998 the government approved the printing of more than three million Bibles, and there are currently more than 18 million Bibles in print. Reports in 2002 indicated that the number of Christians had risen to about 5 million Catholics and 15 million Protestants.

Falun Gong (also known as Falun Dafa) is a combination of Taoism, Buddhism, meditation techniques, and the physical

exercises of quigong. Though spiritual in content, it is considered more of a general practice than a religion, since there are no clergy and no places of worship. The group has been considered a heretical cult by the Chinese government and reports indicate that thousands of adherents have been arrested and imprisoned since 1999. It is believed that several hundred have died while in detention.

## 11 TRANSPORTATION

Railways, roads, and inland waterways all play an important role in China's transportation system, which has undergone major growth since the 1940s. China's rail network forms the backbone of the transportation system. Chinese railways increased in length from 21,989 km (13,663 mi) in 1949 to 67,524 km (41,959 mi) in 2002, of which 13,362 km (8,303 mi) were electrified. In the rush to expand rail facilities during the "Great Leap Forward," the Chinese laid rails totaling 3,500 km (2,175 mi) in 1958; some 4,600 km (2,900 mi) were added in 1959. The construction pace slowed somewhat in the 1960s, but many major projects were completed in the 1970s, including double-tracking of major lines in the east; the electrification of lines in the west, including the 671 km (417 mi) Baoji-Chengdu link; and the addition of several new trunk lines and spurs, many providing service to the country's more remote areas. While the total rail network is more than twice what it was in 1949, the movement of freight is more than 25 times that of 1949. Increased freight volumes have been achieved by loading freight cars up to 20% over their rated capacity and by containerization. Shortages of freight and tank cars continue to delay deliveries of coal and other industrial raw materials to their destinations. In 1991, China invested \$8 billion for infrastructure improvements, including the upgrade of 309 km (192 mi) of double-track railway and the electrification of 849 km (528 mi) of track.

Road transportation has become increasingly important. Motor roads grew from about 400,000 km (249,000 mi) in 1958 to 550,000 km (342,000 mi) in 1964 and to 1.4 million km (869,960 mi) by 2002. About 271,300 km (168,586 mi) were paved, including 16,000 km (9,942 mi) of expressways. Major roads completed in the 1970s included the 2,413 km (1,499 mi) Sichuan-Tibet Highway, the 2,100 km (1,305 mi) Qinghai-Tibet Highway, and the 1,455 km (904 mi) Xinjiang-Tibet Highway. Between 1981 and 1985, 50,000 km (31,000 mi) of highways and more than 15,000 bridges were built. By 2000, an estimated 3,955,272 passenger automobiles used the highway system, up from 50,000 in 1949. In addition, there were some 11,894,272 commercial vehicles operating in the same year. Bicycles are the chief mode of transport in large cities; in Beijing, there are an estimated eight million bicycles, accounting for 83.5% of the city's road traffic.

Navigable inland waterways reached a peak of 161,900 km (100,600 mi) in 1962 and decreased to 110,000 km (68,354 mi) in 2001. About 25% of the waterways are navigable by modern vessels; wooden junks are used on the remainder. The principal inland waterway is the Yangtze River; much work was done in the early 1980s to dredge and deepen the river, to improve navigational markers and channels, and to eliminate the treacherous rapids of the Three Gorges section east of Yibin. Steamboats can now travel inland throughout the year from Shanghai, at the river's mouth, upstream as far as Yibin; 10,000-ton oceangoing vessels can travel inland as far as Wuhan in the high-water season and Nanjing in the low-water season. Major ports on the river include Chongqing, the principal transportation hub for the southwest; Wuhan, its freight dominated by shipments of coal, iron, and steel; Wuhu, a rice-exporting center; Yuxikou, across the river from Wuhu and the chief outlet for the region's coal fields; Nanjing; and Shanghai. The Pearl River is navigable via a tributary as far as Nanning. The ancient Grand Canal, rendered impassable by deposits of silt

for more than 100 years, has been dredged and rebuilt; it is navigable for about 1,100 km (680 mi) in season and 400 km (250 mi) year-round.

China's merchant fleet expanded from 402,000 GRT in 1960 to over 10,278,000 GRT in 1986, and to 16,915,3047 GRT in 2002. China's 1,764 merchant ships of 1,000 GRT or over can accommodate most of the country's foreign trade; the balance is divided among ships leased from Hong Kong owners and from other foreign sources. The principal ports are Tianjin, the port for Beijing, which consists of the three harbors of Neigang, Tanggu, and Xingang; Shanghai, with docks along the Huangpu River channel; Lüda, the chief outlet for the northeast and the Daqing oil field; and Huangpu, the port for Guangzhou, on the right bank of the Pearl River. Other important ports include Qinhuangdao; Qingdao; Ningbo, the port for Hangzhou; Fuzhou; Xiamen; and Zhanjiang.

The Civil Aviation Administration of China (CAAC) operates all domestic and international air services. Operations have grown significantly with the purchase, since the 1970s, of jet aircraft from the United States, United Kingdom, and other Western sources. In 2001 there were 489 airports, of which 324 had paved runways. Principal airports include Capital at Beijing, Shuangliu at Chengdu, Hongqiao at Shanghai, Baiyun at Guangzhou, Wujiaba at Kunming, and Gaoqi at Xiamen. From Beijing there are scheduled daily flights to Shanghai, Guangzhou, Kunming, Chengdu, Shenyang, Changchun, Changsha, Wuhan, Zengzhou, and Harbin. The total scheduled international and domestic service performed in 2001 included 4,232 million freight ton-km (2,630 million freight ton-mi), as well as 72,660,704 passengers carried.

## 12 HISTORY

Fossils attest to hominid habitation in China more than 500,000 years ago, and Paleolithic cultures appeared in the southwest by 30,000 BC. Neolithic peoples appeared before 7000 BC; by 3000 bc there were millet-growing settlements along the Yellow River. The original home of the Chinese (Han) people is probably the area of the Wei, Luo (Lo), and middle Yellow rivers. According to tradition, the Xia (Hsia) dynasty (c.2200–c.1766 BC) constituted the first Chinese state. Its successor, the Shang, or Yin, dynasty (c.1766–c.1122 BC), which ruled over the valley of the Yellow River, left written records cast in bronze or inscribed on tortoiseshell and bone. The Shang was probably conquered by the Western Zhou (Chou) dynasty (c.1122–771 BC), which ruled a prosperous feudal agricultural society. Fleeing foreign attack in 771 BC, the Western Zhou abandoned its capital near the site of Xi'an and established a new capital farther east at Luoyang (Loyang). The new state, known as the Eastern Zhou dynasty (771–256 BC), produced the great Chinese philosophers including Confucius (K'ung Fu-tzu or Kong Fuzi) and the semi-historical figure, Lao Tzu (Lao Zi). Between 475 and 221 BC, the Qin (Ch'in) dynasty (221–207 BC) gradually emerged from among warring, regional states to unify China. Shi Huangdi (Shih Huang Ti, r.221–210 BC), the first Qin emperor (the outer edges of whose tomb, opened in the 1970s, were discovered to contain stunningly lifelike terra-cotta armies), ended the feudal states and organized China into a system of prefectures and counties under central control. For defense against nomadic proto-Mongolian tribes, Shi Huangdi connected walls of the feudal states to form what was later to become known as the Great Wall. By this time, the Yellow River had an irrigation system, and cultivation had begun in the Yangtze Valley; at the end of Shi Huangdi's reign, China probably had close to 40 million people. During the period of the Han dynasties (206 BC–AD 8, AD 25–220), China expanded westward, nomadic tribes from the Mongolian plateau were repelled, and contacts were made with Central Asia, the West, and even Rome. The Han saw the invention of paper. Under the later Han, Buddhism was introduced into China. After the Han

period, the Three Kingdoms (Wei, Shu, and Wu) contended for power, and nomadic tribes from the north and west raided northern China. From the 4th century ad on, a series of northern dynasties was set up by the invaders, while several southern dynasties succeeded one another in the Yangtze Valley, with their capital at Nanjing (Nanking). Buddhism flourished during this period, and the arts and sciences were developed. The empire was reunited by the Sui (589–618) dynasty, which built the Grand Canal, linking the militarily strategic north with the economic wealth of the south and laying the basis for the Tang (T'ang, 618–907) dynasty.

Under the early Tang, especially under Emperor Taizong (T'ai-tung, r.627–49), China became powerful. The bureaucratic system, begun by the Han, was further developed, including the regular use of an examination system to recruit officials on the basis of merit. Handicrafts and commerce flourished, a system of roads radiated from the capital (at the site of Xi'an), successful wars were fought in Central Asia, and China became the cultural and economic center of Asia. Poetry and painting flourished, particularly under Emperor Xuan-Zong (Hsüan-tung, r.712–56). Civil wars and rebellion in the late Tang led to a period of partition under the Five Dynasties (r.907–60) which was followed by the Northern and Southern Song (Song) dynasties (960–1127, 1127–1279), distinguished for literature, philosophy, the invention of movable type, the use of gunpowder in weapons, and the improvement of the magnetic compass. However, Mongol and Tatar tribes in the north forced the Song to abandon its capital at Kaifeng in 1126 and move it to Hangzhou (Hangchow). In 1279, Kublai Khan (r.1279–94) led the Mongols to bring all of China under their control and became the first ruler of the Mongols' Yuan dynasty (1279–1368). The Mongols encouraged commerce and increased the use of paper money. The Grand Canal was reconstructed, and a system of relay stations ensured safe travel. Many European missionaries and merchants, notably Marco Polo, came to the Mongol court.

After a long period of peasant rebellion, Mongol rule was succeeded by the native Chinese Ming dynasty (1368–1644). The famous Ming admiral, Zheng He (Cheng Ho, 1371–1433) led seven naval expeditions into the South China Sea and the Indian Ocean between 1405 and 1433, reaching as far as the east coast of Africa. The Portuguese reached China in 1516, the Spanish in 1557, the Dutch in 1606, and the English in 1637. The Ming dynasty was overthrown by the Manchus, invaders from the northeast, who established the last imperial dynasty, the Qing (Ch'ing or Manchu, 1644–1911). The first century and a half of Manchu rule was a period of stability and expansion of power, with outstanding reigns by Kang xi (K'ang-hsi, 1662–1722) and Qian long (Ch'ien-lung, 1736–96). Although the Manchus ruled as conquerors, they adopted indigenous Chinese culture, administrative machinery, and laws. Under Manchu rule, Chinese territories included Manchuria, Mongolia, Tibet, Taiwan, and the Central Asian regions of Turkestan. The population of over 300 million by 1750 grew to over 400 million a century later.

By the close of the 18th century, only one port, Guangzhou (Canton), was open to merchants from abroad, and trade was greatly restricted. Demands by the British for increased trade, coupled with Chinese prohibition of opium imports from British India, led to the Opium War (1839–42), which China lost. By the Treaty of Nanjing (1842), the ports of Guangzhou, Xiamen (Amoy), Fuzhou (Foochow), Ningbo, and Shanghai were opened, and Hong Kong Island was ceded to Britain. The Taiping Rebellion (1850–64), nearly overthrew the Manchus and cost 30 million lives. A second war (1856–60) with Britain, joined by France, resulted in the opening of Tianjin (Tientsin) to foreign trade. The West's interest then turned from trade to territory. Russia acquired its Far Eastern territories from China in 1860. China's defeat in the Sino-French War (1884–85), in which it came to the defense of its tributary, Vietnam, resulted in the

establishment of French Indo-China. In the First Sino-Japanese War (1894–95), Japan obtained Taiwan, the opening of additional ports, and the independence of Korea (which Japan subsequently annexed in 1910). This was a major turning point and led to the “scramble for concessions.” In 1898, Britain leased Weihai in Shandong and the New Territories (for 99 years) of Hong Kong, Germany leased part of Shandong, Russia leased Port Arthur at the tip of Liaodong Peninsula, and France leased land around Guangzhou Bay in the south. The Boxer Rebellion, an uprising in 1899–1901 by a secret society seeking to expel all foreigners and supported by the Manchu court, was crushed by the intervention of British, French, German, American, Russian, and Japanese troops.

A revolution that finally overthrew Manchu rule began in 1911 in the context of a protest against a government scheme that would have handed Chinese-owned railways to foreign interests. City after city repudiated the Manchus, and in February 1912, the dowager empress, Ci Xi (Tz’u Hsi), signed an abdication document for the infant emperor, Puyi (P’u-yi). The Chinese republic, ruled briefly by Sun Zhongshan (Sun Yat-sen), followed by Yuan Shikai (Yuán Shih-kai), entered upon a period of internal strife. Following Yuan’s death in 1916, the Beijing regime passed into the hands of warlords. The Beijing regime joined World War I on the Allied side in 1917. In 1919, the Versailles Peace Conference gave Germany’s possessions in Shandong to Japan, sparking the May Fourth Movement as student protests grew into nationwide demonstrations supported by merchants and workers. This marked a new politicization of many social groups, especially those intellectuals who had been emphasizing iconoclastic cultural change.

Meanwhile, civil war grew more intense. In the south, at Guangzhou, the Nationalists (Guomindang, Kuomintang) led by Sun Zhongshan in alliance with the Communists (whose party was founded in Shanghai in 1921) and supported by Russia, built a strong, disciplined party. After Sun Zhongshan’s death in 1925, his successor, Chiang Kai-shek (Jiang Jieshi), unified the country under Nationalist rule in 1928 with the capital in Nanjing. In 1927, the Nationalists began a bloody purge of the Communists, who sought refuge in southern Jiangxi Province. Their ranks severely depleted by Nationalist attacks, the Communists embarked on their arduous and now historic Long March during 1934–35. The Communists eventually reached Shaanxi Province in northwestern China, where, under the leadership of Mao Zedong (Tse-tung), they set up headquarters at Yan’an (Yenan). Japan, taking advantage of Chinese dissension, occupied Manchuria (Dongbei) in 1931.

Increasing Japanese pressure against northern China led, in July 1937, to the second Sino-Japanese war, which continued into World War II and saw Japanese forces occupy most of China’s major economic areas. Nationalist China, established in the southwestern hinterland with its capital at Chongqing, resisted with US and UK aid, while the Communists fought the Japanese in the northwest. Japan evacuated China in 1945, and both Communist and Nationalist forces moved into liberated areas. The rift between the two factions erupted into civil war. Although supported by the United States, whose mediation efforts had failed, the Nationalists steadily lost ground through 1948 and 1949, were expelled from the mainland by early 1950, and took refuge on Taiwan.

### The People’s Republic

The Communists, under the leadership of Mao, as chairman of the Chinese Communist Party (CCP), proclaimed the People’s Republic of China (PRC) on 1 October 1949, with the capital at Beijing. A year later, China entered the Korean War (1950–53) on the side of the Democratic People’s Republic of Korea (DPRK). In the fall of 1950, China entered Tibet, which had asserted its independence after the overthrow of the Manchu dynasty, despite

formal claims to it by all subsequent Chinese governments. In 1959, the Dalai Lama fled to India during a Tibetan revolt against Chinese rule. Tibet became an autonomous region in 1965. The Nationalists held, in addition to Taiwan, islands in the Taiwan (Formosa) Strait: the Pescadores, Quemoy (near Xiamen), and the Matsu Islands (near Fuzhou).

In domestic affairs, a rapid program of industrialization and socialization up to 1957 was followed in 1958–59 by the Great Leap Forward, a crash program for drastic increases in output and the development of completely collectivized agricultural communes. The program ended in the “three bad years” of famine and economic crisis (1959–61), which produced 20 million deaths above the normal death rate, followed by a period of restoration and retrenchment in economics and politics. In the early 1960s, Chinese troops intermittently fought with Indian border patrols over conflicting territorial claims in Ladakh and the northeastern Indian state of Assam. Mediation attempts failed, but in 1963, the Chinese withdrew from the contested areas that they had occupied, and war prisoners were repatriated. Meanwhile, growing discord between China and the former Soviet Union had become more open, and in 1960, the USSR withdrew its scientific and technical advisers from China. Public polemics sharpened in intensity in the succeeding years, as the two powers competed for support in the world Communist movement.

After the Chinese economy had recovered in 1965, Mao again steered the country onto the revolutionary path, and gradually he built up momentum for the Great Proletarian Cultural Revolution, one of the most dramatic and convulsive periods in modern Chinese history. It continued until Mao’s death in 1976, but the most tumultuous years were from 1966 to 1969, during which the cities witnessed a chaotic and violent pattern of factional fighting, accompanied by attacks on bureaucrats, intellectuals, scientists and technicians, and anyone known to have overseas connections.

Increasing confrontation between Mao and the party establishment, beginning in the fall of 1965, culminated in August 1966 with the CCP Central Committee’s “16-Point Decision” endorsing Mao’s Cultural Revolution policy of criticizing revisionism. In response to Mao’s initiative, high levels of urban protest demonstrated widespread dissatisfaction with bureaucracies and privilege. In the latter half of 1966, the Red Guard movement of radical students attacked educational and state authorities and split into competing factions. Amid the rising conflict, the party institution collapsed in major cities. Liu Shaoqi, second to Mao in the political hierarchy and Chairperson of the People’s Republic, was ousted from power as the chief target of the Cultural Revolution. In 1968, Liu was formally dismissed from all positions and expelled from the party. He died at the end of 1969. From January 1967 through mid-1968, the discredited political establishment was replaced by Revolutionary Committees, comprised of the new radical organizations, the officials who remained in power, and representatives of the army. Finally, the army was told to restore order. In 1968 and 1969, students were sent out of the cities into the countryside. Colleges did not reopen until 1970. At the Ninth Party Congress in April 1969, the military’s role was confirmed when Lin Biao, the Minister of Defense, was named Mao’s successor.

Estimates place the number of dead as a direct result of the Cultural Revolution from 1966 to 1969 at 400,000. Much of the countryside, however, was unaffected and the economy, despite a setback in 1968, suffered little. The remaining years of the Cultural Revolution decade, up to 1976, were marked by a legacy of struggles over policies and over political succession to the aging Mao (83 at his death in 1976). In September 1971, Lin Biao died in a plane crash, allegedly while fleeing to the former USSR following an abortive coup. The decade from 1966 to 1976

left persistent factionalism in Chinese politics and a crisis of confidence, particularly among the young.

These years of domestic upheaval also brought profound changes in international alignments. In 1969, Chinese and Soviet forces clashed briefly along the Amur River frontier of eastern Heilongjiang Province. Throughout the late 1960s and early 1970s, China played a major role in supporting the Democratic Republic of Vietnam (North Vietnam) in the Vietnamese conflict. In November 1971, the PRC government replaced Taiwan's Nationalist government as China's representative at the UN and on the Security Council, following a General Assembly vote of 76–35, with 17 abstentions, on 25 October. Following two preliminary visits by US secretary of state Henry Kissinger, President Richard M. Nixon journeyed to China on 21 February 1972 for an unprecedented state visit, and the two countries took major steps toward normalization of relations as the two nations sought common ground in their mutual distrust of Soviet intentions. In the period following the Nixon visit, US-China trade accelerated, and cultural exchanges were arranged. In May 1973, the two countries established liaison offices in each other's capital and full diplomatic relations were established by 1979.

In 1975 at the Fourth National People's Congress, Zhou Enlai (Chou En-lai) announced a reordering of economic and social priorities to achieve the Four Modernizations (of agriculture, industry, national defense, and science and technology). Factional strife reminiscent of the late 1960s emerged between radical party elements led by Mao's wife, Jiang Qing (Chiang Ch'ing), and three associates (later collectively dubbed the Gang of Four), who opposed the modernization plans, and veteran party officials, such as Deng Xiaoping (previously associated with Liu Shaoqi and restored to power in 1973), who favored them. When Zhou died on 8 January 1976, the radicals moved to block the appointment of Deng (Zhou's heir apparent) as premier, with Mao resolving the impasse by appointing Hua Guofeng, a veteran party official and government administrator, as acting premier. Attacks on Deng continued until he was blamed for spontaneous disorders at a Beijing demonstration honoring Zhou on the Festival of the Dead, 5 April 1976 and, for the second time in his career, Deng was removed from all official positions.

### After Mao

When Mao Zedong died on 9 September 1976, Hua Guofeng was quickly confirmed as party chairman and premier. A month later, the Gang of Four was arrested, and in early 1977, the banished Deng Xiaoping was again "reinstated." By 1978, Deng Xiaoping had consolidated his political dominance, and a new era of economic reforms began. The Third Party Plenum and the Fifth National People's Congress in 1978 adopted a new constitution and confirmed the goals of the Four Modernizations. Another new constitution in 1982 again confirmed policies of economic reform and emphasized legal procedure. The Cultural Revolution was officially condemned and Mao's historical role reevaluated. After a show trial from November 1980 to January 1981, the Gang of Four, together with Mao's former secretary and five others associated with Lin Biao, were convicted of crimes of the Cultural Revolution. Jiang Qing, whose death sentence was commuted to life imprisonment, committed suicide in 1991 after being diagnosed with cancer.

In 1980, Zhao Ziyang, a protégé of Deng Xiaoping, replaced Hua Guofeng as premier, and Hu Yaobang, another Deng protégé, became general secretary of the CCP while Hua resigned as party chairperson (a position which was abolished) in 1981. The 1980s saw a gradual process of economic reforms, beginning in the countryside with the introduction of the household responsibility system to replace collective farming. As the rural standard of living rose, reforms of the more complex urban economy began in the mid-1980s in an attempt to use the economic levers of the market instead of a command system of

central planning to guide the economy. These included, with varying degrees of success, reforms of the rationing and price system, wage reforms, devolution of controls of state enterprises, legalization of private enterprises, creation of a labor market and stock markets, the writing of a code of civil law, and banking and tax reforms. At the same time, the Chinese pursued a policy of opening toward the outside world, establishing Special Economic Zones, and encouraging joint ventures and foreign investment.

In the 1980s and 1990s, China attempted to settle its relations with neighboring states. After a border clash with Vietnam in 1979, there were agreements with Great Britain in 1984 for the return of Macau, a Portuguese colony since the 16th century, in 1999. In May 1989, Soviet President Mikhail Gorbachev visited Beijing in the first Sino-Soviet summit since 1959. Top Vietnamese leaders came to China in 1991, normalizing relations between the two countries after a gap of 11 years. In the early 1990s, China and South Korea established regular relations.

Until 1989, economic reforms were accompanied by relatively greater openness in intellectual spheres. A series of social and political movements spanning the decade from 1979 to 1989 were critical of the reforms and reacted to their effects. In the Democracy Wall movement in Beijing in the winter of 1978–79, figures like Wei Jingsheng (imprisoned from 1979 to 1994 and subsequently reimprisoned) called for democracy as a necessary "fifth modernization." A student demonstration in Beijing in the fall of 1985 was followed in the winter of 1986–87 with a larger student movement with demonstrations of up to 50,000 in Shanghai, Beijing, and Nanjing, in support of greater democracy and freedom. In June 1987, blamed for allowing the demonstrations, Hu Yaobang was dismissed as party General Secretary, and several important intellectuals, including the astrophysicist Fang Lizhi and the journalist Liu Binyan, were expelled from the party. At the 15th Party congress of November 1987, many hard-line radicals failed to retain their positions, but Zhao Ziyang, who was confirmed as General Secretary to replace Hu, had to give up his position as Premier to Li Peng. By the end of 1988, economic problems, including inflation of up to 35% in major cities, led to major disagreements within the government, resulting in a slowdown of reforms. In December 1988, student disaffection and nationalism were expressed in a demonstration against African students in Nanjing.

On 15 April 1989, Hu Yaobang died of a heart attack. Students in Beijing, who had been planning to commemorate the 70th anniversary of the May Fourth Movement, responded with a demonstration, ostensibly in mourning for Hu, demanding a more democratic government and a freer press. Student marches continued and spread to other major cities. The urban population, unhappy with high inflation and the extent of corruption, largely supported the students and, by 17 May, Beijing demonstrations reached the size of one million people, including journalists, other salaried workers, private entrepreneurs and a tiny independent workers' organization, as well as students. On 19 May, martial law was imposed to no effect, and the government attempted to send troops to clear Beijing's Tiananmen Square, where demonstrators were camped, on 19–20 May and 3 June. Finally, in the early hours of 4 June 1989, armed troops, armored personnel carriers, and tanks, firing on demonstrators and bystanders, managed to reach the Square. Firing continued in the city for several days, and estimates of the total number killed range from 200 to 3,000. The events of 4 June sparked protests across the country, and thousands were arrested as the movement was suppressed. On 24 June, Zhao Ziyang was dismissed as General Secretary and Jiang Zemin, the mayor of Shanghai, was named in his place.

Parallel to but separate from the student movements were ongoing demonstrations by ethnic minorities. The most visible were those of the Tibetans, due to their international connections, but there have also been protests by other minorities, such as

Muslims in Xinjiang province. Violent Tibetan demonstrations in the fall of 1987 and spring of 1988 were forcibly suppressed, and from March 1989 to April 1990, martial law was imposed in Lhasa, Tibet.

Following 4 June 1989, economic reforms were curtailed and some private enterprises closed down as the leadership launched an anticorruption drive. Ideological expression, higher education, and the news media were more tightly controlled in the ensuing years. The move toward a market-oriented economy began again, with increased speed, after Deng Xiaoping made a publicized visit in the spring of 1992 to the most developed areas in southern China. China's economy became one of the most rapidly growing in the world but continued to be plagued by inflation, corruption, and a growing disparity among the provinces. With a high rate of tax evasion, state revenues were shrinking and one-third went to subsidize state enterprises. Having been at the forefront of change in the early 1980s, peasants in the early 1990s were being left behind. In 1993 and 1994, there were peasant protests and riots over receiving IOUs for their produce and over local corruption. There were workers' disputes and strikes (250,000 between 1988 and 1993) in response to low pay and poor working conditions.

Labor unrest continued into 1997 as thousands of workers in several impoverished inland provinces rioted when promises of back pay went unfulfilled. A March 1997 labor protest involving 20,000 workers in Nanchong was the largest since the Communist revolution.

China's uneven economic development also led to the growth of a migrant worker class. By 1996, it was estimated that some 100 million peasants left their homes in northern and western provinces in search of menial work along the coast.

Unrest also flared anew in Tibet and other border provinces. A Muslim uprising in Xinjiang, near Kazakhstan, was met with force by the Chinese military in February 1997, leaving an estimated 100 ethnic Uygur and 25 Chinese dead. But the situation in Tibet posed the most difficulty for Beijing. China's efforts to control Tibet and dilute its culture led in 1995 to the indefinite detention of the six-year-old boy chosen by the exiled Dalai Lama as his reincarnation, or Panchen Lama. Beijing selected another six-year-old and forced Tibetan leaders to accept him.

In September 1997, the CCP's 15th National Congress elected a Central Committee, which selected the 22-member Politburo. Jiang Zemin became the General Secretary of the party in addition to his title of President. Li Peng was appointed Prime Minister, and Zhu Rongji, Deputy Prime Minister. During this Congress, political power was consolidated in the triumvirate, with Jiang Zemin officially taking the deceased Deng Xiaoping's position.

As the government prepared for the 50th Anniversary of the proclamation of the People's Republic of China, it witnessed the return of Hong Kong (1 July 1997) and Macau (20 December 1999). Both former colonies were designated Special Administrative Regions (SAR) and Jiang stated that each SAR would continue to operate with considerable degree of economic autonomy.

Also in 1999, Chinese nationalism increased with the US bombings of the Chinese Embassy in Belgrade, Yugoslavia in May as an outpouring of government sanctioned anti-American demonstrations took place in Beijing. Despite rising nationalism, the political leadership felt threatened by a small but rapidly growing religious sect, the Falun Gong. On 22 July 1999, Chinese authorities banned the sect and arrested its leaders despite international human rights watch groups' criticism. The country celebrated its 50th anniversary on 1 October 1999 with a 500,000-person military parade showcasing its new technological achievements in armaments.

In February and March 1996, China test-fired missiles near Taiwan's two main ports, which caused the United States to send

two aircraft carrier groups to the Taiwan Strait. It was the largest US naval movement in the Asia-Pacific region since the Vietnam War. The missile firings and accompanying military exercises were considered to be responses to Taiwan's presidential elections of March 1996, which President Lee Teng-hui, whom China accused of supporting Taiwanese independence, won.

In the run-up to Taiwanese presidential elections in March 2000, Chen Shui-bian of the Democratic Progressive Party, the eventual winner, issued pro-independence campaign speeches advocating "one country on each side", contradicting China's "one-country, two systems" policy. In March 2000, Zhu Rongji, the Deputy Prime Minister, warned Taiwan and the United States that Taiwanese independence could lead to armed conflict. A Chinese newspaper also quoted a government white paper stating that war with the United States is inevitable in the future and that if the United States intervened on behalf of Taiwan, the Chinese may use nuclear weapons. Meanwhile, China began construction of military bases on the mainland across the Taiwan Strait. In 1996, China had fewer than 50 short-range missiles within striking distance of Taiwan. As of April 2002, it was estimated that China's military forces had more than 350 missiles in the region.

On 1 April 2001, a US Navy EP-3 reconnaissance aircraft survived a mid-air collision with a Chinese F-8 fighter jet over the South China Sea. The Chinese fighter pilot was lost. The EP-3 conducted an emergency landing on Hainan Island, and the 24-member crew was detained there for 11 days in a standoff between the two countries. The United States and China blamed each other's aircraft for the crash. The EP-3 was later disassembled for transport back to the United States.

China expressed deep sympathy to the United States following the 11 September 2001 terrorist attacks on the World Trade Center in New York and the Pentagon in Washington, D.C. It has backed the American-led war on terrorism, and cited its own problems with what it considers to be terrorist activities led by ethnic Uighurs fighting for an independent homeland in the northwest Xinjiang province. As of March 2002, China had detained thousands of Uighurs since 11 September 2001.

On 11 December 2001, China formally became a member of the World Trade Organization, representing international recognition of China's growing economic power. Several non-governmental organizations and individuals world-wide protested China's accession to the body, due to its record on human rights violations.

In November 2002, China and the ten members of ASEAN signed an accord to resolve any conflicts over the Spratly Islands without armed force. The Spratlys are claimed by China, Taiwan, Brunei, Malaysia, the Philippines and Vietnam, and are home to some of the world's busiest shipping lanes; they are also believed to be rich in oil and natural gas. Signatories to the accord agreed to cease further occupation of the islands, to help anyone in distress in the area, to exchange views with one another on defense issues, and to give advance warning of military exercises.

At the 16th Communist Party Congress held 8–14 November 2002, what is considered to be a "fourth generation" of Chinese leaders emerged, led by Hu Jintao, Jiang Zemin's replacement as Communist Party General Secretary. In addition to Hu, the other eight members of the 9-member Politburo Standing Committee were new appointees. Jiang Zemin retained the position of head of the party's Central Military Commission, and was to keep the office of President until March 2003. China voted in favor of UN Security Council Resolution 1441 on 8 November 2002, which required Iraq to immediately disarm itself of weapons of mass destruction (chemical, biological, and nuclear weapons), to allow UN and International Atomic Energy Agency (IAEA) arms inspectors into the country, and to comply with previous UN resolutions regarding Iraq. The final text of the resolution included modifications in the original wording which had

concerned China, along with France and Russia, whose representatives said the wording might be used by the United States as a “hidden trigger” for an attack on Iraq.

Leading pro-democracy activist Xu Wenli, jailed since 1998 on charges of endangering state security, was released from a 13-year prison sentence on 24 December 2002, and was flown to the United States for medical treatment. Xu was arrested for attempting to establish the opposition China Democracy Party with other activists.

### 13 GOVERNMENT

On 4 December 1982, China adopted its fourth constitution since 1949, succeeding those of 1954, 1975, and 1978. In theory, the highest organ of state power is the National People’s Congress (NPC), in which legislative power is vested. The constitution stipulates, however, that the congress is to function under the direction of the Chinese Communist Party. The NPC meets annually for about two weeks to review major new policy directions, to adopt new laws, and to approve the national budget submitted to it by the State Council. Each congress consists of more than 3,000 deputies elected indirectly for a term of five years. The NPC elects a standing committee as its permanent working organ between sessions. The State Council, the executive organ of the NPC, consists of a premier (the head of government), five vice-premiers, ministers, and heads of other major government agencies. The State Council issues administrative regulations and both formulates and executes the economic plan and the state budget. The 1982 constitution restored the largely ceremonial post of state chairman, or president, a position abolished by Mao Zedong in 1968. The eighth National People’s Congress, in March 1993, elected Jiang Zemin as president and reelected Li Peng, first elected in 1988, to a second five-year term as premier. At the ninth National People’s Congress in March 1998, Li Peng was elected chairman of the NPC standing committee, and Zhu Rongji became premier. Since the 1980s, the NPC has slowly increased its function as a locus for discussion of issues instead of merely being a rubber stamp. The 1992 debate on the Yangtze River (Chang Jiang) dam project is an example of this.

The death of Communist Party patriarch Deng Xiaoping in February 1997 brought to a head the infighting between Jiang Zemin, Li Peng, and Zhu Rongji. At the 15th party congress, Jiang was chosen to succeed Deng Xiaoping. The political leadership settled into one of shared leadership. At the 16th party congress held in November 2002, Jiang Zemin, Li Peng and Zhu Rongji resigned their posts in the Politburo standing committee, and the three were expected to give up their positions as president, chairman of the NPC standing committee, and premier, respectively, at the 10th NPC to be held in March 2003.

### 14 POLITICAL PARTIES

The Chinese Communist Party (CCP) has been the ruling political organization in China since 1949. Eight other minor parties have existed, since 1949, as members of a United Front, but their existence has been purely nominal. The party, with 55 million members (1999 estimate), plays a decisive role in formulating broad and detailed government policies and supervising their implementation at all levels of administration. Party supervision is maintained not only through placement of CCP members in key government posts, but also through specialized organs of the central committee of the CCP, which focus their attention on given subjects (e.g., propaganda or rural work). The CCP also forms branches within individual government units, as well as in factories, communes, schools, shops, neighborhoods, and military units.

Theoretically, the highest organ of party power is the National Party Congress, which usually meets once every five years. At each party congress a central committee is elected to oversee

party affairs between sessions. The central committee (356 members elected in 2002—198 full members and 158 alternate members) meets annually in plenary session to elect a political bureau, or Politburo (with 24 members as of 2002), and its standing committee, the party’s most powerful organ (9 members in 2002). Directing day-to-day party affairs at the highest level is the secretariat, headed by Hu Jintao as general secretary since November 2002. In 1982, the post of party chairman, formerly the most powerful in the nation, was abolished; the title had been held by Mao Zedong until his death in 1976, by Hua Guofeng from 1976 until his ouster in 1981, and by Hu Yaobang thereafter.

Deng Xiaoping, China’s acknowledged political leader since 1977, retired from the central committee in 1987, retired as chairperson of the party’s central military commission in 1989, and retired as chairperson of the state’s central military commission, his last formal position, in 1990. A new CCP charter adopted at the 12th Communist Party congress in September 1982 forbids “all forms of personality cult” and, in an implicit criticism of Mao, decrees that “no leaders are allowed to practice arbitrary individual rule or place themselves above the party organization.” A major purge of party members in the early 1980s sought to exclude elements opposed to Deng’s modernization policies. A re-registration program applicable to all party members, about half of whom were believed to have joined during the Cultural Revolution, was announced in 1983. The 13th party congress, convened in October 1987, affirmed Deng’s reform policies and the drive for a younger leadership.

In the wake of the June Fourth massacre in 1989, Deng Xiaoping declared that Jiang Zemin, former mayor of Shanghai, should be the “core” of collective leadership after Deng’s death. The Politburo announced prohibitions, largely ineffectual, against some forms of party privileges and nepotism, the corruption that had sparked the 1989 protests. The 14th party congress in October 1992 removed Yang Shangkun, state president (1988–1993), from the Politburo, weakening the power of his clique in the military. In 1993, the National People’s Congress reelected Jiang Zemin, already party general secretary, as chairperson of the central military commission and elected him as state president. This was the first time since the late 1970s that top, formal positions in the party, government, and military were concentrated in one leader’s hands.

After the 15th Communist Party congress, a highly publicized anticorruption drive resulted in the execution of several prominent cases. In addition, Jiang began to remove the Communist Party from state owned enterprises through an aggressive privatization strategy. In 2000, Jiang introduced a theory revamping the image of the Communist Party. Called the “three represents,” it was written into the party constitution at the 16th Party congress in November 2002. Seen as a re-orientation of the party away from its sole mission to serve the proletariat, the theory of the “three represents” emphasizes the importance of the middle class, stating that the party will represent not only workers and peasants, but the “advanced productive forces, advanced culture and the broad masses of the people.” The inclusion of Jiang’s theory at the party congress was an affirmation of the considerable influence Jiang continues to hold in China, despite his resignation as General Secretary in favor of Hu Jintao. Hu, slated to become state president at the National People’s Congress in March 2003, was a protégé of Deng Xiaoping, chosen as the “core” of the younger generation. Seen as moderate and cautious, he is expected to proceed with Jiang’s slow, but steady, policy of economic liberalization, and perhaps to introduce some administrative and political reform.

### 15 LOCAL GOVERNMENT

The People’s Republic of China (PRC) consists of 22 provinces (*sheng*) (the PRC claims Taiwan as its 23rd province), five

autonomous regions (*zizhiqu*), and four centrally administered municipalities (*zhixiashi*). Provinces and autonomous regions, in turn, are divided into “special districts,” counties (*xian*), and cities (*shi*) under provincial jurisdiction, as well as into autonomous minor regions (*zhou*) and autonomous counties (*zizhixian*), where non-Han Chinese minority groups reside. Counties, autonomous counties, and autonomous zhou are divided into townships (*xiang*), autonomous townships (for small minority groups), towns, and rural communes. Hong Kong and Macau are designated as Special Administrative Regions (SAR).

From 1958 to 1982, local administrative authority formerly held by the *xiang* was transferred to the communes and their local people’s councils. In 1988, Hainan Island, formerly part of Guangdong, was made China’s newest province. The 1982 constitution returned local administrative control to the *xiangs* as the communes began to be disbanded. Local revolutionary committees, which replaced the local people’s councils during the Cultural Revolution and under the 1975 constitution, were abolished in 1980. The restored local people’s councils have the power to formulate local laws and regulations. The local people’s governments are administrative organs of the state and report to the State Council.

In the 1980s an emphasis was placed on recruiting and promoting younger and better educated officials in local party and government posts. Many provinces along the coastal regions have adopted more decentralized forms of administration while interior provinces remain highly beholden to the central party. Local elections involving multiple candidates have taken place, especially in the more urbanized coastal areas. Elections began on a trial basis in 1987, and in over 730,000 villages, peasants are scheduled to go to the polls every three years to elect local committees.

## 16 JUDICIAL SYSTEM

China’s legal system, instituted after the establishment of the PRC in 1949, is largely based on that of the former USSR. However, after 1957, Mao Zedong’s government consistently circumvented the system in its campaign to purge the country of rightist elements and “counter-revolutionaries.” The Ministry of Justice was closed down in 1959, not to reopen until 1979, and the excesses of the Cultural Revolution wrought havoc on legal institutions and procedures. Efforts to reestablish a credible legal system resumed in 1977 (when there were no lawyers in China), as party moderates came to power. These efforts were accelerated in the early 1980s as China sought to provide the legal protection required by foreign investors.

The highest judicial organ is the Supreme People’s Court, which, with the Supreme People’s Procuratorates, supervises the administration of justice in the basic people’s courts and people’s tribunals (courts of first instance), intermediate people’s courts, and higher people’s courts. The judiciary is independent but subject to the Communist Party’s policy guidance. The legal profession was still in an incipient stage of development in the mid-1980s. Over 25 law departments at universities and four special schools for training legal officials were in operation in 1987, when China had 26,000 lawyers. By 1993, there were 70,000 lawyers with plans to increase this number to 150,000.

A major anticrime campaign during the autumn of 1983 resulted in public executions at the rate of at least 200 a month; capital punishment may be meted out for 65 offenses, including embezzlement and theft. Under the Chinese criminal codes, as revised in 1979, local committees may sentence “hoodlums” to terms in labor camps of up to four years, in proceedings that grant the suspect no apparent opportunity for defense or appeal. Government records for 1990 indicated that nearly 870,000 persons were assigned to such camps during the 1980s. Since 1990, sentences to labor camps may be judicially challenged

under the Administrative Procedures Law. In practice the review of such a sentence is rarely sought.

Due process rights are afforded in the 1982 Constitution, but they have limited practical import. The Criminal Procedural Law requires public trials, with an exception for cases involving state secrets, juveniles, or personal privacy. Cases are rapidly processed and conviction rates are about 99%. The 1976 Criminal Code contained 26 crimes punishable by death. A 1995 law raised this number to 65, including financial crimes such as passing fake negotiable notes and letters of credit, and illegal “pooling” of funds. Appeal is possible but with little chance of success. However in 1996, the National Peoples’ Congress passed new legislation to reform criminal procedure and the legal profession. The new legislation recognized for the first time that lawyers represent their clients, not the state. Under the new system lawyers may establish private law firms. Defendants may also ask near relatives or guardians to provide additional defense.

Amendments to the criminal procedure became effective in January 1997. The amendments state that suspects may retain a lawyer after being first interrogated by an investigative organ. Attorneys may conduct limited investigation, call defense witnesses, and argue their client’s cases in open court. According to the amendments defendants will enjoy a presumption of innocence.

Beginning in 1998, the government began a comprehensive “internal shake-up” of the judiciary, resulting in the punishment or dismissal of over 4,200 judicial branch employees. In January 1999, the former head of the Anticorruption Bureau of the Supreme People’s Procuratorate was dismissed for corruption.

China’s entry into the World Trade Organization (WTO) in December 2001 has caused China to undertake a full-scale revision of its laws and regulations in order to adhere to WTO rules. In opening its market up to sectors involving finance, insurance, telecommunications, commerce, transportation, construction, tourism, and other services, China will require its judicial system to perform in accordance with international standards.

As of January 2003, China’s lawyers were adhering to a new policy to wear black suits in court, in an attempt to promote professionalism and as a step toward integration with international practices.

## 17 ARMED FORCES

Active military forces include some 2,270,000 personnel and another 500–600,000 reserves. China has been modernizing the military at a rapid pace even as it reduces personnel. The army consists of 1,600,000 in seven military regions. The Chinese navy consists of 250,000 personnel, including 10,000 marines. The airforce has 420,000 personnel including strategic forces. Chinese military strength includes an enormous amount of equipment including nuclear capability. It is suspected that China possesses 410 strategic and non-strategic nuclear weapons. There are more than 100,000 offensive missile forces including ICBMs and IRBMs. The Chinese have over 7,000 tanks, 69 submarines, 21 destroyers, and more than 2,000 combat aircraft. The paramilitary in China includes about 1,500,000 members of the people’s armed police. The Chinese are involved in UN and Peacekeeping missions in 6 regions around the world.

Chinese defense spending for 2002 was reported to be \$20 billion, but a more accurate estimate is \$45–\$65 billion. This amounts to 1.6% of GDP, or 3.5–5% of GDP.

## 18 INTERNATIONAL COOPERATION

China has held a seat in the UN since 24 October 1945. After the Communist victory in 1949, UN representation was exercised by the Republic of China (ROC) government on Taiwan until November 1971, when the PRC replaced the ROC in the world organization and its member agencies. As of January 1988, the

PRC belonged to ESCAP and all the nonregional specialized agencies. The PRC displaced the ROC in the IBRD and IMF in 1980. China is a signatory to the Law of the Sea and acceded to WTO membership on 11 December 2001.

The United States extended recognition to China on 15 December 1978 and resumed full diplomatic relations as of 1 January 1979. Continued US links with Taiwan in the 1980s, however, remained an irritant in US-PRC relations. The future of Hong Kong, for which part of the lease (the New Territories) expired in 1997, dominated UK-Chinese discussions, and in 1986, an agreement to give Hong Kong back to China in 1997 was formally signed. Relations with the USSR, severed during the Sino-Soviet split in the 1960s, improved somewhat in the 1980s but remained strained over China's support of anti-Soviet forces in Cambodia and Afghanistan. By the end of 1985, more than 130 nations had extended full diplomatic recognition to the PRC, with a parallel drop to about 10 in the number recognizing Taiwan's government. By the mid-1980s, the PRC had achieved normal relations with most of its Asian neighbors, including Japan, India, Pakistan, Malaysia, Thailand, and Singapore. Relations with Vietnam, Cambodia, and Laos (all allies of the former USSR) were tense after the late 1970s, but improved in the 1990s. At the Eighth Summit of the Association of Southeast Asia Nations held in November 2002, China forgave the debts of Vietnam, Laos, Myanmar and Cambodia. Following the collapse of the Soviet Union in late 1991, China established diplomatic relations with the republics of the former Soviet Union. China normalized relations with the Republic of Korea in 1992. At an "ASEAN+3" (China, Japan, and the Republic of Korea) summit meeting held in November 2000, the three countries agreed to promote human and cultural exchanges between them. As of January 2003, a proposed ASEAN-China Free Trade Area was being planned, to begin in 2010.

## 19 ECONOMY

Traditional China was predominantly agricultural. Adhering to farming patterns developed over a score of centuries, China could sustain a harsh level of self-sufficiency, given surcease from natural calamities. For almost three decades prior to 1949, the incessant ravages of civil disorder, foreign (principally Japanese) invasion, and gross economic neglect virtually decimated China's frail abilities to sustain itself. The first task of the new PRC government thus was to restore the flow of natural resources to prewar levels. By the early 1950s, the government had succeeded in halting massive starvation. Almost all means of production and distribution were brought under state control, and vast parcels of land were redistributed to the peasantry. During 1953–57, China's first five-year plan stressed heavy industry. Economic development was aided by imports of machinery and other industrial equipment from the former USSR and East European countries. In return, China exported agricultural produce to them. A major geological prospecting drive resulted in the discovery of mineral deposits that provided a major thrust toward industrialization.

The Great Leap Forward of 1958–59 initially produced sharp gains in industry and agriculture, but the zeal for increased quotas quickly resulted in undue strain on resources and quality. The Great Leap was followed by "three bitter years" of economic crisis brought on by bad harvests and the economic dislocation of the previous period. By 1961, the GNP had fallen to an estimated \$81 billion, roughly the level reached in 1955. By 1965, however, a readjustment of expectations, coupled with a careful program of industrial investment, helped the economy to recover. China's trade patterns, meanwhile, had shifted radically away from the USSR and toward Japan and Western Europe.

During the late 1960s, in the Cultural Revolution period, long-range central economic planning was abandoned in favor of policies promoting local self-reliance. Self-sufficiency in grain

production was particularly stressed. The negative impact of this emphasis on agricultural development, together with the turmoil of the Cultural Revolution, resulted in a drop in industrial production of 10–20%, while agricultural output, aided by good weather, improved only marginally.

The sixth five-year plan (1981–85), adopted in 1982, reflected this new pragmatic approach to economic development by emphasizing agriculture, light industry, energy, and improved transportation facilities. During the 1980s, the Chinese economy underwent a major restructuring under the leadership of Zhao Ziyang. Rural reforms launched in 1979, which linked remuneration to output and centered on household responsibility, had a profound and beneficial impact on the rural economy, and output and income rose to record levels for rural residents. The commune system was disbanded in 1983–84 and replaced by a system of townships, and the household or family became the main unit of rural production. In the wake of the success of these rural reforms, the CCP Central Committee published "A Decision on the Reform of the Economic Structure" in October 1984, with the goal of totally overhauling the national economy and bringing urban industrial organization in line with rural practice. The main points of the decision were that all urban enterprises would be responsible for their own profits and losses, managers would have greater decision-making authority, and national and local governments would relinquish direct control over enterprises and assume a regulatory and supervisory position. Remuneration would be based on productivity, subsidies would be abolished, wages and prices would find their own level, and private and collective enterprises would be encouraged. Centralized planning resumed in 1970 with Zhou Enlai's announcement of key goals for the fourth five-year plan (1971–75), including an increase in grain output. The fifth five-year plan (1976–80), disrupted during the political upheaval that followed the deaths of Mao and Zhou in 1976, was restructured in 1978 to embody the Four Modernizations, with the use of Western technology as necessary. At the same time, a 10-year plan (1975–85) calling for the traditional expansion of agriculture and heavy industry was revamped to emphasize the growth of light industries and the accelerated development of industrial raw materials. Trade with the US expanded after full diplomatic relations were restored in 1979, and four special economic zones were established as centers for foreign investment.

The seventh five-year plan (1986–90) made reform its paramount concern. The reforms put forth in 1984 and firmly anchored in the 1988 Enterprise Law proved remarkably successful, leading to much higher rates of industrial and general economic growth than previously expected. Real GNP grew by an average of 9.6% annually between 1979–1988, reaching 11% in 1988. By this time, however, indicators of a seriously overheated economy were also clearly emerging; inflation accelerated to 20.7% and shortages in raw material and energy supply as well as transportation capacity rapidly worsened. Growth fell to only 4% in 1989 before austerity measures initiated by the government brought inflation to below 10% and eventually restored growth to double digit levels.

Infrastructure development was given special priority in the China's eighth plan covering 1991–1995. During this period economic growth accelerated, averaging more than 10% annually, giving China one of the fastest growing economies in the world. With growth came rising inflation and infrastructural bottlenecks which highlighted the need for further improvements in macroeconomic management. The 1996–2000 economic plan, which called for economic growth of 9–10% through 2000, reaffirmed the importance of the private sector and opening the economy to the outside world. To attract and maintain foreign investors China needed to reform its legal and financial institutions. Despite the government's endorsement of market

reforms, the plan continued to affirm the role of state-owned enterprises, which still accounted for more than one-third of total industrial output. In 1996, China committed two-thirds of fixed-asset investment to state-owned enterprises even though most were heavily in debt. By propping up the state sector China risked continuing budget deficits and the higher debt service that came with the borrowing necessary to pay for those expenditures. Investment in the state sector accounted for nearly all of the new investment in 1998, in the form of a special infrastructure-spending package forwarded by the government, supporting a GDP growth rate of 7% in 1999. Economic growth, which slowed during the late 1990s, was expected to rebound after China gained entrance to the WTO.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2002 China's gross domestic product (GDP) was estimated at \$6 trillion. The per capita GDP was estimated at \$4,600. The annual growth rate of GDP was estimated at 8%. The average inflation rate in 2002 was -0.8%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 18% of GDP, industry 49%, and services 33%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$556 million, accounting for approximately 0.1% of GDP. Worker remittances in 2001 totaled \$912 million. Foreign aid receipts amounted to about \$1 per capita.

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$399. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 5%. The richest 10% of the population accounted for approximately 30.4% of household consumption and the poorest 10% approximately 2.4%. It was estimated that in 2001 about 10% of the population had incomes below the poverty line.

## 21 LABOR

In 2000, China's labor force was 706 million. In 2001, 50% of civilian employment was in agriculture, 23% in industry; and 27% in services. Unemployment in urban areas was about 10% in 2002, with substantial unemployment and underemployment in rural areas.

China's labor policies have vacillated since 1949 between "to each according to his need," operative during the Great Leap Forward and the Cultural Revolution, and "to each according to his work." The first gave rise to job security—known as the "iron rice bowl" in China—but was generally associated with falling output. In 1978, a new economic formula, known as the "responsibility system," called for agricultural and industrial workers to sign a contract to produce a fixed amount of goods but provided for disposal on the free market for goods produced in excess of contractual levels.

On 27 December 1966, forces within the Cultural Revolution dissolved the All-China Federation of Trade Unions (ACFTU), previously the only nationwide labor organization. Some of its functions were then carried on by "revolutionary" organizations set up in factories, and by workers' congresses and trade unions organized on municipal and provincial levels. Strikes and lockouts became widespread during the Cultural Revolution. Other labor problems encountered during this period were "economism" among workers (i.e., emphasis on wages, bonuses, awards, and benefits, and appropriating factory funds and facilities under various pretexts); breakdowns in labor discipline

(referred to as "anarchy"); disorders from fights between rival workers' factions (called "factionalism"); and slowness in developing sensitivity to nonmaterial incentives, as required by the prevailing ideology. Signs of labor unrest stemming from low wages and many of these same issues reemerged during 1974, bringing on notable disruptions among railway workers; in 1975, labor clashes in Hangzhou led to the calling in of the military. In October 1976, the ACFTU was restored to power. A new constitution of trade unions was adopted in 1978 and subsequently revised in 1982 to permit workers the right to strike when conditions are hazardous; strikes for purely economic advantages are forbidden, however.

As of 2002, the Communist Party-Controlled ACFTU was the country's sole labor confederation. It had 16 industry-based, and 31 province-based member unions, as well as 586,000 grassroots-level unions. Over 90% of the ACFTU's reported 103 million members worked in state-owned enterprises. Independent trade unions are illegal, although some allegedly exist in secrecy. Organization and protection of workers is especially difficult in the huge number of rural agricultural laborers. Union officials working outside the official confines of the ACFTU have reported being harassed and detained by authorities. Any union activity outside of the ACFTU is deemed "illegal" by the authorities. However, there is a rise in labor disputes with the changing economy.

There is a minimum working age of 16 but compliance with this is irregular, especially in the burgeoning and unregulated private economy. The huge surplus of adult labor reduces the incentive to employ children. Children are most often found working on farms in poorer, isolated areas. The minimum wage varies depending on the area of the country. It generally provides a decent standard of living for a family. The Labor Law provides that the standard workweek is 40 hours, with a mandatory 24-hour rest period weekly.

## 22 AGRICULTURE

With some 50% of the economically active population engaged in farming, agriculture forms the foundation of China's economy. Limitations in topography, soil, and climate, however, have restricted cultivation to only about 14.5% of the total land area. Despite recent advances—grain crops totaling an estimated 457 million tons were produced in 1999 (22.1% of the world's total)—the enormous pressures of feeding and clothing China's vast and growing population remain among the country's most compelling concerns. From 1980 to 1990, agricultural output grew at an average annual rate of 5.9%, above the population growth rate and the first sustained expansion of agriculture since 1966; output increased at an average annual rate of 4.1% from 1990 to 2000.

The PRC government expropriated large landholdings in a land reform carried out in 1951–52, redistributing the land among poor peasants. By the end of 1954, 11.5% of all peasant households had been collectivized; by 1955, 65%; and by 1965, 99%. The Chinese collective farms had virtually no mechanical equipment, but the peasants pooled their labor in various projects, such as water management, which were beyond the capacity of individual peasants. In 1958, the collective farms were merged into larger units as people's communes. The communes were concerned not only with agricultural output but also with subsidiary farm activities, such as light industry and handicrafts, usually produced for local consumption.

Far-reaching changes in the organization of communes took place during 1961–62. Formerly, the production brigade (the major division of a commune), of which there were about 719,438 in 1982, was regarded as the commune's "basic accounting unit." In 1962, however, the production team (the subdivision of a commune) became the commune's basic organizational element. The average production team consisted

of 33 households and cultivated about eight ha (20 acres). Production teams functioned almost autonomously, making basic decisions on production and distribution of income, while the commune mainly exercised the functions of a township government. Households, the final link in the system, were permitted the use of private plots, which made up about 5% of the arable land assigned to a team. In the early 1980s, these private holdings accounted for 19% of total agricultural output and the bulk of the country's production of vegetables, fruits, hogs, and poultry. Under the "responsibility system," which was introduced in 1978 and by 1983 was operating in 90% of rural China, all production in excess of assigned levels could be sold on the open market to yield a profit for individual production teams. In 1982, in addition to the rural communes, which provided most of China's agricultural output, there were 2,078 state farms working approximately 4.5% of all farmland. These farms, under the Ministry of State Farms and Reclamation, generally served as commodity production centers and as research units for the improvement of crop and livestock yields.

In 1983–84, a major reform of the agricultural system was launched. The 50,000 communes were disbanded and replaced by 92,000 townships, and the six million production brigades were broken up. Production decisions are now made by the household, which sets production targets in contracts with the government; households can sell their surpluses in the open market for cash. Crop diversification is encouraged. By the late 1980s, 60% of agricultural output was free of state controls, and most of China's peasants practiced the household responsibility system.

Grains are the chief crop, accounting for 70% of the total value of crop output and occupying 80% of all land under cultivation. Shandong, Jiangsu, and Henan together account for about 25% of the total crop value.

The main food crops are rice, wheat, and corn, followed by kaoliang (a type of sorghum), millet, potatoes, and soybeans. China is the world's leading producer of rice, with production increasing from 106.6 million tons in 1970 to an estimated 200.5 million tons (34% of the world's total) in 1999. Over 90% of all rice is produced in southern China, with two (and in the far south, three) crops being grown each year where irrigation facilities permit. Early rice is planted in April and harvested in July; single-crop rice is planted in May and harvested in September; and late double-cropped rice is planted in June and harvested in October. The total wheat crop in 1999 amounted to 114.4 million tons, more than double the 1970 output. Wheat is cultivated throughout the country, often as a dry-season crop in the rice-growing south, with specialized production centered in the Yangtze Valley and North China Plain. Output of other coarse grains, including corn in the southwest and drought-tolerant millet and kaoliang in northern and northeastern China, exceeded 142.1 million tons in 1999. Production of roots and tubers, including sweet potatoes grown as a second crop in areas south of the Yellow River and white potatoes in cooler areas north of the Great Wall, totaled 175.6 million tons in 1999.

Industrial crops occupy only 8–9% of the cultivated areas. Among the most important are cotton (the chief raw material for the important textile industry), various oil-bearing crops, sugar, tobacco, silk, tea, and rubber. Cotton output totaled 3.8 million tons in 1999, down from 5.6 million tons in 1991, with production concentrated along the middle and lower reaches of the Yangtze River and on the plains of the Yellow and Huai rivers. Oilseed output in 1999 was derived from a diverse assortment of widely grown industrial crops, including sunflower seeds (1,550,000 tons) and rapeseed (9,700,000 tons). Other oilseed products included 200,000 tons of castor beans, 550,000 tons of sesame seeds, and 420,000 tons of linseed in 1999. Sugar production reached 8.9 million tons in 1999, up from 1.8 million tons in 1974; an estimated 84% of all sugar is derived from

sugarcane grown in the south, and the remaining 16% from sugar beets grown in the north and northeast. Production of tea, also an important traditional export, increased from 120,000 tons in 1956 to 723,000 tons in 1999 (25% of world production), with most of the tea grown in hilly regions of the south and southeast. Most tobacco is produced as a sideline by commune householders working private plots; output was 2.6 million tons in 1999. Most natural rubber is produced on specialized state farms; production totaled 440,000 tons in 1999.

The irrigated area is estimated to have increased from about 15.3 million ha (37.8 million acres) in 1950 to 52.5 million ha (130 million acres) in 1998, making China the world's leader in irrigated land. The expansion of fertilizer production is viewed as a key to major growth in the agricultural sector. Toward this end, China during 1972–74 contracted for the purchase of 13 large urea plants from Japan, the United States, and Western Europe. China's use of chemical fertilizers increased from 184 kg per ha in 1984 to about 291 kg per ha in 1998. Farm machinery in 1998 included 704,066 tractors and 114,000 combines.

## 23 ANIMAL HUSBANDRY

Except in outlying areas, nearly all of China's arable land is devoted to crops. Most agricultural units, however, also support the raising of large quantities of hogs and poultry. Natural grasslands for the grazing of sheep and cattle occupy 3.53 million sq km (1.36 million sq mi), or 37% of China's total area; the four major pasture areas are Xinjiang, Gansu, Qinghai, and Inner Mongolia. In an effort to improve these pastures, 303 million ha (749 million acres) were planted with improved forage seed strains from 1976 to 1980. Nonetheless, animal husbandry continues to be the weak link in the agricultural economy.

China leads the world in swine production, the total number of hogs reaching about 454.4 million at the beginning of 2001 (55% of the world's total), as compared with 89.8 million in 1952. The provinces with the largest hog populations are Sichuan, Hunan, Henan, and Shandong. Pig raising, often pursued as a private sideline by peasants, is the fastest-growing sector of the livestock industry, and hogs and pork products are becoming valuable export earners.

The number of sheep expanded from 36.9 million in 1952 to nearly 133.2 million in 2001. Most sheep are raised by pastoral herders, mostly the ethnic minorities, in the semiarid lands of Xinjiang, Inner Mongolia, Gansu, and Sichuan (Szechuan). Goats, also raised primarily in semiarid areas but increasingly promoted throughout China as a profitable household sideline for milk and dairy production, increased in number from 24.9 million in 1952 to 157.4 million in 2001. Sheep and goats together numbered 288 million in 2001. Provinces with the greatest numbers of sheep and goats include Shandong, Inner Mongolia, Xinjiang, and Itenan. In 2001 there were also 129 million head of cattle and buffalo, up from 66.6 million in 1965; 8.8 million horses (792,000 in 1965); and 326,000 camels (448,000). Chickens and ducks are raised throughout China on private plots and constitute, together with fish and pork, China's chief sources of dietary protein. The provinces with the largest cattle populations are Itenan, Shandong, Sichuan, and Guangxi. China produced 254,000 tons of honey in 2001, more than any other nation. China also led the world in silk production in 2001, at some 94,000 tons (75% of world production).

In 2001, China produced 65.3 million tons of meat, ranking first in the world with 27% of the total. Some 12.8 million tons consisted of poultry, second only to the United States and accounting for 12% of world production. Pork production in 2001 amounted to 42.9 million tons (first in the world), equivalent to 40% of global production.

## 24 FISHING

With a coastline of some 6,500 km (4,000 mi) adjoining a broad continental shelf, China has excellent coastal fisheries. A vast number of inland lakes and ponds, covering a total area of about 300,000 sq km (116,000 sq mi), are also used for fish culture, and a 30 km (19 mi) section of the Yangtze below Gezhouba Dam at Yichang is a designated sturgeon preserve. The principal marine fisheries are located on the coast of southern and southeastern China, in the provinces of Guangdong, Fujian, and Zhejiang. The total catch in 2000 was 16,987,325 tons, the highest in the world and 18% of global production. Of that total, 2,233,230 tons came from inland waters and 14,754,095 tons from marine fishing. China typically accounts for about 10% of the world's catch, but per capita Chinese consumption of fish amounts to only 9.3 kg (20.5 lb) per year (live weight equivalent), one of the lowest amounts in Asia. China's leading aquacultural products are carp, kelp, oysters, and scallops.

Exports of fisheries products in 2000 accounted for 6.5% of the commodity's world exports, and were valued at over \$3.6 billion (second after Norway). Regulations for the protection of aquatic resources were enacted in 1979.

## 25 FORESTRY

Forest cover has grown from 8.6% of the land base in 1949 to over 17.5% in 2000. Mature stands are decreasing, however, while the share of plantation and commercial forests continues to rise in response to government policies. Most of the forests are in remote regions, however, and lack of transportation limits exploitation. China has three major forest areas: the northeast (Heilongjiang, Jilin, and Inner Mongolia); the southwest (Sichuan and Yunnan); and the southeast (Guangdong, Guangxi, Fujian, Jiangxi, and Hainan). Fujian, Zhejiang, Anhui, and Guangdong together account for about 30% of the total value of the forestry sector. Coniferous stands, which yield the most valuable commercial timber, are found mainly in the northeast and adjoining parts of Inner Mongolia. Deciduous trees are felled in Sichuan and Yunnan. Between 1990 and 1995, however, the northeast's share of production fell to from 38% to 30%, as production shifted from state-owned forests in the north to plantation forests in the south. While China is a major producer of softwood logs and lumber, virtually all of its production is domestically consumed. Paper production, which has benefited from the substitution of rice-straw and other nonwood materials for wood pulp, nearly tripled during the 1980s. Special forestry products originating in southwestern China include tung oil, cassia oil, and aniseed oil. Wood imports can vary widely from year to year. China is the largest timber importer in the world—imports of timber and related products reached \$9.87 billion in 2001, with \$3.47 billion in timber products and \$6.38 billion in pulp and paper. Production amounts for 2000 (in 1,000 cu m) were roundwood, 287,472; sawnwood, 7,702, wood-based panels, 18,647; wood pulp, 3,700; and paper and paperboard, 35,529.

Deforestation has been a persistent and serious problem in China, leading to massive erosion and desertification. The government has, from the start of its first five-year plan in 1953, given high priority to campaigns for afforestation. By 1980, 26 million ha (64 million acres) of new forests had been planted, and during the 1980s, afforestation proceeded at the rate of 4.55 million ha (11.24 million acres) per year. However, cutting of trees for fuel continued in rural areas, and many of the trees planted as part of afforestation efforts were lost because of neglect after planting. In its ninth five-year plan commencing in January 1996, the Ministry of Forestry had the following goals: operating 10 major forest conservation projects by 2000; increasing the variety of wood species in state-owned forest plantations; developing the paper making industry; exploring and

developing growing trees in marginal land (such as hilly, mountainous, or sandy terrain); and classifying forests as either industrial (for environmental protection) or economic (for commercial production). During 1990–2000, the forested area grew by an annual average of 1.2%.

## 26 MINING

China produced more than 70% of the world's tungsten, was the largest producer and exporter of rare earths, the largest producer of cement, tin and, steel, and a world leader in the production of antimony. Intensive geologic exploration has yielded greatly expanded mineral reserves. This increase in known subsurface resources was reflected in production rises for China's most important mineral products—coal, petroleum, iron ore, copper, lead, zinc, tungsten, mercury, antimony, tin, molybdenum, barite, fluorspar, magnesite, and rare earths. In 2000, China produced a total of 7.51 million tons of 10 nonferrous metals, 14.6% more than in 1999; production in all 10 metals increased. The production of iron and steel was China's leading industry in 2002, coal production ranked second, and petroleum, cement, and chemical fertilizers were among the top eight. Mineral fuels ranked fifth among export commodities. GDP grew by 8% in 2000 and 7.1% in 1999, due mainly to a strong turnaround of exports.

Iron ore production in 2000 (gross weight) was 224 million tons, down from 268 million in 1997. Virtually all iron mining was carried out north of the Yangtze River, and the country's total resources totaled 55,000 million tons, the largest reserves being in Liaoning, Hebei, and Sichuan. The largest producers—Anshan Mining Co. (in Liaoning, Anshan) and Shoudu (Capital) Mining Co. (Beijing)—had annual capacities of 30 million tons and 20 million tons, respectively. As domestic iron deposits were of a low ore grade (less than 35% on the average) and required concentration, China has imported more than 50 million tons of ore in the past several years, and steel enterprises continued to look for joint-venture possibilities for iron mines in other countries. Officials from Heilongjiang Province and the Jewish Autonomous Republic of Russia discussed developing the Kimkan iron ore deposit (Khabarovsk, Russia), whose reserves totaled 189 million tons.

Tungsten output in 2000, mainly from Jiangxi, was 37,000 tons (metal content), up from 31,100 in 1999 and 25,000 in 1997; 9,276 tons of tungstates were exported, worth \$43.8 million. China National Nonferrous Metals Industry Corp. had a capacity of 60,000 tons per year in Guangdong, Guangxi, Hunan, Jiangxi, and Zhejiang. China's output had a major influence on world prices and, in an effort to control production and exports, the government forced major producers to reduce output, closed 145 illegal mines in 1999 and 2000, and decreased the export quota in 2000 to 17,000 tons. The government approved the export of tungsten by 13 companies, six producers, and seven trading companies in 2001.

Copper output (metal content) was 590,000 tons, up from 520,000 in 1999, 487,000 in 1998, and 439,000 in 1996. Because domestic concentrates supplied one-half of the country's rising demand and 40% of smelters' needs, China imported 1.8 million tons of concentrates in 2000, 45% more than in 1999. Three major copper mining development projects would add 100,000 tons of output capacity by 2003. The Ministry of Land Resources announced the discovery of a large porphyry copper deposit in eastern Tianshan (southwest of Hami City, in Xinjiang Uygur Autonomous Region) that contained 10 million tons of copper ore (0.5%–1.5% copper), 3,000 tons of silver, 100 tons of gold, and a significant amount of molybdenum. Also in Xinjiang Uygur, near Habahe, the government approved the construction of the Ashel Copper Mine; the mine, which also contained iron and zinc, planned to produce 2,000–3,000 tons per day of ore and concentrates that contained 25% copper and 53% zinc for

the duration of its projected 38-year life. The Xitianshan Mining Bureau, renamed Western Mining Co. Ltd., had a lead and zinc mining capacity of 1 million tons per year (Qinghai Province), and was approved to develop the Saishitang Copper Mine, northwest of Xining, and China's largest undeveloped copper deposit, Yulong (6.5 million tons reserves), in Xizang Autonomous Region. Jiangxi Copper Co. Ltd. planned to expand one mine, acquired another, and bought the exploitation rights to a third.

Other metallic ore outputs were: tin (chiefly in Yunnan), 97,000 tons, up from 80,100 in 1999 and 67,500 in 1997; antimony (from Guangxi, Guizhou, and Hunan), 98,700 tons, down from 131,000 in 1997; bauxite (gross weight), 9 million tons, up from 6.2 million tons in 1996; lead (metal content), 570,000 tons, down from 712,000 in 1997; molybdenum, 28,900 tons; mercury, 200 tons, down from 830 in 1997; and zinc, 1.7 million tons, up from 1.27 in 1998. China also mined alumina, bismuth, cobalt, gallium, germanium, gold, indium, manganese, nickel, platinum-group metals, silver, uranium, and vanadium. Pingguo Aluminum Co. received approval for its expansion plans, which would increase output capacities to 700,000 tons per year of alumina in 2005 (from 400,000); 2.4 million tons per year of bauxite; 100,000 tons per year of nonmetallurgical grade alumina; 300,000 tons per year of aluminum; and 50,000 tons per year of graphite block. Henan geologists discovered a bauxite deposit in western Hunan Province that could contain reserves of 50 million tons and a significant amount of gallium. Another bauxite discovery, in Jingxi County, Guangxi Province, could contain reserves of 82 million tons (37 million tons of which could be economically developed), 100,000 tons of gallium, and a significant amount of niobium, scandium, and titanium.

The government planned to reform the gold sector by easing restrictions on foreign investment and establishing a gold exchange market by 2002. Domestic producers were required to sell all their gold to the Central Bank at a fixed price; the bank would gradually withdraw from its gold monopoly position. The establishment of gold mining companies that were wholly owned by foreign investors was not permitted. A joint exploration and development agreement was signed to explore for gold and silver in the Hulunbeier League; the Canadian partner in the agreement, Naneco Minerals Ltd., had to provide the capital for further exploration and development of the Errentouligai gold and silver deposit, near the Jiawula polymetallic deposit. Alaskan Exploration Corp., a subsidiary of Vega-Atlantic Corp., of Germany, and Yunnan Northeast Silver Industry Co. Ltd., formed a joint venture to develop the Luomachang silver mine, in Yunnan Province; the mine, which had operated for three years, at a capacity of 17 tons per year, had reserves of 9 million tons at a grade of 221.9 grams per ton of silver.

The output of rare-earth oxide content—60% from Nei Mongol, 18% from Sichuan, and 17%, Jiangxi—was 73,000 tons in 2000, up from 60,000 in 1998; more than two-thirds was exported, the major destinations being France, Japan, and the United States. In Nei Mongol, rare-earth concentrate, known as Baotou rare-earth concentrate, was the byproduct of producing iron concentrates, and contained oxides of the light rare-earth group—lanthanum, cerium, praseodymium, neodymium, samarium, europium, and gadolinium. In Mianning and Dechang (Sichuan), rare earths were mainly bastnasite, and, in Ganzhou (Jiangxi), the rare earths were of the ionic absorption type. A joint venture in Jiangsu province was to produce vanillin. The largest producers—Gansu Rare Earths Co. (in Jiangxi, Nanchang) and Baotou Iron and Steel and Rare Earths Corp. (in Nei Mongol, Baotou)—had capacities of 32,000 and 25,000 tons, respectively. China's rare-earth processing capacity expanded from 50,000 tons per year in 1995 to 130,000 tons per year in 2000. Rare earths remained a highly controlled sector,

and a rare-earth quota was introduced in 1999 to control exports. China also produced 65,000 tons of rare-earth products (46,700 exported), including 32,000 tons of high-purity individual rare-earth oxide.

Hydraulic cement production was 583.2 million tons, up from 511.7 million tons in 1997 and 491.2 million tons in 1996, although many of the manufacturing plants were old and inefficient; export of 6.06 million tons earned \$190 million. Other industrial mineral production included fluorspar, 2.45 million tons (1.2 million tons exported, for \$117.9 million); barite (from Guizhou, Xiangshou), 3.5 million tons (2.52 million tons of barium sulfate was exported, worth \$79.4 million); magnesite, 2.5 million tons (2.04 million tons exported, worth \$266.4 million); gypsum, 6.8 million tons, down from 9.1 million tons in 1997; graphite, 400,000 tons, up from 300,000 in 1999 and 185,000 in 1996 (333,460 tons exported, for \$51 million); talc and related materials, 3.5 million tons, down from 3.9 million tons in 1999 (710,000 tons exported, for \$58.5 million); mine boron (boron oxide equivalent), 100,000 tons, down from 137,000 in 1998 and 157,000 in 1996; asbestos, 245,000 tons; and bromine, 42,000 tons. China also produced diamond, diatomite, dolomite, kyanite and related materials, lithium minerals, nitrogen, phosphate rock and apatite, potash, salt, sodium compounds, and sulfur.

The government in 2000 approved the opening of a diamond exchange market in Shanghai. China in 2000 became the world's eighth-largest consumer of precious stones (actual figures were difficult to ascertain because of smuggling and overseas purchases), and "Great China," which included Hong Kong and Taiwan, was believed to be the world's third-largest diamond market, after the United States and Japan.

In 2000, the government issued several laws and regulations to improve the country's investment environment and foreign investors' confidence. The laws and regulations dealt with, among other things, mineral resource exploitation planning, land exploitation, mine ownership transfer, customs law, gold mining, Sino-foreign contractual joint ventures, foreign capital enterprises, and mineral-resource deposit size classification standards. The government continued its efforts to restructure the mining and metal sectors, abolishing nine bureaus, transferring responsibilities to industrial associations, dissolving three state-owned nonferrous enterprises, and, to help the industry become more efficient, ceding management to provincial and city governments. The government also offered incentives to companies—exemption from income tax, tariffs, and import value-added tax (VAT)—to invest in the poorer western provinces. It also began to phase out the preferential taxes for foreign enterprises, prepared to draft a "zero tariff rate" policy for exports, issued guidelines to allow foreign enterprises to conduct mineral exploration in China, and agreed to eliminate import quotas and dismantle export subsidies. China planned to increase production of cement, copper, fertilizer, iron, lead, nickel, salt, soda ash, and zinc, and expected to retain its dominance in the world market for antimony, barite, fluorspar, magnesite, rare earths, and tungsten.

The iron and steel trade was valued at \$14.1 billion, out of 2000's trade total of \$474.3 billion; nonferrous metals at \$10.1 billion; and nonmetallic minerals at \$7.1 billion. Exports of cement, copper products, coal, coke, steel products, and zinc and its products rose by more than 10%. Export duties for unwrought antimony declined from 20% to 5%; and unwrought zinc, 25% to 0%. The government decided in 2000 to provide a full VAT rebate for 80,000 tons of copper concentrates and 200,000 tons of copper anode for three years.

## 27 ENERGY AND POWER

China's petroleum resources are a key to its industrial development. Crude oil production increased from 102,000

barrels per day in 1960 to 3.3 million per day as of 2002. In 1998 China had proven reserves of 24 billion barrels. The major producing centers are the Daqing field in Heilongjiang, which came into production in 1965 and accounts for nearly one-third of national production, and the Liaohe field, located in northeastern China. In addition to numerous other mainland finds, China has potential offshore reserves in the Bo Hai area (thought to have reserves of over 1.5 billion barrels) and the South China Sea, especially in the vicinity of Hainan Island.

By the mid-1970s, China no longer had to rely on oil imports; petroleum exports had, in fact, emerged as a major source of foreign exchange earnings. More than 9,740 km (6,050 mi) of long-distance pipelines transport the oil from fields to refineries and other points of consumption and export. China, however, became a net importer of oil in 1996, because rapid increases in oil demand from high economic growth rates outpaced the slower increases in oil production.

After rising dramatically in the early 1980s, owing largely to the discovery and exploitation of vast deposits in Sichuan Province during the late 1950s and early 1960s, natural gas output stagnated somewhat in the late 1980s. As of 2002 natural gas supplied only 3% of the country's energy. However, with proven reserves totaling over 1.4 trillion cu m (48 trillion cu ft), it was expected that consumption would triple by 2010. In 2000, total national production reached 27.2 billion cu m (960 billion cu ft). A pipeline to transport natural gas from the Xinjiang province in the west to Shanghai in the east was planned, with Shell chosen to lead a consortium of development companies.

Although China's rivers provide a vast hydroelectric potential (an estimated 378 million kW), only a small part has been developed. In the late 1990s, after economic growth slowed due to the Asian economic crisis, the government declared a two- to three-year moratorium on construction of new power plants due to an oversupply problem. The main hydroelectric projects include Ertan in Sichuan Province, Yantan in Guangxi Zhuang Autonomous Region, Manwan in Yunan Province, Geheyan in Hubei Province, Wuqiangxi in Hunan Province, Yamzho Yumco in Xizang Autonomous Region, and Lijia Xia in Qinghai Province. In April 1992, the government approved the construction of the largest hydropower project in China—the Three Gorges Project on the middle reaches of the Chang Jiang. Construction, begun in 1996, was still underway in 2002, with completion of the 26 hydropower generating units slated for 2009. The Three Gorges Project has a designed capacity of 17,680 MW and will require the relocation of millions of people just in Sichuan Province alone. A second major hydroelectric project, consisting of a series of dams on the Yellow River, was also underway in 2002.

In 2001, China's net installed electrical generating capacity was 318.3 million kW, up from 115.5 million kW in 1988. Total output of electricity increased during the 1988–98 period from 545 billion to 1,098 billion kWh. Net generation in 2000 was 1,288 billion kWh, of which 81.8% was from fossil fuels, 16.8% from hydropower, and 1.2% from nuclear power. Electricity consumption in 2000 was 1,206 trillion kWh.

Traditionally, coal has been the major primary-energy source, with auxiliary biomass fuels provided by brushwood, rice husks, dung, and other noncommercial materials. The abundance of coal continues to provide cheap thermal power for electric plants. In 2000 China was both the world's largest coal producer, at 1,270 million tons, and its leading consumer of coal, at 1,310 million tons. Coal comes from over two dozen sites in the north, northeast, and southwest; Shanxi Province is the leading producer. Recoverable reserves as of 2000 were estimated at over 126.2 billion tons. As of 1996, China accounted for 11.1% of the world's proven reserves of coal. Large thermal power plants are situated in the northeast and along the east coast of China, where industry is concentrated, as well as in new inland industrial

centers, such as Chongqing, Taiyuan, Xi'an, and Lanzhou. In 2000, coal accounted for 63% of primary energy consumption. By that year, some of the country's large coal-producing companies had returned to profitability following a period of oversupply in the late 1990s that led to the closure of many small mines.

The 279 MW Qinshan nuclear power plant near Shanghai began commercial operation in 1994. That same year, two 944-MW reactors at the Guangdong facility at Daya Bay also started commercial service. In 1995, Chinese authorities approved the construction of four more reactors. Net capacity for China's three nuclear reactors was estimated at 2,167,000 kW in 1996. As of 2002 construction of several nuclear power projects was underway. The first unit of the Lingao nuclear power plant came online in May 2002; a second unit was scheduled to begin operating in May 2003. Nuclear generation was planned to play a secondary but important role, especially in areas that lack both hydropower potential and major coal resources.

China ranks as the world's second-largest consumer of energy (after the United States). The goals of China's ninth five-year plan (1996–2000) included building power plants (primarily coal), strengthening oil and gas exploration and development, improving energy inefficiency, and developing rural energy (including small hydropower, solar, geothermal, and biogas).

## 28 INDUSTRY

China has achieved a rapid increase in the gross value of industrial output (used before China switched to GNP accounting in 1986), which, according to official Chinese statistics, rose by 13.3% annually between 1950 and 1979. The greatest sustained surge in growth occurred during the first decade, with the rate averaging 22% annually during 1949–60. During 1961–74, the yearly growth rate fell to about 6%, partly as a result of the disruptions brought on by the collapse of the Great Leap Forward (which accompanied the withdrawal of Soviet technicians in mid-1960) and of work stoppages and transportation disruptions during the Cultural Revolution. Growth averaged 10% from 1970 to 1980 and 10.1% from 1979 to 1985. Major policy reforms of 1984 further accelerated the pace of industrial growth, which reached 20.8% by 1988. After a brief retrenchment period in 1989–90 as government policies prioritized inflation control over other concerns, expansion of the country's industrial sector resumed apace, exceeding 20% in 1992 and 18% in 1994. Industrial output was officially up 13.4% in 1995, with state enterprises contributing the majority.

While approximately 50% of total industrial output still derives from the state-owned factories, a notable feature of China's recent industrial history has been the dynamic growth of the collectively owned rural township and village enterprise as well as private and foreign joint-venture sectors. Also apparent has been the spatial unevenness of recent industrial development, with growth concentrated mainly in Shanghai, the traditional hub of China's industrial activity, and, increasingly, a number of new economic centers along the southern coast. The coastal provinces of Jiangsu, Guangdong, Shandong, Shanghai and Zhejiang provinces together account for close to 33% of the country's total industrial output and most of its merchandise exports. One key factor in this industrial geography has been the government's establishment of several Special Economic Zones in Guangdong, Fujian and Hainan provinces, and its designation of over 14 "open coastal cities" where foreign investment in export-oriented industries was actively encouraged during the 1980s.

Before the first five-year plan (1953–57), China had only one major steel center—Anshan, in the northeast—and several minor ones. All these produced 1.93 million tons of pig iron and 1.35 million tons of steel in 1952. By 1995, China was producing 92,970 million tons of crude steel and 101,700 million tons of pig iron. China had one trillion tons of confirmed coal reserves and

an estimated five trillion tons of coal reserves and 48.7 billion tons of iron ore in 2000. Anshan continues to be the hub of the industry, but other huge steel complexes have been constructed at Baotou, Benxi (about 50 km/30 mi east of Anshan), Taiyuan, Wuhan, and Ma'anshan (near Nanjing).

China's cotton textile industry is the largest in the world, producing yarn, cloth, woolen piece goods, knitting wool, silk, jute bags, and synthetic fibers. Labor-intensive light industries played a prominent role in the industrial boom of the late 1980s and early 1990s, accounting for 49% of total industrial output, but heavy industry and high technology took over in the late 1990s. In addition to garments and textiles, output from light industry includes footwear, toys, food processing, and consumer electronics. Heavy industries include iron and steel, coal, machine building, armaments, petroleum, cement, chemical fertilizers, and autos. High technology industries produce high-speed computers, 600 types of semiconductors, specialized electronic measuring instruments, and telecommunications equipment.

Since 1961, industry has been providing agriculture with farm machines, chemical fertilizers, insecticides, means of transportation, power, building materials, and other essential commodities. Handicraft cooperatives also have been busy making hand-operated or animal-drawn implements. Production of a variety of industrial goods has expanded, increasingly in order to supply the country's own expanding industrial base. In addition to fertilizers, the chemicals industry produces calcium carbide, ethylene, and plastics. Since 1963, great emphasis has been placed on the manufacture of transportation equipment, and China now produces varied lines of passenger cars, trucks, buses, and bicycles. In 1995, output included 1,452,697 motor vehicles (more than double the 1991 figure). Output for 1997 was over 1.6 million units. The industry underwent a major overhaul in the late 1990s in order to stimulate efficiency and production.

## 29 SCIENCE AND TECHNOLOGY

Modern China is the heir to a remarkably inventive civilization that pioneered in the development of the abacus (the first mechanical calculating device), paper (and paper money), printing by movable type, gunpowder, the magnetic compass, and the rocket. Contact with the West during the 19th century revealed how technologically backward China had become, and it is only in recent decades that the nation has begun to catch up.

China detonated its first fission device in 1964 and its first hydrogen bomb in 1967; the nation now possesses a variety of nuclear weapons mounted on missiles, bombers, submarines, and other delivery systems. Its first satellite was launched in 1970. By 1992, the PRC had launched an INTELSAT satellite on a Chinese launch vehicle. Other priorities have been the development of high-energy physics, laser research, powerful computer memory chips, color television broadcasting technology, and laser infrared devices, although the PRC still relies heavily on outside investment and technology transfer. Major advances have also been claimed in rice hybridization, insecticides, fertilizers, biogas digesters for rural electrification, and pollution control technology.

Two scientific exchange agreements between the US and China were signed in January 1984 during Premier Zhao Ziyang's visit to Washington, D.C. China has proposed to several Western nations that it provide long-term storage facilities in remote provinces for radioactive waste—a proposal that Western observers believed would provide China not only with hard currency but also with nuclear materials for possible reprocessing.

China's principal technological handicap is lack of skilled personnel. Only 1% of the PRC's 127 million 22-year-olds receive a university degree. However, 37% of all Chinese degrees are in engineering, the highest ratio in Asia. Part of China's

response to this shortage has been to send tens of thousands of students overseas for advanced study, especially in the US. In 1987–97, science and engineering students accounted for 43% of college and university enrollments. China had 454 scientists and engineers and 200 technicians per million people engaged in research and development during the same period. Scientific research is coordinated by the prestigious Chinese Academy of Sciences, founded in 1949 and headquartered in Beijing. China in 1996 had 90 specialized learned societies in the fields of agriculture, medicine, science, and technology. Most are affiliated members of the China Association for Science and Technology, founded in 1958. International science and technology cooperation is also increasing. In 1998, high-technology exports were valued at \$23.3 billion and accounted for 15% of manufactured exports. However, concerns over human rights issues have had the effect of cooling US-PRC science and technology exchanges. In 1996, China had 105 universities and colleges offering courses in basic and applied science.

## 30 DOMESTIC TRADE

Three types of retail trade outlets—the periodic market, the peddler, and the urban shop—constituted the basis of the traditional commercial structure. In the early 1950s, however, a number of state trading companies were established for dealing in commodities such as food grains, cotton, textiles, coal, building materials, metals, machinery, and medicines. These companies, under the control of the Ministry of Commerce, have established branch offices and retail stores throughout the country.

In the 1960s, the establishment of state-owned department stores and cooperative retail outlets virtually replaced private trade. There was a resurgence of periodic open markets and private traders when domestic trading regulations were relaxed in 1978. In addition, the government has progressively loosened or eliminated many of its former price controls; an estimated 90% of all retail sales are no longer controlled.

In 2001, 50% of the work force was employed in agriculture, keeping the country basically self-sufficient in grain production, even though only about 13% of the land is arable. Farmlands and the agricultural industry, however, remain under state control.

The China Export Commodities Fair, usually held each spring and fall in Guangzhou, was for more than 20 years an important point of contact for Westerners doing business with China. Though still important as an initial introduction to the full range of China's potential suppliers, the decentralization of trading activities in recent years has greatly reduced the fair's role in mediating sustained contact between producers and buyers. Local foreign trade commissions in various industrial centers of the country have taken on a much more active role in organizing many of the services associated with the commodities fair, while any domestic enterprise with foreign trading rights may now participate directly in all events related to trade promotion. Guangzhou still hosts two annual trade fairs, though on a reduced scale. In the major cities, Friendship Stores and other restaurants, hotels, service bureaux and taxis cater exclusively to foreign visitors; payment is made in foreign exchange certificates.

By the mid-1980s, international credit cards could be used to obtain cash advances in selected outlets and for direct purchases in Friendship Stores. Some Internet commerce took place in China after 1998.

## 31 FOREIGN TRADE

Though China has only recently become a major trading nation, its enormous trading potential is attracting great attention by both advanced and newly industrializing nations, shown by the world's interest in China's membership with the WTO. Trade has performed important functions within the economy, providing needed capital goods and modern technology to abet development, as well as primary commodities (such as grains) to

supplement local supply in slack years. Foreign trade is under the direction of a single Ministry of Foreign Economic Relations and Trade, created in 1982 through the merger of the former ministries of Foreign Trade and Foreign Economic Relations with the Export-Import and Foreign Investment commissions. A major issue since the early 1980s, however, has been the decentralization of trade management and greater reliance on currency devaluation (major devaluations were implemented in 1989 and 1991) and market incentives rather than direct export and import controls to promote desired trade patterns. After the Asian financial crisis of 1998, officials were tempted to devalue the currency once more; instead the Ministry of Foreign Trade and Economics (MOFTEC) spent massive sums of money on state industry, while dismantling trade barriers in anticipation of WTO membership.

Prior to 1949, some three-fourths of China's exports were agricultural products. This proportion ebbed to a low of 13% during the agricultural crisis of 1961. Foodstuffs and other primary products including crude nonfood raw materials, minerals and fuels averaged about 43% to 50% of exports through 1985, after which the proportion declined steadily to reach only 6% in 1998, as manufactured exports expanded rapidly. Textiles (excluding garments) accounted for 10% of all exports in 1994 and clothing for about 19.7% (up from 7.5% in 1985). However, China's efforts to emulate the success of Japan, British Hong Kong, Taiwan, and the ROK in basing economic expansion on textile and clothing exports have encountered protectionist resistance from major potential markets in the United States and European Union.

The textile and clothing industry created the large majority of China's commodity exports in 1998. China's special administrative region of Hong Kong also produces clothes for a large percentage of its export market (12%), averaging 12.1% of the world's total clothes exports. The majority of Hong Kong's exports go to China. Other exports include electrical parts (16%), watches and clocks (2.6%), telecommunications equipment (6.7%), and footwear (3.0%). Hong Kong produces 28% of the world's exports in watches and clocks. China's top 10 exports (excluding Hong Kong) are as follows:

	% OF COUNTRY TOTAL
Telecom equipment	5.0
Footwear	3.8
Outerwear knit, non-elastic	3.5
Women's outerwear, not knit	3.3
Men's outerwear, not knit	2.7
Road vehicles	2.6
Toys and sporting goods	2.0
Iron and steel	2.0
Petroleum and petroleum products	1.9
Undergarments, knitted	1.7

Food imports, which made up only about 2% of the import volume in the 1950s, averaged 20% of the total in 1973 and 1974 but, as total imports rose, fell to less than 4% by 1985 and remained at 2.4% in 1994 and 5% in 1998. In 2000 China's imports were distributed among the following categories:

Consumer goods	3.6%
Food	3.4%
Fuels	9.0%
Industrial supplies	42.1%
Machinery	37.3%
Transportation	3.8%
Other	0.8%

The direction of China's trade has followed three major patterns since the 1930s. Prior to World War II, Japan, Hong Kong, the United States, and the United Kingdom together made up about three-fourths of the total trade volume. With the founding of the PRC in 1949, trade shifted in favor of the former

USSR and Eastern Europe. During 1952–55, more than 50% of China's trade was with the former USSR; during 1956–60, the proportion averaged about 40%. As Sino-Soviet relations deteriorated during the 1960s, trade exchanges steadily declined, reaching a bare 1% of China's total volume in 1970 (3.6% in 1986). By the early 1980s, most of China's leading trade partners were industrialized non-Communist countries, and China's trade pattern overall reflected a high degree of multilateralism.

In recent years, as China has rapidly enlarged its role on the international market, the importance of Hong Kong as an entrepot and major source of revenue has increased. In 1992, Hong Kong accounted for close to 35% of China's total trade (up from about 21% in 1986). Hong Kong reverted to Chinese rule in 1998, but because of its enormous trade activity, Hong Kong's trade is often measured separate from China. During the 1990s, Japan ranked as the second largest trading partner, importing oil and other raw material and claiming 15% of China's total trade. The most dramatic change in the mid-1980s was the emergence of the United States as China's third-largest trading partner; by 2000 the United States was China's second-largest trading partner, and the largest importer of Chinese goods.

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	52,156	22,375	29,781
Hong Kong	44,518	9,429	35,089
Japan	41,654	41,510	144
Germany	9,278	10,409	-1,131
Korea	11,292	23,207	-11,915
Netherlands	6,687	1,236	5,451
United Kingdom	6,310	3,593	2,717
Singapore	5,761	5,060	701
France	3,715	3,951	-236
Russia	2,233	5,770	-3,537

### 3.2 BALANCE OF PAYMENTS

Both foreign trade and international financing in China are state monopolies, with policies and transactions administered by the People's Bank of China (PBC). Among its various functions, the PBC sets exchange rates for foreign currencies. The PBC releases foreign exchange to the Bank of China, which plays a major payments role through its branches in Hong Kong, Singapore, and other overseas financial centers. The government has, overall, maintained a record of financial stability, linked to a policy of stringent controls over its international transactions. Adhering generally to a principle of self-reliance, it has resorted to the use of commercial credit at certain junctures but until the 1970s avoided falling into long-term indebtedness as a means of financing major development goals. In the period 1958–60, the Great Leap Forward and the succeeding years of economic crisis caused a sharp deterioration in China's international payments position. In 1960, large negative clearing account balances with Communist countries (-\$625 million) were even more than the foreign exchange reserves of \$415 million. By the end of 1964, however, the negative balance with Socialist nations had been reduced to \$55 million, and China's net international financial resources stood at a surplus of \$345 million, owing to monetary gold holdings of \$215 million and foreign exchange balances from trade with non-Communist countries amounting to \$185 million. By 1965, the Chinese had completely cleared their long-term debt to the former USSR, and by 1968, China had redeemed all national bonds and was free of all long-term external and internal debts. Publication of official balance-of-payments statistics was discontinued during the Cultural Revolution and not resumed until September 1985. According to Western analyses, the period 1978–81 saw a continuing surplus in current accounts, as rising levels of imports were generally matched or

exceeded by increases in exports over the same period. In addition, transfers of an estimated \$1.1 billion in 1978 and \$1 billion in 1980, derived from increased earnings in tourism, shipping, and remittances from Hong Kong and other sources, resulted in overall current accounts surpluses of \$900 million and \$1.2 billion in 1978 and 1980, respectively. China's drive to industrialize under the Four Modernizations policy resulted in an unprecedented deficit on capital accounts of \$1.1 billion in 1978. The subsequent unilateral decisions to cancel \$2.6 billion in contracts with Japan (1979) and \$2 billion with Japan and Western nations (1981) were interpreted by some observers as an indication of acute cash-flow problems and a reordering of investment priorities at the highest levels. The trade account was helped by the slow but steady devaluation that occurred after China went to a managed float exchange rate system in January 1991. Tourism receipts and visitor figures also continued to grow, passing pre-Tiananmen levels. Foreign investment boomed in the 1990s, with a total of nearly \$45 billion committed in 1998 alone. Approximately half of China's loans came from the Asian Development Bank, the World Bank, and Japan; external debt reached \$159 billion in 1998. A usually positive current account balance stockpiled China's reserves. In 1998, China had some \$147 billion in official reserves, but state industries had accumulated a huge amount of what was called triangular debt with the state banks and other lending agencies. Government infrastructure and industrial projects received funding for goods that could not be sold domestically in 1999 due to lower demand, losing money for each party involved. In effect, external trade plays a secondary role in China's economy because of normally high, unsatisfied domestic demand. Agreements with the WTO threaten to increase China's dependence on foreign trade. China's external debt stood at \$149.4 billion in 2002.

The US Central Intelligence Agency (CIA) reports that in 2002 the purchasing power parity of China's exports was \$312.8 billion while imports totaled \$268.6 billion resulting in a trade surplus of \$44.2 billion.

The International Monetary Fund (IMF) reports that in 2001 China had exports of goods totaling \$266 billion and imports totaling \$232 billion. The services credit totaled \$33.3 billion and debit \$39.3 billion. The following table summarizes China's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	<b>17,401</b>
Balance on goods	34,017
Balance on services	-5,933
Balance on income	-19,175
Current transfers	8,492
<b>Capital Account</b>	<b>-54</b>
<b>Financial Account</b>	<b>34,832</b>
Direct investment abroad	-6,884
Direct investment in China	44,241
Portfolio investment assets	-20,654
Portfolio investment liabilities	1,249
Other investment assets	20,813
Other investment liabilities	-3,933
<b>Net Errors and Omissions</b>	<b>-4,732</b>
<b>Reserves and Related Items</b>	<b>-47,447</b>

### 33 BANKING AND SECURITIES

Economic reforms under the Four Modernizations program adopted in 1978 brought major changes in China's highly centralized and tightly controlled banking system. In 1982, the People's Bank of China (PBOC) became the central bank and turned over its commercial operations to the new Industrial and Commercial Bank. The State Administration of Foreign Exchange (SAFE) helps set foreign exchange policy. Other specialized agencies include the People's Construction Bank, the Agricultural

Bank of China, the Bank of China, the Bank of Communications, the China Development Bank, and the Export-Import Bank of China. The China Construction Bank (CCB) makes payments for capital construction according to state plans and budgets. The Agricultural Bank of China finances agricultural expansion, grants rural loans, supervises agricultural credit cooperatives, and assists in the modernization of agriculture. The Bank of China (BOC) handles foreign exchange and international settlements for the PBC. It has branches throughout China as well as in Singapore, Hong Kong, Paris, London, Luxembourg, New York, and Tokyo. The BOC is charged with financing China's foreign trade and also acquiring and channeling into appropriate areas the foreign capital needed for imports of industrial equipment and other items for modernization.

The foreign-owned Standard Chartered Bank maintains long-established offices in China. Over 90 foreign banks, representing Japan, the United States, France, Italy, Pakistan, and the United Kingdom, received permission to establish offices in Beijing in the early 1980s. In 1985, for the first time, foreign banks were allowed to do business in the four special economic zones (established to attract foreign investment) in foreign currency. In mid-1997, 10 foreign banks were given permission to operate outside of the special zones; and in 1996, foreign banks were given limited authority to do business in renminbi (the local currency at the time). The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$745.3 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$1,889.7 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 3.24%.

In 1987, stock exchanges opened in Shanghai and several other cities, and several stock and bond issues were floated domestically. Securities exchanges are controlled by the PBC, and trading in securities is very limited. In 1997, China accelerated stock-market listings of about 50 large and medium-sized state-owned enterprises (SOEs) and considered raising the number of enterprises piloting group holding structures from 57 to 100. In November 1996, the Shanghai Stock Exchange President, Yang Xianghai, predicted that China's two exchanges (Shanghai and Shenzhen) would number in excess of 1,000 companies by 2000. At the time he was speaking, there were 472 companies listed on the stock exchanges. By 2003, there were 746 listed companies and 871 listed securities being traded on the exchange. In 2001, China's stock market had a value of RMB27.6 trillion, Asia's second largest behind Tokyo. The stock exchange is split into two sections, the "A" share market and the "B" share market. Foreigners may only participate in the B-share market, denominated in foreign currencies and consisting predominantly of foreign private companies. The A-share market is reserved for domestic investors (who are not allowed to participate in the B-share market) and dominated by state enterprises.

### 34 INSURANCE

The People's Insurance Co. of China (PICC), formed in 1949, is authorized to handle all kinds of insurance, including the insurance of China's foreign trade and foreign insurance operations in China. In 2001, the People's Insurance Co. of China controlled 78% of China's property/casualty insurance industry, with 4,200 branches and a workforce of 110,000. Two newer domestic Insurance Companies, China Pacific and Ping An, have 11% and 8%, respectively, of the market. Two additional state enterprises, the China Insurance Co. and the Tai Ping Insurance Co., are in operation, and several foreign insurance companies have established representative offices in Beijing. By October 1995, 77 insurance companies from over ten nations had established 199 agencies in China. Demand for insurance projects is predicted to grow as economic reforms limit the social security

benefits provided by state enterprises. By 2001, life insurance premiums were growing at an average rate of nearly 70% per year, with nonlife premiums growing at around 15% per year.

### 35 PUBLIC FINANCE

The annual state budget is prepared by the Ministry of Finance and approved by the National People's Congress. A major reform in public finance, introduced in 1980, was a new system of allocating revenues and expenditures between local and national levels of government. Previous revenue-sharing procedures allowed the central government to fix maximum spending levels for each province, autonomous region, and centrally administered municipality. The new system fixed for a five-year period the proportion of local income to be paid to the central government and (except for emergency appropriations for floods and other such disasters) the level of subsidies to be provided by the central government, as well as the proportion of local income to be retained by local governments. Autonomous regions receive proportionately greater state subsidies than the provinces and centrally administered municipalities, and they are entitled to keep all revenues from local industrial and commercial taxes.

During the 1990s, the Chinese consolidated budget deficit grew at a rapidly increasing rate. According to the IMF, the 1998 budget deficit amounted to 4% of GDP, due to rising expenditures and tax evasion. Deficits are largely financed by domestic debt issuance rather than by money creation. In 1999, the central government performed an audit of embezzlement, finding that some \$2.4 billion in state funds had been diverted into private bank accounts, and that a total equaling one-fifth of the central government's tax revenues were misused. In all, the government's liabilities were equal to 100% of GDP in 2000, according to some sources. Annual tax revenues equal 13% of GDP, one-fifth of which goes annually to paying interest on government debts.

The US Central Intelligence Agency (CIA) estimates that in 2000 China's central government took in revenues of approximately \$161.8 billion and had expenditures of \$191.8 billion. Overall, the government registered a deficit of approximately \$30 billion. External debt totaled \$149.4 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	161,800
Tax revenue	85.4%	138,122
Non-tax revenue	5.4%	8,759
Capital revenue	<0.1%	27
Grants	9.2%	14,891
EXPENDITURES	100.0%	191,800
General public services	8.4%	16,151
Defense	12.0%	23,006
Public order and safety	2.5%	4,724
Education	1.7%	3,244
Health	0.3%	484
Social security	3.8%	7,270
Housing and community amenities	0.2%	288
Recreation, cultural, and religious affairs	0.4%	685
Economic affairs and services	17.8%	34,193
Other expenditures	53.1%	101,754

### 36 TAXATION

An overhaul of China's tax system began in 1979 as part of the Four Modernizations program. The principal domestic levies, as in the past, were commercial and industrial taxes imposed on all enterprises, but, after 1979, taxes were due only on assigned production quotas. In 1993, the Consolidated Industrial and

Commercial Tax was levied (usually at 5–10%) on agricultural and industrial production, commercial retailing, and service, transportation, and communication earnings.

On 1 January 1994, the PRC Individual Income Tax law came into effect in China. The PRC introduced a new turnover tax system consisting of a VAT, business tax, and consumption/excise tax, to replace the CICT. Under the new system the sale or importation of goods and services are subject to VAT at a standard rate of 17%. Other services and the transfer of real property and intangible assets are subject to a business tax with a rate ranging from 3% to 20%. Consumption/excise taxes were also introduced to tax 11 categories of goods, including cigarettes and alcoholic beverages.

Under a tax law that took effect on 1 July 1991, joint and foreign owned ventures pay a combined national and provincial tax levied at 33% of pre-tax income. A foreign-owned enterprise with income from sources in China but not established there pays a 20% withholding income tax, and royalties for certain types of technical knowledge are taxed at 10% of the revenue amount. Individuals are required to submit individual income tax returns to the Tax Bureau on a monthly basis. As of 1 January 1996, tax rates ranged from 5% to 45% for individual income tax.

### 37 CUSTOMS AND DUTIES

Although China is in the process of aligning its trade system with international standards, prohibitively high tariffs and quotas discourage many imports. It uses the Harmonized System for tariff classification. A minimum tariff rate is granted to countries that have special agreements with China, including the United States. Tariff rates range from 3–100% with the highest rates reserved for goods such as automobiles. Raw materials are exempt. In 1996, as a step toward WTO compliance, China reduced tariffs on more than 4,000 products by an average of 30%, and then reduced tariffs even further in 2001 in preparation for WTO accession. In 2000, the US-China Trade Relations Working Group successfully opened trade relations with China, with such agreements as: reducing the automobile tariff from a maximum of 100% to a maximum of 25%; reducing auto parts tariffs from 23.4% to 10%; and eliminating quotas by 2005. In addition, China agreed to a reduction in chemical tariffs from about 15% to 7% and a reduction in textile tariffs from 25% to 12% by 2005 (but a quota safeguard would be available in the event that the industry failed). Steel tariffs were to be reduced from 10% to 6% by 2003. These reductions would be implemented on a sliding yearly basis. Most other tariffs have been scheduled for reduction by more than 50%, to an average of 9.4% by 2005 on industrial tariffs and an average of 17% on agricultural tariffs by 2004. China acceded to the World Trade Organization on 11 December 2001.

Official PRC policy is that direct trade with Taiwan is interregional, rather than international, since Taiwan is considered a province of China and, therefore, no customs duties are levied. There are free trade zones in Shanghai, Tianjin, Dalian, Haikou, the Hainan Island Special Economic Zone, and within the Shenzhen Special Economic Zone. Smuggling, reportedly well organized along the coasts of Guangdong, Fujian, and Zhejiang provinces and in the frontier regions of Tibet and Yunnan, is a major governmental concern.

### 38 FOREIGN INVESTMENT

China strongly emphasizes attracting foreign investment in projects that will enhance the nation's economic development. Beginning in the early 1970s, China contracted for the construction of a substantial number of complete plants, notably for iron and steel, automobile, and fertilizer manufacture and power generation, including nuclear power. Such agreements, often made with private firms from Japan, Germany, Italy, France, the United Kingdom, and Canada, as well as with

agencies of the Communist states, all called for direct purchase of materials and services. Residual ownership by foreigners and remittance of profits from production were expressly disallowed. In 1979, China established the Foreign Investment Control Commission to attract and coordinate foreign investment, and the first four Special Economic Zones (SEZs) in southern China at Shenzhen, Xiamen, Shantou, and Zhuhai to attract foreign investment (the fifth SEZ was established on Hainan Island in 1988). China's policies toward private investment have become increasingly open. In the 1980s, foreign investment was restricted to export-oriented businesses, and foreign investors were required to enter into joint ventures (JVs) with Chinese counterparts in order to enter the market. Under the Joint Ventures Law, enacted in 1979 and revised in 1982, the development of joint ventures for the production of exports has been particularly stressed as a means of securing for China the foreign exchange needed to pay for purchases of advanced technology. Foreign investment in products for the domestic market, other than those needed for modernization, was discouraged. In 1984, further foreign investment opportunities were created with the designation of 14 open coastal cities—Shanghai, Guangzhou, Tianjin, Fuzhou, Dalian, Qinhuaodao, Yantai, Qingdao, Lianyungan, Nantong, Ningbo, Wenzhou, Zhanjiang, and Beihai—where preferential incentives could also be offered. Since then, 52 state-approved economic and technology zones have come into existence, and most provinces, regions, and major municipalities have their own international and trust investment corporations, of which the one in Shanghai is the largest. Special corporations for the attraction of investment by overseas Chinese have been established in Fujian and Zhejiang provinces. In the early 1990s, the government began allowing foreign investors to manufacture and sell an increasingly wide variety of goods in the domestic market. From the mid-1990s, wholly foreign-owned enterprises (WFOEs) have been allowed to operate. In 2000 and 2001, China revised its laws on JVs and WFOEs to eliminate requirements for foreign exchange balancing, to eliminate domestic sales ratio requirements, to eliminate or adjust advanced technology and export performance requirements, and to modify provisions on domestic procurement of raw materials. With China's accession to the WTO in November 2001, foreign investment opportunities were further expanded with the removal of financial and distribution services from the restricted list. Only the production of arms, and the mining and processing of certain minerals are currently off-limits to foreign investment.

China attracts capital in four ways: (1) by soliciting loans and credits from foreign governments and international financial institutions; (2) by floating bonds and debentures on international capital markets; (3) by promoting direct foreign investment through joint ventures and other cooperative enterprises; and (4) by accumulating trade surpluses from export sales.

From 1979 to 2000, according to Chinese government figures, FDI totaled \$350 billion. This figure includes investment from the Special Administrative Regions (SARs) of Hong Kong and Macao as well as from Taiwan. On an annual basis, this not-very-foreign proportion of FDI has dropped from over two-thirds to an average of 45.5% for 1999 and 2000. (Analysts have also estimated that 10% to 30% of FDI from Hong Kong actually comes from Chinese mainland companies looking for a tax break). From 1979 to 1990, double-digit annual growth rates in the early years (55% in 1984 and 38% in 1985) declined to a low of 2.7% in 1990, the year after the Tiananmen Square violence. However, in 1991, FDI increased 25% and then soared by triple digits in 1992 (152%) and 1993 (150%). By the end of 1995, over 258,000 foreign-invested enterprises had registered in China. In 1996 a World Bank study found that China attracted more than one-third of all investment in factories and other manufacturing plants in developing nations. Growth rates, of

course, moderated after their early surge, but it was not until the Asian financial crisis of 1997–98, precipitated by China's reabsorption of Hong Kong in June 1997, that annual FDI levels stagnated, with a 0.45% growth rate in 1998, and then declined, with an 11.1% fall in 1999 from \$45.46 billion to \$40.4 billion annual FDI. In 1999 foreign invested firms numbered 300,000 and accounted for almost 50% of exports. In 2000, FDI only grew 0.9%, to \$40.77 billion, but in 2001, a 14.6% increase sent annual FDI to a record \$46.8 billion.

China continues to have no mergers and acquisitions law that would permit the involuntary take-over of a company. A company can be bought outright but the sale requires specific government approval, as do all investments in China. Indirect foreign (or portfolio) investment (FII) is limited to those willing to invest in the mainland companies listed on the Chinese stock exchange. Mainland companies raised about \$22 billion in 2000. This fell to about \$12 billion in 2001, reflecting the near 50% drop in foreign investment worldwide following the 11 September 2001 terrorist attacks on the United States.

Until the early 1980s, the flow of Chinese funds abroad was confined to assistance to developing countries and to investment in Hong Kong real estate. In 1983, however, China began making direct investments overseas, in the United States, Canada, the Solomon Islands, and Sri Lanka. China has been a significant supplier of development aid to other countries. Recipients of Chinese military and economic assistance have included the DPRK, Vietnam, Egypt, Pakistan, and Tanzania.

### **39 ECONOMIC DEVELOPMENT**

A profound restructuring of China's economy began in 1949 following the founding of the PRC. Adhering to orthodox models borrowed wholesale from the former USSR, the PRC brought all major industrial, infrastructure, and financial enterprises directly under state ownership. Agriculture was collectivized. Management of the economy was closely controlled by central authorities, whose powers extended to the allocation of basic commodities and the basic division of resources into investment, consumption, and defense channels. Centralized planning for economic development was introduced in the form of five-year economic plans.

The first five-year plan (1953–57), belatedly announced in 1957, pursued rapid industrialization along Soviet lines, with a special emphasis on increases in steel and other heavy industries. The plan reportedly achieved its goals of a 5% gain in gross value of agricultural output and a 4% gain in grain production, and exceeded the 19% growth target in gross value of industrial output.

The second five-year plan (1958–62) was voided at its start by the social and economic upheavals of the Great Leap Forward. At the heart of the Great Leap was the establishment of the self-sufficient rural commune; decentralization of industry was stressed, and the rural unemployed put to work in “backyard steel furnaces” and other industrial enterprises of dubious efficiency. Incomes were determined by need, and coercion and revolutionary enthusiasm replaced profit as the motivation for work. Publication of economic data ceased at this time, but Western observers estimated a 1% decline in agriculture for the 1958–60 period, an increase in GNP of only 1%, and no more than a 6% increase in industrial output. After the bad harvests of 1960 and 1961, an “agriculture first” policy was adopted under which large areas of semiarid steppe and other marginal lands in the north and west were converted to agricultural use.

A third five-year plan (1966–70), formulated by governmental pragmatists and calling for rapid growth of all sectors, was aborted by the outbreak of the Cultural Revolution. In 1969, the government published a report calling for a more open approach to foreign assistance and trade. Domestically, it confirmed the use of the “mass line”—the system of calling upon workers and

peasants to take responsibility and initiative, and to work without material incentives. It favored the simultaneous use of modern and traditional employment methods (the “walking on two legs” policy), and recommended expansion of industry through investment of profits derived from the sale of agricultural and light industrial products. At the heart of the 1969 policy was a reversion to the commune system of 1958—a program to make the countryside self-sufficient, with every commune not only growing its own food but also producing its own fertilizer and tools, generating its own electricity, and managing its own small handicrafts factories, health schemes, and primary schools. In contrast to the hastily organized communes of 1958–60, however, the new units frequently adhered to the traditional—and more manageable—structure of Chinese rural life.

Long-range economic planning resumed in 1970 with the announcement of a fourth five-year plan, for 1971–75. In late 1975, Premier Zhou Enlai proclaimed the plan successful. Agricultural output was reported to have grown by 51% during the 1964–74 period, while gross industrial output was said to have increased by 190%. Specifically, the following growth rates (1964–74) for mining and industry were reported: petroleum, 660%; coal, 92%; steel, 120%; cotton yarn, 86%; tractors, 540%; chemical fertilizers, 350%; and electric power, 200%.

A fifth five-year plan (1976–80), announced in 1975, gave priority to modernization of the economy and, for the first time, emphasized the development of light rather than heavy industry. Implementation of this new departure was, however, delayed by the deaths of Mao and Zhou in 1976 and did not occur until 1978, by which time the economic pragmatists, led by Deng Xiaoping, had emerged victorious from the subsequent political and ideological struggles.

The sixth five-year plan (1981–85), announced in November 1982, reemphasized China’s commitment to the pragmatic line and to the Four Modernizations. Approximately \$115 billion was allocated for capital construction, and another \$65 billion for renovation of existing infrastructure. GNP increased by an annual average of 10%, industrial output by one of 12%, and agricultural output by one of 8.1%.

The seventh five-year plan (1986–90), announced in March 1986 and called by Deng Xiaoping “The New Long March,” featured the following major goals: increasing industrial output 7.5% annually (to \$357 billion), agricultural output 4% annually (to \$95.4 billion), national income 6.7% annually (to \$252.7 billion), and foreign trade 40% (to \$83 billion); spending \$54 billion on 925 major development projects in energy, raw materials, transportation, and postal and telecommunications; and investing \$74.6 billion in technological transformation of state enterprises. Rural per capita income was to rise to \$151 annually.

Concerns about the unevenness of China’s economic development progress, both in geographic and sectoral terms, shaped the country’s eighth five-year plan. To ameliorate potentially crippling bottlenecks in the supply of raw materials, energy, transportation, and communications capacity, the government prioritized the financing of infrastructure investments. Streamlining of inefficient state industrial enterprises was targeted as well, with the setting up of an unemployment security fund planned in order to assist laid-off workers make the transition to employment in nonstate industry and the services sector. Direct foreign investment in industry, services as well as infrastructure (especially energy and communications development) were promoted. The plan also emphasized better distribution of the country’s development momentum. Inland cities, especially along the Russian, Mongolian, and North Korean borders were targeted for development as export-oriented special economic zones in addition to coastal areas. Particular emphasis was given to developing major infrastructure projects to link Hong Kong, Macao and the Pearl River delta area of

Guangdong province into an integrated economic area and major export base for the 21st century.

The ninth five-year plan (1996–2000) called for a shift from a centrally planned economy to a “socialist market economy.” It also stressed resource allocation to achieve higher efficiency. The goals included continuing progress toward quadrupling the 1980 GNP by the year 2000 (a goal that had already been met by 1996) and doubling the 2000 GNP by the year 2010, a goal carried over into tenth five-year plan (2001–2005). By the end of 2002, the Chinese economic growth had come through two major external shocks (the Asian financial crisis of 1997–98 and the global economic slowdown of 2001–02) without seriously faltering, at least according to official government figures. Real GDP growth at 8% in 2000, dipped to 7.3% in 2001, and a growth rate of 7% is forecast for 2002. Inflation has been held near to zero or below, with three of the last five years showing a slight deflation in consumer prices (-0.8% in 1998; -1.4% in 1999 and a forecast of -0.4% in 2002). In 2000 and 2001 inflation was below 1%, at .4% and 0.7%, respectively.

The tenth five-year plan (2001–2005) basically calls for a continuance of these trends: average GDP growth rates of 7% with a goal of reaching a GDP of \$1.5 trillion by 2005 in the context of stable prices. Nominal per capita income would reach \$1,135, based on a natural population growth rate of only nine per thousand, which would bring China’s population to 1.33 billion by 2005. The government estimates that the labor force will increase 40 million by 2005, and that there will also be 40 million surplus rural laborers to be transferred, as the proportion of the labor force in agriculture drops from 50% (2001 est.) to a planned 44% by 2005. Under the tenth fiscal year plan the government sought to improve its “socialist market economy.” Priorities include establishing a “modern enterprise system” in the state-owned enterprises (SOEs), improving social security, and increasing the depth and breath of participation in the international economy. Registered urban unemployment, at 3.6% in 2001 and below 4% in 2002, was to be controlled at about 5% under the tenth plan. The CIA estimated that total urban unemployment was about 10% in 2001, and that there was substantial underemployment in rural areas. The tenth fiscal year plan foresaw agriculture’s share in the GDP decreasing to 13% by 2005 from 17.7% in 2001, while industry’s share was expected to increase from 49.3% to 51%, and the share of services, from 33% to 36%, across the planning period. Educational goals include attaining gross enrollments of 90% at the junior high school level, 60% in high school and 15% in higher education. Environmental targets include attaining a 18.2% forest coverage, a 35% urban green rate, and an overall 10% reduction in pollutants discharged from 2000 levels.

## 40 SOCIAL DEVELOPMENT

Social welfare programs cover workers in state-operated enterprises and institutions, which include virtually all employees of government agencies, mining, manufacturing, industry, railroad, shipping, and construction units. Welfare in rural areas is administered by the state and collective farms, which provide clothing, shelter, and food for sick and disabled people and place the aged in homes. Recreational and cultural services are also supported through welfare payments. Although wage scales in China remain low, the range of benefits has been expanding. According to the Labor Law, male workers and professional women are eligible to retire at age 60, female non-salaried workers at 55, and other women at age 50. The amount of the pension is decided by the local or city government based on the standard of living in that area.

Workers may receive six months’ sick leave at 60–100% of salary. For work-related total disability, workers are entitled to lifetime compensation of 75–90% of the standard wage. Maternity leave at full pay is provided for up to 90 days. In

addition, numerous health, day-care, and educational benefits are provided free of charge. In urban areas, housing rentals rarely exceed 5% of the monthly wage.

The economic status of women, formerly considered little more than chattels for their husband's family, improved considerably after 1950, aided by the introduction of a work-point system of payment on the communes and by legislation guaranteeing equal pay for equal work. A campaign to increase literacy among women, formerly denied education, also opened doors to increased employment opportunities. The 1950 Marriage Law abolished arranged marriages, outlawed polygamy, and further protected women's rights by granting widows the right to remarry without the consent of the dead husband's family and guaranteeing to women as well as to men the right of divorce. Nonetheless, it is still usual for a woman to move in with her husband's family after marriage, and women continue to be significantly underrepresented at the higher levels of government.

Despite constitutional provisions, women may face discrimination in the workplace. Women continue to report that unfair dismissal, sexual harassment, demotions, and wage disparity are significant problems. In addition, some enterprises are reluctant to hire women because of the additional costs of maternity leave. Most women earn less than men, and make up approximately 70% of the nation's illiterate population. Violence against women remains a serious problem, and spousal abuse goes largely unreported. The suicide rate among women is three times the global average.

A serious human rights problem is female infanticide by families wishing for sons. The imbalance of sex ratios in the country has led to a shortage of women of marriageable age, and a dramatic increase in the abduction of women for this purpose. The government continued to condemn and took steps to curb traditional abuse of women.

China's human rights record continued to draw international censure. Ongoing human rights abuses include arbitrary and lengthy detention, forced confessions, torture and the mistreatment of prisoners. Repression of political dissent continues. Prison conditions are poor and China does not allow any independent monitoring of its prisons. Widespread human rights abuses have also been reported in Chinese-occupied Tibet. The government does not tolerate any political dissent or pro-independence movements in Tibet.

## 41 HEALTH

A revamping of China's health system is under way to manage serious diseases. The Ministry of Public Health's ninth five-year plan on the control of serious diseases outlined major reforms to be reached by the year 2000. These include strengthening epidemic prevention management systems and facilities. National health practices, including the provision of both Western and traditional Chinese health services are under the supervision of the Ministry of Health. The ministry has emphasized preventive medicine and general improvement of sanitary conditions.

Since the early 1950s, mass campaigns have been mounted to deal with major public health problems. These have included nationwide cleanup campaigns and mass educational programs in the sanitary preparation of food, the treatment of drinking water, personal hygiene, and waste disposal. The entire population was mobilized to eradicate the four pests—rats, sparrows, flies, and mosquitoes—with mixed results. Epidemic prevention centers were established to carry out massive immunizations, while parasitic diseases, affecting hundreds of millions in China, were also attacked. As a result, schistosomiasis, malaria, kala-azar, and hookworm are thought to have been largely brought under control. The country's 1991–1995 five-year plan was instituted to upgrade services yet again. The prevalence of infectious diseases was to be lowered by 20% by 1990; all provinces were to provide

primary medical care to citizens; there were plans to add 450,000 hospital beds and 500,000 technical health workers; and the availability of health insurance was forecast to increase. From 1985 to 1992, 90% of inhabitants had access to health care services. In 2000, 75% of the population had access to safe drinking water and 38% had adequate sanitation.

There were 62,000 hospitals at the end of 1990 (a rise of 3,000 over 1985) and total beds numbered 2.6 million (up by 370,000), a rate of 2.33 per 1,000. As of 1999, there were an estimated 1.7 physicians and 2.4 hospital beds per 1,000 people. During the Cultural Revolution, in an effort to even out the disparity between rural and urban health services, medical personnel from hospitals (as much as 30–50% of a hospital's medical staff) were included in groups of people sent down to the countryside and the number of locally trained paramedical personnel, called barefoot doctors, expanded. An increasingly important medical factor since the Cultural Revolution, these young peasants or middle-school graduates have been trained on the job by township doctors or in two-month courses at township health clinics. Barefoot doctors and production teams and brigade health stations are still the major deliverers of health care in the countryside.

As of 2000, an estimated 83% of married women (ages 15 to 49) used contraception. The infant mortality rate was reduced from as high as 200 per 1,000 live births before 1949 to an estimated 32 per 1,000 in 2000. The maternal mortality rate was estimated at 55 per 100,000 live births in 1998. In the mid-1990s, China vaccinated a high percentage of its children up to one year of age: tuberculosis, 94%; diphtheria, pertussis, and tetanus, 93%; polio, 94%; and measles, 89%. Despite the high immunization rates, diseases still persist. China had the greatest number of tuberculosis cases of any UN member state. In 1999, there were 103 cases of tuberculosis per 100,000 people. According to the World Health Organization, cholera was reported in 10,344 individuals in 1995. In China, which accounts for 20% of the world's tetanus cases, over 90,000 a year die from neonatal tetanus. In the mid-1990s, only 10% of pregnant women were immunized against tetanus.

Average life expectancy in 2000 was 70 years, up from an average of 45 years in 1950. From 1985 to 1990, major causes of death were recorded as: communicable diseases and maternal/perinatal causes (117 per 100,000), noncommunicable diseases (696 per 100,000), and injuries (88 per 100,000). In an effort to prevent the spread of AIDS, the government (in 1987) required the testing of all foreigners for the HIV virus. HIV prevalence in 1999 was 0.1 per 100 adults. At the end of 2001 the number of people living with HIV/AIDS was estimated at 1.25 million and deaths from AIDS that year were estimated at 17,000.

## 42 HOUSING

China has an acute shortage of housing, attributable not only to the large annual increases in population (over 10 million a year) that must be accommodated but also to the long-standing policy of directing investment funds into heavy industry rather than into housing and other social amenities. In the mid-1990s, the total number of housing units in China stood at 276,502,000. Approximately 400,000 new dwellings were completed per year and 90.6% of all homes had piped water. By the end of 2002, an additional 19.25 million square meters of commercial housing had been completed, presenting a 10.5% increase from the previous year. The government expects to build 486 million to 549 million square meters of floor space each year for the first 20 years of the 21st century. In 2002, the annual investment for housing was at about US\$97 billion. During the 1990s, the government began a program of transferring ownership of state-owned housing into private hands at fairly low costs and with subsidized mortgages. As a result, an estimated 73% of families own their own residence.

### 43 EDUCATION

Prior to 1949, schools were available for less than 40% of school-age children; 85% of the people were illiterate. During 1949–59, school attendance increased nearly fourfold. In 1959, about 50 million children received preschool education; primary schooling was nearly universal, with some 92.6 million students (between 85% and 90% of all school-age children) in primary schools; 12 million were in secondary schools. By 1966, total school enrollment in China reached 116 million, with the average pupil receiving 5.5 years of formal schooling.

The Cultural Revolution affected education more than any other sector of society. Schools were shut down in mid-1966 to give the student Red Guards the opportunity to “make revolution” on and off campus. The Cultural Revolution touched off purges within the educational establishment. Upper- and middle-level bureaucrats throughout the system were removed from office, and virtually entire university faculties and staffs dispersed. Although many lower schools had begun to reopen during 1969, several universities remained closed through the early 1970s, as an estimated 10 million urban students were removed to the countryside to take part in labor campaigns. During this period and its aftermath, revolutionary ideology, and local conditions became the principal determinants of curriculum. A nine-year program of compulsory education (compressed from 12 years) was established for youths 7–15 years of age.

Education was reoriented in 1978 under the Four Modernizations policy, which restored the pre-1966 emphasis on competitive examinations and the development of special schools for the most promising students. The most striking changes were effected at the junior and senior high school levels, in which students were again streamed, according to ability, into an estimated 5,000 high-quality, well-equipped schools, or into lower-quality high schools, or into the technical and vocational schools, which were perceived as the least prestigious. In addition, 96 universities, 200 technical schools, and 7,000 primary schools were designated as “key” institutions. Universities were reopened, with a renewed emphasis given to science and technology. During the 1980s, having universal primary education instituted by 1990 became a main goal.

By 1998, there were 628,840 primary schools with 5,794,000 teachers and 139,954,000 students. Student-to-teacher ratio stood at 24 to 1. At the secondary level, there were 4,437,000 teachers and 718,883,000 students. As of 1999, 93% of primary-school-age children were enrolled in school. For the year 2000, adult illiteracy rates (per UNESCO) were estimated at 15.0% (males, 7.7%; females, 22.6%). In 1995, public expenditure on education was 2.2% of GDP.

In 1985 there were 1,016 colleges and universities in China. Among the largest and most prestigious institutions were Beijing University and Qinghua University, both in Beijing; Zhongshan University, in Guangzhou; Nanjing University and Nanjing Institute of Technology; Nankai University and Tianjin University, in Tianjin; and Fudan University, in Shanghai. Graduate education resumed in the late 1970s; the number of graduates increased from 147,111 in 1981 to 645,510 in 1991. By 1998, the number of students enrolled in post-secondary institutions totaled 6,075,215, with 516,400 teachers.

Tuition has traditionally been free in vocational secondary schools, and in training schools for elementary teachers, as well as in colleges and universities; students in need of food, clothing, and textbooks receive state grants-in-aid. Primary and general secondary school students pay a nominal tuition fee. Part-time primary and secondary schools, evening universities, and correspondence schools exist for adult workers and peasants.

### 44 LIBRARIES AND MUSEUMS

The National Library in Beijing (founded in 1909) is the largest in China, with over 22 million volumes, including more than 291,000 rare ancient Chinese books and manuscripts. The Chinese Academy of Sciences Central Library, in Beijing, has a collection of 6.2 million volumes, with branches in Shanghai, Lanzhou, Wuhan, and Chengdu. The Capital Library in Beijing (2.6 million volumes) is the city’s public library and operates lending, reference, and children’s services. The Shoudou Library, also in Beijing, has 2.35 million volumes.

Small lending libraries and reading rooms can be found in factories, offices, and rural townships. The library of Beijing University, with over four million volumes, is the largest university library. Other important university collections are at Nanjing University in Nanjing (3.2 million volumes), Fudan University in Shanghai (3.6 million volumes), and Qinghua University in Beijing (2.5 million volumes). The Central Institute of Nationalities in Beijing—one of dozens of private institutions with libraries—has a collection of 800,000 volumes, including 160 foreign-language journals.

China has a wealth of about 1,000 museums, most of them cultural in nature. The Imperial Palace Museum in Beijing houses collections of art, sculpture, silk fabric, and furniture. The Museum of the Chinese Revolution, on Tiananmen Square, has exhibits of the revolutionary movement in China from the Opium War to the founding of the PRC. In Shanghai is the Museum of Art and History, with some of the country’s outstanding archaeological and art collections. Many museums are memorials to Chinese artists and writers, and house collections of their work. China also has 500 historical sites with exhibitions. With the return of Hong Kong to China, the country gained the Hong Kong Museum of Art, the University Museum and Art Gallery, the Hong Kong Museum of History, and the Hong Kong Space Museum.

### 45 MEDIA

Postal service and telecommunications facilities fall under the authority of the Ministry of Posts and Telecommunications. The posts are responsible for the sale and distribution of newspapers and magazines, an important function in a country that relies heavily on these media for mass communication. Mail is delivered twice a day seven days a week. There were 53,600 post offices in 1990. In 2000, there were an estimated 135 million mainline telephones in use. In 2001, an additional 65 million cellular phones were in use.

#### Radio, Television and Internet

Television broadcasting began in 1958, and color transmissions in 1973. As of 1998 China had 369 AM and 259 FM radio broadcasting stations. In 1997, China Central Television operated 209 government-owned television stations. There were also 31 provincial stations and almost 3,000 city stations. The most important station is Beijing’s Central People’s Broadcasting Station (CPBS); from there, programs are relayed by local stations. CPBS broadcasts daily on several channels using a variety of languages, including Mandarin (or standard Chinese), the Hokkien and Hakka dialects, Cantonese, Mongolian, Tibetan, Uygur, Kazakhi and Korean.

In 2000 there were 339 radios and 293 television sets for every 1,000 people. Many of the TV sets are installed in public meeting places and in government and economic enterprises, although increasingly a television set has become a much-prized private acquisition. Since large segments of the rural population are as yet without radios and television sets, the government operates a massive wired broadcast network linked to over 100 million loudspeakers.

Despite controls, a rapidly growing number of Chinese have access to satellite television and the Internet. The government regulates access of the Internet through the Ministry of Information Industry and the Ministries of Public and State Security. In 2000 there were three Internet service providers, which were serving 26.5 million subscribers in 2001.

### The Press

The press is closely controlled by the government, the CCP, or the various political and mass organizations associated with the CCP. Minority newspapers are published in Mongolian, Uygur, Tibetan, Korean, and other languages. The main news agencies are the official New China (Xinhua) News Agency; the China News Service, which supplies information to overseas Chinese newspapers and journals; and China Feature, which supplies articles to magazines and newspapers worldwide.

The Cultural Revolution caused substantial upheaval in the Chinese press establishment. Many publications closed down, and others underwent purges of editorial staffs. Publication of *Hongqi* (Red Flag), the most authoritative of the CCP publications, resumed in 1968.

The major newspapers, with their locations and circulations in 2002, are:

CHINA	LOCATION	CIRCULATION
<i>Gongren Ribao</i> (Worker's Daily)	Beijing	2,500,000
<i>Renmin Ribao</i> (People's Daily)	Beijing	2,150,000
<i>Xin Min Wanbao</i> (Xin Min Evening News)	Shanghai	1,800,000
<i>Wenhui Bao</i> (Wenhui Daily)	Shanghai	1,700,000
<i>Yangcheng Wanbao</i> (Yangcheng Evening News)	Guangzhou	1,300,000
<i>Jiefang Ribao</i> (Liberation Daily)	Shanghai	1,000,000
<i>Jiefangjun Bao</i> (Liberation Army Daily)	Beijing	800,000

*Jiefangjun Bao*, the army news, played a leading role in the Cultural Revolution. China's first English-language newspaper, the *China Daily*, founded in 1981, is published in Beijing and had a circulation of 150,000 in 1999. The most authoritative publication for foreigners is the multilingual weekly *Beijing Review*, which distributed in China and abroad, with a 1995 circulation of more than 100,000.

In 2002, Hong Kong had over 75 daily newspapers in circulation, some of which are English-language papers from other countries, such as the *Toronto Star*, the *Boston Globe*, and the *Australian*. Major Hong Kong dailies and their 2002 circulation are:

HONG KONG	CIRCULATION
<i>Tin Tin Yat Pao</i>	199,260
<i>Sing Tao Wan Pao</i>	125,000
<i>Wah Ku Yat Po</i>	125,000
<i>Ching Pao</i>	120,000
<i>Hong Kong Commercial Daily</i>	110,000
<i>South China Morning Post</i>	104,000
<i>Hong Kong Daily News</i>	101,815

The largest daily newspaper in Macau is *Ou Mun Iat Pou* (Macau Daily News, 2002 circulation 100,000).

Though China's constitution states that freedom of speech and of the press are fundamental rights, in practice the Communist Party and the government control all print and electronic media, which are compelled to propagate the current ideological line. All media are under explicit, public orders to guide public opinion as directed by the authorities.

## 46 ORGANIZATIONS

Prior to 1966, the leading mass organizations, all closely tied to the regime, were the Communist Youth League, the Women's Federation, the Federation of Literary and Art Circles, the Federation of Scientific Societies, and the Federation of Industry

and Commerce. These bodies were to some extent eclipsed by the Cultural Revolution, which spawned a host of new groups. After the Cultural Revolution passed its peak, many of the new organizations lost ground, while local Communist Youth League organizations, including the Young Pioneers, gained prestige. By the mid-1980s, the pre-Cultural Revolution groups were once again ascendant.

There are professional and trade organizations representing a wide variety of professional fields. The All China Federation of Industry and Commerce promotes international trade. The All China Federation of Trade Unions serves as an advocate for worker's rights and benefits, particularly for women. The Asia Pacific Occupational Safety and Health Organization (APOSHO) is located in Hong Kong. There are also several organizations dedicated to research and education in various fields of medicine and science. The China National Association of Literature and Fine Arts is based in Taiwan.

National women's organizations include the Association for the Advancement of Feminism (AAF), based in Hong Kong and the All China Women's Federation, based in Beijing. A wide variety of sports organizations are active throughout the country, including the Chinese Table Tennis Association, which has gained international recognition. The largest youth association is the umbrella organization the All-China Youth Federation (ACYF), which is led by the Communist Party of China. Member organizations include the Rural Young Entrepreneurs Association, the Association for Young Journalists, the Communist Youth League (CYL) of China, the All-China Students Federation (ACSF), the YMCA and YWCA, and the Chinese Young Entrepreneurs Association (CYEA). Scouting groups exist in Hong Kong and Macau.

## 47 TOURISM, TRAVEL, AND RECREATION

Chinese restrictions on tourism were eased to allow access by foreigners on group tours in 1976 and further relaxed in 1983, when the ban on individual travel was lifted. By 1985, 244 Chinese cities and scenic spots were open to foreign tourists and a number of resorts specifically designed for foreigners were in operation. China was opened to tourists from Taiwan in 1987. All visitors to China must have visas. In 2000, 10,160,432 tourists arrived in China. Total receipts from tourism in that year were estimated at \$16.2 billion. There were 948,185 hotel rooms with 1,855,965 beds and a 56% occupancy rate. In 2000, the US Department of State estimated that the daily expenses for a stay in Beijing were about \$227.

### Tourist Attractions

The most famous tourist attraction in China is the Great Wall, the construction of which began in the 3rd century BC as a barrier against northern invaders. Other leading tourist attractions include the Forbidden City, or Imperial Palace, in Beijing; the nearby tombs of the Ming emperors; historic Hangzhou, with its famous West Lake and gardens; busy Shanghai, with its well-stocked stores and superb cuisine; Xi'an, the site of monumental Qin dynasty excavations; and Guangzhou, the center of Cantonese cooking, with an extensive Cultural Park.

### Sports

Sports activities in China are coordinated by the State Physical Culture and Sports Commission and the All-China Sports Federation. Active sports, represented by national associations, include gymnastics, diving, basketball, soccer, tennis, cycling, swimming, tennis, volleyball, weight lifting, and mountain climbing.

Distinctively Chinese pastimes include wushu, a set of ancient exercises known abroad as *gonfu* (kung fu), or the "martial arts"; taijiquan, or shadow boxing, developed in the 17th century; and *liangong shibafa*, modern therapeutic exercises for easing neck,

shoulder, back, and leg ailments. Qigong (literally “breathing exercises”) is also widely practiced both as a sport and as physical therapy. A popular traditional spectator sport is Chinese wrestling. Traditional pastimes for the national minorities are horse racing, show jumping, and archery among the Mongolians; the sheep chase (in which the winner successfully locates and defends possession of a slaughtered sheep) among Uygurs and Kazaks; and yak and horse racing among Tibetans.

The costs of traveling in China vary from city to city. In 1999 the UN estimated the daily cost of staying in Shanghai at \$125, Beijing at \$108, and Zhengzhou at \$85.

## 48 FAMOUS CHINESE

Confucius (K'ung Fu-tzu or Kong Fuzi, 551–479 BC) is generally regarded as the most important historical figure, as well as the greatest scholar, of ancient China. His philosophy and social ideas include observance of filial piety, the sanctity of the family, and social responsibility. Other early philosophers were Lao-tzu (Laozi; Li Erh, 604?–531 BC), the traditional founder of Taoism; Mencius (Meng-tzu or Mengzi, 385–289 BC), who stressed the essential goodness of human nature and the right of subjects to revolt against unjust rulers; and Mo Ti (Di, 465?–390? BC), who stressed the theme of universal love. Among the principal early poets was Chu (Chü) Yuan, (340–278 BC), whose *Li Sao*, a melancholy rhapsody, is among the world's great poems. Sima Qian (Ssu-ma Ch'ien, 145–87 BC) produced the monumental *Shih-i* (*Shih-chi; Historical Records*), the first general history of China. Ban Gu (Pan Ku, AD 32–92) wrote *Qian Hanshu* (*Ch'ien-Han shu; History of the Former Han Dynasty*), a continuation of Sima Qian's work. Zhang (Chang) Heng (78–139), an astronomer, is credited with having invented the first seismograph. Zhang Zhongjing (Chang Chung-ching, 152–219) was a celebrated physician, and Zu Zhongzhi (Tsu Chung-chih, 429–500) calculated the figure 3.14159265 as the exact value for  $\pi$ . Three brilliant poets of the Tang dynasty were Li Bo (Po, 701–62), Du (Tu) Fu (712–70), and Bo Juyi (Po Chü-yi, 772–846). Li Shizhen (Shi-chen, 1518–93), an outstanding pharmacologist, wrote a monumental *Materia Medica*. Great authors of the Qing dynasty were Wu Jingzi (Ching-tzu, 1701–54), who wrote *Rulin Waishi* (*Ju-lin wai-shih; Unofficial History of the Scholars*), a superb satire on the civil service system, and Cao Xuequin (Ts'ao Hsüeh-ch'in, 1715?–63), who produced a remarkable novel, *Honglou meng* (*Hung-lou meng; The Dream of the Red Chamber*). Lu Xun or Lu Hsun (Zhou Shuren or Chou Shu-jen, 1881–1936) is generally regarded as China's greatest writer of the modern period. Mao Dun (Shen Yanbing, 1896–1981) and Ba Jin (Li Feigan, b.1904) are leading novelists. Lin Yutang (Yu-t'ang, 1895–1976) popularized Chinese culture in the West.

## Political Figures

Sun Yat-sen (Zhongshan or Chung-shan, 1866–1925) planned the revolution against the Manchus and became the first president (1911–12) of the republic. Mao Zedong (Tse-tung, 1893–1976), the foremost figure of postrevolutionary China, served as chairman of the Central Committee of the CCP from 1956 to 1976. Other prominent Chinese Communist leaders include Zhu De (Chu Teh, 1886–1976), who became commander in chief of the Red Army in 1931 and chairman of the Standing Committee of the NPC; Zhou Enlai (Chou En-lai, 1898–1976), first premier of China's State Council; Liu Shaoqi (Shao-ch'i, 1898–1969), who became China's head of state in 1959 and was purged during the Cultural Revolution but posthumously rehabilitated in 1985; and Lin Biao (Piao, 1908–71), who became deputy premier and minister of defense in 1959 and who, prior to his death and subsequent political vilification, had been certified as Mao's successor in the constitution drawn up in 1969. Women in the political hierarchy have included Song Qingling (Soong Ch'ing-ling, 1892–1981), Sun Zhongshan's wife, and Jiang Qing

(Chiang Ch'ing, 1913–1991), Mao's fourth wife, who emerged as a radical leader during the Cultural Revolution. Jiang, with other prominent radicals, was purged in the wake of the ascension of Hua Guofeng (b.1920) as CCP chairman in 1976. Deng Xiaoping (1904–97), twice disgraced (1966–73 and 1976) by radical administrations, reemerged in 1977 to become China's most powerful political figure, albeit without major office, and a major figure in its modernization drive; he officially retired in 1987. A protégé, Hu Yaobang (1915–1989), was party secretary until his ouster in 1987. Another protégé, who emerged in 1987 as the likely preeminent Chinese leader of the future, although still currently in the political shadow of Deng, was Zhao Ziyang (b.1919), who became general secretary of the CCP in 1987; Li Peng (b.1928) was named premier in the same year.

## 49 DEPENDENCIES

### Hong Kong

Hong Kong consists of 237 small islands off the southeast coast of the mainland of China and a small peninsula adjoining Guangdong Province on the mainland between 22°29' and 22°37' N and 113°52' and 114°30' E. With a total area, including reclamation, of 1,068 sq km (412 sq mi), it comprises the island of Hong Kong and adjacent islands, 79 sq km (30 sq mi); the Kowloon Peninsula, 11 sq km (4 sq mi); and the New Territories (a leased section of the Chinese mainland) and the remaining islands, 978 sq km (377 sq mi). Most of Hong Kong territory is rocky, hilly, and deeply eroded. The climate is subtropical, with hot and humid summers. Rainfall is heavy, and there are occasional typhoons.

Total population, which was under 600,000 in 1945, was approximately 7.3 million in 2002. Some 60% of Hong Kong's residents in 1996 were born there. The phenomenal increase since World War II (1939–45) resulted primarily from a large influx of mainland Chinese. During the late 1970s and early 1980s, hundreds of thousands of “boat people” arrived from Vietnam. Most have been resettled in other countries, and by mid-1987 only 8,500 remained in camps. In the summer of that year, however, Hong Kong faced another influx of Vietnamese, most of them ethnic Chinese. These people—more than 6,000 of them—had fled to China after the Vietnam war but found it difficult to assimilate there.

The overall population density in 2002 was 5,800 per sq km (14,500 per sq mi). About 95% of the inhabitants are Chinese, and about 95% of the people live in metropolitan areas. Chinese (Cantonese dialect) is the principal spoken language; both Chinese and English are official languages. Taoists, Confucianists, and Buddhists constitute a majority of the population. The Christian population (10%) is split about evenly between Roman Catholics and Protestants. There are also Muslim and Hindu communities (1%). The capital is Victoria, commonly known as Hong Kong.

Hong Kong has regular shipping, air, cable, and wireless services to every part of the world. Government-maintained roads span more than 1,830 km (1,135 mi). The mile-long Cross Harbour Road Tunnel connecting Hong Kong Island to Kowloon was opened in 1972, and the Lion Rock Tunnels link Kowloon with Sha Tin; the Aberdeen Tunnel beneath Hong Kong Island entered service in 1982. The government-owned Mass Transit Railway, a 38.6 km (24 mi) subway system, was begun in November 1975 and started operations in October 1979. The government also owns and operates a 56-km (35-mi) rail line, known as the Kowloon-Canton Railway. The railroad links up with the rail system of Guangdong Province and constitutes a major land-entry route to China; passenger service, suspended in 1949, was resumed in 1979. The Kowloon-Canton Railway operates a 34-km (21-mi) light rail system for the New Territories; as of 2001, it connected to the China railway system.

Hong Kong has one of the finest natural harbors. There are deepwater berths in Kowloon Peninsula and in Hong Kong; a container terminal at Kwaichung in Kowloon handles some 60% of Hong Kong's exports. An extensive ferry service connects Hong Kong's islands; hydrofoils provide service to Macau. The Hong Kong airport, Kai Tak, is the world's fourth largest in terms of passenger traffic; it can handle upwards of 27 million passengers a year. A new airport, Chep Lap Kok, a US\$20 billion project that included bridges, highways, tunnels, and a high-speed railway, opened in 1998. The first phase of the airport project, the West Kowloon expressway connecting the airport to Hong Kong Island, opened in February 1997. In April that year, another link—the Tsing Ma Bridge, the longest suspension bridge for road and rail travel in the world—opened with lavish ceremonies. Three days later, a tunnel with capacity for 180,000 cars a day opened to provide another link between Hong Kong Island and the West Kowloon expressway.

A bleak fisherman's island for most of its early history, Hong Kong was occupied in 1841 by the British. Formal cession by China was made in 1842 by the Treaty of Nanking. The Kowloon Peninsula and adjacent islands were added in 1860, and in 1898, the New Territories were leased from China for 99 years. Hong Kong fell under Japanese occupation from 25 December 1941 to 30 August 1945. Negotiations between the UK and China culminated in an agreement on 26 September 1984 under which sovereignty over the entire colony would be transferred to China as of 1 July 1997. For a 50-year period, Hong Kong would be a Special Administrative Region and would retain its capitalist economy, its political rights, and its general way of life. A Basic Law, forming a constitution for this period, took effect in 1990.

In the interim, the colony was ruled by a UK-appointed governor, with an advisory Executive Council headed by the local commander of UK forces, and an appointed Legislative Council presided over by the governor. Chris Patten, appointed governor in 1992, held the post until the transfer of control to China 1 July 1997. The Urban Council of 30 members (15 elected and 15 appointed by the governor) dealt primarily with municipal affairs, and the government secretariat was responsible for the work of some 40 executive departments. The public sector's share of GDP decreased steadily after 1973. Under a 1981 defense agreement, about three-fourths of the cost of the maintenance of a garrison of 8,945 troops (including four Gurkha battalions) in Hong Kong was borne by the Hong Kong government. The currency unit is the Hong Kong dollar; exchange rates as of January 2002 were HK\$1 = US\$7.798; US\$1 = HK\$0.1282).

Located at a major crossroads of world trade, Hong Kong has become a center of commerce, shipping, industry, and banking. Rapid industrialization, accelerated by the influx of new labor, skills, and capital, changed the pattern of the economy after World War II. While heavy industries, such as shipbuilding and ship repairing, iron, and steel, remain important, light industries—especially watches, clocks, toys, and electronics—have developed more rapidly in recent years. The service sector has also experienced growth; as of 1999, approximately 86% of Hong Kong's GDP derived from services. In 2001, the gross domestic product (GDP) stood at US\$180 billion, with annual growth from 1989–97 averaging about 5% per year; in 1998, economic difficulties in Asia resulted in a 5% decline in GDP in Hong Kong. By 2000, the economy had recovered somewhat, when the growth rate stood at 10%, but was estimated to be 0% for 2001 and 1.8% for 2002.

Less than 10% of the total land area is used for farming, most of which is intensive vegetable cultivation. Agriculture does not represent a significant portion of Hong Kong's GDP, and most of Hong Kong's agricultural produce is imported. Hong Kong is among the top export markets for US produce.

Electricity is supplied by two franchise companies. Water resources, for long a serious deficiency, have been increased by

converting Plover Cove into a lake. About one-quarter of the water supply is purchased annually from China.

Imports in 2001 were valued at US\$203 billion, and exports and reexports at US\$191 billion. As one of the world's largest banking centers, Hong Kong receives a continuous flow of outside capital. The Hong Kong Association of Banks was created in January 1981 to regulate charges and deposit interest rates and oversee banking standards. There is no central bank; currency is issued by two commercial banks. In addition to the licensed banks, many Chinese firms handle Chinese remittances from overseas.

Hong Kong is self-supportive except for external defense. Revenues in 2001 were at US\$22.9 billion, derived mainly from internal taxation and import duties. Government expenditures, including US\$465 in capital expenditure, amounted to US\$24.6 billion in 2000/01.

Tourism was an important industry prior to 1997, and remained so after the transfer of Hong Kong to China. About one-fourth of the total number of tourists travel to Hong Kong from the United States, Canada, and Western Europe, with another one-fourth from Japan.

Main line telephones numbered about 3.8 million in 1999; mobile cellular telephones numbered about 3.7 million that year. Broadcasting services are provided by a government station, Radio Television Hong Kong, and by commercial operators. Broadcasting services are in both Chinese and English. More than 90% of all households have one or more television sets. The Hong Kong press included 734 newspapers and periodicals. Almost all the newspapers are in Chinese; five are English-language dailies.

The infant mortality rate was 5.73 deaths per 1,000 live births in 2002. The average life expectancy as of 2002 was 79.8 years (females, 82.69 years and males 77.1 years). In 1995, there were

4.7 hospital beds per 1,000 population, and the daily cost of a hospital bed in a public hospital was \$60.

The Hong Kong Housing Authority plans, builds, and manages public housing developments. About 40% of the population lived in public and aided housing as of the late 1990s.

In September 1980, education until the age of 15 was made compulsory; six years of primary and three years of secondary schooling are provided by the government free of charge. Schools are of three types: Chinese, English, and Anglo-Chinese. Prevocational training was offered in more than a dozen government-run institutions. Student enrollment in primary and secondary school is about a quarter of the population. Higher education is provided primarily by the University of Hong Kong and the Chinese University of Hong Kong. Hong Kong Polytechnic and the City Polytechnic of Hong Kong also provides

post-secondary education for the colony's residents. As of the late 1990s, approximately 15% of the population had received education beyond secondary school, and 92% of the population was literate.

### Macau

Macau (Macao) is situated on the south coast of China, at the mouth of the Pearl (Zhu) River, almost directly opposite Hong Kong, which is about 65 km (40 mi) away. Located at 22°6' to 22°13' N and 113°33' to 113°37' E, Macau consists of a peninsula, about 5 km (3 mi) long and 1.6 km (1 mi) wide, and two small islands, Taipa and Coloane. The total area is about 16 sq km (6 sq mi), and the total coastline is 41 km (25 mi). The climate is subtropical, with high humidity from April to October, when Macau receives most of its rainfall. Daily maximum temperatures average 29°C (84° F) during the summer; normal daily temperatures are less than 20°C (68°F) during the winter months.

Macau's population was estimated at 461,833 in mid-2002, down from 496,837 in mid-1996. The population density of over 29,000 per sq km (79,000 per sq mi) was among the highest in the world. Chinese, many of them refugees from the People's Republic of China (PRC) before Macau reverted to the PRC in 1999, constitute 95% of the total; the remaining 5% are Portuguese or of mixed Chinese-Portuguese ancestry. Large-scale movement of Chinese in and out of Macau has inevitably affected the economic and social life of the territory. The common language is Chinese, usually spoken in the Cantonese or Mandarin dialect. Portuguese is spoken by government officials, and some English, French, and Spanish are also understood. As of 1997, Buddhism (50%) and Roman Catholicism (15%) are the dominant religions.

In 1996 there were about 50 km (31 mi) of highways. A causeway links Taipa and Coloane islands, and a 2.7-km (1.7-mi) bridge connects Macau and Taipa. Macau's main asset is its harbor; ferries, hydrofoils, and jetfoils offer shuttle service between Macau and Hong Kong. In 1994, a 240-km (149-mi) road connecting Macau and Hong Kong opened, running through Guangdong Province in the PRC.

Macau is the oldest European settlement in the Far East. The first Portuguese attempts to establish relations with China were made in the early 16th century. In 1557, the Chinese authorities agreed to Portuguese settlement of Macau, with leaseholder rights. The Portuguese, however, treated Macau as their possession and established a municipal government in the form of a senate of the local inhabitants. Disputes concerning jurisdiction and administration developed. In 1833, Macau together with Timor became an overseas province of Portugal under the control of the governor-general of Goa, and in 1849, Portugal succeeded in having Macau declared a free port. On 26 March 1887, China confirmed perpetual occupation and governance of Macau and its dependencies by Portugal, but the question of the delimitation of the boundaries was left unsettled.

As the only neutral port on the South China Sea during World War II (1939–45), Macau enjoyed a modicum of prosperity. In 1949, the government of the PRC renounced the "unequal treaty" granting Portuguese suzerainty over Macau. Civil disturbances in late 1966 between Macau police and Chinese leftist groups resulted in concessions to the territory's pro-China elements. The 1974 military coup in Portugal led to a constitutional change in Macau's status from a Portuguese province to a "special territory." In January 1976, Portugal's remaining few hundred troops were withdrawn from Macau. China and Portugal established diplomatic ties in 1980. In March 1987, the PRC and Portugal reached an agreement for the return of Macau to the PRC on 20 December 1999. The PRC has guaranteed not to interfere in Macau's capitalist economy and way of life for a period of 50 years.

Prior to and immediately following Macau's transfer to PRC control, the unit of currency was the Macau pataca (P) of 100 avos; Hong Kong dollars also circulated freely. There are coins of 10, 20, and 50 avos and 1 and 5 patacas, and notes of 5, 10, 50, 100, and 500 patacas. The pataca is linked to the Hong Kong dollar at the rate of HK\$1 = P1.03. Corporate taxes and import duties are important sources of revenue; major expenditures are for finance, security, education, and health and welfare. Until December 1999, Macau was ruled by a governor appointed by Portugal, although it was empowered to make its own laws, appoint and control its own civil service, and contract directly for foreign loans.

Macau's economy is consumer-oriented. There is little agriculture, and the territory is heavily dependent on imports from China for food, fresh water, and electricity. Important economic sectors are commerce, tourism, gambling, fishing, and light industry. There are small- and medium-scale enterprises concerned especially with the finishing of imported semimanufactured goods, in particular the manufacture of clothing, ceramics, electronic equipment, toys, and fireworks, and the printing and dyeing of cloth and yarn.

Macau's historic role has been that of a gateway for southern China. It has close trade relations with neighboring Hong Kong, another free port. Gold trading, formerly a major facet in Macau's economy, virtually came to a halt in 1974–75 following Hong Kong's decision to lift its own restrictions on gold trading. The principal exports were textiles, clothing, toys, electronics, cement, fireworks, footwear, and machinery. Principal export partners in 2000 were the United States, 43%; European Union (EU), 28%; China, 10%; and Hong Kong, 7%. The principal imports for domestic use are clothing, textiles, yarn, minerals, electrical machinery, fuel, and livestock. Total imports in 2000 were valued at \$2.3 billion, of which China provided 41%; Hong Kong, 15%; EU, 10%; Taiwan, 10%; and Japan, 6%.

Government schools are operated mainly for the children of civil servants and wealthier families, while poor Chinese students are educated in schools supported by China. Macau's University of East Asia opened in 1981. The Medical and Health Department, although critically understaffed, operates a 400-bed hospital. The 800-bed Kiang Vu Hospital has a largely China-trained staff.

Macau has six postal stations, two telephone stations, and two telegraph stations. Macau has 2 FM stations and has access to satellite communications. There are newspapers published in Chinese and Portuguese. Macau receives television broadcasts from Hong Kong.

With its varied gambling facilities, gambling provides about 60% of government revenue. Travelers must have a valid passport and a visa, which is generally purchased at the point of disembarkation. After the transfer of Macau to Chinese control in 1999, there was an increase in tourists arrivals from China.

# CYPRUS

Republic of Cyprus  
*Kypriaki Dimokratia*

**CAPITAL:** Nicosia

**FLAG:** The national flag consists of the map of Cyprus in gold set above two green olive branches on a white field.

**ANTHEM:** *Ethnikos Hymnos (National Hymn)*, beginning “Se gnorizo apo tin kopsi” (“I recognize you by the keenness of your spade”).

**MONETARY UNIT:** The Cyprus pound (c£) is a paper currency of 100 cents. There are coins of 1, 2, 5, 10, 20, and 50 cents and 1 pound, and notes of 50 cents, and 1, 5, 10, and 20 pounds. c£1 = \$1.851 (or \$1 = c£0.54; as of February 2003). The Turkish lira (TL) of 100 kuruş is the currency in the Turkish Cypriot zone.

**WEIGHTS AND MEASURES:** The metric system is the legal standard. Imperial and local measures also are used.

**HOLIDAYS:** New Year’s Day, 1 January; Epiphany, 6 January; Late President Makarios’ Day, 19 January; Greek Independence Day, 25 March; Cyprus National Day, 1 April; Labor Day, 1 May; Cyprus Independence Day, 1 October; Greek Resistance Day, 28 October; Christmas, 25 December; Boxing Day, 26 December. Holidays observed by the Turkish Cypriot community include Founding of the Turkish Federated State of Cyprus, 13 February; Turkish National Sovereignty and Children’s Day, 23 April; Turkish Youth and Sports Day, 19 May; Turkish Victory Day, 30 August; Turkish Independence Day, 29 October. Movable Christian religious holidays include Green Monday, Good Friday, Holy Saturday, and Easter Monday. Movable Muslim religious holidays are observed in the Turkish Cypriot zone.

**TIME:** 2 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Cyprus is the largest Mediterranean island after Sicily and Sardinia. Including small island outposts of Cape Andreas known as the Klidhes, its area is 9,250 sq km (3,571 sq mi). Comparatively, the area occupied by Cyprus is about three-fifths the size of the state of Connecticut. Since 1974, the northern third of the island, or 3,367 sq km (1,300 sq mi), has been under the de facto control of the Turkish Cypriot Federated State (proclaimed in 1975), which on 15 November 1983 proclaimed its independence as the Turkish Republic of Northern Cyprus; the southern two-thirds (5,884 sq km/2,272 sq mi) are controlled by the government of the Republic of Cyprus. A narrow zone called the “green line,” patrolled by UN forces, separates the two regions and divides Nicosia, the national capital.

Cyprus is situated in the extreme northeast corner of the Mediterranean; it is 71 km (44 mi) S of Turkey, 105 km (65 mi) W of Syria, and some 800 km (500 mi) E of the Greek mainland. Cyprus extends 227 km (141 mi) ENE–WSW from Cape Andreas to Cape Drepanon and 97 km (60 mi) SSE–NNW. The average width is 56–72 km (35–45 mi); the narrow peninsula known as the Karpas, which is nowhere more than 16 km (10 mi) wide, extends 74 km (46 mi) northeastward to Cape Andreas. Cyprus has a total coastline of 648 km (403 mi).

The capital city of Cyprus, Nicosia, is located in the north central part of the country.

## <sup>2</sup>TOPOGRAPHY

Two dissimilar mountain systems, flanking a central plain, occupy the greater part of the island. The Troodos Massif, in the southwest, attaining its highest point in Mt. Olympus (1,953 m/6,406 ft), sends out numerous spurs to the northwestern, northern, and southern coasts. In the north, a geologically older

range, the Kyrenia Mountains, extend more than 160 km (100 mi) along the coast in a series of rocky peaks, capped often by medieval castles. Between these principal formations lies the Mesaoria, a low plain extending from Famagusta Bay on the east to Morphou Bay on the west. Once forested, this now treeless region, varying in width from 16 to 32 km (10–20 mi), contains the bulk of the island’s cultivable and pastoral area. There are few lakes or rivers; rivers are little more than rocky channels that carry away torrents during the thaw of spring and early summer.

## <sup>3</sup>CLIMATE

Cyprus is for the most part dry and sunny. The warm currents of the Mediterranean ensure mild winters but bring humidity to the coastal area in the summer, when the central plain is hot and dry. On the hills, daily sunshine is interrupted only occasionally by a wet period rarely lasting more than a week. The mean annual temperature is about 20°C (68°F). A cool, rainy season lasts from November to March. In winter, snow covers the higher peaks of the Troodos; elsewhere the temperature seldom falls below freezing, and conditions are mild and bracing. Rainfall is erratic and varies greatly in different parts of the island. The annual average precipitation ranges from below 30 cm (12 in) in the west-central lowlands to more than 114 cm (45 in) in the higher parts of the southern massif. The main agricultural areas receive rainfall of from 30 to 40 cm (12–16 in) annually. Earthquakes are not uncommon.

## <sup>4</sup>FLORA AND FAUNA

Except for some small lowland areas in which eucalyptus has been planted, the forests are natural growths of great antiquity, from which the Phoenician shipbuilders drew much of their timber. Forests consist principally of Aleppo pine; other

important conifers, locally dominant, are the stone pine, cedar (which is becoming rare), Mediterranean cypress, and juniper, the last growing chiefly on the lower slopes of the Kyrenia Mountains. Oriental plane and alder are plentiful in the valleys, while on the hills, Olympus dwarf oak mingles with pines of various species. Wild flowers grow in profusion, and herbs are numerous.

Cyprus has few wild animals, but birdlife is varied and includes partridge, quail, snipe, plover, and woodcock. Eagles are commonly seen in the mountains.

## 5 ENVIRONMENT

Under the Town and Country Planning Law of 1972, the government has the power to issue "reservation orders" in order to protect historic buildings, trees, or other specific points. Other conservation laws seek to preserve forests, restrict the hunting of wildlife, and maintain environmental health. The most significant environmental problems in Cyprus are water pollution, erosion, and wildlife preservation. The purity of the water supply is threatened by industrial pollutants, pesticides used in agricultural areas, and the lack of adequate sewage treatment. Other water resource problems include uneven rainfall levels at different times of the year and the absence of natural reservoir catchments. Cyprus has 0.2 cu mi of water, of which 91% is used for farming activity. One hundred percent of Cyprus' urban and rural dwellers have access to safe water. Another environmental concern is erosion, especially erosion of Cyprus's coastline. In accordance with the Foreshore Protection Law, several coastal areas have been zoned to prevent undesirable development. The Ministry of Agriculture and Natural Resources has primary responsibility for environmental matters. The expansion of urban centers threatens the habitat of Cyprus' wildlife. As of 1994, one mammal species, 17 types of birds and 43 plant species in a total of 2,000 are threatened with extinction. About 20 species of flora are protected. The Cyprus mouflon or wild sheep is protected in the Paphos Forest game reserve.

## 6 POPULATION

The population of Cyprus (Greek and Turkish zones) in 2003 was estimated by the United Nations at 802,000, which placed it as number 152 in population among the 193 nations of the world. In that year approximately 10% of the population was over 65 years of age, with another 22% of the population under 15 years of age. There were 100 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 0.76%, with the projected population for the year 2015 at 861,000. The population density in 2002 was 97 per sq km (250 per sq mi). The Turkish sector is more sparsely populated than the Greek zone.

It was estimated by the Population Reference Bureau that 57% of the population lived in urban areas in 2001. Nicosia, the capital city, located near the center of the island in the Mesaoria plain, had a 2002 population of 193,000. Other chief towns—all seaports—are Limassol, Famagusta, Larnaca, Paphos, and Kyrenia. According to the United Nations, the urban population growth rate for 2000–2005 was 1.5%.

## 7 MIGRATION

Cyprus suffered massive population shifts following the Turkish military occupation of the northern third of the island in July 1974. Some 120,000 Greek Cypriots fled from the occupied area to the south, and about 60,000 Turkish Cypriots fled in the opposite direction. As of the 1989, some 611 Greek Cypriots lived in the north, mostly on the Karpas Peninsula, and about 100 Turkish Cypriots remained in the south.

In the 1990s, asylum seekers originated mainly from the Middle East and North Africa. Until 1998, a yearly average of 70 to 100 people applied for refugee status. This figure rose

significantly in the second half of 1998 due to the arrival of approximately 150 asylum seekers who arrived in Cyprus by boat from Lebanon.

Some asylum seekers are detained as illegal entrants or over-stays. While acknowledging the difficulties in dealing with the increased number of asylum seekers, the UNHCR has encouraged the government to find alternatives to detention. The Republic of Cyprus allows recognized refugees to remain with work permits while waiting for resettlement to a third country; however resettlement is a lengthy process, and many refugees never obtain employment. Local integration is to be the preferred solution after adoption of the new refugee law.

In 2000, the net migration rate was 3.9 migrants per 1,000 population, down from 8.4 a decade earlier. There were 49,000 migrants in that year, of which only 100 were refugees. The government views the immigration level as too high.

## 8 ETHNIC GROUPS

Following the 16th-century Turkish conquest, Cyprus received a substantial permanent influx of Ottoman Turks. Many soldiers became owners of feudal estates, and there was immigration from Anatolia and Rumelia. There was virtually no intermarriage; each community preserved its own religion, language, dress, and other national characteristics, and major cities and towns had their Greek and Turkish quarters. The 1974 war had the effect of almost completely segregating the two communities.

Estimates in 2000 indicate that about 85% of the population are Greek and about 12% are Turkish. The remainder of the population includes Lebanese Maronites, Armenians, British, and others.

## 9 LANGUAGES

After independence in 1960, Greek and Turkish became the official languages. Since 1974, Greek has been the language of the south and Turkish the language of the north. English is also used extensively.

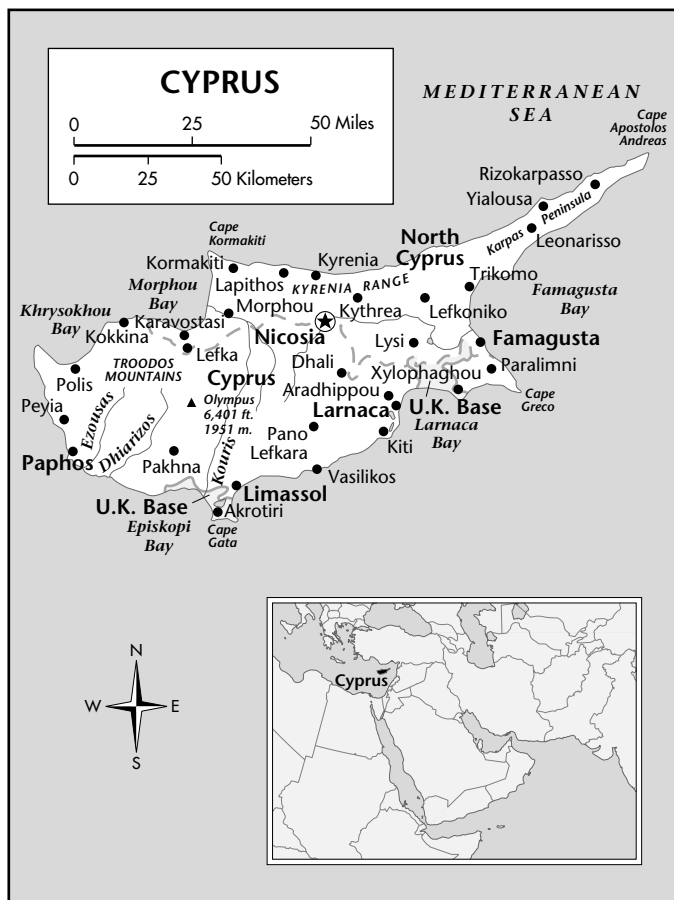

## 10 RELIGIONS

In a 2002 report, about 96% of the government-controlled area of Cyprus was Greek Orthodox. Nearly 99% of the Turkish Cypriots are Muslim. Other faiths include Maronite, Armenian Orthodox, Roman Catholic, and Protestants. Religion holds a significantly more prominent place in Greek Cypriot society than in Turkish Cypriot society, with correspondingly greater cultural and political influence. Under the Cyprus ethnarch Archbishop Makarios III, who was president of Cyprus from 1960 until his death in 1977, the church was the chief instrument of Greek Cypriot nationalism. Makarios' successor as ethnarch, Archbishop Chrysostomos, elected for life, also has played an active role in Greek Cypriot political affairs.

The independence of the Church of Cyprus was recognized by the Council of Ephesus in AD 431 and confirmed by Emperor Zeno in 478. The Church of Cyprus is one of the oldest constituent bodies of the Holy Orthodox Eastern Church, being senior by centuries to the Orthodox Church of Greece, and junior only to the four original patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem. Virtually all Turkish Cypriots are Sunni Muslims of the Hanafi sect.

## 11 TRANSPORTATION

Internal transport is exclusively by road. In 2002, there were 10,663 km (6,626 mi) of roads in the Greek area and 2,350 km (1,460 mi) of roads in the Turkish area. In the Turkish area, 1,370 km (851 mi) of the roads were paved, compared with 6,249 km (3,883 mi) in the Greek area. In addition to numerous taxicabs, the chief towns are served by private buses, whose services are regulated by the Road Motor Transport Board. In

LOCATION: 34°33' to 35°34' N; 32°16' to 34°37' E. TERRITORIAL SEA LIMIT: 12 miles.

2000 there were 257,100 licensed private motor cars and 123,300 commercial vehicles.

Although off the main world shipping routes, Cyprus is served by passenger and cargo shipping lines. Famagusta on the east coast was the main port, but it and the ports of Kyrenia and Karavostasi were closed to national shipping after the Turkish invasion in 1974. (The port of Famagusta was reopened by the Turkish Cypriots in 1978.) The Limassol and Larnaca ports have been modernized and are now considered good deepwater harbors. Other ports include Moni, Vasiliko-Ziyyi, and Paphos. In 2002, 1,254 ships totaling 22,802,712 GRT comprised the merchant fleet, one of the world's leaders in terms of deadweight tonnage, at 36,337,768 . About two-thirds of the trade passed through Limassol. There are no inland waterways.

There were 15 airports in 2001, of which 13 had paved runways. The civil airport at Nicosia was used by many international airlines until the 1974 war, after which nearly all flights were diverted to the new international airport built at Larnaca. In 1983, a new international airport opened in Paphos. In 2001, 1,503,400 passengers were carried on scheduled domestic and international flights. Cyprus Airways has services to Middle Eastern countries, but there is no regular internal air service.

## 12 HISTORY

Numerous Stone Age settlements excavated in Cyprus indicate that as early as 4000 BC a distinctive civilization existed on the island. Living in circular huts, this Neolithic people produced decorated pottery of great individuality, and used vessels and tools ground from the close-grained rocks of the Troodos Mountains. Cyprus was famous in the ancient world for its

copper, which, from about 2200 BC, was used throughout the Aegean in the making of bronze. The island is believed either to have derived its name from or to have given it to this mineral through the Greek word *kypros*—copper. Although celebrated also for its cult of Aphrodite, Cyprus was at first only a far outpost of the Hellenic world. Greek colonizers came there in sizable numbers in 1400 BC, and were followed soon afterward by Phoenician settlers. About 560 BC, Cyprus was conquered by Egypt. Coveted by each rising civilization, it was taken in turn by Persia, Alexander the Great, Egypt again, Rome, and the Byzantine Empire. Its Christian history began with the visits of Paul, accompanied first (as described in the Acts of the Apostles) by Barnabas, and later by the apostle Mark. For several centuries after AD 632, Cyprus underwent a series of Arab invasions. The island was wrested from its Byzantine ruler Isaac Comnenus in 1191 by Richard I (the Lion-Hearted) during the Third Crusade. Sold by the English king to the Knights Templar, it was transferred by that order to Guy de Lusignan, under whose dynasty the island experienced a brilliant period in its history, lasting some 300 years. Conquered in 1489 by Venice, Cyprus fell to the Turks in 1571.

The administration of Cyprus by the United Kingdom began in 1878 at a convention with Turkey initiated by the British prime minister, Benjamin Disraeli, at the Congress of Berlin. He sought to establish Cyprus as a defensive base against further Russian aggression in the Middle East. Upon the entry of Turkey into World War I, Cyprus was annexed to the British crown. It was declared a crown colony and placed under a governor in 1925.

For centuries, under Ottoman and British rule, Greek Cypriots had regarded Greece as their mother country and had sought union (*enosis*) with it as Greek nationals. In 1931, enosis agitation, long held in check, broke into violence. The Government House was burned amid widespread disturbances, and the British colonial administration applied severe repressive measures, including the deportation of clerical leaders. Agitation was dormant until the close of World War II, when it recommenced, and demands that the United Kingdom cede the island to Greece were renewed. The National Organization of Cypriot Fighters, led by Col. George Grivas, a retired Greek army officer, began a campaign of terrorism in 1955; upward of 2,000 casualties were recorded. The unity of NATO was endangered by the opposing positions taken on the Cyprus question by Greece and Turkey, but efforts by NATO members to mediate the dispute proved unsuccessful.

Against this background, the prime ministers of Greece and Turkey met in Zürich, Switzerland, early in 1959 in a further attempt to reach a settlement. Unexpectedly, the Greek Cypriots set aside their demands for enosis and accepted instead proposals for an independent republic, with representation of both the Greek and Turkish Cypriot communities guaranteed. A formula for the island's future, approved by the governments of the United Kingdom, Greece, and Turkey, also received the blessing of the Cyprus ethnarch, Archbishop Makarios III, who returned in triumph to the island from which he had been deported by the British government on charges of complicity with terrorism.

Besides determining Cyprus' legislative institutions, the Zürich settlement provided for a number of instruments defining the island's future international status. Enclaves on Cyprus were set aside for the continuation of British military installations in an effort to restore constitutional order. The United Kingdom, Greece, and Turkey, the guarantor powers, had the right to act together or singly to prevent either enosis or partition. In addition, provision was made for Greek, Turkish, and Cypriot forces to be stationed together at a tripartite headquarters. By 1 July 1960, agreement was reached on all outstanding differences, and independence was officially declared on 16 August.

From the outset, the two Cypriot communities differed on how the Zürich settlement would be implemented, and how much

autonomy the Turkish minority would enjoy. In December 1963, Turkish Cypriots, protesting a proposed constitutional change that would have strengthened the political power of the Greek Cypriot majority, clashed with Greek Cypriots and police. When fighting continued, the Cyprus government appealed to the UN Security Council. On 4 March 1964, the Security Council voted to send in troops. Turkey and Cyprus agreed on 10 August to accept a UN Security Council call for a cease-fire, but on 22 December, fighting again erupted in Nicosia and spread to other parts of the island. The UN General Assembly passed a resolution in December 1965 calling on all states to “respect the sovereignty, unity, independence, and territorial integrity of the Republic of Cyprus, and to refrain from any intervention directed against it.” The General Assembly requested the Security Council to continue UN mediation.

Violent clashes between Greek and Turkish Cypriots nearly precipitated war between Greece and Turkey in 1967, but the situation was stabilized by mutual reduction of their armed contingents on Cyprus. By January 1970, the UN peacekeeping force numbered some 3,500 troops; both Greek Cypriot National Guard and Turkish Cypriot militia also maintained sizable national guards of their own. Although talks continued between the two communities, no agreement was reached on the two basic points of dispute. Politically, the Turks wanted full autonomy, while the Greeks demanded continued unitary majority rule. Territorially, the Turks wanted Cyprus divided into Greek and Turkish-controlled zones, a position that was likewise at odds with the Greek Cypriot concept of a unitary state.

Meanwhile, tensions had developed between Makarios, who continued to oppose enosis, and the remnants of the military junta that had ruled Greece since 1967. On 2 July 1974, Makarios accused the Greek government of seeking his overthrow and called for the immediate withdrawal of 650 Greek officers in the Cypriot National Guard. Less than two weeks later, the National Guard toppled the Makarios government, forcing the Archbishop into exile and installing Nikos Sampson as president. To counter the threat of Greek control over Cyprus, Turkish Cypriot leaders asked Turkey to intervene militarily. Turkish troops landed on 20 July, but within two days the UN force had been augmented and a UN Security Council cease-fire resolution had taken effect. The coup failed, Sampson resigned on 23 July, and Glafkos Clerides became acting president in accordance with the Cyprus constitution. However, Turkey did not withdraw its forces, and while peace talks were conducted in Geneva, the Turkish military buildup continued. When talks broke down, a full-scale Turkish offensive began, and by mid-August, when a second cease-fire was accepted, Turkish forces controlled about 38% of the island. Makarios returned to Cyprus and resumed the presidency in December. On 13 February 1975, in an action considered illegal by the Cyprus government, the Turkish-held area proclaimed itself the Turkish Cypriot Federated State; Rauf Denktash, a former vice president of Cyprus and the president of the interim Autonomous Turkish Cypriot Administration (formed after the 1967 crisis), became president. A Security Council resolution on 12 March regretted the proclamation of the new state and called for the resumption of intercommunal talks. The government of the Republic of Cyprus continued to be recognized as the legally constituted authority by the UN and by all countries except Turkey, although its effective power extended only to the area under Greek Cypriot control.

After the de facto partition, Greek and Turkish Cypriot leaders met several times under UN auspices to explore a possible solution to the Cyprus problem. President Makarios conferred with Denktash in Nicosia early in 1977. When Makarios died of a heart attack on 3 August, Spyros Kyprianou became president, and he also held talks with Denktash in May 1979. Further negotiations between leaders of the two communities were held in August 1980, but again no agreement was reached. In February

1982, Greek Premier Andreas Papandreu visited Nicosia, where he pledged to argue the Greek Cypriot cause before the UN, the EC, and the Council of Europe; three months later, in May, the Turkish prime minister paid an official visit to northern Cyprus, drawing protests from the governments of both Greece and the Republic of Cyprus. On 15 November 1983, the Turkish sector proclaimed itself an independent state, the Turkish Republic of Northern Cyprus (TRNC). Denktash was named president, but only Turkey recognizes the TRNC. The UN, which condemned the TRNC's declaration of independence, tried repeatedly to end the partition between north and south, but all proposals were rejected by both parts. The major stumbling block was the south's demand that the estimated 25,000 Turkish troops in the north be withdrawn before negotiations began and the north's refusal to remove the troops before a final solution was reached. In February 1988, George Vassiliou was elected president of Cyprus, and he stated that he would call for reunification talks with the Turkish Cypriots.

Talks between him and Turkish Cypriot President Denktash, who was reelected in 1990, have taken place at intervals since 1988. In 1991, the UN Security Council called on both sides to complete an overall framework agreement. Despite speculation in 1994 that UN peacekeeping forces might be withdrawn if some progress was not registered, the mandate was renewed. In 1993 voting, Glafkos Clerides, a conservative, replaced right-wing George Vassiliou as president. Clerides won reelection to a second five-year term in 1998.

August of 1996 saw the most violent border clashes since the 1974 partition. In the space of one week, protestors broke through Greek-Cypriot security lines and clashed with Turkish-Cypriot and Turkish military forces in the buffer zone lying between the two divided parts of the island. Two Greek-Cypriots were killed and over 50 were injured by the Turkish military. The killing of the protestors, who were unarmed, brought general expressions of condemnation from the West but was supported by the Turkish government as acts of self-defense.

While they have not yet led to violence, there have been choleric clashes between Greek and Turkish Cypriot leaders over Cyprus' proposed entrance into the EU. The EU invited Cyprus to be one of ten nations to join the EU in the next round of the Union's enlargement, to take place in May 2004. Having declared that it would prefer a united Cyprus to join, the EU stipulated that if a settlement to the issue of unification was not reached before entry negotiations were scheduled to begin, then the negotiations would be begun with the Greek-Cypriot Republic of Cyprus. Both the government of Turkey and Turkish-Cypriot leaders vociferously denounced such a plan. In November 2001, Turkey threatened to annex the northern part of the island if the Greek-Cypriot Republic of Cyprus joined the EU before a settlement was reached. In December 2002, the EU's formal invitation to Cyprus to join the Union stipulated that by 28 February 2003, the two communities agree to a UN peace plan for reunification outlined by UN Secretary General Kofi Annan in November 2002. Without reunification, only the Greek Cypriot part of the island would gain membership.

Further complicating the relationship between the Northern and Southern parts of the island was the proposed sale to the Republic of Cyprus by Russia of sophisticated anti-aircraft missiles to be stationed at a newly constructed Greek air force base in Paphos. The proposed sale brought threats of invasion from the Turkish government. In January 1999, Greek Cypriots reversed their decision to install the missiles in Cyprus and agreed to station them on the Greek island of Crete instead. Tensions were eased further by the resumption of proximity talks on the reunification of the island. Under this format, Clerides and Denktash met separately with UN Secretary General Kofi Annan in New York in December 1999 and in Geneva in January-February 2000. A chief stumbling block in the discussions was

the Turkish Cypriot demand that a reunified Cyprus be a confederation, while the Greek Cypriots favor a federation. UN-sponsored negotiations between Clerides and Denktash took place again in January 2002. In November, Annan presented a comprehensive peace plan for Cyprus, envisaging a Swiss-style confederation of two equal component states, presided over by a rotating presidency. The plan would have required a referendum on both sides of the island to go into effect.

In late 2002 and early 2003, thousands of Turkish Cypriots held rallies to call for the island's reunification and Denktash's resignation. Denktash was accused of blocking progress on the November 2002 UN peace plan. In January 2003, Recep Tayyip Erdogan, the head of Turkey's governing party, the Justice and Development Party, criticized Denktash for the same reason. Denktash threatened to stand down as leader rather than sign the UN plan. Talks on Annan's reunification plan broke down on 11 March 2003, and Annan declared the island's two communities might not get a similar chance for peace for years. The Republic of Cyprus, remaining divided, signed the Accession Treaty for the EU on 16 April 2003, and is to join that body in May 2004.

Contributing to the failed peace negotiations was the election of hard-line nationalist Tassos Papadopoulos as president of Cyprus on 16 February 2003. In a surprise first-round win, Papadopoulos soundly defeated Clerides, with 51.5% of the vote to 38.8. Papadopoulos seeks the right of return of all Greek Cypriot refugees to the Turkish northern section of the island.

### 13 GOVERNMENT

The 1960 constitution of the Republic of Cyprus respects the two existing ethnic communities, Greek and Turkish, by providing specifically for representation from each community in the government. The president must be Greek and the vice president Turkish. Under the constitution, these officers are elected for five years by universal suffrage by the Greek and Turkish communities, respectively; each has the right of veto over legislation and over certain decisions of the Council of Ministers. (The Council of Ministers is made up of seven Greek and three Turkish ministers, designated by the president and vice president jointly.) Legislative authority (as of 20 June 1985) is vested in the 80-member House of Representatives, elected by the two chief communities in the proportion of 56 Greek and 24 Turkish. In January 1964, following the outbreak of fighting, Turkish representatives withdrew from the House, and temporary constitutional provisions for administering the country were put into effect.

Archbishop Makarios, who became president of Cyprus in 1960, was reelected in 1968 and 1973. Following his death in 1977, the leader of the House of Representatives, Spyros Kyprianou, became president; he was elected to two five-year terms in 1978 and 1983. (George Vassiliou, an independent, succeeded him in 1988; Glafcos Clerides was elected in 1993 and reelected in 1998. Tassos Papadopoulos was elected president in 2003). Rauf Denktash was elected vice president in 1973, but the post has remained effectively vacant since the 1974 war, in the absence of Turkish participation. Denktash has been president of the Turkish area since 1975.

On 13 February 1975, subsequent to the Turkish invasion of Cyprus, the Turkish Cypriot Federated State (TCFS) was proclaimed in the northern part of the island, and Denktash became its president. A draft constitution, approved by the state's Constituent Assembly on 25 April, was ratified by the Turkish Cypriot community in a referendum on 8 June. Establishment of the TCFS was described by Denktash as "not a unilateral declaration of independence" but a preparation for the establishment of a federal system. Denktash was elected president of the TCFS in 1976 and again in 1981; elections to a unicameral legislature of 40 seats were held those same years. On 15 November 1983, the TCFS proclaimed itself the Turkish Republic

of Northern Cyprus (TRNC), separate and independent from the Republic of Cyprus. In June 1985, TRNC voters approved a new constitution that embodied most of the old constitution's articles. The new constitution, however, increased the size of the Legislative Assembly to 50 seats. In elections held in June 1985, Rauf Denktash won reelection to a five-year term as president with more than 70% of the vote. Denktash has since been reelected in 1990, 1995, and 2000.

### 14 POLITICAL PARTIES

The four principal political parties of the Greek community in 2001 were the Progressive Party of the Working People (Anorthotikon Komma Ergazomenou Laou—AKEL), a pro-Communist group; the right-wing Democratic Rally (Demokratikos Synagermos—DISY); the center-right Democratic Party (Demokratiko Komma—DIKO); and the Socialist Party, or Social Democrats Movement (Kinima Sosialdimokraton—KISOS, formerly Eniea Demokratiki Enosi Kyprou or EDEK). Party representation in the House and percentages of the popular vote won by the parties in the elections of 27 May 2001 were AKEL, 20 seats (34.7%); DISY, 19 seats (34%); DIKO, 9 seats (14.8%); KISOS, 4 seats (6.5%); and other parties, 4 seats (9.9%). The Orthodox Church of Cyprus also exercises substantial political influence.

The Turkish Republic of Northern Cyprus held elections for a 50-seat Legislative Assembly on 6 December 1998. The right-wing National Unity Party won 24 seats (40.3% of the vote); the Democratic Party, 13 seats (22.6%); the Communal Liberation Party, 7 seats (15.4%), and the Republican Turkish Party, 6 seats (13.4%). Other minor parties won the remaining 8.3% of the popular vote.

### 15 LOCAL GOVERNMENT

Elected municipal corporations function in the chief towns and larger villages. The smaller villages are managed by commissions comprising a headman (*mukhtar*) and elders (*azas*). Voluntary district committees are responsible for activities outside the scope of the major government development projects. There are six administrative districts for the island: Famagusta, Kyrenia, Larnaca, Limassol, Nicosia, and Paphos. The Turkish Cypriot area's administrative divisions include Kyrenia, all but a small part of Famagusta, and small parts of Nicosia and Larnaca.

The 1960 constitution provided for two communal chambers, these bodies having wide authority within the two main ethnic groups, including the power to draft laws, impose taxes, and determine all religious, educational, and cultural questions. The Greek Communal Chamber, however, was abolished in 1965, and its functions reverted to the Ministry of Education (later renamed the Ministry of Education and Culture). The Turkish Communal Chamber embraces municipalities that are exclusively Turkish. Originally the duties of the Turkish Communal Chamber were to supervise Turkish cooperatives, sports organizations, and charitable institutions. But since the late 1960s, the Turkish communities have maintained strict administrative control of their own areas and have insisted on civil autonomy.

### 16 JUDICIAL SYSTEM

In the Greek Cypriot area, the Supreme Court is the final appellate court and has final authority in constitutional and administrative cases. It deals with appeals from assize and district courts, as well as from decisions by its own judges, acting singly in certain matters. There are six district courts and six assize courts. The Supreme Council of Judicature appoints judges to the district and assize courts.

In the Turkish-held area, a Supreme Court acts as final appellate court, with powers similar to those of the Supreme Court in the Greek Cypriot area. In addition to district and assize

courts, there are two Turkish communal courts as well as a communal appeals court.

The Cypriot legal system incorporates a number of elements of the British tradition including the presumption of innocence, due process protections, and the right to appeal. Both parts of Cyprus provide for fair public trials. Both in theory and in practice, the judiciary is independent of executive or military control.

## 17 ARMED FORCES

Under the Zürich agreement, Cyprus was to have an army of 2,000 men, of whom 60% were to be Greek and 40% Turkish. Subsequently, the government passed a military conscription law, enlisting men between the ages of 19 and 26 for 26 months of service. The Cypriot national guard comprised 10,000 personnel in 2002, backed by 60,000 reservists in all services. A paramilitary force of 750 men provides police services. About 1,250 troops and advisors from Greece were stationed in the south in 1999. Military spending in 2000 amounted to \$370 million or 4.2% of GDP.

## 18 INTERNATIONAL COOPERATION

Cyprus was admitted to UN membership on 20 September 1960 and is a member of ECE and all the nonregional specialized agencies. Cyprus is also a member of the Commonwealth of Nations, Council of Europe, G-77, and the WTO, as well as a signatory to the Law of the Sea. A cooperation agreement between Cyprus and the EU became effective in June 1973, and an application for membership was pending as of 2003.

## 19 ECONOMY

Historically an agricultural country with few natural resources, Cyprus has been shifting from subsistence farming to light manufacturing, and a service dominated economy. Farm mechanization has reached an advanced state, and a hopefully long-lasting solution to an erratic water supply has been achieved with the completion of a second desalination plant in 2001 that has allowed the lifting of restrictions on water usage. Large trade deficits have been partially offset by tourism and remittances from Cypriots working abroad. The Greek Cypriot economy has established itself as a business and service center for enterprises engaged in shipping, banking, and commerce. Cyprus is now classified by the World Bank as a high-income country and is on track for accession to the EU in 2004, though it is unclear what relationship it will have with the Turkish-occupied north which lags behind economically. Also Turkey has made clear its opposition to the EU's inclusion of Cyprus before its inclusion of Turkey.

The 1974 coup and the Turkish armed intervention badly disrupted the economy. Physical destruction and the displacement of about a third of the population reduced the output of the manufacturing, agricultural, and service sectors. The lands occupied by Turkish forces accounted for about 70% of the country's prewar economic output. In general, the Greek Cypriot zone recovered much more quickly and successfully than the Turkish-held region, which was burdened with the weaknesses of Turkey's economy as well as its own. Scarcity of capital and skilled labor, the lack of trade and diplomatic ties to the outside world, and the consequent shortage of development aid have aggravated the problems of northern Cyprus. In the south, on the other hand, tourism has exceeded prewar levels, foreign assistance has been readily available, and the business community has benefited from the transfer to Cyprus of the Middle Eastern operations of multinational firms driven from Beirut by the Lebanese civil war.

The Republic of Cyprus saw strong economic growth throughout the 1990s. In 1992, the economy grew by over 8%. In 1995 and 1996, growth was more modest, but still robust, registering 6.6% in 1996, a level not since attained. Growth

slumped in 1997 to 3%, which was followed by three years of recovery, with growth rates of 5%, 4.5% and 5.1% 1998 to 2000. The global slowdown of 2001 impacted Cyprus' vulnerable economy, which posted a 2.6% decline. Although growth returned in 2002, it was at an anemic 2% level due mainly to the sharp decline in tourism following the 11 September 2001 terrorist attacks on the United States. Barring serious disruptions, which are not, unfortunately all that unlikely as consequences of the confrontation with Iraq, the IMF has predicted that growth will return to 3% in 2003. Inflation and unemployment have continued at low levels. From 1992 to 2001, the weighted annual rate of inflation was 2.48%, and had fallen to 1.9% (consumer prices) in 2001, according to CIA estimates. The unemployment level was averaging below 2% before 1996, and since has averaged a little over 3%. Unemployment was at 3% in 2001, and is estimated at 3% for 2002, according to official government statistics.

In the North, however, the economy has continued to grow more slowly, at less than 1% a year accompanied by persistently high inflation. In 1995, growth was estimated at 0.5% and inflation at 215%. In 2000, according to CIA estimates, growth was .8% and inflation, based on consumer prices, was 53.2%. Unemployment in the Turkish-held north, estimated at 1.5% in 1995, was at an estimated 5.6% in 1999, the latest available year. Nominal per capita income in the south is about three times that of the north, although in purchasing power parity (PPP) terms, as estimated by the CIA, the difference is somewhat narrower.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 the Greek Cypriot area's gross domestic product (GDP) was estimated at \$9.1 billion and the Turkish Cypriot area's GDP was estimated at \$1.1 billion. The per capita GDP was estimated at \$15,000 in the Greek Cypriot area in 2001 and at \$7,000 in the Turkish Cypriot area in 2000. The annual growth rate of GDP was estimated at 2.6% in the Greek Cypriot area in 2001, and at 0.8% in the Turkish Cypriot area in 2000. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 4.6% of GDP, industry 19.9%, and services 75.5% in the Greek Cypriot area in 2001; agriculture accounted for 8.3% of GDP, industry 20.7% and services 71% in the Turkish Cypriot area in 2000. Foreign aid receipts amounted to about \$65 per capita and accounted for approximately 1% of the gross national income (GNI).

## 21 LABOR

In 2000, the economically active population totaled 291,000 in the Greek Cypriot area and 86,300 in the Turkish Cypriot area. Of total employees in the Greek Cypriot area in 2000, 73% were employed in services, 22% in industry, and 5% in agriculture. In the Turkish Cypriot area, the breakdown was services 56%, industry 23%, and agriculture 21%. The unemployment rate in the Greek Cypriot area was 3% in 1999, while in the Turkish area it amounted to 5.6%.

Trade unions, legalized in 1937, represent employees in agriculture, forestry, fishing, mining, quarrying, building construction, utilities, governmental services, trade, and general labor. Registration of trade unions is compulsory, but membership in a union is not. Most labor disputes are resolved by government mediation. Workers of the Turkish community have their own labor organizations: the Turkish Cypriot Trade Union Federation and the Revolutionary Trade Unions Federation. More than 70% of the Greek Cypriot workforce belonged to a union in 2002. Approximately 50 to 60% of the

Turkish Cypriot workforce in the private sector is unionized, and all of the public sector employees are union members.

There is a legislated minimum wage in the Greek Cypriot community; because of inflation this figure is adjusted twice yearly. In 2002 it was \$420 per month for many occupations, rising to \$450 per month after six months employment. In the same year, the Turkish Cypriot minimum wage was approximately \$170 per month. These wages are insufficient to support a wage earner and family, but most workers earn significantly more than this. The minimum working age in both communities is 16, with apprentice programs allowing 15 year olds to work in the Turkish Cypriot community. In the government controlled areas the legal workweek is 39 hours for white-collar workers and 38 hours for blue-collar workers, with fewer hours in the summer months. In the Turkish Cypriot community the workweek is 38 hours in the winter and 36 hours in the summer. Health and safety standards in the workplace continue to improve.

## 22 AGRICULTURE

Agricultural methods are adapted to the island's hot and dry summers and generally limited water supply. Spring and early summer growth is dependent on moisture stored in the soil from the winter rains, but summer cultivation is dependent on irrigation. About 15.3% of the total land area is arable.

Most farmers raise a variety of subsistence crops, ranging from grains and vegetables to fruits. Since 1960 there has been increased production of citrus fruits and potatoes. These two commodities, along with grapes, kiwi, and avocados are grown both for the domestic market and as exports to EU nations. Principal crops in 1999 (in tons) included barley, 119,000; potatoes, 170,000; grapes, 115,000; grapefruit, 33,000; oranges, 43,000; lemons, 19,000, and wheat, 14,000. Tomatoes, carrots, olives, and other fruits and vegetables are also grown. The areas that have been Turkish-held since 1974 include much of Cyprus' most fertile land; citrus fruits are a major export. Citrus production in 1999 reflected a decline since 1992 because of continued dry weather.

The Agricultural Research Institute, through experiments with solar-heated greenhouses, soil fertility, water usage optimization, and introduction of new varieties of grain, attempts to improve the efficiency of Cypriot agriculture. Agricultural products accounted for 41% of exports in 2001.

## 23 ANIMAL HUSBANDRY

Grazing land for livestock covers about 1,100 ha (2,700 acres). Animal husbandry contributes about one-third of total agricultural production. Output of pork, poultry, and eggs meets domestic demand, but beef and mutton are imported. Sheep and goats, which feed upon rough grazing land unsuitable for cultivation, provide most of the milk products. In 2001, sheep numbered about 246,000, hogs 413,800, and goats 378,600.

Indigenous cattle, kept primarily as draft animals, are decreasing with the advance of farm mechanization. There is no indigenous breed of dairy cattle, but near main towns, dairy stock, mostly shorthorns, are kept under stall-fed conditions, and Friesian cattle have been imported from the Netherlands and the United Kingdom. Cattle numbered about 54,200 in 2001.

Livestock products in 2001 included 50,700 tons of pork, 34,000 tons of poultry meat, 141,500 tons of milk, and 11,000 tons of eggs.

## 24 FISHING

Year-round fishing is carried on mostly in coastal waters not more than 3.2 km (two mi) from shore. The fish in Cyprus waters are small from the lack of nutrient salts, and the catches are meager. The 2000 catch was 2,308 tons. Fish exports in 2000 were valued at \$6.4 million. There is no deep-sea fishing. Sponges

of good quality are taken, mostly by licensed fishermen from the Greek Dodecanese Islands.

## 25 FORESTRY

About 172,000 ha (425,000 acres) are forested; 137,800 ha (340,500 acres) are reserves managed by the Forest Department, the remainder being natural growths of poor scrub used by village communities as fuel and as grazing grounds. Besides furnishing commercial timber, the forests provide protective cover for water catchment areas and prevent soil erosion. Their value is also scenic, numerous holiday resorts being situated in the forest reserves. Most numerous by far among forest trees is the Aleppo pine. The stone pine is found on the highest slopes of the Troodos Massif; the cedar, once a flourishing tree, has become a rarity. In the lowlands, eucalyptus and other exotic hardwoods have been introduced. Other important local species include cypress, plane, alder, and golden oak. The demand for timber during World War I resulted in some overcutting, and in 1956 large fires further reduced forests, particularly in Paphos, where 211,000 cu m (6 million cu ft) of standing timber were destroyed. To offset these losses, all felling of fresh trees for timber was stopped and systematic reforestation begun. The timber cut decreased from 152,415 cu m (5.4 million cu ft) in 1977 to 14,374 cu m (50.1 million cu ft) in 2001 (88% coniferous). Most of Cyprus' timber requirements must be met by imports. In 2000, imports of forestry products exceeded exports by \$35 million.

## 26 MINING

In 2001, the mineral industry of Cyprus was dominated by the production of bentonite, cement, copper, and refined petroleum products. Mineral production reached a peak in 1960, when minerals formed 58% of total exports; in 2001, they represented 5% of exports. The decline was attributed to depletion of minerals and unfavorable marketing conditions abroad. The place of mining in the GDP similarly declined from 16.7% in 1952 to 0.3% by 1994. In recent years, production of Cyprus' historically important export minerals—*asbestos*, *celestite*, *chromite*, *copper*, and *iron pyrite*—has stopped. Cyprus was a significant source of the mineral pigments *umber* and *yellow ochre*, which, along with *gypsum*, were produced for export in 2001. Ownership and control of minerals and quarry materials were vested in the government, which may grant prospecting permits, mining leases, and quarrying licenses. Royalties on extracted mineral commodities ranged from 1% to 5%.

Hydraulic cement, a leading export commodity, accounted for half of the country's mining and quarrying production. Production figures for 2001 included: 1.37 million tons of cement (910,000 in 1997), 126,600 tons of bentonite (70,660 in 1996), 9.3 million tons of sand and gravel (6 million in 1996), 850,936 tons of high-grade copper ore (0.60% Cu), 863,716 tons of low-grade copper ore (0.29% Cu), 250,000 tons of crude gypsum (181,546 in 1999), 7,800 tons of umber (9,169 in 1999, 4,604 in 1996), 1.78 million tons of marl (for cement production), and 1.5 million tons of crushed limestone (Havara). Other mine and quarry products for 2001 were crushed aggregate, common clays, calcined gypsum, hydrated lime, marble, the mineral pigments *ocher* and *terra verte*, building stone, and sulfur.

## 27 ENERGY AND POWER

The principal source of power is steam-generated electricity, which is distributed by the Electricity Authority of Cyprus (EAC) from three generating stations at Dhekelia and Momi. In 2001 these plants had an installed capacity of 737,000 kW. Total generation has risen from 12 million kWh in 1952 to 3.13 billion kWh in 1999, of which 100% was from fossil fuels. Consumption of electricity was 2.9 billion kWh in 1999. The grid system includes all towns and most villages. The south provides

the Turkish sector with all of its electricity, although the EAC is prevented from collecting revenue from the Turkish sector.

## 28 INDUSTRY

Industries are numerous and small in scale, 95% of them employing fewer than 10 workers. Working owners make up a large part of the industrial labor force. Manufacturing, which accounts for about 10.6% of GDP, and employs 9.1% of the labor force, is dominated by small enterprises. The manufacturing sector of industrial production has declined in absolute value over 10% from its peak in 1992, reflecting declines in the traditional leaders, textiles and food processing. Textiles, the leading manufacturing industry since 1974, has declined in output value about 50% since a peak reached in 1988, whereas food processing (food, beverages and cigarettes) has declined about 15% from a peak reached in 1992. The manufacture of non-metallic mineral products has also declined, about 7% from peak levels in 1994–95. Growth has occurred among nontraditional manufactures in the areas of chemicals, petroleum, rubber and plastics, up over 25% in the decade. Other industrial sectors have increased strongly: mining and quarrying is up nearly 60% since 1990 and the production of electricity, gas, and water treatment, increased nearly 80%. According to CIA estimates, overall industrial production grew 2.2% in 1999 in the Greek Cypriot area, but was declined an estimated .3% in the Turkish area. The leading products are textiles, shoes, cement mosaic tiles and cigarettes. Major plants include modern flour mills, tire-treading factories, knitting mills, preprocessing facilities, and a petroleum refinery. Furniture and carts are also manufactured. Nine industrial estates have been established. In both the Greek and Turkish areas of Cyprus, industry accounts for about 20% of GDP and employs about 22% of the labor force.

## 29 SCIENCE AND TECHNOLOGY

The Cyprus Research Center promotes research principally in the social sciences and in history, ethnography, and philology. In addition, Cyprus has three universities and several colleges offering degrees in basic and applied sciences. In the mid-1990s total expenditures for research and development amounted to 5.6 million Cyprus pounds per year; 165 technicians and 147 scientists and engineers were engaged in research and development.

## 30 DOMESTIC TRADE

A flourishing cooperative movement provides facilities for marketing agricultural products. There are more than 500 Greek cooperative societies, with some 100,000 members. Many towns and villages have cooperative stores; the towns also have small independent shops, general stores, and bazaars. The nation is not self-sufficient and relies on imports for a number of food products and consumer goods. Since 1990, at least 12 US franchises have been established throughout the country.

Government price controls have been virtually eliminated as the nation has realigned its economic policies to be acceptable to the European Union. The result has been a more open market with greater competition.

Business hours are from 8 AM to 1 PM, and 2:30 to 5:30 PM in the winter and from 7:30AM to 1 PM and 4 to 6:30 PM in the summer. Shops are open only in the morning on Wednesday and Saturday. Normal banking hours are from 8:30 AM to noon, Monday–Saturday. Advertising is mainly through newspapers and television. Direct marketing/telemarketing has also been used.

As a result of the island's division in 1974, there is no trade between the two communities across the UN buffer zone.

## 31 FOREIGN TRADE

With limited natural resources, Cyprus is dependent on other countries for many of its needs. Other than some agricultural commodities, it has few surpluses, and the balance of trade has steadily grown more unfavorable.

The tobacco industry in Cyprus provides the export market with the largest portion of revenues (30%), while medicinal and pharmaceutical products take care of another large proportion (11%). Other exports include passenger motor vehicles (6.3%), vegetables (5.7%), apparel (4.5%), and fruit (2.5%).

In 2000 Cyprus's imports were distributed among the following categories:

Consumer goods	29.7%
Food	8.3%
Fuels	12.6%
Industrial supplies	20.3%
Machinery	15.6%
Transportation	12.1%
Other	1.4%

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United Kingdom	159	408	-249
Greece	78	330	-252
Russia	76	158	-82
Syria	63	118	-55
Germany	29	269	-240
United States	22	399	-377
Israel	19	156	-137
Spain	15	127	-112
Italy	10	340	-330
Japan	n.a.	223	n.a.

Lack of international recognition for the Turkish Cypriots severely hampers their foreign trade. Because of the Greek Cypriot economic boycott, all goods originating in northern Cyprus must transit through Turkey, thereby adding to shipping costs. Moreover, a 1994 ruling by the European Court of Justice declared that phyto-sanitary certificates issued by the "Turkish Republic of Northern Cyprus" were invalid due to the "illegality" of the entity.

## 32 BALANCE OF PAYMENTS

Since Cyprus has persistently imported more than it exports, it consistently runs a trade imbalance which has grown steadily over the past two decades. Cyprus' trade deficit has been somewhat offset by tourist dollars, spending by foreign military forces, and remittances from workers abroad.

The US Central Intelligence Agency (CIA) reports that the purchasing power parity of Greek Cypriot exports was \$851 million in 2001 (f.o.b.), and Turkish Cypriot exports totaled \$50.7 million, while Greek Cypriot imports totaled \$3.5 billion in 2001, and Turkish Cypriot imports totaled \$424.9 million, resulting in a trade deficit of \$2.6 billion for the Greek Cypriot portion of the island, and a \$374.2 million trade deficit for the Turkish Cypriot portion of the island.

The International Monetary Fund (IMF) reports that in 2001 Cyprus had exports of goods totaling \$977 million and imports totaling \$3.53 billion. The services credit totaled \$3.35 billion and debit \$1.19 billion. The following table summarizes Cyprus's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	-395
Balance on goods	-2,550
Balance on services	2,168
Balance on income	-34
Current transfers	22
<b>Capital Account</b>	...
<b>Financial Account</b>	846

Direct investment in Cyprus	163
Portfolio investment assets	-443
Portfolio investment liabilities	524
Other investment assets	-541
Other investment liabilities	1,360
<b>Net Errors and Omissions</b>	161
<b>Reserves and Related Items</b>	-612

### 33 BANKING AND SECURITIES

In 1963, the Ottoman Bank (since renamed the Central Bank of Cyprus) was designated as the government's banking and currency clearing agent. The Banking law of 1997 provided for a properly-funded deposit insurance scheme and regulation were before the House of Representatives in late 1999. In general, banking services compare with the level experienced in European countries and the United States. There are six domestic banks. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$695.0 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$4.5 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 4.93%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 5.5%.

The Cyprus Stock Exchange, which opened in March 1996, ended 1996 with gains of just 0.2%, but experienced an extended bull run starting in late November of 1998. Since 1996, foreign investors are no longer required to obtain the Central Bank's permission to invest in the CSE, although there are limits on foreign participation. Legislation passed in 1999 prohibited insider trading and a new screen-based automated trading system helped enhance investor confidence. The CSE index reached 162.8 by June 1999, up from its initial starting point of 100 in 1996. By mid 2003, however, it had dropped to around 84. Market capitalization is \$5.4 billion.

### 34 INSURANCE

Insurance companies, mostly British, make available life, fire, marine, accident, burglary, and other types of insurance. Auto collision insurance and workers' compensation are compulsory. At the beginning of the 1990s, more than 50 insurance companies operated in Cyprus. All insurance companies in Cyprus must be members of the Insurance Association of Cyprus, and foreign ownership is subject to government approval.

### 35 PUBLIC FINANCE

The fiscal year follows the calendar year. Import duties and income tax are the principal sources of government revenue. The principal ordinary expenditures are education, defense, and police and fire services. Due to the introduction of a value-added tax and a more efficient tax collection system, Cyprus made steady progress in reducing its budget deficit in the early 1990s, which reached 1% of GDP in 1995. The deficit, however, due in part to a slowing economy, is now again on the increase.

Turkish Cypriots use the Turkish lira for currency, and the Turkish government reportedly provides a large part of the TRNC annual budget.

The International Monetary Fund (IMF) estimates that in 1997 Cyprus's central government took in revenues of approximately

\$710.9 million and had expenditures of \$830.4 million including capital expenditures of \$83.2 million. Overall, the government registered a deficit of approximately \$120 million.

The following table shows an itemized breakdown of government revenues and expenditures in millions of US dollars. The percentages were calculated from data reported by the IMF.

<b>REVENUE AND GRANTS</b>	<b>100%</b>	<b>710</b>
Tax revenue	78.0%	554
Non-tax revenue	21.8%	155
Grants	0.1%	1
<b>EXPENDITURES</b>	<b>100%</b>	<b>830</b>
General public services	6.3%	53
Defense	3.8%	32
Public order and safety	5.6%	46
Education	11.9%	99
Health	6.3%	52
Social security	24.5%	203
Housing and community amenities	4.0%	34
Recreation, cultural, and religious affairs	1.7%	14
Economic affairs and services	12.9%	107
Other expenditures	0.6%	5
Interest payments	14.3%	119
Adjustments	7.9%	66

### 36 TAXATION

Income taxes were first introduced in 1941, and a system of withholding in 1953. The first value-added tax (VAT) was enacted in 1992. With an eye to its hoped-for accession to the EU in 2004, the Greek Cypriot government enacted a series of new tax laws in July 2002, effective as of 1 January 2003, designed to be fully compliant with OECD tax criteria and the EU tax Code of Conduct.

The new corporate income tax rate, applied to both local and international business companies (IBC's), is 10%. Active IBCs already operating from Cyprus may retain the previous ring-fence rate of 4.25% until 2005 if their income for the period 2001 through 2005 continues to come entirely from sources outside of Cyprus. If they opt to retain the 4.25% rate until 2005, they cannot carry forward any tax losses up to 2000 beyond 2005. Dividends paid to Cypriot tax residents are subject to a 15% withholding tax. A major feature of the new tax code is the integration of corporation and withholding taxes with income tax on distributed profits. The combination of the income tax and the withholding tax, assuming that 70% of the after-tax profits are distributed, produces a final tax rate of 19.45%, which is below the highest income tax rate of 25% before the reforms. Provisions for "special contributions to defense of the Republic" are changed under the new tax laws. The defense tax on interest income was raised from 3% to 10% except for recipients whose total income is less than €7,000 (about \$13,100), and except on interest from government bonds, pension funds, and deposits with the HFC, which are taxed at 3%. With some exceptions, the defense levy on dividends received was increased from 3% to 15%. Interest income is subject to a final 10% withholding tax. All interest earned by individuals and 50% of the interest earned by corporations are exempt from income tax.

Income taxation of companies will no longer depend on where they are registered but on where they are managed and controlled. Companies registered in Cyprus but managed and controlled from another country, will only be taxed in Cyprus on their Cyprus-source income. IBCs will not be entitled to benefits under double taxation treaties, but they will also not be subject to the exchange of information requirements of such treaties.

Under the new laws, expatriate employees pay personal income taxes at the same rates as Cypriot citizens, as well as

contribute to the Social Security Fund. For personal income tax rates, 2002 and 2003 are transitional years before the fully reformed schedule goes into effect in 2004. In 2001, for example, income up to C£6000 (\$11,221) was exempt from personal income tax; in 2002, the threshold was raised to C£9000 (\$16,800); in 2003, the threshold remained at C£9000 but with a reduction in the first marginal tax rate from 30% to 20%; and, finally, in 2004, the threshold will be raised to C£10,000 (\$18,700). Starting in 2004, personal income above C£10,000, will be taxed at marginal rates of 20%, 25% and 30%, applied, respectively, to bands C£10,001 to C£15,000 (\$28,050) and C£15,000 to 20,000 (\$37,400), and above C£20,000. The capital gains tax, its rate of 20% unchanged under the new laws, is imposed only on the disposal of property situated in the Republic. Indirect taxes include a value-added tax (VAT) whose rate was raised in two steps (from 10% to 13% as of 1 July 2002, and to 15% as of 1 January 2003), plus various excise taxes.

Duty free facilities for expatriates are scheduled to be withdrawn in April 2003.

### 37 CUSTOMS AND DUTIES

As of 1 January 1998, tariffs on many goods imported from the European Union fell to zero as Cyprus adopted the EU's common customs tariff on most products from third-party countries. In addition, Cyprus is a member of the World Trade Organization (WTO). The Republic of Cyprus also provides a 20% price preference on domestic goods and services for public tenders, although foreign pressure—the European Union and WTO forbid such practices—may halt this practice. A 15% VAT is also levied.

### 38 FOREIGN INVESTMENT

Because Turkish Cyprus is recognized as a sovereign nation by no other nation besides Turkey, it has attracted little foreign investment. The majority of factories are owned by domestic companies but, in most of the major industrial concerns, there has been considerable British and Greek capital. The central government encourages foreign investment that results in the import of new technology or new production methods and improves the quality of the goods produced, especially for export. Any purchase of shares in a domestic company by nonresidents requires approval by the Central Bank of Cyprus.

As part of its accession to the EU, expected in 2004 barring untoward events, Cyprus has endeavored to transform itself from an off-shore tax haven, featuring a 4.25% corporate tax rate for ring-fence businesses (that is, those having no trade inside Cyprus) to a what it calls a tax incentive country, free from the suspicion usually associated with tax havens. Under the new tax code effective as of effect 1 January 2003, foreign companies already enjoying the tax haven 4.25% (in 1996, for instance, there were some 1,168 offshore companies operating out of Cyprus) can continue to do so until the end of 2005, provided they have not trade inside Cyprus.

Other companies will receive for the most part national treatment, which features a competitive corporate tax rate, (of 19.45% instead of the highest income rate of 25% through the way the income and withholding taxes are combined) but not an offshore rate. In the accession process (or *acquis*), Cyprus has been under intense scrutiny for money laundering. Its anti-money laundering law of 1996 was amended in 1999 to satisfy enforcement concerns. As of 2002, both the IMF and the OECD's Financial Action Task Force on Money Laundering (the TATF) have certified Cyprus as satisfactory on this count.

Cyprus has not been removed, however, from the Flags of Convenience (FOC) black list of the Paris Memorandum of Understanding on Port State Control, known as the Paris MOU, which is an agreement among 19 countries aimed at eliminating substandard shipping. Historically, Cyprus has operated the fourth- or fifth-largest maritime fleet through offering lax safety

and inspection regimes on ships registered under its flag. From 1999 to 2001, there were signs of improvement, according to EU reports. The percent of Cyprus-flagged vessels detained by Port State control dropped from 9.97% in 1999 to 8.85% in 2001, compared to an EU average of 3.14% in 2001. In all, 397 of 4,100 Cypriot ships were detained. To move up to the Paris MOU's "grey list," no more than 319 or 7.7% of Cypriot vessels should have been detained. In June 2002, Georgia instituted a new ship safety and inspection law to help improve its record. Also as part of the accession process, Cyprus has instituted more a liberalized investment regime, removing interest rate ceilings and capital controls.

The government first made changes in the investment code to encourage foreign investment in 1986, but many restrictions remained. In 1996, the investment code was liberalized to allow foreign participation of up to 49% in Cypriot companies. Certain services were allowed 100% foreign participation. Sector specific restrictions remain, however, in several important areas including electricity, tourism, and air transport and travel offices. The telecommunications sector, also, has not been privatized. To date the inflow of foreign direct investment (FDI) has remained small, averaging 1.3% of GDP 1997 to 2001. The trend, however, is toward an increase. FDI as a percent of GDP doubled during this period, from 0.9% of GDP in 1997 to 1.8% of GDP in 2001.

### 39 ECONOMIC DEVELOPMENT

The first development plan (1962–66), designed to broaden the base of the economy and to raise the standard of living, resulted in an average annual real growth rate of 5.4%. The second development plan (1967–71) called for an annual growth rate of 7% in the GDP; actual growth during this period was nearly 8% annually. The third development plan (1972–76) envisaged an annual economic growth rate of 7.2%, but a drought in 1973 and the war in 1974 badly disrupted development programs. Physical destruction, a massive refugee problem, and a collapse of production, services, and exports made it impossible for Cyprus to reach the targets.

Since 1975, multi-year emergency economic action plans inaugurated by the Republic of Cyprus have provided for increased employment, incentives to reactivate the economy, more capital investment, and measures to maintain economic stability. The 1994–98 Strategic Development Plan emphasized a free-market, private-sector economic approach with a target GDP growth of 4% annually. The plan called for a domestic savings rate of 22.3% of GDP; an increase of labor productivity of 2.8% between 1994–96; an inflation rate of approximately 3%, and unemployment no greater than 2.8%. As of 1996, Cyprus has largely met these goals with the exception of less than target levels of savings and productivity.

While Cyprus used to receive substantial amounts of development aid, due in part to its own improving economy and a recession in the European donor countries, it now receives little direct financial assistance from other nations.

Since its military intervention in 1974, Turkey has provided substantial financial aid to the Turkish Cypriot area. In 1996, this assistance was estimated to be approximately one-third of the area's GDP, or approximately \$175 million.

Membership in the European Union (EU) is a major goal of the Republic of Cyprus. As a result, Cyprus is harmonizing its laws in accordance with EU standards. At the December 1999 EU summit in Helsinki, Cyprus joined the list of candidates for entry. The Republic of Cyprus has also offered to allow a Turkish Cypriot delegation in its negotiating group. Turkish Cypriots, however, oppose Greek Cypriot entry into the EU prior to both a political settlement of the island's division and Turkish accession to the EU. Many observers believe it unlikely that the EU will allow the Republic of Cyprus to join prior to the island's reunification. Greece, however, has threatened to veto any EU

expansion if Cyprus is denied entry, regardless of the political situation on the island.

#### 40 SOCIAL DEVELOPMENT

A social insurance and non contributory old age pension system is in effect for all employed and self-employed persons. It provides unemployment and sickness benefits; old age, widows', and orphans' pensions; maternity benefits; missing persons' allowances; injury and disability benefits. There is a universal system for a family allowance and child benefits.

Although women have the same legal status as men, women's groups maintain that the divorce law discriminates in favor of men. There have been reports of "honor" crimes, where a woman is victimized by relatives in retaliation for "dishonoring" the family. Sexual harassment is not proscribed by law in the government-controlled area. Spousal abuse is a serious social problem, and legislation passed in 2000 entitled Violence in the Family Law makes it easier to report and prosecute family violence.

Although human rights are generally respected, police brutality continues to be a problem. There are also reports of the mistreatment of domestic servants, usually of East or South Asian origin. Freedom of movement between the Greek and Turkish zones is restricted.

#### 41 HEALTH

As of 2002, the birth rate was estimated at 12.9 per 1,000 people. There were 1,199 doctors, 96 pharmacists, and 428 dentists in 1990. In the mid-1990s there were six hospital beds per 1,000 people in the Republic. In 1995 there were 0.6 dentists and 1 pharmacist per 1,000 people. As of 1996, there were 2.5 physicians and 4.5 nurses per 1,000 people. There are both public and private medical facilities, including about 50 rural health centers. The island has a low incidence of infectious diseases, but hydatid disease (echinococcosis) is endemic. Malaria has been eradicated and thalassaemia, which affected 15% of the population in 1960, has been eliminated. As of 1999, the number of people living with HIV/AIDS was estimated at 400 and deaths from AIDS that year were estimated at 160. The fertility rate in 1999 was two children per mother. The infant mortality rate was estimated at 7.7 per 1,000 live births in 1999 and the average life expectancy was 77 years. In the same year, the general mortality rate was 7.4 per 1,000 inhabitants. In 1994, 83% of children were vaccinated against measles. In 1990, 95% of the population had access to health care services and 100% had access to safe water.

#### 42 HOUSING

Village homes in Cyprus are generally constructed of stone, sundried mud bricks, and other locally available materials; in the more prosperous rural centers, there are houses of burnt brick or concrete. A growing population has resulted in a shortage of dwellings, especially in urban areas. This was further aggravated by the 1974 war, which resulted in the displacement of more than 200,000 people and the destruction of 36% of the housing stock. The government provided temporary accommodations for about 25,000 displaced people and embarked on a long-term plan to replace the lost housing units. Between 1974 and 1990, 50,227 families were housed in a total of 13,589 low-cost dwellings.

In 1982, the Cyprus Land Development Corporation was formed to address the housing needs of low- and middle-income families, including the replacement of old housing stock. By 1991, the corporation had disposed of 573 building plots and helped construct 391 housing units. Between 1975 and 1991, the private sector constructed 83,197 housing units. The total number of housing units grew from about 75,000 in 1976 to about 125,000 at last estimate.

According to a 2001 census, there were about 292,934 conventional dwellings across the country. Nearly 43% were single, detached houses; nother 20% were apartment blocks. About 35,829 conventional dwellings were built from 1996–2001. Most dwellings have from four to seven rooms. The average household contained three people. About 68% of dwellings were owner occupied. About 5.6% of dwellings are temporary housing sites for refugees.

#### 43 EDUCATION

Adult illiteracy rates for the year 2000 were estimated at 3.1% (males, 1.3%; females, 5.0%). In 1959, the Greek and Turkish communities were made responsible for their own school systems. Education is compulsory for nine years, with children attending six years of primary school and six years of secondary. In 1997, there were 376 primary schools with 4,202 teachers and 64,761 students attending them. At the secondary level, there were 4,934 teachers and 61,266 students attending in that same year. The pupil-teacher ratio at the primary level was 15 to 1 in 1999. In the same year, 82% of primary-school-age children were enrolled in school, while 78% of those eligible attended secondary school. Cyprus has no college, so about 14,000 Cypriot students were studying abroad in 1983, including some 3,000 in the United States. The Greek community made plans to open a university for both Greek and Turkish students. Unwilling to agree, the Turkish community instead upgraded the Higher Technological Institute, which is situated near Famagusta, to university level. It opened under the name of Eastern Mediterranean University in 1986. In 1997 the number of students enrolled in post-secondary institutions totaled 9,982, with 1,061 teachers. As of 1999, public expenditure on education was estimated at 5.8% of GDP.

#### 44 LIBRARIES AND MUSEUMS

Cyprus has numerous school, private, and public libraries. The National Library in Nicosia hold 105,000 volumes and serves as the central library for the Republic of Cyprus. There are also municipal libraries in Famagusta, Limassol, Ktima, Larnaca, and Paphos, and bookmobile services in the Nicosia environs. Among the most important specialized libraries are those of the Cyprus Museum (15,000 volumes), the Phaneromeni Library of the Eastern Orthodox Church (33,000), and the Cyprus Turkish National Library (56,000), all in Nicosia. The University of Cyprus holds 150,000 volumes in Nicosia.

The Department of Antiquities is responsible for a wide, continuing program of research at Neolithic and classical sites. On behalf of ecclesiastical authorities, it conserves the cathedrals, mosques, monasteries, and other monuments, and over a period of many years has cooperated with numerous scientific expeditions. The entire range of archaeological discoveries from prehistoric to medieval times is displayed in the Cyprus Museum at Nicosia. In addition to the Cyprus Historical Museum and Archives and the Folk Art Museum in Nicosia, there are important collections in museums at Paphos, Larnaca, and Limassol. In all, there are about 20 museums in Cyprus, the majority being archaeological and historical. There are over 1,000 monuments and historic sites.

#### 45 MEDIA

The Cyprus Telecommunications Authority (CTA) operates the internal communications system. The telephone network is nearly wholly automatic, and the CTA connects Cyprus with more than 67 other countries; in 1980, its first telecommunications satellite, Makarios, was placed in earth orbit. In 1998, there were an estimated 405,000 mainline telephones in use in the Greek Cypriot sector and 83,162 in the Turkish Cypriot area. The same year there were about 68,000 cellular phones in use in the Greek

Cypriot area and, by 1999, 70,000 cellular phones in the Turkish area.

The Cyprus Broadcasting Corp. maintains regular service. Commercial spot announcements and a few sponsored programs are permitted on both radio and television. Radio programming in both AM and FM is transmitted by the CBC on two channels in Greek, Turkish, Arabic, and English. Private radio stations have been allowed since 1990, and there were 30 licenses issued by the end of 1992. The CBC has two channels, and licenses have been granted to four private stations (one of them cable) since April 1993. The main television transmitting station is located on Mt. Olympus. Since 1980, the television service has been linked via satellite with the Eurovision network for live transmission of major events in Europe. As of 1998, the Greek sector had 7 AM and 60 FM radio stations; the Turkish sector had 3 AM and 11 FM stations. In 1995, each area had four television stations. In 1997, the Greek Cypriots had about 310,000 radios and 248,000 television sets in use throughout their area. In 1994, the Turkish Cypriots had about 56,540 radios and 52,300 television sets in use. Nationwide, there were about 120,000 Internet subscribers served by six service providers in 2001.

Nicosia has traditionally been the publishing center for the island and the editorial headquarters of nearly all the daily newspapers and weeklies. There is no censorship in the south, and newspapers are outspoken on political matters. The following are the major daily newspapers (with estimated 2002 circulations):

	ORIENTATION	CIRCULATION
<i>O Phileleftheros</i> (Greek)	Independent liberal	26,000
<i>Kibris</i> (Turkish)	NA	13,000
<i>Althia</i> (Greek)	NA	11,000
<i>Haravghi</i> (Greek)	Communist	9,000
<i>I Simerini</i> (Greek)	Conservative	9,000
<i>Apogevmatini</i> (Greek)	Independent moderate	8,000
<i>Halkin Sesi</i> (Turkish)	Independent nationalist	6,000
<i>Agon</i> (Greek)	Independent right-wing	5,000
<i>Cyprus Mail</i> (English)	Independent conservative	4,000

Freedom of speech and the press are mandated by law and are said to be in full support by the government. Private television and radio stations and university-run stations compete successfully with the government-controlled stations.

#### 46 ORGANIZATIONS

The government encourages cooperative societies in many ways, including exemption from certain forms of taxation. In 1962, the island's main commercial organizations, the Cyprus Chamber of Commerce, the Cyprus Federation of Trade and Industry, and the Union of Industrialists, combined to form the Cyprus Chamber of Commerce and Industry. There is also a Turkish Cypriot Chamber of Commerce in Nicosia. Professional and trade organizations cover a wide variety of careers.

There are a great number of youth organizations, particularly athletic clubs. The Pancyprian Federation of Students and Young Scientists (POFNE) serves as an umbrella organization for student movements. Some political parties have youth organizations, such as the Cyprus Socialist Youth, the Cyprus Workers Federation Youth Section, and the Democratic Party Youth. Scouting organizations are active in the country and there are branches of the YWCA.

#### 47 TOURISM, TRAVEL, AND RECREATION

Although Cyprus is located off the main routes of travel and has few luxury hotels, the island's salubrious climate, scenic beauties,

extensive roads, and rich antiquarian sites have attracted numerous visitors. In 2000 there were 43,363 rooms with 84,478 beds available in hotels, primarily located in the larger towns on the coasts. Tourism generated \$1.8 billion in earnings that year, with 2,686,205 foreign visitors, of whom about 90% came from Europe.

All visitors must have a valid passport. Tourists from certain countries, including the United States, Canada, and the United Kingdom, many stay for up to three months without a visa.

In 2003, the US Department of State estimated the daily cost of staying in Nicosia as \$215 per day. In other areas, expenses can range from \$120 to \$190 per day.

#### 48 FAMOUS CYPRIOTS

Most widely known of Cypriots in the pre-Christian world was the philosopher Zeno (335?–263? BC), who expounded his philosophy of Stoicism chiefly in the marketplace of Athens.

Makarios III (1913–77), archbishop and ethnarch from 1950 and a leader in the struggle for independence, was elected the first president of Cyprus in December 1959, and reelected in 1968 and 1973. His successor as president, Spyros Kyprianou (1932–2002), also was twice elected to the office, in 1978 and 1983. Rauf Denktash (Denкташ b. 1924), the leader of the Turkish Cypriot community, was elected vice-president of Cyprus in 1973, became president of the TCFS in 1975, and of the TRNC in 1983; he was reelected in 1985.

#### 49 DEPENDENCIES

Cyprus has no territories or colonies.

# EAST TIMOR

**CAPITAL:** Dili

**FLAG:** The national flag is rectangular. Two isosceles triangles, the bases of which form the left edge and overlap each other. One triangle is black and its height is equal to one-third of the length overlapped to the yellow triangle, whose height is equal to half the length of the flag. A white five-pointed star, signifying “the light that guides,” is centered on the black triangle. The remaining part of the flag is red.

**ANTHEM:** *Pátria! Pátria!* (Nation! Nation!) was designated the national anthem until a new anthem is voted on by the National Assembly.

**MONETARY UNIT:** East Timor has adopted the US dollar (\$) of 100 cents. There are coins of 1, 5, 10, 25, and 50 cents and 1 dollar, and notes of 1, 5, 10, 20, 50, and 100 dollars.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year’s Day, 1 January; Labor Day, 1 May; Assumption Day, 15 August; Constitution Day, 30 August; All Saints Day, 1 November; Santa Cruz Day, 12 November; Independence Day, 28 November; Feast of the Immaculate Conception, 8 December; Christmas, 25 December. Movable holiday is Good Friday.

**TIME:** 9 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

East Timor survives within Timor, an island roughly the size of the Netherlands (32,000 sq km/12,355 sq mi) that forms an arc between Asia and Australia and is situated within the Nusatenggara Archipelago. Opposite the well-traveled island of Bali, East Timor is surrounded by the Indian Ocean at the south at the Pacific Ocean at the north. Its size rivals New Jersey or Israel, and its 15,007-km (9,325-mi) territory extends beyond its mainland to include the enclave of Ocussi-Ambeno in West Timor, and the islands of Atauro in the north and Jaco in the east. Dili, a small port city on the northern coast, is the capital.

## <sup>2</sup>TOPOGRAPHY

The landscape offers a patchwork of rugged mountains, waterfalls, coastal lagoons, and diverse features that span variable vegetation, dry grasslands, savannah forests, gullies and patches of dense rainforests. Gunung Tata Mai Lau, a mountain that forms the highest point on East Timor, reaches 2,963 m (9,721 ft) just south of the capital city of Dili, and the Lacló river in the north stretches some 80 km (50mi), forming the longest river.

## <sup>3</sup>CLIMATE

Temperatures in the dry season, from May to November, average 20°–33°C (68–91°F). The weather during this season is pleasant and dry. Around October or November, oppressive humidity arrives, and monsoon cloud activity builds up. The wet season, from December to April, sees average temperatures of 29°–35°C (84–95°F), with heavy rains and flooding. In the mountains, day temperatures are warm to hot, but are cool to cold at night. Earthquakes, tsunamis, and tropical cyclones occur.

## <sup>4</sup>FLORA AND FAUNA

The primary forest area of East Timor has been reduced to around 220,000 acres, or 1% of the territory. Dense forests are found only on the south coast or in mountainous areas. The vegetation consists mostly of secondary forests, savannah, and

grasslands. Flora includes ironwood, eucalyptus, black eucalyptus, redwood, sandalwood, cendana, and lontarwood. Fauna include deer, monkeys, cockatoos, horses, cows, and beo kakoaks.

## <sup>5</sup>ENVIRONMENT

The main environmental threats come from the widespread use of slash and burn agriculture, which has led to deforestation and soil erosion. As of 2001, there were 24 endangered species of birds in East Timor, including the black kite, shirt-toed eagle, Japanese sparrow eagle, and red-cheeked parrot.

## <sup>6</sup>POPULATION

The population of East Timor was estimated at 952,618 in 2002. The population growth rate was 7.26%. In 2002, there were 28 births per 1,000 people and a death rate of 6.5. The life expectancy at birth was an average 65 years (63 years for men and 67 years for women). The fertility rate was 3.88 children born per woman. The population of Dili was estimated at 49,900 in 2002.

## <sup>7</sup>MIGRATION

Although “Timor” is the Malay word for “Orient,” East Timor’s people betray a long procession of migrations from the west, north, and east. The Portuguese arrived on the island in the early 16th century. At the end of 2002, there were approximately 30,000 East Timorese refugees living in settlements in the West Timorese countryside. There were 51 migrants per 1,000 population in 2002.

## <sup>8</sup>ETHNIC GROUPS

Historically the ethnic population was largely defined by the Atoni and the more dominant Belu, which was a blend of Malay, Melanesian, and Austronesian peoples who were fluent in the Tetum language. At independence in 2002, the approximate ethnic divisions in the population were as follows: 78% Timorese, 20% Indonesian, and 2% Chinese.

## 9 LANGUAGES

In addition to Tetum, there are about 15 other indigenous languages spoken within East Timor. Tetum, Galoli, Mambai, Tokodede are classified as Austronesian languages, while Bunak, Kemak, Makassar, Dagada, Idate, Kairui, Nidiki, and Baikenu are the non-Austronesian tongues. Tetum and Portuguese are official languages. Indonesian and English are also prominent.

## 10 RELIGIONS

The last available figures on religion were collected in 1992 (before independence), at which time about the population was 90% Roman Catholic, 4% Muslim, 3% Protestant, 0.5% Hindu and an undetermined number were Buddhist. As of 2002, the dominant religion still appeared to be Catholicism; however, it is believed that a number of registered Catholics actually practice traditional animism, a religious category which had not been officially recognized by the Indonesian government.

The new government has generally respected the regulations for freedom of religion that were established by the UNTAET administration. Though public opinion had leaned toward making Catholicism the national religion, the presiding Bishop Carlos Filipe Ximenes Belo (a Nobel Peace Prize laureate) encouraged members of the Constituent Assembly not to make such a designation. The 2002 constitution instead provides for the separation of church and state.

Due to past associations with Indonesian occupation groups, some Muslim and Protestant minorities have reported social harassment.

## 11 TRANSPORTATION

Rebuilding the transportation infrastructure has been a key concern for the nation. As of 2002, there were no railways reported. Highways stretched across about 3,800 km (2,361 mi), but only about 428 km (266 mi) were paved and these roads remained poorly maintained. Driving accidents are frequent due to poor road conditions, lack of illumination, and the absence of required driving permits. Roads are widely shared by pedestrians and vendors, especially in city areas. Taxis, small buses, and minivans provide public transportation, but the system is generally overcrowded and not reliable.

There were eight airports operating in 2001, but only three had paved runways. There was one heliport in 2002.

## 12 HISTORY

Since the mid-to-late 1500s, the island of Timor and its lush offering of sandalwood lured both Portuguese and Dutch explorers, who contested for the territory until an official territorial division was determined through the *Sentença Arbitral* in April 1913. Unlike the Dutch, Portugal's sphere of influence was concentrated in the local leadership of the East Timorese "liurai rei": rulers, chieftains and biracial families known as the "Black Portuguese" who were of Timorese and Portuguese parentage. While Portugal's colonial hold on East Timor failed to avail the local population of educational and general advancement opportunities, even leaving the island with barely 30 km (19 km) of paved asphalt road, its detachment enabled the East Timorese cultural identity to remain largely intact and unscathed by modernity.

Ironically, efforts to crush the East Timorese are not traced to the Portuguese, but to the Indonesian people and their brutal tactics for integration following Portugal's exodus from the island. When the "Carnation Revolution" of April 1974 prompted the demise of nearly fifty years of dictatorship in Portugal, the decolonization of East Timor, among Portugal's other colonies, seemed a favorable consequence. By the start of May 1974 three political parties surfaced within the island: the Apodest Timori (Timorese Democratic People's Union), largely a

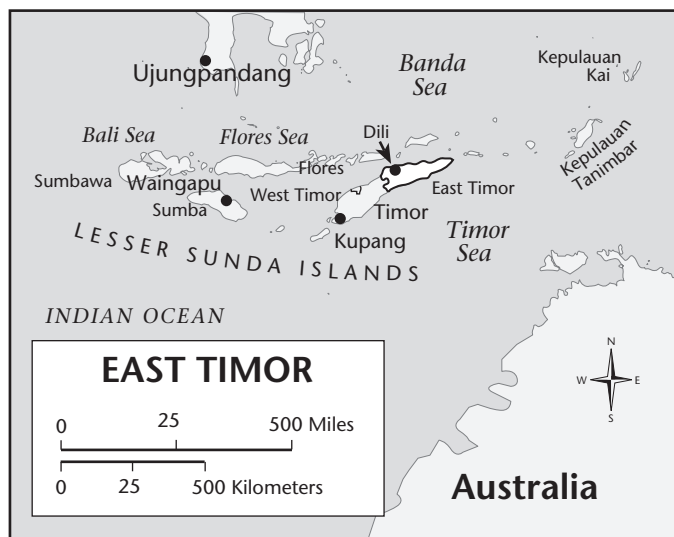

device of the Indonesian government that advocated that East Timor be integrated into Indonesia; the UDT (Democratic Union of Timor), advocating a progressive process of autonomy under Portugal; and the ASDT (Timorese Social Democratic Association), which later became the left-wing independence movement Fretilin (Revolutionary Front for an Independent East Timor), advocating the island's total independence.

The subsequent union and mounting popularity of UDT and Fretilin by January 1975 proved threatening enough to the Indonesian government that President Suharto, whose integrationist stance was already endorsed by the United States, Australia, Japan, and other nations, justified his military intervention in East Timor through the "Operasi Komodo." Authored by the president's intelligence-supremo Ali Moertopo (1924–84), Operasi Komodo essentially splintered Fretilin as being secretly Communist and served to splinter its alliance with the UDT by May. Consequently, on 6 June 1975, Indonesia already occupied the Oecussi-Ambeno enclave under the guise of restoring order in East Timor, which had not endured any form of foreign occupation with the exception of a brief but brutal occupation by the Japanese during World War II (1939–34).

Despite Indonesian presence and pressure within East Timor, Fretilin still gained 55% of the popular vote in local elections on 29 July 1975. Thus again threatened, Indonesia manipulated the UDT to counter Portuguese authority and Fretilin's influence through a coup staged from 11 August through 24 September 1975. However, the coup against Fretilin failed; in fact, Fretilin instead gained control of the entire East Timorese territory and launched humanitarian advancements (in education, medical treatment, and local decision-making) that had been historically denied to the islanders. Still, reports generated by the US Central Intelligence Agency discerned Indonesian infiltration and fighting within East Timor and around its borders during mid-September and through October 1975. After capturing the violence on videotape, four foreign journalists were executed by Indonesian militia on 17 October 1975 and tension between pro- and anti-independence forces was heightened. On 28 November 1975, Fretilin's formal assertion of an independent state of East Timor was answered the very next day by Moertopo's "petition" for the integration of East Timor into Indonesia through the "Balibo" Declaration, which UDT leaders were forced to sign.

On 7 December 1975, only one day after a visit to Jakarta by President Gerald Ford and Secretary of State Henry Kissinger of the United States, Indonesia deployed 10,000 troops—by sea, air, and land—into Dili after an already devastating naval and aerial bombardment led by General Benny Murdani. Within days of an invasion marked by public torture, rape, and the random killing of mass civilians, Portuguese governor Mario Lemos Pire and his remaining administration made a covert and final exodus during the night to the island of Atauro, marking the end of over 460 years of colonization, without decolonization achieved. On 17 July 1976, Indonesia claimed East Timor its 27th province despite condemnation from the United Nations, and it continued full-scale attacks through March 1979 through weaponry largely supplied by the United States under the administration of President Jimmy Carter. Within a year of the attack, an estimated 60,000 East Timorese had been killed, while tens of thousands sought refuge from the Armed Forces of the Republic of Indonesia (ABRI) in the rugged mountainous interior of East Timor, where Fretilin guerrilla forces remained; others were forced into Indonesian resettlement camps, where disease, malnutrition, and death were rampant. The island was relegated to a "closed colony" status by the military from December 1975 through 1 January 1989.

It has been estimated that some 250,000 were killed since 1975 when warfare seized the island. Mass terror and killings were widespread, including 1,000 in Aitana in July 1981, 400 in Lacluta in September 1981, and, finally securing international

LOCATION: 8° 50'S, 125° 55' E. BOUNDARY LENGTHS: Indonesia, 228 km (142 mi).  
COASTLINE: 706 km (439 mi).

attention, some 270 during the Santa Cruz massacre of 12 November 1991, in which peaceful mourners and demonstrators were killed by Indonesian troops' open fire in a cemetery in Dili. While Indonesia experienced a shift in leadership with the forced resignation of President Suharto in 1997 and rise to power of his vice president, B. J. Habibie, East Timor endorsed Fretilin leader José Alexandre "Xanana" Gusmão, then the president of the National Council of Timorese Resistance (CNRT). Their continued resistance against military occupation and terror, coupled with heightened international scrutiny of the atrocities within the island, may have prompted Habibie in January 1999 to extend the choice to East Timorese citizens: autonomy under Indonesian rule, or outright independence. An overwhelming 99% of eligible voters were present during the 30 August 1999 referendum, which secured the vote for independence.

However, postelection violence and killings led by pro-Indonesian militias and the army, which killed more than 1,000 people and drove some 250,000 from East Timor following the election, were a dark reminder of East Timor's subjugation to the Indonesian military, which has long remained the source of ultimate government authority. Following a unanimous decision on 25 October 1999 by the UN Security Council, East Timor was governed by UNTAET (the United Nations Transitional Administration in East Timor) and the National Consultative Council (originally formed by 15 East Timorese whose representation was later increased to 33), with the mission to rebuild the island and establish a new government by the close of 2001. In September 2001, a constituent assembly was elected, and given with the task of writing a constitution for East Timor. In April 2002, José Alexandre "Xanana" Gusmão defeated Xavier do Amaral for the presidency, and on 20 May 2002 East Timor became an independent nation. A successor mission to UNTAET, the United Nations Mission of Support in East Timor (UNMISSET) was established to provide assistance to East Timor over a period 12 months, especially in matters of law enforcement and security. East Timor became the 191st UN member state on 27 September 2002.

As of December 2002, there were an estimated 30,000 remaining of the 250,000 people who, after the violence of September 1999, first arrived in settlement camps found along the countryside of West Timor, largely around the town of Atambua. More live outside the camps or elsewhere in Indonesia. The Indonesian government and the office of the UN High Commissioner for Refugees declared that all East Timorese

residing in Indonesia would lose their refugee status after 31 December 2002.

Indonesia's attempts to bring to justice those responsible for the 1999 violence in East Timor have been heavily criticized. Under intense international pressure, Indonesia set up a special human rights court to try those responsible for the violence. The court's record—in both investigating the involvement of Indonesia's most senior security officials and its apparent willingness to acquit others with what is considered overwhelming evidence against them—has been condemned. As of 20 January 2003, the court had indicted eighteen suspects for atrocities in East Timor: four were convicted, eleven acquitted, and three cases were still being heard.

Bishop Carlos Ximenes Belo, who shared the Nobel Peace Prize with José Ramos Horta in 1996, announced his resignation in November 2002. He won the prize for his stand in defense of Timorese rights. In 1999, militia gangs attacked and burned his residence where hundreds of refugees were being sheltered. In December 2002, the Indonesian human rights court sentenced the first Indonesian military official convicted in the 1999 violence for failing to prevent pro-Indonesian militiamen from attacking Belo's home. The official, Lt. Col. Soedjarwo, was sentenced to five years in prison.

Disputes between Australia and Indonesia over parts of the oil- and gas-rich seabed of the Timor Sea led to the signing of the 1989 Timor Gap Treaty, which resulted in a 50–50 split of the royalties from the shared zone of undersea exploration between Australia and Indonesia. In May 2002, the treaty was renegotiated, and newly independent East Timor was granted 90% of the royalties, with Australia receiving 10%. However, the terms of the agreement were conditional on East Timor foregoing its territorial claim to almost the entire oil and gas field. Foreign officials estimate a potential revenue flow of several tens of millions of dollars a year to East Timor.

### 13 GOVERNMENT

A parliamentary system of government with a largely ceremonial president was established as a result of elections held 30 August 2001 for a Constituent Assembly to draft a constitution for East Timor. On 22 March 2002, the Constituent Assembly approved East Timor's constitution. The constitution was modeled largely on that of Portugal, although the German and US constitutions were consulted as well. The constitution bans the death penalty and provides for fundamental political rights and civil liberties, including due process rights. In the elections for the Constituent Assembly, held 30 August 2001, Fretilin took 55 of the 88 seats. Twenty-three of the candidates, or 27% of the total, were women.

The Constituent Assembly was transformed into the National Legislative Assembly, or National Parliament, on 20 May 2002. The unicameral National Legislative Assembly is composed of a minimum of 52 and a maximum of 65 members, serving five-year terms. Thirteen of the members are district representatives, corresponding to East Timor's 13 districts. For its first term of office, the National Parliament was comprised of 88 members on an exceptional basis.

The first presidential elections were held 14 April 2002. José Alexandre "Xanana" Gusmão defeated Xavier do Amaral for the presidency, winning with 82.7% of the votes cast. Mari Alkatiri was chosen as East Timor's first prime minister. A Council of State advises the president. It is composed of former presidents who were not removed from office, the prime minister, the speaker of parliament, five members elected from parliament, and five members appointed by the president. A Council of Ministers is comprised of the prime minister, any deputy prime ministers, and the ministers of state.

## 14 POLITICAL PARTIES

There were 16 registered parties for the Constituent Assembly elections held in August 2001. Fretilin won 57.37% of the national votes and elected 12 of the 13 district representatives. The 12 parties represented in East Timor's first 88-member Parliament were: Fretilin (Revolutionary Front of Independent East Timor), 55 seats; the Democratic Party (PD), 7 seats; the Social Democratic Party (PSD) and the Social Democratic Association of Timor (ASDT), 6 seats each; the Democratic Union of Timor (UDT), the Christian Democratic Party (PDC), the People's Party of Timor (PPT), the Nationalist Party of Timor (PNT), and the Timorese Monarchist Association (KOTA), 2 seats each; the Liberal Party (PL), the Christian Democratic Party of Timor (UDC/PDC), the Socialist Party of Timor (PST), and an independent candidate, 1 seat each.

## 15 LOCAL GOVERNMENT

East Timor is divided into 13 districts: Aileu, Ainaro, Baucau, Bobonaro, Covalima, Dili, Ermera, Lautem, Liquiçá, Manatuto, Manufahi, Oecussi, and Viqueque. The districts are further divided into 68 *postos* (sub-districts). A *posto* is further divided into *sucos*, or clusters of villages. There are approximately 500 *sucos* in the country. *Sucos* are divided into *aldeias* (villages), and there are approximately 2,100 *aldeias* in East Timor.

## 16 JUDICIAL SYSTEM

A Ministry of Justice was established in East Timor to guarantee an independent and impartial judiciary. A department of judicial affairs is responsible for the recruitment, appointment and training of judges, prosecutors and public defenders.

The Supreme Court of Justice is the highest court in the nation, with the power of judicial review. There is a High Administrative, Tax, and Audit Court, military courts, and the constitution provides for maritime and arbitration courts.

In March 2000, UNTAET created a civil law court system with 13 district courts and one national Court of Appeal. The law later was amended to include a court system of only four district courts and one national Court of Appeal. The four district courts are located in Dili, Baucau, Suai, and the Oecussi enclave. The district courts have jurisdiction over criminal and non-criminal offenses referred to as "ordinary crimes," whereas special panels within the Dili District court have exclusive jurisdiction over "serious criminal offenses."

As of October 2002, the court system in East Timor was limited in operation. The Court of Appeal was not functioning, due to delays in the recruitment and contracting of international judges, as well as the appointment of Timorese judges. A backlog of cases raised human rights concerns, as cases pending trial and appeal were unable to be heard within a reasonable amount of time.

## 17 ARMED FORCES

The East Timor Defense Force, established in 2000, comprises a light-infantry division of about 1,500 regulars and an additional 1,500 reservists. Basic training for the first group of recruits was aided by Portugal, with special training programs aided by Australia. In April 2002, UN Peacekeeping Forces totaled about 6,200 members from 20 countries. The number of UN forces is expected to decline as the government and the UN continued to make arrangements for national security. The general military age is 18–21 years old. Both male and female recruits have been accepted. Military expenditures for 2003 were estimated to be at about \$4.4 million.

## 18 INTERNATIONAL COOPERATION

East Timor joined the UN in September 2002. The nation is also a member of the IMF and World Bank, and the ADB. The nation is considering membership in ASEAN.

## 19 ECONOMY

As a result of the post-independence referendum violence in 1999 led by Indonesian troops and anti-independence militias, approximately 70% of the economic infrastructure was devastated, and some 250,000 people moved into West Timor. Reconstruction efforts undertaken by UNTAET improved both urban and rural areas. Agriculture remains the main source of income in most of the country's villages, with only a small percentage of people selling a significant proportion of their rice or maize harvest. During 2000 and 2001, the agriculture sector expanded, due to a rebuilding of seed stocks and irrigation systems, improved access to fertilizer and transportation, a reduced threat of violence, and high demand resulting from the large international presence in the country. The services sector also registered strong growth in 2000–01 in order to meet the needs of the international staff and reconstruction efforts. Since mid-2002, however, growth moderated, as a result of the winding-down of the international presence. During the Indonesian occupation, tourism was not a large industry, but there is a great potential growth in this area. The East Timorese economy stands to benefit in the long term from the development of the oil- and gas-rich seabed of the Timor Sea.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 East Timor's GDP was estimated at \$415 million. The per capita GDP was estimated at under \$500. The annual growth rate of GDP was forecast at -2% in 2003. The average inflation rate was estimated at 3% in 2001. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 25% of GDP, industry 17%, and services 57%.

## 21 LABOR

The labor force in 1998 was 397,131. Subsistence agriculture accounts for three-fourths of employment. The unemployment rate, including underemployment, stood at approximately 50% in 2002.

## 22 AGRICULTURE

As of 2003, there are only about 174,000 hectares (430 acres) of arable land in East Timor. With generally poor and shallow soil, steep terrain, and an unreliable climate, most farming is at a subsistence level. The farming system is based on slash and burn farming shifting cultivation. In the north and a few fertile areas of the south, maize, cassava, cowpeas, and sweet potatoes are primary crops. Rice is cultivated in lowlands with the help of semi-irrigation and technical irrigation systems. The main harvest for maize occurs from February through April. The main harvest for rice occurs from May through September in the north and from August through November in the south. Other agricultural products include, soybeans, cabbage, mangoes, bananas, vanilla, mung beans, taro (swamp and upland), onions, peanuts, sago, coconuts, and tobacco.

Coffee serves as an important cash crop, with over 60% of the country's organic coffee being produced in the Ermera district. Bobanaro, Oecussi, Viqueque, and Baucau are the most important food producing districts. In 2003, agriculture accounted for about 25% of the GDP.

## 23 ANIMAL HUSBANDRY

Most livestock production is based on household farms, with larger animals kept primarily for household use and consumption while pigs and smaller animals are sold for cash. Though there are some large herds of cattle, buffalo, sheep, and goats, most farms keep smaller numbers of a variety of animals. In 2001, the Ministry of Agriculture reported the livestock populations to be: 79,400 goats, 23,700 sheep, 343,100 pigs, 670,900 chickens, 7,000 pedigree chicken, 11,200 ducks, 166,200 cattle, 101,700 buffalo, and 45,200 horses.

## 24 FISHING

Coastal communities have historically relied on fishing as a main source of food and income, with catches that include large tuna, flying fish, coral reef fish, and deepwater snappers. The violence following independence caused serious damage and destruction to nearly 90% of the boats and gear of these communities, as well as to the onshore processing infrastructure. The industry is slowly moving toward recovery through the work of the Department of Fisheries and the Marine Environment (DFME) in the Ministry of Agriculture and Fisheries and with the help of various international volunteers and agencies. For instance, in 2003 officials from the DFME met with Australia's minister for primary industry and fisheries in Australia's Northern Territory to discuss training opportunities in tropical fisheries management.

Besides working to recover maritime fishing activities, the DFME is exploring options for inland hatcheries and freshwater fish production. One such project includes breeding fish in rice fields.

In 2002, the DFME estimated that of the 20,000 fishermen in East Timor, over 50% were involved in fishing as their primary source of food and income.

## 25 FORESTRY

Data from the government of Indonesia has shown the alarming trends of deforestation on the once forest-rich lands of East Timor. In 1975, about 50% of East Timor's land was primary and secondary forest. By 1989, the figure dropped to about 41% and by 1999, only 1% of these forests remained. Most of the deforestation was conducted under logging operations for teak, redwood, sandalwood, and mahogany for export. The use of wood as a primary fuel source has added to the problem of diminishing forests.

In 2000, the UNTAET administration issued Regulation 2000-17 to prohibit any logging operations that would include the export of logs, lumber, and/or furniture from East Timor. Burning and destruction of remaining forests for any reason was also prohibited. The UNDP has launched several programs to counter deforestation as well as begin reforestation. These include a nationwide seed propagation program to establish community nurseries and encourage replanting of forestlands, particularly on hillsides and in areas where erosion is a problem. There are also subsidy programs in the works to provide low-cost kerosene and cookers to rural residents in an effort to reduce dependency on wood as fuel.

## 26 MINING

There are small deposits of gold, manganese, and copper throughout the nation, but not enough to be considered for major commercial industries. Marble is present in significant quantities, but it seems uncertain as to whether or not the exploitation of such deposits will have a significant impact on the country's economy in the near future.

## 27 ENERGY AND POWER

East Timor's ability to develop its oil and gas reserves in the Timor Sea will greatly affect the economy. By 2003, the government planned to introduce a petroleum fund, designed to enhance transparency and accountability in the management of oil and gas revenues. A gas recycling project in the Bayu Undan offshore gas field was expected to begin in 2004. Revenues from that and other projects were projected to flow in by 2006. Fossil fuels account for 100% of electricity production.

## 28 INDUSTRY

Before the Indonesian invasion in 1975, East Timor was self-sufficient in food and enjoyed revenue from the coffee industry. The US Agency for International Development (USAID) was one organization supporting East Timor's coffee industry in the early 2000s, especially through the Cooperative Coffee Timor (CCT). East Timor at that time was heavily dependent upon food aid, however, and the agriculture industry was in need of development. Other industries include printing, soap manufacturing, handicrafts, and woven cloth.

## 29 SCIENCE AND TECHNOLOGY

There was no university in East Timor under the Portuguese. The Universitas Timor Timur (UNTIM) was established in 1986 under Indonesian rule. By 1998/99, it had nearly 4,000 students in three main faculties—agriculture, social and political sciences, and education and teacher training. The Indonesian government closed the UNTIM following the April 1999 demonstrations demanding an independence referendum. The Polytechnic in East Timor had technical courses based in Becora and at a campus in Hera; it provided courses in electrical and mechanical engineering, civil construction, and accountancy. The education system was a target for destruction by the Indonesian military and their militias. The UNTIM and Polytechnic buildings in Dili and Hera were looted and burned. A new university was established by former UNTIM and Polytechnic staff and students, without funding from UNTAET. In September 2000, the government allotted \$1.3 million to the university from East Timor's education budget. The National University of East Timor (Universidade Nacional Timor Lorosae—UNTL) opened for classes on 27 November 2000. There are five faculties: agriculture, political science, economics, education and teacher training, and engineering. All new students follow a course including human rights, ethics, philosophy of science, and Timorese history.

## 30 DOMESTIC TRADE

Local businesses realized weak performance in the early 2000s, as they attempted to recover from the post-independence referendum violence. Traditional markets are filled by the local community, while foreign-owned businesses are largely patronized by the wealthy. In April 2001, the World Bank launched a \$4.85 million small enterprises project, offering loans of \$500 to \$50,000 to East Timorese with viable business plans. The project also finances the delivery of business skills training to small and medium-sized enterprises.

## 31 FOREIGN TRADE

Trade in East Timor in 2002-03 was dominated by foodstuffs, construction materials, electronics, and clothing. Some 97% of manufactured goods are imported, with coffee being the sole significant export. Australia and Portugal are East Timor's principal trade partners. East Timor in the early 2000s was seeking trade partners to develop its oil and gas reserves, among them China and Malaysia. Coffee is exported to the United States, Australia, New Zealand, Italy, and the Netherlands, among other countries.

### **32 BALANCE OF PAYMENTS**

The external current account was in large deficit by 2003 (-\$230 million), resulting in large measure from imports associated with donor-assisted reconstruction activities. The deficit was more than financed by official transfers, however, and, inclusive of these transfers, the external current account was in surplus (\$37 million). In 2001, the CIA estimated exports at \$8 million, and imports at \$237 million. The IMF estimated East Timor would maintain a negative merchandise trade balance of \$163 million in 2003, with an overall trade deficit of \$3 million. Development assistance during the 1990s totaled \$81 million, increasing from \$1 million in 1989 to more than \$12 million in 1999. As of 2002, East Timor was receiving \$2.2 billion in economic aid.

### **33 BANKING AND SECURITIES**

The finance sector is small, with a limited central bank role played by the Banking and Payments Authority (formerly the Central Payments Office). There are two operating branch offices of overseas banks (the ANZ Banking Group and the Banco Nacional Ultramarino) and informal lenders comprise the remainder of the finance sector.

### **34 INSURANCE**

It is possible to obtain insurance for vehicles in East Timor, although virtually no one does so. Most individuals involved in traffic accidents informally settle them. Third-party motor vehicle insurance is unavailable. Information on life or other forms of insurance was unavailable as of mid-2003.

### **35 PUBLIC FINANCE**

East Timor proposed a \$77 million budget for the 2002/03 fiscal year. The government anticipated \$42 million in revenues from the Timor Sea Arrangement and from taxes and other revenue; the rest of the budget was expected to come from international donors. East Timor has limited access to domestic borrowing, and the government is cautious with regard to external borrowing. East Timor's public deficit stood at \$7.4 million in 2002, and was projected at \$5.8 million in 2003.

### **36 TAXATION**

In 2000, UNTAET issued a "Revenue System for East Timor," providing the basis for a tax regime. It largely adopted the Indonesian Income Tax Law with some modifications. East Timor's tax system is designed to tax business profits and "designated passive" income. Business profits include capital gains. Passive income includes interest, royalties, and rental and dividend income. The standard income tax rates for resident companies and individuals are 10% on the first \$3,368; 15% on the next \$3,368; and 30% on income over \$6,737.

Employment-related income initially was not subject to income tax; however, a "wage income tax" (WIT) was levied for wages received on or after 1 January 2001. WIT applies to employment-related remuneration only, as opposed to general personal income. WIT is due as follows: the rate is 0% on monthly salaries of \$0 to \$100; 10% on monthly salaries of \$101 to \$650; and 30% on monthly salaries of \$651 or more.

### **37 CUSTOMS AND DUTIES**

Excise taxes are imposed on the import or domestic production (but not both) of certain goods. Goods are exempt from excise taxes if they are exported from East Timor within 28 days of production and are exempt from import duty, or if they relate to the Timor Gap Agreement. Goods subject to excise taxes include (but are not restricted to) the following: confectionery, fruit juices, ice cream, soft drinks, tobacco, gasoline, diesel fuel, beer, wine, other alcohol, make-up, shampoos, toiletries, electrical

goods, mobile phones, televisions, automobiles, motorcycles, and arms and ammunition.

As of 2001, all imported goods were subject to an import duty of 5% of the customs value (CIF value).

### **38 FOREIGN INVESTMENT**

Most foreign investment is from Singapore and Australia, and has centered in the hotel and restaurant business, the importation of used cars, and construction. The government in 2002/03 was encouraging foreign investment in light industries such as textile, garment, and shoe factories. Fishing and ecotourism also have potential for foreign investment (East Timor has some of the best scuba diving in Asia). Rudimentary infrastructure and a lack of skilled labor hamper investment. Investors have little guarantees regarding property rights, insurance, or bankruptcy. The labor law also serves to inhibit foreign investment because it is difficult for employers to fire East Timorese workers, and businesses are prohibited from hiring replacement employees during a strike.

### **39 ECONOMIC DEVELOPMENT**

Although East Timor was expected to rely upon significant amounts of foreign aid in the medium term as of 2003, it was on the path to greater self-reliance. In the context of a reduced international presence, the government was improving its administrative capacity and taking steps toward nation-building in accordance with its National Development Plan (NDP). The country stands to benefit from the development of oil and gas reserves in the Timor Sea, which is expected to sharply increase government revenues. The NDP covering the fiscal years 2002/03–2006/07 set out certain objectives, including the attainment of 5% growth in GDP over the medium term and the alleviation of poverty. The government indicated the need to develop the private sector and build up local institutions in addition to maintaining a stable macroeconomic environment. Other NDP goals included promoting good governance and creating jobs.

### **40 SOCIAL DEVELOPMENT**

As of 2003, humanitarian concerns remained at the forefront of social development in East Timor. The rehabilitation of roads was providing access to rural areas that otherwise would have remained isolated. Electricity was being brought to rural areas, which would increase the potential for social benefits. Water-supply projects improved access to safe water, and freed women and children from the task of collecting water. Increased emphasis was being placed upon nutrition and health programs. Market vendor loans were being granted equally to men and women, but certain group loans were disproportionately awarded to women. These loans were geared to support employment on farms and in households and small trading businesses.

The United National Development Fund for Women (UNIFEM) initiated a program to increase the participation of women in decision-making for peace and gender justice. The program was geared to assist local communities to make concrete use of national instruments such as the constitution, parliament, courts, and certain legislation, from a rights-based and gender perspective. Another UNIFEM program, on gender, globalization, and marketing, was dedicated to upgrade the production of textiles in East Timor.

East Timorese women under Indonesian occupation were systematically raped, tortured, and imprisoned as sex slaves, and the process of recovery from that period is ongoing.

East Timor's constitution includes important human rights protections, including the right to a fair trial, criminal due process, freedom of expression, freedom of association, and freedom of religion. The constitution forbids the death penalty and life imprisonment, and includes the right to be free from torture, servitude, and cruel or degrading treatment. However, problems relating to the criminal justice system, including a

proposed amnesty for past abuses, remained unresolved as of 2003. In addition, the status of minorities, including noncitizens, remains unclear in the constitution, as do social and economic rights and the right to be free from discrimination based on sexual orientation.

#### 41 HEALTH

A large number of health centers and hospitals were severely damaged or destroyed due to independence-related violence. The new nation also found itself lacking medical professionals, since the vast majority of health workers were Indonesian nationals who left the area. Post-independence, most health care has been provided by international NGOs under the general direction of the Division of Health Services (est. July 2000), which works in cooperation with the World Health Organization (WHO) to develop healthcare policies and coordinate services throughout the country.

In 2000, primary health care was provided by fifteen international NGOs, six local NGOs, twenty-three religious organizations, four military groups, and two private/business agencies. There were two hospitals operating in Dili and one in Baucau. In 2001, a program of District Health Plans included 64 community health centers, 88 health posts, and 117 mobile clinics. There is a laboratory in Dili. There were an estimated 2,000 health workers in the country, including 28 East Timorese doctors.

Though current figures are uncertain, estimates suggest that the 2002 life expectancy rate was 64.85 years (male, 62.64 years; female: 67.17 years). The same year, the fertility rate was estimated at 3.88 children born per woman. The birth rate was estimated at 28.07 births per 1,000 people. Infant mortality was estimated at 52 deaths per 1,000 live births, but this figure may be conservative since most births are not attended by skilled professionals. The most common causes of infant deaths have been infections, prematurity, and birth trauma. It was further estimated that 125 out of 1,000 children died before the age of five. In 2001, maternal mortality was estimated at 890 per 100,000 live births, with the most common cause of death being severe postpartum bleeding.

In 2000, the World Health Organization reported that about 3–4% of all children ages six months to five years were acutely malnourished and 20% were chronically malnourished. Intestinal parasitic infections affect about 80% of all children. Other common childhood illnesses include acute respiratory diseases, diarrheal conditions, malaria, and dengue fever. An immunization program was reinstated in March 2000, which included a special campaign that immunized 45,000 children against measles. In November and December 2000, a nationwide polio immunization campaign reached about 84% of the population.

Endemic diseases include malaria, leprosy, and lymphatic filariasis. Tuberculosis is a major problem as well, affecting over 8,000 people as of 2000 (31% under the age of 15 years). Sexually transmitted diseases are prevalent. The major causes of death are communicable diseases (60%), noncommunicable diseases, chronic diseases, traffic accidents, and others.

#### 42 HOUSING

Housing has been a serious problem since independence. Nearly 85,000 houses (about 70% of the nation's entire housing stock) were destroyed by the Indonesian military in September 1999. Though UNTAET and a number of international aid organizations responded quickly with temporary shelter kits, rebuilding of permanent housing has been slow and property ownership disputes have not been fully addressed.

Tens of thousands of residents fled the country during the violence and those who remained sought shelter in abandoned homes. As property owners returned to their homes, many found occupants claiming ownership and unwilling to leave. Some

occupants have demanded large payments from the owners for “house-sitting” or “improvements” made to the homes in the owner's absence. Through a proposed Land and Property Commission, it has been generally recognized that the original owners or tenants of a property have the right to eventual restitution and reoccupancy, but administration and enforcement of such rights has been a low priority as the government struggles to rebuild an entire nation and care for the emergency needs of its people.

As of 2003, it was difficult to estimate housing demand. Besides the vast number of those within the country who have been left homeless and/or with inadequate shelter and facilities, there were (as of the close of 2002) about 28,000 East Timorese refugees waiting to return from the West Timor territory and about 1,300 in Australia.

In urban areas such as Dili, Bacau, and Alieu, homes have been typically built from concrete. A majority of the population lives in rural areas with homes made from bamboo, wood, and thatch.

#### 43 EDUCATION

Over 90% of all school buildings were severely damaged or destroyed by the Indonesian military and in the exodus of Indonesians out of East Timor, the nation lost 20% of its primary school teachers and 80% of secondary teachers, most of whom are not expected to return. UNICEF and other international aid organizations responded fairly quickly, however, reestablishing classes for 420 of the country's 800 primary schools by December 1999 plus an additional 273 schools by April 2000.

In 2001, East Timor appointed its first minister of education. At the beginning of the 2001 academic year, there were about 240,000 primary and secondary school students enrolled in classes with over 700 primary schools, 100 junior secondary schools, 40 preschools, and 10 technical colleges. About 6,000 teachers were employed. The National University of East Timor (Universidade Nacional Timor Lorosae—UNTL) opened for classes on 27 November 2000 and had about 5,000 students in attendance in 2003. There are five faculties at the university: agriculture, political science, economics, education and teacher training, and engineering. All new students follow a course including human rights, ethics, philosophy of science, and Timorese history.

The education system includes six years of primary education and six years of secondary education. In 2000, the language of instruction was Indonesian, but this has been a subject of debate. Many are encouraging a switch to the national language of Tetum as a primary language with Portuguese and English as secondary languages. The new minister of education will need to address the issues of continued repairs and rebuilding of schools, providing adequate training for teachers, and establishing a standardized curriculum relevant to East Timorese students.

The literacy rate as of 2001 was 48% of the population ages 15 and over.

#### 44 LIBRARIES AND MUSEUMS

Prior to its closing in 1999, the Universitas Timor Timur (UNTIM) Library had a collection of 7,000 books. There were small branch libraries concentrating on politics and education in Dili, and on agriculture in Hera, each of which had a collection of some 400 books. The Polytechnic Library in Hera had a collection of 20,000 books. The Dili Public Library, in Vila-Verde, had 35,000 books, but the building was subsequently gutted and burned. As of 2002, it was proposed that a new National Library of East Timor would be established in the old Vila-Verde building, along with a National Archive. The new university, the Universidade Nacional Timor Lorosae (UNTL), was established in 2000 as an amalgamation of the UNTIM and the Polytechnic. The new UNTL library, housed in a former gymnasium, opened for student access on 21 January 2002.

With assistance from UNESCO and the World Bank, work on a National Museum and Culture Center of East Timor began in late 1999, but at the time there were no artifacts to display and no one to administer the museum. The Japan International Cooperation Agency (JICA) providing training for the establishment of the museum. Following the renovation of the first wing of the museum, an exhibition of Timorese textiles and artifacts from the former national museum were to be held.

#### 45 MEDIA

The new constitution provides for the freedom of speech and press and the government generally respects these rights in practice.

As of 2002, there were two daily newspapers, two weeklies, and several bulletin-type newspapers with sporadic publication and circulation. The government operates a radio station with nationwide reception and a television station that broadcasts only in Dili. There were six private radio stations in 2002 and a few community radio stations in development stages. In May 2002, legislation was passed to create a public broadcasting service.

Telecommunication services, which were cut off by the Indonesian government, are being restored through the help of Australian companies, one of which had established a cellular telephone network service. Another Australian company was installing a land telephone line network as of 2003. International communication authorities have approved an individual country code (670) for East Timor.

#### 46 ORGANIZATIONS

Student organizations in East Timor were influential in the nation's independence campaign and have continued to speak out for civil rights. The National Student Resistance of East Timor (Resistencia Nacional Dos Estudantes De Timor Leste) began in 1988 as an underground organization of Indonesian university students. The East Timor Students Solidarity Council originated in 1998 at the National University of East Timor. It has since set up regional groups throughout the country to represent the views of university and high school students and faculty. Catholic youth organizations have formed. There are also youth scouting groups active in the new nation.

The Red Cross Society was in formative stages as of 2003. There are a number of women's groups, covering political, health, and social issues, including Rede Feto Timor Lorosae, which serves as a network of about 15 individual groups.

The Cooperative Coffee Timor (CCT) is a federation of Timorese-owned organic coffee cooperatives that has received recent aid and developmental support from USAID. The Chamber of Commerce of East Timor and the National Association of East Timor Entrepreneurs are two major business associations in good standing, though in 2001 they were not officially endorsed by the new Division of Trade and Investment.

#### 47 TOURISM, TRAVEL, AND RECREATION

There are at least 25 hotels in Dili, with room prices ranging between \$30 and \$280. Budget accommodations elsewhere may be obtained for as little as \$8 a night. Meal prices range from \$3 to over \$20. One of Dili's two luxury hotels is an anchored cruise ship. Scuba diving and whale and dolphin watching are tourist attractions, in addition to the country's beaches. The northern coast features white sand beaches, while the southern coast is

rocky with occasional black sand beaches. There are elaborate intact coral reefs, populated by over 1,000 aquatic species. East Timor's colonial towns and rugged mountains are also popular with visitors.

Passports must be valid for six months beyond the intended date of departure. An Indonesian visa is required to cross the land border from east to west. As of 2003, the tourist industry was developing. However, a lack of infrastructure and tourist facilities, as well as a continued threat of militia activity in the west, combine to curtail some tourist activity.

#### 48 FAMOUS EAST TIMORESE

Martinho da Costa Lopes (1918–1991) was a Timorese priest with close ties to the Portuguese colonial government and an early advocate for the Timorese people. In 1996, exiled pro-independence leader Jose Ramos-Horta (b.1949) and Bishop Carlos Filipe Ximenes Belo (b.1948) shared the Nobel Peace Prize. Bishop Belo was the highest representative of the Roman Catholic Church in predominantly Catholic East Timor, and was a strong advocate of non-violent resistance. Ramos-Horta served as the UN representative for the East Timorese cause from 1976–89. Jose Alexandre "Xanana" Gusmao (b.1946) was a former FALINTIL (Armed Forces of National Liberation of East Timor) and FRETILIN (Revolutionary Front for an Independent East Timor) guerrilla leader and East Timor's first president. He was imprisoned by the Indonesian army in 1992 and released in 1999. He was elected president in April 2002.

#### 49 DEPENDENCIES

East Timor has no dependencies.

**CAPITAL:** Suva

**FLAG:** The national flag of Fiji consists of the red, white, and blue Union Jack in the upper left corner of a light blue field, with the Fiji shield in the lower right corner.

**ANTHEM:** *God Bless Fiji.*

**MONETARY UNIT:** The Fiji dollar (F\$) of 100 cents is the national currency. There are coins of 1, 2, 5, 10, 20, and 50 cents, and notes of 1, 2, 5, 10, and 20 Fiji dollars. F\$1 = US\$0.5181 (or US\$1 = F\$1.93) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is official, but some British weights and measures are still in use.

**HOLIDAYS:** New Year's Day, 1 January; Constitution Day, 24 July; Independence Day, 10 October; Christmas Day, 25 December; Boxing Day, 26 December. Movable religious holidays include Good Friday, Easter Monday, Dewali, and Milad an-Nabi.

**TIME:** 12 midnight = noon GMT.

### **<sup>1</sup>LOCATION, SIZE, AND EXTENT**

Fiji, situated in the South Pacific about 4,450 km (2,765 mi) SW of Hawaii and 1,770 km (1,100 mi) N of New Zealand, comprises some 850 islands, of which only about 100 are inhabited. The island of Rotuma, added to Fiji in 1881, is geographically separate from the main archipelago and has an area of 44 sq km (17 sq mi). The total area (including Rotuma) is 18,270 sq km (7,054 sq mi). Comparatively, the area occupied by Fiji is slightly smaller than the state of New Jersey. Fiji (not including Rotuma) extends 595 km (370 mi) SE–NW and 454 km (282 mi) NE–SW. The largest islands are Viti Levu, with an area of 10,386 sq km (4,010 sq mi), and Vanua Levu, with 5,535 sq km (2,137 sq mi). Fiji's total coastline is 1,129 km (702 mi).

Fiji's capital city, Suva, is located on the island of Viti Levu.

### **<sup>2</sup>TOPOGRAPHY**

The larger Fiji islands are volcanic, with rugged peaks, and flatland where rivers have built deltas. Coral reefs surround the islands. Viti Levu's highest point, Tomanivi, is 1,323 m (4,340 ft); 28 other peaks are over 910 m (3,000 ft). Its main river, the Rewa, is navigable by small boats for 113 km (70 mi).

### **<sup>3</sup>CLIMATE**

Temperatures at sea level range from 20° to 29°C (68°–85°F); easterly trade winds blow during the greater part of the year. Annual rainfall is well distributed and averages 305 cm (120 in) in Suva. At sea level on the leeward sides of the islands there are well-defined wet and dry seasons, with a mean annual average of 178 cm (70 in) of rain.

The cyclone season, from November to April, brings storms that generally cause extensive property damage and loss of crops as well as numerous deaths.

### **<sup>4</sup>FLORA AND FAUNA**

The larger islands have forests on the windward side and grassland on the leeward slopes. Mangroves and coconut

plantations fringe the coasts. Among indigenous fauna are bats, rats, snakes, frogs, lizards, and many species of birds.

### **<sup>5</sup>ENVIRONMENT**

The main challenges to the environment in Fiji are deforestation, soil erosion, and pollution. Over the last 20 years or so, 30% of Fiji's forests have been eliminated by commercial interests. The rainfall pattern, the location of agricultural areas, and inadequate agricultural methods contribute to the loss of valuable soils. Fiji is also concerned about rising sea levels attributed to global warming caused by the burning of fossil fuels in the industrial world.

The land and water supply are polluted by pesticides and chemicals used in the sugar and fish processing industries. The nation has about 6.9 cu mi of water with roughly 60% used for farming purposes and 20% used for industrial activity. The nation's cities produce 0.1 million tons of solid waste per year.

Fiji's natural environment is protected by the National Trust, which under the 1981–85 development plan began to establish national parks to conserve the island's unspoiled landscape, reefs, and waters, as well as indigenous flora and fauna. As of 2001, four species of mammal, nine types of birds, six species of reptiles and one type of amphibian were considered endangered, as were 64 of Fiji's 1,600-plus plant species. Threatened species include the Fiji banded iguana and crested iguana, the Fiji petrel, the insular flying-fox, and the Samoan flying-fox. The bar-winged rail has become extinct.

### **<sup>6</sup>POPULATION**

The population of Fiji in 2003 was estimated by the United Nations at 839,000, which placed it as number 151 in population among the 193 nations of the world. In that year approximately 3% of the population was over 65 years of age, with another 35% of the population under 15 years of age. There were 104 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 0.98%, with the projected population for the year 2015 at 919,000. The population density in 2002 was 47 per sq km (121

per sq mi). About 70% of the population lives on the island of Viti Levu.

It was estimated by the Population Reference Bureau that 49% of the population lived in urban areas in 2001. The capital city, Suva, had a population of 196,000 in that year. According to the United Nations, the urban population growth rate for 2000–2005 was 2.6%.

## 7 MIGRATION

In the late 19th and early 20th centuries, about 50,000 Indian laborers arrived in the islands to work on sugar plantations. Most recent immigrants come from neighboring islands. There has been steady internal migration from rural to urban areas. There was a substantial increase in emigration by Indians in the immediate aftermath of the coup of May 1987. There are no restrictions on emigration, as 40,000 have done so since 1987. Most of these emigrants were professionals or Indo-Fijians. In 1996, it was estimated that Indians emigrated at a rate of between 4,000 and 5,000 a year. In 1999 the net emigration rate was -3.78 migrants per 1,000 population.

## 8 ETHNIC GROUPS

The indigenous Fijian population is predominantly Melanesian, with a Polynesian admixture. In 1998, the population was estimated to be 51% indigenous Fijian, 44% Indian, and 5% European, other Pacific Islanders, overseas Chinese, and other.

## 9 LANGUAGES

English is the official language, but Fijian and Hindi are also used in Parliament. Fijian dialects belong to the Malayo-Polynesian language group; the Bau dialect is used throughout the archipelago except on Rotuma, where Rotuman is spoken. Hindustani (a local dialect of Hindi) is the lingua franca of the Indians of Fiji.

## 10 RELIGIONS

About 52% of Fijians are Christians, primarily Methodist (37%) and Roman Catholic (9%). Among Indian Fijians, 38% are Hindu, 8% Muslim (Sunni), and 2% other. The newly amended constitution (1998) provides for freedom of religion, and the government reportedly respects this right in practice. Confucianism is practiced by a portion of the Chinese community.

## 11 TRANSPORTATION

During the late 1970s, Fiji completed a new highway between Suva and Nadi and constructed 885 km (550 mi) of rural roads. As of 2002, Fiji had 3,440 km (2,138 mi) of main roads, of which 1,692 km (1,051 mi) were paved. Registered vehicles numbered 3,329 in 2001. A private rail system of about 597 km (371 mi) serves most of the sugar-producing areas. Major ports are Suva, Lautoka, and Levuka. In 2002, Fiji had six merchant ships in service, with a capacity of 11,870 GRT. Inland waterways consist of 203 km (126 mi), of which 122 km (76 mi) are navigable by motorized craft and 200-ton barges. There were 27 airports in 2001, but only three had paved runways. An international airport at Nadi serves regularly scheduled flights to neighboring Pacific islands, Australia, and New Zealand, via Air Pacific. Fiji Air provides domestic and charter service. In 2001, 612,700 passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

Voyagers from the east settled Fiji at least 2,500 years ago. Some of their descendants later moved on to settle the Polynesian islands to the west. The first known European contact came when the Dutch navigator Abel Tasman sighted the Fiji group in 1643.

English Captain James Cook visited it in 1774, and Charles Wilkes headed a US expedition there for three months in 1840.

European sandalwood traders, army deserters, and shipwreck survivors also landed on the islands during the first half of the 19th century, a period in which the chiefs of Bau rose to a dominant position. Protestant missionaries from Tonga arrived in 1835, and French Catholic priests in 1844. After a few chiefs had been converted, more and more Fijians embraced Christianity, usually in the form of Wesleyan Methodism.

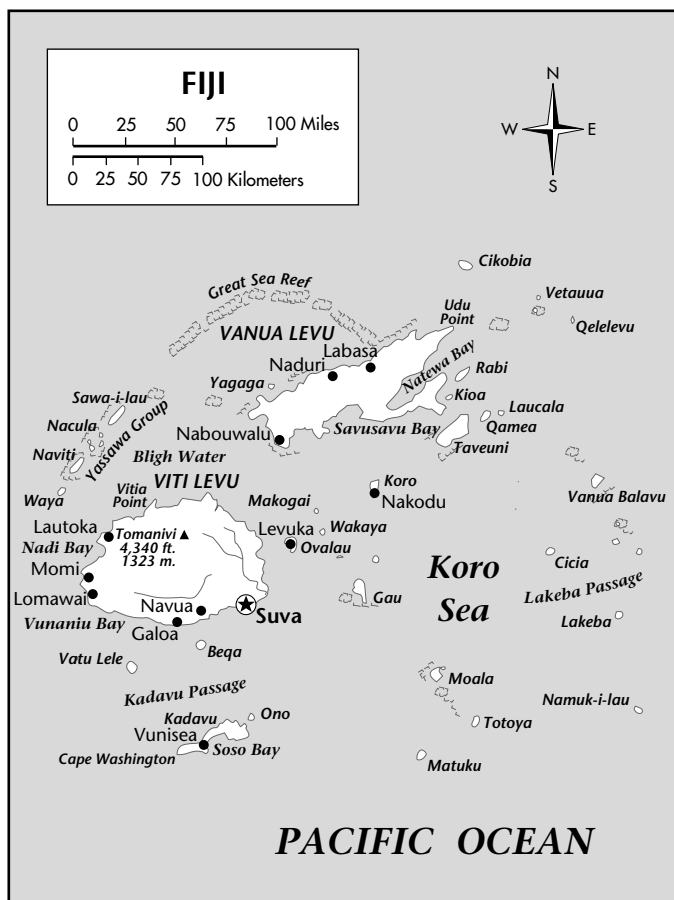

In the course of a civil war in the 1850s, Cakobau, the most powerful chief in Fiji, combined forces with the king of Tonga to become paramount chief of western Fiji. The growing presence of Europeans contributed to political and economic instability. In 1871, some 3000 Europeans supported Cakobau's claim to rule as king of all Fiji, but unrest continued. Cakobau's government appealed to Britain for assistance and, on 10 October 1874, Fijian chiefs signed a Deed of Cession making Fiji a British Crown Colony.

From 1879 to 1916, more than 60,000 indentured laborers from India arrived to work on European-owned sugar plantations, and by 1920 they had settled as free farmers. European settlers were granted elective representation in the Legislative Council in 1904, and Indians were admitted in 1929. Ethnic Fijian representation was based on traditional hierarchies until 1963, when the council was reconstituted; the franchise was extended to women, and direct election of Fijian members was provided for. In 1966, the council was enlarged and again reconstituted, and Fiji attained virtual internal self-government.

On 10 October 1970, Fiji became a sovereign and independent state within the Commonwealth of Nations, with Kamisese K. T. Mara, head of the Alliance Party, as prime minister. He and his majority party won elections in 1972, 1977, and 1982, but lost the April 1987 elections to a coalition of the Indian-based National Federation Party and the Labour Party. The new government was short-lived, however. Within a month, it was toppled by a military coup led by Lt. Col. Sitiveni Rabuka and aimed at restoring political leadership to ethnic Fijians. On 20 May thousands of rioting Fijians attacked Indians. Under a compromise reached the next day, the governor-general temporarily to head the government, assisted by an 18-member advisory council, including the coup leader and former Prime Minister Mara. Elections were to be held within six months, and the council was to propose constitutional revisions that would safeguard the political dominance of indigenous Fijians.

On 25 September 1987, however, Rabuka led a second coup. He subsequently suspended the constitution, dissolved the parliament, and declared Fiji a republic. The governor-general, Ratu Sir Penaia Ganilau, was appointed president of the republic, and Mara was reappointed prime minister. Full civilian rule returned in January 1990 when Rabuka gave up his position as minister of home affairs and returned to barracks as head of the armed forces.

The second coup in 1987 and the adoption of the 1990 constitution, which favored ethnic Fijian control of the government, led to heavy Indian emigration, especially among those Indians with sufficient capital to move. This emigration caused serious economic difficulties for Fiji, but it also ensured that the native Fijian population became the majority. In May of 1992 the Soqosoqo ni Vakavulewa ni Taukei (SVT) or the Fijian Political Party, led by now Major-General Rabuka, won 30 of the 37 seats reserved for ethnic Fijians. Rabuka formed a coalition government with the General Voters Party (GVP) and with the informal support of the Fijian Labour Party (FLP), and became prime minister. After President Ganilau's death in December 1993, the Council of Chiefs elected Ratu Sir Kamisese Mara as the new president in January 1994. Rabuka's government fell in November 1993 when the legislature defeated the government's

LOCATION: 15°43' to 21°2' S; 176°54' E to 178°28' W (not including Rotuma, which is at 12°30' S; 177°5' E). TERRITORIAL SEA LIMIT: 12 miles.

budget. New elections were held in February 1994. The SVT won 31 seats, and Rabuka was able to form a coalition government with the GVP. However, Rabuka's hold on power was tenuous as pressure mounted from within and outside the country for constitutional reform.

Beginning in 1995, a Constitutional Review Commission spent almost two years to develop a system that would avoid purely ethnic politics and, at the same time, take account of the concerns of the native Fijian community. Its recommendations were unanimously adopted by Parliament in July 1997. In 1999, parliamentary elections were held that resulted in a government led by Mahendra Chaudhry, leader of the Fiji Labour Party (FLP), who became the first Indian prime minister of Fiji.

On 19 May 2000, George Speight, a failed businessman and son of Sam Speight, an opposition member of Parliament, took Parliament by show of force and held Prime Minister Chaudhry and most of his multiracial cabinet hostage for 56 days. In exchange for the hostages' release, the military—which imposed martial law during the crisis—agreed to replace Chaudhry's government, grant an amnesty to the rebels taking part in the coup, and to abolish Fiji's multiracial constitution. One of Speight's demands was a new constitution that would only permit indigenous Fijians to hold the posts of prime minister and president. The coup resulted in widespread civil unrest and attacks against ethnic Indians, and caused a drop of 41% in tourism. Speight and 369 of his supporters were arrested in July 2000, and the military installed ethnic Fijian Laisenia Qarase as prime minister in a caretaker government. He was charged with

organizing Fiji's next general election and drawing up a new constitution. Fiji's Great Council of Chiefs appointed Ratu Josefa Iloilo—a former father-in-law of Speight's brother—president.

Eighteen political parties fielded 351 candidates for office in parliamentary elections held in August and September 2001. Qarase was elected prime minister as the head of his newly created party, the nationalist Soqoso Duavata ni Lewenivua Party (Fijian United Party or SDL), which took 32 out of 71 parliamentary seats. Qarase's campaign focused on indigenous Fijians' fears of political domination by ethnic Indians, who make up 44% of the population. Almost all ministers in Qarase's new government were indigenous Fijians. In February 2002, the Fijian Supreme Court ruled that Laisenia Qarase had to include ethnic-Indian members of the Fiji Labour Party in his cabinet.

Speight won a seat in Parliament while facing treason charges in court, but was later denied parliamentary status. He was originally sentenced to death for treason in February 2002, but the sentence was commuted to life imprisonment.

As of January 2003, more than 14,000 ethnic Indians left the country since the May 2000 coup, mainly professionals and skilled workers.

### 13 GOVERNMENT

Before December 1987, the head of state was the British monarch, as represented by a governor-general. The cabinet, responsible to the parliament of Fiji, consisted of a prime minister and ministers appointed by the governor-general on the former's advice. Parliament consisted of an elected house of representatives and an appointive senate. The electoral process was distinctive in establishing communal, or ethnic rolls, in which only members of a specified group might vote, versus national rolls in which anyone could vote. The senate consisted of 22 members: eight nominated by the council of chiefs, a traditional body that had veto power over bills passed by the house involving native Fijians' customs or land rights; seven by the prime minister; six by the leader of the opposition; and one by the Rotuman Council.

The new post-coup constitution went into effect in July 1990. It established Fiji as a sovereign, democratic republic with a bicameral legislature. Fiji's president was to be appointed to a five-year term by the Great Council of Chiefs, which would also nominate 24 Fijians to the 34-member senate. Nine seats were guaranteed to Indians and other races, and one to Rotuma. The senate would have veto power over legislation affecting Fijians. The 71-member house of representatives was to be elected every five years by universal suffrage under the communal system. In addition to stipulating that the office of the prime minister must be held by an ethnic Fijian, the 1990 constitution also guaranteed a majority of seats to the Fijian community. This constitution prohibited cross-race voting; that is, Fijians could only vote for Fijians and Indians only for Indians. It provided for an independent judiciary.

The 1997 constitution specifies that the president, who is head of state, must always be a native Fijian. It also gives considerable recognition to the Great Council of Chiefs, which not only nominates and participates in electing the president, but also maintains its responsibility for matters relating to native Fijians. Parliament consists of two houses. The lower, where all legislation must originate, has 71 members. Of these, 46 are communal: 23 for Fijians, 19 for Indians, 3 for general electors, and 1 for Rotumans. The remaining 25 are "open" seats contested on a common roll basis without any reference to ethnicity, either for the voters or for the candidates.

The president appoints as prime minister the member of parliament who commands majority support in the lower house, or house of representatives. The constitution also provides for mandatory power sharing in cabinet. Any party holding more than eight lower house seats is invited to join the cabinet in

proportion to the number of seats it holds. The upper house or senate consists of 32 appointed members: 14 nominated by the Great Council of Chiefs, 9 by the prime minister, 8 by the leader of the opposition, and 1 by the Council of Rotuma. Parliament serves for a maximum of four years after a general election though the president on the advice of the prime minister can dissolve it.

In the May 1999 election, the first held under this constitution, the Fiji Labour Party won a stunning victory, gaining 37 seats and an absolute majority of the house of representatives. Rabuka's SVT took only eight seats, and the once powerful NFP won no seats at all. Mahendra Chaudhry, leader of the FLP, became the first Indian prime minister of Fiji. The 1999 election was the first test of the amended constitution and introduced open voting for the first time at the national level.

In the August 2001 election, Prime Minister Laisenia Qarase's nationalist Soqoso Duavata ni Lewenivuaana Party (Fijian United Party or SDL) took 32 seats in the house of representatives, and the FLP took 27. In March 2002, Qarase was ordered by the supreme court to allow for 8 seats in the senate from the opposition FLP, as stipulated by the constitution, 4 more than he had originally awarded it.

## 14 POLITICAL PARTIES

Fiji's political parties were in a state of flux after the FLP's unexpected victory in 1999. FLP is a multiethnic party, though some see it as Indian-dominated. After SVT's disappointing showing, Sitiveni Rabuka resigned as leader, and this Fijian-based party was headed by Ratu Inoke Kabuabola, leader of the opposition. It is currently headed by Felipe Bole. The Fijian Association Party, also focused on ethnic interests, is led by a woman, Adi Kuini Speed. It is not clear if the Indian-based National Federation Party will ever come back from its stunning defeat. After the August 2001 parliamentary elections, the NFP, for nearly 40 years the dominant Indian party, was entirely eliminated, as was the SVT. The FLP, led by Mahendra Chaudhry, has a support base of trade unions, workers and farmers, providing it with an efficient, grassroots campaigning structure. The Soqoso Duavata ni Lewenivuaana Party (Fijian United Party or SDL) was created by caretaker Prime Minister Laisenia Qarase in an attempt to consolidate his support and unite the Fijian vote. The SDL has been accused of not broadening its appeal to Indian voters, and some have accused it of racism.

## 15 LOCAL GOVERNMENT

Local government is organized under provincial and urban councils. Fiji is divided into 14 provinces, each with its own council. Some members are appointed, but each council has an elected majority. The councils have powers to make bylaws and to draw up their own budgets, subject to central government approval. Suva and Lautoka have city councils, Nadi a town council, and certain other urban areas are administered by township boards. A few members of urban councils are appointed, but most members are elected on a common roll of taxpayers and residents.

## 16 JUDICIAL SYSTEM

The 1990 constitution reorganized the judicial system, but it retains elements of the British system. The courts include the Magistrate Courts, a High Court, the Court of Appeals, and the Supreme Court. There are no special courts, and the military courts try only members of the armed forces.

The Magistrate Courts are courts of first instance that try most cases. The High Court hears more serious cases in first instance and hears appeals from decisions in the Magistrate Courts. The appellate courts, including the High Court, may engage in constitutional review. The High Court has jurisdiction to review violations of individual rights provided by the Constitution.

The 1990 Constitution makes the judiciary independent of the other branches of government. Due process rights are similar to those in English common law.

Dependents have the right to a public trial and to counsel. A public legal adviser assists indigent persons in family law cases. Detainees must be brought before a court within 24 to 48 hours. Incommunicado and arbitrary detention are illegal. The criminal law permits corporal punishment as a penalty for certain criminal acts, but this provision is seldom invoked.

## 17 ARMED FORCES

Fiji's active armed forces in 2002 numbered 3,500 backed up by some 6,000 reserves. The army totalled 3,200 with 300 in the navy. Of Fiji's seven infantry battalions, two are deployed abroad in Egypt (MFO) and Lebanon (UNIFIL), and observers are stationed in Iraq and Papua New Guinea. Fiji spent \$35 million in 2000, or 2.2% of GDP, on defense.

## 18 INTERNATIONAL COOPERATION

Since joining the UN on 13 October 1970, Fiji has been a leading spokesman for Pacific island states and has contributed contingents to UN peacekeeping forces in Lebanon (1978) and the Sinai (1982). In September 2002, Prime Minister Laisenia Qarase reaffirmed Fiji's continued willingness to participate in UN peacekeeping operations. Fiji belongs to ESCAP and all UN nonregional specialized agencies except IAEA. A member of the WTO, Fiji also is a member of the Asian Development Bank, G-77, and the South Pacific Commission and Forum. Its membership in the Commonwealth of Nations was said to have "lapsed," according to a meeting of Commonwealth heads of government held shortly after the September 1987 coup.

On 10 December 1982, Fiji became the first nation to ratify the Law of the Sea. Fiji's delegates had taken a prominent role in framing the document.

## 19 ECONOMY

Agriculture, mining and fishing have dominated the economy in the past, but manufacturing and tourism are becoming progressively more important in Fiji. The first five years after independence (1970-75) were years of high growth for Fiji, when growth averaged 5.9%, driven by primary commodities. In the next five years, growth continued but at a slower rate—about 3.5% per year. In 1980-86, Fiji suffered the effects of high inflation, especially in energy prices. It also endured three recessions. In 1986, growth rebounded, with GDP increasing 8.1%. This was immediately stopped by the 1987 coup. From 1987 to 1996 the economy grew at average annual rate of 2.5%; counting from independence to 1996, the average annual growth rate for GDP was 3.3%. In 1996, the economy grew 3%, but then, caught in the Asian financial crisis, it declined 3.9% in 1997 and grew at only 1.4% in 1998. 1999 saw a burst of recovery, as GDP shot up 9.7% (7.8% in real terms), only to be cut short, as happened in 1987, by a coup that sent the economy into recession, registers a 2.85% fall in GDP for 2000. Amid continued high political tensions the GDP increased in real terms only 1% in 2001, an improvement attributed mainly to some recovery in tourism.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Fiji's gross domestic product (GDP) was estimated at \$4.4 billion. The per capita GDP was estimated at \$5,200. The average inflation rate in 2000 was 3%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 17% of GDP, industry 25%, and services 58%. Foreign aid receipts

amounted to about \$32 per capita and accounted for approximately 2% of the gross national income (GNI). It was estimated that in 1991 about 26% of the population had incomes below the poverty line.

## 21 LABOR

In 1999, the entire labor force in Fiji was 137,000 workers. Subsistence agriculture and farming accounted for nearly 75% of the workforce in 2001. The unemployment rate was about 7.6% in 1999.

The law protects the right of workers to unionize with some restrictions. All unions must be registered, but they are not controlled by the government. Wages and conditions of employment are regulated by agreements between trade unions and employers. The only central labor organization is the Fiji Trade Union Congress (FTUC). Workers have the right to collective bargain and strike, although a union may not strike in connection with a union recognition dispute. About 55% of the paid workforce was unionized as of 2002.

The normal workweek ranges from 40 to 48 hours but there is no statutory regulated workweek. There is no national minimum wage. The enforcement of child labor regulations is not effective. Health and safety standards are not closely monitored.

## 22 AGRICULTURE

In 2001, agriculture comprised about 30% of Fiji's export earnings. More than three-quarters of all households engage in agriculture, livestock production, forestry, or fishing. A total of 285,000 ha (704,000 acres), or over 15.6% of Fiji's area, was used for crop production in 1998. Sugarcane production was 4,398,000 tons in 1999. In 2001, sugar exports accounted for about 21% (\$112.2 million) of total exports and 70% of agricultural exports. Fijians retain legal ownership of the lands, but Indians farm it and produce about 90% of Fiji's sugar. In 1995, the average sugarcane farm was four ha (9.9 acres), produced 183 tons of cane, and made F\$9.810. Cane is processed into raw sugar and molasses by the Fiji Sugar Corporation, which is 68% owned by the government. The sugar industry is vital to the national economy; as such, the government plays a leading role in all aspects of its production and sale.

Production of copra and coconuts in 1999 was 12,000 tons and 209,000 tons, respectively; paddy rice output was 18,000 tons. Corn, tobacco, cocoa, ginger, pineapples, bananas, watermelons, and other fruits and vegetables are also grown.

## 23 ANIMAL HUSBANDRY

Beef production was some 8,900 tons in 2001; pork, 3,870 tons; and goat meat, 950 tons. A breed of sheep highly adapted to the tropics was introduced in 1980. Fiji's poultry production was 8,420 tons in 2001, and egg production was 2,668 tons that same year.

## 24 FISHING

The fishing industry has expanded in recent years, and a new cannery has increased tuna exports. The fish catch in 2000 was estimated at 36,600 tons, over 20% of which was tuna. Barracuda, snapper, grouper, mackerel, and mullet are other principal species caught. In the early 1980s, several new fish farms began to produce carp, prawns, oysters, eels, and mussels. In 2000, prepared and preserved fish exports were valued at \$34.2 million.

## 25 FORESTRY

Some 45% of the land area is forested, and 253,000 ha (625,000 acres) are suitable for commercial use. Large-scale planting of pines under the 1986-90 development plan involved reforestation of 50,000 ha (120,000 acres). Output of logs in 2000 totaled 486,000 cu m (17,156,000 cu ft). Exports of sawn timber and

other wood products were valued at \$22.2 million in 2000. The first exports of pine logs started in 1980.

## 26 MINING

The mining sector of Fiji contributed 3% to the GDP, virtually all of it from gold, the only metallic mineral recovered in Fiji in 2001. Gold was the third-leading export commodity in 2002, generating 6% of Fiji's foreign exchange. The sole gold producer, Emperor Mines Ltd., was the largest private employer, with more than 1,600 employees. Gold has been mined and exported continuously since 1933. The country was also richly endowed in deposits of copper, lead, and zinc. Gold and silver ranked fourth and fifth among Fiji's top industries in 2002, although no figures were available for the year. Production of gold rose steadily in the mid-1990s, reaching 4,671 kg in 1997; it has since remained static, with the 2001 total at 3,858. Hydraulic cement production was 95,000 tons in 2001. In 2001, Fiji also produced crushed and dimension stone, sand and gravel, and sand for cement manufacture. No silver was mined in 2001; 1,475 kg was mined in 2000 and 2,594 in 1997. In addition to resources at existing sites, 930 million tons of copper (in Viti Levu) and gold reserves have been reported, and prospecting continued for oil and phosphates, and at base-metal sulfide deposits, disseminated porphyry copper deposits, epithermal precious-metal deposits, residual bauxite deposits, and manganese and heavy-mineral sand deposits that have previously been identified and evaluated. None has been shown to have sufficient tonnage to be economically viable. Ownership of minerals was vested in the state, which granted mining and prospecting rights.

## 27 ENERGY AND POWER

The Fiji Electricity Authority, set up in 1966, is responsible for the generation and distribution of electricity, which provides only about 10% of energy consumed. Sugar mills generate their own power, as do hotels and other establishments outside town limits. To lessen dependence on imported oil, the Monasavu hydroelectric project was completed in 1984, with a capacity of 80 MW. Total installed capacity in 2001 was 199 MW; output in 2000 was 515 million kWh, of which 81.9% came from hydroelectric power and 18.1% from fossil fuels. Consumption of electricity in 2000 was 479 million kWh. Exploration for oil and natural gas has taken place, but has been unsuccessful. In the 1990s, the government formed a state-owned petroleum company, Finapeco, to act as the exclusive petroleum importer to Fiji. Finapeco is also a supplier of petroleum to smaller countries in the region (e.g., Kiribati, Tonga, and Tuvalu).

## 28 INDUSTRY

Fiji's industry is based primarily on processing of agricultural products, mainly sugarcane and coconut, and on mining and processing of gold and silver. Other major product groups are processed foods, and garments. In 2001 sugar production fell 14% to 293,000 cubic tons, well short of previous norms of close to 350,000 cubic tons. The government ascribes problems with sugar production to expiring land leases, poor mill performance, high incidence of cane burning, and cane transportation problems. Years of underinvestment in farms, sugar mills and power, water, and transportation infrastructure have resulted in declining quality as well as quantity. In February 2003 the Japanese rejected a shipment of Fiji sugar because of poor quality.

The gold industry suffered due to low world market prices (below \$300 oz.) prevailing from late 1998 to mid-2002, but faces better prospects in the sharp rise to over \$370 oz. in early 2003. Gold production is concentrated in the 66-year-old Vatukoula mine operated by Emperor Mines, which calculates that the mine will last another 10 or 15 year.

The garment industry in Fiji began in 1988, and in 2002 produced a record value of about \$150 million. In 1996, there

were at least 68 garment manufacturing factories operating in tax-free zones, earning \$141 million. About a dozen factories were closed in 2001, with a loss of 5000 to 6000 jobs, but other operations were expanding. Garment industry exports, at \$143 million for 2001, were down, however, due to disruptions in relations with customers from trade sanctions.

Overall, the value of merchandise trade declined about 9% in 2001, and is not expected to surpass the \$557 million of 1997 or even the \$532 million of 1999 until 2003. Tourism receipts were \$228.9 million in 2001, an improvement on 2000, but still constrained by post-coup political uncertainties. Expensive power, lack of trained labor, and the limited local market have also inhibited industrial production. Overall, the value of manufacturing in Fiji, which had declined 6.2% in 2000, increased an estimated 11.5% in 2001, but is projected, by the IMF, to have increased only 1.5% in 2002, with non-sugar manufacturing down .9% in value.

## 29 SCIENCE AND TECHNOLOGY

The University of the South Pacific at Suva, founded in 1968, has schools of agriculture and pure and applied science. Other institutions of higher education are the Fiji College of Agriculture at Nausori, and the Fiji Institute of Technology and the Fiji School of Medicine, both at Suva. The major learned societies are the Fiji Society, concerned with subjects of historic and scientific interest to Fiji and other Pacific islands, and the Fiji Medical Association, both in Suva.

## 30 DOMESTIC TRADE

Fiji has several large trading corporations and hundreds of small traders. The corporations own retail stores, interisland ships, plantations, hotels, travel services, copra-crushing mills, and breweries. Small enterprises range from a single tailor or shopkeeper to larger family businesses, most of which are operated by Indians or Chinese.

Businesses are normally open from 8:00 AM to 1 PM and from 2 to 4:30 PM on weekdays, and from 8 or 8:30 AM to 1 PM on Saturdays. Retail outlets are generally open from Monday through Friday, with half a day on Saturday. Most non-essential services and retail establishments are closed on Sundays. Though most major businesses and retail enterprises accept credit cards and travelers checks, a number of smaller, local businesses and shops operate on cash only.

## 31 FOREIGN TRADE

Like most developing countries that export primarily basic commodities—which are subject to wide market price fluctuations—and import high-valued manufactured products, Fiji has traditionally run a merchandise trade deficit. The years of 1995 and 1996 saw unprecedented trade surpluses while the 1998 merchandise trade deficit was \$263 million. In 2000, however, the country reversed again to a trade surplus, this time totaling \$227 million.

Clothing production dominates Fiji's export commodities, with over a third of export revenues tied to the apparel trade (33%). Sugar and honey are in second place in export sales (24%). Other exports include fish (7.2%) and gold (7.0%). Most of Fiji's exports go to Australia, the United Kingdom, and New Zealand.

In 1994, Fiji's imports were distributed among the following categories:

Consumer goods	13.9%
Food	14.8%
Fuels	11.2%
Industrial supplies	28.1%
Machinery	12.3%
Transportation	18.6%
Other	1.1%

Principal trading partners in 1998 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
Australia	212	359	-147
United States	102	38	64
United Kingdom	99	12	87
Japan	29	40	-11
New Zealand	27	121	-94
Korea	9	15	-6
China (inc. Hong Kong)	8	34	-26
Malaysia	8	19	-11
Singapore	1	53	-52
Thailand	n.a.	27	n.a.

## 32 BALANCE OF PAYMENTS

Fiji has traditionally had an annual trade deficit and an annual deficit on current accounts. Long-term capital inflows, both public and private, generally cover the deficits; however in 1991, the trade deficit was \$37 million, down from \$84 million in 1990. By 1992, the current account balance registered a surplus (as in 1989), due to increased earnings from exported sugar cane and growing tourism. The next year, however, deficits returned, but by 1996, the government was again posting a surplus. In 1997, Fiji just about broke even, but the 1998 figure reported a current account deficit equal to 2.5% of the GDP. A banking collapse due to mismanagement and corruption in the National Bank of Fiji severely damaged the financial account that year.

In addition to sugar exports, strong garment exports and agricultural exports other than sugar were expected to improve the balance of payments situation in the early 2000s.

The US Central Intelligence Agency (CIA) reports that in 2000 the purchasing power parity of Fiji's exports was \$572 million while imports totaled \$833 million resulting in a trade deficit of \$261 million.

The International Monetary Fund (IMF) reports that in 1999 Fiji had exports of goods totaling \$538 million and imports totaling \$653 million. The services credit totaled \$525 million and debit \$390 million. The following table summarizes Fiji's balance of payments as reported by the IMF for 1999 in millions of US dollars.

<b>Current Account</b>	<b>13</b>
Balance on goods	-116
Balance on services	135
Balance on income	-36

<b>Net Errors and Omissions</b>	<b>33</b>
<b>Reserves and Related Items</b>	<b>45</b>

## 33 BANKING AND SECURITIES

The Reserve Bank of Fiji is the central bank, (formerly the Central Monetary Authority), created in 1983 to replace the currency board; the Fiji Development Bank is the main development finance agency. Commercial banking facilities consist of the National Bank of Fiji (NBF) and branches of several foreign banks. As of 2000, there were six commercial banks in Fiji. The NBF enjoys the status of a commercial bank, but it does little business. The troubled NBF is undergoing a process of restructuring following revelations of a high level of non-performing loans. The government had to spend upwards of \$105 million to keep the bank operating. Other banks include

two Australian banks, one Indian bank, one Pakistani bank, and the Bank of Hawaii. The government-owned Fiji Development Bank provides financing for development projects.

Growth in money supply has fluctuated widely in response to trends in foreign trade, affecting the level of reserves. The government tends to follow a cautious monetary policy, which has concentrated on maintaining price stability and on managing high levels of liquidity in the commercial banking system resulting from low levels of private investment. Total assets of financial institutions in 1997 reached \$2.3 billion, an increase of only 0.7% from 1996. The government devalued the currency by 20% in January 1998 due to economic woes. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$272.7 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$644.4 million. The money market rate, the rate at which financial institutions lend to one another in the short term, was 0.79%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 1.75%.

The Suva Stock Exchange operates in Suva, Fiji.

### 34 INSURANCE

In 1986, there were 11 insurance companies, five of which were life insurance firms. Premiums were divided almost equally between life (49%) and nonlife (51%) insurance. Third-party motor liability coverage is compulsory. Some of the companies listed as doing business in Fiji in 1995 were Dominion Insurance, Fiji Reinsurance Corp., Guardian Royal Exchange Assurance, National Insurance Co., the New India Assurance Co., Panpacific Insurance Com., and Queensland Insurance.

### 35 PUBLIC FINANCE

From 1985–96, Fiji suffered a crisis in both private and public investment. Total investment—both public and private—stood at 21.3% of GDP in 1985 and had dropped to 15.8% in 1994. Investment in public enterprises rose for the same period, however, from 3.2% of GDP in 1985 to 6.5% in 1994. The fiscal position of the government also worsened after 1996 due to the collapse of the National Bank of Fiji. During that time, the public deficit increased to 6.5% of GDP, but fell to 2.4% of GDP in 1998.

The US Central Intelligence Agency (CIA) estimates that in 2000 Fiji's central government took in revenues of approximately \$427.9 million and had expenditures of \$531.4 million. Overall, the government registered a deficit of approximately \$103.5 million. External debt totaled \$162.7 million.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	428
Tax revenue	85.2%	365
Non-tax revenue	13.0%	55
Capital revenue	0.9%	4
Grants	0.9%	4
EXPENDITURES	100.0%	531
General public services	26.0%	138
Defense	5.8%	31
Public order and safety	5.0%	26
Education	18.2%	97
Health	8.7%	46
Social security	4.1%	22
Housing and community amenities	2.9%	15
Recreation, cultural, and religious affairs	0.9%	5
Economic affairs and services	18.9%	101
Interest payments	9.5%	51

### 36 TAXATION

Local councils levy taxes to meet their own expenses. National taxes include a nonresident dividend withholding tax (30%), an interest withholding tax (15%), and a dividend tax. In 2003 a full dividend exemption system is to be introduced to prevent double taxation of dividends. For a resident with taxable income over F\$15,000, normal tax is F\$2,300 plus 32% of the excess. For a nonresident with taxable income over F\$15,000, normal tax is F\$3,925 plus 32% of the excess. The normal corporate tax rate in 2001 was 32% on chargeable resident income and 45% on profits of branches of foreign companies. Other taxes include a land sales tax, an excise tax, and a VAT of 12.5%. A plan to reduce the top personal and corporate rate to 30% in 2003 was deferred by the government due to the widening budget deficit, which in 2001, was at 6.5% of GDP in 2001.

### 37 CUSTOMS AND DUTIES

About one-third of Fiji's revenues derive from customs duties. Tariffs range from 0% to 35% on most goods except motor vehicles, alcohol and tobacco, and chemical products, for which the tariffs imposed can be up to 60%, 60%, and 70%, respectively. Duties are levied on the cost, insurance, and freight (CIF) value of the goods.

There are several tax-free zones (TFZs) in Fiji, and 133 tax-free factories as of 1996. TFZs offer a 13-year tax holiday, duty exemptions on capital goods and raw materials, and free repatriation of profits.

### 38 FOREIGN INVESTMENT

The development of existing industries has been made possible largely by foreign investment. Fiji continues to promote overseas capital investment through the Fiji Trade and Investment Board because it requires foreign goods and services to meet many of its needs, including domestic employment. Tax and tariff concessions are offered to approved new industries, and special incentives apply to fuel-efficient or export-oriented enterprises. However, since the coup against the Chaudhry government in May 2000 political tensions have seriously hampered Fiji's prospects for attracting foreign investment in two major ways: through concerns over nativist restrictions and labor problems, and through concerns that trade sanction could be imposed on the defiantly unconstitutional government.

### 39 ECONOMIC DEVELOPMENT

Under the development plan for 1986 to 1990, the government emphasized diversification of industries and expansion of tourism, and set the goal for real GDP growth at 5% annually. Four key areas that were supported for future economic growth were domestic and foreign development in the sugar sector; trade liberalization in major export markets; the resolution of industrial disputes; and the replacement of middle-level skills lost to emigration caused by political turmoil. During the 1990s, Fiji attempted to diversify its economy away from the sugarcane industry by focusing on the garment manufacturing and exporting trade. Bad weather conditions and political turmoil conspire to hinder economic development in the future.

### 40 SOCIAL DEVELOPMENT

Employed workers are eligible for retirement, disability, and survivor benefits, to which they contribute 7% of their wages, matched by their employers. A lump sum is payable to citizens moving out of the country, and to female employees after marriage. Employers also pay for workmen's compensation, covering both temporary and permanent disability benefits.

The constitution provides women with equal rights and includes affirmative action provisions for the disadvantaged. Amendments that took effect in 1998 address legal

discrimination against women in the areas of spousal and offspring rights. Fijian women primarily fulfill traditional roles, although some do attain leadership roles in the public and private sectors. Garment workers, who are mainly female, are subject to a lower minimum wage than that stipulated for other workers. Domestic abuse appears to be on the increase partially due to economic hardship, and an active women's rights movement is addressing the issue.

The government overtly promotes the rights of ethnic Fijians over that of other ethnic groups. Ethnic Fijians predominate in senior government positions and in the ownership of land. Although Indo-Fijians may be found in senior positions in the private sector, few are in government. Indo-Fijians are sometimes subject to discrimination. Human rights abuses are occasionally reported. However, Fiji's major human problem remains discrimination against ethnic minorities.

#### 41 HEALTH

Fiji's health standards are relatively high. In 1986, there were 385 doctors, 67 dentists, and 1,572 nurses. Medical facilities included three main hospitals and three specialized hospitals; a total of 27 hospitals had 1,743 beds. In 1997 there were 0.5 physicians, 2 nurses, and 0.04 dentists per 1,000 people. Cardiovascular disease and cancer have become the top two causes of death in hospitals during the last few years. The increasing mortality has been attributed to hypertension and diabetes mellitus. Diabetes, once relatively unknown in the Fijian community, increased tenfold among Fijian urban dwellers between 1967 and 1980. A cancer survey conducted in 1989 showed extremely high dietary intakes of fat and cholesterol.

The fertility rate was an estimated 2.8 in 2002. The infant mortality rate was estimated at 13.7 per 1,000 live births and estimated average life expectancy was 68.5 years. The estimated overall death was 5.7 per 1,000 people and the birth rate was 23.2 per 1,000. Between 1991 and 1994, 96% of children were immunized against measles. Venereal diseases have increased in recent years and infantile diarrhea persists. In 1996, seven AIDS cases were reported. As of 2000 the number of people living with HIV/AIDS was estimated at 85.

#### 42 HOUSING

According to government estimates, Fiji requires more than 4,200 new houses each year to maintain adequate housing standards. Natural disasters such as cyclones and tropical storms have caused problems in creating and maintaining adequate housing stock.

The Fiji Housing Authority provides accommodations for urban workers and extends credit for houses it builds and sells. At last estimate, housing stock exceeded 126,000 units, of which 30% were made of corrugated iron or tin; 30% were concrete; more than 25% were wood; and nearly 10% were bure. The water supply was mostly either individually piped (53%), communally piped (20%), or obtained from wells (13%). Roughly 32% of all dwellings had private flush toilets while 42% used latrines, and 49% had electricity.

#### 43 EDUCATION

Education is not compulsory but is free through the first eight years. There are government schools as well as private schools operated by individual groups or by missions under government supervision. In 1990, public expenditure on education was 4.6% of GDP. In the mid-1990s there were 4,644 teachers and 145,630 pupils in 693 primary schools. Secondary schools had 3,631 teachers and 66,890 students. Of these, 6,653 students were enrolled in technical and vocational schools. The pupil-teacher ratio at the primary level was 23 to 1 in 1999. In the same year, 99% of primary-school-age children were enrolled in school. The University of the South Pacific, which opened in Suva in 1968,

had more than 3,600 students in the mid-1990s. Its students are drawn from several Pacific island states. All third-level institutions and universities had approximately 8,000 students and a faculty staff nearing 300 personnel. Adult illiteracy rates for the year 2000 were estimated at 7.1% (males, 5.0%; females, 9.1%).

#### 44 LIBRARIES AND MUSEUMS

The Ministry of Education runs the Library Service of Fiji in Suva and provides public, special, and school services through three mobile libraries and 33 government libraries with a total collection of over 960,000 volumes. Suva maintains its own public library of 77,000 volumes, most of which is a children's collection. The library at the University of the South Pacific contains 750,000 volumes. There are several libraries associated with theological institutions and colonial cultural centers. The Fiji Museum, established at Suva in 1906, has a collection of Fijian artifacts and documents Fijian oral traditions.

#### 45 MEDIA

Suva and its surrounding area are served by an automatic telephone exchange that had 80,901 mainline telephones in 1999. In 1997, there were 5,200 cellular phones in use nationwide. Fiji is a link in the world Commonwealth cable system and has radiotelephone circuits to other Pacific territories.

The Fiji Broadcasting Commission offers programs in Fijian, English, and Hindustani over Radio Fiji on three channels. In 1998, there were 13 AM and 40 FM radio stations. As of 2001, there is one television broadcast station, Fiji One TV, which is owned by private and government interests. In 1999, Fiji had 541,476 radios and 88,100 television sets nationwide. In 2000, two Internet service providers were serving 7,500 subscribers.

The two daily newspapers, both published at Suva, are the English-language *Fiji Times* (with an estimated circulation of 34,000 in 2002) and *Fiji Daily Post* (9,000). The Fijian *Nai Lalakai* and the Hindi *Shanti Dut* (1995 circulations, respectively, 9,600 and 10,750) are two of the most widely read periodicals.

Freedom of speech and press are said to be generally respected by the government, and political figures and other citizens can speak out against the government freely.

#### 46 ORGANIZATIONS

The main chamber of commerce is located in Suva. Two organizations representing the interests of employers and business owners are the Fiji Employers' Federation and the Fiji National Training Council. Unions and professional associations exist for several occupations, including manufacturing industries, sugar cane growers, teachers, and optometrists. The Fiji Trades Union Congress serves as a larger advocate for worker's rights. At last estimate there were more than 1,200 registered cooperatives.

Youth organizations include the Fiji Youth and Student League, the Fiji Scout Association, and Fiji Girl Guides. National women's organizations include The National Council of Women and the Fiji Women's Rights Movement.

#### 47 TOURISM, TRAVEL, AND RECREATION

Popular tourist attractions are the beach resorts and traditional Fijian villages. Visitors with valid passports are granted tourist visas renewable for up to six months. Spectator sports include soccer, cricket, rugby and basketball, and Fiji has excellent golf facilities.

In 2000, there were 294,070 tourist arrivals, nearly 60% from East Asia and the Pacific region. That year gross receipts from tourism amounted to \$195 million. There were 5,283 rooms in hotels and other establishments with 13,463 beds.

In 2002, the US State Department estimated the cost of staying in Suva at \$174 per day and in Nadi at \$160 per day.

#### 48 FAMOUS FIJIANS

The best-known Fijians are Ratu Sir Lala Sukuna (d.1958), the first speaker of the Legislative Council in 1954; Ratu Sir George Cakobau (1911–89), the first Fijian to be governor-general; and Ratu Sir Kamisese K. T. Mara (b.1922), elected prime minister in 1970 and president in 1994.

#### 49 DEPENDENCIES

Fiji has no territories or colonies.

# FRENCH PACIFIC DEPENDENCIES

## FRENCH POLYNESIA

The overseas territory of French Polynesia (Polynésie Française) in the South Pacific Ocean includes five island groups. The Society Islands (Îles de la Société) were discovered by the British in 1767 and named after the Royal Society, are the most important. They include Tahiti (at 17° 40' s and about 149° 20' w), the largest French Polynesian island with an area of 1,042 sq km (402 sq mi); Moorea; and Raiatea. The French established a protectorate in 1844 and made the islands a colony in 1880. The Marquesas Islands (Îles Marquises, between 8° and 11° s and 138° and 141° w), about 1,500 km (930 mi) NE of Tahiti, were discovered by Spaniards in 1595 and annexed by France in 1842. The Tuamotu Islands, about 480 km (300 mi) s and sw of the Marquesas and consisting of 78 islands scattered over an area of 800 sq km (310 sq mi), were discovered by Spaniards in 1606 and annexed by France in 1881. The Gambier Islands, se of the Tuamotus, were discovered by the British in 1797 and annexed by France in 1881. Three of the islands, Mangareva, Taravai, and Akamaru, are inhabited. The Tubuai or Austral Islands (Îles Australes), south of the Society Islands, were discovered in 1777 by James Cook and annexed by France in 1880. Clipperton Island (10° 18' N and 109° 12' w), an uninhabited atoll sw of Mexico and about 2,900 km (1,800 mi) west of Panama, was claimed by France in 1858 and given up by Mexico, which also had claimed it, in 1932. In 1979, it was placed under direct control of the French government. Total area of the territory is between 3,600 and 4,200 sq km (1,400 and 1,600 sq mi).

The estimated mid-2002 population was 257,847, of whom about 78% were Polynesian, 12% Chinese, and 10% European. About 55% of the population is Protestant and 30% is Roman Catholic; there are also small animist and Buddhist minorities. French and Tahitian (a Maori dialect) are the official languages; English is also spoken. Marine life is abundant, both in the surrounding ocean and in rivers and streams; there are no indigenous mammals.

The territory is divided into five administrative areas (circonscriptions). A 49-member territorial assembly is elected every five years by universal suffrage. A council of ministers, headed by a president picked by the assembly, chooses a vice-president and nine other ministers. The president assists the French-appointed high commissioner, who is the administrator for the whole territory of French Polynesia. The Economic Social and Cultural Council, composed of representatives of industry and professional groups, is a consultative body. Two deputies and a senator represent the territory in the French parliament.

Tourism produces income of more than CFP40 billion yearly; visitor numbers exceeded 250,000 for the first time in 2000. Seven international airlines operate to and from French Polynesia. Tropical fruit, vanilla, coffee, and coconuts are the principal agricultural products. Fishing has intensified in recent years, especially for tuna and shark meat. Phosphate deposits, mined on Makatea in the Tuamotu Islands, were exhausted by 1966. The Pacific Nuclear Test Center, constructed on the atoll of Mururoa in the 1960s, the Office for Overseas Scientific and Technical Research, and the Oceanological Center of the Pacific

(which experiments with shrimp and oyster breeding) operate in the region. A space telecommunications station is based at Tahiti. In 1996, France definitively halted all nuclear testing in French Polynesia, after it had resumed nuclear testing on the Mururoa atoll in 1995.

Currency is the Communauté Française de Pacifique franc, linked to the euro at a rate of €1=CFP Fr119.25. Exports in 1999 totaled us\$205 million (mostly cultured black pearls and coconut products); imports, us\$749 million.

There are a number of hospitals and private clinics on the island, and one large government hospital on Tahiti. The educational system is well-developed, and the Université de la Polynésie Française (UPF) was created in 1999, out of the former Université Française du Pacifique. The UPF had 2,372 students preparing for a diploma during the 2002–03 academic year. Agricultural and technical schools also offer postsecondary education.

French Polynesia in 1995 had 3 daily newspapers, 5 AM stations, 2 FM radio stations, and 6 TV stations.

## FRENCH SOUTHERN AND ANTARCTIC TERRITORIES

The French Southern and Antarctic Territories (Terres Australes et Antarctiques Françaises), an overseas territory of France, have a total area of 7,781 sq km (3,004 sq mi), not including Adélie Land, and are administered by an appointed administrator and consultative council from Paris. Most of the population (145 in 2002) in the territories were researchers.

The Kerguelen Archipelago, situated at 48° to 50° s and 68° to 70° E, about 5,300 km (3,300 mi) SE of the Cape of Good Hope, consists of one large and about 300 small islands with a total area of 7,215 sq km (2,786 sq mi). France maintains a captive register for French-owned merchant ships in the archipelago.

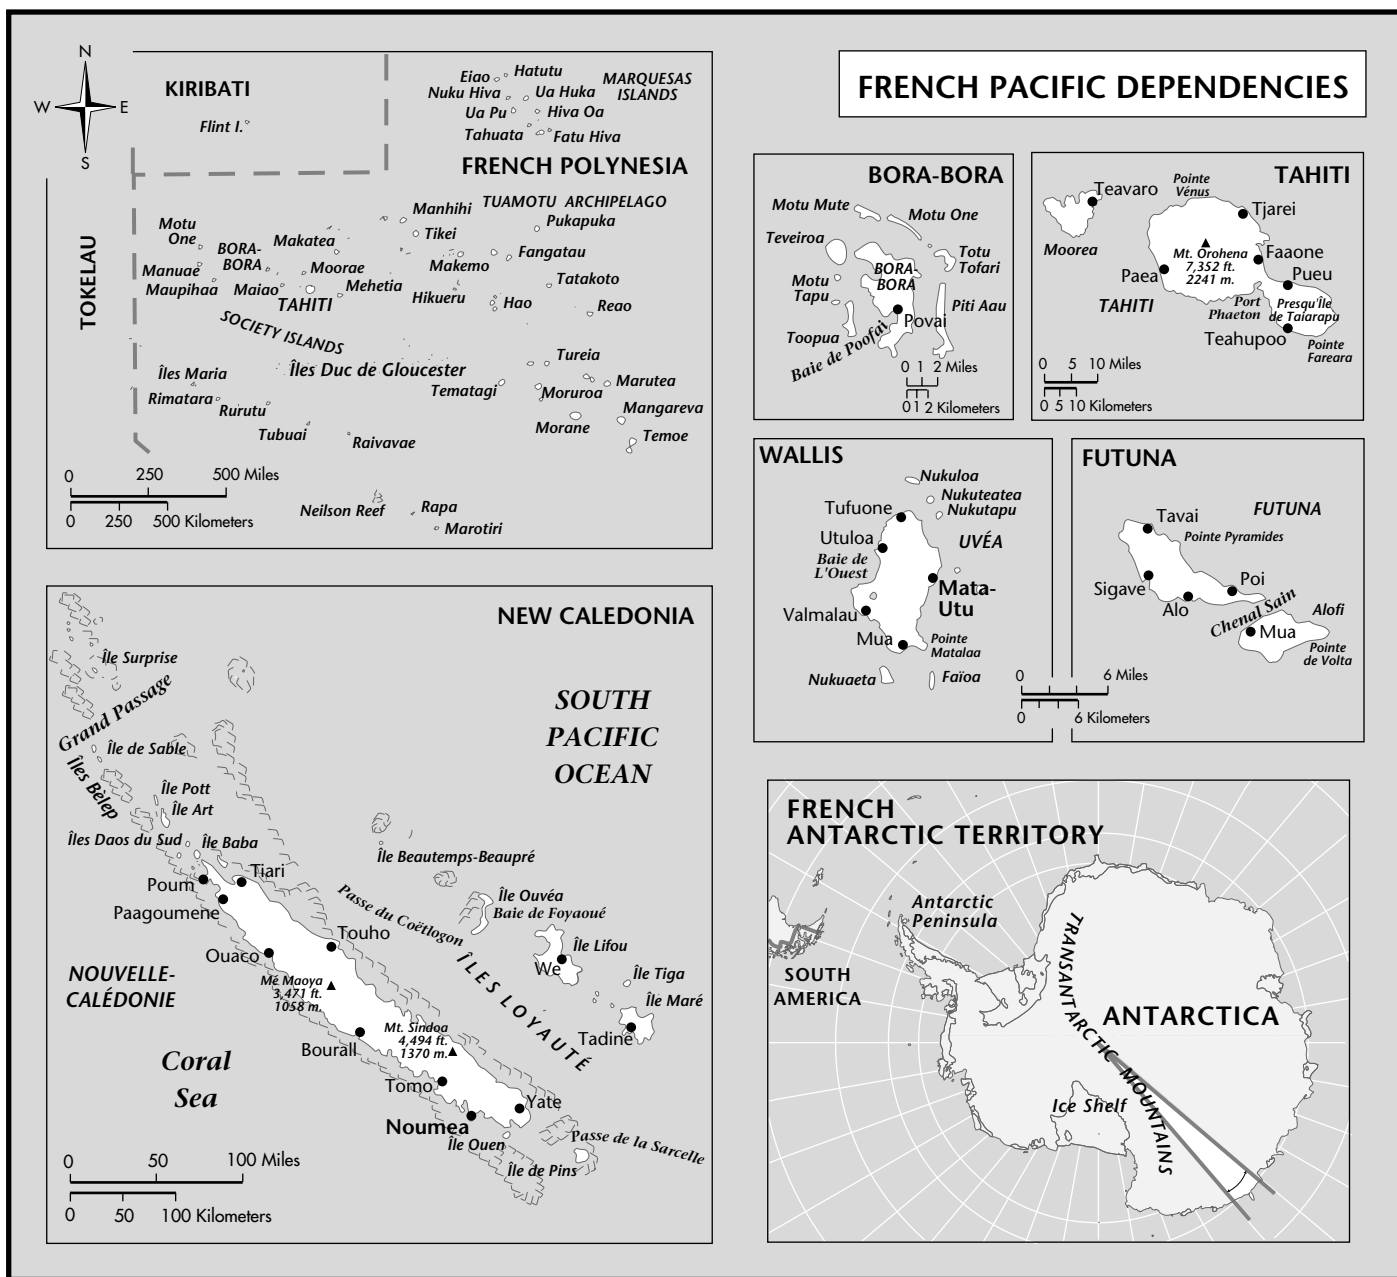

Crozet Archipelago, at 46° s and 50° to 52° E, consists of 5 main and 15 smaller uninhabited islands, with a total area of 505 sq km (195 sq mi).

St. Paul, at about 38° 25' s and 77° 32' E, is an uninhabited island with an area of about 7 sq km (2.7 sq mi). Some 80 km (50 mi) to the north, at about 37° 50' s and with an area of about 54 sq km (21 sq mi), is Amsterdam Island.

Adélie Land (Terre Adélie), comprising some 432,000 sq km (167,000 sq mi) of Antarctica between 136° and 142° E, s of 67° s, was discovered in 1840 by Dumont d'Urville and claimed by him for France.

## NEW CALEDONIA

New Caledonia (Nouvelle-Calédonie), a French overseas territory NE of Australia in the South Pacific Ocean, lies between 18° and 23° s and 162° and 169° E. The main island is about 400 km (250 mi) long and 50 km (30 mi) wide, with a surface area of 16,192 sq km (6,252 sq mi). Mountainous and partly surrounded by coral reefs, the island is mostly forested or covered with low bush. With its dependencies and protectorates, it has an overall area of 18,576 sq km (7,172 sq mi). Native fauna is sparse, but

plant life is abundant; among the plants unique to the territory is niaouli, a tree of the eucalyptus family whose leaves are processed for the pharmaceutical industry.

Total population in 2002 was estimated to be 207,858, of whom 42.5% were native Melanesians and 37% were Europeans. French and various Melanesian and other local languages are spoken. Roman Catholicism is the majority religion.

New Caledonia was discovered in 1768 by Louis Antoine de Bougainville and was named by James Cook, who landed there in 1774. Local chiefs recognized France's title in 1844, and New Caledonia became a French possession in 1853. In 1946, it became a French overseas territory, and in 1958, its assembly voted to maintain that status. Under 1976, 1984, and 1985 laws, New Caledonia is administered by an appointed high commissioner, an executive council, and a 54-seat territorial

Congress, consisting of the membership of the three provincial assemblies. New Caledonia has two representatives in the French national assembly and one in the senate. The territory is divided into three provinces (Îles Loyauté, Nord, and Sud); municipal communes play a role in primary education and social welfare.

The economy is based on agriculture and mining. Coffee, copra, potatoes, cassava, corn, wheat, and fruits are the main crops, but agricultural production does not meet the domestic demand. New Caledonia is the fourth largest producer of ferromanganese in the world, after Canada, Indonesia, and Russia. Nickel mining and smelting accounted for an estimated 12% of GDP and 80% of export earnings in 2000. New Caledonia has approximately 25% of the world's known nickel reserves. Coffee, copra, and chromium make up most of the other exports. Trade is mainly with France, Australia, Japan, and the United States. In

2000, exports totaled us\$400 million, imports totaled us\$1 billion.

## WALLIS AND FUTUNA

Wallis Island and the Futuna, or Hoorn, Islands in the Southwest Pacific constitute a French overseas territory, with the capital at Mata-Utu, on Wallis (also called Uvéa). Lying about 400 km (250 mi) w of Pago Pago, American Samoa, at 13° 22' s and 176° 12' w, Wallis, 154 sq km (59 sq mi) in area, is surrounded by a coral reef with a single channel. The Futuna Islands are about 190 km (120 mi) to the sw at 14° 20' s and about 177° 30' w. They comprise two volcanic islands, Futuna and Alofi, which, together with a group of small islands, have a total area of about 116 sq km (45 sq mi).

The Futuna group was discovered by Dutch sailors in 1616; Wallis (at first called Uvéa) was discovered by the English explorer Samuel Wallis in 1767. A French missionary established a Catholic mission on Wallis in 1837, and missions soon followed on the other islands. In 1842, the French established a protectorate, which was officially confirmed in 1887 for Wallis and in 1888 for Futuna. As of mid-2002, Wallis and Futuna had an estimated 15,585 inhabitants. Most of the population is Polynesian; only 2.5% are European. French and Uvean are the principal languages spoken; 99% of the population is Roman Catholic. A high administrator, representing the French government, is assisted by a 20-seat territorial assembly. Principal commercial activities are the production of copra and fishing for trochus. The chief food crops are yams, taro, bananas, manioc, and arrowroot.

---

# INDIA

Republic of India  
*Bharat Ganarajya*

**CAPITAL:** New Delhi

**FLAG:** The national flag, adopted in 1947, is a tricolor of deep saffron, white, and green horizontal stripes. In the center of the white stripe is a blue wheel representing the wheel (chakra) that appears on the abacus of Asoka's lion capital (c.250 BC) at Sarnath, Uttar Pradesh.

**ANTHEM:** *Jana gana mana (Thou Art the Ruler of the Minds of All People)*. A national song of equal status is *Vande Mataram (I Bow to Thee, Mother)*.

**MONETARY UNIT:** The rupee (R) is a paper currency of 100 paise. There are coins of 5, 10, 20, 25, and 50 paise, and 1, 2, and 5 rupees, and notes of 2, 5, 10, 20, 50, 100, and 500 rupees. R1 = 0.02129 (or \$1 = R46.97) as of May 2003.

**WEIGHTS AND MEASURES:** Metric weights and measures, introduced in 1958, replaced the British and local systems. Indian numerical units still in use include the lakh (equal to 100,000) and the crore (equal to 10 million).

**HOLIDAYS:** Republic Day, 26 January; Independence Day, 15 August; Gandhi Jayanti, 2 October. Annual events—some national, others purely local, and each associated with one or more religious communities—number in the hundreds. The more important include Shivarati in February; and Raksha Bandhan in August. Movable religious holidays include Holi, Ganesh Chaturthi, Durga Puja, Dussehra, 'Id al-Fitr, Dewali; and Christmas, 25 December.

**TIME:** 5:30 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

The Republic of India, Asia's second-largest country after China, fills the major part of the South Asian subcontinent (which it shares with Pakistan, Nepal, Bhutan, and Bangladesh) and includes the Andaman and Nicobar Islands in the Bay of Bengal and Lakshadweep (formerly the Laccadive, Minicoy, and Amindivi Islands) in the Arabian Sea. The total area is 3,287,590 sq km (1,269,345 sq mi), including 222,236 sq km (85,806 sq mi) belonging to Jammu and Kashmir; of this disputed region, 78,932 sq km (30,476 sq mi) are under the de facto control of Pakistan and 42,735 sq km (16,500 sq mi) are held by China. Comparatively, the area occupied by India is slightly more than one-third the size of the United States. China claims part of Arunachal Pradesh. Continental India extends 3,214 km (1,997 mi) N-S and 2,933 km (1,822 mi) E-W. India is bordered on the N by the disputed area of Jammu and Kashmir (west of the Karakoram Pass), China, Nepal, and Bhutan; on the E by Myanmar, Bangladesh, and the Bay of Bengal; on the S by the Indian Ocean; on the W by the Arabian Sea; and on the NW by Pakistan. The total boundary length is 21,103 km (13,113 mi), of which 7,00 km (4,340 mi) is coastline.

India's capital city, New Delhi, is located in the northcentral part of the country.

## <sup>2</sup>TOPOGRAPHY

Three major features fill the Indian landscape: the Himalayas and associated ranges, a geologically young mountain belt, folded, faulted, and uplifted, that marks the nation's northern boundary and effectively seals India climatically from other Asian countries; the Peninsula, a huge stable massif of ancient crystalline rock, severely weathered and eroded; and the Ganges-Brahmaputra Lowland, a structural trough between the two rivers, now an alluvial plain carrying some of India's major rivers from the

Peninsula and the Himalayas to the sea. These three features, plus a narrow coastal plain along the Arabian Sea and a wider one along the Bay of Bengal, effectively establish five major physical-economic zones in India.

Some of the world's highest peaks are found in the northern mountains: Kanchenjunga (8,598 m/28,208 ft), the third-highest mountain in the world, is on the border between Sikkim and Nepal; Nanda Devi (7,817 m/25,645 ft), Badrinath (7,138 m/23,420 ft), and Dunagiri (7,065 m/23,179 ft) are wholly in India; and Kamet (7,756 m/25,447 ft) is on the border between India and Tibet.

The Peninsula consists of an abrupt 2,400-km (1,500-mi) escarpment, the Western Ghats, facing the Arabian Sea; interior low, rolling hills seldom rising above 610 m (2,000 ft); an interior plateau, the Deccan, a vast lava bed; and peripheral hills on the north, east, and south, which rise to 2,440 m (8,000 ft) in the Nilgiris and Cardamoms of Kerala and Tamil Nadu. The Peninsula holds the bulk of India's mineral wealth, and many of its great rivers—the Narbada, Tapti, Mahanadi, Godavari, Krishna, and Kaveri—flow through it to the sea. The great trench between the Peninsula and the Himalayas is the largest alluvial plain on earth, covering 1,088,000 sq km (420,000 sq mi) and extending without noticeable interruption 3,200 km (2,000 mi) from the Indus Delta (in Pakistan) to the Ganges-Brahmaputra Delta (shared by India and Bangladesh), at an average width of about 320 km (200 mi). Along this plain flow the Ganges, Brahmaputra, Son, Jumna, Chambal, Gogra, and many other major rivers, which provide India with its richest agricultural land.

## <sup>3</sup>CLIMATE

The lower east (Coromandel) and west (Malabar) coasts of the Peninsula and the Ganges Delta are humid tropical; most of the

Peninsula and the Ganges-Brahmaputra Lowland are moist subtropical to temperate; and the semiarid steppe and dry desert of the far west are subtropical to temperate. The northern mountains display a zonal stratification from moist subtropical to dry arctic, depending on altitude.

Extremes of weather are even more pronounced than the wide variety of climatic types would indicate. Thus, villages in western Rajasthan, in the Thar (Great Indian) Desert, may experience less than 13 cm (5 in) of rainfall yearly, while 2,400 km (1,500 mi) eastward, in the Khasi Hills of Assam, Cherrapunji averages about 1,143 cm (450 in) yearly. Sections of the Malabar Coast and hill stations in the Himalayas regularly receive 250–760 cm (100–300 in) yearly; many areas of the heavily populated Ganges-Brahmaputra Lowland and the Peninsula receive under 100 cm (40 in). Winter snowfall is normal for the northern mountains and Kashmir Valley, but for most of India, scorching spring dust storms and severe hailstorms are more common. The northern half of the country is subject to frost from November through February, but by May a temperature as high as 49°C (120°F) in the shade may be recorded. High relative humidity is general from April through September. Extratropical cyclones (similar to hurricanes) often strike the coastal areas between April and June and between September and December.

The monsoon is the predominant feature of India's climate and helps to divide the year into four seasons: rainy, the southwest monsoon, June–September; moist, the retreating monsoon, October–November; dry cool, the northeast monsoon, December–March; hot, April–May. The southwest monsoon brings from the Indian Ocean the moisture on which Indian agriculture relies. Unfortunately, neither the exact times of its annual arrival and departure nor its duration and intensity can be predicted, and variations are great. In 1987, the failure of the southwest monsoon resulted in one of India's worst droughts of the century.

#### 4 FLORA AND FAUNA

Almost one-fourth of the land is forested. Valuable commercial forests, some of luxuriant tropical growth, are mainly restricted to the eastern Himalayas, the Western Ghats, and the Andaman Islands. Pine, oak, bamboo, juniper, deodar, and sal are important species of the Himalayas; sandalwood, teak, rosewood, mango, and Indian mahogany are found in the southern Peninsula. Some 15,000 varieties of midlatitude, subtropical, and tropical flowers abound in their appropriate climatic zones.

India has over 300 species of mammals, 900 species of breeding birds, and a great diversity of fish and reptiles. Wild mammals, including deer, Indian bison, monkeys, and bears, live in the Himalayan foothills and the hilly section of Assam and the plateau. In the populated areas, many dogs, cows, and monkeys wander as wild or semiwild scavengers.

#### 5 ENVIRONMENT

Among India's most pressing environmental problems are land damage, water shortages, and air and water pollution. During 1985, deforestation, which, especially in the Himalaya watershed areas, aggravates the danger of flooding, averaged 1,471 sq km (568 sq mi) per year. India also lost 50% of its mangrove area between 1963 and 1977. Despite three decades of flood-control programs that had already cost an estimated \$10 billion, floods in 1980 alone claimed nearly 2,000 lives, killed tens of thousands of cattle, and affected 55 million people on 11.3 million hectares (28 million acres) of land. As of the mid-1990s, 60% of the land where crops could be grown had been damaged by the grazing of the nation's 406 million head of livestock, deforestation, misuse of agricultural chemicals, and salinization.

Due to uncontrolled dumping of chemical and industrial waste, fertilizers and pesticides, 70% of the surface water in India is polluted. The nation has 1,260 cu km of renewable water

resources, of which 92% is used for farming. Safe drinking water is available to 95% of urban and 79% of rural dwellers. Air pollution is most severe in urban centers, but even in rural areas, the burning of wood, charcoal, and dung for fuel, coupled with dust from wind erosion during the dry season, poses a significant problem. Industrial air pollution threatens some of India's architectural treasures, including the Taj Mahal in Agra, part of the exterior of which has been dulled and pitted by airborne acids. In what was probably the worst industrial disaster of all time, a noxious gas leak from a Union Carbide pesticide plant in Bhopal, the capital of Madhya Pradesh, killed more than 1,500 people and injured tens of thousands of others in December 1985. In 1992 India had the world's sixth-highest level of industrial carbon dioxide emissions, which totaled 769 million metric tons, a per capita level of 0.88 metric tons.

The environmental effects of intensive urbanization are evident in all the major cities, although Calcutta—once a symbol of urban blight—has been freed of cholera, and most of the city now has water purification and sewer services. Analogous improvements have been made in other leading cities under the Central Scheme for Environmental Improvement in Slum Areas, launched in 1972, which provided funds for sewers, community baths and latrines, road paving, and other services. However, as of the mid-1990s, only 21 of India's 3,245 cities had effective sewage treatment.

The National Committee on Environmental Planning and Coordination was established in 1972 to investigate and propose solutions to environmental problems resulting from continued population growth and consequent economic development; in 1980, the Department of the Environment was created. The sixth development plan (1979–84), which for the first time included a section on environmental planning and coordination, gave the planning commission veto power over development projects that might damage the environment; this policy was sustained in the seventh development plan (1985–90). The National Environmental Engineering Research Institute has field center areas throughout the country.

The Wildlife Act of 1972 prohibits killing of and commerce in threatened animals. In 1985 there were 20 national parks and more than 200 wildlife sanctuaries. As of 2001, 4.4% of India's total land area was protected. In addition to 75 species of mammals, 73 types of birds are endangered, as are 785 plant species. Endangered species in India include the lion-tailed macaque, five species of langur, the Indus dolphin, wolf, Asiatic wild dog, Malabar large-spotted civet, clouded leopard, Asiatic lion, Indian tiger, leopard, snow leopard, cheetah, Asian elephant, dugong, wild Asian ass, great Indian rhinoceros, Sumatran rhinoceros, pygmy hog, swamp deer, Himalayan musk deer, Kashmir stag or hangul, Asiatic buffalo, gaur, wild yak, white-winged wood duck, four species of pheasant, the crimson tragopan, Siberian white crane, great Indian bustard, river terrapin, marsh and estuarine crocodiles, gavia, and Indian python. Although wardens are authorized to shoot poachers on game reserves, poaching continues, with the Indian rhinoceros (whose horn is renowned for its supposed aphrodisiac qualities) an especially valuable prize.

#### 6 POPULATION

The population of India in 2003 was estimated by the United Nations at 1,065,462,000, which makes it the second most populous country among the 193 nations of the world. China is the only nation with more people, and the only other country with more than one billion inhabitants. Moreover, the US Census Bureau expects India's population to surpass China's by 2035. The key to India's rapid population growth since the 1920s has been a sharp decline in the death rate because of improvements in health care, nutrition, and sanitation. In 1921, when India's population stood at 251,321,213, the birthrate was 48.1 but the

LOCATION: 8°4' to 37°6' N; 68°7' to 97°25' E. BOUNDARY LENGTHS: Nepal, 1,690 kilometers (1,050 miles); Bhutan, 605 kilometers (373 miles); Myanmar, 1,463 kilometers (910 miles); Bangladesh, 4,053 kilometers (2,520 miles); total coastline, 7,000 kilometers (4,360 miles); Pakistan, 2,912 kilometers (1,800 miles). TERRITORIAL SEA LIMIT: 12 miles.

death rate was 47.2; by 1961, when the population reached 439,234,771, the birthrate was still high at 40.8, but the death rate had dropped by more than half to 22.8. A drop in the birthrate from 41.1 in 1971 to 30.2 in 1990–91, presumably attributable to an aggressive program of family planning, contraception, and sterilization, had little immediate impact on the compounded population growth rate, which averaged 2.1% in the 1980s and 1.9% in 1990–95. The government considers the rapid population growth a serious problem, particularly in relation to reducing poverty. The goal of the Indian government is to reach zero population growth by 2050 with a population of 1.3 billion. In 2003 approximately 4% of the population was over 65 years of age, with another 36% of the population under 15 years of age. There were 106 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 1.51%, with the projected population for the year 2015 at 1,246,351,000. The population density in 2002 was 319 per sq km (827 per sq mi). It was estimated by the Population Reference Bureau that 28% of the population lived in urban areas in 2001. The majority of people live in some 555,315 villages with fewer than 10,000 residents each. The capital city, New Delhi, had a population of 11,345,000 in 2002. Other large urban areas were Mumbai (formerly Bombay) (18,042,000), Calcutta (12,900,000), Delhi (11,680,000), Madras (6,639,000), Hyderabad (6,833,000), Bangalore (5,554,000), Ahmadabad (4,154,000), Pune (3,485,000), Kanpur (2,447,000), Lucknow (2,565,000), Surat 2,341,000, Nagpur (2,060,000), and Jaipur (2,143,000). According to the United Nations, the urban population growth rate for 2000–2005 was 2.8%. The surge in urban population is considered to be another major constraint to economic development.

## 7 MIGRATION

The partitioning of the South Asian subcontinent to create India and Pakistan in 1947 produced one of the great mass migrations in human history, involving some 20 million people. Historically, major migratory movements have been to and from Sri Lanka, Malaysia, Myanmar, and Bangladesh. The influx of Muslim refugees (estimated at 280,000 in 1983) from Bangladesh to Assam state has sparked protests among Hindus since the late 1970s. Persons of Indian origin domiciled abroad (excluding Pakistan) reside mainly in Sri Lanka, Malaysia, Nepal, Myanmar, South Africa, Mauritius, Trinidad and Tobago, Guyana, Fiji, the United States, and the United Kingdom. Indian minority groups in foreign countries generally do not become assimilated with the local population but live as separate groups, intermarry, and retain their own distinctive culture even after a residence of several generations.

There has been a steady migration within India from rural to urban areas. Linguistic differences limit the degree of interstate migration, as do efforts by some states to limit job opportunities for migrants and to give preference in public employment to longtime local residents. In 1999 there were around 66,000 Sri Lankan refugees located in 133 camps in the southern state of Tamil Nadu. An estimated 40,000 Sri Lankans live outside the camps. They began arriving in the early 1990s. Since 1992, 54,000 repatriated voluntarily. However, repatriation stopped in 1995 due to violence in Sri Lanka. Some 3,800 people arrived in 1998, and the arrivals continue. Indian authorities have not requested international assistance for Sri Lankan refugees, and the repatriation of Sri Lankans to their country is voluntary.

In 2000 there were 6,271,000 migrants living in India, including 170,900 refugees. In 2000 the net immigration rate was -0.03 migrants per 1,000 population, which amounted to a net loss of approximately 280,000 people. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

India's ethnic history is extremely complex, and distinct racial divisions between peoples generally cannot be drawn clearly. However, Negroid, Australoid, Mongoloid, and Caucasoid stocks are discernible. The first three are represented mainly by tribal peoples in the southern hills, the plateau, Assam, the Himalayas, and the Andaman Islands. The main Caucasoid elements are the Mediterranean, including groups dominant in much of the north, and the Nordic or Indo-Aryan, a taller, fairer-skinned strain dominant in the northwest. The dark-complexioned Dravidians of the south have a mixture of Mediterranean and Australoid features. In 1999, 72% of the population was Indo-Aryan, 25% Dravidian, 3% Mongoloid and other.

## 9 LANGUAGES

The 1961 census recorded 1,652 different languages and dialects in India; one state alone, Madhya Pradesh, had 377. There are officially 211 separate, distinct languages, of which Hindi, English, and 15 regional languages are officially recognized by the constitution. There are 24 languages that are each spoken by a million or more persons.

The most important speech group, culturally and numerically, is the Indo-Aryan branch of the Indo-European family, consisting of languages that are derived from Sanskrit. Hindi, spoken as the mother tongue by about 240 million people (30% of the total population) in 1999, is the principal language in this family. Urdu differs from Hindi in being written in the Arabic-Farsi script and containing a large mixture of Arabic and Farsi words. Western Hindi, Eastern Hindi, Bihari, and Pahari are recognized separate Hindi dialects. Other Indo-Aryan languages include Assamese, Bengali, Gujarati, Kashmiri, Marathi, Oriya, Punjabi, Rajasthani, and Sindhi. Languages of Dravidian stock are dominant in southern India and include Telugu, Tamil, Kannada, and Malayalam. A few tribal languages of eastern India, such as Ho and Santali, fit into the aboriginal Munda family, which predates the Dravidian family on the subcontinent. Smaller groups in Assam and the Himalayas speak languages of Mon-Khmer and Tibeto-Chinese origin.

English is spoken as the native tongue by an estimated 10–15 million Indians and is widely employed in government, education, science, communications, and industry; it is often a second or third language of the educated classes. Although Hindi in Devanagari script is the official language, English is also recognized for official purposes. According to government policy, Hindi is the national language; for that reason, Hindi instruction in non-Hindi areas is being rapidly increased, and large numbers of scientific and other modern words are being added to its vocabulary. However, there has been considerable resistance to the adoption of Hindi in the Dravidian-language areas of southern India, as well as in some of the Indo-Aryan-speaking areas, especially West Bengal.

The importance of regional languages was well demonstrated in 1956, when the states were reorganized along linguistic boundaries. Thus, multilingual Hyderabad state was abolished by giving its Marathi-speaking sections to Mumbai (formerly Bombay, now in Maharashtra), its Telugu sections to Andhra Pradesh, and its Kannada sections to Mysore (now Karnataka). The Malayalam-speaking areas of Madras were united with Travancore-Cochin to form a single Malayalam state, Kerala. Madhya Bharat, Bhopal, and Vindhya Pradesh, three small Hindi-speaking states, were given to Madhya Pradesh, a large Hindi state, which, at the same time, lost its southern Marathi areas to Mumbai (formerly Bombay) state. Many other boundary changes occurred in this reorganization. Mumbai state originally was to have been divided into Gujarati and Marathi linguistic sections but remained as one state largely because of disagreement over which group was to receive the city of

Mumbai (formerly Bombay). In 1960, however, it, too, was split into two states, Gujarat and Maharashtra, on the basis of linguistic boundaries. In 1966, the government of India accepted the demand of the Punjabi-speaking people, mainly Sikhs, to divide the bilingual state of Punjab into two unilingual areas, with the Hindi-speaking area to be known as Haryana and the Punjabi-speaking area to retain the name of Punjab.

India has almost as many forms of script as it has languages. Thus, all of the Dravidian and some of the Indo-Aryan languages have their own distinctive alphabets, which differ greatly in form and appearance. Some languages, such as Hindi, may be written in either of two different scripts. Konkani, a dialect of the west coast, is written in three different scripts in different geographic areas.

## 10 RELIGIONS

India is the cradle of two of the world's great religions, Hinduism and Buddhism. The principal texts of Hinduism—the *Rig Veda* (*Verses of Spiritual Knowledge*), the *Upanishads* (*Ways of Worship*), and the *Bhagavad-Gita* (*Song of the Lord*)—were written between 1200 and 100 BC. The teachings of Buddha, who lived during the 6th–5th centuries BC, were first transmitted orally and then systematized for transmission throughout Asia. Jainism, a religion that developed contemporaneously with Buddhism, has largely been confined to India. The Sikh religion began in the 15th century as an attempt to reconcile Muslim and Hindu doctrine, but the Sikhs soon became a warrior sect bitterly opposed to Islam.

Freedom of worship is assured under the constitution. In 2002, an estimated 81% of the population adhered to Hinduism. Hindus have an absolute majority in all areas except Nagaland, Jammu and Kashmir, and the tribal areas of Assam. Sikhs (about 2% of the population) are concentrated in the state of Punjab, which since 1980 has been the site of violent acts by Sikh activists demanding greater autonomy from the Hindu-dominated central government. Other religious groups include Muslims (12% in 2002, mostly Sunni) and Christians (2.3%). The remaining religion followers consist of Buddhists, Jains, and other groups. Muslims comprise more than 10% of the population in Maharashtra, Bihar, Karnataka, and West Bengal, and more than 30% of the total population in Assam and Kerala. Christians form the majority in Nagaland and are a sizable minority in Kerala. The Jains are an important minority in Rajasthan and Gujarat, and the Parsis (Zoroastrians) in Maharashtra.

The caste system is a distinct feature of Hinduism, wherein every person either is born into one of four groups—Brahmins (priests and scholars), Kshatriyas (warriors and rulers), Vaisyas (shopkeepers, artisans, and farmers), and Sudras (farm laborers and menial workers)—or is casteless and thus untouchable (now known as Harijan, from the term used by Mahatma Gandhi). Within the four major castes there are 2,500 to 3,000 subcastes based upon occupation, geographic location, and other factors. Although the constitution outlaws caste distinctions and discrimination, especially those applying to untouchability, progress in changing customs has been slow.

## 11 TRANSPORTATION

The railway system is highly developed and is the major means of long-distance internal transport. In 2002, the railways spanned some 63,963 km (39,747 mi), forming the largest system in Asia and the fourth largest in the world. Also in 2002, a total of 13,771 km (8,557 mi) of track was electrified. Virtually all railways are state owned. The state-owned railways are the nation's largest public enterprise. In October 1984, India's first subway began operation in Calcutta over 3 km (1.9 mi) of track.

The national and state road network in 2002 consisted of about 3,319,644 km (2,062,827 mi), of which 1,517,077 km (942,712 mi) were paved. In 2000, there were 7,557,753 motor

vehicles, including 3,640,919 automobiles and 3,916,834 commercial vehicles.

India has about 16,180 km (10,054 mi) of inland waterways, with 3,631 km (2,256 mi) navigable by large vessels. Most important are the Ganges, Brahmaputra, Godavari, and Krishna rivers and the coastal plain canals of Kerala, Madras, Andhra Pradesh, and Orissa. Canals span some 4,300 km (2,700 mi), but only 331 km (206 mi) are used by motorized vessels.

In 2002, India's merchant fleet totaled 319 vessels, with a combined GRT of 6,325,284, sufficient to handle almost all of the country's coastal trade and much of its trade with adjacent countries; the rest of India's trade is handled by foreign ships. Eleven major ports handle the bulk of the import-export traffic; the leading ports are Mumbai (formerly Bombay) and Mormugao. There are 140 smaller ports along the Indian coastline.

In 2001, there were 335 airports, of which 232 had paved runways. International airports are at Mumbai, formerly Bombay (Santa Cruz); Calcutta (Dum Dum); Delhi (Indira Gandhi); Madras (Meenambakkam); and Trivandrum. The Indian Airlines Corp., a nationalized industry, operates all internal flights and services to neighboring countries with daily flights to 60 cities. Air-India, also government owned, operates long-distance services to foreign countries on five continents. A new national airline, Vayudoot, was established in 1981 to provide service to otherwise inaccessible areas in the northeast. Private airlines are growing in importance as well. In 2001, 17,272,100 passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

India is one of the oldest continuously inhabited regions in the world. In Harappa, an area in the Indus Valley (now in Pakistan), between 3000 and 2000 BC, scores of thriving municipalities developed a distinct urban culture. This riverain civilization disappeared around 1500–1200 BC, probably owing to the arrival of Aryan (Indo-European-speaking) invaders, who began pouring through Afghanistan onto the lush plains of northern India. There followed over a thousand years of instability, of petty states and larger kingdoms, as one invading group after another contended for power. During this period, Indian village and family patterns, along with Brahmanism—the ancient form of Hinduism—and its caste system, became well established. Among the distinguished oral literature surviving from this period are two anonymous Sanskrit epics, the *Ramayana* (traditionally attributed to the legendary poet Valmiki) and the *Mahabharata* (the longest poem in the world, containing over 100,000 verses, including the *Bhagavad-Gita*).

The South Asian subcontinent already had a population of about 30 million, of whom approximately 20 million lived in the Ganges Basin, when Alexander the Great invaded the Indus Valley in 326 BC. His successors were absorbed by the new Maurya dynasty (c.321–c.184 BC); under Chandragupta (r. c.321–c.297 BC), from his capital at Pataliputra (now Patna), the Mauryans subdued most of northern India and what is now Bangladesh. His successor, Asoka (r.273–232 BC), put all of India under unified control for the first time; an early convert to Buddhism, his regime was remembered for its sectarian tolerance, as well as for remarkable administrative, legal, and cultural achievements. Many of the Buddhist monuments and elaborately carved cave temples found at Sarnath, Ajanta, Bodhgaya, and other places in India date from the reigns of Asoka and his Buddhist successors.

In the years following Asoka, India divided again into a patchwork of kingdoms, as other invaders arrived from central and western Asia. In the process, Hinduism prevailed over Buddhism, which found wide acceptance in Asian lands other than India, its birthplace. Although predated by other states of

Brahmanic origin, true Hindu kingdoms first appeared in the Peninsula after the 4th century AD. The era of the Gupta dynasty rule (AD 320–c.535) was a golden age of art, literature, and science in India. And Hindu princes of the Rajput sub-caste, ruling in the north, reached their peak of power from AD 700 to 1000, although their descendants retained much of their influence well into British days.

In the 8th century, the first of several waves of Islamic invaders appeared at the traditional northwest portals; between the years 1000 and 1030, Mahmud of Ghazni made 17 forays into the subcontinent. The first Muslim sultan of Delhi was Kutb-ud-din (r. c.1195–1210), and Islam gradually spread eastward and southward, reaching its greatest territorial and cultural extent under the Mughal (or Mogul) dynasty. “Mughal” comes from the Farsi word for Mongol, and the Mughals were descendants of the great 14th-century Mongol conqueror Timur (also known as “Timur the Lame” or Tamerlane), a descendant in turn of Genghis Khan.

One of the Timurid princes, the great Babur (r.1526–30), captured Kabul in 1504 and defeated the Sultan of Delhi in 1526, becoming the first of the Mughals to proclaim himself emperor of India. It was not until 1560 that Akbar (r.1556–1605), Babur's grandson, extended the dynasty's authority over all of northern India, and it was Akbar who was the first of the Muslim emperors to attempt the establishment of a national state in alliance with Hindu rajahs (kings). Though illiterate, he was a great patron of art and literature. Among his successors were Shah Jahan and his son Aurangzeb, who left their imprint in massive palaces and mosques, superb fortresses (like the Lahore fort), dazzling mausoleums (like the Taj Mahal at Agra), elaborate formal gardens (like those in Srinagar), and the abandoned city of Fatehpur Sikri (37 km/23 mi w of Agra). Under Aurangzeb (r.1658–1707), who seized his father's throne, the Mughal Empire reached its greatest extent and then began its decline, largely the result of his repressive policies. The Hindu Marathas fought the Mughals and established their own empire in western India.

Vasco da Gama reached India's southwest coast by sea in 1498, and for a century the Portuguese had a monopoly over Indian sea. Although it continued to hold bits of Indian territory until 1961, Portugal lost its dominant position as early as 1612 when forces controlled by the British East India Company defeated the Portuguese and won concessions from the declining Mughals. The company, which had been established in 1600, had permanent trading settlements in Madras, Mumbai (formerly Bombay), and Calcutta by 1690. Threatened by the French East India Company, which was founded in 1664, the two companies fought each other as part of their nations' struggle for supremacy in Europe and the western hemisphere in the 18th century. They both allied with rival Indian princes and recruited soldiers (*sepoys*) locally, but the French and their allies suffered disastrous defeats in 1756 and 1757, against the backdrop of the larger sweep of the Seven Years' War (1756–63), and by 1761, France was no longer a power in India. The architect of the British triumph, later known as the founder of British India, was Robert Clive, later Baron, who became governor of the Company's Bengal Presidency in 1764, to be followed by Warren Hastings and Lord Cornwallis in the years before 1800. The Company's rule spread up the Gangetic plain to Oudh and Delhi, and eventually, to western India where the Maratha Confederacy, the alliance of independent Indian states that had succeeded the Mughal Empire there, was reduced to a group of relatively weak principalities owing fealty to the British in 1818.

The British government took direct control of the Company's Indian domain during the Sepoy Mutiny (1857–59), a widespread rebellion by Indian soldiers in the company's service, and in 1859, Queen Victoria was proclaimed Empress of India. The succeeding decades were characterized by significant economic

and political development, but also by a growing cultural and political gap between Indians and British. Indian troops were deployed elsewhere in the world by the Crown in defense of British interests but without any recourse of Indian views.

### Nationalism and Independence

While the British moved gradually to expand local self-rule along federal lines, British power was increasingly challenged by the rise of indigenous movements advocating a faster pace. A modern Indian nationalism began to grow as a result of the influence of groups like the Arya Samaj, in the last century, of Western culture and education among the elite, and of the Indian National Congress (INC). Founded as an Anglophile debating society in 1885, the INC grew into a movement leading agitation for greater self-rule in the first 30 years of this century. Under the leadership of Mohandas Karamchand Gandhi (called the Mahatma, or Great Soul) and other nationalist leaders, such as Motilal and Jawaharlal Nehru, the INC began to attract mass support in the 1930s with the success of its noncooperation campaigns and its advocacy of education, cottage industries, self-help, an end to the caste system, and nonviolent struggle. But Muslims had also been politicized, beginning with the abortive partition of Bengal during the period 1905–12. And despite the INC leadership's commitment to secularism, as the movement evolved under Gandhi, its leadership style appeared—to Muslims—uniquely Hindu, leading Indian Muslims to look to the protection of their interests in the formation of their own organization, the All-India Muslim League (ML).

National and provincial elections in the mid-1930s persuaded many Muslims that the power the majority Hindu population could exercise at the ballot box, however secular the INC's outlook, could leave them as a permanent electoral minority in any single democratic polity that would follow British rule. Sentiment in the Muslim League began to coalesce around the “two nation” theory propounded by the poet Iqbal, who argued that Muslims and Hindus were separate nations and that Muslims required creation of an independent Islamic state for their protection and fulfillment. A prominent Mumbai (formerly Bombay) attorney, Muhammad Ali Jinnah, who came to be known as “Quaid-i-Azam” (Great Leader), led the fight for a separate Muslim state to be known as Pakistan, a goal formally endorsed by the ML in Lahore in 1940.

Mahatma Gandhi, meanwhile, had broadened his demand in 1929 from self-rule to independence in 1929; in the 1930s, his campaigns of nonviolent noncooperation and civil disobedience electrified the countryside. In 1942, with British fortunes at a new low and the Japanese successful everywhere in Asia, Gandhi rejected a British appeal to postpone further talks on Indian self-rule until the end of World War II. Declining to support the British (and Allied) war effort and demanding immediate British withdrawal from India, he launched a “Quit India” campaign. In retaliation, Gandhi and most of India's nationalist leaders were jailed.

The end of World War II and the British Labor Party's victory at the polls in 1945 led to renewed negotiations on independence between Britain and the Hindu and Muslim leaders. Jawaharlal Nehru and the INC leadership pressed anew for a single, secular nation in which the rights of all would be guarded by constitutional guarantees and democratic practice. But Jinnah and the Muslim League persevered in their campaign for Pakistan. In mid-August 1947, with Hindu-Muslim tensions rising, British India was divided into the two self-governing dominions of India and Pakistan, the latter created by combining contiguous, Muslim-majority districts in British India, the former consisting of the remainder. Partition occasioned a mass movement of Hindus, Muslims, and Sikhs who found themselves on the “wrong” side of new international boundaries; as many as 20 million people moved, and up to three million of these were

killed in bloodletting on both sides of the new international frontier. Gandhi, who opposed the partition and worked unceasingly for Hindu-Muslim amity, became himself a casualty of heightened communal feeling; he was assassinated by a Hindu extremist five months after Partition.

Among the unresolved legacies of Partition was that it did not address the more than 500 princely states with which the British Crown had treaty ties. Most princely rulers chose one or the other dominion on grounds of geography, but the state of Jammu and Kashmir, bordering both new nations, had a real option. A Muslim-majority state with a Hindu maharaja, Kashmir opted first for neither but then chose to join the Indian Union when invaded in 1948 by tribesmen from Pakistan. Quickly, Indian and Pakistani armed forces were engaged in fighting that cut to the heart of the "two-nation" theory and brought the dispute to the fledgling United Nations. A UN cease-fire in 1949 left the state divided, one-third with Pakistan and the rest, including the prized Vale of Kashmir, under Indian control. An agreement to hold an impartial plebiscite broke down when the antagonists could not agree on the terms under which it would be held. While Pakistan administers its portion of the former princely state as Azad ("free") Kashmir and as the Northern Areas, under a legal fiction that they are separate from Pakistan, the Indian portion is governed as Jammu and Kashmir, a state in the Indian Union. Periodic statewide elections have been held in Jammu and Kashmir, but no plebiscite has been held on the state's future. In July 2002, the United States announced that it did not support Pakistan's persistent demand for a plebiscite in Kashmir, a statement welcome to India.

The issue has defied all efforts at solution, including two spasms of warfare in 1965 and 1971. In the late 1980s, India's cancellation of election results and dismissal of the state government led to the start of an armed insurrection by Muslim militants. Indian repression and Pakistan's tacit support of the militants have threatened to spark renewed warfare and keeps the issue festering.

India and China have been at odds about their Himalayan border since the Chinese occupation of Tibet in 1959, leading to clashes between Indian and Chinese troops at a number of locations along the disputed Himalayan border, including remote areas of Ladakh. In 1962, Chinese troops invaded—then withdrew from—Chinese claimed areas along the border, defeating India's under-equipped and badly led forces. The border dispute with China remains unresolved, although tensions have been eased by a standstill accord signed by the two countries in September 1993.

### Nehru's Successors

After Nehru's death on 27 May 1964, his successor, Lal Bahadur Shastri, led India in dealing with an unprecedented round of Hindu-Muslim violence occasioned by the theft of a holy Islamic relic in Kashmir. In August and September 1965, his government successfully resisted a new effort by Pakistan to resolve the Kashmir dispute by force of arms. India was victorious on the battlefield, and an agreement both nations signed at Tashkent in January 1966, essentially restored the status quo ante. Shastri died of a heart attack at Tashkent, while at the height of his power, and his successor, Indira Gandhi (Nehru's daughter), pledged to honor the accords. India again went to war with Pakistan in December 1971, this time to support East Pakistan in its civil war with West Pakistan; Indian forces tipped the balance in favor of the separatists and led to the creation of Bangladesh from the former East Pakistan; in Kashmir, there were minor territorial adjustments.

Domestically, Indira Gandhi consolidated her power, first dividing, and then converting the ruling Congress Party to her own political instrument. The party lost its accustomed majority in parliament in the 1967 elections, but she continued to govern

with the support of other parties and independents, winning again in 1972. In June 1975, after her conviction on minor election law violations in the 1972 polls, which required her to resign, she continued in power by proclaiming a state of emergency. By decree, she imposed press censorship, arrested opposition political leaders, and sponsored legislation that retroactively cleared her of the election law violations. These actions, although later upheld by the Supreme Court, resulted in widespread public disapproval.

Two years later, she held parliamentary elections in which she was defeated, forcing the CP into the parliamentary opposition for the first time. The state of emergency was lifted, and Morarji Desai, formerly Nehru's deputy prime minister and the compromise choice of the winning five-party Janata coalition, became prime minister. But Janata did not last. Formed solely to oppose Mrs. Gandhi, the Janata coalition had no unity or agreed program, and it soon collapsed. Mrs. Gandhi's newly reorganized Congress Party/I ("I" for Indira) courted Hindu votes to win a huge election victory in January 1980, and she regained office.

Rajiv Gandhi immediately succeeded his mother as prime minister and, in parliamentary elections held in December 1984, led the CP/I to its largest victory. But during the next two years, Rajiv proved unequal to the task, and his popularity declined precipitously as the public reacted to government-imposed price increases in basic commodities, his inability to stem escalating sectarian violence, and charges of military kickbacks and other scandals. In October 1987, Rajiv Gandhi sent Indian troops to Sri Lanka to enforce an agreement he and the Sri Lankan president had signed in July, aimed at ending the conflict between the country's Sinhalese majority and Tamil minority. In February 1983, India was beset by communal violence, a residue of the police excesses during the alleged emergency. Hindu mobs in the state of Assam (where direct central government rule had been imposed after student-led protests toppled the government the year before) attacked Muslims from Bangladesh and West Bengal, killing at least 3,000 persons. In October, Sikh factionalism triggered by her partisan maneuvering led to widespread violence by Sikh separatist militants in Punjab and to the imposition of direct rule in that state. A year later, with the Sikh separatist violence unchecked, she became herself one of its victims—assassinated by Sikh members of her own guard.

After a rise in Indo-Pakistan tensions in 1986–87, Rajiv Gandhi and Prime Minister Benazir Bhutto of Pakistan signed a protocol in which both nations agreed not to attack the nuclear facilities of the other in 1988. And in September 1989, Rajiv agreed with Sri Lanka's request to pull his 100,000 troops out of their bloody standoff with Tamil separatists by the end of the year. In elections later that fall, his Congress/I Party won only a plurality of seats in the Lok Sabha, and he resigned. Vishwanath Pratap Singh, formerly Rajiv's rival in the CP and leader of the second largest party (Janata Dal) in the house, formed a government with the support of two other parliamentary groups. Despite an encouraging start, V.P. Singh's government lost first its momentum, then its ability to command a majority in the parliament. He resigned on losing a confidence vote 11 months later and was succeeded, with Congress/I support, by longtime Janata and Congress leader Chandra Shekhar, who resigned after four months.

During the election campaign that followed in the spring of 1991, Rajiv Gandhi was assassinated by a disgruntled Sri Lankan Tamil while in Tamil Nadu. Congress/I rallied around longtime party stalwart P. V. Narasimha Rao, a former minister under both Rajiv and Indira Gandhi, drawing on a sympathy vote, to finish close enough to a majority to form a minority government. As prime minister, Rao—who was also Congress Party president—dealt sensitively with widespread Hindu-Muslim violence focused on a dispute over the land on which "Babur's Mosque" sits at Ayodhya in the state of Uttar Pradesh. He and his finance

minister were dynamic and innovative on economic reform, opening India to foreign investors and market economics, including rupee convertibility. And, despite frail health and advancing years, he brought new vigor to India's foreign policy in light of the end of the Cold War.

Rao lost his hold on power in 1996, however, after three cabinet members resigned amid charges of corruption and two elections weakened the Congress Party's rule. In May 1996, President Shankar Dayal Sharma appointed Hindu nationalist Atal Bihari Vajpayee as prime minister, beginning a whirlwind of power struggles and political instability during which India changed governments four times in 11 months. Vajpayee's Bharatiya Janata Party (BJP) government was short-lived, replaced in October by the H. D. Deve Gowda-led United Front, India's first coalition government. The Congress Party withdrew its support for Gowda in April 1997, and the UF selected I. K. Gujral, foreign minister in the outgoing government, to replace him. Gujral, a compromise choice between the United Front and Congress Party, survived in office only seven months. In November 1997, Congress again withdrew its support from the UF government. General elections were held in early 1998 and the BJP emerged as the largest single party in Parliament. A. B. Vajpayee, the BJP leader, was appointed prime minister and succeeded in forming a coalition government. This coalition collapsed in April 1999, but in elections held in September–October, the country returned Vajpayee to office at the head of the BJP-led National Democratic Alliance.

In May 1998, Vajpayee's government surprised the world by exploding several underground nuclear devices. Pakistan responded by holding its own nuclear tests later in the month. This was a cause of great concern in the international community: two countries, historical enemies whose armies faced each other in Kashmir, were now nuclear powers. The tests brought economic sanctions against both India and Pakistan from the United States and other countries. Tensions eased somewhat in February 1999, however, when Vajpayee inaugurated the first ever bus service between India and Pakistan by traveling to Lahore to meet Pakistan's prime minister. This resulted in the Lahore Declaration (signed 21 February 1999), by which India and Pakistan pledged to resolve their differences peacefully and work for nuclear security. Nevertheless, both countries continued to test medium-range missiles capable of delivering nuclear warheads on targets throughout the region.

Significantly, the Lahore Declaration made no mention of Kashmir. This hit the international headlines in the summer of 1999 when Pakistani troops and armed Islamic militants infiltrated the Indian-held Kargil region of Kashmir, bringing India and Pakistan close to full-scale war. Pakistan eventually withdrew from Kargil, after heavy fighting and casualties on both sides. This ill-fated military adventure contributed to the military coup in Pakistan in October 1999. Border clashes between Indian and Pakistani troops along the Line of Control in Kashmir are commonplace. On 24 December 1999, Kashmiri militants hijacked an Indian Airlines plane flying between Nepal and Delhi to Afghanistan, an incident India blamed on Pakistan.

Following the September 2001 terrorist attacks on the United States, the United States lifted sanctions imposed on India following its 1998 nuclear tests, citing India's support in the US-led war on terrorism (India offered US forces the use of Indian airbases during the military campaign in Afghanistan, among other acts). India began to insist that Pakistan play a larger role in curtailing "cross-border terrorism" in Kashmir and India itself. On 13 December 2001, the Indian Parliament was attacked by 5 suicide fighters. Fourteen people died in the raid, including the five attackers. India blamed the attacks on two Pakistan-based organizations, Lashkar-e-Taiba and Jaish-e-Muhammad, which the United States also listed as terrorist groups. Following the attacks on Parliament, diplomatic contacts were curtailed, rail,

bus and air links were severed, and close to 1 million troops amassed on India's and Pakistan's shared border, the largest military build-up since the 1971 war. The two nuclear-armed countries were on the brink of war. In January 2002, India successfully test-fired the Agni, a nuclear-capable ballistic missile off its eastern coast. In May, Pakistan test-fired three medium-range surface-to-surface Ghauri missiles, capable of carrying nuclear warheads. In June, the United States and the United Kingdom undertook a diplomatic offensive to avert war, and urged their citizens to leave India and Pakistan. In October, India announced its troops had begun withdrawing from Pakistan's border, but Pakistan stated it wanted proof of the pullback before starting its own.

On 27 February 2002, a group of Muslims in the town of Godhra in the state of Gujarat attacked and set fire to two train cars carrying Hindu activists returning from the disputed holy site of Ayodhya. The Hindu Vishwa Hindu Parishad (VHP) group was threatening to build a temple on the site in Ayodhya where activists tore down a 16th century mosque in 1992. Fifty-eight Hindus were killed in the 27 February attack. Starting the following day, Hindus attacked Muslims in Gujarat, leaving hundreds dead and tens of thousands displaced. In three months of communal violence, approximately 2,000 individuals were killed, mostly Muslims.

An upsurge in violence marked the run-up to state elections held in Indian-administered Jammu-Kashmir in September–October 2002. More than 800 people were killed in the violence. The elections were fought among pro-India parties, with separatists boycotting the elections. The elections resulted in an upset for the National Conference; it was the first time the party had been voted out of office since independence. The NC won 28 seats out of 87 in the State Assembly. The People's Democratic Party, which firmly stood against human rights abuses in Kashmir, emerged as victor, along with the Congress Party. India has 7 million troops amassed on the Line of Control in Kashmir. As of the end of 2002, more than 61,000 people had been killed in the conflict in Kashmir.

On 19 March 2003, the US-led coalition launched war in Iraq. The war has been seen to have set a precedent for authorizing pre-emptive strikes on hostile states. The notion that India and Pakistan might adopt such a policy toward one another has caused international concern. In April 2003, spokesmen from both India and Pakistan asserted that the grounds on which the US-led coalition attacked Iraq also existed in each other's country.

### 13 GOVERNMENT

India is a sovereign socialist secular democratic republic. Its constitution, which became effective 26 January 1950, provides for a parliamentary form of government, at the center and in the states. The constitution also contains an extensive set of directive principles akin to the US Bill of Rights. Legislative acts and amendments have weakened some of those guarantees, while a number of decisions by the supreme court have left some weakened and others—like the commitment to secularism and to representative government—strengthened. Suffrage is universal at age 18.

The parliament, or legislative branch, consists of the president, the Council of States (Rajya Sabha), and the House of the People (Lok Sabha). The Rajya Sabha has a membership of not more than 250 members, of whom 12 are appointed by the president and the remainder indirectly elected by the state legislatures and by the union territories for six-year terms, with one-third chosen every two years. The Lok Sabha has 545 directly elected members (530 from the states, 13 from the union territories) and two members appointed by the president to represent the Anglo-Indian community. More than 22% of the seats are reserved for so-called "backward classes," that is, schedule castes (formerly "Untouchables") and scheduled tribes. The Lok Sabha has a

maximum life of five years but can be dissolved earlier by the president; under the state of emergency proclaimed in June 1975, elections scheduled for early 1976 were postponed until 1977.

The president and vice president are elected for five-year terms by an electoral college made up of the members of both parliamentary houses and the legislative assemblies of the states. Legally, all executive authority, including supreme command of the armed forces, is vested in the president, as head of state, who, in turn, appoints a council of ministers headed by a prime minister. In fact, power is exercised by the prime minister who, as head of government, is chosen by legislators of the political party, or coalition of parties, that commands the confidence of the parliament. The prime minister forms—and the president then appoints—the council of ministers, consisting of cabinet ministers, ministers of state, and deputy ministers to formulate and execute the government program. The vice president serves as president of the Rajya Sabha and usually succeeds the president at the end of the latter's term.

By tradition, the presidency and vice presidency trade off between northern and southerner, although a Muslim and a Sikh—nonregional identifications—have also held these positions. P. V. Narasimha Rao from Andhra Pradesh became the first southerner to hold the office of prime minister in June 1991. In July 2002, A. P. J. Abdul Kalam was elected India's 11th president, garnering 90% of the electoral college vote. He was the scientist responsible for carrying out India's nuclear tests in 1998, and is a Muslim.

Elections at the state level are no longer timed to coincide with national elections, and their schedule has become erratic, as state governments have been more or less stable. But state elections have come to influence national politics. Hindu party victories in 1995 assembly elections in what were Congress Party (CP) strongholds precipitated the CP's ouster from majority status in 1996 national elections.

Moderate Hindu party leader A. B. Vajpayee emerged from the May 1996 election as the new prime minister. Deve Gowda became prime minister in 1996 after Vajpayee's government was given a vote of no confidence. Gowda's United Front, with support of the Congress Party, formed the country's first coalition government. However, Gowda's leadership ended in April 1997 when he, too, lost a parliamentary vote of confidence. He was succeeded by his foreign minister, I. K. Gujral, a compromise candidate of the United Front and the Congress Party. Gujral himself was forced to resign in November 1997 when the Congress withdrew its support. As neither Congress nor the BJP were able to form a government, India's president, Kocheril Ramayan Narayanan, dissolved parliament. (Narayanan himself made history when he was elected to office in July 1997, becoming the first president of India to come from the Dalit or "untouchable" community.) Following elections held in February–March 1998, A. B. Vajpayee of the BJP became prime minister at the head of a 14-party coalition government. Vajpayee remained in office for over a year, resigning in April 1999 when, after defections from the coalition, his government lost a vote of no confidence by one vote. In elections held in September–October 1999, however, Vajpayee was returned to office at the head of a BJP-led coalition called the National Democratic Alliance (NDA). By December 2002, Vajpayee's NDA governing coalition was comprised of 26 parties.

## 14 POLITICAL PARTIES

India began its independent existence with the Indian National Congress supreme at the center and in all state legislatures. In its various manifestations, it has controlled the government for most of the years since independence in 1947. Founded in 1885, the Indian National Congress, known after 1947 as the Congress Party (CP), was the most powerful mass movement fighting for independence in British India. It became the ruling party of a free

India by reason of its national popularity and because most leaders of the independence movement were among its members, including Indian first prime minister, Jawaharlal Nehru. In its progression from independence movement to ruling party, the CP spawned many offshoots and continues to do so to this date, as often for personal reasons as for matters of party policy. The first to do so was the socialist wing that split off shortly after independence to form a party in its own right, dividing again several times thereafter.

Other major parties at the time of independence included the Communist Party of India (CPI), with its origins in the peasants and workers parties of the past, representing, like them, the communist left. The CPI began the independence period under a cloud because of its Moscow-directed cooperation with the British during World War II. On the right were parties like the Hindu Mahasabha (HMS), doomed to ignominy when one of its kind killed Mahatma Gandhi in 1948. Within the political system, the HMS, nonetheless, reflected a vital Hindu nationalist strain that has seen several party iterations in the years since and continues to be force in the Hindi-speaking belt of north India. Parties on the left, right, and center have continued to divide or split off over the years, and more recently, with the decline of the Congress Party as an All-India national party, there has been a rise in the number of single state linguistic, sectarian, and regional parties capable of governing only at the state level but available for coalition building at the center.

Over time, ideology, as traditionally defined, has come to mean less and less in Indian politics even though use of the word socialism is widespread. The Congress Party platform supports a secular democratic state with planned economic and social development. In November 1969, as Indira Gandhi consolidated her political position as prime minister, she and her supporters split the party. Her splinter group called itself the New Congress Party and advocated a stronger socialist line than the other CP group. In elections held in March 1971, the New Congress Party (which later resumed calling itself the Congress Party) won an overwhelming majority in the Lok Sabha. Prime Minister Gandhi's declaration of a state of emergency in 1975, followed by the arrest of thousands of her political foes, led several opposition parties of otherwise divergent viewpoints to form the Janata (People's) coalition, which, campaigning against her "dictatorship," scored a major election victory in March 1977. The Janata government began a judicial inquiry into Mrs. Gandhi's activities as prime minister (along with investigations of her son Sanjay and others), denied her a parliamentary seat that she had won in a by-election in late 1978 and briefly had her jailed.

Rather than disgracing the former prime minister, these measures revived her popular following as the Janata coalition leadership began to unravel. Mrs. Gandhi and her reorganized Congress/I Party—"I" for Indira—reemerged as the nation's dominant political force, winning a large majority of seats in elections to the Lok Sabha in January 1980. Congress/I subsequently won control of 17 of 22 state governments.

Janata reverted to its three principal constituents: the Lok Dal, with strong caste support in certain rural areas; the Bharatiya (Indian) Janata Party (BJP), a descendant of the Hindu nationalist Bharatiya Jana Sangh Party (and heir to the HMS tradition); and the rump Janata Dal (JD), Congress in all but name, reflecting various populist, socialist, business, personal, and regional interests. Other active parties include the traditional Congress/S—"S" for Socialist—Party; the once Maoist, now nationalist, Communist Party of India/Marxist (CPI/M), which has long controlled governments in the states of West Bengal and Kerala; the pro-Moscow Communist Party of India (CPI); Telugu Desam, an Andhra Pradesh-based party; the All-India Dravida Munetra Kazaghham (AIDMK) of Tamil Nadu, the Akali Dal factions

representing Sikhs; the All-India Muslim League (AIML); and other ethnically or regionally based parties and groups.

In the 1990s, three changes took place in the government. In elections in the fall of 1989, the Congress/I lost its majority, and although it remained the largest single party, Rajiv Gandhi resigned as prime minister. Vishwamath Pratap (V. P.) Singh, leader of the Janata Dal, formed a government and became prime minister, with the help of two other parliamentary groups in December 1989. Eleven months later, he lost a confidence vote and was replaced by Chandra Shekhar, a former Congress leader, who formed a government with Congress/I support, only to resign himself four months later. During the 1991 election campaign that followed, former prime minister Rajiv Gandhi was assassinated, but the Congress Party/I was swept back into power under P. V. Narasimha Rao, a former minister in both Gandhi governments and Rajiv Gandhi's successor as party leader. Rao became prime minister in June 1991.

The election results of June 1991, as modified by party shifts later that year, established the following party standings in the Lok Sabha: Congress (I), 245; the Bharatiya Janata Party (BJP), 119; the CPI/M, 35; the Janata Dal Party (JDP) of V. P. Singh, 31; the breakaway Janata Dal (JD) of Ajit Singh, 20; the CPI, 14; the Telegu Desam, 13, the AIDMK, 11; others 38 (including five parties with fewer than 5), and nine vacancies. Congress strength rose to 256 by July 1993 when Rao narrowly survived a confidence vote, but in December, Ajit Singh and nine JD members of parliament joined the Congress Party, giving Rao a slender majority of 266 members (with 16 other seats vacant). Flux continued in June 1994 when the former prime minister V. P. Singh and 13 others left the JDP and sought recognition from the speaker of the house as a separate party.

Vajpayee had difficulty holding his government together amid several corruption scandals, however. He was replaced in 1996 by Deve Gowda, leader of the dozen small factions that formed the 176-seat United Front in the Lok Sabha. Gowda lost a no-confidence vote in April 1997 and resigned. He was replaced by Foreign Minister I. K. Gujral. The BJP rose to power as the country's most popular party in the 1996 elections, when it won 161 seats in the Lok Sabha and its leader, A. B. Vajpayee, was named prime minister. Meanwhile, Congress/I was in decline as corruption charges rocked the party, and won only 30% of the vote.

Several scandals affecting major political figures erupted in the summer of 1997. In June, Laloo Prasad Yadav, president of the Janata Dal was arrested on conspiracy charges in his home state of Bihar. Though he resigned from the Janata Dal, he subsequently formed the breakaway Rashtriya Janata Dal party. Former prime minister Narasimha Rao was charged with corruption and criminal conspiracy. Results of an investigation into the destruction of the mosque at Ayodhya in 1992 also resulted in criminal charges being brought against senior BJP figures such as L. K. Advani and the Shiv Sena's Bal Thackeray.

In May 1997, Rajiv Gandhi's widow, Sonja Maino, formally joined the Congress Party/I, a move many hoped would help restore the party's failing fortunes. Sitaram Kesri was reelected president of Congress/I in June. Within six months, Congress/I brought down the UF government after Gujral rejected its demand that the DMK, the Tamil Nadu-based party allegedly linked to Rajiv Gandhi's assassination, be expelled from the UF coalition. As neither Congress/I nor the BJP could form a coalition government, new elections were called for February–March 1998. Sonja Gandhi campaigned actively for Congress/I, but no party was able to gain an absolute majority in the elections. The BJP emerged as the largest party with 182 seats in the 545-seat Lok Sabha, followed by Congress/I with 142 seats. A. B. Vajpayee, parliamentary leader of the BJP, was appointed prime minister and asked to form a coalition government. He succeeded in putting together a fragile 14-party coalition that

survived a vote of confidence on 28 March by 13 votes. This narrow parliamentary majority, however, clearly hampered Vajpayee's legislative program. In July, for example, the government was forced to shelve a bill that would have reserved one-third of the seats in the Lok Sabha and state legislatures for women because of strong opposition from (mostly male) deputies.

Sonja Gandhi began to take a more active role in Congress politics in 1998, and shortly after the elections she was elected to the post of president of Congress/I. Towards the end of the year, Congress/I showed signs of recovery by regaining Delhi and Rajasthan, both traditional BJP strongholds, in regional elections. However, this did not carry over to the national elections resulting from the fall of Vajpayee's government in April 1999, following the AIDMK leaving the coalition. In the run up to the September–October 1999 elections, both Sonja Gandhi and her daughter actively campaigned for Congress. The party split, however, over the issue of whether a foreign-born individual (i.e. Sonja Gandhi) could become leader of the country. Gandhi resigned as president of Congress in May 1999, although the party refused to accept her resignation. Shortly afterwards, Congress/I expelled Sharad Pawar, P. A. Sangma, and Tariq Anwar, the chief opponents of Gandhi within the party.

Sonja Gandhi won a seat in Parliament in the October 1999 elections and was also elected the Congress/I parliamentary leader. The Gandhi name, however, did not halt the decline of Congress. The party won only 112 seats (compared to 142 in the 1998 elections) and with its allies controlled only 135 votes. The BJP claimed 182 seats, and once again A. B. Vajpayee was asked to form a government. He succeeded in putting together a coalition government, the National Democratic Alliance, which controlled 298 seats in the Lok Sabha. For the first time in four years, an Indian government—albeit a coalition government—appeared to have a decisive working majority in the legislature. As the leader of the BJP's moderate wing, Vajpayee has sought to control the party's more extreme Hindu nationalist members.

## 15 LOCAL GOVERNMENT

The Republic of India is a union of states. The specific powers and spheres of influence of these states are set forth in the constitution, with all residual or non-specified powers in the hands of the central government (the reverse of the US Constitution). The central government has the power to set state boundaries and to create and abolish states. The state governments are similar to the central government in form, with a chief minister and a cabinet responsible to the state legislature, which may be unicameral or bicameral. State governors, usually retired civil servants or politicians, are appointed by the president for a five-year term and act only on the advice of the state cabinet.

The constitution gives the president the power—on the advice of the prime minister—to dissolve a state legislature and dismiss a state government if no party commands the support of a majority or if the state's constitutional machinery is incapable of maintaining order. The Lok Sabha, which must approve each six-month extension of direct rule, acts as the state legislature during its imposition, governing through the governor. Termed as "President's Rule" in the constitution, this power derives from a provision for "Governor's Rule" in the Government of India Act of 1935 and survives in the Pakistan constitution of 1973 in that form. It was invoked for the first time in 1959 by Prime Minister Nehru, and on the advice of Indira Gandhi, who was then Congress Party president; in power herself, she invoked the power repeatedly, often for partisan political purposes and, especially in the early 1980s, in the wake of ethnic/communal violence in Punjab, Assam, and Jammu and Kashmir. Limitations on its partisan use were imposed in a Supreme Court decision in spring 1994.

Under the States Reorganization Act of 1956, there were 14 states and five union territories, organized, where appropriate, on linguistic grounds. Through a gradual process of reorganization and division, two former union territories have become states while new union territories have been created (there were seven as of 2003), and the number of states has grown to 28.

Administratively, the states and union territories are divided into districts, under the control of senior civil servants who are responsible for collecting revenues, maintaining law and order, and setting development priorities. Districts are further divided into subdivisions, and subdivisions into *taluks* or *tehsils*. State government and lower levels of representative councils vary in organization and function, but all are based on universal adult suffrage. Large towns are each governed by a corporation headed by a mayor; health, safety, education, and the maintenance of normal city facilities are under its jurisdiction. Smaller towns have municipal boards and committees similar to the corporations but with more limited powers. District boards in rural areas provide for road construction and maintenance, education, and public health. The constitution provides for the organization of village councils (*panchayats*), and nearly all the villages have been so organized. The panchayats are elected from among the villagers by all the adult population and have administrative functions and a judicial wing that enables them to handle minor offenses.

In the mid-1990s, there were several campaigns to form new states in India, carving new borders along factional lines in existing states. A promise by former Prime Minister Deve Gowda to create a new state in Uttar Pradesh in 1996 renewed separatist sentiments in several other states.

The Hindu nationalist party (BJP) proposed five new states in 1996, hoping to control their assemblies rather than fight political foes in larger entities. Both proposals ignore potentially chaotic consequences in favor of political gain; existing state boundaries were drawn on language differences, while there appears to be no motive other than politics for the boundaries suggested by the new proposals. On its return to power in 1998, the BJP government succeeded in drafting bills that created three new states (Chhattisgarh, Uttaranchal, and Jharkhand), but put on hold its plans for making Delhi, presently a Union Territory, a state. Chhattisgarh, Uttaranchal, and Jharkhand became India's three newest states in November 2000, raising the total from 25 to 28.

## 16 JUDICIAL SYSTEM

The laws and judicial system of British India were continued after independence with only slight modifications. The supreme court consists of a chief justice and up to 25 judges, appointed by the president, who hold office until age 65. The court's duties include interpreting the constitution, handling all disputes between the central government and a state or between states themselves, and judging appeals from lower courts.

As of January 2003, there were 18 high courts, subordinate to but not under the control of the supreme court. Each state's judicial system is headed by a high court (three high courts have jurisdiction over more than one state), whose judges are appointed by the president and over whom state legislatures have no control. High court judges can serve up to the age of 62. Each state is divided into districts; within each district, a hierarchy of civil courts is responsible to the principal civil courts, presided over by a district judge. The 1973 Code of Criminal Procedure, effective 1 April 1974, provides for the appointment of separate sets of magistrates for the performance of executive and judicial functions within the criminal court system. Executive magistrates are responsible to the state government; judicial magistrates are under the control of the high court in each state.

Different personal laws are administered through the single civil court system. Islamic law (*Shari'ah*) governs many

noncriminal matters involving Muslims, including family law, inheritance and divorce. There are strong constitutional safeguards assuring the independence of the judiciary. In 1993–94, the supreme court rendered important judgments imposing limits on the use of the constitutional device known as “President’s Rule” by the central government and reaffirming India’s secular commitment.

In Kashmir the judicial system barely functions due to threats by militants against judges and witnesses.

India accepts the compulsory jurisdiction of the International Court of Justice with reservations.

## 17 ARMED FORCES

The Indian Armed Forces have a proud tradition, having provided one million soldiers during World War I and two million in World War II battles in Asia, Africa, the Middle East, and Europe. The armed forces are entirely volunteer and consist of the regular army, navy, and air force; the territorial (reserve) army; and 13 different full-time or reserve special purpose paramilitary units for border, transportation, and internal defense. The home guard and provincial armed constabulary alone number over 1,000,000 while the Ministry of Home Affairs controls 167,400 riot police and 174,000 in the Border Security Force (BSF).

In 2002, armed forces personnel totaled 1,298,000. The army had 1,100,000 personnel, organized into three armored divisions, one mechanized division, 18 infantry divisions, nine mountain divisions, five independent armored brigades, five independent infantry brigades, three independent artillery brigades, four air defense brigades, and three engineer brigades. Armaments included 3,898 main battle tanks and 90 light tanks. The navy (including the naval air force and marines) had 53,000 personnel; naval vessels included 16 submarines, two aircraft carriers, seven destroyers, 13 frigates, five corvettes, 15 patrol boats, and 18 mine-warfare ships. The air force had 145,000 personnel and 701 combat aircraft. There is a coast guard of over 8,000 personnel, with 14 aircraft and 34 patrol craft. It is suspected that India possesses 60 nuclear weapons, and has the capability for producing more.

Budgeted defense expenditures in 2001 were \$12.1 billion or 2.5% of GDP. India provides personnel to four peacekeeping operations. Opposition forces number between 2,000 and 2,500.

## 18 INTERNATIONAL COOPERATION

India is a member of the Commonwealth of Nations. Even before its independence in 1947, India became a charter member of the UN on 13 October 1945, and it belongs to ESCAP and all the nonregional specialized agencies. India also has joined the Asian Development Bank and G-77, and has signed the Law of the Sea. It is a dialogue partner with the Association of Southeast Asian Nations (ASEAN).

India was a founder of the nonaligned movement and has pursued a formally neutralist foreign policy since independence. Relations between the United States and India have ranged from correct to cordial; relations with China, hostile during the early 1960s, have been normalized since 1976. India's primary ally among the superpowers had been the former USSR, with which a 20-year treaty of peace, friendship, and cooperation was signed in 1971. Indian armed forces and political missions have assisted in implementing truce and cease-fire agreements in Korea, Vietnam, Laos, Cambodia, the Middle East, Congo (formerly Zaire), and Cyprus. India also negotiated a settlement in Sri Lanka's civil unrest in July 1987, sending in troops to enforce the agreement.

Since independence, India has fought three wars with neighboring Pakistan, in 1947–48, 1965, and 1971. Relations between the two countries improved in the early 1980s. On 10 March 1983, India and Pakistan signed a five-year agreement for improving economic and cultural ties, which was viewed as a

major step in the normalization of their relations. Tension between India and Pakistan increased again in 1986–87, when both countries conducted military exercises near their common border in the sensitive Punjab region. Indo-Pakistan relations worsened again in 1990 and in the years immediately following as a consequence of Pakistan's support of Islamic insurgents in Indian Kashmir. In 1998 both countries became nuclear powers, conducting a series of underground nuclear tests. Tensions between them worsened again after an attack on the Indian Lok Sabha in December 2001, and both countries amassed approximately 1 million troops on their shared border. India blames two Pakistan-based militant Islamic organizations, Lashkar-e-Taiba and Jaish-e-Muhammad, for violence in Kashmir and India itself.

India became a founding member of the World Trade Organization on 1 January 1995.

## 19 ECONOMY

As of 2001, according to World Development Indicators, India had become the world's fourth-largest economy in purchasing power parity (PPP) terms, up from fifth place in 1999. Although in current dollars, India's GDP was only \$477.4 billion, in PPP terms, a calculation which takes account of the low price levels for goods and services in India compared to the United States, India's effective GDP equals \$2.9 trillion, over six times the nominal level. Annual per capita income, of course, remains very low even in PPP terms—\$2,540 (PPP) according to CIA estimates—but its new fourth-place rank does reflect the country's remarkable record of steady growth: an annual average of 6% growth since 1991 with a 10% reduction in the proportion of the population living in poverty. Severe impediments and future challenges remain, however. Over 60% of the labor force is still employed or underemployed in agriculture, which constitutes 25% of the GDP. Industry also contributes about 25% to GDP but employs only 17% of the labor force. Services account for the other 23% of the labor force, and the other half of the GDP, up from a 12.8% share in 1980. India's population growth dropped below 2% for the first time in four decades, but the growth rate for the working-age group 15 to 60 years olds continues to accelerate presenting the government policy makers with the need to accelerate job creation.

India is rich in mineral, forest, and power resources, and its ample reserves of iron ore and coal provide a substantial base for heavy industry. Coal is the principal source for generating electric power although hydroelectric and nuclear installations supply a rising proportion of India's power needs. The government also promotes considerable expansion in oil exploration and production. Anticipating a rapid growth in oil consumption in the near future, the government is actively promoting oil exploration and development. Since 1997, under its New Exploration and Licensing Policy (NELP), foreign companies have been permitted to participate in upstream oil exploration, long restricted to Indian-owned firms.

The Indian economy is a mixture of public and private enterprises. Under a planned development regime since independence, the public sector provided the impetus for industrialization and for absorption of sophisticated technology. Nevertheless, a large proportion of the total manufacturing output continued to be contributed by small, unorganized industries. In recent years, and especially since 1991, the government has placed greater emphasis on private enterprise to stimulate growth and modernization. Reflecting this policy shift, public enterprises accounted for only about 7% of the country's GDP in 1999, down from 23% in the mid-1980s. In December 1999, the government created the Ministry of Disinvestment and announced plans to disinvest in 247 companies owned by the central government down to a 26% share in most companies, excluding only three strategic sectors altogether: railways,

defense, and nuclear energy. In its first disinvestment deal, the government sold 51% equity in Bharat Aluminum Corp., Ltd. to the Indian company Sterlite Industries for \$118 million despite strong political opposition. In all, about \$530 million was received from disinvestment in 2000/01. In 2002/03 total receipts from disinvestment were only about 28% (\$717 million) of the Ministry's projected target \$2.5 billion. Sales included a strategic stake of Videsh Sanchar Nigam Ltd. (VSNL), India's premier international communications and internet service provider (ISP) company to the Tata Group, India's largest conglomerate; a strategic stake in IBP, the national petroleum marketing company, to Indian Oil; a strategic stake in Indian Petrochemical Company Ltd. (IPCL) to the Indian company, Reliance Industries; and a strategic share of Maruti Udyog Ltd. (MUL), India's top car maker with a 60% market share, to Suzuki Maintenance Corporation (SMC) of Japan, which was already MUL's technology provider and owned a 46% share, which it increased to 51% in the deal.

Following the proclamation of a state of emergency in June 1975, a 20-point economic reform program was announced. Price regulations were toughened, and a moratorium on rural debts was declared. A new campaign was mounted against tax evaders, currency speculators, smugglers, and hoarders. This program, which lapsed when Indira Gandhi was out of power (1977–80), was revised and incorporated into the sixth five-year plan (1980–85). The reforms were buttressed by a 30-month arrangement under the IMF's Extended Fund Facility (EFF), which made available SDR5 million (only SDR3.9 million actually drawn) 9 November 1981 to 10 May 1984. After the collapse of world oil prices in 1986, India's average annual growth increased to 6.2% on the latter half of the decade. This expansion was accompanied, however, by numerous persistent weaknesses: slow growth in formal sector employment, inefficiency and technological lags in the public sector, and increasing fiscal and balance of payments deficits, which by 1990 had produced double digit inflation. The oil shock accompanying the Gulf War catalyzed an acute balance of payments crisis in early 1991.

Swift stabilization measures taken by the newly elected government, including two stand-by arrangements with the IMF—a short four-month arrangement 18 January to 17 April 1991 with a SDR551 line of credit, and a larger, 8-month arrangement 31 October 1991 to 30 June 1993 with an SDR1,6456 million line of credit—proved highly successful. By mid-1992, foreign exchange reserves had recovered to a comfortable margin (equal to five months of imports; a decade later, in 2002, coverage was at 8 months of imports) and inflation declined from 13.1% in 1991–92 to 8.6% in 1993–94. Further reforms focused on trade liberalization, privatization and deregulation helped push GDP growth to an average of 6.5% for the five years 1995 to 1999. Accelerating growth sparked a return of double-digit inflation, reaching 13.1% in 1998/99, but a currency devaluation of almost 12% helped bring inflation down to 3.4% in 1999 (as measured by consumer prices). Economic growth slowed significantly in 2000/01 to around 4% reflecting both the global economic slowdown and also weak agricultural growth in India. The 2000/01 budget included a 30% increase on defense spending because of the conflict with Pakistan, increasing the public debt. The central government's fiscal deficit increased steadily from 1997/98 to 2001/02, from 4.9% of GDP to 6.1% of GDP. In 2001/02, however, growth recovered to around 5.5% largely due to a recovery in agriculture. In the more export-sensitive industrial sector, the growth rate was only 2.7%. In 2002/03 industrial growth recovered to an estimated 6.17%, while services increased 7.1%. Overall estimates of real growth for 2002/03 have been scaled back to 4.4%, however, from predictions of over 5%, mainly due to setbacks in agriculture because of a poor monsoon, 19% short in volume, the worst since 1987/88. The shortfall is even more

dramatic given that an 8% per year growth target was set for the Tenth Five-Year Plan, 2002–2007. The feasibility of achieving such a high annual growth rate was defended by the government largely in terms of the plan's concentration on agriculture where high percent gains seem attainable because of the widespread inefficiency.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2002 India's gross domestic product (GDP) was estimated at \$2.66 trillion. The per capita GDP was estimated at \$2,540. The average inflation rate in 2002 was 5.4%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 25% of GDP, industry 25%, and services 50%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$9.034 billion or about \$9 per capita and accounted for approximately 1.9% of GDP. Worker remittances in 2001 totaled \$11.36 billion. Foreign aid receipts amounted to about \$2 per capita.

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$294. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 3%. The richest 10% of the population accounted for approximately 33.5% of household consumption and the poorest 10% approximately 3.5%. It was estimated that in 2002 about 25% of the population had incomes below the poverty line.

## 21 LABOR

In 1999, India's active labor force totaled 406 million. In that year, 60% were employed in agriculture, 17% in industry, and 23% in services. The unemployment rate in 2002 stood at 8.8%.

In 2002, there were an estimated 13 to 15 million organized industrial workers, all belonging to the formal economy, which accounted for 30 million workers, or less than 10% of the total labor force. Most trade unions are affiliated with political parties. The right to strike is often exercised, but public sector unions are required to give 14 days notice prior to an organized strike. Employers are prohibited from discriminating against union activity, and collective bargaining is practiced.

Working hours are limited by law to 48 per week for adults with eight hour days. Minimum wages are set according to industry. By law, earned income also includes a cost-of-living allowance and an annual bonus. These regulations are only applicable to factories and all other establishments with 20 or more employees. Factory employment of children under 14 years of age is prohibited, although estimates place the number of child laborers as of 1999 at anywhere between 11 to 55 million. Many of them work in the hand-knotted carpet industry. Bonded labor was abolished in 1976, but is still prevalent. Estimates of the number of bonded laborers range as high as 40 million. Health and safety standards are not regularly enforced.

## 22 AGRICULTURE

In 1998, of the total land area of 297 million hectares (734 million acres), the net sown area was 169 million hectares (420 million acres), or about 57%. The irrigated area totaled 59 million hectares (145.8 million acres) in 1998. At least 10 million hectares (24.7 million acres) were redistributed under land reform programs during 1951–79. Agriculture employs about 60% of India's population and contributes about 25% to GDP.

Agricultural production increased at an average annual rate of 2.9% during the 1970s, 3.1% during the 1980s, and 3.8%

during 1990–98, mainly as the result of the "green revolution," which has made India basically self-sufficient in grain output through the use of improved hybrid seeds, irrigation, and fertilizers. Cereal production averaged over 104 million tons per year from 1979 to 1981; in 1999, production totaled 230 million tons. Rice leads all crops and, except in the northwest, is generally grown wherever the conditions are suitable. In 1999, 131.2 million tons of rice were produced on 44.8 million hectares (110.7 million acres). The combined acreage and production of other cereals, all to a large extent grown for human consumption, considerably exceed those of rice. These include jowar, a rich grain sorghum grown especially in the Deccan; wheat, grown in the northwest; and bajra, another grain sorghum grown in the drier areas of western India and the far south. A wheat crop of 70.8 million tons was harvested on 27.4 million hectares (67.7 million acres) in 1999. Vegetables, pulses, and oilseeds are the other main food crops. Oilseed production in 2000/01 included 4.9 million tons of cottonseed and 3.73 million tons of rapeseed.

Nonfood crops are mainly linseed, cotton, jute, and tobacco. The cotton crop in 2000 was 10.9 million bales (170 kg each) and was large enough to both supply the increasing demands of the domestic textile sector and provide export receipts. For centuries, India has been famous for its spices and today is one of the world's largest producers, consumers, and exporters of a wide range of spices. Of the 63 spices grown in the country, black pepper, cardamom, ginger, turmeric, and chilles are the most economically important. Since World War II (1939–45), India has been the world's largest producer of black pepper (19,641 tons exported in 2001). Pepper production is concentrated in the southern states of Kerala (65%), Karnataka (20%), and Tamil Nadu (15%).

India was the world's second-leading producer (after Brazil) of sugarcane in 1999, with an output of 282.3 million tons. Tea, coffee, and rubber plantations contribute significantly to the economy, although they occupy less than 1% of the agricultural land (in hill areas generally unsuited to Indian indigenous agriculture), and are the largest agricultural enterprises in India. Tea, the most important plantation crop, is a large foreign exchange earner, with an export value of \$367.2 million in 2001, based on exports of 177,603 tons. Production in 1999 was 749,000 tons, the highest in the world and 26% of global production. It is grown mostly in Assam and northern Bengal, but also in southern India. Coffee (265,000 tons in 1999) is produced in southern India, and rubber (550,000 tons in 1999) in Kerala. Leaf tobacco production totaled 702,000 tons in 1999.

Because of the ever-present danger of food shortages, the government tightly controls the grain trade, fixing minimum support and procurement prices and maintaining buffer stocks. The Food Corp. of India, a government enterprise, distributes 12 million tons of food grains annually and is increasing its storage capacity.

## 23 ANIMAL HUSBANDRY

The livestock population of India is huge and animals as a whole play an important role in the agricultural economy even though they often receive inadequate nourishment. Slaughter of cattle in India is prohibited in all but a few states since Hindus believe that cows and other animals may contain reincarnated human souls. The slaughter of buffaloes is not as offensive to the religious beliefs of Hindus, and buffaloes are slaughtered for meat.

In 2001 there were an estimated 219.6 million head of cattle, representing about 15% of the world's total and more than in any other country. There are eight breeds of buffalo, 26 cattle breeds, and numerous crossbreeds. The bovine inventory in 2001 also included 94.1 million buffalo. Other livestock in 2001 included 123.5 million goats, 58.2 million sheep, 17.5 million hogs, 900,000 camels, 750,000 asses, 800,000 horses, and 735 million chickens. Bullocks (steers) and water buffalo are important draft

animals. Dairy farming has made India self-sufficient in butter and powdered milk. Dairying in India is undertaken on millions of small farms, where one to three milk animals are raised on less than a hectare (2.5 acres), and yields consist of two to three liters of milk daily. To improve milk production, a dairy development program was begun in 1978 to build up the milch herd to 150 million crossbred cows. Milk output in 2001 from over 35 million dairy cows was estimated at 37.1 million tons, second in the world. Egg production in 2001 was 1,906,000 tons. The production of cattle and buffalo hides and goat- and sheepskins is a major industry. About 53,700 tons of wool were produced in 2001. Silk production that year amounted to 15,000 tons, second highest after China. Animal dung is also used for fuel and fertilizer.

## 24 FISHING

Fishing is an important secondary source of income to some farmers and a primary occupation in small fishing villages. Almost three-fifths of the catch consists of sea fish. The bulk is marketed fresh; of the remainder, more than half is sun-dried. Fish and fish products account for about 2.5–3% of the total export value. Deep-sea fishing is not done on a large scale. Inland fishing is most developed in the deltaic channels of Bengal, an area where fish is an important ingredient of the diet. In recent years, the government has been encouraging ocean fishing through the establishment of processing plants and the introduction of deep-sea craft. Fishing harbors have been built along the coasts of the Bay of Bengal and the Arabian Sea. Under the fifth national plan (1974–79), fish farming was encouraged through the creation of Fish Farmers' Development Agencies. Fish production achieved a new high of about 3.7 million tons at the end of the seventh national plan (1986–91).

The total fish catch in 2000 was 3,594,396 tons (eighth in the world), of which marine fish accounted for 2,797,682 tons and inland sources for 796,714 tons. Fish exports, still only a fraction of the potential, have shown a steady gain in recent years. In 2000, exports of fish products amounted to over \$1.4 billion.

## 25 FORESTRY

The major forestlands lie in the foothills of the Himalayas, the hills of Assam state, the northern highlands of the Deccan, the Western Ghats, and the Andaman Islands. Other forestlands are generally scrub and poor secondary growth of restricted commercial potential. India's forests are mostly broad-leaved; the most important commercial species are sal (10.9% of forest trees), mixed conifers (8.1%), teak (6.8%), fir (3.2%), chir-pine (2.4%), and upland hardwood (2.4%). In 2000 there were 64,113,000 hectares (158,423,000 acres) of forestland, according to a satellite survey. About 40% of the forest area is highly degraded and devoid of wood producing trees.

India's forests have historically suffered tremendous pressure from its large human and animal populations as a source of fuel wood, fodder, and timber. In recent decades, harvesting and encroachment resulted in a 2.3% reduction of forest land each year. According to the government's national forest policy, 33% of the land area should be covered by forest, but actual forest coverage is just 21.6%. About 138,000 hectares (341,000 acres) were planted annually during the 1980s under afforestation programs. During 1990–2000, the forested area grew by an annual average of 38,000 ha (94,000 acres). Most forests (98%) are owned by state governments and are reserved or protected for the maintenance of permanent timber and water supplies. The government has prohibited commercial harvesting of trees on public land, except for mature, fallen, or sick trees. In order to help meet the fuel needs of much of the population, harvesting dead and fallen branches is permitted in government forests, but this policy is widely violated. About 93% of the total timber cut in 2000 was burned as fuel.

The total timber cut in 2000 was 319.5 million cu m (11.3 billion cu ft). Production that year included (in million of cubic meters): sawn wood, 7.9; paper and paperboard, 3.8; wood-based panels, 0.4; and wood pulp, 1.6. Other forestry products include bamboos, canes, fibers, flosses, gums and resins, medicinal herbs, tanning barks, and lac. Imports of forest products nearly totaled \$1,028 million in 2000, and mainly consisted of newsprint (\$176.1 million), printing and writing paper (\$104.8 million), and recovered paper products (\$96.7 million).

## 26 MINING

Well endowed with industrial minerals, India's leading industries in 2002 included steel, cement, mining, and petroleum, and gems and jewelry comprised the country's second-leading export commodity. The minerals industry of India produced more than 80 mineral commodities in the form of ores, metals, industrial minerals, and mineral fuels and was among the world's leading producers of iron ore, bituminous coal, zinc, and bauxite, with 10% of world deposits. In 1997, total mineral production was valued at \$9.5 billion, or about 3.5% of GDP, which grew by 5.4% in 2001. Mineral resources contributed 2% to GDP in 2001. Minerals accounted for 20% of exports. An estimated 4,400 mines operated in the country. Most mines were small surface operations using only handtool methods. There were also 300 underground mines in the nonfuel sector, most of which were operated manually. Employment in the minerals industry was estimated at more than 1 million (4.5% of the employed labor force), with the public sector employing 90% of the total. Total exports represented 10% of GDP in 2001, with jewelry leading the growth. The country exploited 52 minerals—11 metallic, 38 non-metallic, and three mineral fuels. Increases in production were noted for bauxite, cathode copper, crude oil, iron ore, steel, and other minerals. Industrial mineral operations were unscathed by the January 2001 earthquake in Gujarat and Rajasthan; infrastructure repairs were under way. In 2001, India also produced lead, monazite, selenium, silver, ilmenite, rutile, tungsten, uranium, zircon, corundum, garnet, jasper, asbestos, barite (from the Cuddapah District mines, Andhra Pradesh), bromine, hydraulic cement, chalk, clays (including ball clay, diaspore, fireclay, and kaolin), feldspar, fluorspar, agate, aquamarine, emerald, ruby, spinel, graphite, kyanite, sillimanite, lime, magnesite, nitrogen, phosphate rock, apatite, ocher, mineral and natural pigments, pyrites, salt, soda ash, calcite, dolomite, limestone, quartz, quartzite, sand (including calcareous and silica), slate, talc, pyrophyllite, steatite (soapstone), vermiculite, and wollastonite.

Output of iron content in mined ore totaled 50.7 million tons in 2001, up from 44.9 in 1999. Iron ore reserves, estimated at 11,000 million tons of hematite ore containing at least 55% iron, were among the largest in the world. Principal iron ore output came from the rich fields along the Bihar-Orissa border, close to all major existing iron and steel works. Smaller amounts were mined in the Bababudan Hills of Karnataka and elsewhere. The joint venture Rio Tinto Orissa Mining Ltd. studied a new mining project, in the Gandhamardan/Malanjtoli areas of Orissa, that had ore reserves of 800 million tons and could start in 2006, produce 25 million tons per year by its fifth year, and have an eventual capacity of 50 million tons per year.

India's gross weight output of bauxite was 8.4 million tons in 2001, up from 6.1 in 1998. Bauxite deposits were estimated at 2,300 million tons. The state-owned National Aluminium Co. Ltd. (Nalco), which doubled its mining capacity to 4.8 million tons per year, was to be privatized by the government in 2001. Nalco's Panchpatmali Hills, Koraput District mines, in Orissa, had a production capacity of 2.4 million tons per year.

Production of zinc concentrates (zinc content) in 2001 was 146,000 tons. The state-owned Hindustan Zinc Ltd. (HZL),

which was for sale, planned to close its Sargipalli lead mine (150,000 tons per year capacity), in Orissa; HZL's Rampura Agucha mines (1.3 million tons per year lead-zinc ore capacity), in Rajasthan, were highly prized.

Gold and silver came largely from the Kolar fields of southeastern Karnataka, where the gold mines have reached a depth of more than 3.2 km and contained reserves of 55,000 kg of gold. The Geological Survey of India outlined three new gold resources—in the Dona block, Andhra Pradesh, 4.8 million tons averaging 1.9 grams per ton of gold; in the Banswar district, Rajasthan, 7.1 million tons averaging 2.96 grams per ton of gold; and in the Ghrhar Pahar block, Sidhi district of Madhya Pradesh, 3.3 million tons averaging 1.04 grams per ton of gold. The import duty on gold was reduced to curtail smuggling.

In 2001, 60,000 carats of diamonds were produced, up from 31,000 in 1997—industrial diamond output went from 20,000 to 43,000. Emerald and fissionable materials also were mined. Transworld Garnet India Pvt. Ltd, 74% owned subsidiary of Western Garnet International Ltd, of the United States, acquired lease rights to a mineral sands beach deposit in Andhra Pradesh with a resource base of 1.1 million tons of garnet and 0.8 million tons of ilmenite grading 24% and 20%, respectively. Western Garnet had been producing garnet in Tamil Nadu from reserves that would last for 20 to 25 years.

Content of manganese in mined ore produced was 600,000 tons in 2001. Manganese deposits were estimated at 154 million tons. Manganese was mined in Andhra Pradesh, Karnataka, the Nagpur section of Maharashtra, northward in Madhya Pradesh, along the Bihar-Orissa border adjoining the iron ore deposits, along the Maharashtra-Madhya Pradesh-Rajasthan border, and in central coastal Andhra Pradesh.

Mineral production in 2001 included 30,900 tons of mined copper ore, down from 39,900 in 1998; 1.68 million tons of gross weight chromite, compared with 1.95 in 2000 and 1.31 in 1998 (India was the largest exporter of chromite to China, selling more than 400,000 tons per year); 2.25 million tons of gypsum; and 1,300 tons of crude mica, down from 1,794 in 1997 (the best-quality mica came from Bihar).

There were extensive workable reserves of fluorite, chromite, ilmenite (for titanium), monazite (for thorium), beach sands, magnesite, beryllium, copper, and a variety of other industrial and agricultural minerals. However, India lacked substantial reserves of some nonferrous metals and special steel ingredients.

The government simplified excise duties and sold its stakes in state-owned enterprises. In 2001, it approved applications for \$700 million of foreign direct investment in the mining sector—poor infrastructure, delays in decision-making, labor laws, and high royalty rates were the most important factors. The West Bengal government was to give up its monopoly on mining rights and to announce a new mining policy to invite private investment; the state was known to contain apatite, coal, and dimension-stone resources. The Haryana government decided to grant mining leases for minor minerals by public auction. The new Ennore port, north of Chennai, in Tamil Nadu, was opened in 2001. A 1993 revision of the National Mineral Policy opened development of 13 minerals to private investment, both foreign and domestic. The exploration and processing of chrome, copper, diamond, gold, iron ore, lead, manganese, molybdenum, nickel, platinum-group metals, sulfur, tungsten, and zinc were exclusively controlled by the government.

## 27 ENERGY AND POWER

Petroleum reserves were estimated at 4.8 billion barrels in early 2002. From less than 100,000 tons in 1951, crude oil production rose to 37.1 million tons in 1995. Production was 1.9 million barrels per day in 2001, and expected to grow to 3.4 million barrels per day by 2010. Oil exploration and production are undertaken in joint ventures between government and private

foreign companies. Oil accounts for roughly 30% of India's energy consumption. Production of natural gas increased from 920 million cu m in 1973 to 21,300 million cu m in 1999.

In 2000, India consumed 509.9 billion kWh of electricity, of which 1.675 billion kWh was imported. Total installed electric capacity, which was 18,500 MW in 1974, rose to 111,777 MW in 2001. Production in 2000 was 512 billion kWh, of which 83.4% was from fossil fuels, 13.9% from hydropower, 2.6% from nuclear power, and the rest from other sources.

A 380 MW nuclear power station, India's first, was completed with US assistance in 1969 at Tarapur, near Mumbai (formerly Bombay). (The Tarapur plant has long been a center of controversy because of India's alleged failure to observe international safeguards to prevent the diversion of nuclear materials for military purposes.) Another nuclear station, in Rajasthan, began partial operations in the early 1970s, and two more plants were added by the end of the decade. In 1996, India had 10 operating reactors with a combined capacity of 1,695 MW, and four more under construction with a planned capacity of 808 MW. In 1999, the 740 MW initial phase of the Dabhol LNG-fired power plant began operation. (LNG is liquefied natural gas.)

Under the Commission on Additional Sources of Energy, within the Department of Science and Technology, research programs in biogas and biomass have been established. Demonstration projects in solar and wind energy were also undertaken in the early 1980s.

## 28 INDUSTRY

Modern industry has advanced fairly rapidly since independence, and the industrial sector now contributes 26.9% of the GDP. Large modern steel mills and many fertilizer plants, heavy-machinery plants, oil refineries, locomotive and automotive works have been constructed; the metallurgical, chemical, cement, and oil-refining industries have also expanded. Moreover, India has established its role in the high value-added sectors of the "new economy" sectors of information technology (IT), computer hardware, computer software, media and entertainment. Yet, though the total product is large, industry absorbs only about 17% of the labor force. Nine states—Maharashtra, West Bengal, Tamil Nadu, Gujarat, Uttar Pradesh, Bihar, Andhra Pradesh, Karnataka, and Madhya Pradesh—together account for most of Indian industry.

Industrial production expanded at an average annual rate of 5–6% between 1970 and 1990. Enforced austerity and demand management measures taken to stabilize rapidly worsening macroeconomic imbalances in 1991–92 slowed growth in the industry sector to 0% for that year. This was followed by a modest recovery to 1.9% growth in 1992–93, though declining to an estimated 1.6% in 1993–94, due to lingering effects of the earlier stabilization measures as well as poorer than expected demand in key export markets. In 1995–96, however, the index of industrial production (IIP) jumped 11.7%, led by a 13% increase in manufacturing output, the highest in 25 years. Growth in industrial production was 6.6% in 1997/98, but slowed to 4.1% in 1998/99 primarily due to the effects of the Asian financial crisis, but also in part to international sanctions imposed after its nuclear tests in 1998. A rebound evidenced in 6.6% growth in 1999/00 was cut short by the global slowdown in 2001, and the aftermath of the 11 September 2001 terrorist attacks on the United States, including intensifying regional tensions with Pakistan. Growth in industrial production slowed, to 5.1% in 2000/01 and to 2.7% in 2001/02.

Under the planned development regime of past decades, government directives channeled much of the country's resources into public enterprises. Private investment was closely regulated for all industries, discouraging investors from formal entry into the sector. However, industrial policy in recent years has shifted

towards privatization and deregulation. Since 1991 government licensing requirements have been abolished for all but a few “controlled areas”: distillation and brewing of alcoholic drinks, cigars and cigarettes, defense equipment, industrial explosives, hazardous chemicals, and drugs and pharmaceuticals. Under the government disinvestment program announced at the end of 1999, only three sectors remain completely closed to private investment: defense, atomic energy, and railway transport. The oil industry was opened to joint foreign investment in 1997 under the New Exploration and Licensing Policy (NELP). The first exploration blocks were auctioned off in two rounds in 2000, but the initiative none of the major international oil companies put in bids. The Ministry of Disinvestment was established in December 1999 to oversee the reduction of government shares in 247 state-owned companies, referred to as public sector units (PSUs), to a 26% stake. The first sale, in early 2000, was 51% of the Bharat Aluminum Company, Ltd. to Sterlite Ltd. of India. In May 2002, managerial control of Maruti Udyog Ltd. (MUL), India’s top carmaker claiming a 60% market share, was transferred to Suzuki Maintenance Corporation (SMC) of Japan, one of the few foreign buyers in the disinvestment program to date. SMC was already MUL’s technology provider in their joint venture and owned a 46% share of MUL. SMC took control by buying an additional 5% for about \$213 million, a move it had previously declined to take. The government plans to offer the rest of its shares on the stock market in 2004. Generally, the PSUs for which the government has found buyers in its disinvestment program have not been in the industrial or manufacturing sectors. Instead, the government has also steps to make their operations more competitive. In 2001, for instance, quantitative restrictions (QRs) were removed from about 715 imports, including cars, clothes watches, pins, dairy products, part of the accession process to the WTO. Credit and capital markets have also been greatly liberalized. Since 1992, all foreign companies have been on par with Indian companies in the area of foreign exchange solvency and on the stock market. With these reforms, private investment in industry is now proceeding at a steady if still modest pace, fostering increased competition in most of the mining and manufacturing sectors previously monopolized by parastatals. In 2001/02 net foreign direct investment (FDI) and net portfolio investment combined equaled \$6.3 billion, the highest on record.

Textile production dominates the industrial field, accounting for about 30% of export earnings while adding only 7% to 8% to imports. The textile industry employs approximately 35 million workers, making it the second-largest employer in India after agriculture. The sector is highly fragmented, containing about 7000 operational units encompassing a \$2.9 billion clothing industry, a \$16.3 billion finished fabrics industry, a \$1.9 billion industrial textile products industry, and a \$600 million household textile products industry. On a broad level it can also be divided between the natural fiber segment (cotton, silk, wool, jute, etc.) and the man-made fiber segment (polyester filament yarn, blended yarns, etc.). Cotton accounts for about 60% of both domestic consumption and exports. In terms of operations, since the 1980s decentralized powerlooms have produced an increasingly large share of production as centralized mills have declined. In 1986, there were about 638,000 decentralized powerlooms in operation, and by 2002 these had increased 260% to about 1,662,000, including an estimated 1,227,000 conventional shuttle looms, 400,000 drop-box semi-automatic looms, 30,000 automatic looms and 5,000 shuttleless looms (most second-hand imports). Anticipating the globalization of the textile market in 2004 when the multifiber agreement (MFA) is scheduled to be phased out, India’s National Textile Policy-2000 has pinpointed the weaving sector as the crucial link in the textile value chain (from fiber to fabric to garment to style) that needs to become more competitive. The Textile Program, announced in

the budget for 2001/02, included a program for modernizing the powerloom sector through the introduction of 50,000 shuttleless looms and 250,000 semiautomatic looms. The union budget for 2002/03 continued the program, adding an array of tax and duty exemptions for the benefit of powerloom operators. In 2002/03, the Office of the Textile Commissioner estimated that decentralized powerlooms accounted for 76.8% of cloth production (including hosiery); hand looms, 18%; mills, 3.7%; and others, 1.5%. By contrast, integrated mill operations, which perform spinning, weaving and processing in a central location, have stagnated and declined. In December 2002, 464 mills were closed compared to 220 in 1999/98, and hundreds more were slated for closure in 2003. There were 1,782 cotton and man-made fiber mills in 1999, only 192 of them were publicly owned. Mumbai (formerly Bombay), Ahmadabad, and the provincial cities in southern India lead in cotton milling, which accounts for about 65% of the raw material consumed by the textile industry. Jute milling is localized at Calcutta, center of the jute agricultural area. India is the world’s number one jute manufacturer. On average, textile production has been growing about 5% a year, although in 2001–02, with demand damped by a series of negative events—economic recession in the United States, a global economic slowdown, the 11 September 2001 terrorist attacks on the United States, the attack on India’s Parliament 13 December 2001 and sectarian violence in Gujarat—growth fell to 2.6%, compared with 4.4% in 2000/01, while textile exports fell 9%. However, by the end of 2002 and continuing into 2003 strong growth was evidenced. The production of textile products, including ready-made garments, grew 17% during the first quarter of 2003 year-on-year (YOY) and textile exports grew 8.48%.

India is the world’s tenth-largest steel producer. In 2001/02, according to the Ministry of Steel, it produced 4.08 million tons of pig iron (up 19.8%) and 30.64 million tons of finished steel (up 4.7%). The industry consists of seven large integrated mills and about 180 mini steel plants. Despite some signs of recovery 2002, all the major steel companies except the Tata Steel Corporation, the largest and oldest (founded in 1907), were facing serious financial problems due to overcapacity, cheap imports, and anti-dumping duties imposed by the United States in June 2001 that affected Indian exports. Nevertheless, during 2002 steel experienced a strong revival due to rising steel prices, increased domestic demand mainly from highway construction projects, and a 15.88% YOY rise in exports April to November 2002. The metallurgical sector also produced 818,000 tons of aluminum products, up from 640,000 tons in 1998/99. Automobile production, fed by both the steel and aluminum industries, has grown at an annual rates of close to 20% since liberalization in 1993, propelled by low interest rates, the expansion of consumer finance, and strong export demand. In 2002, 90.2% of vehicles produced were economy cars, and 9.8% were luxury cars and SUVs. From 1999/2000 to 2001/02, total production of cars, utility vehicles and commercial vehicles declined 4.7% from 875,179 to 834,071, while the production of two-wheelers increased 14.4%, from about 4.8 million to 5.47 million. Exports of all kinds of vehicles totaled 215,318 April to December 2002, a 68% YOY increase.

In the field of computers and consumer electronics production has been boosted by the liberalization of technology and component imports. In consumer durables, production in many cases grew at double-digit rates in 2002/02 (air conditioners, 25%; microwave ovens, over 20%; color TVs, over 15%, refrigerators, 12%; audio products and DVDs, 10%; washing machines, less than 5%), while computer production was up 36%. Computer software exports have grown as a compound growth rate of 50% per year for the past five years. In 2001/02, electronics hardware exports reached \$1.253 billion, up 22.6%

over 2001/02, while computer software exports reached \$7.8 billion, up 28.7%.

In the petrochemical sector, India has 18 refineries throughout the country with a total refinery capacity of more than two million barrels per day. Sixteen refineries are government-owned, one is jointly owned, and one, the 540,000-barrels-per-day Reliance Industries refinery at Jamnagar in Gujarat State, is privately owned. Almost half India's refinery capacity—now at 970,000 barrels per day—has been built since 1998, the government's goal being self-sufficiency in refined petroleum products. India's total refinery capacity should currently be enough to meet domestic demand, but because of operational problems it still has to import diesel fuel.

India's cement industry is the second-largest in the world, after China, with an installed capacity of 135 million tons as of March 2002. Exports have been very limited and only to immediate neighbors. The cement industry is highly fragmented, consisting of 120 large plants and 56 companies. In the last decade, government's portion of cement consumption decreased from 50% to 35% as the domestic housing market has grown. However, government financed infrastructure projects also helped sparked a growth in construction of about 9.7% YOY April to December 2002. In 2001/02, 106.9 million tons of cement were produced, of which 5.14 million tons were exported.

Like cement, India's food processing industry is oriented mainly toward the domestic market. It is India's fifth largest industry, with output reaching \$31 billion food in 2001/02. Structurally it consists of about 9000 operational units, accounts for about 6.3% of GDP, 13% of exports, and 18% of industrial employment (about 1.6 million workers).

India's fertilizer industry is the third largest in the world, and central to its efforts to increase agricultural productivity. The industry consists of 64 large fertilizer plants (39 producing urea, the most affordable fertilizer and 18 manufacturing diammonium phosphate or DAP, and other products), and 79 small and medium plants. As of 2000, installed capacity in nitrogen-based nutrients was 11 million tons and in phosphate-based nutrients, 3.6 million tons. Potassium-based nutrients must all be imported. Since 1992 the government has been gradually decontrolling the price of fertilizers. The prices of urea are scheduled to be completely decontrolled by 2006/07.

Overall industrial production grew at 2.7% in 2001/02, its weakest performance since the early 1990s. Manufacturing, accounting for about 80% of the sector, grew 2.9%, while the electricity segment increased 3.1% and mining only 1.2%. Figures for April to November 2002 showed signs of recovery, however, with a 5.3% YOY increase for industrial production overall, and 5.4% YOY growth in manufacturing.

## 29 SCIENCE AND TECHNOLOGY

Total expenditures on research and development amounted to 41.9 billion rupees in 1987–97; India had an estimated 149,000 scientists and engineers and 108,000 technicians engaged in research and development that year. Allocations are divided among government and industry, with government providing the major share. There has been a marked growth in the training of engineers and technicians. In 1987–97, science and engineering students accounted for 25% of college and university enrollments. Among the technological higher schools are the Indian Institute of Science at Bangalore and the Indian Institutes of Technology at Mumbai (formerly Bombay), Delhi, Kanpur, Kharagpur, and Madras. In 1947, there were 620 colleges and universities; by 1996, that number was nearly 7,700. One of the primary science and technology issues facing India is a "brain drain." Over 13,000 Indian students annually seek science and engineering degrees in the United States. Such an exodus may greatly reduce the quality of science and engineering education in India.

There are more than 2,500 national research and development institutions connected with science and technology in India. Principal government agencies engaged in scientific research and technical development are the Ministry of Science and Technology, the Council of Scientific and Industrial Research, the Ministry of Atomic Energy, and the Ministry of Electronics. The Council for Scientific and Industrial Research (founded in 1942) has 39 national laboratories under its umbrella. In March 1981, a cabinet committee, headed by the prime minister, was established to review science and technology programs and to decide future policy.

An importer of nuclear technology since the 1960s, India tested its own underground nuclear device for the first time in 1974 at Pokaran, in Rajasthan. In May 1996, India once again performed nuclear tests, dropping three bombs into 700-foot-deep shafts in the desert at Pokoran, with an impact of 80 kilotons. Pakistan responded later the same month with tests of its own. The first Indian-built nuclear power plant, with two 235-MW heavy-water reactors, began operating in July 1983, and an experimental fast-breeder reactor was under construction.

The country's largest scientific establishment is the Bhabha Atomic Research Center at Trombay, near Mumbai (formerly Bombay), which has four nuclear research reactors and trains 150 nuclear scientists each year. In the area of space technology, India's first communications satellite, *Aryabhata*, was launched into orbit by the former USSR on 19 April 1975, and two additional satellites were orbited by Soviet rockets in 1979 and 1981. The Indian Space Research Organization constructed and launched India's first satellite-launching vehicle, the SLV-3, from its Vikram Sarabhai Space Center at Sriharikota on 18 July 1980; the four-stage, solid-fuel rocket put a 35 kg (77 lb) Rohini satellite into near-earth orbit. Indian-built telecommunications satellites have been launched into orbit from Cape Canaveral, Florida, by the US National Aeronautics and Space Administration, by the European Space Agency, and from French Guiana. India has established a satellite-tracking station at Kavalur, in Tamil Nadu. In 1984, the first Indo-Soviet manned mission was completed successfully; in 1985, two Indians were selected for an Indo-US joint shuttle flight. An important international sciences program is the United States-India Fund (USIF), through which scientists and engineers participate in Indo-US joint research projects at 15 institutions in each country. Projects include earthquake, atmospheric, marine, energy, environment, medical, and life sciences.

Major learned societies in the country are the Indian Academy of Sciences (founded in 1934 in Bangalore), the Indian National Science Academy (founded in 1935 in New Delhi), and the National Academy of Sciences (founded in 1930 in Allahabad).

## 30 DOMESTIC TRADE

Under a nationwide scheme launched in 1979 for the distribution of essential commodities, goods are procured by the central government and then supplied to citizens. Each state has its own consumer cooperative federation; all of these groups are under the aegis of the National Cooperative Consumers Federation with the Minister of Consumer Affairs and Public Distribution. By 2000, more than 26,000 cooperatives and 681 wholesale stores shared in the distribution of sugar, edible oils, and grains in rural areas.

With the government's new emphasis on growth in private enterprise since the late 1980s, the expansion of privately-owned retail outlets have competed with the cooperative sector. Most private commercial enterprises are small establishments owned and operated by a single person or a single family; retail outlets are often highly specialized in product and usually very small in quarters and total stock. Often the Indian retail shop is large enough to hold only the proprietor and a small selection of stock; shutters fronting the store are opened to allow customers to

negotiate from the street or sidewalk. There are no major national chains but foreign franchises do exist. In most retail shops, fixed prices are rare and bargaining is the accepted means of purchase. Some department stores and supermarkets have begun to appear in shopping centers in major cities. These shopping centers usually offer entertainment and leisure activities as well.

India's domestic trade is widely influenced by informal and unreported commerce and income, known as "black money."

Government and business hours are generally from 10 AM to 5 PM, Monday through Friday, with a lunch break from 1 to 2 PM. Larger shops in Delhi are open from 9:30 AM to 1:30 PM and from 3:30 to 7:30 PM. Normal banking hours are from 10 AM to 4 PM on weekdays and from 10 AM to 12 noon on Saturdays.

### 31 FOREIGN TRADE

Initially, India's foreign trade followed a pattern common to all underdeveloped countries: exporting raw materials and food in exchange for manufactured goods. The only difference in India's case was that it also exported processed textiles, yarn, and jute goods. Until the late 1980s, the government's strongly import substitution-oriented industrial policy limited the significance of exports for the Indian economy, and while exports have become more important, they remain only about 8% of national income. With imports exceeding exports almost continuously in the 1970s and 1980s, India registers a chronic trade deficit. Stabilization and structural adjustment measures taken in 1991, including a 50% currency devaluation, have improved the country's balance of trade position by depressing imports and making exports more competitive in the world market. Given the country's relatively well-developed manufacturing base, items like textile goods, gems and jewelry, engineering goods, chemicals, and leather manufactures now comprise the country's leading exported items, replacing jute, tea, and other food products that dominated its export base in the 1960s and early 1970s.

In 1999 India's imports were distributed among the following categories: India's exports are dominated by textiles, followed by agricultural products, gems and jewelry, and engineering goods. Major imports include petroleum and petroleum products, gold and precious stones, machinery, chemicals, and fertilizers.

Consumer goods	2.6%
Food	6.8%
Fuels	30.8%
Industrial supplies	40.3%
Machinery	14.2%
Transportation	2.8%
Other	2.4%

Principal trading partners in 1999 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	8,380	3,562	4,818
China (inc. Hong Kong)	3,025	2,105	920
United Arab Emirates	2,074	2,333	-259
United Kingdom	2,030	2,706	-676
Germany	1,732	1,841	-109
Japan	1,682	2,535	-853
Belgium	1,335	3,680	-2,345
Saudi Arabia	742	3,015	-2,273
Singapore	668	1,534	-866
Malaysia	446	2,023	-1,577

### 32 BALANCE OF PAYMENTS

India has a chronic deficit on current accounts. What bridges the gap between payments and receipts is mainly external aid (especially nonproject assistance), tourism earnings, and remittances from Indians working abroad. Heavy imports of food

grains and armament purchases caused a decline in India's foreign exchange reserves in the mid-1960s. An economic recovery from 1968-69, however, eased the problem, and by September 1970, foreign exchange reserves amounted to \$616 million, as compared with \$383 million by December 1965. Reserves declined to \$566 million by the end of 1972 but increased to \$841 million as of December 1975, despite massive deficits on current accounts, attributable to the quadrupling of oil import prices during 1973-74. Foreign exchange reserves declined from \$6,739 million at the end of 1979 to \$3,476 million as of November 1982 but subsequently rose to \$5,924 million by March 1987. The Gulf War crisis worsened the ratio of current account deficit to GDP. Foreign exchange reserves plummeted because of export losses in Kuwait, Iraq, and other nations. Remittances from Indian workers fell, and sudden price increases for oil imports caused an estimated loss to India of over \$2.8 billion in earnings. By November 1993, however, India's foreign exchange reserves had risen to \$8.1 billion, the highest level since 1951. A substantial reduction in the trade deficit, increased inflows from foreign institutional investors, a stable exchange rate, and improved remittances all contributed in the recovery of reserves. Although export growth remained strong, the current account deficit tripled from 1993-94 to 1995-96. The increase was attributed to a continuing surge in imports and higher debt service requirements. However, between 1995 and 1998 the current account deficit shrank to about 1% of GDP due to increased textile exports and a liberalizing trade regime. India's total external debt in 2001 was estimated at \$100.6 billion. In 2000, the external debt-GDP ratio stood at around 20.7%, down from 41% in 1991/92. In the early 2000s, India's exports to East and Southeast Asia increased, including to Japan and South Korea. High growth rates were registered for textiles, chemicals and related products, engineering goods, and leather and manufactures.

The US Central Intelligence Agency (CIA) reports that in 2001 the purchasing power parity of India's exports was \$44.5 billion while imports totaled \$53.8 billion resulting in a trade deficit of \$9.3 billion.

The International Monetary Fund (IMF) reports that in 2000 India had exports of goods totaling \$43.1 billion and imports totaling \$55.3 billion. The services credit totaled \$18.3 billion and debit \$19.9 billion. The following table summarizes India's balance of payments as reported by the IMF for 2000 in millions of US dollars.

<b>Current Account</b>	<b>-4,198</b>

### 33 BANKING AND SECURITIES

A well-established banking system exists in India as a result of British colonialism. The Reserve Bank of India, founded in 1935 and nationalized in 1949, is the central banking and note-issuing authority. The Reserve Bank funds the Deposit Insurance and Credit Guarantee Corporation, which provides deposit insurance coverage to the banking sector. The largest public-sector bank is

the State Bank of India, which, at the end of 1996, accounted for one-third of income. Banks operating in the public sector account for 75% of commercial banking, while private banks take 15% of the market and foreign banks account for the remaining 10%. In 1997, 58% of commercial banks operated regionally, extending credit to small borrowers in rural areas. Scheduled banks maintain branches, mainly in the major commercial and industrial centers of Maharashtra, West Bengal, Uttar Pradesh, and Tamil Nadu states and the Delhi territory. Over 100 branches of Indian commercial banks operate overseas as well, primarily in the United Kingdom, United States, Fiji, Mauritius, Hong Kong, and Singapore. As of July 2000, there were 45 foreign banks in India with 180 branches, as well as 26 foreign representative offices. Total deposits in commercial banks reached \$206 billion in 2000-01.

The cost of borrowing remains very high, because of bad debts and non-performing assets. Most Indian banks lend approximately 30% to 40% of their capital to the government of India, and over 80% of investment is in government securities. In an attempt to regulate lending practices and interest rates, the government encouraged the formation of cooperative credit societies. Long-term credit is provided by the cooperative land development banks. Nonagricultural credit societies and employees' credit societies supply urban credit. A process of gradual liberalization is being applied to government institutions that supply most medium- and long-term credit. These term-lending institutions also control about 30% of all share capital and act as a channel for most foreign borrowing by the private sector. The main bodies are the Industrial Development Bank of India (IDBI), the Industrial Finance Corporation of India (IFCI), the Industrial Credit and Investment Corp. of India (ICIC), and the Export-Import Bank of India (Eximbank). The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$81.6 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$283.4 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 6.5%.

The main stock exchanges are located in Calcutta, Mumbai (formerly Bombay), and Madras, and there are secondary exchanges in Ahmadabad, Delhi, Kanpur, Nagpur, and other cities. The Securities and Exchange Board of India supplies regulation of the stock market. These regulations are not strict, and at times margin trading and other questionable practices have tended to produce wild speculation. Rules favor exchange members rather than public protection or benefit. Brokerage and jobbing are commonly combined. Of India's 21 stock exchanges, the Mumbai Stock Exchange (BSE) and National Stock Exchange (NSE) are the most important. There are more than 5,000 companies listed in Mumbai (formerly Bombay), the largest on the Indian market and on this criterion the largest outside New York. Total market capitalization on the BSE's 5,795 listed companies was R5.3 trillion as of 2001. The NSE, however, is perceived as more transparent, has faster trading cycles, more timely settlements, and is in the process of setting up a share depository. Major efforts have been made to strengthen the stock market institutionally and make it less like a casino.

In 1996-97 negative market sentiment, particularly among foreign institutional investors, took the overall price earnings ratio down from 19.6 in June 1996 to 11.3 in November. In the two years ending October 1996, all but 436 of the 2,531 most-traded shares lost over half their value; more than 1,000 lost over 80% of their value. The market continued to lose ground in 1997 and 1998 due to the Asian financial crisis. In 1999-2000, though, both the BSE and the NSE gained approximately 40% in market share value due to the growth in information technology (IT) stocks. Between 1998 and 1999 alone, the local S&P CNX Index

grew 97.8%, but then dropped about 23-24% in each of the next two years. The S&P IFCG and IFCI Indexes also dropped about 20-30% in 1999 and 2000.

### 34 INSURANCE

The life insurance business was formally nationalized on 1 September 1956 by the establishment of the Life Insurance Corp. of India (LIC), which absorbed the life insurance business of 245 Indian and foreign companies. LIC also transacts business in certain African and Asian countries where there are large Indian populations. The general insurance business was nationalized as of 1 January 1973, and all nationalized general insurance companies were merged into the General Insurance Corp. (GIC) of India. GIC serves as the parent company for the four operating insurers, the New India Assurance Company, the Oriental Fire and General Insurance Company, the National Insurance Company, and the United India Insurance Company.

In 1997, despite repeated promises to allow private insurers into the industry, an announcement on privatization in the financial services sector was postponed in the face of institutional resistance. The unions and left-wing parties led a struggle to stop an opening up of the insurance sector. They were alarmed by government plans to introduce legislation that would set up an independent Insurance Regulatory and Development Authority (IRA). Under the Insurance Regulatory and Development Authority Act of 1999, the IRA finally gained the power to issue licenses to private insurance companies in 2000 to Indians and foreigners. In India, third-party auto liability, public liability for hazardous material handling, workers' compensation, and third-party liability for inland water vessels are all compulsory.

### 35 PUBLIC FINANCE

The government's financial year extends from 1 April to 31 March, and the budget is presented to the parliament on the last day of February. The executive branch has considerable control over public finance. Thus, while parliament can oversee and investigate public expenditures and may reduce the budget, it cannot expand the budget, and checks exist that prevent it from delaying passage.

Budgets in recent decades have reflected the needs of rapid economic development under rising expenditures of the five-year plans. Insufficient government receipts for financing this development have led to yearly deficits and a resulting increase of new tax measures and deficit financing. The Gulf crisis, increased interest payments, subsidies, and relief in 1991 caused the central government's fiscal deficit to reach 9% of GDP. It fell to 5.7% in 1992-93 but rose to 7.3% of GDP in 1993-94. Principal sources of government revenue are customs and excise duties and individual and corporate income taxes. Major items of expenditure are defense, grants to states and territories, interest payments on the national debt, and economic, social, and community services. High interest rates, 8% inflation, slow industrial growth, and weak foreign investment prompted the government to recommend dramatic new initiatives in the 1997-98 budget, including cuts in taxes and duties. The proposed budget projected a 15% increase in expenditures to \$65 billion and a reduction in the deficit to 4.5% of GDP. While expenditures were cut, the budget deficit actually grew in 1997-98 to about 8.5% of the GDP due to currency devaluation and the Asian financial crisis. The budget for 2000 included a 30% increase on defense spending due to the Pakistani conflict.

Although applauded by the business community as market-friendly, some observers were chagrined by the 2000 budget's failure to squarely tackle infrastructure reforms. Most analysts agree that India spends too much on current expenditures and not enough on public investment. India suffers from inadequate roads and ports, a substandard educational system, and unreliable power supplies.

The US Central Intelligence Agency (CIA) estimates that in 2001/2002 India's central government took in revenues of approximately \$48.3 billion and had expenditures of \$78.2 billion including capital expenditures of \$14 billion. Overall, the government registered a deficit of approximately \$29.9 billion. External debt totaled \$100.6 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	48,300
Tax revenue	73.1%	35,306
Non-tax revenue	22.6%	10,932
Capital revenue	4.0%	1,953
Grants	0.2%	109
EXPENDITURES	100.0%	78,200
General public services	6.1%	4,793
Defense	15.6%	12,202
Education	2.2%	1,739
Health	1.8%	1,405
Housing and community amenities	4.4%	3,480
Economic affairs and services	14.6%	11,386
Other expenditures	27.4%	21,412
Interest payments	27.9%	21,784

### 36 TAXATION

Taxes are levied by the central government, the state governments, and the various municipal governments. The sources of central government tax revenue are union excise duties, the central value-added tax or CENVAT, corporate and personal income (nonagricultural) taxes, wealth taxes, and customs duties. The gift tax was abolished in January 1998. State government sources, in general order of importance, are land taxes, sales taxes, excise duties, and registration and stamp duties. The states also share in central government income tax revenues and union excise duties, and they receive all revenues from the wealth tax on agricultural property. Municipal governments levy land and other property taxes and license fees. Many also impose duties on goods entering the municipal limits. There is little uniformity in types or rates of state and municipal taxes.

The lowest level of income subject to taxation was lowered to ₹50,000 for individuals in 2000, less than half the previous level. Income tax rates are progressive and form four brackets: 0% on taxable income to ₹50,000 (\$1,035); 10% on taxable income between ₹50,000 and ₹60,000 (\$1,240); 20% on income between ₹60,000 and ₹150,000 (\$3,000) plus ₹1000 (\$20); and 30% on income above ₹150,000 plus ₹19,000 (\$390). In 2002/03, surcharges of 12% and 17% on incomes of ₹60,000 and ₹150,000, respectively, were replaced with a 2% surcharge on all incomes above ₹60,000.

Corporate income tax for domestic companies as of 1 April 2001 is 35% plus a 5% surcharge, and for foreign companies 40% plus a 5% surcharge, down from 48%.

The wealth tax is one percent of wealth exceeding ₹1,500,000 (\$31,000). Interest income is taxed at 10%; rental income; capital gains at 20% at 15%; and winnings from lotteries and horse races at 30%. There is not tax on dividends.

The central government imposes a 16% value-added tax (VAT) called the CENVAT introduced in 2001/02. The CENVAT has not been fully implemented throughout India; this is scheduled for completion in 2005.

For the 2003/04 Union Budget, the excise structure was rationalized into four tiers: exempt items many of which had

carried 4% rates (like umbrellas, band-aids, toys, corrective glasses, CDs); 8% (like pressure cookers, buckets, dental chairs); 16% (the standard VAT rate applied to most items), and 24% reduced from 20% to 50% on polyester filament yarn, motor cars, utility vehicles, and replacement tires. Special Excise Duties of 32% are applied to aerated soft drinks and concentrates, pan masala, and chewing tobacco.

As of 1 April 2003, instead of being 100% tax free, profits and gains derive from Software Technology Parks of India (STPIs) and export oriented units (EOUs) will only be 90% tax-free.

### 37 CUSTOMS AND DUTIES

The majority of imports and some exports are subject to tariffs. There are both revenue and protective tariffs, although the former are more important and have long been a major source of central government income. The Indian government has been steadily reducing tariff rates in order to increase trade and investment. A 35% tariff ceiling was set in the 2001–2002 budget. However, India's tariffs are still among the highest in the world. Additional, special duties can more than double the barriers to importing a product, including textiles and apparel. Gold is taxed at an added rate of 9% at the state level and at least an added 3% at the local level. Indians spend more money on gold than anything but oil, at a level of \$7 billion in 2000. India intends to reduce tariff rates to a peak of 20% by the year 2005.

### 38 FOREIGN INVESTMENT

Until recently, foreign investment remained closely regulated. Rules and incentives directed the flow of foreign capital mainly toward consumer industries and light engineering, with major capital-intensive projects reserved for the public sector. Under the Foreign Exchange Regulation Act of 1973, which went into effect on 1 January 1974, all branches of foreign companies in which nonresident interest exceeded 40% were required to reapply for permission to carry on business; most companies had reduced their holdings to no more than 40% by 1 January 1976. Certain key export-oriented or technology-intensive industries were permitted to maintain up to 100% nonresident ownership. Tea plantations were also exempted from the 40% requirement. Although the government officially welcomed private foreign investment, collaboration and royalty arrangements were tightly controlled. Due to the restrictiveness of these policies, foreign investment remained remarkably low during the 1980s, ranging between \$200 and \$400 million a year.

Government reform measures in mid-1991 changed this picture significantly. Under the New Industrial Policy, the amount of money invested in the country doubled annually from 1991 to 1995. In 1997 the New Exploration and Licensing Policy (NELP) was announced permitting the participation of foreign oil companies in upstream exploration and development of oil and gas resources. In 2000, the first exploration blocks were awarded in two rounds of bidding, but the major international oil companies (BP, Shell, ExxonMobil) have yet to become involved. Effective 1 April 2001, imports of crude oil and petroleum products were liberalized, with state-run enterprises losing their exclusive right to import certain petroleum products for domestic consumption. Also in 2001, India removed quantitative restrictions (QRs) from 715 items (147 agricultural products, 342 textile items, and 226 manufactured goods, including automobiles) in compliance with WTO standards. Under the New Industrial Policy as amended most sectors have been opened for 100% foreign investment. Sectors such as banking, telecommunications, and print media are still restricted. In some restricted sectors, foreign investment up to 49% or 74% is allowed in the equity of an Indian joint venture company. Recently the requirement prior approval by the Reserve Bank of India was removed from enterprises falling within categories allowing 100% foreign investment.

India has eight export processing zones (EPZs) designed to provide internationally competitive infrastructure and duty-free, low-cost facilities for exporters. Foreign investors in some industries can operate in EPZs, export oriented units (EOUs), special economic zones (SEZs) and Software Technology Parks of India (STPIs). Under the Market Access Initiative of 2001, greater access to SEZs was afforded, although as of 1 April 2003 profits and gains derived from the STPIs and EOUs would only be 90% tax-free. SEZs are regarded as foreign territory for purposes of duties and taxes and sector caps that limit foreign direct investment (FDI) in different industries do not apply in the SEZs. In any case, the corporate tax rate on foreign companies was reduced to 48% to 40%, and the peak customs rate was reduced from 35% to 30%. Other liberalizing steps in the 2002/03 budget include the removal of price controls on petroleum products, the removal of price controls from all but 99 drugs, and permission for foreign banks to set up subsidiaries instead of only branches. In November 1999 the government announced its intention to disinvest in 247 state-owned enterprises to the general level of 26% ownership, and established the Ministry of Disinvestment. Although the program has involved the transfer of significant amounts of equity and management control from the government to private sector, it has yet to generate appreciable foreign investment. Despite the trend towards liberalization, India's foreign investment regime remains complex and relative restricted. Although FDI has increased, average a net \$2.64 billion per year 1997/98 to 2001/02, the inflow is still small compared to China, the most relevant comparison, where FDI is running \$30 billion to \$40 billion a year. The net flow dropped to \$1.8 billion in 2000/01, and then recovered to a net \$3.4 billion in 2001/02. Net portfolio investment, \$1.8 billion in 1997/98, turned negative in 1998/99, at net -\$100,000. Over the next three years, however, the net portfolio inflow averaged about \$3 billion.

Statistics on FDI for India show Mauritius as consistently the largest source, averaging about \$700 million per year from 1995 to 2000, with the US in second place, averaging about \$383 million a year. However, most of the investments credited to Mauritius are actually from American companies seeking to take advantage of its lower withholding taxes or exemptions on payments of royalties, dividends, technical service fees, interest on loans and capital gain by Indian joint venture companies under the terms of the Double Tax Agreement (DTA) between India and Mauritius. From 1991 to 2001 about 10% of FDI has come from the US and 20% from Mauritius. The third-, fourth-, and fifth-largest sources 1995 to 2000 were Japan (annual average \$138.3 million), Germany (annual average \$115.8 million), and the United Kingdom (annual average 78.2 million). Foreign investment through the stock market is limited to 30% to 40%.

### 39 ECONOMIC DEVELOPMENT

Under a series of five-year plans through 2000, the government became a participant in many industrial fields and increased its regulation of existing private commerce and industry. Long the owner-operator of most railway facilities, all radio broadcasting, post, and telegraph facilities, arms and ammunition factories, and river development programs, the government reserved for itself the right to nationalize any industries it deemed necessary. Yet the government's socialist approach was pragmatic, not doctrinaire; agriculture and large segments of trade, finance, and industry remained in private hands. Planning is supervised by an eight-member planning commission, established in 1950 and chaired by the prime minister.

India's first four five-year plans entailed a total public sector outlay of R314.1 billion. The first plan (1951–56) accorded top priority to agriculture, especially irrigation and power projects. The second plan (1956–61) was designed to implement the new industrial policy and to achieve a "socialist pattern of society."

The plan stressed rapid industrialization, a 25% increase in national income (in fact, the achieved increase was only 20%), and reduction of inequalities in wealth and income. The focus of the third plan (1961–66) was industrialization, with 24.6% spent on transportation and communications and 20.1% on industry and minerals. Drought, inflation, and war with Pakistan made this plan a major disappointment; although considerable industrial diversification was achieved and national income rose, per capita income did not increase (because of population growth), and harvests were disastrously low. Because of the unsettled domestic situation, the fourth five-year plan did not take effect until 1969. The 1969–74 plan sought to control fluctuations in agricultural output and to promote equality and social justice. Agriculture and allied sectors received 16.9%, more than in any previous plan, while industry and minerals received 18.5%, transportation and communications 18.4%, and power development 17.8%, also more than in any previous plan.

The fifth plan (1974–79) aimed at the removal of poverty and the attainment of self-reliance. A total outlay of R393.2 billion was allocated (26% less than originally envisaged), and actual expenditures totaled R394.2 billion. Once again, the emphasis was on industry, with mining and manufacturing taking 22.5%, electric power 18.7%, transportation and communications 17.2%, and agriculture 12.1%. The fifth plan was cut short a year early, in 1978, and, with India enmeshed in recession and political turmoil, work began on the sixth development plan (1980–85). Its goal, like that of the fifth, was the removal of poverty, although the planners recognized that this gigantic task could not be accomplished within five years. The plan aimed to strengthen the agricultural and industrial infrastructure in order to accelerate the growth of investments and exports. Projected outlays totaled R975 billion, of which electric power received 27.1%, industry and mining 15.4%, transportation and communications 12.7%, and agriculture 12.2%. The main target was a GDP growth rate of 5.2% annually. The seventh development plan (1985–90) projected 5% overall GDP growth (which was largely achieved and even exceeded) based on increases of 4% and 8% in agricultural and industrial output, respectively. Outlays were to total R1,800 billion.

The eighth development plan (for 1992–97), drafted in response to the country's looming debt crisis in 1990–91, laid the groundwork for long-term structural adjustment. The plan's overall thrust was to stimulate industrial growth by the private sector, and thereby free government resources for greater investment in basic infrastructure and human resources development. In addition to liberalized conditions for private and foreign investment, the foreign exchange system was reformed, the currency devalued, the maximum tariff reduced from 350% to 85%, import barriers generally loosened, and those for key intermediate goods removed altogether. Reform of the tax system, reduction of subsidies, and restructuring of public enterprises were also targeted. While the eighth plan generally supported expansion of private enterprise, unlike structural adjustment programs in other developing countries, it did not stipulate a large-scale privatization of the public sector.

As the eighth plan came to an end in 1997 most analysts proclaimed it a success; economic growth averaged 6% a year, employment rose, poverty was reduced, exports increased, and inflation declined.

The ninth development plan (1997–2002) focused on the redistribution of wealth and alleviation of poverty, the further privatization of the economy and attraction of foreign investment, and the reduction of the deficit. Overall there were improvements in the reform era including an increase in the GDP growth rate from an average of about 5.7% to about 6.1% in the Eighth and Ninth Plan periods, a reduction of the percent in poverty from a third of the population to a fourth, increased literacy from 52% in 1991 to 65% in 2001, and India's

emergence as a competitor in state-of-the-art technologies of the new information age economy. However, persistent inefficiencies—unemployment and underemployment, and welfare deficiencies—remained. Moreover, since 1998 a series of domestic and international shocks have brought a disturbing deceleration to India's economic growth.

In the tenth five-year plan, 2002–2007, the government set the ambitious target of achieving an average 8% growth, above the level achieved during the ninth plan and well ahead of the 5% to 5.5% growth forecast for 2002/03. Other monitorable economic targets include a reduction of the poverty rate by 5% by 2007, and by 15% by 2012; providing gainful and high-quality employment at least equal to the projected increases in the labor force; increase in forest and tree cover to 25%, in 2007 and to 33% by 2012; all villages with sustained access to potable water by 2007; and cleaning of all major polluted rivers by 2007. Agricultural development is viewed as the core element of the tenth plan with attention to sectors most likely to create employment opportunities. These include agriculture in its extended sense, construction, tourism, transport, small-scale industries (SSI), retailing, IT, and communications enabling services. Industrial policy includes continued emphasis on privatization and deregulation. The ambitious 8% annual growth of the tenth plan is considered achievable because of the inefficiencies that have traditionally plagued Indian agriculture and industry. Because the scope for improvement is so wide, both in the public sector and in the private sector, strong growth can be expected from efficiency enhancing policies.

#### 40 SOCIAL DEVELOPMENT

India's governments have established an extensive social welfare system. Programs for children include supplementary nutrition for expectant mothers and for children under seven years of age, immunization and health programs, vacation camps for low-income families, and training for adolescents. There are also services for the blind, deaf, mentally retarded, and orthopedically handicapped. Programs for women include welfare grants, women's adult education, and working women's hostels. Special measures are aimed at rehabilitating juvenile delinquents, prostitutes, and convicts. Begging in public places is forbidden by law in most states and localities. Other social welfare programs cover displaced persons; family planning and maternity care; rural community development; emergency relief programs for drought, flood, earthquake, and other disasters; untouchability (the Harijans); and underdeveloped tribal peoples.

The program for old age, disability, and death benefits are covered by a provident fund with deposit linked insurance for industrial workers in 177 categories. The system is partially funded by insured persons and employers, with a small pension scheme subsidized by the government. There is a social insurance system covering sickness and maternity as well as work injury. The law requires employers to pay a severance indemnity of 15 days pay for each year of employment.

Although the law prohibits discrimination in the workplace, women are paid less than men in both rural and urban areas. Discrimination exists in access to employment, credit, and in family and property law. Laws aimed at preventing employment discrimination, female bondage and prostitution, and the sati (widow burning), are not always enforced. Wife murder, usually referred to as "dowry deaths," are still evident. Domestic violence is commonplace and more than half of women surveyed believe it is justifiable and a normal part of married life. Not only does the male population exceed that of females, but India is also one of the few countries where men, on the average, live longer than women. To explain this anomaly, it has been suggested that daughters are more likely to be malnourished and to be provided with fewer health care services. Female infanticide and feticide is a growing problem in a society that values sons over daughters.

It is estimated there are nearly 500,000 children living and working on the streets. Child prostitution is widespread. Despite its illegality, child marriages are still arranged in many parts of India.

Human rights abuses, including incommunicado detention, are particularly acute in Kashmir, where separatist violence has flared. Although constitutional and statutory safeguards are in place, serious abuses still occur including extrajudicial killings, abuse of detainees, and poor prison conditions. Despite efforts to eliminate discrimination based on the longstanding caste system, the practice remains unchanged.

#### 41 HEALTH

Great improvements have taken place in public health since independence, but the general health picture remains far from satisfactory. The government is paying increasing attention to integrated health, maternity, and child care in rural areas. An increasing number of community health workers and doctors are being sent to rural health centers. Primary health care is provided to the rural population through a network of over 150,000 primary health centers and sub-centers that are staffed by trained midwives and health guides. In the mid-1990s, India had nearly 400,000 physicians and almost 700,000 hospital beds.

The government's eighth five-year plan, from 1990 to 1995, included eradication of malaria and control of leprosy, tuberculosis, and cataracts. India also wants to achieve a goal of one hospital bed per 1,000 people. (As of 1999, there were an estimated 0.4 physicians and 0.8 hospital beds per 1,000 people.) In the mid-1990s, there were nearly 40,000 hospitals and dispensaries. In addition, the rural population was served by more than 130,000 subcenters, over 20,350 primary health centers, and nearly 2,000 community health centers. There are also numerous herb compounders, along with thousands of registered practitioners following the Ayurvedic (ancient Hindu) and Unani systems.

India has modern medical colleges, dental colleges, colleges of nursing, and nursing schools. More than 100 colleges and schools teach the indigenous Ayurvedic and Unani systems of medicine and 74 teach homeopathy. New drugs and pharmaceutical plants, some assisted by the UN and some established by European and American firms, manufacture antibiotics, vaccines, germicides, and fungicides. However, patent medicines and other reputed curatives of dubious value are still widely marketed; medical advisors of the indigenous systems and their curatives probably are more widely followed than Western doctors, drugs, and medical practices.

As of 1999, total health care expenditure was estimated at 5.4% of GDP. Average life expectancy increased from 48 years in 1971 to 63 years in 2000. Infant mortality declined from 135 per 1,000 live births in the mid-1970s to 69 in 2000. The high mortality rate among infants and children is directly linked to size of family, which is being reduced through the small family norm (National Family Planning Program). The overall mortality rate in 2002 was an estimated 8.6 per 1,000 people. The government's goal is to raise the life expectancy to 64 years.

The government of India took stringent measures to prevent plague following outbreaks during 1994. Mandatory screenings at airports and inspections of passengers were instituted. A short-term multi-drug therapy launched in India in 1995 led to a dramatic fall in the leprosy prevalence. The incidence of malaria was reduced by 98% between 1953 and 1965, but the number of reported cases increased from 14.8 million in 1966 to 64.7 million in 1976 because DDT-resistant strains of mosquitoes had developed. The incidence of malaria in 1995 was 295 cases per 100,000 people. The death toll from smallpox was reduced to zero by 1977 through a massive vaccination program and plague has not been reported since 1967. Between 1948 and 1980, 254 million people were tested for tuberculosis and 252 million

received BCG, an anti-tuberculosis vaccine. In 1999, there were 185 reported cases of tuberculosis per 100,000 people. In 1994, there was a serious outbreak of pneumonic plague in western India, which spread to others parts of the country, killing thousands. Many diseases remain, especially deficiency diseases such as goiter, kwashiorkor, rickets, and beriberi. However, India's immunization rates for children up to one year old are high. Data from 1997 shows vaccinations against tuberculosis, 96%; diphtheria, pertussis, and tetanus, 90%; polio, 91%; and measles, 81%. There is also a national system to distribute vitamin A capsules to children because a lack of this vitamin contributes to blindness and malnutrition. As of the mid-1990s, nearly 25% of the country's children had been reached. Hypertension is a major health problem in India. Between 3.5% and 6.5% of adults have high blood pressure.

UN data shows that India is currently the country with the most HIV-infected people. As of 1999 the number of people living with HIV/AIDS was estimated at 3.7 million and deaths from AIDS that year were estimated at 310,000. HIV prevalence was 0.7 per 100 adults.

## 42 HOUSING

Though progress has been made toward improving the generally primitive housing in which most Indians live, there are still some deficits in housing supply and access to basic utilities. A number of subsidized, low-cost housing schemes have been launched by the government, but the goal of providing a house for every homeless family cannot be met because of the prohibitive cost. The sixth five-year plan envisaged an expenditure of R94 billion for rural housing and R35 billion for urban housing during 1980–85, including R11.9 billion to provide shelter for homeless people. The eighth five-year plan (1990–95) called for an investment of \$40 billion in housing, with 90% of this sum earmarked for the private sector. The government's goal is to provide eight million new housing units between 1990 and 2000, two million to fill the existing backlog and six million to meet the needs that will be created by population growth.

According to 2001 national statistics, there was a total of about 187,162,172 residential dwelling units nationwide. About 50% were considered to be in "good" condition and 44% were described as "livable." Many rural dwellings are constructed of mud brick or burnt brick walls with mud floors and a thatched or tiled roof. Urban dwellings are made from concrete or burnt brick. As of 2001, about 55% of dwellings had access to electricity. Only about 36% of all dwellings had indoor bathroom facilities.

## 43 EDUCATION

According to 2000 UNESCO estimates, 44.2% of India's population was illiterate (males, 31.4%; females, 57.9%). This figure represents a slow decline from the 59.2% illiteracy rate reported in 1981. In 1986, the National Education Policy (NPE) was adopted in order to bring about major reforms in the system, primarily universalization of primary education. In 1988, a national literacy mission was launched, following which states like Kerala and Pondicherry achieved 100% literacy. In 1992, the second program of action on education was introduced to reaffirm the 1986 policy with plans to achieve total literacy and free education for all children up to grade eight by the year 2000. As of 1995, public expenditure on education was 3.1% of GDP.

Since 1947, public educational facilities have been expanded as rapidly as possible. The main goal has been primary education for children in the 6–11 age group. An emphasis on "basic education"—learning in the context of the physical and cultural environment, including domestic and commercial productive activities—has met with some success. In addition to expansion of primary education, there has been marked increase in educational facilities in secondary schools, colleges, universities,

and technical institutes. An intensive development of adult education is under way in both urban and rural areas.

Free and compulsory elementary education is a directive principle of the constitution. In 1997, there were 598,354 primary level schools with 1,789,733 teachers and 110,390,406 pupils. There were a total of 68,872,393 pupils, with 2,738,205 teachers, in secondary schools in that same year. The pupil-teacher ratio at the primary level was 43 to 1 in 1999.

India's system of higher education is still basically British in structure and approach. The university system is second in size only to that of the United States' with 150 universities and over 5,000 colleges and higher-level institutions. Educational standards are constantly improving and especially in the area of science and mathematics are as high as those found anywhere in the world. The older universities are in Calcutta, Mumbai (formerly Bombay), and Madras, all established in 1857; Allahabad, 1877; Banares Hindu (in Varanasi) and Mysore (now Karnataka), both in 1916; Hyderabad (Osmania University), in 1918; and Aligarh and Lucknow, both in 1921. Most universities have attached and affiliated undergraduate colleges, some of which are in distant towns. Christian missions in India have organized more than three dozen college-rank institutions and hundreds of primary, secondary, and vocational schools. In addition to universities there are some 3,500 arts and sciences colleges (excluding research institutes) and commercial colleges, as well as 1,500 other training schools and colleges. The autonomous University Grants Commission promotes university education and maintains standards in teaching and research. Many college students receive scholarships and stipends. In 1997, a total of 6,060,418 students were enrolled in institutions of higher learning.

## 44 LIBRARIES AND MUSEUMS

The National Library in Calcutta, with over 221 million volumes, is, by far, the largest in the country, and possibly the world. Some of the other leading libraries are the New Delhi Public Library (1.4 million volumes), the Central Secretariat Library in New Delhi (700,000 volumes), and the libraries of some of the larger universities. The Khuda Baksh Oriental Library in Patna, with a collection of rare manuscripts in Arabic, Urdu, and Farsi, is one of 10 libraries declared "institutions of national importance" by an act of parliament. The National Archives of India, in New Delhi, is the largest repository of documents in Asia, with 25 km (16 mi) of shelf space. There is an extensive public library system as well as cultural and religious institutions and libraries throughout the country.

Noted botanical gardens are located in Calcutta, Mumbai (formerly Bombay), Lucknow, Ootacamund, Bangalore, Madras, and Darjeeling, and well-stocked zoological gardens are found in Calcutta, Mumbai, Madras, Trivandrum, Hyderabad, Karnataka, and Jodhpur. Most of India's hundreds of museums specialize in one or several aspects of Indian or South Asian culture; these include 25 archaeological museums at ancient sites, such as Konarak, Amravati, and Sarnath. Some of the more important museums are the Indian Museum in Calcutta, the Prince of Wales Museum of Western India in Mumbai (formerly Bombay), and the National Museum and the National Gallery of Modern Art, both in New Delhi. There are also municipal museums throughout the country and dozens of museums and galleries devoted to prominent South Asian artists. There are science museums in Bhopal, Calcutta, Mumbai (formerly Bombay), and New Delhi. Bhavongor houses the Gandhi Museum, one of several sites devoted to the history of the national hero. In 2001 the Broadcasting Museum was founded in Delhi. There also are thousands of architectural masterpieces of antiquity—the palaces, temples, mausoleums, fortresses, mosques, formal gardens, deserted cities, and rock-hewn monasteries—found in every section of the subcontinent.

## 45 MEDIA

All postal and telegraph and most telephone services are owned and operated by the government. International telephone services, both radio and cable, are available between India and all major countries of the world. In 2000, there were 27.7 million telephone lines and 2.93 million cellular phones in use.

All-India Radio (AIR), government-owned, operates short- and medium-wave transmission through 148 stations and broadcasts in all major languages and dialects for home consumption. AIR also operates external services in 24 foreign and 36 Indian languages. There are privately licensed radio stations, but they are only permitted to broadcast educational or entertainment programming. News broadcasting by independent stations is prohibited. In 1959, India's first television station was inaugurated in Delhi, and color television broadcasting was inaugurated in 1982. By the end of 1985, the government's Doordarshan television network operated 22 broadcasting centers. As of 1999, there were, altogether, 153 AM and 92 FM radio stations and 562 television stations. In 2000, there were 121 radios and 78 television sets for every 1,000 people. The School Television Section broadcasts regular in-school instruction programs on selected subjects. India has a thriving film industry, centered at Mumbai (formerly Bombay), Madras, Calcutta, and Bangalore. Indians are avid film-goers and users of videocassettes. In 2001, there were five million Internet subscribers served by about 43 service providers.

The first newspaper in India, an English-language weekly issued in Calcutta in 1780, was followed by English-language papers in other cities. The first Indian-language newspaper (in Hindi) appeared in Varanasi (Benares) in 1845. There are hundreds of newspapers in circulation throughout the country, published in some 85 languages, primarily Hindi, English, Bengali, Urdu, and Marathi. The majority of Indian newspapers are under individual ownership and have small circulations. About 30% are published in Delhi, Mumbai (formerly Bombay), Calcutta, and Madras.

The principal national English-language newspapers are the *Indian Express*, with editions published in Mumbai (formerly Bombay) and 10 other cities, and the *Times of India*, published in Ahmadabad, Mumbai, Delhi, and three other cities. The largest Hindi daily is the *Navbharat Times*, published in Mumbai. Principal dailies (with estimated 2002 circulation) are as follows:

	LANGUAGE	CIRCULATION
MUMBAI (FORMERLY BOMBAY)		
<i>Indian Express</i>	English	576,200
<i>Times of India</i>	English	536,166
<i>The Economic Times</i>	English	336,060
<i>Lokasatta</i>	Marathi	258,090
<i>Maharashtra Times</i>	Marathi	NA
CALCUTTA		
<i>Jugantar</i>	Bengali	302,000
<i>The Telegraph</i>	English	234,500
<i>Aajkaal</i>	Bengali	157,713
DELHI		
<i>Navbharat Times</i>	Hindi	418,500
<i>Punjab Kesari</i>	Hindi	173,390
<i>Indian Express</i>	English	130,000
<i>Hindustan</i>	Hindi	98,900
MADRAS		
<i>The Hindu</i>	English	300,320
<i>Thanthi</i>	Tamil	297,797
<i>Dinamani</i>	Tamil	178,230
CALICUT		
<i>Mathirubhumi</i>	Malayalam	454,351
KOTTAYAM		
<i>Malayala Manorama</i> (nationwide circulation)	Malayalam	1,013,590
KANPUR		
<i>Dainik Jagran</i>	Hindi	409,480

In 1976, the four leading Indian news agencies—the Press Trust of India (English), United News of India (English), Hindustan Samachar (Hindi), and Samachar Bharati (Hindi)—

merged to form Samachar, which means “news” in Hindi. The merger followed the cancellation by AIR of subscriptions to all four services. Samachar was dissolved in 1978, and as of 1991 there were three separate agencies: Indian News and Features Alliance, Press Trust of India and United News of India.

Freedom of the press has been nominally ensured by liberal court interpretations of the constitution, but the government has long held the right to impose “reasonable restrictions” in the interest of “public order, state security, decency, and morality.” The government’s censorship of newspapers imposed in June 1975 was declared illegal by the courts, and press restrictions proclaimed by Indira Gandhi’s government in 1976 were relaxed by the Janata government in 1977. The independent Press Council, which had been abolished in 1975, was restored in 1979 with the function of upholding freedom of the press. On a day-to-day basis, the press is essentially unfettered, and news magazines abound in addition to the newspapers.

## 46 ORGANIZATIONS

Cultural activities, especially traditional arts and crafts, are promoted throughout India by the National Academy of Fine Arts; the National Academy of Music, Dance, and Drama; the National Center for the Performing Arts; and the National Academy of Letters. Other state organizations for the furthering of cultural activities include the Ministry of Information and Broadcasting, the Indian Council for Cultural Relations, and the National Book Trust. There are a great many private cultural and institutional organizations based on religion and philosophy, language (including Sanskrit and Pali), drama, music and dancing, modern writing, the classics, and painting and sculpture.

There are a number of scholarly and professional societies and associations focused on education and research in various scientific and medical fields, including the national Indian Medical Association.

There are many political, commercial, industrial, and labor organizations, and rural cooperatives. Almost all commercial and industrial centers have chambers of commerce. The Center of Indian Trade Unions and All India Trade Union Congress are umbrella organizations representing the rights of worker’s.

Notable national youth organizations include the All India Students Federation, Girl Guides and Scouts of India, Indian National Youth Organization, National Council of YMCA’s of India, Service Civil-Youth Volunteers of India, Student Christian Movement of India, Student Federation of India, The Bharat Scouts and Guides, Tibetan Youth Congress, United Nations Youth Organization of India, and Young Catholic Students of India. National women’s organizations include All India Women’s Conference, Women’s Equal Rights Group, and Women’s Protection League.

There are a wide variety of international organizations with chapters in India, including Christian Children’s Fund, Defence for Children International, Habitat for Humanity, the Red Cross, Amnesty International, Kiwanis, and Lion’s Clubs.

## 47 TOURISM, TRAVEL, AND RECREATION

The national Department of Tourism maintains tourist information offices at home and abroad. It has constructed many facilities for viewing wildlife in forest regions (by minibus, boat, or elephant) and operates tourist lodges in wildlife sanctuaries. The principal tourist attractions are India’s distinctive music, dance, theater, festivals, and cuisines; the great cities of Calcutta, Mumbai (formerly Bombay), and Madras; and such monuments as the Red Fort and Jama Masjid mosque in Delhi, the Taj Mahal at Agra, and the Amber Palace in Jaipur. Tourists and pilgrims also flock to the sacred Ganges River, the Ajanta temple caves, the temple at Bodhgaya where the Buddha is said to have achieved enlightenment, and many other ancient temples and tombs throughout the country. In general, all visitors must have a

valid passport and an entry, transit, or tourist visa. Inoculation against cholera is recommended.

The big-game hunting for which India was once famous is now banned, but excellent fishing is available, and there are many golf courses. Cricket, field hockey, polo, football (soccer), volleyball, and basketball are all popular, as are pony-trekking in the hill stations and skiing in northern India.

All major cities have comfortable Western-style hotels that cater to tourists; in 1999 there were 72,114 hotel rooms with 144,228 beds and a 50% occupancy rate. In 2000, tourist arrivals numbered 2,641,157, with Europe being the most important generating region of tourists to India. Tourist receipts totaled \$3.1 billion.

As of 1999, the US government estimated the cost of staying in New Delhi at \$260 per day. Daily expenses were estimated at \$268 in Calcutta, \$257 in Mumbai (formerly Bombay), and \$215 in Bangalore.

## 48 FAMOUS INDIANS

Siddhartha Gautama was (624–544 BC according to Sinhalese tradition; 563?–483? BC according to most modern scholars) later known as the Buddha (“the enlightened one”). Born in what is now Nepal, he spent much of his life in eastern Uttar Pradesh and Bihar, propounding the philosophical doctrines that were later to become Buddhism. Contemporary with the Buddha was Vardhamana (599?–527 BC), also known as Mahavira (“great hero”), a saintly thinker of Bihar from whose teachings evolved Jainism. Some of the noteworthy religious and political leaders were Chandragupta (r.321?–297? BC), founder of the Maurya Dynasty; Asoka (r.273–232 BC), who made Buddhism the religion of his empire; Chandragupta II (r. AD 375?–413), whose era marked a high point of Hindu art and literature; Shivaji (1627?–80), a hero of much Hindu folklore; Nanak (1469–1539), whose teachings are the basis of Sikhism; and Govind Singh (1666–1708), the guru who gave Sikhism its definitive form. Akbar (1542–1605) greatly expanded the Mughal Empire, which reached its height under Shah Jahan (1592–1666), builder of the Taj Mahal, and his son, the fanatical emperor Aurangzeb (1618–1707).

Sanskrit grammarian Panini (5th?–4th? cents. BC), wrote the first book on scientific linguistics. The Bengali educator and reformer Rammohan Roy (1772–1833) has been called “the father of modern India.” Swami Vivekananda (1863–1902), founder of the nonsectarian Ramakrishna Mission and a great traveler both in India and abroad, did much to explain the Hindu philosophy to the world and to India as well. Sarvepalli Radhakrishnan (1888–1975), a leading 20th-century Hindu scholar and philosopher, also served as president of India from 1962 to 1967. Another revered religious philosopher was Meher Baba (1894–1969). The rising position of India in science and industry is well exemplified by Jamshedji Nusserwanji Tata (1822–1904), founder of the nation’s first modern iron and steel works as well as many other key industries; the physicist Jagadis Chandra Bose (1858–1937), noted for his research in plant life; Srinivasa Ramanujan (1887–1919), an amazingly original, although largely self-taught, mathematician; Chandrasekhara Venkata Raman (1888–1970), who was awarded the 1930 Nobel Prize for research in physics; Chandrasekhara Subramanyam (1910–1995), also a Nobel Prize laureate in physics, and Vikram A. Sarabhai (1919–71), the founder of the Indian space program. Mother Teresa (Agnes Gonxha Bojaxhiu, 1910–97, in what is now Yugoslavia) won the Nobel Peace Prize in 1979 for her 30 years of work among Calcutta’s poor.

In modern times no Indian so completely captured the Indian masses and had such a deep spiritual effect on so many throughout the world as Mohandas Karamchand Gandhi (1869–1948). Reverently referred to by millions of Indians as the Mahatma (“the great-souled one”), Gandhi is considered the

greatest Indian since the Buddha. His unifying ability and his unusual methods of nonviolent resistance contributed materially to the liberation of India in 1947. A leading disciple of the Mahatma, Vinayak (“Vinoba”) Narahari Bhawe (1895–1982), was an agrarian reformer who persuaded wealthy landowners to give about 600,000 hectares (1,500,000 acres) of tillable land to India’s poor.

Gandhi’s political heir, Jawaharlal Nehru (1889–1964), had a hold on the Indian people almost equal to that of the Mahatma. Affectionately known as Chacha (Uncle) Nehru, he steered India through its first 17 years of independence and played a key role in the independence struggle. Indira Gandhi (1917–84), the daughter of Nehru and prime minister from 1966 to 1977 and again from 1980 to 1984, continued her father’s work in modernizing India and played an important role among the leaders of nonaligned nations. Her son Rajiv (1944–91) succeeded her as prime minister and, in the 1985 election, achieved for himself and his party the largest parliamentary victory since India became independent.

A classical Sanskrit writer in Indian history was the poet and playwright Kalidasa (fl. 5th cent. AD), whose best-known work is *Shakuntala*. In modern times, Rabindranath Tagore (1861–1941), the great Bengali humanist, influenced Indian thought in his many songs and poems. Tagore received the Nobel Prize in literature in 1913 and through his lifetime wrote more than 50 dramas and about 150 books of verse, fiction, and philosophy. Another Bengali writer highly esteemed was the novelist Bankim Chandra Chatterjee (1838–94). Tagore and Chatterjee are the authors, respectively, of India’s national anthem and national song. The novel in English is a thriving genre; notable modern practitioners include Rasipuram Krishnaswamy Narayan (1906–2001), Bhabani Bhattacharya (1906–88), and Raja Rao (b.1909) and Khushwaut Singh. Influential poets of the last two centuries include the Bengalis Iswar Chandra Gupta (1812–59) and Sarojini Naidu (1879–1949), known as “the nightingale of India,” a close associate of Gandhi and a political leader in her own right.

Modern interpreters of the rich Indian musical tradition include the composer and performer Ravi Shankar (b.1920) and the performer and educator Ali Akbar Khan (b.1922). Zubin Mehta (b.1936) is an orchestral conductor of international renown. Uday Shankar (1900?–1977), a dancer and scholar, did much to stimulate Western interest in Indian dance. Tanjore Balasaraswati (1919?–84) won renown as a classical dancer and teacher. Preeminent in the Indian cinema is the director Satyajit Ray (1921–1992).

## 49 DEPENDENCIES

### Andaman and Nicobar Islands

The Andaman and Nicobar Islands are two groups of islands in the Indian Ocean, extending approximately 970 km (600 mi) N–S and lying about 640 km (400 mi) W of both the Tenasserim coast of Myanmar and peninsular Thailand. Their total area is 8,293 sq km (3,202 sq mi); their population was estimated to exceed 188,000 in the mid-1990s. These islands together form a union territory with its capital at Port Blair. The legal system is under the jurisdiction of the high court of Calcutta.

The Andaman Islands extend more than 354 km (220 mi) between 10° and 14°N and 92°12′ and 94°17′ E. Of the 204 islands in the group, the three largest are North, Middle, and South Andaman; since these are separated only by narrow inlets, they are often referred to together as Great Andaman. Little Andaman lies to the south.

The Nicobars extend south from the Andamans between 10° and 6°N and 92°43′ and 93°57′ E. Of the 19 islands, Car Nicobar, 121 km (75 mi) S of Little Andaman, holds more than

half the total population; the largest, Great Nicobar, 146 km (91 mi) NW of Sumatra, is sparsely populated.

The Andamans were occupied by the British in 1858, the Nicobars in 1869; sporadic settlements by British, Danish, and other groups were known previously. During World War II (1939–45), the islands were occupied by Japanese forces. They became a union territory in 1956. That same year, the Andaman and Nicobar Islands (Protection of Aboriginal Tribes) Act came into force; this act, designed to protect the primitive tribes that live in the islands, prohibited outsiders from carrying on trade or industry in the islands without a special license. Six different tribes live in the Andaman and Nicobar Islands, the largest being the Nicobarese. There are lesser numbers of Andamanese, Onges, Jarawas, Sentinalese, and Shompens in the dependency. Access to tribal areas is prohibited.

Agriculture is the mainstay of the economy. The principal crops are rice and coconuts; some sugarcane, fruits, and vegetables are also grown. There is little industry other than a sawmill and plywood and match factories, but the government is making plans to promote tourism in the islands. These plans include the construction of a 1,000-bed hotel, a casino, and duty-free shopping facilities in Port Blair.

### Lakshadweep

The union territory of Lakshadweep consists of the Laccadive, Minicoy, and Amindivi Islands, a scattered group of small coral atolls and reefs in the Arabian Sea between 10° and 13°N and 71°43' and 73°43' E and about 320 km (200 mi) W of Kerala state. Their total area is about 32 sq km (12 sq mi). Minicoy, southernmost of the islands, is the largest.

In the mid-1990s, the population of Lakshadweep was estimated to exceed 40,000. The inhabitants of the Laccadives and Amindivis are Malayalam-speaking Muslims; those on Minicoy are also Muslim, but speak a language similar to Sinhalese. The islanders are skilled fishermen and trade their marine products and island-processed coir in the Malabar ports of Kerala. The main cottage industry is coir spinning. Politically, these islands were under the control of the state of Madras until 1956. The present territorial capital is at Kavaratti. Judicial affairs are under the jurisdiction of the high court of Kerala.

# INDONESIA

Republic of Indonesia  
*Republik Indonesia*

**CAPITAL:** Jakarta

**FLAG:** The national flag, adopted in 1949, consists of a red horizontal stripe above a white stripe.

**ANTHEM:** *Indonesia Raya (Great Indonesia)*.

**MONETARY UNIT:** The rupiah (Rp) consists of 100 sen. There are coins of 1, 2, 5, 10, 25, 50, and 100 rupiahs, and notes of 100, 500, 1,000, 5,000, and 10,000 rupiahs. Rp1 = \$0.0001149 (or \$1 = Rp8,700) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is standard.

**HOLIDAYS:** New Year's Day, 1 January; Independence Day, 17 August; Christmas, 25 December. Movable religious holidays include the Prophet's Birthday, Ascension of Muhammad, Good Friday, Ascension Day of Jesus Christ, the end of Ramadan, 'Id al-Fitr, 'Id al-'Adha', and the 1st of Muharram (Muslim New Year).

**TIME:** Western, 7 PM = noon GMT; Central, 8 PM = noon GMT; Eastern, 9 PM = noon GMT.

---

## **<sup>1</sup>LOCATION, SIZE, AND EXTENT**

The Republic of Indonesia consists of five large islands and 13,677 smaller islands (about 6,000 of which are inhabited) forming an arc between Asia and Australia. With a total area of 1,919,440 sq km (741,100 sq mi), Indonesia is the fourth-largest Asian country, after China, India, and Saudi Arabia. Comparatively, the area occupied by Indonesia is slightly less than three times the size of the state of Texas. It extends 5,271 km (3,275 mi) E-W and 2,210 km (1,373 mi) N-S. The five principal islands are Sumatra; Java; Borneo, of which the 72% belonging to Indonesia is known as Kalimantan; Sulawesi, formerly called Celebes; and Irian Jaya (West Irian), the western portion of the island of New Guinea. Indonesia has land boundaries with Malaysia (on Borneo), Papua New Guinea (on New Guinea), and East Timor (on Timor). It is bounded on the N by the South China Sea, on the N and E by the Pacific Ocean, and on the S and W by the Indian Ocean. Indonesia's total land boundary length is 2,830 km (1,758 mi). Its coastline is 54,716 km (33,999 mi).

Indonesia's capital city, Jakarta, is located on the island of Java.

## **<sup>2</sup>TOPOGRAPHY**

The Indonesian archipelago consists of three main regions. One of the regions consists of Sumatra, Java, Kalimantan, and the islands that lie between them, which stand on the Sunda shelf, where the ocean depths are never more than 210 m (700 ft). Another region consists of Irian Jaya and the Aru Isles, which stand on the Sahul shelf, projecting northward from the north coast of Australia at similar depths. Between these two shelves is the remaining region, consisting of the Lesser Sunda Islands, the Maluku Islands (Moluccas), and Sulawesi, which are surrounded by seas with depths that reach 4,570 m (15,000 ft). The large islands have central mountain ranges rising from more or less extensive lowlands and coastal plains. Many inactive and scores of active volcanoes dot the islands, accounting for the predominantly rich volcanic soil that is carried down by the rivers to the plains and lowlands; there are over 100 volcanoes. Peaks

rise to 3,650 m (12,000 ft) in Java and Sumatra. Java, Bali, and Lombok have extensive lowland plains and gently sloping cultivable mountainsides. Extensive swamp forests and not very fertile hill country are found in Kalimantan. Sumatra's eastern coastline is bordered by morasses, floodplains, and alluvial terraces suitable for cultivation farther inland. Mountainous areas predominate in Sulawesi.

## **<sup>3</sup>CLIMATE**

Straddling the equator, Indonesia has a tropical climate characterized by heavy rainfall, high humidity, high temperature, and low winds. The wet season is from November to March, the dry season from April to October. Rainfall in lowland areas averages 180–320 cm (70–125 in) annually, increasing with elevation to an average of 610 cm (240 in) in some mountain areas. In the lowlands of Sumatra and Kalimantan, the rainfall range is 305–370 cm (120–145 in); the amount diminishes southward, closer to the northwest Australian desert. Average humidity is 82%.

Altitude rather than season affects the temperature in Indonesia. At sea level, the mean annual temperature is about 25–27°C (77–81°F). There is slight daily variation in temperature, with the greatest variation at inland points and at higher levels. The mean annual temperature at Jakarta is 26°C (79°F); average annual rainfall is about 200 cm (79 in).

## **<sup>4</sup>FLORA AND FAUNA**

The plant life of the archipelago reflects a mingling of Asiatic and Australian forms with endemic ones. Vegetation ranges from that of the tropical rain forest of the northern lowlands and the seasonal forests of the southern lowlands, through vegetation of the less luxuriant hill forests and mountain forests, to subalpine shrub vegetation. The bridge between Asia and Australia formed by the archipelago is reflected in the varieties of animal life. The fauna of Sumatra, Kalimantan, and Java is similar to that of Peninsular Malaysia, but each island has its peculiar types. The orangutan is found in Sumatra and Kalimantan but not in Java, the siamang only in Sumatra, the proboscis monkey only in

Kalimantan, the elephant and tapir only in Sumatra, and the wild ox in Java and Kalimantan but not in Sumatra. In Sulawesi, the Maluku Islands, and Timor, Australian types begin to occur; the bandicoot, a marsupial, is found in Timor. All the islands, especially the Malukus, abound in great varieties of bird life, reptiles, and amphibians. The abundant marine life of Indonesia's extensive territorial waters includes a rich variety of corals.

## 5 ENVIRONMENT

An extensive "regreening" and reforestation of barren land, initiated under the 1975–79 national economic development plan, was greatly expanded and integrated with flood control and irrigation programs under the national plans for 1979–84 and 1984–89. From the mid-1980s to the mid-1990s, Indonesia's forests and woodland areas increased by 1.4%. Indonesia also has the world's most extensive mangrove area, which covered over 4 million ha (9.9 million acres) in 1994. Flood-control programs involve river dredging, dike strengthening, construction of new dams, and sandbagging of river banks at critical points. The burning of oil and coal along with the abuse of fertilizers and pesticides results in significant damage to the environment. The nation used 3.1 million tons of fertilizer per year at last estimate. The nation's cities produce about 12.9 million tons of solid waste per year. Indonesia has 2,838 cu km of renewable water resources with 93% used in farming activity and 1% used for industrial purposes. About 90% of all city dwellers and 69% of rural dwellers have access to pure drinking water. Legislation introduced in 1982 endorsed the establishment of penalties for environmental pollution.

Protection of indigenous wildlife is entrusted to the Directorate of Nature Conservation and Wildlife Management. In 1984/85, the government set up three new national parks, part of 19 included in the 1984–89 plan, and four new natural reserves. As of 1986 there were 146 parks and nature reserves, with more in the planning stage; the government's goal was to allocate 10% of the nation's land area to reserves. By 2001 this goal had been met—protected lands totaled 10.1% of Indonesia's total land area. Indonesia's coastal waters are among the world's richest in biodiversity of marine life. As of 2001, 128 of Indonesia's mammal species were endangered and 104 bird species were threatened with extinction. Endangered species in Indonesia include the pig-tailed langur, Javan gibbon, orangutan, tiger, Asian elephant, Malayan tapir, Javan rhinoceros, Sumatran rhinoceros, Sumatran serow, Rothschild's starling, lowland anoa, mountain anoa, Siamese crocodile, false gavia, river terrapin, and four species of turtle (green sea, hawksbill, olive ridley, and leatherback). Buhler's rat and the Javanese lapwing have become extinct.

## 6 POPULATION

The population of Indonesia in 2003 was estimated by the United Nations at 219,883,000, which placed it as the fourth most populous country among the 193 nations of the world. In that year approximately 5% of the population was over 65 years of age, with another 31% of the population under 15 years of age. There were 100 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 1.26%, with the projected population for the year 2015 at 250,428,000. The population density in 2002 was 114 per sq km (295 per sq mi). However, population distribution is uneven, with 60% living in just 7% of the nation's land. Some urban areas have density equivalent to 17,000 per sq km (44,030 per sq mi). The government is continuing efforts to curb population growth.

It was estimated by the Population Reference Bureau that 41% of the population lived in urban areas in 2001. The capital city, Jakarta, had a population of 10,621,000 in that year. Other large cities include Bandung, 3,420,000; Surabaya, 2,507,000; Medan,

1,910,000; Palembang, 1,429,000; Ujung Pandang, 1,064,000; and Semarang, 826,000. According to the United Nations, the urban population growth rate for 2000–2005 was 3.6%.

## 7 MIGRATION

Historically, there has been considerable migration from and to China. Following a decree banning foreigners from participating in retail trade in rural Indonesia, some 120,000 Chinese left Indonesia in 1960 and the first six months of 1961. After the attempted coup of 1965 and the resultant deterioration in relations with China, many more Chinese left Indonesia. Migration between the Netherlands and Indonesia has been greatly reduced since independence; nearly all the 250,000 Netherlands nationals in Indonesia in 1949 returned home.

Resettlement of people from crowded areas to the less populous outer islands is official government policy. The 1979–84 National Economic Plan had as a target the "transmigration" of 500,000 families from Java, Bali, and Madura to Sumatra, Kalimantan, Sulawesi, Maluku Province, and Irian Jaya. Participation was voluntary, and the actual number of families that resettled was about 366,000, containing about 1.5 million people. Since the annual population increase of Java is more than two million, the costly transmigration scheme did little to relieve that island's human congestion, but it had a considerable impact in developing sparsely settled areas. Each family was entitled to 2 ha (5 acres) and was provided with housing, food, seedlings, fertilizers, pesticides, and other supplies that it could use to become productive. Under the 1987–91 plan, 338,433 families were resettled.

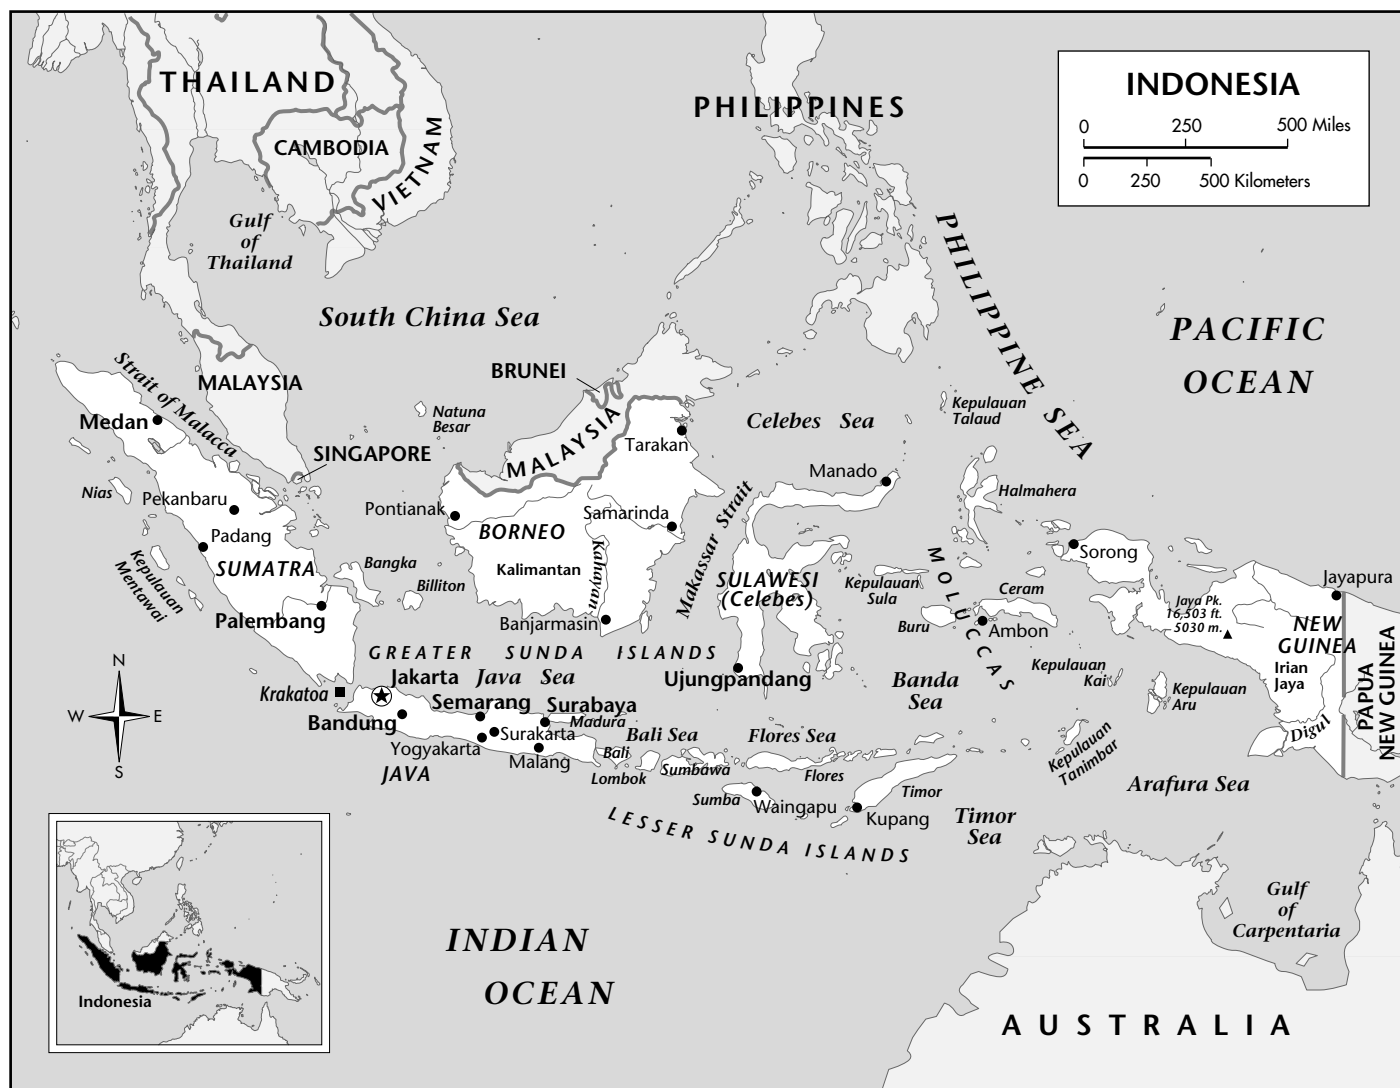

First asylum was granted to over 145,000 Indochinese refugees between 1975 and 1993. Of these refugees, 121,708 were from Vietnam. Of the Vietnam asylum seekers, 112,000 had left for resettlement in the West by March of 1996. A total of 8,400 returned home voluntarily, and 4,300 remained on Galang Island. This remaining group of Vietnamese are also expected to return home. In 1999 the net migration rate for Indonesia was zero.

## 8 ETHNIC GROUPS

The indigenous peoples, ethnologically referred to as Malays or Indonesians, also are found on the neighboring islands of the Philippines, in Peninsular Malaysia, and even as far away as Taiwan and Madagascar. Indonesians are characterized by smallness of stature, light to dark-brown pigmentation, thick, sleek black hair, broad formation of the head, a wide nose, and thick lips. The inhabitants of eastern Indonesia have Negroid features, the result of intermarriage with the Papuans of New Guinea.

The population is officially classified into four main ethnic groups: Melanesians, who constitute the majority; Proto-Austronesians, including the Wajaks and the Irianese on Irian Jaya; Polynesians, including the Ambonese on the Maluku Islands; and Micronesians, found on the tiny islets of Indonesia's eastern borders. The Melanesians are subdivided into the Acehnese of north Sumatra; the Bataks of northeastern Sumatra; the Minangkabaus of west Sumatra; the Sundanese of west Java; the Javanese in central and east Java; the Madurese on the island of Madura; the Balinese on Bali; the Sasaks on the island of Lombok; the Timorese on Timor; the Dayaks in Kalimantan; and the Minahasa, Torajas, Makassarese, and Buginese on Sulawesi. In 1999, 45% of the population was Javanese, 14% Sundanese, 7.5% Madurese, 7.5% coastal Malays, and 26% other.

Ethnic Chinese, the principal minority, were the target of riots in 1974 and 1980. Active mainly in business in the major cities, they are relatively prosperous and widely resented by ethnic Indonesians.

LOCATION: 95°1' to 141°2' E; 6°5' N to 11°S. BOUNDARY LENGTHS: Malaysia, 1,782 kilometers (1,110 miles); Papua New Guinea, 820 kilometers (510 miles); total coastline, 54,716 kilometers (33,996 miles). TERRITORIAL SEA LIMIT: 12 miles.

## <sup>9</sup>LANGUAGES

Bahasa Indonesia, a product of the nationalist movement, is the official language, serving as a common vehicle of communication for the various language groups. Based primarily on Malay and similar to the official language of Malaysia, it also contains many words from other Indonesian languages and dialects, as well as from Dutch, English, Arabic, Sanskrit, and other languages. In 1973, Indonesia and Malaysia adopted similar systems of spelling. Outside of Jakarta, only 10–15% of the population speaks the language in the home, but more than half the population uses it as a secondary language. Use of some 669 local languages persists, including Sundanese, Malay, and the most widely used, Javanese. English and Dutch are widely used in industry and commerce.

## <sup>10</sup>RELIGIONS

According to data made available in 1990, about 87% of the inhabitants were adherents of Islam; 6% were Protestants; 4% were Roman Catholics; 2% were Hindus; 1% are Buddhists, and 1% follow tribal and other religions.

Most Muslims are Sunni, but the Shi'a, Amadhiyah, and Sufi branches are also represented. There are also small groups of

messianic Islam groups including Darul Argam, Jamaah Salamulla, and Negara Islam Indonesia.

Hinduism was the religion of Java for several centuries, but when Islam swept over Indonesia in the 15th century, Hinduism retreated to Bali, and some three million Indonesians on Bali and elsewhere have remained Hindu in religion and culture. The religious faith of the Chinese in Indonesia may be characterized as Christian or Buddhist-Confucianist. The chief Christian communities are found on Ambon and adjacent islands, in northern Sulawesi, in north-central Sumatra, and on Timor and adjacent islands. In central Kalimantan and Irian Jaya, as well as a few other areas, substantial numbers of Indonesians follow animist tribal religions.

Freedom of religion is guaranteed by the constitution for members of five out of six officially recognized religions. Restrictions on some unrecognized religions do exist; however, in 1998 the People's Consultative Assembly adopted a new Human Rights Charter, which provides for citizens' freedom to practice their religion without specifying any particular religions. The government actively supports Islamic religious schools and pays for a number of annual pilgrimages to Mecca.

## 1<sup>1</sup>TRANSPORTATION

Indonesia is politically and economically dependent upon good communications and transportation among the islands. Transportation facilities suffered greatly from destruction and neglect during World War II and immediately thereafter. The revitalized and partially modernized system suffered an additional setback during 1957-58 as a result of the withdrawal of Dutch equipment and personnel.

Of the 342,700 km (121,954 mi) of roadways in 2002, 158,670 km (98,598 mi) were paved. Indonesia had 526,300 passenger cars and 2,419,000 commercial vehicles as of 2001. Railways connect the main cities in Java and parts of Sumatra. The state owns all of the 6,458 km (4,013 mi) of railroad track in service. Air-conditioned cars and express service have been introduced in parts of Java, but no new lines have been built in recent years.

About 21,579 km (13,409 mi) of inland waterways form the most important means of transportation in Kalimantan and in parts of Sumatra. The principal ports of international trade are Tanjungpriok (for Jakarta) and Tanjungperak (for Surabaya) in Java, and Belawan (near Medan) and Padang in Sumatra. Ports with less traffic but capable of handling sizable ships are Cirebon and Semarang in Java; Palembang in Sumatra; Banjarmasin, Balikpapan, and Pontianak in Kalimantan; Tanjungpinang in Bintan; and Ujung Padang in Sulawesi. In 2002, Indonesia's total fleet included 5,668 vessels of 1,000 gross tons or more, totaling 2,969,281 GRT. Regulations were imposed in 1982 requiring that all government imports and exports be shipped in Indonesian vessels, and port charges were substantially altered to benefit Indonesia's national carriers. In 1984, a policy of scrapping old vessels was implemented.

Indonesia had 490 airports in 2001, of which 153 had paved runways. The center of international air traffic is Jakarta's Sukarno-Hatta International Airport. Other principal airports include Halim Perdanak at Jakarta and Polonia at Medan. In 2001, 10,048,000 passengers were carried on scheduled domestic and international flights.

## 1<sup>2</sup>HISTORY

Evidence for the ancient habitation of Indonesia was discovered by the Dutch paleontologist Eugène Dubois in 1891; these fossil remains of so-called Java man (*Pithecanthropus erectus*) date from the Pleistocene period, when Indonesia was linked with the Asian mainland. Indonesia's characteristic racial mixture resulted from at least two waves of invasions from South China by way of the Malay Peninsula and from intermarriage of these Indonesians with later immigrants, especially from India. The important population groups of today trace their descent from the immigrants of the second wave, which occurred around the 2nd or 3rd century BC. They subjugated and absorbed most of the other inhabitants. Indian influences permeated Java and Sumatra from the 1st to the 7th century AD. During this period and extending into the 15th century, local Buddhist and Hindu rulers established a number of powerful kingdoms. Among the most powerful of these was the Buddhist kingdom of Srivijaya, established on Sumatra in the 7th century; it prospered by gaining control of trade through the Strait of Malacca. To the east, in central Java, the Sailendra dynasty established its Buddhist kingdom in the 8th century. Relics of Sailendra rule include the great temple of Borobudur, Asia's largest Buddhist monument, with hundreds of bas-reliefs depicting the life of Buddha. Succeeding the Sailendra dynasty in 856 were followers of the Hindu god Shiva; these Shivaites built the great temple at Prambanan, east of Yogyakarta. Other Hindu kingdoms subsequently extended Indian influence eastward into east Java and Bali. The last of these was the Hindu kingdom of Majapahit, which was at the height of its power during the 13th century,

when Marco Polo visited Java and northern Sumatra. When Majapahit collapsed around 1520, many of its leaders, according to tradition, fled to Bali, the only island in Indonesia that retains Hinduism as the chief religion. Even before Majapahit disintegrated, Muslim missionaries, probably Persian merchants, had begun to win much of the archipelago for Islam. About this time, also, the first Europeans arrived, and the first Chinese settlements were made. The Portuguese captured Malacca (Melaka), on the west coast of the Malay Peninsula, in 1511 and established control over the archipelago.

Dutch ships visited Java in 1596. The Dutch came in increasing numbers and soon drove the Portuguese out of the archipelago (except for the eastern half of the island of Timor), beginning nearly 350 years of colonial rule. The States-General of the Dutch Republic in 1602 incorporated the East Indian spice traders as the United East India Company and granted it a monopoly on shipping and trade and the power to make alliances and contracts with the rulers of the East. By force and diplomacy, the company thus became the supreme ruler of what became known as the Dutch East Indies. However, maladministration and corruption weakened the company after its early years of prosperity, and the Dutch government nullified its charter in 1799 and took over its affairs in 1800. The British East India Company ruled the Indies during the Napoleonic wars, from 1811 to 1816. During this period, Sir Thomas Stamford Raffles became governor of Java. When Dutch rule was restored, the Netherlands government instituted the "culture system" on Java, under which the Javanese, instead of paying a certain proportion of their crops as tax, were required to put at the disposal of the government a share of their land and labor and to grow crops for export under government direction. From a fiscal point of view the system was very successful, yielding millions of guilders for the Netherlands treasury, but this "net profit" or "favorable balance" policy fell under increasing moral attack in the Netherlands and was brought to an end about 1877. Thereafter, private Dutch capital moved into the Indies, but the augmentation of Dutch prosperity at the expense of Indonesian living standards was increasingly resented. With the adoption of what colonial administrators called the "ethical policy" at the beginning of the 20th century, the first steps were taken to give Indonesians participation in government. A central representative body, the Volksraad, was instituted in 1918. At first it had only advisory powers, but in 1927 it was given co-legislative powers. An Indonesian nationalist movement began to develop during those years and steadily gained strength. Although retarded in the 1930s by the world economic depression, which was strongly felt in Indonesia, the movement revived during the Japanese occupation (1942-45) in World War II. A nationalist group under the leadership of Sukarno and Mohammad Hatta proclaimed an independent republic on 17 August 1945, adopted a provisional constitution providing for a strong presidential form of government, formed a revolutionary government, and resisted Dutch reoccupation. After four years of intermittent negotiations, frequent hostilities and UN intervention, the Netherlands agreed to Indonesian demands.

Sukarno became the first president of the new nation in 1949, and Hatta the vice president. Internal difficulties, fostered by a multiplicity of political parties inherited from Dutch colonial days, soon developed, and regional rivalries also threatened the unity of the new nation. Then as now, Java had some two-thirds of the country's population, but the great sources of wealth were found on the other, much less densely settled islands. Those living in the so-called Outer Islands believed too much governmental revenue was being spent in Java and too little elsewhere. After Vice-President Hatta, a Sumatran, resigned in December 1956, many in the Outer Islands felt they had lost their chief and most effective spokesman in Jakarta. Territorial army commanders in Sumatra staged coups and defied the central government; other

rebel movements developed in Sulawesi. The government took measures providing for greater fiscal and administrative decentralization, but discontent remained, and the rebellions were put down by force. Thereafter, Sukarno bypassed parliamentary procedures and pursued an increasingly authoritarian, anti-Western policy of “guided democracy.” In 1959, he decreed a return to the 1945 constitution, providing for a centralized form of government, and consolidated his control. On 27 December 1949, the Dutch recognized the independence of all the former Dutch East Indies except West New Guinea (Irian Jaya) as the Republic of the United States of Indonesia. A few months later, on 17 August 1950, the federal system was rejected and a unitary state, the Republic of Indonesia, was established under a new constitution. West New Guinea remained under Dutch control until October 1962, when the Netherlands transferred the territory to the United Nations Temporary Executive Administration (UNTEA). On 1 May 1963, Indonesia took complete possession of the disputed territory as the province of Irian Barat (West Irian); the province was renamed Irian Jaya in 1973. Indonesia, which aimed to acquire Sarawak and Sabah (which are on the island of Borneo with Kalimantan), opposed the formation of the Federation of Malaysia in September 1963 and announced a “crush Malaysia” policy. This policy was implemented by guerrilla raids into Malaysian territory that continued until August 1966, when a formal treaty was concluded between the two countries.

Communist agitation within the country and secessionist uprisings in central and eastern Java came to a head in the 30th of September Movement under the direction of Lt. Col. Untung. Sukarno, whose foreign policy had turned increasingly toward the Communist Chinese, may have had advance knowledge of the Communist-led coup attempt on 30 September 1965, which was directed against Indonesia’s top military men; the coup was crushed immediately by the army, however, and in the ensuing anti-Communist purges more than 100,000 persons (mostly Indonesian Chinese) lost their lives and another 700,000 were arrested. By mid-October, the army, under the command of Gen. Suharto, was in virtual control of the country. On 12 March 1966, following nearly three weeks of student riots, President Sukarno transferred to Suharto the authority to take, in the president’s name, “all measures required for the safekeeping and stability of the government administration.” In March 1967, the People’s Consultative Assembly (Majelis Permusyawaratan Rakyat—MPR) voted unanimously to withdraw all Sukarno’s governmental power and appointed Gen. Suharto acting president. One year later, it conferred full presidential powers on Suharto, and he was sworn in as president for a five-year term. The Congress also agreed to postpone the general elections due in 1968 until 1971. Sukarno died in June 1970. On 3 July 1971, national and regional elections were held for the majority of seats in all legislative bodies. The Joint Secretariat of Functional Groups (Sekber Golongan Karya—Golkar), a mass political front backed by Suharto, gained 60% of the popular vote and emerged in control of both the House of Representatives (DPR) and the MPR.

### Suharto Gains Control

In March 1973, the MPR elected Suharto to a second five-year term. Thus Suharto, with key backing from the military, began a long period of dominance over Indonesian politics. Under Suharto’s “New Order,” Indonesia turned to the West and began following a conservative economic course stressing capital development and foreign investment. In foreign affairs, Suharto’s government achieved vastly improved ties with the United States, Japan, and Western Europe while maintaining links with the USSR.

On 7 December 1975, following Portugal’s withdrawal from East Timor, a power struggle developed among various political

groups, including the Revolutionary Front for an Independent East Timor (Frente Revolucionário de Este Timor Independente—Fretilin). The left-wing independence movement achieved military dominance forcing the Indonesian government to send troops into the former Portuguese colony and assume full control of the territory. On 17 July 1976, the Suharto government incorporated the territory as an Indonesian Province. This action was neither recognized by the UN, which called on Indonesia to withdraw and allow the Timorese the right to self-determination, nor accepted by Fretilin. Discontent with the Suharto regime mounted after the elections of 1977, in which Suharto’s Golkar Party gained an overwhelming majority. The government acknowledged holding 31,000 political prisoners; according to Amnesty International, the total was closer to 100,000. Student riots and criticism of government repression resulted in further government measures: political activity was suspended, and leading newspapers were temporarily closed. Suharto was elected by the MPR to a third five-year term in 1978; during late 1977 and 1978, some 16,000 political prisoners were released, and the remainder of those detained in 1965 were released by the end of 1979. Golkar made further gains in the 1982 elections, and Suharto was elected for a fourth five-year term in March 1983.

To strengthen the government in the face of rising Muslim militancy, Suharto began to reestablish Sukarno as a national hero eight years after his death. Suharto called for greater loyalty by all political groups to the Pancasila (“five principles”) framed by Sukarno in 1945. The credo encompassed belief in the one supreme being, humanitarianism, national unity, consensus democracy, and social justice. Muslim groups strongly objected to the new government program and organized demonstrations that took place in 1984 and 1985. The war against Fretilin continued into the 1980s, with reports of massacres by government troops and severe economic hardship among the Timorese. Negotiations with Portugal, still considered responsible for decolonization by the UN, began in July 1983. In Irian Jaya, the Organization for a Free Papua (Organisasi Papua Merdeka—OPM), which desires unification with Papua New Guinea and has been active since the early 1960s, increased its militant activities in 1986. The Indonesian Army (ABRI) continued to play a dual military and socioeconomic function, and this role was supported by legislation in 1988. Golkar made further gains in the 1987 elections, and Suharto was again reelected for a fifth five-year term in March 1988. During disagreements over nomination procedures for the vice presidency ABRI’s influence was eroded.

Golkar sought to create national unity through its resettlement policies. From 1969–92, the Transmigration Program, a policy aimed redistributing population in Indonesia for political purposes and for demographic reasons resulted in almost 1,488,000 families moved from the Inner Islands to the Outer Islands. The Transmigration Program suffered from land disputes with local residents and environmental concerns over deforestation. The program alienated local populations and fueled ethnic conflict throughout the country. In Irian Jaya, the Free Papua Movement (OPM), attempted to sabotage the government’s program that was turning the indigenous Melanesian majority into a minority. Indonesian troops attempting to capture Melanesian separatists would cross the border into Papua New Guinea. Indonesia and Papua New Guinea agreed to provide greater cooperation on security and trade issues and the leader of OPM, Melkianus Salossa, was eventually arrested in Papua New Guinea and deported to Indonesia and sentenced to life in prison in 1991. In 1989, tension from land disputes in Java and the Outer Islands produced social unrest that resulted in clashes between villagers and the armed forces. In 1990 an armed rebellion in northern Sumatra at Aceh arose over hostility toward government exploitation of mineral resources and its transmigration program.

The government squashed the rebellion with a massive display of force.

Political openness was increasingly espoused during 1990–91 by political and labor organizations. In 1990 a group of prominent Indonesians publicly demanded that Suharto retire from the presidency at the end of his current term; in 1991 labor unrest increased with a rash of strikes, which the army was called in to quell. Government efforts to raise funds through a state lottery were opposed and finally forbidden on religious grounds when the country's highest Islamic authority declared the lottery "haram" or forbidden.

On 12 November 1991, during a funeral for a young Timorese killed in demonstrations against Indonesia's rule of East Timor, soldiers opened fire on the defenseless mourners provoking worldwide condemnation. Although the government took unprecedented steps to punish those involved, western governments threatened to suspend aid, and demands were made linking aid to human rights issues. The Netherlands' demand linking its aid to improvements in human rights was rejected when Suharto refused Dutch economic aid on 25 March 1992. In the aftermath of these events Suharto spoke at the Nonaligned Movement summit in Jakarta and to the UN General Assembly suggesting that developing nations needed to take a more prominent role in opposing North-South economic inequality. Suharto's challenge received a cool reception from Western nations, but it clearly signaled a reassessment of Indonesia's future international presence. In early December 1992 government forces captured Jose Alexandre (Xanana) Gusmao, leader of the Fretilin, who was hiding in Dili, in East Timor. On 21 May 1993 he was sentenced to life imprisonment. In late 1992, tensions between Muslims and Christians increased to the point of violence and vandalism of churches and mosques. Suharto requested that religious tolerance be practiced. By 1993 US policy toward Indonesia shifted toward criticism of Indonesia's rule in East Timor, and a threat to revoke trade privileges pursuant to Indonesia's treatment of the largest independent trade union, the SBSI (Indonesian Prosperous Labor Union). Adding further scrutiny to Indonesia's tarnished international image was a UN resolution on Indonesia's human rights violations placing the country on a rights "watch" list in 1993.

Although its total share of votes declined, Golkar won the 1992 elections, securing 282 of the 400 elective seats. In March 1993, Suharto was elected to a sixth term as president. Try Sutrisno, the commander in chief of ABRI, was chosen as vice president. Despite Golkar's victory, the country continued to experience economic and political difficulties. A major scandal occurred in March 1993 with the sale of \$5 million in fake shares on the Jakarta Stock Exchange (JSE). In January 1994 President Suharto inaugurated 12 electric power plants with combined installed capacity of more than 2,000 MW. Violent labor unrest broke out in Medan in April 1994 with the mysterious death of a union activist. Ethnic Chinese, who are only about 3% of the population of Indonesia, were the target of demonstrators; one Chinese factory manager was killed. The success of the Chinese is widely envied and they are accused of exploiting the workers. On 21 June 1994 the government closed *Tempo* and two other publications by revoking publishing licenses. *Tempo* was accused of violating the journalistic code of ethics and pitting one person against another to the point where it affected national security based on its coverage of a controversial purchase of 39 warships from the former East German navy. Other publications were accused of more technical infractions including the failure to comply with registration procedures and publishing political and general news in spite of license restrictions limiting a popular tabloid's coverage to detective stories and crime stories.

Violent outbreaks, clashes, and riots increased in Indonesia from 1995–97. Riots between Catholics and Muslims broke out

in East Timor in September 1995, leaving Dili's central marketplace in ashes. This was before Timor's Roman Catholic bishop, Carlos Filipe Ximenes Belo, and pro-independence advocate José Ramos-Horta shared the Nobel Peace Prize in 1996. Many incidents of rural unrest, including land disputes and ethnic strife, continued in 1995–96. The campaign for the 29 May 1997 elections was an unusually violent one, dubbed the "festival of democracy," as voters and demonstrators brought rocks, bricks, knives, machetes, and even snakes to the campaign. There was a ban on parades of trucks, cars, and motorcycles. This followed the uproar resulting from the ouster of Megawati Sukarnoputri as the Indonesian Democratic Party chairperson in June 1996. Her political involvement was seen as a rallying point for democratic change. Golkar took 74% of the vote in elections that were seen to be marked by fraud and over 200 people were killed during the campaign. The Muslim-oriented United Development Party (PPP) obtained 22%, and 3% went to the PDI.

In other violence, hundreds of lives were lost in a full-scale ethnic war in Kalimantan, as clashes between the Dayaks, the indigenous people of the area, and Muslim settlers from the island of Madura, broke out in December 1996. The fighting led to Malaysia closing part of its border with Indonesia in February 1997. In 1997, the country experienced the dual effect of increased ethnic conflict and economic decline. These twin forces were the harbinger for the decline of Golkar and the departure of Suharto from Indonesian politics. In the May 1997 legislative elections, Golkar managed to allegedly secure 74.3% of the popular vote, amid massive violence that killed over one hundred political activists. Violence continued after the elections and was worsened by the Asian economic crisis. After severe devaluation of the rupiah in August and October of 1997, Suharto accepted an International Monetary Fund (IMF) loan package but failed to carry out IMF-imposed conditions for economic reform. By December, news of Suharto's worsening physical health also cast doubt on his ability to see Indonesia through a worsening economic and political situation.

After Suharto won an unopposed presidential election in March 1998, student protests swept Jakarta and ethnic tensions also swelled as Chinese merchants were attacked. In East Timor, José Ramos-Horta urged the government to agree to a cease-fire and cooperation with the UN to determine the ultimate governance structure for the country. On 21 May 1998, Suharto resigned as president, after hundreds of people were killed, looting swept through the capital, and thousands of foreigners living or working in Indonesia were evacuated in months of unrest. B. J. Habibie, the former vice president, was sworn in as president. Upon assuming the presidency, he adopted a conciliatory posture toward defusing the East Timor crisis by stating that East Timor may be given "special status" with increased autonomy within Indonesia. In August 1998, Portugal and Indonesia met to discuss the future of the province. After significant pressure from the United Nations, Australia, and Portugal, Habibie agreed on 27 January 1999 to hold a referendum for the province. Despite widespread violence instigated by the pro-Indonesia armed militia, 98% of voters cast their ballots on 30 August, with 78.5% in favor of independence. This was followed by a rampage by pro-Indonesia forces who looted and burned the entire province creating a major humanitarian situation and refugee crisis. With the aid of Australian troops, the United Nations intervened with approximately 8,000 troops to restore order and establish humanitarian programs. Meanwhile, in Irian Jaya and Aceh, the military forces and the national police continued to commit extra-judicial killings in 2000.

B. J. Habibie's political fortunes waned in the aftermath of the UN-sponsored referendum in East Timor. His state of the nation address to the People's Consultative Assembly in October 1999

did not allay the perception that he had not exercised the appropriate leadership in handling domestic and international matters. Pressure on Habibie mounted and he subsequently resigned as a result of a no confidence vote. In 20 October elections in the People's Consultative Assembly, the first free elections in 44 years, Abdurrahman Wahid, the leader of the National Awakening Party and a near-blind Muslim cleric, was pitted against Megawati Sukarnoputri. Megawati's party won the most votes, but rather than negotiate with other politicians to form a coalition, Megawati allowed the more experienced Wahid to become president. Despite protest from her supporters, Megawati asked backers to refrain from violent protest. She became vice president. Wahid worked to curb the influence of the military and promised major reforms in the government.

In July 2001, Wahid declared a state of emergency and ordered parliament dissolved, after months of opposition from legislators over the competence of his administration. On 23 July 2001, legislators in the People's Consultative Assembly voted 591–0 to remove Wahid from the presidency. He had been charged with corruption and incompetence, being accused of embezzling US\$4.1 million in state funds and illegally accepting US\$2 million from the Sultan of Brunei. He was cleared of all charges that May, but the parliament continued to insist upon impeachment proceedings based on dissatisfaction with his administration. Megawati was sworn in as president immediately after Wahid's removal.

Megawati, a Muslim who is however identified with her nationalist-secular policies, faced demonstrations upon assuming office from strict Islamic fundamentalists calling for the establishment of Shari'ah law. She also had to face the Aceh independence movement, as more than 1,000 people were killed in the province in 2001, adding to the thousands more that had been killed in the past decade. Megawati expressed support for the United States-led war on terrorism following the 11 September 2001 terror attacks on the World Trade Center and the Pentagon, and she visited the United States the following week.

Following the fall of Suharto, Indonesia experienced a resurgence of Islamic activity. The main extremist Islamist organizations in Indonesia are Darul Islam, the Islamic Defender's Front and Laskar Jihad. Laskar Jihad is the most prominent and organized of Indonesia's radical Islamist organizations, and between 300–400 new members joined within the first month following the 11 September attacks. On 12 October 2002, Indonesia experienced its own terror attack. Two nightclubs in the resort town of Kuta on the island of Bali were bombed, killing over 190 people, the majority young Western tourists. Many of the casualties came from Australia. On 18 October, President Megawati issued an emergency decree to give the government expanded powers to fight terrorism. This act came after international criticism directed at her government for not taking the necessary steps to address the problem of terrorism. Megawati permitted the arrest of Abubakar Bashir, a Muslim cleric who is the spiritual leader of Jemaah Islamiyah. Jemaah Islamiyah was accused of staging the Bali bombings. It has links to the al-Qaeda organization.

Following its independence referendum held in August 1999, East Timor was governed by UNTAET (the United Nations' Transitional Administration in East Timor), and a National Consultative Council. A constituent assembly was elected in September 2001 with the task of writing a constitution for the country. In April 2002 José Alexandre "Xanana" Gusmão was elected president, and on 20 May 2002 East Timor became an independent nation.

In June 2000, 2,500 activists representing 250 tribal groups in Irian Jaya declared the region—which they call West Papua—a sovereign state. The region was granted limited autonomy by parliament in October 2001, but many inhabitants, including

independence rebels, rejected the measure and called for full independence. On 9 December 2002, the government and the separatist Free Aceh Movement (GAM) signed a peace deal aimed at ending over three decades of violence. The accord provides for autonomy and free elections in Aceh; in return the GAM must disarm.

Demonstrators protested price increases on basic necessities such as fuel and electricity in January 2003, commodities that have been rooted in corruption. Megawati, originally seen as a friend of the poor, was urged to resign by some for failing to eliminate corruption. She will stand as a candidate for the 2004 presidential elections.

### 13 GOVERNMENT

The provisional constitution of 17 August 1950 provided for a unitary republic. The president and vice president, "elected in accordance with rules to be laid down by law," were to be inviolable, but cabinet ministers were jointly and individually responsible. The house of representatives was to be a unicameral parliament. Its members were elected by a system of proportional representation for a four-year term, but it might be dissolved earlier by presidential decree. Sukarno and Hatta, the first president and vice president, were elected by parliament; no term of office was stipulated by the constitution. In practice, the government was not truly parliamentary, since President Sukarno played a role far greater than is usual for the head of state in a parliamentary system. He was the great national revolutionary hero, and his popularity with the masses enabled him to exert great influence on government policy. Parliament was not strong enough to hold the president to the role prescribed by the constitution. In 1957, Sukarno adopted a more authoritarian policy of "guided democracy." He further strengthened his powers in 1959 by decreeing a return to the provisional 1945 constitution, which called for a strong president and stressed the philosophy of Pancasila as a national ideology. On 5 March 1960, Sukarno suspended parliament and began to rule by decree. In June, he appointed a new 283-member parliament drawn from 9 political parties and 14 "functional groups." In mid-August, Sukarno named another 326 legislators who, with the 283 members of parliament, were to constitute the Provisional People's Congress. This congress was to meet at least once every five years and to be responsible for drawing up the outlines of national policy and electing the president and vice president. In 1963, the congress elected Sukarno president for life. Following the political upheavals of 1965–66, the army, led by Gen. Suharto, moved to establish a "New Order." In 1967, Sukarno formally relinquished power to Suharto, who had become Indonesia's effective ruler in March 1966. Suharto reorganized the cabinet, making all of its 12 ministers responsible to him. In February 1968, he dismissed 123 members of the People's Consultative Assembly (Majelis Permusyawaratan Rakyat or MPR), an outgrowth of the Provisional People's Congress, and replaced them with his own nominees. In June of that year, following his appointment to a five-year term as president, Suharto formed a new cabinet, with himself as prime minister and defense minister.

On 3 July 1971, general elections—the first since 1955—were held for portions of two reconstituted national bodies, a 460-seat house of representatives (Dewan Perwakilan Rakyat or DPR) and a 920-seat MPR. In 1987, the memberships were increased to 500 and 1,000, respectively. The number of seats in the MPR was later reduced to 700. The People's Consultative Assembly includes the DPR plus 200 indirectly selected members; it meets every five years to elect the president and vice president and to approve broad outlines of national policy and also has yearly meetings to consider constitutional and legislative changes. Legislative responsibility is vested in the DPR, which consists of 462 elected members and 38 members appointed by the president

from the military (Armed Forces of People's Republic of Indonesia, Angkatan Bersenjata Republik Indonesia or ABRI). Under the Suharto government, the MPR acted as a consultative body, setting guidelines for national policy; its principal legislative task was to approve the Broad Outlines of State Policy. In March 1973, the MPR elected President Suharto to a second five-year term; he was reelected to a third term in 1978, a fourth in 1983, a fifth in 1988, a sixth in 1993, and a seventh in 1998. However, Suharto was forced to step down in May 1998 in favor of his vice-president, B. J. Habibie. Habibie sought to decrease the role of the military in Indonesian politics and promised major political and economic reforms. He too was forced to resign after the People's Consultative Assembly questioned his leadership. In a surprise move, the body chose Abdurrahman Wahid as president in October 1999. Wahid, a well respected Muslim cleric, promised democratization and an end to corruption. Ironically, Wahid was eventually removed from office in July 2001, for corruption and political incompetence. Megawati Sukarnoputri, the daughter of Sukarno, became president. She also took on the perennial problem of corruption, but had to face the issue of international terrorism as well.

In August 2002, the People's Consultative Assembly approved constitutional amendments due to take effect in time for presidential elections in 2004. Seats in parliament will no longer be reserved for the armed forces (currently standing at 38 seats); in return, members of the military will be allowed to vote. The assembly rejected the imposition of Shari'ah for Muslims. After 2004, a second standing body will function as a senate in Indonesia—the Regional Representative Council. But most important, parliament will no longer elect the president; instead, he or she will be directly elected. President Megawati initially opposed the change to direct election, but then accepted it.

#### 14 POLITICAL PARTIES

Until the autumn of 1955, when the first national elections were held, members of the House of Representatives were appointed by the president in consultation with party leaders. Of the 37,785,299 votes cast in the 1955 general election, six parties received more than one million votes each: the Indonesian Nationalist Party (Partai Nasional Indonesia—PNI), 22.3% of the total; the Council of Muslim Organizations (Masjumi), 20.9%; the Orthodox Muslim Scholars (Nahdlatul Ulama—NU), 18.4%; the Indonesian Communist Party (Partai Komunis Indonesia—PKI), 16.4%; the United Muslim Party, 2.9%; and the Christian Party, 2.6%. In all, 28 parties won representation in the 273-member Parliament. Almost all the political parties had socialist aims or tendencies. The PNI, many of whose prominent members were leaders in the prewar nationalist movement, represented a combination of nationalism and socialism. Government officials and employees had originally constituted its backbone, but subsequently it grew powerful among labor and farmer groups as well. The Masjumi was more evenly distributed throughout Indonesia than any other party. Although it contained a large percentage of the small middle class, its principles were markedly socialist, owing to the influence in the party of a religious socialist group. The NU, which broke away from the Masjumi largely because of differences in religious outlook, represented the orthodox but not strictly conservative views of the rural people and religious teachers. The Christian Party was founded by Protestants; a smaller Roman Catholic Party was also formed. On 17 August 1960, Sukarno ordered the dissolution of the Masjumi and socialist parties on the grounds of disloyalty. A month later, on 13 September, political action by all parties was barred.

Early in 1961, notice was given that all political parties were required to apply for permission to function. On 15 April, parties certified to continue in existence included the PKI, PNI, NU, Catholic, Islamic Association, Indonesian, Indonesian Protestant

Christian, Indonesian Islam Sarekat, and the League for Upholding Indonesian Independence. The PKI, which at the height of its power in 1965 had an estimated three million members and was especially strong on Java, was banned by Gen. Suharto in March 1966, by which time more than 100,000 PKI members were estimated to have been killed in riots, assassinations, and purges; many more PKI members were arrested. Since then, the party has operated underground. The Masjumi dissolved in 1960. Under the Suharto government, political opposition in Indonesia had become increasingly quiescent. Prior to the 1971 elections, the government formed a mass organization, known as Golkar (Golongan Karya), as the political vanguard for its "New Order" program. Golkar drew upon elements outside traditional party ranks—the civil service, labor, youth, cooperatives, and other groups—and succeeded in effectively circumventing the parties' ability to play a national role. Prior to the 1971 voting, a government-appointed election committee screened all prospective candidates, eliminating 735 from the initial list of 3,840; only 11 of those eliminated were from Golkar. Candidates were forbidden to criticize the government or to discuss religious issues. In the elections, held on 3 July 1971, Golkar candidates received 63% of the vote, while winning 227 of the 351 contested seats in the House of Representatives. Besides Golkar—which is not formally considered a political party—nine parties took part in the elections, as compared with 28 in 1955. The Orthodox Muslim NU placed second in the balloting, with 58 seats; the moderate Indonesian Muslim Party (Parmusi), an offshoot of the banned Masjumi Party, won 24 seats; and the PNI, Sukarno's former base, won only 20 seats. Four smaller groups—the Muslim Political Federation, the Protestant Christian Party, the Catholic Party, and the Islamic Party—divided the remaining 22 seats. The government subsequently announced that 57 million persons, or over 95% of the electorate, had taken part in the voting. An act of 1975 provided for the fusion of the major political organizations into two parties—the United Development Party (Partai Persatuan Pembangunan—PPP) and the Indonesian Democratic Party (Partai DemoKrasi Indonesia—PDI)—and Golkar. The PPP, Golkar's chief opposition, is a fusion of the NU, Parmusi and other Muslim groups, while the PDI represents the merger of the PNI, the Christian Party, the Roman Catholic Party, and smaller groups. In the third general election, held on 2 May 1977, Golkar won 232 seats in the House of Representatives, against 99 seats for the PPP and 29 seats for the PDI. Golkar made further gains in the elections of 4 May 1982, winning 246 of the 364 contested seats, against 94 for the PPP and 24 for the PDI. Both opposition parties charged that the government had falsified the vote totals. Rioting marred the campaign period, and 35,000 army troops were stationed in Jakarta on election day. In the election of 23 April 1987, Golkar won 292 of the 400 elected seats (73.2%), against 64 for the PPP (16%), and 44 for the PDI (10.8%).

For the 1992 election the campaign rules banned automobile rallies and picture posters of political leaders; large outdoor rallies were discouraged, radio and televised appeals had to be approved in advance by the elections commission, and no campaigning took place in the five days before the elections. In 1992 there were 17 million first-time voters in a population of 108 million registered voters. More than 97 million Indonesians voted, 90% of the registered voters. Golkar won 68% of the popular vote, down by 5% from 1987. The PPP took 17% of the vote. The PDI took 15% of the vote compared to 10.9% in 1987. These results in terms of DPR seats were: Golkar took 281 DPR seats (down 18 seats from 1987); PPP took 63 seats (down 2 seats from 1987); and the PDI took 56 seats (an increase of 16 seats).

The most violent election campaign in recent years was in 1997 as the ruling Golkar party took 74% of the vote. The 29 May 1997 elections were marked by fraud. More than 200

people were killed in the campaign, which banned motorcades. The PPP took 22% of the vote, and the PDI, 3%. The 7 June 1999 elections resulted in a victory for Megawati Sukarnoputri's PDI-P (or Indonesia Democracy Party–Struggle); however, she relinquished the presidency in favor of Abdurrahman Wahid. The PDI-P took 37.4% of the vote, Golkar took 20.9% of the vote, Wahid's National Awakening Party (PKB) took 17.4% of the vote, and the PPP took 10.7%. Megawati became president on the removal of Wahid in July 2001. The next elections are due to be held in 2004.

## 15 LOCAL GOVERNMENT

The structure and organization of local governments follow the pattern of national government. Indonesia is divided into 27 provinces. There are three special territories, namely the capital city of Jakarta, the special territory of Yogyakarta, and the special territory of Aceh. Each province is administered by a governor chosen by the central government from candidates proposed by the provincial assembly. Governors must be approved by the president. Provinces are divided into 357 districts (*kabupatens*), administered by Bupati appointed in the same manner as governors. Both provincial and district governments are granted autonomy. As of 1993 there were also 56 municipalities (*kotamadyas*) headed by a mayor (*walikota*), 3,625 subdistricts (*kecamatan*) headed by a *camat*, and 67,033 villages. *Desa* are rural villages and *kelurahans* are urban villages. The head of a *desa* is elected by the villages community. The head of a *kelurahan*, a *lurah*, is a civil servant appointed by a *camat* on behalf of the governor. A unique feature of village life is the village council of elders, composed of 9 to 15 prominent village leaders. With the implementation of decentralization on 1 January 2001, the 357 districts have become the key administrative units responsible for providing most government services.

## 16 JUDICIAL SYSTEM

Since 1951, the administration of justice has been unified. Government courts, each with a single judge, have jurisdiction in the first instance in civil and criminal cases. In December 1989, the Islamic Judicature Law gave wider powers to Shari'ah courts. The new law gave Muslim courts jurisdiction over civil matters, including marriage. Muslims and non-Muslims can decide to appear before secular courts. The supreme court is the highest court in the country; its primary function is review of decisions by lower courts. The high court hears appeals in civil cases and reviews criminal cases. Judges are appointed by the central government. In the villages, customary law (*adat*) procedures continue unchanged.

Islamic law (*Shari'ah*) governs many noncriminal matters involving Muslims, including family law, inheritance and divorce; a civil code based on Roman law is applied to Europeans; a combination of codes is applied to other groups such as ethnic Chinese and Indians. Since 1985, the supreme court since 1985 has the power to review ministerial decrees and regulations for legality and conformity to the constitution, but it has yet to use this power. The supreme court does not have the power to review the constitutionality of laws passed by the national assembly. Military and administrative courts also exist below the supreme court level. Codifying these disparate forms of law will require considerable work.

## 17 ARMED FORCES

The Indonesian armed forces consist of an army, a navy, and an air force, totaling 297,000 personnel in 2002 with reserves numbering 400,000. The army of 230,000 includes provincial and special forces. The air force of 27,000 personnel has 90 combat aircraft. The navy, with 40,000 personnel (including naval aviators and marines), has two submarines, 17 frigates, and

58 large patrol craft. Paramilitary forces include a 195,000-man police force and three other armed security forces. Indonesia spent \$1 billion for defense in 1998–99 or 1.3% of GDP. Indonesia provides support to peacekeeping missions in five regions. It faces opposition forces of approximately 2,150.

## 18 INTERNATIONAL COOPERATION

Indonesia was admitted to UN membership on 28 September 1950 and is a member of ESCAP and all the nonregional specialized agencies. Following the seating of Malaysia in the Security Council, Indonesia withdrew from the UN on 7 January 1965; it resumed its seat on 28 September 1966. Indonesia is also a member of the Asian Development Bank, Colombo Plan, G-77, APEC, the WTO, International Tin Council, OPEC, and other intergovernmental organizations. Indonesia became one of the founding members of ASEAN in 1967. In March 1970, a treaty of friendship was signed between Indonesia and Malaysia; the treaty also established the boundary between the two countries in the Strait of Malacca. Indonesia is a signatory to GATT and the Law of the Sea.

## 19 ECONOMY

In colonial times Indonesia depended upon the export of a relatively small range of primary commodities. In the 17th and 18th centuries, the basis of the export-oriented economy was spices. In the 19th century, it shifted to sugar and coffee; in the 20th century, production of oil, tin, timber, and rubber has become fundamental. Despite export gains, however, subsistence agriculture, with rice as the chief crop, remains the principal occupation of a large proportion of Indonesians, and standards of living are low. Indonesia's record of economic growth and diversification is among the most successful in the developing world; but with the onset of the Asian financial crisis in mid-1997, with Indonesia at the epicenter, and the political upheavals and unrest that followed, economic growth has been arrested. The 1998 political unrest and drought that contributed to a recession hit the country hard, severely depressing the economy and halting economic growth.

Indonesia is exceptionally rich in coal, oil, and other industrial raw materials, but industrial development has lagged in relation to the size of the population and the national income. In part, this was a consequence of expropriation policies carried out by Sukarno and of chronic inefficiency and corruption among government officials. After the 1964–66 political crisis, the government of President Suharto took steps to stabilize the economy. Exporters were allowed to keep a larger proportion of their foreign exchange earnings. The government also imposed strict controls on imports, encouraged foreign investment, returned many nationalized assets, ended nonproductive projects, and reduced government control of the economy. The inflation rate, which had been 635% in 1966 and 120% in 1967, fell to 85% in 1968 and further declined to 10% in 1971. National economic planning was used to guide economic growth. Under the 1969–74 plan, the government successfully introduced fiscal and credit restraints, rescheduled internal debts, returned expropriated properties, liberalized foreign investment laws, and actively sought assistance from overseas. Economic growth was set back by the near-collapse of Pertamina, the giant government-backed oil conglomerate, in 1975 and the financing of its \$10.5 billion debt, but accelerated as rising oil prices increased revenues in the late 1970s. The economy was again severely strained in the early 1980s as falling oil prices forced the government to cut back on its spending plans. Legislation requiring majority participation of ethnic Indonesians (*pribumi*) in all enterprises formed since 1974 has also slowed foreign investment. Indonesia's obligation to reduce production of oil, its chief export, in line with OPEC agreements, together with the decline in non-oil export earnings brought about by the worldwide recession, severely strained the

government's resources. In an effort to meet the nation's developmental needs, Suharto was forced to make the unpopular move, long advocated by the IBRD and IMF, of ending subsidies on food and reducing subsidies on kerosene and other fuels. He also announced new trade policies to spur exports in an effort to reverse the nation's worsening economic condition.

In the 1980s policies were designed to reduce restrictions on imports and to encourage foreign investment. In areas of trade, debt, and currency management, Indonesia took a pro-active stance that was internationally acknowledged by increasing foreign investment and endorsement by multilateral organizations. Efforts focused on bureaucratic reform and efficiency, incentives to private investors, and diversification of sources of foreign exchange earnings resulted in steady growth in the manufacturing sector and in industrial exports. Specific structural reforms were deregulation of foreign investment allowing broader ownership rights in export oriented manufacturing sectors; and streamlining of the investment process, including the adjustment of procedural requirements; progressive reduction in tariffs and non-tariff barriers; major banking deregulation that opened the banking sector to foreign investment; privatization of the Jakarta Stock Exchange; the elimination of major subsidies and supports; and increasing participation of the private sector. The basis of recent Indonesian development still consists of smallholders (0.5 ha on average) in a rural-based economy with pockets of industry and large-scale mining and forestry, and a sizeable range of state-owned enterprises.

In 2000, however, the economy showed signs of being on the way to recovery with a stronger-than-expected real GDP growth rate of 4.8%, a budget deficit amounting to only 3.2% of GDP (below the government's target of 4.8%), and a surprisingly low inflation rate of 3.75%. On 4 February 2000, the government, now headed by Abdurrahman Wahid, signed for a second agreement under the Extended Fund Facility (EFF) of the IMF, in this case involving a \$5 billion line of credit. In April 2000, a second agreement was reached with the Paris Club members for the rescheduling another \$5.8 billion of principal owed on official debt. From 1989 to 1993 real GDP growth averaged 6.7%. Restrictive monetary policy and a conservative fiscal stance held inflation to below 10%. Amid efforts to keep the economy from overheating, real growth climbed to 7.3% and 7.5% in 1994 and 1995, respectively, before peaking in 1996 at 7.8%. Inflation was held to single digits, and the official unemployment rate was 3%, although underemployment was estimated at as high as 4%. In nominal terms, per capita income rose above \$1000, and in purchasing parity power (PPP) terms, at least three times the nominal figure. Economic catastrophe struck in mid-1997, fueled by a loss of investor confidence in the region, particularly in the weaker economies, as Hong Kong came under Chinese control in July.

The collapse of currencies began in July in Thailand but spread swiftly to Indonesia. Within a year 75% to 80% of all businesses in Indonesia were technically bankrupt as the rupiah went from about 2,600 to one US dollar in June 1997 to a low of 17,000 to one US dollar in June 1998. GDP growth, which had been 8% in the first quarter of 1997, and 7% in the second quarter, fell to 3% in the third quarter and 2% in the fourth. In November 1997 an international bail-out package was arranged that included a stand-by agreement with the IMF with a \$11.5 billion line of credit, an \$8 billion loan from the World Bank and the Asian Development Bank (ADB), \$5 billion loan from its own reserves, and \$3 billion in US loan guarantees. The extended impact of the crisis can be seen in the figures for 1998, when real GDP fell by over 13%, industrial production was down by 18.24%, and the net outflow of invested capital reached of about \$13.8 billion.

Economic distress erupted in bloody pogrom against resident Chinese in which over 1000 people were killed, dozens of women

raped, over 2,500 shops, including about 40 shopping malls, were looted or destroyed, and the streets were left strewn with more than 1,000 vandalized vehicles. On 19 May, students took over the parliament building, and two days later President Suharto resigned, ending 32 years of autocratic rule. His designated successor was B. J. Habibie, the architect of Indonesia's ambitious shipping and aircraft manufacturing industry. Habibie promised elections, which were held in 1999. In the meantime, in August 1998, a second agreement was concluded with the IMF, in this case for a \$7.4 billion line of credit offered under the terms of its Extended Fund Facility (EFF). The next month, the government reached an agreement with the Paris Club for rescheduling \$4.6 billion of principal owed on official (foreign aid) debts.

The government's official debt situation was being radically altered. Pre-crisis, the government had incurred virtually no domestic debt, borrowing all capital expenditures abroad, primarily from the World Bank and the Asian Development Bank (ADB), and its external debt was at an unproblematic 25% to 27% of GDP. In 1998, total debt leapt to 78% of GDP, but with no domestic borrowing. In 1999, however, domestic borrowing went from \$0 to \$68.7 million, and combined with a record \$75.8 million in foreign loans, government debt reached a peak of 102% of GDP. In 1999 real growth returned, but only at an anemic 0.2% level, as there was a net outflow of investment funds of almost \$10 billion—a net loss of \$2.7 billion in FDI and a net loss of \$7.2 billion in portfolio investment, according to Bank Indonesia figures. The outflow continued, as did rising violence throughout the country around the parliamentary election, and, of particular international concern, before and after the referendum on the independence of East Timor. Economic frustrations doubtless aggravated the conflicts. In February 1999 the government estimated that 27% of the population was living in poverty. Inflation, though less than the 1998 average rate of 58.44%, was still high at 20.46%.

Unfortunately, both internal and external factors soon contrived to slow the momentum of the recovery. In December 2000, Indonesia's February agreement with the IMF-EFF for the \$5 billion follow-on credit went into suspension as IMF staff found themselves unable to complete the program's third review. As both a cause and an effect of calls for his impeachment and removal, President Wahid, through a combination of neglect and defiance, was failing to implement the requirements of the IMF programs. Tensions were increased as thousands of Wahid's Islamic followers vowed to fight to the death his removal from office. It was not until August 2001, after Wahid's removal in July and the installation of Vice President Megawati Soekarnoputri as president, that discussions with the IMF could be reopened, and a new Letter of Intent negotiated under what were now changed circumstances. Megawati's pro-reform, pro-market economic team promised a favorable response in the international economy, but this was cut short, first by the global economic slowdown of 2001, and then the aftershocks of the 11 September 2001 terrorist attacks on the United States. In Indonesia, real growth rates of 5% and 4% in the first two quarters of 2001 fell to 3% and 2%, respectively in the last two quarters, producing an average 3.3% growth for the year. Inflation returned to double digits, at 11.5%, and in February 2002 the government reported that poverty had had an uptick, increasing to 14.5% of the population. The industrial production index after year-on-year increases every quarter in 2000 and for the first three quarters of 2001, fell 6% in the fourth quarter. The net outflow of capital continued, reaching \$9 billion for 2001. Some \$8.3 billion of the net outflow reflected divestment by private direct and portfolio investors, but \$700 million was on the official capital account and reflected delays in the disbursement of adjustment loans due to the political turmoil of the first half of the year.

In the first two quarters of 2002, year-on-year declines in Indonesia's Industrial Production Index worsened, to about 12% and 14%, respectively. Net outflow of private capital continued, although at a reduced rate. More positive signs were an appreciation of the rupiah from 10,500 to one US dollar in December 2001 to 8,800 to one US dollar in May 2002; a spurt of private consumption spending of 10% (yoy) in the last quarter of 2001, which was still a positive 6.4% (yoy) in the second quarter of 2002; and a rise of the Jakarta Stock Exchange Index from 390 to 530. In the second quarter of 2002, the IMF made the decision that the Indonesian budget had been sufficiently reined in for it to extend its financial involvement in Indonesia until the end of 2003 (instead of ending it at the beginning of 2002), which was a necessary prerequisite for further dealings with Paris Club on rescheduling any of the \$40 billion sovereign external owed to the Paris Club members, or for opening of negotiations with the London Club on rescheduling the \$1.3 billion of commercial loans owed to members of that creditors' club. On 12 April 2002, Indonesia concluded its third post-crisis agreement with the Paris Club, rescheduling \$5.4 billion of principal and interest owed. On 6 September 2002 Indonesia reached an agreement with the London Club for the rescheduling of its commercial debt to its members, which involved among its terms an extension of the repayment period to seventeen and a half years. The total debt-to-GDP ratio for the government fell from 90% for 2001 to a more manageable 70% in 2002, and the annual budget deficit was estimated to have fallen to below 2% of GDP, bettering the IMF-set target of 2.5%. Hopes that Indonesia might be safely on its way out of its post-crisis stagflation, even despite the continued global economic malaise, were shattered by the terrorist bombs in Bali on 12 October 2002 aimed at Western tourists vacationing on Kuta Beach. Beyond the death toll of nearly 200, which was not that unusual for the many trouble spots in the country, was the message that tourist enclaves and, perhaps, the industrial enclaves, were no longer safe for foreign visitors and foreign investors. After the Bali bombings, the rupiah depreciated to more than 9,000 to one US dollar and the Jakarta Stock Exchange Index fell back below 400, though by the beginning of 2003 both indicators of investor confidence had returned to near their pre-bombing levels. The World Bank, which had predicted a 3.5% real growth rate for Indonesia in 2002, reduced its prediction to 3.2%. Analysts agreed, however, that a real growth rate of at least 6% would have been necessary to finally bring the economy out of its post-crisis slump. Unfortunately, much depends not on the government's policies, and the real economic advantages that Indonesia continues to enjoy—ample natural resources, a relatively skilled work force, a strategic location, and a large and expanding internal market—but on what happens in the global economy in which it is embedded and over which it has little control.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Indonesia's gross domestic product (GDP) was estimated at \$687 billion. The per capita GDP was estimated at \$3,000. The average inflation rate in 2001 was 11.5%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 17% of GDP, industry 41%, and services 42%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$1.190 billion or about \$6 per capita and accounted for approximately 0.8% of GDP. Worker remittances in 2001 totaled \$1.046 billion. Foreign aid receipts amounted to about \$7 per capita and accounted for approximately 1% of the gross national income (GNI).

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$759. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 5%. Approximately 47% of household consumption was spent on food, 6% on fuel, 5% on health care, and 14% on education. The richest 10% of the population accounted for approximately 26.7% of household consumption and the poorest 10% approximately 4.0%. It was estimated that in 1999 about 27% of the population had incomes below the poverty line.

## 21 LABOR

In 1999, the labor force numbered 99 million people. In that year, 45% were engaged in agriculture, 16% in industry, and 39% in services. Unemployment figures for 2001 stood at 8%, but actual unemployment likely was much higher, and about half of the workforce is underemployed.

The law protects the right to form and join unions to all workers regardless of political affiliation. Ten or more workers can unionize, and thousands of unions have been registered. However, a union can be banned by the government if its foundation goes against the constitution. Sometimes there are clashes between different unions within one workplace. With the exception of civil servants, workers have the right to strike after mandatory mediation. Collective bargaining is utilized, but most contracts do not provide workers with more than the government minimum standards.

Children under age 15 are prohibited from working more than four hours per day, but this limit is exceeded by millions of child laborers. In addition, children are not legally permitted to work in hazardous occupations, but child labor laws are not enforced. There is no national minimum wage. Wages are set by area wage councils who estimate the amount a worker needs to earn to provide for his or her basic needs. In 2002, the minimum wage in Jakarta was \$39 per month. However, many employers do not pay this minimum wage. The 40-hour workweek and a seven to eight-hour day are established by law throughout Indonesia, although these standards are not regularly enforced.

## 22 AGRICULTURE

About 45% of Indonesian workers are engaged in agriculture, which accounts for 17% of GDP in 2001. Some 31 million ha (76.6 million acres) are under cultivation, with 35% to 40% of the cultivated land devoted to the production of export crops. Some 60% of the country's cultivated land is in Java.

There are three main types of farming: smallholder farming (mostly rice), smallholder cash cropping, and about 1,800 large foreign-owned or privately owned estates, the latter two producing export crops. Small-scale farming is usually carried out on modest plots—those in Java average about 0.8–1 ha (2–2.5 acres)—often without benefit of modern tools and methods, good seed, or fertilizer. Although rice, vegetables, and fruit constitute the bulk of the small farmer's crops, about 20% of output is in cash crops for export, the chief of which is rubber. Of the estate-grown crops, rubber, tobacco, sugar, palm oil, hard fiber, coffee, tea, cocoa, and cinchona are the most important. Dutch, United Kingdom, United States, French, and Belgian capital financed estate agriculture in colonial times, with the Dutch share being the largest. Management of Dutch interests was taken over by the Indonesian government in December 1957; in 1964, the 104 UK-operated plantations were confiscated without any compensation, and Indonesian managers were appointed. The following year, the US-operated plantations were expropriated, and all foreign plantations were placed under the control and supervision of the Indonesian government. In 1967, some of the estates seized in 1965, including the US-leased rubber

plantations, were returned, but the majority were retained by the government.

Because the population is rapidly increasing, the government seeks to achieve food self-sufficiency through expansion of arable acreage, improved farm techniques (especially the use of fertilizers and improved seeds), extension of irrigation facilities, and expanded training for farmers. Production of rice, the staple food, has been gradually increasing, and production comes close to meeting domestic requirements. This increase has resulted less from extension of cultivated area through the government's resettlement policy than from expanded use of irrigation, fertilizers, and pesticides and cultivation of high-yielding hybrid rice, especially insect-resistant hybrids. It also reflects the success of the government's "mass guidance" program, which provides technical assistance, easy credit terms, and marketing support through a system of village cooperatives. Additional support was provided by the National Logistics Board, which is responsible for price regulation and the national rice-rationing programs. Due to the rapid growth of the industrial sector, the agricultural contribution to GDP is expected to decline to 11.8% by 2003.

Rice is the primary staple crop; production in 2001 totaled 50,461,000 tons. Other staple crops in 1999 included cassava (15,422,000 tons), corn (9,139,000 tons), and sweet potato (1,928,000 tons). Vegetable production in 2000 included 1,366,410 tons of cabbages, 772,818 tons of shallots, and 454,815 tons of mustard greens. Sugar is the largest commercial crop, with production reaching 26,000,000 tons in 1999. About 1,564,000 tons of rubber were produced in 1999, as compared with about 648,400 in 1964. Faced with the prospect of declining yields, the government began an extensive replanting and rehabilitation program in 1981. In 2001/02, Indonesia was the world's fourth largest producer of coffee (after Brazil, Colombia, and Viet Nam); some 369,600 tons of coffee were grown that year, as compared with 188,900 tons in 1972 and an annual average of 120,400 tons during 1960–65. Indonesia is the world's second-largest producer of palm oil (after Malaysia); 9.1 million tons were produced in 2001/02. Palm kernels (2.68 million tons in 2001/02) and copra (1.36 million tons in 2001/02) are also important export crops.

### 23 ANIMAL HUSBANDRY

In 2001, the livestock population was 11,191,000 head of cattle, 12,456,000 goats, 7,294,000 sheep, 5,867,000 hogs and 430,000 horses. There are also about 2,287,000 buffalo in the country. The production of meat (about 1,742,000 tons in 2001) and cows' milk (505,000 tons) is secondary to the raising of draft animals for agricultural purposes and transportation. The government has established cattle-breeding stations and artificial-insemination centers to improve the stock and has been carrying on research to improve pastures. Technical and other assistance is also offered to chicken and duck farmers in an effort to increase protein supplies. There were an estimated 853.8 million chickens and 29.9 million ducks in 2001, when some 641,000 tons of eggs were produced. Local demand for animal products is constrained by low purchasing power, but increases in consumer income will raise demand for animal protein. Dairy and egg exports totaled \$115.2 million in 2001.

### 24 FISHING

As Indonesia is the world's largest archipelago (13,667 islands), fish is a readily-available source of animal protein for domestic consumption. In 2000, the total catch was 4,140,045 tons, ranking Indonesia sixth in the world. Fishing is more important than statistics indicate, because the catch of many part-time fishermen never enters trade channels. Commercial fishing is confined to a narrow band of inshore waters, especially off northern Java, but other fishing also takes place along the coast, as well as in the rivers, lakes, coastal swamps, artificial ponds,

and flooded rice fields. The government has stocked the inland waters, encouraged cooperatives to provide credit facilities, introduced improved fishing methods, provided for the use of motorized fishing boats and improved tackle, and built or rehabilitated piers. Fish and fish product exports had a value of \$1,584,454,000 in 2000.

### 25 FORESTRY

Forests represent a potentially vast source of wealth in Indonesia. Of the 105 million ha (259 million acres) of forests, nearly three-fourths are in Kalimantan and eastern Indonesia. The more accessible forest areas of Sumatra and Kalimantan furnish the commercially cut timber for domestic consumption and export. Indonesia has over 4,000 species of trees, including 120 types of hardwood suitable for commercial use. Timber estates produce fast growth species such as pine, eucalyptus, albizia, and acacia for the pulp and paper industry. Practically all forestlands belong to the state. In Java, excessive cutting has caused soil erosion, aggravated floods, created water shortages, and damaged some irrigation facilities. Replanting and rehabilitation of the Javanese forests and reforestation in the Outer Islands are promoted as part of the nation's "regreening program." Teak and other tropical hardwoods are the most valuable species, but there is hope of obtaining wood pulp from pine and bamboo and commercial timber from new plantings of fir and pine.

Indonesia is the largest producer of tropical hardwood plywood in the world. Export sales of processed wood in 2001 amounted to \$3.3 billion, representing 9.6% of all Indonesian exports. Production of sawn wood in 2000 totaled 2.4 million cu m (85 million cu ft); plywood, 7.2 million cu m (254 million cu ft); and particleboard, 213,000 cu m (7.5 million cu ft). About two-thirds of the timber output is exported. French, Japanese, US, and Philippine interests have large investments in the timber industry. Indonesia is the world's second largest producer of tropical hardwood logs and lumber, after Malaysia. Due to a hardwood log export ban enacted in 1985 to protect rapidly diminishing forests, Indonesia has exported no logs since then. Prohibitive export taxes imposed in 1990 have all but eliminated tropical hardwood exports, in order to conserve declining forest resources for production and export of higher value items such as plywood. However, an estimated 30 million cu m (1.1 billion cu ft) of illegal logging occurs annually, of which an estimated 10 million cu m (353 million cu ft) is illegally exported.

### 26 MINING

Indonesia was a leading world supplier of oil and gas, which comprised the main engine of growth. In addition, though, Indonesia supplied 30% of the world's tin (10.5% of known reserves), 11% of nickel, 6% of copper, and 5% of gold, and was a leading Southeast Asian producer of cement, bauxite, and nitrogen fertilizer. Mining and cement comprised the country's third-leading industry in 2002, and in 2000, Indonesia also produced hydraulic cement, dolomite, feldspar, granite, gypsum, marble, nitrogen, salt, quartz sand, silica stone, sulfur, and zeolite.

The economic recovery of 2000—GDP grew by 4.8%—was slow, but more broadly based than that of 1999, which was based mainly on consumption. The mining and quarrying sector increased by 2.3% in 2000, having declined by 2.4% in 1999. In 2000, total exports increased by 27.5%, to \$62 billion; the value of exports from the mining sector was \$3 billion—copper ore and coal accounted for 93%, bauxite, dimension stone, nickel ore, and tin were other major export commodities. In 1999, the value of mining exports was 11% of total exports, and the mining industry contributed \$1.5 billion to the economy.

Copper output (content in ore) was 1 million tons, up from 766,027 in 1999 and 529,121 in 1996. The Indonesian Environmental and Natural Resources Non-Governmental

Forum filed a lawsuit against PT Freeport Indonesia Co., the second-largest producer, for environmental mismanagement and misinformation in the Wanagon Basin, next to Freeport's Grasberg Copper Mine in Irian Jaya. In May 2000, a period of excess rainfall caused a slippage of the mine waste stockpile; four employees were unaccounted for. After the accident, the government imposed a restriction on ore processing; the mine was cleared to return to full capacity in December. After completing its first full year of operation, the Batu Hijau copper and gold mine (Sumbawa Island), with reserves of 4 million tons of copper and 332 tons of gold, was to receive a \$1 billion project fund financed through the Japanese, US, and German export banks. Copper production began at Tembagapura, Irian Jaya, in 1974.

Bauxite production was 1.55 million tons in 2000, 1.12 million in 1999, 809,000 in 1997, and 1.4 million tons in 1991. Indonesia possessed large deposits of high-grade bauxite, from mines in Kijang (Bintan Island) and Sumatra. Most of the output was exported to Japan; the remainder, to the US.

Tin mine output in 2000 was 51,629 tons. The chief deposits of tin were in Bangka, Belitung, and Singkep, islands off the east coast of Sumatra. Tin mining has, for several years, faced depleting resources, the decline of tin, community conflicts in several mining sites, and illegal mining and smuggling, the latter resulting in increased compensation to company contractors and high tin output from offshore mining. The existing resources of PT Koba Tin, which produced 11,000 tons of refined tin, had a mine life of eight years. The 65%-state-owned tin producer, PT Tambang Timah, which had a capacity of 60,000 tons per year, was listed on the London and Jakarta stock exchanges. Tambang expected that tin production would decline in 2001 and was exploring opportunities to mine tin in Burma, Cambodia, Malaysia, and Vietnam, and to explore for diamond and gold in Kalimantan and North Sumatra.

Gold mine output was 124,596 kg, up from 86,927 in 1997. Because of political uncertainty and illegal mining, Aurora Gold Ltd., of Australia, the largest gold producer in Indonesia, with annual capacity of 60 tons, decided to sell its 85% share in the Toka Tindung project, North Sulawesi, where it had discovered an indicated and inferred resource of 15.4 million tons of ore averaging 3 grams per ton of gold and 8 grams per ton of silver. Another Aurora prospect, Talawaan, had been heavily contaminated with mercury used by illegal miners. PT Newmont Pacific Nusantara decided to close its Greenfield explorations in Indonesia because of confusion about legal mining regulation and investment policies; it would keep its projects in North Sulawesi and West Nusa Tenggara operating. PT Newmont Minahasa Raya's Minahasa mine, on the northern tip of North Sulawesi, was forced to close several times in 2000 because of a continuing dispute with ex-landowners and a strike by mining contractors. In addition, the local government attempted to shut down the mine because of a dispute dealing with overburden tax compensation; the matter was settled out of court. Because of depletion of ore resources, Newmont Minahasa planned to cease operations at Minahasa in 2003. The company would not develop the nearby Lobongan gold deposit because of excessive illegal mining. Iriana Resources Corp., of Canada, announced that its Mafi gold exploration (Irian Jaya) had begun in 2000; initial assay samples contained 26.7 grams per ton of gold, 445 grams per ton of silver, and 10.4% lead, with possible occurrences of antimony and zinc in the area. Responding to demands of residents of Java and West Kalimantan, the Ministry of Energy and Mineral Resources (MEMR) ordered illegal gold miners to stop using mercury in their gold-processing activities, which had caused mercury levels in West Kalimantan rivers to be 10 times greater than the maximum allowed.

Nickel mine output was 98,200 tons in 2000 and 74,063 in 1998. Nickel was produced in Soroako (North Sulawesi),

Pomalaa (South Sulawesi), and the Maluku and Gebe islands, with some of the largest reserves in the world. Higher nickel prices and security concerns have hindered production. PT Weda Bay Nickel announced that indicated and inferred nickel and cobalt resources in Halmahera Island increased to 202 million tons. The inferred resource of the Santa Monica deposit was estimated to be 75.8 million tons containing 1.38% nickel and 0.12% cobalt, and that of the Big Kahuna deposit was estimated to be 40.4 million tons at a grade of 1.32% nickel and 0.08% cobalt.

Iron ore was found in sizable quantities, but was commercially exploited only in central Java. There were fair to good reserves of gold, silver, iodine, diamond (industrial and gem quality), and phosphate rock, and considerable supplies of limestone, asphalt, bentonite, fireclay, and kaolin powder. Herald Resources Ltd., of Australia, announced the discovery of significant lead and zinc resources in the Dairi area, Bukit Barisan Highland; the exploration concentrated in the Anjing Hitam area, in the southeastern part of the Sopokomil/Bongkaras domal structure, and it was estimated that the deposit contained an indicated resource of 7.5 million tons of lead and zinc at 10.3% lead, 16.7% zinc, and 14 grams per ton of silver and an inferred resource of 2.5 million tons at 6.8% lead and 11.3% zinc. Despite some reserves, no manganese was mined in 1999 and 2000.

Concerns about political uncertainties continued to deter foreign investment, creating an inhospitable environment for investment and operations. Expansion plans were on hold until the economic climate improved. In 1999, the Indonesian parliament passed two laws, to be implemented in 2001—on regional political autonomy and fiscal decentralization—whose impact on investment rules and procedures remained unclear. Mining companies were confused about the connection between the two laws on general mining. The major problem was contradictions between the centralistic 1967 law on mining, and the decentralistic law of 1999. In 2001, the 1967 law would no longer have legal strength to protect mining operations, particularly on new investments. Also, another 1999 law, on forestry, prohibited open-cast mining, which would protect forests in 68% of the area of Irian Jaya potentially available for mining exploration; 58%, in Sumatra; 50%, in Maluku; and 39%, in Sulawesi. Many mining companies postponed their expansion and new investment projects until the government could provide legal protection that was clear and unequivocal. In 2000, mining companies that operated under contracts of work (COWs) spent \$550 million, which was half the amount expended in 1999. In 2000, 30 mining contractors, 14 producing, and 16 exploration companies postponed their investment programs, and 18 COWs were terminated. MEMR and related departments drafted a new mining law/regulation to replace the 1967 law with an updated regulatory framework that recognized the changing role of government, especially with regard to implementation of regional autonomy and fiscal decentralization and further safeguard of the natural environment.

Indonesia's constitution places all natural resources in the soil and waters under the jurisdiction of the state. In 1999, the government increased taxes and royalties that created a less competitive investment environment. Restructuring and privatization of state-owned industries has been very slow, and new investment was still low. As the world's fourth most populous country, Indonesia could become one of the largest steel-consuming countries. However, its volatile political situation and uncertain economic climate hampered development. The state-owned general mining company, PT Aneka Tambang, has gone public on the Jakarta Stock Exchange.

## 27 ENERGY AND POWER

Indonesia ranks among the world's leading petroleum-producing countries. Production in 1990–2000 averaged between 1.3 and 1.4 million barrels per day, up from the 1.33 million barrels produced in 1988. Known reserves in 2002 were put at five billion barrels, and since most of the potential sources have not been surveyed, resources may be much larger. Sumatra, the richest oil area, produces about 70% of Indonesian oil. Kalimantan is the second-leading producer; Java and Madura have a scattering of smaller producing wells. Lesser amounts are also produced in Irian Jaya.

Before 1965, nearly 90% of Indonesia's petroleum was extracted by foreign companies and slightly more than 10% by state-owned companies. In March 1965, the government took over all foreign-owned oil companies, but offered them the option of continuing operations under Indonesian control and supervision. A public-sector enterprise, Pertamina, was set up to represent the government in all matters relating to the petroleum industry. By the mid-1970s, Pertamina had assumed a dominant role in oil exploration and production and in such related fields as petrochemicals, fertilizers, and natural gas. During the 1980s, Pertamina spent \$3 billion per year on high-risk oil development projects, which helped to maintain a 20-year reserve level of oil and a 40-year reserve level of natural gas. In May 1993, reserves estimated at 225 million barrels were discovered (the largest find in Asia in a decade) at the Widuri field. Three major new projects expected to become operational before 2004 are the West Seno field offshore from East Kalimantan (60,000 barrels per day), the Belanak project in West Natuna (100,000 barrels per day), and the Banyu Urip field in Java.

Natural gas production increased rapidly in the 1970s and 1980s, with output totaling 63.4 billion cu m by 1998, as compared with 19.9 billion cu m in 1982. Part of production goes for industrial and domestic use, but large amounts are exported in the form of liquefied natural gas (LNG). Indonesia is the world's largest exporter of LNG; its major customers are Japan, South Korea, and Taiwan.

Power facilities are overtaxed, despite heavy government investment in electrical installations. Total installed capacity in 2001 was 20,822,000 kW, as compared with 10,830,000 kW in 1988. Production in 2000 totaled 87,600 million kWh (up from 2,932 kWh in 1973); of that amount, 81% was from fossil fuels, 14% from hydropower, and 5% from other sources. Electricity consumption in 2000 was 86.1 billion kWh. The nation's first geothermal electric power station was inaugurated in 1974 in West Java, and a 750 MW hydroelectric plant was completed there in 1985. In 1995, P.T. Perusahaan Listrik Negara (PLN), the state-owned electric company, projected that electricity demand will rise by 14% annually, with a generating capacity at 25,000–30,000 million kW needed by 2010.

## 28 INDUSTRY

Indonesia's industrial sector has not fully recovered from the blows of the Asian financial crises in 1997–1998, when the fall of the rupiah, from about 2,600 down to 17,000 to one US dollar, left 75% to 80% of its businesses technically bankrupt. Recovery to pre-crisis levels has been hindered by both internal and external disturbances, particularly after 2001, when the effects of the global slowdown were aggravated by intensifying political violence and uncertainty climaxing in the 12 October 2002 bombings in the Bali resort of Kuta Beach. The Indonesian government's Industrial Production Index showed a year on year (*yoy*) growth throughout 2000, peaking at a 14% increase in the first quarter of 2001. Year on year increases declined in second and third quarters, and then turned negative in the fourth quarter, reaching a -13% (*yoy*) decline in the second quarter of 2002. Smaller enterprises, reflected in the government's figures for non-

oil manufacturing, have done better, maintaining a positive *yoy* growth rate, although one that has dropped steadily from a 7.5% (*yoy*) improvement in the first quarter of 2000 to less than 3% (*yoy*) in the second quarter of 2001. Overall, the US Central Intelligence Agency (CIA) estimates that the industrial production growth rate in 2001 was 3.1%. The leading industries by value are petroleum and natural gas; textiles, apparel and footwear; mining; cement; chemical fertilizers; plywood; rubber; food and tourism.

Industrial expansion is given a high priority in development plans. Labor-intensive industries are stressed, together with industries producing consumer items for domestic consumption and export and products accelerating agricultural development. The government encourages industrial investors, particularly those who plan to export, to locate in one of its eight bonded zones (BZs), the Batam Industrial Park or free trade zone (FTZ) or in an export-processing zone (EPZ). The Batam Industrial Park, located on Batam Island in the Malacca Strait 20 km (12.5 mi) south of Jakarta, was designed to attract investment away from crowded Singapore. In the period January to November 2002, 80 foreign projects were licensed in Batam, up from 59 during the same period in 2001. In November 2002, however, Sony Electronics, Indonesia's largest industrial employer, announced that it would be closing its Indonesian operations in March 2003 as part of a plan to downsize from 70 plants to 54 worldwide. Outside of Batam, foreign investment approvals in 2002 dropped 23% compared to 2001 (from 1333 to 1028), and 35.4% in value (from about \$15 billion to \$9.7 billion). Approvals, which the Indonesian government reports regularly, are indicators of foreign investor confidence but they are not the same as the actual level of investment, which is much lower. Domestic investment projects also declined in both number and value in 2002 compared to 2001, down 31.5% to 181 projects, and down 57% to Rp25,262 billion (about \$11.2 billion in purchasing power parity terms). It is also estimated that at least 20 foreign businesses have left in the first three quarters of 2002 due to local taxes and other regulations that localities have or might impose as they were empowered to do under tax reforms introduced in January 2001. Political uncertainties, insecurities about the new decentralized tax regime and worsening labor relations were cited as the main factors holding back foreign investment.

Industries which process Indonesia's abundance of natural resources include those based on petroleum, wood, sugar, rubber, tea, coconuts, palm kernels, sisal, kapok, rice, and cassava. Manufactured products include consumer goods such as tires and tubes, rubber shoes, radios, batteries, soap, margarine, cigarettes, light bulbs, textiles, glass, paper, tractors, and trucks. Other industries established in recent decades include the Krakatau Steel Industrial Estate at Cilegon (in northwest Java), plywood factories, cement works, spinning mills, knitting plants, iron works, copper and other foundries, a ceramics plant, a leather-goods plant, and a glass factory, and the manufacture of petrochemicals and urea fertilizers, as well as, most ambitiously, facilities for automobile assembly, shipbuilding and aircraft manufacture. The Asian financial crisis doomed ambitions for the mass production of passenger airplanes, as well as a "national car," the Timor. Indonesia's National Car Project was established in February 1996 as an extension of a 1993 program that gave tariff and tax incentives for using locally produced parts in automobiles, and which sought to market the Timor as the "national car," although in fact it was made mostly in Korea. Nepotism and corruption were also charged against the project as Pres. Suharto put his youngest son, Huotomo or "Tommy," at its head. The Asian financial crisis of 1997–98 swept most vestiges of the project away, aided by a WTO ruling calling for the elimination of the program's special tax, customs, and credit privileges issued by a WTO panel called for on the eve of the

crisis by Japan (17 April 1997), the European Union (12 May 1997), and the United States (12 June 1997), and issued in April 1998. In the meantime, the immediate elimination of the National Car Program's privileges had been made a conditional of the Indonesia's IMF bailout program by the Memorandum on Economic and Financial Policies (MEFP) of 15 January 1998.

From World War II until the 1990s, overall industrial growth was small with agriculture the dominant sector of the Indonesian economy. However, in the 1990s, industry and services took over as the dominant sectors, respectively contributing about 41% and 42% of the GDP, with agriculture falling to 17%. Although the government has put an emphasis on developing labor-intensive industries, industry accounts for only for 16% of employment, compared to a 45% share for agriculture and 39% for services. In 1991, textiles were the key industrial export, accounting for 47% of the total. In 2001 textiles and garments were technically still the leading industrial export, but only accounted for 13.6% of total export earnings. The value of textiles exports was down 15% from 2000, due mainly to the global economic slowdown, and was predicted to drop another 10% in 2002. Textiles remains characterized by small producers, with more than 1200 registered textile companies in Indonesia, employing more than a million workers.

The petroleum refining industry has not grown significantly over the last decade. In 1992, Indonesia had six refineries, all operated by Pertamina, the state oil company. Production of refined products was 572.8 million barrels, which is 38% higher than the annual production from Indonesia's now eight state-owned refineries in 2001, operating at 96% capacity. Statistics on refined petroleum products consumption are questionable because of considerable smuggling out of Indonesia to escape its price controls. Oil products subsidies are scheduled to be phased out by 2004. The government has issued several licenses to foreign investors to build refineries, but as of 2002, only one has reached the construction phase. Coal production reached 70 million tons per year by 1999. In 2001 production was 92.5 million tons with 65.3 million tons exported, and was on track for production of over 100 million tons. and exports of 70 million tons. in 2002. The regulation and licensing of the coal industry in Indonesia, which currently includes 33 producing companies, was decentralized in legislation that went into effect in 2001.

The steel industry in Indonesia basically consists of one large integrated mill, the PT Krakatau Steel complex plus numerous mini mills that use scrap steel as their raw material input. In 1992 steel billet production was 560,000 tons. In 2000, total steel billet capacity was 2.34 million tons across 11 companies, but the plants were only running at 60% capacity. In the Asian financial crisis, Indonesia's total steel production dropped from 7.3 million tons in 1997 to 2.7 million tons in 1998 as domestic demand collapsed. The industry was able to survive through exports, although facing stiff competition from its regional neighbors, Eastern Europe and Latin America, particularly. What recovery had been achieved in 2000, however, was cut off abruptly in 2001 when the United States, its biggest customer, placed dumping duties on Indonesian steel.

Indonesia produces nitrogen, phosphate and potash fertilizers, but the strongest prospects are for the urea industry because of Indonesia's natural gas deposits. In 2001, urea production was 6.954 million tons, above the total fertilizer production for 1992, which was 6.5 million tons. Prospects are good for an export market in urea, but in 2002 most fertilizer output was for domestic consumption, and plants, many of them state-owned, were running at near 100% capacity, and fertilizer formed less than 1% of exports.

Wood and wood products have traditionally been Indonesia's second-largest industrial export group, accounting for 11% or 12% of total export value, though electronic some times claims a

larger share. The robust growth in the output of wood and wood products, from 4 million cm in 1967 to an estimated 60 to 70 million cm in 2001, is the cause of international controversy because of the rapid deforestation involved. Global Forest Watch estimates that forest cover has declined from 162 million hectares to 98 million hectares (39.5%) from 1995 to 2000. Laws are in place to curb the rate of exploitation, but it is estimated that over half of the logging done is illegally. In 2001 consumption of plywood was 13 million cu m and the total consumption of logs was 26 million cu m. Wood products, pulp, paper, and paper products, are Indonesia's second-largest sector of industrial exports. The chemical industry experienced an annual growth rate of 13% prior to 1993; and after 1997, the depreciation of the currency encouraged chemical production for the export market. In the consumer goods manufacturing sector, activities are run primarily by private enterprise. All oil and natural gas processing have historically been controlled by government enterprises, as have been other major heavy industries, such as basic metals, cement, paper products, fertilizer, and transport equipment. After the recession in 1998, the government proposed liberalizing heavy industry. Of the 168 parastatals, 140 were scheduled for privatization.

During the 1990s, Indonesia's eight oil refineries, all owned by the state company Pertamina, produced about one million barrels of refined petroleum per day, contributing 9% of the GDP in 1999. In 1997, the fuel sector contributed about 20% to Indonesia's foreign exchange earnings and a waning amount of government tax revenues. Prior to 1997, these sectors accounted for nearly 80% of exports and 70% of government revenues. Natural gas production has steadily increased, and may take over from petroleum as a major source of export revenue. Natural gas proven reserves will last 40 years at current production rates, which reached 180,000 barrels per day in 1999.

In July 1992 non-tariff barriers were reduced and key industries were deregulated to allow free importation of essential manufacturing inputs. There is a shortage of skilled technical personnel to support high-tech industries; most technology has been imported through joint ventures. The agency for Strategic Industries (BPIS), a state-owned holding company including aircraft, telecommunications and high-technology industries, formed a joint venture with a major foreign multinational technology corporation to promote technology transfer to Indonesia. Most industrial enterprises were negatively affected by the 1998 recession, with an overall decline of at least 15%. The Indonesian Bank Restructuring Agency (IBRA) took over the majority of Indonesia's non-performing industrial assets in 2000 with plans to sell, including: cement factories, mining facilities, manufacturing plants, food processing firms, plywood production plants, vehicle assembly lines, chemical plants, property, and agribusinesses.

## 29 SCIENCE AND TECHNOLOGY

Like many developing nations, Indonesia has a shortage of scientific personnel and engineers. The Indonesian Institute of Sciences, a government agency established in 1967, has centers for research and development in biology; oceanology; geotechnology; applied physics and applied chemistry; metallurgy; limnology; biotechnology; electricity and electrical engineering; information and computer sciences; telecommunication, strategic electronics, component and material sciences; and calibration, instrumentation, and metrology. The country has 45 other research institutes concerned with agriculture and veterinary science, medicine, the natural sciences, and technology. Courses in basic and applied sciences are offered at 53 state and private universities. At a more basic level, Agricultural Training Center programs provide workshops throughout Indonesia to acquaint rural workers with the use of plumbing and automotive equipment, small engines, electric

tools, and chain saws, and to familiarize farmers with the use of modern hybrid seeds, pesticides, and fertilizers. In 1987–97, total expenditures for research and development amounted to 0.07% of GDP; 182 scientists and engineers per million population were engaged in research and development. During the same period, science and engineering students accounted for 39% of all college and university students. In 1998, high-tech exports were valued at \$2.1 billion and accounted for 10% of manufactured exports.

### 30 DOMESTIC TRADE

Jakarta, the capital and chief commercial city, is Indonesia's main distribution center. The principal business houses, shipping and transportation firms, and service agencies have their main offices there and branches in other cities. Since the end of World War II, the government had sought to channel trade and business activities into Indonesian hands by a policy of granting special privileges to Indonesian firms—including export license monopolies, sole agency rights, and exclusive licenses to import and sell specific goods—and of making government purchases through Indonesians. In 1998, however, most of these restrictions of foreign retail investment were removed. Foreign investment is also allowed in wholesale and distribution activities; however, in many cases, the company must be represented locally by an Indonesian firm or national. Most trade is conducted through small and medium-sized importers who specialize in specific product lines. Direct marketing has become popular for a variety of goods and services.

Commercial business hours vary, but are usually 7:30AM to 4 PM. Retail stores and some other businesses are open from 8 AM to 4 PM. Some shops are open from 9 AM to 10 PM, Monday through Saturday. Offices and most businesses close at 11 AM on Fridays in observance of Muslim sabbath. Local banks transact business from 8 AM to 1 PM and 2 to 3 PM, Monday through Friday, and 8 to 11 AM on Saturdays. Newspapers, magazines, posters, and billboards are the most popular advertising media. English is widely used in business and government. There is little advertising by mail, and none at all on radio or television. The government restricts advertising space in newspapers to 35% of the paper's content.

### 31 FOREIGN TRADE

Trade balances since World War II have invariably been favorable. Trade liberalization began in 1982 as an effort to increase non-oil exports. By 1987, non-oil exports matched revenue from oil and gas exports for the first time. Imports, which are closely regulated in government efforts to restrain growth of merchandise imports, consist mainly of machinery and raw materials, indicating a reliance on imports to support industry. Discrepancies in trade figures are common and reflect widespread smuggling and corruption of customs and government officials. The late 1990s revealed shrinking exports of plywood, and slow growth in exports of garments and textiles. Emerging exports such as footwear and consumer electronics also showed weak growth. However, rising world prices for oil (except in 1997 and 1998), rubber, and other commodities kept these exports high. The surge in non-oil imports owes much to the demand for consumer goods. In 1998, Indonesia was the world's largest rice importer due to drought, and imported little else. Economic, political, and social crisis was accompanied by a small leap in exports due to currency depreciation, but earnings in the non-oil sector remained low nonetheless.

In the 1970s, Japan became Indonesia's dominant trade partner taking over 41% of Indonesia's exports (mainly petroleum) and supplying over 25% of its imports. Although Japan remains the dominant trade partner, other trade partners—including the US, Singapore, and China—have become important to the economy. Trade with the Netherlands, which was of primary importance in colonial times when Indonesia was known

as the Dutch East Indies, has decreased since 1957. With the creation in 1992 of the ASEAN Free Trade Area (AFTA), trade within the region has increased.

Indonesia puts out a large amount of gas (10.6% of country exports, 8.0% of world exports) and crude petroleum (9.8%) into its commodities export market. Other major exports include apparel (7.7%), textiles (5.7%), paper products (3.7%), plywood (3.2%), footwear (2.6%), and copper ore (2.6%).

In 2000 Indonesia's imports were distributed among the following categories:

Consumer goods	2.7%
Food	7.5%
Fuels	18.2%
Industrial supplies	43.1%
Machinery	19.4%
Transportation	9.1%

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
Japan	14,415	5,397	9,018
United States	8,489	3,393	5,096
Singapore	6,562	3,789	2,773
China (inc. Hong Kong)	4,322	2,364	1,958
Korea	4,318	2,083	2,235
Malaysia	1,972	1,129	843
Netherlands	1,837	434	1,403
Australia	1,519	1,694	-175
United Kingdom	1,507	557	950
Germany	1,443	1,245	198

### 32 BALANCE OF PAYMENTS

Indonesia had persistent balance-of-payments difficulties from the time of its independence. Typically, surpluses on merchandise trade were achieved by restricting imports, but these surpluses did not provide sufficient exchange for debt repayments or for other invisibles, such as profit remittances on foreign investment and interest payments on government loans from abroad. Indonesia's payments position brightened considerably in the late 1970s as a result of a rapid increase in oil prices mandated by OPEC. However, expansion of the non-oil export industries failed to keep pace with burgeoning import requirements for some consumer goods and machinery, equipment, and spare parts for development programs. The current account deficit averaged -2% of GDP between 1992 and 1997, but accrued a surplus of over 4% of GDP in 1998 due to currency devaluation and a cut in imports of one-third. Real GDP growth was expected to rise in 2004, as demand for exports of goods and services increased. The current account was forecast to remain in surplus in 2003/04, but to decline as a percentage of GDP. Indonesia's total external debt stood at approximately \$135 billion in 2001; a loan with the IMF was due to expire in December 2003.

The US Central Intelligence Agency (CIA) reports that in 2001 the purchasing power parity of Indonesia's exports was \$56.5 billion while imports totaled \$38.1 billion resulting in a trade surplus of \$18.4 billion.

The International Monetary Fund (IMF) reports that in 2001 Indonesia had exports of goods totaling \$57.4 billion and imports totaling \$34.7 billion. The services credit totaled \$5.5 billion and debit \$15.9 billion. The following table summarizes Indonesia's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	<b>6,899</b>
Balance on goods	22,695
Balance on services	-10,380

<b>Reserves and Related Items</b>	<b>15</b>

### 33 BANKING AND SECURITIES

The government's Bank Negara Indonesia (BNI) was established in 1953 as the successor to the Java Bank. In 1965, all state banks with the exception of State Trading Bank were incorporated into the BNI as separate units. In 1969, this policy was reversed, and the state banks were again reorganized as individual banks. In 1967, as part of the new regime's policy of encouraging foreign investment, foreign banks were permitted to operate in Indonesia, on condition that they invested at least \$1 million, of which at least \$500,000 had to be brought into the country. The law also provided that foreign banks were to appoint Indonesian banks as their correspondents for any dealings outside Jakarta. The Indonesian banking system transformed after 1980, through a process of gradual but steady reform, which culminated in the 1992 banking law. Joint-ventures were allowed with Indonesian partners. The partial liberalization of the banking industry had a dramatic impact. One result was a sharp deterioration of the banking system's asset quality. The precipitous growth in bank credits threatened to undermine economic stability by stimulating a sharp increase in import demand and inflationary pressures. Responding to this threat, the government initiated an abrupt tightening of monetary policy during the 1990s. From 1992 until 1997, the rupiah was managed in relation to the dollar, but in 1997, the currency was allowed to float because of Asian currency depreciation. Unfortunately, political and social unrest resulted in a highly volatile currency. The 1998 economic failure brought about a major restructuring of the banking system which was literally bankrupted. State-owned banks held \$80 billion in corporate debts and more than two-thirds of their loans were non-performing in 1999. The Bank of Indonesia alone faced a deficit of over \$4.1 billion in 2000.

Bank Indonesia, as the central bank, is responsible for the administration and regulation of the four state banks and other banking operations. Among the state banks, Bank Rakjat Indonesia specializes in credits to agricultural cooperative societies but also provides fishing and rural credit in general. Bank Tabungan Negara promotes savings among the general public. Bank Negara Indonesia (BNI) provides funding for industry. After the financial crash in 1999, four of the state banks were merged into the new Bank Mandiri; including the Bank Bumi Daya, Bank Dagang Negara, Bank Ekspor Impor, and BAPINDO. Bank Bumi Daya provided credits to estates and forestry operations; Bank Dagang Negara provided credits to the mining sector; and Bank Ekspor Impor Indonesia specialized in credits for the production, processing, and marketing of export products, and the Development Bank of Indonesia (Bank Pembangunan Indonesia-or BAPINDO) provided financial assistance to government enterprises and approved new industries. There were 128 private domestic commercial banks in 1998; 38 of them were liquidated in 1999, eight of them were taken over by the government, eight of them were able to function with government aid, and 71 private banks were able to

continue without assistance. Two joint-venture banks closed, out of a total of 32 jointly-owned banks. Foreign investment in the banking system is now allowed up to 99%. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$16.6 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$81.6 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 15.03%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 17.62%.

Indonesia's first stock exchange was established in December 1912 in Jakarta, although both this and two subsequent exchanges established in Surabaya and Semarang in 1925 were shut down during the Japanese occupation. An attempt to revive the capital markets in the early 1950s proved futile, and it was not until August 1977 that the Jakarta Stock Exchange (JSE) was successfully relaunched amid a comprehensive set of institutional reforms that resulted in the establishment of the Capital Market Executive Agency (Badan Pelaksana Pasar Modal-BAPEPAM) to manage the market, as well as a state-owned securities firm, Danareksa, to facilitate the flotation of shares. After sinking to 276 in the fall of 1998, the JSI rose from just below 500 in early 1999 to above 700 in mid-1999, but was back down to 508 in mid-2000 and below 400 by 2001.

### 34 INSURANCE

The insurance and reinsurance industry is governed by an insurance law issued in February 1992 that allows foreign ownership of insurance companies. The industry is regulated by the Ministry of Finance as well as the Insurance Council of Indonesia. The growth of the industry over the past decade is reflected in an impressive increase in many of the industry's financial variables, including assets, gross premiums, and investments. third-party motor liability insurance, workers' compensation, and passenger accident insurance are compulsory. Workers' compensation must be insured with the Government company, ASTEK. Employees also have no right to sue. A 1998 Financial Services Agreement with the WTO equalized capital requirements for both domestic and foreign insurance firms.

### 35 PUBLIC FINANCE

Government expenditures (including capital expenditures) have outrun public income by a considerable margin each year since 1952, and this cash deficit has been met by foreign aid receipts. Since 1985, however, Indonesia has discouraged public sector and monetary growth, resulting in an overall budgetary surplus in 1991/92, despite a significant drop in oil revenues from falling prices. The East Asian financial crisis of 1998 hit Indonesia hard. In 1998, the government deficit reached over 3% of GDP, partially because of subsidized rice imports and investment in the failing banking sector. As of 2002, the economy was just beginning to recover to pre-1997 levels, and the growth rate was not considered high enough to achieve full employment anytime soon. At the end of 2001, Indonesia's external debt was the equivalent of 20% of total GDP.

The US Central Intelligence Agency (CIA) estimates that in 2000 Indonesia's central government took in revenues of approximately \$26 billion and had expenditures of \$30 billion. Overall, the government registered a deficit of approximately \$4 billion. External debt totaled \$135 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	26,000
Tax revenue	63.9%	16,610
Non-tax revenue	36.1%	9,383
Capital revenue	<0.1%	3
Grants	<0.1%	4
EXPENDITURES	100.0%	30,000
General public services	4.6%	1,388
Defense	3.0%	892
Public order and safety	2.1%	618
Education	3.7%	1,122
Health	1.3%	380
Social security	8.6%	2,571
Housing and community amenities	1.3%	395
Recreation, cultural, and religious affairs	0.6%	189
Economic affairs and services	3.6%	1,065
Other expenditures	71.3%	21,381

### 36 TAXATION

Taxes on oil companies are the largest single source of central government income. Under the general corporation rate, corporate income up to Rp25 million is taxed at 10%, income between Rp25 million and Rp50 million is taxed at 15%, and income exceeding Rp50 million is taxed at 30%. A 20% withholding tax is payable on branch profits after corporate tax. However, concessional rates are available for tax treaty countries. Special corporation taxes, with generous depreciation and other deductions from taxable income, cover petroleum, mining, shipping, airline, and insurance companies. Individual incomes are taxed at the same rate as those of corporations. An eight-year carried-forward loss for investment in eastern Indonesia is allowed. Indirect taxes include a VAT, which will replace the sales tax after 2000, and excise taxes on luxury goods.

### 37 CUSTOMS AND DUTIES

Indonesia has, in the past few years, made attempts to liberalize its foreign trade, but unanticipated problems arose preventing substantial progress. Most tariffs are designed to stimulate exports and to protect infant domestic industries. However, the tariff system is burdensome and time consuming and evasion is widespread. Exempt from import duties are raw materials and manufactured items imported for use in government-backed or approved labor-intensive enterprises. Duties on imports from ASEAN member countries were lowered to 20% in 1978. Two years later, duties on 384 products—including cement, sarongs, engine pistons, cameras, and telecommunications equipment—were reduced or abandoned, regardless of origin. Many items may only be imported by government-approved importers and there are quotas for certain non-durable goods. A three-tiered tariff structure, with rates of 0%, 5%, or 10% applied to various commodities, has been implemented to satisfy Indonesia's IMF commitments. An import sales tax is imposed on imports at point of entry (except for those goods considered essential by the government) at rates of 5–30%. Distilled spirits are dutied at a rate of 170% and vehicle taxes range from 5% for trucks up to 75% for some sedans. Indonesia has also committed to the ASEAN Free Trade Agreement and its Common Effective Preferential Tariff (CEPT), and is further liberalizing its trade in order to meet the provisions of that compact. There is a free trade zone on Batam Island that is exempt from all import and export taxes; a free trade facility near Tanjung Priok, the country's main port; a bonded warehouse in Cakung, near Jakarta; and a number of other export processing zones.

### 38 FOREIGN INVESTMENT

Foreign investments have played a key role in the Indonesian economy since the turn of the 20th century. The Dutch were for decades the principal foreign investors in Indonesia, involving themselves heavily in the production of sugar, cinchona, coffee,

tobacco, rubber, and oil. UK investments were in oil, rubber, and manufacturing. Rubber estates, particularly those in northern Sumatra, were operated by Belgian, UK, Danish, French, Norwegian, Swiss, and US individuals and companies. In the dispute with the Netherlands over Irian Jaya, the Indonesian government took over Dutch enterprises in the country and seized Dutch assets. Although Indonesians recognized that foreign capital was needed to develop their economy, government policies were ambiguous and hesitant throughout the 1950s and early 1960s. The foreign investment law of 1958 attempted to provide certain guarantees to foreign investors and to establish safeguards for Indonesian interests. At the same time, the government guaranteed some foreign-owned industrial enterprises that they would not be expropriated by the state or nationalized for a maximum period of 20 or, in the case of large agricultural enterprises, 30 years. In November 1964, the government began to reverse this policy by nationalizing all British-owned commercial enterprises and placing them under direct Indonesian management and control. A decree of 25 February 1965 nationalized all US-owned rubber plantations in northern Sumatra, and another decree of 19 March placed three oil companies—two of them US companies—under the supervision and control of the government. Finally, on 24 April 1965, President Sukarno ordered the seizure of all remaining foreign property in Indonesia. This policy was again reversed after the ouster of Sukarno.

During 1967–70, the confiscated estates were gradually returned to their former owners (except in cases where the owner opted to accept compensation). The Foreign Capital Investment Law of 1967 governed foreign direct investment. The overall flow of private investments from overseas sources increased during the early 1970s, in response both to liberal terms offered under the Suharto government and to favorable world markets for Indonesian oil and other primary products. The annual flow of foreign investment funds approved by the government increased from \$333 million in 1972 to \$521 million in 1973 and to \$1,050 million in 1974. Some 65 US firms invested more than \$1 billion in petroleum enterprises during 1967–74, accounting for about 90% of the country's total production; in 1975 alone, an additional \$1.2 billion was spent in the oil sector by US interests. During 1967–85, Japanese investments led all others in nonoil sectors, totaling \$3.9 billion; US investors were second, supplying \$1.4 billion. In all, between 1967 and 1980, a total of \$8 billion was invested by foreign companies, of which \$6.6 billion was in the petroleum sector. Between 1982 and 1985, direct foreign investment averaged \$242.3 million annually. Since 1973, all foreign investment has been channeled through the Investment Coordinating Board (BKPM), and Indonesian partners were mandated for all foreign concerns established after 1974. Among the incentives for investment approved in 1986 were regulations allowing foreign investment in more industries (arms production is still prohibited) and granting foreign partners in joint ventures the right to distribute the products themselves. The Negative Investment List, 1989 and as amended in 2000, specifies the business areas that are closed to, or impose limitations on, foreign investors.

Between 1967 and 1992, more than 1,590 manufacturing projects involving \$59 billion in foreign investment were approved by the BKPM. Japan was a major investor accounting for 21% of the total, along with Hong Kong (9%), and Taiwan (7%). Foreign investment in manufacturing in Indonesia has been facilitated by the rising cost of labor and inputs in other Asian countries, incentives offered by Indonesia, easing of restrictions, and the streamlining of investment procedures. In 1993 new regulations on the requirements for share ownership in companies invested with foreign capital amended the 1967 Foreign Capital Investment Law, as well as streamlining the investment approval process, and reducing import tariffs on

various goods. A new deregulation package approved in June 1994 further increased incentives for foreign investment by allowing 5% to 51% foreign ownership in infrastructure (harbors, electricity, telecommunications, shipping airlines, railways, and water supply). New foreign investment approvals for 1992 to 1998 were estimated at a total of \$160 billion. From 1967 to 1998, Japan received approval for investments in Indonesia totaling approximately \$35 billion; the United Kingdom, \$24 billion; Singapore, \$18 billion; and Hong Kong, \$14 billion. In 1998 and 1999, new regulations paved the way for increased foreign investment; including concessions to foreign interests in distribution and the financial sector, tax concessions, and simplification of the licensing process. Sectors that remain closed to foreign investment include freshwater fishing, forestry, public transport, broadcasting and film, and medical clinics. More than one-third of the investment since 1967 has been in the chemicals industry, followed by mining, and natural gas.

### 3<sup>9</sup>ECONOMIC DEVELOPMENT

From the late 1960s through the mid-1980s, the Suharto government focused its efforts on financial stabilization, relying heavily on advice and assistance from multilateral aid donors. The results were mixed. The fiscal crisis threatened by the accumulated debts of the Sukarno years was averted through debt rescheduling and improved economic management; nevertheless, the depth of Indonesia's continuing reliance on foreign aid remained apparent through the mid-1980s. Efforts to develop capital-intensive import-substitution industries afforded only marginal benefits to the vast majority of Indonesians. Public expenditures on the first five-year plan (1956–60) included 25% for mining and manufacturing, 25% for transport and communications, 15% for power projects, and 35% for all other categories. A new eight-year development plan was launched in January 1961. Funds were allocated for key "A" projects; including 25% for transport and communications, 22% for industry, 13% for special projects including the military, 12% for clothing, and 11% for food. Eight "B" projects (petroleum, rubber, tin, and forestry) were to supply the financing for the "A" projects. Because of the lack of foreign financing, upon which most of the "B" projects depended, all "A" and some "B" projects were suspended in November 1964. For the period 1965–68, economic rehabilitation took precedence over development, and all official projects were evaluated on purely economic lines. A subsequent plan (1969–74) placed emphasis on the development of agriculture. Aid to industries was encouraged for activities that support agricultural development, such as the production of fertilizers, cement, agricultural equipment, and machinery for processing agricultural products. Assistance was also given to such import-substitution industries as textiles, paper, rubber tires, and housing materials. The 1975–79 plan represented a shift from stabilizing policies to stepped-up development. The plan placed considerable focus on the rural economy, stressing labor-intensive industries along with improved provision of housing and education. In the program to aid farmers in increasing their output and marketing their commodities, emphasis was placed on encouraging farmers' cooperatives and banks. Labor unions were encouraged to help improve the lot of plantation and industrial workers.

Efforts to restructure the economy in the 1980s resulted in an expansion of real GDP 6% annually on average. The 1979–84 development plan, called Repelita III, emphasized the "development trilogy" of economic growth, equity, and national stability. Top priorities were tourism and communication (15%), agriculture and irrigation (14%), mining and energy (13%), education (10%), and regional and local development (10%). The 1984–89 five-year plan, called Repelita IV, emphasized industry (9.5% growth rate), agriculture (3%), petroleum and mining (2.5%), transportation and communications (5.2%), and

construction (5%). However, low oil prices caused the government to reduce its goals and to promote private and foreign investment. Repelita V, 1989–94 emphasized industry (8.5% growth rate), agriculture (3.6%), petroleum and mining (4.2%), trade (6%), transportation and communications (6.4%), and construction (6%). The development of mining and energy were prioritized, as well as certain areas of manufacturing, forestry, agriculture, transportation, communications, and tourism. The sixth five-year development plan (1994–99), Repelita VI, forecast an annual average GDP growth rate of 6.2%, and estimated that per capita income would reach \$1000 by 1999. The plan focused on the privatization of a number of industries, and the gradual opening up of foreign investment. These goals were met by 1997, but the 1998 breakdown of the economy prompted international aid agencies to step in.

The most important economic development policy before privatization and liberalization was outlined in the 1988 Guidelines of State Policy. This document introduced transmigration development; a policy aimed at overcoming uneven population distribution in Indonesia. The policy had multiple objectives: to ease the burden of densely populated regions, to upgrade regional development, to expand job opportunities, to support national unity, and to strengthen national defense. Transmigration in densely populated areas such as Java, Bali and West Tenggara aimed to increase population productivity and decrease environmental hazards. Transmigration in sparsely populated regions such as Sumatra, Kalimantan, Sulawesi, Maluku, Irian Jaya, and East Timor, aimed to increase productivity of natural resources, as well as increase employment and job opportunities. Declining extent of land ownership by farmers was a major problem in both densely and sparsely populated areas. These activities are overseen by the Coordinating Body for the Implementation of Transmigration (BAKOPTRANS). Forestry statistics from 1985 showed that some 30 million ha of forestland in sparsely populated areas could be converted to agricultural uses. Agriculture was an important sector for development in the transmigration policy. As new areas opened more employment opportunities were predicted to be available. Productive land use included, fisheries, industry, services and industrial forest products. In Repelita V the transmigration target was to relocate 550,000 families into new settlement areas outside of Java and Bali. The third year of Repelita V (1991/92) targeted 70,000 families for transmigration, including 28,240 families of public transmigration and 41,760 families of self-initiated transmigration. In fact 64,211 families (91.7%) were resettled, consisting of 25,720 families of public transmigration and 38,491 families of self-initiated transmigration.

Major obstacles to the implementation of the policy continued to delay the preparation of the settlements in the destination areas and at the places of origin during assembly and departure of transmigrants. Agricultural lassitude was one indicator of the program's failure. In 1991/92 rice production was about the same as the previous year, but compared to the national production rate per hectare, production was considered low. The production rate of nuts, bean crops, and cassava declined during the same time periods, and while coconut plantations increased, coffee and clove estates decreased by about 30%. The increase of large and medium livestock was minor, while poultry numbers declined by 21%.

Bilateral and multinational assistance has played a major role in Indonesia's development. Before 1965, Indonesia received substantial aid from the USSR and other communist states; such funding included some \$750 million in economic credits and more than \$1 billion in military aid. Since 1966, the foreign-aid pattern has turned dramatically toward the West. A group of nations (including the United States, Netherlands, Japan, Belgium, France, Germany, Italy, United Kingdom, Switzerland,

Canada, and New Zealand) and organizations (including the IBRD and Asian Development Bank) have joined to form the Inter-Governmental Group on Indonesia (IGGI) as a major funnel for aid. Total IGGI assistance was estimated at \$2.5 billion for 1985/86. During the 1970s and early 1980s, the IMF took a central part in reorganizing Indonesia's financial structure and planning methods. At the Indonesian government's invitation, the IMF has also evaluated the country's economic programs for the purpose of advising donor nations. More recently, the IMF expanded its role by advising the government on planning and foreign aid allocation. In November 1991, in reaction to the Indonesian army's shootings of demonstrators in Dili, East Timor; the Netherlands, Denmark, and Canada suspended aid to Indonesia. In a blanket refusal to link foreign assistance to human rights issues, the government announced it would decline all future aid from the Netherlands. The government also requested that the IGGI be disbanded and replaced by the Consultative Group of Indonesia (CGI) formed by the World Bank and comprised of 18 donor countries (Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Italy, Japan, New Zealand, Norway, South Korea, Spain, Sweden, Switzerland, the United, and the United States) and 12 multilateral agencies. An IMF-funded program that began in 1997 offered a total of \$12.5 billion to Indonesia over a period of three years to support the financial system and aid in the restructuring of the economy. The total international aid package was projected at a total of over \$40 billion by 1999.

#### 40 SOCIAL DEVELOPMENT

The constitution enjoins the government to protect the family and to provide for the needs of the "poor and the waifs," but implementation of these principles has proceeded slowly because of the cost and the lack of professional personnel to put into effect a broad welfare program. Various government departments are responsible for welfare activities: juvenile delinquents are under the care of the Ministry of Justice; child care and maternal health programs are part of the public health program; the Ministry of Labor has responsibility for enforcement of labor welfare legislation; and the Ministry of Social Affairs is concerned with narcotics traffic, exploitation of women and children, prostitution, and people unable to provide for themselves (particularly demobilized soldiers). There is nothing approximating a general public-assistance program in the Western sense, but the society is one in which family and clan relationships run strong. Some social security provisions exist. Firms with 10 or more employees or a payroll of one million rupiah or more a month paid 3.7% of their payroll (and employees paid 2% of earnings) for retirement, disability, and survivor benefits, and coverage is gradually being extended to smaller companies and casual workers. Employers pay 6% of payroll for married employees (3% for single employees) to provide sickness and maternity benefits, and both employers and employees fund a workers' compensation program. In addition, many orphanages, homes for the aged, youth activities, and private volunteer organizations meet special needs, in some cases receiving government subsidies.

Women are accorded the same legal rights as men and they enjoy a more favorable position in Indonesia than is customary in Muslim societies. This situation is largely the result of the work of Princess Raden Ajeng Kartini at the turn of the century in promoting the development of Javanese women. The movement for the emancipation of women preceded the nationalist movement by at least 10 years. Improvement of the status of women was specifically included in the guidelines for the 1979-84 national economic plan. A Ministry of Women's Affairs was created to promote the economic and social welfare of women.

In spite of women's official equality, in practice they often find it hard to exercise their legal rights. Although they constitute

roughly one quarter of the civil service, they occupy very few of its top posts. Marriage laws define the husband as the head of the family, and divorce procedures are much more difficult for a woman. Citizenship for a child is derived solely from the father. Female workers generally receive lower pay than that for men., Although maternity leave is mandated by law, many women lose their jobs as a result of pregnancy. Violence against women, especially domestic abuse remains a serious and widespread problem.

The economic crisis of the late 1990s took a toll on the welfare of the nation's children; infant mortality nearly doubled between 1995 and 1998. UNICEF estimates that eight million pre-school-age children suffer from malnutrition.

Ethnic Chinese face considerable discrimination. There are restrictions on the rights of noncitizen Chinese to operate and own businesses. It is illegal to import Chinese language publications and the celebration of Chinese New Year is prohibited by law.

Gross violations of human rights in East Timor continue, including violence by pro-integration militias following a referendum in which a majority of Timorese voted for autonomy. Over 250,000 civilians fled the region to escape a wave of violence in which hundreds died. With the liberalization of Indonesia's government, human rights abuses decreased overall, although serious problems remain.

#### 41 HEALTH

The Ministry of Health places emphasis on preventive work, while private initiative is encouraged in the curative field. Only 1% of the GDP goes to public health expenditures (1990-95). National health programs, of which family planning is an important part, stress the building of small and healthy families. Eradication of contagious diseases focuses on malaria, rabies, elephantiasis, tuberculosis, cholera, and leprosy. Filariasis is widespread. This tropical disease is endemic in remote rural areas. The World Health Organization reported cholera active in Indonesia. Malaria is also endemic to the country; in 1994 there were 140,559 cases of malaria. The incidence of the disease was 729 per 100,000 population in 1996. There were also 49,647 cases of tuberculosis. In 1999, there were 282 cases of tuberculosis per 100,000 people. Overcrowded cities, poor sanitation, impure water supplies, substandard urban housing, and dietary deficiencies are contributing factors to health problems. In 2000, 76% of the population had access to safe drinking water and 56% had adequate sanitation.

Average life expectancy in 2000 was 66 years for men and women. The 2000 infant mortality rate was 41 per 1,000 live births. The overall death rate was estimated at 6.3 per 1,000 in 2002. The maternal mortality rate was 450 deaths per 100,000 live births in 1998. Malnutrition was present in 42% of all children under five years of age as of 2000. As of September 1995, the World Health Organization (WHO) reported 130,988 deaths of children under five from diarrheal diseases. The estimated goiter rate was 27.7 per 100 school-age children in 1996.

Indonesia has received much help from the UN, particularly through WHO and UNICEF, in solving health problems. The Ministry of Health is seeking to build up a health service, starting at the village level with a hygiene officer, who is an official of the village, and working up through groups of villages, with more facilities and better trained personnel, to the regional doctor, who directs the curative and preventive work.

In 1990, there were 25,752 doctors, 98,842 nurses, and 6,689 midwives. More than one-third of the country's doctors practice in Jakarta and other big cities. In 1990-95, 80% of the population had access to health care services. Tobacco consumption has increased from 1.4 kg (3.1 lbs) in 1984-86 to 1.6 kg (3.5 lbs) a year per adult in 1995.

In 1991, Indonesia had 1,552 hospitals, with about 120,711 beds (one bed per 1,515 people in 1994). In addition, there were 5,656 public health centers. As of 1999, there were an estimated 0.2 physicians and 0.7 hospital beds per 1,000 people. In the same year, total health care expenditure was estimated at 1.6% of GDP.

Indonesia's birth rate was an estimated 21.9 per 1,000 people as of 2002. About 57% of married women (ages 15 to 49) were using contraception as of 2000. A total of 40% of all Indonesian children under five were underweight in the years 1990–95. Immunization rates for 1997 for children up to one year of age were as follows: tuberculosis, 100%; diphtheria, pertussis, and tetanus, 91%; polio, 90%; and measles, 92%. In 1995 the government paid 100% of the entire vaccine bill.

As of 1999, the number of people living with HIV/AIDS was estimated at 52,000 and deaths from AIDS that year were estimated at 3,100. HIV prevalence was 0.05 per 100 adults.

## 42 HOUSING

Housing is an acute problem in both urban and rural areas. In the rural areas, housing generally falls below even the most modest standards. In the 1970s, about one-fifth of the country's housing consisted of one-room dwellings; in the countryside, most had no electricity. National statistics from 1998 indicate that only about 20% of all residences had access to piped water. In 2000, only about 66% of the population had access to improved sanitation systems.

Under the 1970–75 plan, the government left construction of housing to private initiative and restricted itself to activities designed to stimulate house construction, such as town planning and the provision of water supplies and sanitation. The 1975–79 and 1979–84 plans included government construction of housing. The 1984–89 plan had a target of 300,000 units, of which 140,000 were to be provided by the government and 160,000 by private sources. In 1990 alone, 210,000 new housing units were completed and the total number of dwellings stood at 44,855,000 in the mid-1990s.

Floods, earthquakes, drought, forest fires and local communal conflicts continue to result in shelter problems for over one million displaced and homeless residents.

## 43 EDUCATION

Vigorous efforts have been made to advance education and reduce illiteracy. In 1971, overall literacy was estimated to be about 58%, ranging from 77% in the cities to only 52% in rural areas. By the year 2000, adult illiteracy rates were estimated at 13.0% (males, 8.1%; females, 17.9%). Under the constitution, education must be nondiscriminatory, and six years of primary education are free and compulsory. In practice, however, the supply of schools and teachers is inadequate to meet the needs of the fast-growing under-15 age group. In the mid-1990s, an estimated 97% of primary-school-age children were enrolled in primary schools. In 1997, 29,236,283 students were enrolled in Indonesia's 173,893 primary schools, with 1,327,178 teachers. The student-to-teacher ratio stood at 22 to 1. Secondary schools employed 986,896 teachers and enrolled 14,209,974 students in that same year. As of 1999, 91% of primary-school-age children were enrolled in school, while 48% of those eligible attended secondary school. Schools are coeducational, except for certain vocational and religious schools. Private (mostly Islamic religious) schools receive government subsidies if they maintain government standards. Bahasa Indonesia is the language of instruction, but local dialects may be used until the third level.

The school system includes a six-year primary school, a three-year junior secondary school, a three-year senior secondary school, and higher education in universities, faculties, teacher-training colleges, and academies. Junior and senior technical schools have been brought into line with junior and senior

secondary schools. Patterned after Dutch practices, Indonesia's educational system divides secondary-school students into groups according to curriculum. In the third year of the junior secondary school, the students are separated into an A-curriculum (languages) and a B-curriculum (mathematics). In senior secondary school, the students normally continue in their previous curriculum, but B-curriculum students may shift to an economics curriculum (C). Teacher-training schools range from the basic teacher-training program of four years (post-primary education) up through teachers' colleges, academies, faculties, and universities. Upon entering institutions of higher learning, students must enter the division for which their curriculum has prepared them; thus, A-curriculum students enter the language and philosophical faculties.

There are 51 universities, the largest of which are the University of Indonesia (in Jakarta) and the University of Gajah Mada (in Yogyakarta). Most of the universities are new, having been established since the mid-1950s. In all universities and third-level institutions, there were a total of 157,695 teachers and 2,303,469 students in 1996.

## 44 LIBRARIES AND MUSEUMS

Indonesia's largest library was created in 1980 with the merger of four libraries into the Perbustakaan National Library of Indonesia, located in Jakarta, with a collection of over 1.15 million volumes. This library includes the large National Museum collection, which was established in 1778. Another well-established library is the Bibliotheca Bogoriensis, also called the Central Library for Biological Sciences and Agriculture; founded in 1814 as a library associated with the botanical gardens in Bogor, on Java, it holds more than 400,000 volumes. Another national library is the National Scientific and Technical Documentation Center, founded in 1965 in Jakarta, with a collection of more than 150,000 volumes. The Library of the Indonesian Parliament, also in Jakarta, has 150,000 volumes. There is little coordination of public libraries, but there are state libraries and local reading rooms in almost every province. University libraries tend to be autonomous faculty or departmental libraries lacking central coordination. The University of Indonesia in Jakarta has just over 200,000 volumes and is the largest in the country.

Two outstanding museums in Indonesia are the National Museum in Jakarta, which is a general museum of Indonesian history and culture, and the Zoological Museum in Bogor, on Java. There is also a Bali Museum at Denpasar, and there are several regional historical museums throughout the provinces. Jakarta also houses a museum of crime, a large military museum, a museum chronicling the country's fight for independence, and several decorative arts museums.

## 45 MEDIA

The government owns and operates postal services and telecommunications facilities through Perumtel, a state enterprise. In 1998 there were over 5.5 million mainline telephones in Indonesia as well as an additional 1.07 million cellular phones in use. The Indonesian-owned telecommunications satellite Palapa B was launched in 1983.

As of 1998, there were 678 AM and 43 FM radio stations and 41 television stations (18 government-owned and 23 commercial). Programs originating in Jakarta are in Bahasa Indonesia; programs from regional stations are usually in local languages or dialects. The overseas service (Voice of Indonesia) broadcasts 11 hours daily in Arabic, Chinese, English, French, German, Japanese, Malay, and Thai. Television service was inaugurated in 1962. In 1995 there were three television networks, TV-Indonesia (TVRI), Rejawali Citra TV, and an educational network in Jakarta. In 2000 there were 157 radios

and 149 television sets for every 1,000 people. In 2001, there were 2 million Internet subscribers served by 24 service providers.

Most newspapers are published in Bahasa Indonesia, with a small number appearing in local dialects, English, and Chinese. The leading dailies, with their estimated 2002 circulations, are as follows:

	LANGUAGE	CIRCULATION
JAKARTA		
<i>Kompas</i>	Bahasa Indonesia	523,450
<i>Pos Kota</i>	Bahasa Indonesia	500,000
<i>Suara Pembaruan</i>	Bahasa Indonesia	250,000
<i>Berita Buana</i>	Bahasa Indonesia	150,000
<i>Merdeka</i>	Bahasa Indonesia	130,000
<i>Jakarta Post</i>	English	50,000
OTHER CITIES		
<i>Pikiran Rakyat</i> (Bandung)	Bahasa Indonesia	150,000
<i>Suara Merdeka</i> (Semarang)	Bahasa Indonesia	200,000
<i>Harian Pagi Memorandum</i> (Surabaya)	Bahasa Indonesia	190,000
<i>Jawa Pos</i> (Surabaya)	Bahasa Indonesia	120,000
<i>Surabaya Post</i> (Surabaya)	Bahasa Indonesia	115,000
<i>Analisa</i> (Medan)	Bahasa Indonesia	75,000

The constitution declares that everyone has the “right to freedom of opinion and expression.” Journalistic activities of foreigners, however, are limited in accordance with the policy that “freedom of expression” does not permit interference in domestic affairs or dissemination of “foreign ideologies” detrimental to the Indonesian system of government. The government censors foreign films and publications, and Indonesian newspapers have been temporarily closed down for violating news guidelines. In 1982, a new press law established a Press Council of government officials, journalists, and scholars empowered to decide what news may be printed. The government began to issue and revoke “publishing licenses” in 1984 to control the media. In 1994 the licenses of three well-known news magazines were revoked.

#### 46 ORGANIZATIONS

The most successful cooperatives in Indonesia have been village unit cooperatives, designed to meet the small farmer’s need for credit and aid in marketing cash crops. The cooperatives have also been instrumental in distributing improved rice, fertilizers, pesticides, and superior cattle breeds, and also in instructing farmers in their handling. Village unit cooperatives also exist for such cottage industries as batik (a method of hand-painting textiles), textiles, and garment production, which are important forms of employment in rural areas.

Among social welfare and women’s organizations are the Indonesian Women’s Congress, a federation founded in 1928; the National Council on Social Welfare; the Indonesian Planned Parenthood Association; the Council of Muslim Women’s Organizations; GOPTKI, a federation of organizations that run kindergartens; Association of Women of the Republic of Indonesia; and the Indonesian National Commission on the Status of Women. International organizations with chapters in Indonesia include Habitat for Humanity, the Red Cross, and the Kiwanis and Lion’s clubs.

National youth organizations include the Indonesian Hindu Youth Association, Indonesian Moslem Youth, Islamic Association of University Students, National Board of IMKA/YMCA Indonesia, Students Solidarity for Democracy in India, and Young Generation of Islam of Indonesia. There is also a national association for Boy Scouts and Girl Scouts (Indonesia Gerakan Pramuka).

There are a number of organizations promoting education and research into various arts and sciences, including the Indonesian Institute of Sciences

Many trade and business promotional organizations are concerned with individual sectors of the business world—

exporters’ organizations, sugar traders’ associations, and so on. An Indonesian chamber of commerce and industries has connections with leading business organizations in the country. United Kingdom, Chinese, Indian, and Pakistani business people have national associations. The Indonesian Consumers Association is active. ASEAN Council on Petroleum, ASEAN Occupational Safety and Health Network, and ASEAN Regional Forum all have offices in Jakarta.

#### 47 TOURISM, TRAVEL, AND RECREATION

Among the most popular tourist destinations are Bali, the restored Borobudur Buddhist temple in Java, and historic Yogyakarta. Cultural attractions include traditional Balinese dancing, the percussive sounds of the Indonesian orchestra (*gamelan*), the shadow puppet (*wayang kulit*) theater, and the famous Indonesian rijsttafel, a banquet of rice and savories. Tourism, as a means of affording wider employment, is strongly promoted by the government, which has supported the development of surfing, skindiving, and other marine sports in the reefs and tropical seas of the archipelago and the creation of resorts in Sumatra, Kalimantan, Nusa Tenggara, Maluku Province, and Irian Jaya. Gambling has been prohibited since 1981.

A valid passport and an entry visa are required of most foreigners entering Indonesia. Citizens of Israel and South America must obtain special travel affidavits from Indonesian officials in their own countries. For certain countries, including the US, a tourist visa does not need a visa for up to 60 days. For other countries, a tourist visa for visits up to 30 days is obtainable. Precautions against malaria, hepatitis, typhoid, and cholera are recommended.

An estimated 5,064,217 foreign tourists visited Indonesia in 2000, with over 70% coming from East Asia and the Pacific region. About 25% of travelers are from Singapore. Tourist receipts amounted to \$5.7 billion. The same year, there were 252,984 hotel rooms with an occupancy rate of 42%.

The cost of traveling in Indonesia varies greatly from city to city. According to 2003 US government estimates, the daily cost of staying in Jakarta was approximately \$195 per day. Daily expenses were an estimated \$130 for Surabaya, \$114 for Medan, and \$220 for Bali. Elsewhere the estimated daily cost was about \$96.

#### 48 FAMOUS INDONESIANS

Gajah Mada, prime minister under King Hayam Wuruk (r.1350–89), brought many of the islands under one rule, the Majapahit Empire. Princess Raden Ajeng Kartini (1879–1904), founder of a school for girls, led the movement for the emancipation of women. Her posthumously published letters, *Door duisternis tot licht*, occasioned considerable interest in the Western world. Many creative and performing artists have attained local prominence, but Indonesia’s only internationally known artist is the painter Affandi (1910–90). Contemporary novelists of considerable local importance include Mochtar Lubis (b.1922). H. B. Jassin (b.1917) is an influential literary critic. Sukarno (1901–70), a founder and leader of the nationalist movement, is the best-known figure of modern Indonesia; Mohammad Hatta (1902–80), one of the architects of Indonesian independence, served as Sukarno’s vice-president and concurrently as prime minister. President Suharto (b.1921), leader of Indonesia after Sukarno’s overthrow, dominated Indonesia’s political and economic life for three decades (1968–98). Adam Malik (1917–84) established an international reputation as a negotiator in restoring and improving relations with Malaysia, the Philippines, the United States, the United Kingdom, and the UN; formerly a foreign minister (1966–77), he became vice-president (1978–83). Umar Wirahadikusumah (b.1924), a retired army general, became vice-president in 1983.

#### 49 DEPENDENCIES

Indonesia has no territories or colonies.

# IRAN

Islamic Republic of Iran  
*Jomhuri-ye Eslami-ye Iran*

**CAPITAL:** Tehran

**FLAG:** The national flag is a tricolor of green, white, and red horizontal stripes, the top and bottom stripes having the Arabic inscription *Allah Akbar* ("God Is Great") written along the edge nearest the white stripe. In the center, in red, is the coat of arms, consisting of a stylized representation of the word *Allah*.

**ANTHEM:** The national anthem begins, "On the horizon rises the Eastern Sun."

**MONETARY UNIT:** The rial (R) is a paper currency of 100 dinars. There are coins of 1, 5, 10, 20, and 50 rials, and notes of 100, 200, 500, 1,000, 2,000, 5,000, and 10,000 rials. R1 = \$0.0001226 (or \$1 = R8,150) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but local units are widely used.

**HOLIDAYS:** National Day, 11 February; Oil Nationalization Day, 20 March; No Ruz (New Year), 21–24 March; Islamic Republic Day, 1 April; 13th Day of No Ruz (Revolution Day), 2 April. Religious holidays (according to the lunar calendar) include Birthday of Imam Husayn; Birthday of the Twelfth Imam; Martyrdom of Imam 'Ali; Death of Imam Ja'afar Sadiq; 'Id al-Fitr; Birthday of Imam Reza; 'Id-i-Qurban; 'Id-i-Qadir; Shab-i-Miraj; Martyrdom of Imam Husayn; 40th Day after the Death of Imam Husayn; Birthday of the Prophet; Birthday of Imam 'Ali.

**TIME:** 3:30 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in southwestern Asia, Iran covers an area of 1,648,000 sq km (636,296 sq mi) and extends about 2,250 km (1,398 mi) SE–NW and 1,400 km (870 mi) NE–SW. Comparatively, the area occupied by Iran is slightly larger than the state of Alaska. Iran is bounded on the N by Armenia, Azerbaijan, Turkmenistan, and the Caspian Sea, on the E by Afghanistan and Pakistan, on the S by the Gulf of Oman and the Persian Gulf, on the W by Iraq, and on the NW by Turkey, with a total land boundary length of 5,440 km (3,380 mi). The coastline is 2,440 km (1,516 mi). The shoreline on the Caspian Sea is 740 km (460 mi). Iran's territory includes several islands in the Persian Gulf.

Iran's capital city, Tehran, is located in the northwestern part of the country.

## <sup>2</sup>TOPOGRAPHY

Most of the land area consists of a plateau some 1,200 m (4,000 ft) above sea level and strewn with mountains. The Zagros and Elburz ranges stamp a "V" upon the plateau; the apex is in the northwest, and within the lower area between the arms are to be found salt flats and barren deserts. Most of the drainage is from these two great ranges into the interior deserts, with limited drainage into the Caspian Sea and the Persian Gulf. The ranges run in parallel files, enclosing long valleys that provide most of the agricultural land. Mt. Damavand, northeast of Tehran, rises to 5,671 m (18,606 ft), while the Caspian littoral is below sea level and has a semitropical climate. Only the Karun River, emptying into the Persian Gulf, is navigable for any distance, but the rivers that rush down from high altitudes offer fine sources of power.

Harbors of limited depth are found along the Persian Gulf, and the Caspian Sea has similar facilities for coastal fishing and trade. Iran is geologically unstable with occasional severe earthquakes. About 140,000 people were killed in Iranian earthquakes during the twentieth century.

## <sup>3</sup>CLIMATE

Iran has a continental type of climate, with cold winters and hot summers prevalent across the plateau. On the plateau, the annual rainfall does not exceed 30 cm (12 in), with the deserts and the Persian Gulf littoral receiving less than 13 cm (5 in). Snow falls heavily on the mountain peaks and is the principal source of water for irrigation in spring and early summer. The Caspian littoral is warm and humid throughout the year, and the annual rainfall is from about 100 to 150 cm (40–60 in). Clear days are the rule, for the skies are cloudless more than half the days of each year. The seasons change abruptly. By the Persian New Year, the first day of spring, orchards are in bloom and wild flowers abound. The Tehran temperature ranges from -3°C (27°F), the average low, to an average high of 7°C (45°F) in January, and from an average minimum of 22°C (72°F) to an average maximum of 37°C (99°F) in July.

## <sup>4</sup>FLORA AND FAUNA

More than one-tenth of the country is forested. The most extensive growths are found on the mountain slopes rising from the Caspian Sea, with stands of oak, ash, elm, cypress, and other valuable trees. On the plateau proper, areas of scrub oak appear on the best-watered mountain slopes, and villagers cultivate orchards and grow the plane tree, poplar, willow, walnut, beech, maple, and mulberry. Wild plants and shrubs spring from the barren land in the spring and afford pasture, but the summer sun burns them away. Bears in the mountains, wild sheep and goats, gazelles, wild asses, wild pigs, panthers, and foxes abound. Domestic animals include sheep, goats, cattle, horses, water buffalo, donkeys, and camels. The pheasant, partridge, stork, and falcon are native to Iran.

## <sup>5</sup>ENVIRONMENT

Iran's high grasslands have been eroded for centuries by the encroachment of nomads who overgrazed their livestock. Desertification resulting from erosion, and deforestation of the

high plateau pose additional dangers to Iran's environment. UN sources estimate that 1 to 1.5 million hectares per year become desert land. The basic law controlling the use of forests dates from 1943. In 1962, the forests and pastures in Iran were nationalized to check trespassing deforestation. In early 1983, blown-out oil wells in the Persian Gulf war zone between Iran and Iraq caused a huge oil slick that threatened ocean and shore life along the southwestern Iranian coast. Air and water pollution have become significant problems in Iran in the aftermath of the 1991 Persian Gulf War. The water in the Gulf is polluted with oil and black rain, and the burning of Kuwaiti oil wells caused significant air pollution as well. Iran also has the 19th highest level of industrial carbon emissions in the world, with a 1992 total of 235 million metric tons, a per capita level of 3.81 metric tons. Iran has 128.5 cubic kilometers of renewable water resources with 92% used for farming activity and 2% used for industrial purposes. Only 83% of the rural people have pure drinking water. Iran's cities produce about 6.2 million tons of solid waste per year. Iran's Department of Environment was established under the Environment Protection and Enhancement Act of 1974; no information is available on implementing legislation.

As of 2001, 20 of Iran's mammal species and 14 bird species are endangered. Endangered species in Iran include the Baluchistan bear, Asiatic cheetah, Persian fallow deer, Siberian white crane, hawksbill turtle, green turtle, Oxus cobra, Latifi's viper, dugong, and dolphins. The Syrian wild ass has become extinct.

## 6 POPULATION

The population of Iran in 2003 was estimated by the United Nations at 68,920,000, which placed it as number 18 in population among the 193 nations of the world. In that year approximately 5% of the population was over 65 years of age, with another 33% of the population under 15 years of age. There were 103 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 1.24%, with the projected population for the year 2015 at 81,422,000. The population density in 2002 was 40 per sq km (104 per sq mi).

It was estimated by the Population Reference Bureau that 62% of the population lived in urban areas in 2001. The capital city, Tehran, had a population of 7,158,000 in that year. The populations of other major metropolitan areas were Mashad, 2,378,000; Esfahan, 2,644,000; Tabriz, 1,624,000; Shiraz, 1,113,000; Ahvaz, 1,018,000; and Kermanshan, 949,000. According to the United Nations, the urban population growth rate for 2000–2005 was 1.8%.

## 7 MIGRATION

Traditionally, there has been little immigration to Iran, with the exception of Shi'a Muslims coming from Iraq. There has been some emigration to Europe and the United States, particularly by Iranians who were studying overseas at the time of the revolution of 1979. About 100,000 Kurds were repatriated from Iran to Iraq during the mid-1970s after the suppression of a Kurdish rebellion in the latter country. Between 1980 and 1990, however, an increased number of Shi'a Muslims fled Iraq because of the Iran-Iraq and Gulf wars; at the end of 1992, 1,250,100 were refugees in Iran. Perhaps 2.8 million Afghan refugees moved to Iran after the Soviet invasion of Afghanistan in December 1979. About 200,000 returned in 1992, and about 2.1 million remained in mid-1993. At least 50,000 refugees from Azerbaijan had fled to Iran by late 1993 to escape Armenian occupation. In the fall of 1996, 65,000 Iraqi Kurds entered Iran due to fighting between two different groups of Iraqi Kurds.

According to 1999 statistics, Iran has the largest refugee population in the world, hosting some 2 million refugees. There

are an estimated 1.4 million Afghan refugees, 580,000 Iraqis, and 40,000 refugees from Tajikistan, Bosnia, Eritrea, and Somalia. Only 5% of refugees live in 30 designated camps, while the rest have integrated themselves in cities and villages around the country. An increase in unemployment and faltering economic conditions have resulted in increased pressure for refugees to return to their homelands. However, due to current conditions in Iraq and Afghanistan, chances for significant repatriation remain poor. The Iranian government feels a heavy economic and social burden and believes the international community should share more responsibility for these refugees.

In 2000 the net migration rate was -1.4 migrants per 1,000 population. The government views the immigration level as too high, but the emigration level as satisfactory. The total number of migrants in the country was 2,321,000 in 2000, down from 3,809,000 ten years earlier.

## 8 ETHNIC GROUPS

Present-day Iranians, or Persians, are considered to be direct descendants of the Aryans who moved into the plateau in the second millennium BC. They speak Persian, or Farsi, and number more than half the total population. In the Zagros range and its extensions are to be found the Kurds, Lurs, Bakhtiari, Qashqa'i, and Qajars; the first three are said to be of stock similar to the Iranian element, and they speak languages that stem from ancient Indo-European languages. At various times after the 10th century AD, Turkish tribes settled in the region, and Turkish-speaking groups are still found in several parts of the country. One-eighth of the total population dwells in East and West Azerbaijan, and there are sizable groups of Azerbaijanis in major cities elsewhere, including Tehran. Arab groups arrived during and after the 7th century AD; their descendants live in the south and southwest and in scattered colonies elsewhere.

In general, non-Iranian elements are to be found along the perimeter of the country. Of these, certain nomadic groups move back and forth across the frontiers. Tribal groups have been a conspicuous element in Iran for many centuries, migrating vertically in spring and fall between high mountain valleys and hot, lowland plains. The important migratory groups include the Qashqa'i, Qajars, Bakhtiari, Balochi, and Turkmen. A large proportion of these people are now settled, however. The nomadic way of life is on the decline, and official policy has sought to resettle these groups on farmlands.

According to 1999 estimates, Persians account for 51% of the population, Azeri 24%, Gilaki and Mazandarani 8%, Kurd 7%, Arab 3%, Lur 2%, Balochi 2%, and Turkmen 2%.

## 9 LANGUAGES

Farsi, commonly called Persian in the West, is the official language of Iran. An Indo-European language of the Indo-Iranian group, Farsi derives from ancient Persian, with an admixture of many Arabic words. Arabic characters and script are used in writing modern Persian. Dialects of Turkish, or Turki—especially Azeri, the language of the Azerbaijanis—are spoken throughout northwestern Iran, by the Qashqa'i tribe in the southwest, and in parts of the northeast by Turkmen tribes and others. The Lurs, Kurds, and Bakhtiari have languages and dialects of their own that descend from earlier Indo-European languages, and the Balochi language spoken in southeastern Iran also is of Indo-European origin. A small number of Brahui in the southeast speak a Dravidian language. According to 1999 estimates, 58% of the population speaks Persian or Persian dialects, 26% Turkic or Turkic dialects, 9% Kurdish, 2% Luri, 1% Balochi, 1% Arabic, 1% Turkish, and 2% other.

## 10 RELIGIONS

As of 2002, about 99% of the population is Muslim, with 89% of the people being Shi'a Muslims and 10% Sunni Muslims. The

LOCATION: 25° to 40°n; 44° to 63°e. BOUNDARY LENGTHS: Afghanistan, 936 kilometers (582 miles); Armenia 35 kilometers (22 miles); Azerbaijan (N) 432 kilometers (268 miles); Azerbaijan (NW) 179 kilometers (111 miles); Caspian Sea coastline, 740 kilometers (460 miles); Gulf of Oman and Persian Gulf coastlines, 2,440 kilometers (1,516 miles); Iraq, 1,458 kilometers (906 miles); Pakistan, 909 kilometers (565 miles); Turkey, 499 kilometers (310 miles); Turkmenistan, 992 kilometers (616 miles). TERRITORIAL SEA LIMIT: 12 miles.

remainder of the population are Zoroastrian, Jewish, Christian, Mandaean, and Baha'i.

Iran is the only Islamic country where Shi'a Muslims hold the reins of power. Shi'a Islam is the official religion of the country and the president, prime minister, and cabinet ministers must be Muslims. The Christian population (about 115,000 to 120,000) includes Armenians and, in the northwest area, Nestorian Christians (Assyrians). Colonies of Parsis, or Zoroastrians, in Yazd, Kerman, and other large towns number about 35,000. The Baha'is number about 300,000 to 350,000; their faith, which sprang from the teachings of a 19th-century Muslim in Iran, has been denounced as heresy to Islam. The Baha'is have been severely persecuted by the Shi'a government since the 1979 revolution, and many of their religious leaders have been executed. The Jewish community, which numbered about 25,000

in 1984, had dwindled to no more than 14,000 by 1990 and may have declined still further since then under the impact of persecution.

## 11 TRANSPORTATION

Iran had 140,200 km (87,120 mi) of roads in 2002, of which 49,440 km (30,722 mi) were paved, including 470 km (292 mi) of expressways. A1, a major paved highway, runs from Bazargan on the Turkish border to the border with Afghanistan. Another major highway, A2, runs from the Iraqi border to the Pakistani border. Much of the revolutionary government's road-building activity has centered on improving roads in rural areas. In 2000 there were over 1,139,500 passenger cars and 384,900 commercial vehicles.

The state-owned Iranian State Railway has 6,130 km (3,809 mi) of track. The main line runs south for 1,392 km (865 mi) from Bandar Turkoman on the Caspian Sea, through Tehran, to Bandar-e Khomeini on the Persian Gulf. Rail construction from Bafq to Sirjan has been completed and is operational.

Iran's main port at Khorramshahr on the Persian Gulf, as well as the port at Abadan, were largely destroyed in fighting during the 1980–88 war with Iraq. Khorramshahr is in limited operation since November 1992. Other ports on the Gulf are Bandar-e Khomeini, Bandar 'Abbas, and Bushehr. Both Bandar-e Khomeini and Bushehr were damaged because of the war. The government is continuing the previous regime's program to modernize the port at Bandar 'Abbas. On the Caspian Sea, there are the ports of Bandar Anzeli (formerly Bandar Pahlavi), and Naushahr. In addition, there are the oil shipment ports of Kharg Island (a principal target in the war with Iraq) and Abadan. There are 904 km (562 mi) of waterways. The principal inland waterways are Lake Urmieh and the Karun River. The Shatt al Arab is usually navigable by maritime traffic for about 130 km (81 mi). In 2002, the Iranian merchant marine included 147 vessels of at least 1,000 GRT, with a total capacity of 4,136,971 GRT.

Iran had 322 airports in 2001, 122 of which had paved runways. Principal airports include Bandar 'Abbas, Mehrabad International at Tehran, and Shiraz International at Shiraz. The state-owned Iran Air maintains frequent service to 15 cities in Iran and is an international carrier. In 2001, 9,317,900 passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

As early as 6000 BC, communities on the Iranian plateau were carrying on agriculture, raising domestic animals, and producing pottery and polished stone implements. Sites datable to later than 3000 BC are numerous and offer quantities of bronze instruments and painted pottery of the finest types. About 1500 BC, masses of Indo-Europeans, or Aryans, began to cross the plateau of Iran. The Iranian group included Medes, Persians, Parthians, Bactrians, and others. The Medes settled in western Iran (Media) about 900 BC and established their capital at Ecbatana (modern Hamadan); the Persians settled to the south of them (Parsis) around 700 BC. The Median king Cyaxares (625–585 BC), along with the Chaldeans, destroyed the power of neighboring Assyria. In the area of Parsis, the Achaemenid clan became overlords, and in 550 BC, their leader, Cyrus the Great, revolted against the Medes; forming a union of Medes and Persians, he then drove with armies both into Asia Minor and to the east of the Iranian plateau and established the Achaemenid Empire. Cambyses, Darius, Xerxes I, and Artaxerxes I were notable rulers of this line who penetrated Greece, Egypt, and beyond the Oxus. The Achaemenid power was centered at Susa and Persepolis; the ruined site of the latter is impressive even today. Zoroastrianism was the religion of the rulers.

In his eastward sweep (334–330 BC), Alexander the Great defeated vast Achaemenid forces and went on to capture Susa and to burn Persepolis. In the 3rd century BC, the Parthians moved into the area east of the Caspian and then into the Achaemenid Empire, establishing the new Parthian kingdom; later rulers moved west to come in contact with and then to fight the Roman Empire. The Parthians considered themselves spiritual heirs of the Achaemenids and adopted Zoroastrianism as the official religion. Weakened by long wars with Rome, the Parthians were followed by a local dynasty, the Sassanian, which arose in the area of Fars in southwestern Iran. Wars with Rome continued and were followed by a struggle with the Byzantine Empire. The Sassanian period (AD 226–641) was one of cultural consolidation and was marked by economic prosperity and by a series of enlightened rulers.

During the first half of the 7th century AD, Arab warriors burst out of the Arabian Peninsula to overwhelm the Sassanian Empire and to spread the teachings of the prophet Muhammad, embodied in Islam. By the opening of the ninth century, Islamic doctrine and precepts had spread over the plateau, and local dynasties faithful to the Muslim creed emerged. Early in the 11th century, the Turkish Ghaznavid dynasty held power from western Iran to the Indus River. Their greatest ruler was Mahmud of Ghazni, a renowned conqueror and a patron of the arts. The Ghaznavids were replaced by the Seljuks, descended from Turkish nomad warriors enlisted in their service.

The Seljuk kingdom had its capital at Ray, just south of Tehran, and stretched from the Bosphorus to Chinese Turkestan. Of rude origins, such rulers as Tughril Beg, Alp Arslan, and Malik Shah did much to promote cultural pursuits and enhance the character of Persian civilization.

In 1219, Mongol hordes under Genghis Khan (Temujin) began to move into Iran; successive waves subdued and devastated the country. Hulagu, a grandson of Genghis, settled in Maragheh in Azerbaijan and as Il-khan, or chief of the tribe, gave this title to the Il-khanid dynasty. His successors, such as Ghazan Khan and Oljaitu, ruled from Tabriz and Sultaniya, and once again untutored invaders became converts to Islam and patrons of Persian science, learning, and arts. Rivalries within the military leadership brought about the breakdown of Il-khanid power in the second half of the 14th century.

Qajar power began to fade at the turn of the 19th century. In the 1890s, Shi'a clerics led a national boycott that made the shah rescind a decree awarding a tobacco monopoly to a foreign agent. In 1906, a coalition of bazaar merchants, clerics, intellectuals, and tribal leaders forced the shah to accept a constitution. This liberal initiative was frustrated, however, by the power of the British and Russians, who controlled spheres of influence in the south and north of Iran. In 1380, Timur ("Timur the Lame," or, in the west Tamerlane) began to move into the Iranian plateau from the east. Within a decade, the entire area was in his power, bringing a renaissance of culture at Herat (in modern Afghanistan) and other towns, but later rulers lacked the force and ability to hold the empire together. Early in the 16th century a number of smaller, local dynasties emerged throughout Iran. The most powerful was the Safavid dynasty, whose leaders, descendants of a spiritual head of the Shi'a sect, imposed this form of Islam on their subjects. The fourth and greatest of this line, Shah Abbas (r.1587–1628), moved the capital to Esfahan, where he had many splendid buildings constructed. The Safavid period, marked by the emergence of a truly native Iranian dynasty after the lapse of many centuries, was a period of military power and general prosperity. However, decline set in, and in 1722, Esfahan fell to invading forces from Afghanistan. Nadir Shah, an Afshar tribesman from the north, drove off the Afghans and in 1736 established the Afshar dynasty. By the end of the 18th century, Zand rulers, dominant in the south, were replaced by the Qajars, a Turkish tribe.

After a period of chaos, the British arranged for a Persian Cossack officer, Reza Khan, to come to power, first as minister of war in 1921, then prime minister, finally in 1925 as Reza Shah, the first sovereign of the Pahlavi dynasty. With ruthless authority, he sought to modernize Iran along the lines of Atatürk in Turkey. In 1941, suspecting him of pro-German sympathies, the British forced Reza Shah to abdicate in favor of his 21-year-old son, Muhammad Reza. British and Russian forces set up a supply line across Iran to the USSR. In April 1946, the British left, but the USSR refused to withdraw its forces. Under pressure from the UN and the United States, Soviet troops eventually withdrew in December 1946.

Oil, the source of nearly all Iran's national wealth, quickly came to dominate postwar politics. Muhammad Mossadeq, who as leader of the National Front in the national assembly (Majlis)

led the fight in 1947 to deny the USSR oil concessions in northern Iran, became chairman of the oil committee of the Majlis. On 15 March 1951, the Majlis voted to nationalize the oil industry, which was dominated by the Anglo-Iranian Oil Co. (AIOC), a prewar concession to the United Kingdom. When the government of Prime Minister Hosein Ala took no immediate action against the AIOC, the Majlis demanded his resignation and the appointment of Mossadeq, who became prime minister in April. The AIOC was nationalized, but its output rapidly declined when the United Kingdom imposed an embargo on Iranian oil, as well as other economic sanctions. As Iran's economic situation worsened, Mossadeq sought to rally the people through fervent nationalistic appeals. An attempt by the shah to replace him failed in the summer of 1952, but by August 1953, Mossadeq had lost his parliamentary majority, but not his popular support. With the backing of a referendum, Mossadeq dissolved the Majlis and then refused to resign when the shah again tried to oust him. The shah fled Iran for four days but returned on 22 August, with backing from the military, the United States, and the United Kingdom. A new conservative government issued an appeal for aid; in September, the United States granted Iran \$45 million. Mossadeq was convicted of treason in December.

After 1953, the shah began to consolidate his power. New arrangements between the National Iranian Oil Co. and a consortium of US, UK, and Dutch oil companies were negotiated during April–September 1954 and ratified by the Majlis in October. The left-wing Tudeh (Masses) Party, which had been banned in 1949 but had resurfaced during the Mossadeq regime, was suppressed after a Tudeh organization was exposed in the armed forces. In 1957, the government sponsored two new pseudo-parties, which contested parliamentary elections in 1960 and 1961. Meanwhile, Iran became affiliated with the Western alliance through the Baghdad Pact in 1955, later the Central Treaty Organization. (CENTO was dissolved after Iran pulled out in 1979.) Frontier demarcation agreements were signed with the USSR in April 1957.

US assistance and goodwill were plainly essential for the shah. In 1961, President John F. Kennedy urged him to undertake a more liberal program. Under the “white revolution” of 1962–63, the shah initiated land reform, electoral changes (including, for the first time, the right of women to hold and vote for public office), and broad economic development. Opposition to the reform program, the dictatorial regime, and the growing American influence was suppressed. Political dissent was not tolerated.

The shah's autocratic methods, his repressive use of the secret police (known as SAVAK), his program of rapid Westernization (at the expense of Islamic tradition), his emphasis on lavish display and costly arms imports, and his perceived tolerance of corruption and of US domination fed opposition in the late 1970s. The economic boom of the previous 15 years also came to an end. Islamic militants, radical students, and the middle class all joined in the revolt, until virtually the entire population turned against the shah. Following nine months of demonstrations and violent army reactions, martial law was declared in Iran's major cities in September 1978, but antigovernment strikes and massive marches could not be stopped. On 16 January 1979, the shah left Iran, appointing an old-line nationalist, Shahpur Bakhtiar, as prime minister. However, the leader of the Islamic opposition, Ayatollah Ruhollah Khomeini (the term *ayatollah* is the highest rank of the Shi'a clergy), who had spent 15 years in exile, first in Iraq and briefly in France, refused to deal with the Bakhtiar regime. Demonstrations continued, and on 1 February the *ayatollah* returned to a tumultuous welcome in Tehran. He quickly asserted control and appointed a provisional government, which took power after a military rebellion and the final collapse of the shah's regime on 11 February.

After a referendum, Khomeini on 1 April declared Iran an Islamic Republic. However, the provisional government, led by Medhi Bazargan and other liberal civilians, was unable to exercise control; revolutionary groups made indiscriminate arrests and summary executions of political opponents. Increasingly, radical clerics sought to take power for themselves. The crisis atmosphere was intensified by the seizure, on 4 November 1979, of 53 US hostages (50 of them in the US embassy compound in Tehran) by militant Iranian students who demanded the return of the shah from the United States (where he was receiving medical treatment) to stand trial in Iran. Despite vigorous protests by the US government, which froze Iranian assets in the United States, and by the UN over this violation of diplomatic immunity, the hostages were held for 444 days; in the intervening period, a US attempt to free the hostages by military force failed, and the shah died in Egypt on 27 July 1980. The crisis was finally resolved on 20 January 1981, in an agreement providing for release of the prisoners and the unfreezing of Iranian assets. A new constitution providing for an Islamic theocracy was ratified by popular referendum in December 1979. In presidential elections in January 1980, 'Abolhassan Bani-Sadr, a moderate who supported the revolution, was elected president. Later elections to the Majlis resulted in victory for the hard-line clerical Islamic Republican Party (IRP).

In June 1981, President Bani-Sadr was ousted by Khomeini; later that month, a bomb explosion at IRP headquarters in Tehran killed Ayatollah Beheshti, who had been serving as chief justice, as well as 4 cabinet ministers, 20 paramilitary deputies, and dozens of others. Another bombing, on 30 August, killed the new president, Muhammad 'Ali Rajai, and his new prime minister, Muhammad Javad Bahonar. The bombings were ascribed by the government to leftist guerrillas. By 1982, at least 4,500 people had been killed in political violence, and some estimates placed the total much higher. In September 1982, Sadegh Ghotbzadeh, who had been foreign minister during the hostage crisis, was executed on charges of plotting to kill Khomeini and establish a secular government.

Iraq, meanwhile, had taken advantage of Iran's political chaos and economic disorder to revive a border dispute that had been settled in 1975 when Iranian and Iraqi representatives reached agreement on the demarcation of their frontiers and Iran ended its support for rebellious Kurds, who were then defeated by the Iraqi army. Full-scale war erupted in September 1980, when Iraq demanded sovereignty over the entire Shatt al-'Arab waterway. Iraqi forces invaded Khuzistan in the southwest, and captured the town of Khorramshahr and the oil refinery center of Abadan. The Iranian army, decimated by the revolution, was slow to mobilize, but by June 1982 it had driven Iraqi soldiers out of Abadan and Khorramshahr and from all undisputed Iranian territory. Iran then launched its own offensive, invading Iraq and thrusting toward Basra, but failed to make significant gains. At this point the land war became stalemated, with Iranian and Iraqi troops setting up an elaborate system of trenches. In 1983, Iraq broadened the war zone to include oil-tanker traffic in the northern Persian Gulf.

The Iraqis first attacked Iranian oil installations, disrupting, but not stopping, oil exports from the main oil terminal at Kharg Island. In mid-1983, Iraq took delivery of French jets bearing Exocet missiles. Iran responded that it would close the Strait of Hormuz if Iraq used the missiles. The United States declared the strait a vital interest and said it would use military force to keep the strait open because of the large volume of oil that passed through it on the way to the West. During 1983, the Iraqis also began to attack civilian targets in Iran with long-range missiles. The attacks caused heavy casualties, and Iran responded by shelling Iraqi border cities. In 1984, Iran began to attack Arab shipping in the Persian Gulf.

Iranian forces staged a surprisingly effective attack on Iraqi forces in the Fao Peninsula in February 1986. The Iranians now controlled all of Iraq's border on the Persian Gulf and were in reach of the major Iraqi city of Basra. In April, Khomeini renewed his demands for an end to the war: Iraqi President Saddam Hussein must step down, and Iraq must admit responsibility and pay war reparations. Iran rejected all demands for a cease-fire and negotiations until its demands were met.

In November 1986, it was revealed that US National Security Adviser Robert McFarlane had secretly traveled to Iran to meet with government leaders. The United States supplied Iran with an estimated \$30 million in spare parts and anti-aircraft missiles in hopes that Iran would exert pressure on terrorist groups in Lebanon to release American hostages. In the wake of this affair, Iran in 1987 attacked Kuwaiti oil tankers reregistered as American tankers and laid mines in the Persian Gulf to disrupt oil tanker shipping. The United States responded by stationing a naval task force in the region and attacking Iranian patrol boats and oil-loading platforms and accidentally shot down a civilian passenger jet.

As the war continued to take a heavy toll in casualties and destruction and economic hardships persisted on the home front, the clerics maintained firm control through repression and Khomeini's charismatic hold over the people. In 1988, Iran finally yielded to terms for a cease-fire in the war. On 3 June 1989, a few months after calling for the death of novelist Salman Rushdie for blasphemy, Khomeini died of a heart attack. Over 3 million people attended his funeral. He was succeeded as the country's spiritual guide by President Ali Khamenei. On 28 July 1989, speaker of the parliament Ali Akbar Rafsanjani, a moderate, was elected president with 95% of the vote. Iran remained neutral during the Gulf War, receiving (and retaining) Iraqi planes that were flown across the border for safekeeping. Iran also accepted thousands of Kurdish refugees from Iraq to add to its heavy burden of Afghan refugees from the civil strife in that country. Inflation, shortages, and unemployment—the products of revolution, war, and mismanagement—continue to generate widespread popular discontent, fueled also by dissatisfaction with the closed and repressive political system.

President Rafsanjani was reelected by a significantly smaller margin in 1993 but continued to press for free-market economic reforms. Rising prices in the wake of decreased government economic subsidies led to civil unrest in 1994 and 1995. Clerical conservatives led by Khamenei continued to battle the political moderates for dominance in the 1996 parliamentary elections, without a decisive victory for either side. Then, in the presidential election of May 1997, a moderate cleric, Muhammed Khatami, who favored economic reform, a more conciliatory foreign-policy stance, and less rigid clerical control of the government, won over two-thirds of the vote. In spite of continued opposition by Islamic conservatives, Khatami established a more tolerant climate in the country and expanded civil liberties. His policies received a decisive endorsement by the Iranian electorate when a political coalition led by the reformist president won 141 out of 290 parliamentary seats in the February 2000 elections and 189 seats in the May runoff elections, despite the shutdown of over a dozen liberal newspapers by conservative elements in the government in the weeks preceding the May polling. On 8 June 2001, Khatami won a landslide reelection victory, securing nearly 80% of the popular vote.

United States president George W. Bush, in his 29 January 2002 State of the Union address, labeled Iran—along with Iraq and North Korea—an “axis of evil,” responsible for seeking out weapons of mass destruction and supporting terrorists. Khatami, who has long advocated a more pro-Western stance, urged anti-US demonstrators to turn out in large numbers to protest the speech, as the speech had come as a surprise. Although Iran did not support the US-led military campaign in Afghanistan to oust

the Taliban regime in late 2001, it had expressed sympathy for the 11 September 2001 attacks on the United States, and stated that it would aid any US service personnel in need on Iranian territory during the war in Afghanistan. Iran called the United States “ungrateful” for Iran's help in forming a post-Taliban government in Afghanistan, as Iran played a key role at the Bonn conference in December 2001 that established Afghanistan's transitional government. Iran supported a greater role for the UN in Afghanistan, and pledged resources to help train an Afghan army. Iran is concerned with securing its border with Afghanistan, to prevent further destabilization of the region.

In January 2003, Iran urged Iraq to cooperate with UN resolutions requiring it to disarm itself of weapons of mass destruction, in an effort to avoid war. Iran took the position that the United States must not take unilateral military action in the dispute, and said that it would not participate or allow its territory to be used in any military action against Iraq. Iran was again outraged by US president George W. Bush's 28 January 2003 State of the Union address, in which he alleged once again that Iran was developing weapons of mass destruction and supported terrorism.

In recent years, a youth movement has formed representing people who reject the theocracy of Iran's hard-line clerics and the “Islamic democracy” of the reformers. Many seek to live in a state based on the rule of law where the clergy's rule is abolished. In November 2002, Hashem Aghajari, a history professor, was sentenced to death on charges of insulting Islam. He had given a speech in which he stated that each generation should re-interpret aspects of Islam rather than simply following religious leaders. Thousands of students protested against the ruling—the largest in three years. Supreme Leader Ayatollah Khamenei ordered a review of the sentence two weeks after the student protests began. However, the head of the judiciary, Ayatollah Mahmoud Hashemi Shahroudi, stated that normal legal procedures would be followed to reconsider the verdict. Those procedures required an appeal, which Aghajari refused. His lawyer in December issued an appeal, and as of 31 January 2003, the case had not been resolved.

### 13 GOVERNMENT

Before the 1979 revolution, Iran was an absolute monarchy, with the constitution of 1906 modified by a supplement of 1907 and amendments of 1925, 1949, and 1957. The shah was the chief of state, with sweeping powers. He commanded the armed forces, named the prime minister and all senior officials, and was empowered to dissolve either or both legislative houses. The legislative branch comprised the national assembly (Majlis) and the senate. Members of the Majlis were elected for four-year terms from 268 constituencies by adults 20 years of age and older. Half of the 60 senators were named by the shah, and half were elected. Members of the Majlis ostensibly represented all classes of the nation, while the somewhat more conservative Senate consisted of former cabinet ministers, former high officials, and retired generals.

The constitution of December 1979, which was approved in a public referendum and revised in 1989, established an Islamic republic in conformity with the principles of the Shi'a faith. Guidance of the republic is entrusted to the country's spiritual leader (*faqih*) or to a council of religious leaders. An appointed Council of Guardians consists of six religious leaders, who consider all legislation for conformity to Islamic principles, and six Muslim lawyers appointed by the supreme judicial council, who rule on limited questions of constitutionality. In accordance with the constitution, an 86-member Assembly of Experts chooses the country's spiritual leader and may nullify laws that do not conform to Islamic tenets. In 1998, seats on the council (which have eight-year terms) were opened for the first time to nonclerics.

The executive branch consists of a president and council of ministers. The president is elected by popular vote to a four-year term and supervises government administration. Candidates for the presidency and parliament must have the approval of Iran's spiritual leaders. As of 2003, the Majlis consisted of 290 members elected directly to four-year terms. Suffrage is universal for those over age 15.

There were more than 800 candidates for president in 2001, and the Council of Guardians narrowed them to 10. Khatami was the sole moderate, with all of the other candidates having ties to conservative or hard-line parties. On 8 June 2001, Khatami secured 77% of the popular vote, with four-fifths of 43 million eligible voters turning out.

## 14 POLITICAL PARTIES

During the reign of Reza Shah (1925–41), political parties were not permitted to function. After 1941, parties sprang up, but most of them were of an ephemeral nature. The Communist-oriented Tudeh (Masses) Party was better organized than the others and benefited from the services of devoted followers and foreign funds. In 1949, an unsuccessful attempt to assassinate the shah was traced to the Tudeh, and it was banned. It continued to work through front groups, and its views were reflected in some periodicals, but the organization was extinguished in the Shah's post-1953 crackdown.

In 1957, the government created facade political parties, the Nationalist (Mellioun) Party, headed by Manochehr Eqbal, then prime minister, and the People's (Mardom) Party, headed by former prime minister Asadullah Alam (the "loyal opposition"). Neither of these parties ever attracted any popular following. In 1975, the shah ordered the formation of a single political organization, the Iran Resurgence (Rastakhiz) Party, into which were merged all existing legal parties. Three cardinal principles were cited for membership in the party: faith in Iran's constitution, loyalty to the monarchical regime, and fidelity to the "white revolution." This party, like others before it, lacked a popular base.

After the overthrow of the shah's regime in February 1979, new political parties were formed, the most powerful being the Islamic Republic Party (IRP), which took control of the Majlis. However, power was wielded primarily by the military, the president, the clerical elite, and the heads of the banyads, autonomous financial organizations which have considerable power and which were formed from the confiscated wealth of the former royal family and its cronies.

Today Iran's parliament, or Majlis, is made up of various groups representing a spectrum of views ranging from hard-line radical Islam to moderates and liberals. Moderates generally hold less hostile views about the West while still believing in an Islamic republic. In 1997, a moderate politician, Mohammad Khatami, was elected president of Iran. The moderates scored a further triumph in the parliamentary elections of February and May 2000. A moderate reformist coalition headed by Khatami won 189 out of 290 seats in the Majlis, with radical Islamists winning 54, independents 42, and religious minority parties 5. The following organizations had success at the 2000 parliamentary elections: Assembly of the Followers of the Imam's Line, Freethinkers' Front, Islamic Iran Participation Front, Moderation and Development Party, Servants of Construction Party, and the Society of Self-sacrificing Devotees.

## 15 LOCAL GOVERNMENT

Iran is divided into 28 *ostans* (provinces), each headed by a governor-general; the governor-general and district officials of each province are appointed by the central government. The ostans are subdivided into *sharestans* (counties), which are in turn divided into *bakhsh* (districts). Each *bakhsh* consists of two or more *dehistsans*, which are composed of groups of villages or

hamlets. Each of the municipalities (*shahrdarys*) is headed by a mayor. Some sharestan officials are elected; others are appointed by Tehran.

## 16 JUDICIAL SYSTEM

The overthrow of the shah and the approval in 1980 of a constitution making Iran an Islamic state have radically changed Iran's judicial system. The 1980 constitution was revised in 1989.

In August 1982, the supreme court invalidated all previous laws that did not conform with the dictates of Islam, and all courts set up before the 1979 revolution were abolished in October 1982. An Islamic system of punishment, introduced in 1983, included flogging, stoning, and amputation for various crimes. There are two different court systems: civil courts and revolutionary courts.

The judicial system is under the authority of the religious leader (faqih). A supreme judicial council responsible to the faqih oversees the supreme court, which has 33 branches, each branch being presided over by two judges. The Ministry of Justice oversees law courts in the provinces.

The revolutionary courts try cases involving political offenses, narcotics trafficking and "crimes against God." Although the constitution guarantees a fair trial, the revolutionary courts provide almost no procedural safeguards. The trials in revolutionary courts are rarely held in public and there is no guarantee of access to an attorney.

Elements of the prerevolutionary judicial system continue to be applied in common criminal and civil cases. In these cases the right to a public trial and the benefit of counsel are generally respected. In 1995 the government began implementing a law authorizing judges to act as prosecutor and judge in the same case.

The constitution states that "reputation, life, property, (and) dwelling(s)" are protected from trespass except as "provided by law." However, in practice, security forces do not respect these provisions.

## 17 ARMED FORCES

In 2002, the total active armed forces of Iran numbered approximately 520,000 with reserves of 350,000. The army had 325,000 soldiers had four armored divisions and six infantry divisions. Their equipment included 1,565 main battle tanks and about 890 multiple rocket launchers. The air force had personnel numbering 52,000 and 306 combat aircraft. The navy of 18,000 had 3 frigates, 6 submarines, and 56 smaller patrol and coastal combatants. The Revolutionary Guards unit (Pasdaran) had an estimated 125,000-man army and 20,000 sailors and marines. The paramilitary had 40,000 active members of law enforcement forces including border guards. There was a reserve of the Popular Mobilization Army of around 300,000 peacetime volunteers, mostly youths. This number can swell up to 1,000,000. It is believed that Iran is developing the capability of producing nuclear weapons. The official military budget in 2000 was \$9.7 billion or 3.1% of GDP.

## 18 INTERNATIONAL COOPERATION

Iran is a charter member of the UN, having joined on 24 October 1945, and belongs to ESCAP and all the nonregional specialized agencies. Iran is also a member of G-77 and a signatory to the Law of the Sea. It is a founding member of OPEC and a leading supporter of higher petroleum prices. In 1979, Iran withdrew from CENTO, causing its demise.

Iran's revolutionary government has aligned itself with the radical Arab states of Libya and Syria, which were the only Arab countries to support Iran in its war with Iraq. Since before 1979, Iranian foreign policy has been to curtail superpower influence in the Persian Gulf area. It also encourages the Islamization of the

governments throughout the Middle East, in such countries as Sudan, Algeria, Bahrain and Saudi Arabia.

## 19 ECONOMY

A country with a substantial economic potential, Iran witnessed rapid economic growth during the reign of Shah Muhammad Reza Pahlavi. Development of its extensive agricultural, mineral, and power resources was financed through oil revenues. The traditional land tenure system, under which farmers were sharecroppers, was replaced through a land reform program inaugurated in 1962. In addition to carpets, Iran produced a variety of consumer goods and building materials. Oil, however, became the lifeblood of the economy. With the astonishing growth of its oil revenues, Iran became a major world economic power, whose investments helped several industrialized countries pay for their oil needs during the 1970s.

The economy changed drastically after 1979. The war with Iraq, which curtailed oil exports, coupled with the decrease in the price of oil, especially in 1986, sent oil revenues spiraling downward from \$20.5 billion in 1979 to an estimated \$5.3 billion in 1986. This forced annual GDP growth down from 15.2% in 1982 to 0.2% in 1984; GDP was estimated to have fallen by 8% in 1986. The war's drain on the state budget, the drop in oil prices, poor economic management, declining agricultural output, an estimated 1987 inflation rate of 30–50%, and large budget deficits combined to put enormous strains on the economy.

After Iran accepted a UN cease-fire resolution in 1988, it began reforming the economy with the implementation of the Islamic republic's first five-year social and economic development plan for the years 1989–1994. The plan emphasized revitalizing market mechanisms, deregulating the economy, and rebuilding basic infrastructure. These reforms led to economic growth and lowered budget deficits. GDP grew an average 7% a year in real terms over 1989–92. The general government deficit was reduced from 9% of GDP in 1988 to an estimated 2% in 1992. The inflation rate decreased from 29% in 1988 to around 10% in 1990, but had redoubled to 20% in 1991 and 1992.

Other impacts of the first plan included a growth in agricultural production of 5.6%; industrial production of 15%; water, gas and electricity of 18.9%; and transport of 11.9%. In 1991, the government adapted a structural adjustment program similar in nature to the kind the IMF imposes on developing nations in exchange for aid. Iran, however, did not need aid, but rather imposed the adjustments on itself in an effort to liberalize its economy, making it more market-oriented while still retaining an authoritarian regime. The structural adjustments advocated by then-president Rafsanjani included privatizations of state-owned enterprises, deregulation, cutting government subsidies, and encouraging foreign investment. While marginally well-intentioned, the Rafsanjani reforms have led to little economic improvement. Privatization was especially ineffective. Political corruption and rampant cronyism led to many enterprises ending up in the hands of a small clique of well-connected elites. By 1997, 86% of Iran's GDP came from state-owned businesses. Deregulation has also hit considerable snags. In 1996 alone, more than 250 regulations on imports and exports were issued by 24 ministries—many of them repetitive or contradictory.

In April of 1995, the United States imposed trade and investment sanctions against Iran, in reprisal for what the United States believed was Iran's continued support of international terrorism. This move, unduplicated even by the US's strongest allies, has had some economic impact—most notably a precipitous drop in the value of the rial, which the government was forced to prop up.

In 1994 the second five-year plan, running through 1999, was implemented. Its priorities were completion of infrastructure and development projects and an increase in social spending. By

1996, Iran's economy was growing rather steadily at about 4.2%. Inflation, however, continued to be a problem. In 1995 it was above 50% but by the next year it had been brought somewhat under control, having been cut nearly in half to 27%. In 1998, the inflation rate was reported at 24%, and the unemployment rate was at 30%. Annual GDP growth occurred at a rate of 4.7% between 1988 and 1998, but fell to 1.7% in 1998 alone, and was at 2.3% in 1999. The third five-year plan, implemented from 2000 to 2005, was to privatize at least six major state-owned enterprises such as communications and tobacco, and at least 2,000 smaller state-owned firms.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Iran's gross domestic product (GDP) was estimated at \$456 billion. The per capita GDP was estimated at \$7,000. The annual growth rate of GDP was estimated at 5%. The average inflation rate in 2002 was 17.3%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 19% of GDP, industry 26%, and services 55%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$320 million. Worker remittances in 2001 totaled \$326.4 million. Foreign aid receipts amounted to about \$2 per capita.

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$964. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 5%. Approximately 20% of household consumption was spent on food, 32% on fuel, 12% on health care, and 8% on education. It was estimated that in 1996 about 53% of the population had incomes below the poverty line.

## 21 LABOR

The total labor force was estimated at 18 million in 1998. In 2001, 30% of the employed workforce was in agriculture, 25% was in industry, and 45% was in the service industry. As of 1999, unemployment stood at 14%.

The labor code grants workers the right to form and join their own organizations, however, the government-controlled Workers' House is the only authorized national labor organization. The Workers' House controls all workers according to government objectives. Strikes are not permitted. Islamic principles and dress are strictly observed at work with transgressions subjecting the worker to penalties. Workers cannot bargain collectively.

The Labor Law forbids employment of minors under 15 years of age, but these regulations are not enforced. Forced and bonded labor by children remains a serious problem. In 1997, the minimum wage was \$2.80 per day. Many middle class citizens work several jobs to support their families. The Labor Code stipulates a six-day, 48-hour workweek, with one rest day.

## 22 AGRICULTURE

Of Iran's total area, 11% is cultivated, 27% consists of permanent pastures, and 7% is forest and woodland. The remaining 55% consists of wasteland, lakes, mountains, desert, and urban areas. About one-third of the labor force is employed in agriculture. In 1998, the total land area under cultivation was estimated at 18.4 million hectares (45.5 million acres).

Progress in Iranian agriculture was greatly stimulated by the land reform of 1962–63, under which 4,025,680 farmers and their family members had taken title to their land by 1975, after the old land tenure system was abolished. However, with a

rapidly increasing population and a sharply rising standard of living, Iran is no longer self-sufficient in its agricultural production, and food imports have risen steadily in recent years.

In 1999, Iranian agricultural production (in thousands of tons) included wheat, 8,687; sugar beets, 4,987; barley, 1,919; rice, 2,300; grapes, 2,315; apples, 1,944; oranges, 1,749; dates, 918; cotton, 141; tea, 60; and tobacco, 23. Almonds and pistachios are grown primarily for export. In 1999, Iran was the largest producer of pistachios in the world (200,000 tons, or 54% of global production), and the fourth largest producer of almonds (after the United States, Spain and Italy), at 112,000 tons.

As of 1998, some 7.56 million hectares (18.68 million acres) were under irrigation. The fifth development plan (1973–78) envisaged an overall increase of 5.5% in agricultural production, but the revised plan raised the target to 8% annually, rescheduled allocations over six years instead of five, and slowed down the projects. Under the revolutionary government's first five-year plan (1983–88), agriculture was to receive 15.5% of total allocations, with food self-sufficiency the primary objective. However, because of the war with Iraq, planned expenditures were never attained. Moreover, food self-sufficiency still remains only a goal: imports of agricultural products exceeded exports by nearly \$1.5 billion in 2001.

### 23 ANIMAL HUSBANDRY

Not only is animal husbandry the major occupation of nomadic and seminomadic tribes scattered over Iran, but each farming village also keeps flocks that graze on the less productive areas. In 2001 there were 53,900,000 sheep, 25,757,000 goats, 8,500,000 head of cattle, 507,000 water buffalo, 145,600 camels, and 280,000,000 chickens. Cattle are raised as draft animals and for milk and are not fattened for beef. Sheep produce many staple items: milk and butter, animal fat for cooking, meat, wool for carpet making, and skins and hides. Poor weather during the 1970s sharply reduced the domestic flocks, and Iran became an importer of wool. The output of animal products has not kept pace with population growth.

### 24 FISHING

The Caspian Sea provides a seemingly inexhaustible source of sturgeon, salmon, and other species of fish, some of which spawn in the chilly streams that flow into this sea from the high Elburz Mountains. In 2000, the total fish catch was 411,500 tons. Caviar of unrivaled quality is produced by the Iranian Fisheries Co., formerly a joint Russo-Iranian venture but now wholly owned by the government of Iran. About 200,000 kg of caviar are sold per year, most of which is exported, providing a substantial share of the world's supply. Exports of fish products in 2000 amounted to nearly \$50 million. The fishing grounds of the Persian Gulf were long neglected, but during the 1970s new fishing fleets and packing and conserving facilities were established. The Iran-Iraq war and consequent environmental damage retarded the development of fisheries in this region. Total marine catch has more than doubled from 1982–84 levels.

### 25 FORESTRY

About 7.3 million hectares (18 million acres) were covered by forest in 2000. An estimated 1.1 million cu m (39 million cu ft) of roundwood were produced in 2000; about 5% was used for fuel. Along the northern slopes of the Elburz Mountains from near sea level to an altitude of about 2,100 m (7,000 ft) are dense stands of oak, ash, elm, beech, ironwood, cypress, walnut, and a number of other varieties. The high plateau forests of Fars, Kurdistan, Luristan, and Khorasan comprise sparse stands of scrub oak, ash, maple, cedar, wild almond, and pistachio. Date palms, acacias, and tamarisks grow in the Persian Gulf area. The deciduous forests on the Caspian littoral are among the best in the world. The timber industry is controlled by the government; its potential

annual capacity is 3 million cu m (106 million cu ft). In 2000, forest plantations covered 2,284,000 ha (5,643,000 acres). Imports of forest products totaled \$479.6 million in 2000.

A forest ranger school was started in 1957 as an extension of the government's forest service. In 1963, a forestry college was established at Karaj, west of Tehran, to train forestry engineers.

### 26 MINING

Iran possessed extensive and varied mineral resources. Iran was the third-largest producer of gypsum, had the second-largest natural gas reserves and the fifth-largest crude oil reserves, and was the fourth-largest producer of petroleum, which contributed 85% of export earnings in 2002. Of Iran's 2,700 mines, most were privately owned and 2,000 were active, producing 42 minerals—65% produced building and construction materials, and 20% were stone quarries. The mining sector accounted for 24% of Iran's industrial output of \$15.4 billion, and mineral and metal exports amounted to \$645 million. Mineral exports included chromite, refined sulfur, lead, zinc, copper, and decorative stone. Iron, steel, and chemicals were leading export commodities. The petroleum and petrochemicals industries were the top industries in 2002, and the production of cement and other construction materials ranked fourth.

Production of gypsum in 2000 (from the Semnan region, east of Tehran) was 11 million tons, up from 8.57 in 1996; iron ore and concentrate, 5.4 million tons (6.3 in 1997 and 4.8 in 1996); copper ore and concentrate (metal content), 258,000 tons (269,000 in 1999 and 228,000 in 1996); bauxite (gross weight), 400,000 tons (912,451 in 1999 and 150,000 in 1997); chromite concentrate (metal content), 137,000 tons, up from 63,800 in 1996; lead concentrate, 15,000 tons, down from 18,200 in 1997 (most of the lead and zinc was produced from the Angouran, Iranhoh, and Kushk mines); zinc, 85,000 tons, up from 76,500 in 1997; manganese, 32,000 tons; molybdenum, 1,600 tons, up from 600 in 1997; sulfur, 1.35 million tons, up from 900,000 in 1997; and marble (blocks, crushed, and slabs), 7.66 million tons, up from 5 million tons in 1997 (the Tangeh Hanna E Nyriz Mine, in Fars, had an 8 million ton per year capacity). Iran also produced orpiment and realgar arsenic concentrates, gold (most as a coproduct of the Sar Cheshmeh copper complex operations), silver, asbestos, barite, borax, hydraulic cement, clays (bentonite, industrial, and kaolin), diatomite, feldspar, fluorspar, turquoise, industrial or glass sand (quartzite and silica), lime, magnesite, nitrogen (of ammonia and urea), perlite, natural ochre and iron oxide mineral pigments, pumice and related volcanic materials, salt, caustic soda, stone (including granite, marble, travertine, dolomite, and limestone), celestite strontium, natural sulfates (aluminum potassium sulfate and sodium sulfate), and talc. Iran also may have produced ferromanganese, ferromolybdenum, nepheline syenite, phosphate rock, selenium, shell, vermiculite, and zeolite, and had the capacity to mine onyx.

Major iron and copper deposits were found in Kerman Province, and Iran also had deposits of antimony and mica. There was new exploration for copper, gold, and zinc in Zarshuran; for gold on the northwestern Agh Darreh prospect and in Baluchestan; and for copper in the northeastern Halak Abad prospect, the northwestern Hazy Kandy prospect, and in the Sistan-va-Baluchestan Province. An evaluation was being conducted of the porphyry copper deposit of Jabal-Barez region, in Hormozgan Province.

In 2000, the government merged the Ministry of Mines and Metals and the Ministry of Industry to form the Ministry of Industry and Mines. For its third five-year economic development plan (2000–2005), the government proposed to privatize 40 mineral industry companies affiliated with the Ministry of Industry and Mines, having already divested itself of numerous smaller mineral enterprises. Since 1998, the government has allowed foreign investment in solid mineral exploration joint

ventures, and, in 1999, showcased 102 mining and mineral-processing projects at the First International Mines and Metals Investment Forum. There was also anticipation that the United States government, having eased restrictions on the sale of Iranian products, might allow its Iran and Libya Sanctions Act of 1996 to lapse in 2001, thus permitting additional investment in Iran's minerals sector. The Iranian constitution prohibited foreign control over natural resources. To diversify and expand the economy in the wake of declining oil prices in the late 1990s, the government sought to increase metal production.

## 27 ENERGY AND POWER

Iran's oil reserves, estimated at 89.7 billion barrels at the start of 2002, constituted 9% of the world's known reserves and were exceeded only by those of Saudi Arabia, Iraq, the United Arab Emirates, and Kuwait. Iran was the second-largest oil producer among Organization of the Petroleum Exporting Countries (OPEC) countries in 1999.

The first oil concessions were granted by government of Iran (then Persia) in 1872 and 1901, and the first recorded crude oil production began in 1913. Production was carried out by the Anglo-Iranian Oil Co. until the petroleum industry was nationalized in 1951, when the country's oil resources were placed under the management of the National Iranian Oil Co. (NIOC). Late in 1954, active oil properties and facilities were awarded to a consortium of eight foreign companies, later joined by nine others, with US, British, Dutch, and French interests represented. The following year, a joint Italo-Iranian exploration and production company (SIRIP) was formed. The Pan American Oil Co. acquired concession rights in the Persian Gulf in 1958, joining with the NIOC in a new mixed company, IPAC. By 1962, both SIRIP and IPAC were producing from wells in the Persian Gulf. Additional fields were explored, and production grew rapidly.

During the early 1970s, tremendous changes took place in the Iranian oil industry. The 1954 oil participation agreement was terminated, and on 31 July 1973 a new agreement was signed that replaced the concessionary arrangements with a buyer-seller relationship, the major Western oil companies agreeing to purchase crude petroleum under long-term contracts with the NIOC, which was given full control over the industry. In 1980, the revolutionary government ended joint-venture operations with Western oil companies and regrouped them under the Iranian Offshore Oil Co. of the Islamic Republic.

Meanwhile, largely through the concerted action of OPEC, world oil prices rose rapidly; the posted price of Iranian light crude oil increased from \$1.36 a barrel in 1970 to \$37 in 1981 before declining to \$12.75 a barrel in 1989. The Gulf War caused prices to jump to \$23.65 a barrel in 1991; by 1993, the price had declined to \$16.70. In order to stabilize the price of oil, OPEC imposed quotas on its members. Iran consistently criticized the quota system and asked for a larger quota. Despite an OPEC-imposed production ceiling for Iran of 3,359,000 barrels per day (a 9% reduction agreed to in February 1992), petroleum production reached 3,705,000 barrels per day in 1995. However, daily production fluctuated by as much as 350,000 barrels. In 2001, production was 3.8 million barrels per day. More than half of Iran's 40 producing fields contain over 1 billion barrels of oil. Most of the reserves are located in onshore fields in the Khuzestan region. The onshore Ahwaz, Marun, Gachsaran, Agha Jari, Bibi Hakimeh, and Pars fields alone account for half of annual oil production. In 1999 Iran announced its largest oil discovery in 30 years, at the Azadegan field in Khuzestan. It is thought to have reserves totaling as much as 24 billion barrels. Oil revenues rose from \$5.1 billion in 1986 to an estimated \$16.4 billion in 2002, when they accounted for about 90% of total export revenues.

In early 2002, Iran's natural gas reserves were estimated at 22.9 trillion cu m (812 trillion cu ft), or 15% of the world's total reserves. Only Russia possesses larger natural gas reserves. Iran's output declined from 19,869 million cu m in 1973 to 7,300 million cu m in 1982 before climbing back to 59,400 million cu m in 2000. More than one-quarter of Iran's natural gas reserves have been discovered since 1992. Exploitation of natural gas is controlled by the National Iranian Gas Co. In the mid-1990s, Iran began developing extensive gas export plans. Inside Iran, a network of pipelines connects Tehran, Qazvin, Esfahan, Abadan, Shiraz, and Mashhad to Ahvaz and the gas fields. In 1995, Iran played an important role in regional talks concerning the construction of a 3,200 km (2,000 mi) pipeline that would carry gas from Turkmenistan to European markets via Iran, Turkey, and possibly Ukraine. Also in 1995, Iran and Pakistan signed an agreement to ship up to 450 million cu m per day via a 1,600 km (1,000 mi) overland pipeline to Pakistan. At the end of 2001, Iran signed an agreement to build a pipeline to natural transmit gas to Azerbaijan from Khoi in the northwestern part of the country.

Although Iran is one of the world's leading oil-producing countries, Iranian industry formerly depended on other energy sources, such as electricity, coal, and charcoal. Recently, however, oil and especially gas have been used increasingly in manufacturing. In 2000, hydroelectric power plants generated about 6% and conventional thermal facilities 94% of the total electricity production of 114.3 billion kWh. Consumption of electricity in 2000 was 111.9 billion kWh. Iran plans to construct ten nuclear power plants by 2015 in order to provide about 20% of the country's power needs. As of 2000, there were five small nuclear reactors in operation.

## 28 INDUSTRY

Principal industries are oil refining, petrochemicals, steel, and copper. In 1987, there were six primary refineries—at Abadan, Bakhtaran, Tehran, Shiraz, Esfahan, and Tabriz—with a potential capacity of 950,000 barrels per day. In late 1980, Iraqi bombing forced the closure of the Abadan refinery, which had a total capacity of 600,000 barrels per day and was one of the world's largest refineries. Several other refineries suffered lesser damage during the war. The Kharg Island oil terminal also was severely damaged by bombing in 1985. Construction by a Japanese consortium of a \$4-billion petrochemical complex at Bandar-e Khomeini, near the Iraqi border, was halted by the war; by mid-1983, the installation, which was 85% complete, had already been attacked six times. In September 1984, the Japanese withdrew their technicians from the site because of renewed Iraqi bombing. Iran has taken on much of the financial responsibility for the plant, and the ending of all payments of Japanese credits and loans in February 1986 most likely meant that the plant would never be completed according to the original plans. After the ceasefire in 1988, Iran began to rebuild its damaged oil export facilities, concentrating mainly on the rehabilitation of Kharg Island. A 500,000-barrel reservoir terminal at Uhang Island was put into operation in March 1993. The oil complex on the southern island of Lavan was reopened after reconstruction at the end of April 1993. The Abadan refinery became again operational at 200,000 barrels per day in May 1993. Isfahan's oil production unit became operational in 1992/93, while the construction of a new refinery at Bandar Abbas was underway. Major refinery products are motor fuel, distillate fuel oil, and residual fuel oil. Oil refining manufacturers had a combined capacity of 1.47 million barrels per day in 2000.

The natural gas industry has boomed in Iran, with the third-largest proven reserves in the world. In 1990, the site was appraised at one-eighth of its true size, which was discovered in 1996. In 1998, Iran produced 1.9 trillion cubic feet of natural gas.

The Abadan plant for the production of plastics, detergents, and caustic soda was completed in the 1960s. Since then, the petrochemical industry has expanded considerably. It has been the main element of the post-war industrialization program. The heavy metals industry began in 1972 with the start of steel production at Esfahan National Steel Mill in Esfahan. It was also given priority by the Rafsanjani government. Manufactured goods include diesel engines, motor vehicles, television sets, refrigerators, washing machines, and other consumer items.

The textile industry has prospered in recent years with increased production of cotton, woolen, and synthetic fabrics. The making of handwoven carpets is a traditional industry in Iran that flourishes despite acute competition from machine-made products. However, carpet exports declined throughout the war years. To promote self-sufficiency, Iran has encouraged development of the food-processing, shoemaking, paper and paper products, rubber, pharmaceutical, aircraft, and shipbuilding industries. Other industrial products include cement, nitrogenous fertilizer, phosphate fertilizers, and refined sugar.

Iran's industrialization program was set back by the political turmoil and labor disruptions of the late 1970s and by the revolutionary government's nationalization of industries in the summer of 1979, causing a flight of capital and trained managers. However, the sector recovered somewhat by 1983/84, when industrial production registered a 23% gain, according to the government.

A more recent development plan (1989/90–1993/94) has increased funding to develop heavy industry. A privatization decree in June 1991 led to the identification of 390 public manufacturing and trading firms for divestiture; of these, 185 were already been divested. Industrial production grew at a rate of 5.3% from 1988 to 1998, as opposed to a -3.4% rate during the 1970s. Market reforms were set to continue after 2000.

## 29 SCIENCE AND TECHNOLOGY

The "white revolution" of the 1960s, which emphasized industrialization, involved the importation of petroleum technology and the training of Iranian technicians abroad, but it did not improve Iran's indigenous technology. The principal scientific institution in Tehran is the International Scientific Research Institute, founded in 1955. Specialized learning societies include the Iranian Mathematical Society and the Iranian Society of Microbiology, both headquartered in Tehran. Also in the city are the Animal Husbandry Research Institute and the Institut Pasteur. Iran has 37 universities offering degrees in basic and applied sciences. Following the removal of the Shah and the formation of an Islamic revolutionary government, Iran suffered a "brain drain" as foreign-trained scientists and engineers either fled the country or refused to return after their education. In 1987–97, science and engineering students accounted for 37% of college and university enrollments.

## 30 DOMESTIC TRADE

Outside the major cities, most goods are sold in small shops or open-air markets. Most large enterprises are controlled by the state. Privately owned shops for trade and services are typically small. Textile industries are located in Esfahan and Shiraz. Kereman is known for production and distribution of fine carpets. Hamadan is an important trade center for agricultural products from the surrounding areas.

In summer, offices open as early as 7 AM and close at about 1 PM; during the rest of the year the hours are 8 AM until 4 PM, with a rest period in the middle of the day. Since Friday is the official holiday, many establishments close early on Thursday afternoon. Banking hours in summer are 7:30 AM to 1 PM and 5 to 7 PM, Saturday–Wednesday, and 7:30 to 11:30 AM on Thursday; winter opening times are 30 minutes to an hour later.

## 31 FOREIGN TRADE

In 2000, major imports included machinery, military supplies, metal works, food, pharmaceuticals, technical services, and refined oil products.

Iran's most expensive export is crude petroleum, which accounts for the majority of its commodity exports revenues (87%). Other exports include floor coverings (2.6%) and fruits and nuts (1.7%). Iran accounts for 10% of the world's carpet exports.

Figures for Iran's exports should not be considered entirely reliable. Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United Arab Emirates	409	1,008	209
Germany	370	1,391	-1,067
Turkey	198	232	-36
Italy	190	813	167
China (inc. Hong Kong)	180	634	-204
India	144	222	285
Japan	88	663	1,268
Russia	71	804	139
Spain	60	323	83
Canada	59	654	61

## 32 BALANCE OF PAYMENTS

Throughout the 1960s and 1970s, Iran had a favorable trade balance, but substantial imports of services resulted in an annual deficit on current accounts. Long-term capital inflows from private sources reached a peak in 1965; between 1968 and 1973, capital from foreign governments played a prime role in Iranian development. By 1974, with a net trade surplus of \$17,718 million and a current accounts surplus of \$10,893 million, Iran was one of the world's major exporters of capital. The current accounts balance remained in surplus annually until the massive economic and civic turbulence caused by the revolution of 1979 and the long, devastating war with Iraq (1980–88). By the time the war had ended, Iran's position as a net foreign creditor was badly eroded due to a substantial drop in the world price for oil and a sharp increase in dependence on imports—largely machinery and basic commodities to rebuild infrastructure. By 1993, Iran owed foreign creditors nearly \$30 billion. In following years, the government, still plagued by lessening oil revenues and a quota of production imposed on it by OPEC, was forced to reschedule the debt—with payments coming due in 1996, when foreign debt went down to approximately \$22 billion. Foreign debt stood at approximately \$8.2 billion in 2002. Increases in oil output in 2003 drove economic growth, but oil prices were forecast to decline in 2004, which would negatively affect the current account.

The US Central Intelligence Agency (CIA) reports that in 2002 the purchasing power parity of Iran's exports was \$24 billion while imports totaled \$19.6 billion resulting in a trade surplus of \$4.4 billion.

The International Monetary Fund (IMF) reports that in 2000 Iran had exports of goods totaling \$28.4 billion and imports totaling \$15.2 billion. The services credit totaled \$1.4 billion and debit \$2.3 billion. The following table summarizes Iran's balance of payments as reported by the IMF for 2000 in millions of US dollars.

<b>Current Account</b>	<b>12,645</b>

### 33 BANKING AND SECURITIES

The Iranian fiscal year begins on 21 March and runs through 20 March of the following calendar year. Before the modern era in Iranian banking, which dates to the opening of a branch of a British bank in 1888, credit was available only at high rates from noninstitutional lenders such as relatives, friends, wealthy landowners, and bazaar money lenders. As recently as 1988 these noninstitutional sources of credit were still available, particularly in the more isolated rural communities. The Central Bank of Iran-Bank Markazil-established by the Monetary and Banking Law of 1960, issues notes, controls foreign exchange, and supervises the banking sector.

The revolutionary government nationalized all commercial banks shortly after taking office in 1979 and announced that banking practices would be brought in line with Islamic principles, which include a ban on interest payments. By 1993 there were five Islamic banks, which had incorporated the previous banks. Instead of paying interest, the new banks give "guaranteed returns" or commissions on loans; the commissions, which equal 4% of the loan's total, were introduced in 1984, and were known as "profit sharing." In Islamic terms, this meant that profit (interest) was acceptable only if a lender's money was "not at risk."

In 1991 measures to promote competition between banks, and to loosen Bank Markazi's control in order to encourage savings within the official banking sector were introduced. In 1994 Bank Markazi introduced reforms allowing private banking operations to register officially and offer most services in competition with the public sector. However, the raft of new currency and export regulations that followed the collapse of the rial in April 1995 put the recently legalized private sector under huge pressure because, for many of the bazaar traders, currency dealings represented a significant share of their total business. There is a basic lack of confidence in the banking system. Many informal banking operations are run from the bazaars. In addition, Iranians who are able to do so operate bank accounts outside the country, importing funds as needed rather than using the domestic system.

Bank Melli, which has acted for the central bank, handles most Iranian banking operations outside the country. The requirements to abide by Islamic principles were never imposed on Bank Melli. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$71.7 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$153.6 billion.

The Tehran Stock Exchange, locally known as the Bourse, was created in 1968. Three years later, the National Bank of Iran and the Industrial and Mining Development Bank of Iran joined with the US firm of Merrill Lynch, Pierce, Fenner and Smith to begin international brokerage activities in Iran. The exchange has stayed open since the revolution but did not play a significant role in the nation's business until the 1990s. Since 1989, the stock

exchange has expanded continuously. A total of 344 companies were being traded and the capitalization of the exchange was reported to be nearly \$26 billion in mid-2003.

### 34 INSURANCE

The insurance industry in Iran had barely started in 1960, and had a negligible role in the accumulation of funds to finance development, largely because insurance was not used by most of the population. On 25 June 1979, the revolutionary government announced the nationalization of all insurance companies. Under a 1971 Act of Parliament, all companies operating in Iran must cede 25% of total acquired nonlife business, and 50% of life business, to Bimeh Markazi Iran, the Central Insurance Co. of Iran. The company writes all classes of insurance and reinsurance. In 2001, there was \$72 million of life insurance premiums written.

### 35 PUBLIC FINANCE

Iran's fiscal year coincides with its calendar year, beginning on 21 March. The budget is prepared by the Finance Ministry and submitted to Parliament. Trade reforms implemented since 1991 have boosted economic growth and reduced budget deficits. The general government deficit fell from 9% of GDP in 1988 to 2% in 1992, but was up to almost 7% again in 1998. By 2002, however, external debt was equivalent to less than 2% of GDP as a result of market reforms.

The US Central Intelligence Agency (CIA) estimates that in 2001 Iran's central government took in revenues of approximately \$24 billion and had expenditures of \$22 billion. Overall, the government registered a surplus of approximately \$2 billion. External debt totaled \$8.2 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

<b>REVENUE AND GRANTS</b>	<b>64.2%</b>	<b>15,410</b>
Tax revenue	4.0%	956
Non-tax revenue	58.7%	14,077
Capital revenue	1.6%	378
<b>EXPENDITURES</b>	<b>100.0%</b>	<b>22,000</b>
General public services	4.0%	869
Defense	14.3%	3,154
Public order and safety	5.0%	1,110
Education	18.6%	4,091
Health	6.5%	1,429
Social security	16.5%	3,620
Housing and community amenities	5.8%	1,280
Recreation, cultural, and religious affairs	3.1%	678
Economic affairs and services	14.8%	3,245
Other expenditures	10.8%	2,383
Interest payments	0.6%	141

### 36 TAXATION

Under tax laws written in May of 1992, individual income is taxed at rates varying from 12–54%. Capital gains and investment income are also taxable, and employees pay a 7% social security contribution. Corporate income, which is also taxed at between 12% and 54%, varies among corporations, partnerships, and branches of foreign corporations. The taxable income of a company is subject to a 10% company tax, and the balance is subject to the income tax rates above. Also levied are real estate taxes, municipal tax, and a 23% levy on expatriate salaries. A new value-added tax of 1% of a manufacturing company's sales can be collected. Another tax is a public

education cost levy to be paid by manufacturing and service companies.

### 37 CUSTOMS AND DUTIES

Most goods entering Iran are subject to customs duties, the majority of which are on the CIF (cost, insurance, and freight) value. A number of government organizations and charitable institutions have been permitted to import their requirements free of duty. The government has been considering eliminating quantitative trade restrictions and reducing tariff levels, with a maximum rate of 30% for most goods. The average tariff was 6.1% in 2002 according to a World Bank study, down from 18.9% in 2000.

### 38 FOREIGN INVESTMENT

Until the early 1970s, Iran rarely participated in foreign businesses. The National Iranian Oil Company (NIOC) did invest in the construction of oil refineries in Madras, India, and other places, and it participated in several mixed ventures with foreign oil firms that held concessions for Iranian oil. But with the vast increase in oil revenues, Iran became one of the world's leading creditor nations; in 1974 alone, bilateral agreements worth hundreds of billions of rials were signed with France, West Germany, Italy, and the United Kingdom. In July 1974, Iran agreed to purchase a 25% interest in the German steel-making firm of Krupp Hüttenwerke, an investment believed to be the largest single stake purchased by any oil-producing nation in a major European firm up to that time. In 1975, Iran began negotiating investments through the UNDP in developing nations.

Prior to World War II, foreign companies had important investments in Iranian banks, insurance companies, transport, and the oil industry. In 1955, the legislature enacted a law providing for withdrawal of invested capital in the currency that was brought into Iran, for the export of annual profits, and for adequate compensation in the event of nationalization of the industry or business. In 1957, the United States and Iran exchanged notes recognizing that the United States would guarantee its private investments in Iran against loss through actions by Iran, and the following year the Majlis enacted a law protecting foreign capital investments. Foreign companies moved into Iran to exploit mineral resources, to establish banks in partnership with Iranian capital, to build factories, and to carry out segments of the shah's vast economic development program.

Since 1979, the instability of the revolutionary government and the catastrophic war with Iraq have had a chilling effect on western investment in Iran. As of 1995, the United States has imposed investment restrictions on US firms, and, in general, Iran looks with official disfavor on reliance upon the west for investment. The economic reality, however, is that the country emerged from the war with Iraq in terrible economic shape. In 1995, desperate for western assistance in rebuilding its oil sector, Iran contracted with the French Oil Company, Total, to develop its Sirri oil field. It is the first instance of foreign investment in the vital petroleum sector since the 1979 revolution. In 1995, Iran had negative direct foreign investment of about \$50 million, reflecting repatriation of profits greater than inflows of new investment. Foreign direct investment was almost non-existent in 1998.

### 39 ECONOMIC DEVELOPMENT

Iran's first development plan (1949–56) foundered because of the lack of oil revenues during the nationalization dispute and also because the IBRD refused to lend the hoped-for one-third of the projected development expenditures. The second plan (1956–63) also ran into financial difficulties when the domestic budget consumed a larger proportion of the oil revenues than expected. An austerity program from 1960, however, facilitated economic

recovery. The third plan (1963–68) was successful, and the period witnessed rapid economic growth. This plan placed emphasis not only on the building of an infrastructure but also on quick-payoff projects making use of local resources. The private sector exceeded the target planned for investment. Substantial foreign aid, varied in its sources, was also forthcoming, and foreign investment in Iran totaled more than \$2.7 billion. The fourth plan (1968–73) was far more successful than the previous ones, with most of its objectives realized beyond expectation. The mean annual GNP growth was 11.2%, as compared with the projected figure of 9%. Similarly, per capita GNP rose to about \$560 (\$300 had been the goal).

In its revised form, the fifth plan (1973–78) provided for infrastructural development and other expenditures. However, a lag in oil revenues led to rescheduling of the plan for six years instead of five and the postponement or slowdown of individual projects. Because of political opposition and social unrest during the last year of the shah's reign, the plan was abandoned in 1978. The Islamic government that came to power in 1979 cut economic development funds because of a shortage of revenues, but in 1983 it proposed its own five-year development plan for 1983–88, with allocations totaling \$166 billion and emphasis given to agriculture and service industries. However, the government's cutbacks on oil production (and, consequently, of the oil revenues that were to finance the plan), coupled with the diversion of resources to the war with Iraq, made it impossible to fulfill the plan's goals. The plan was revised twice after its introduction; in January 1986 the Parliament approved the outline of the revised plan, details of which were not available. The original plan called for 15.5% of development funds to be spent on agriculture, 5.3% on oil, 52.2% on industry and mines, and 27% on services.

The five-year plan (1989/90–1993/94) authorized up to \$27 billion in foreign borrowing. It aimed to increase productivity in key industrial and economic sectors and to promote the non-oil export sector. The 1994/95–1998/99 plan aimed at investing money in transport, particularly in the railroad system and in the construction of a public underground for Tehran. Other projects were aimed at revitalizing the petroleum sector and developing the natural gas sector.

### 40 SOCIAL DEVELOPMENT

Traditionally, the family and the tribe were supplemented by Islamic waqf (obligatory charity) institutions for the care of the infirm and the indigent. Iran's monarchical system was slow to awaken to the responsibility of the state in this respect. Social welfare programs include workers' compensation, disability benefits, maternity allowances, retirement benefits, death benefits, and family and marriage allowances. These programs cover only employed persons in specific occupations and geographical areas. There were also special pension systems in force for public employees. Old-age benefits were a percentage of average earnings multiplied by the number of years of contributions. Survivor benefits are 50% of the descendant's pension.

The human rights abuses that characterized the shah's regime were, if anything, intensified after his overthrow. The government rejected the principle of the universality of human rights, and argued that Islamic rather than Western precepts should be used in determining the rights of citizens. The revolutionary government was accused of conducting arbitrary arrests and summary trials, of using torture in interrogating political prisoners, and of persecuting such religious minorities as Baha'is and Jews.

The imposition of Islamic fundamentalism brought with it censorship of all media and a revocation, in large part, of the emancipation of women achieved during the previous regime. Women face legal and informal discrimination. Wearing of the

chador, the traditional cloak, was reimposed and vigorously enforced, together with gender separation in public places. Family and property laws favor men, women's testimony in court is worth half that of men. Muslim men may marry non-Muslim women, but Muslim women are not free to marry non-Muslim men. Women must receive the permission of their father or husband to obtain a passport. Domestic abuse and violence against women is not publicly discussed, and rape is a widespread problem.

The Jewish, Christian, and Baha'i minorities face government discrimination in areas including education, employment, public accommodations. They also suffer harassment and abuse.

Serious human rights abuses persist including summary execution, disappearance, torture, rape, stoning, flogging, arbitrary arrest and detention, and harsh prison conditions. In spite of the installation of more moderate leaders since the death of Ayatollah Khomeini, the Iranian government continues to restrict freedoms of speech, assembly, religion, association, and the press.

#### 4<sup>1</sup>HEALTH

In 1999, there were 54 reported cases of tuberculosis per 100,000 people; one quarter of visits to health centers have been attributed to respiratory disease. Health expenditure comprised 4.2% of the gross domestic product as of 1999. Beginning in the 1960s, national campaigns against such major diseases as malaria and smallpox were undertaken. Other major health problems included high infant mortality, smallpox outbreaks, venereal disease, trachoma, typhoid fever, amoebic dysentery, malaria, tuberculosis, and the debilitating effects of smoking opium. The creation in 1964 of a health corps, consisting of physicians and high-school graduates who agreed to spend the period of their military service serving in semimobile medical units in rural areas, helped to reduce the death rate. Roving health corps teams, comprising a doctor, a dentist, a pathologist, and (when possible) a nurse, served the villages, offering medical services to 10,000–15,000 rural inhabitants annually. As of 2002, the death rate was estimated at 5.4 per 1,000 people. The infant mortality rate in 2000 was 33 per 1,000 live births.

The Islamic republic has continued to provide health care programs to rural areas. As of 1999, there were an estimated 0.9 physicians and 1.6 hospital beds per 1,000 people. In 1991, there were 4,847 dentists in Iran. Many physicians left the country after the 1979 revolution and health conditions were reportedly deteriorating; however, by the mid-1980s, many doctors who had been in exile during the shah's reign had returned. Between 1989–95, 80% of the population had access to health care services. As of 1999, total health care expenditure was estimated at 4.2% of GDP. Average life expectancy in 2000 was estimated at 69 years for both women and men. In 2000, 95% of the population had access to safe drinking water and 81% had adequate sanitation. Some form of contraceptive was used by 73% of married women ages 15–49 as of 2000. Iran's estimated birth rate in 2002 was 17.5 per 1,000 people. In 1994, children up to one year old were immunized against tuberculosis, 100%; diphtheria, pertussis, and tetanus, 95%; polio, 95%; and measles, 95%.

The prevalence of low birth weight babies has risen from 4% of all births in 1980 to 10% in 1999. As of 2000, 16% of all children were malnourished. Cholera was reported in 2,177 individuals. Malaria cases are high; in 1993 there were 65,000 reported cases. AIDS was documented in only seven cases. As of 1999, the prevalence of HIV was less than 0.01 per 100 adults.

#### 4<sup>2</sup>HOUSING

Rapid urbanization and migration of refugees into the country have made housing one of the country's most acute social problems. Although housing has always been given top priority in development plans, the gap between supply and demand for

dwelling has grown increasingly wide. During the fourth plan (1968–73), nearly 300,000 housing units were built, but because some 120,000 new families were added to the urban population during that period, the average density rose from 7.7 to 8.5 persons per dwelling. During the same period, the national urban housing deficit rose from 721,000 to 1.1 million units. However, housing starts fell sharply after the 1979 revolution, as construction declined precipitously because of lack of funding (construction of all buildings dropped by 21% in 1981/82 and 24% in 1982/83).

in the Second Five-Year Development Plan (1995–2000), the government presented programs focused on attracting private sector investment and approving legal and economic measures that could result in the construction and availability of 2,500,000 housing units. As of 2003, data concerning the completion of these projects was unavailable to this publication.

According to 1996 national statistics, there were about 12,349,003 private households in permanent dwellings. About 38,940 households were listed as "unsettled," which is to say they were either homeless or nomadic.

In 1986 (the latest year for which such statistics are available), 43% of all housing units were constructed of brick with iron beams, 19% were adobe and wood, 16% were brick with wooden beams, 10% were adobe and mud, 5% were cement block, and 3% were iron with a cement skeleton. Electricity was available in 84% of all housing units, 95% had a water toilet, 75% had piped water, 54% had a kitchen, and 47% had a bath.

#### 4<sup>3</sup>EDUCATION

Literacy training has been a prime concern in Iran. For the year 2000, adult illiteracy rates were estimated at 23.1% (males, 16.3%; females, 30.0%). A literacy corps was established in 1963 to send educated conscripts to villages. During its first 10 years, the corps helped 2.2 million urban children and 600,000 adults become literate. In 1997, there were 9,238,393 pupils enrolled in 63,101 primary schools, with 298,755 teachers. The student-to-teacher ratio stood at 31 to 1. In that same year, secondary schools had 8,776,792 students and 280,309 teachers. The pupil-teacher ratio at the primary level was 26 to 1 in 1999. In the same year, 83% of primary-school-age children were enrolled in school. As of 1999, public expenditure on education was estimated at 4.6% of GDP.

Education is virtually free in Iran at all levels, from elementary school through university. At university level, however, every student is required to commit to serve the government for a number of years equivalent to those spent at the university. During the early 1970s, efforts were made to improve the educational system by updating school curricula, introducing modern textbooks, and training more efficient teachers.

The 1979 revolution continued the country's emphasis on education, but Khomeini's regime put its own stamp on the process. The most important change was the Islamization of the education system. All students were segregated by sex. In 1980, the Cultural Revolution Committee was formed to oversee the institution of Islamic values in education. An arm of the committee, the Center for Textbooks (composed mainly of clerics), produced 3,000 new college-level textbooks reflecting Islamic views by 1983. Teaching materials based on Islam were introduced into the primary grades within six months of the revolution.

The tradition of university education in Iran goes back to the early centuries of Islam. By the 20th century, however, the system had become antiquated and was remodeled along French lines. The country's 16 universities were closed after the 1979 revolution and were then reopened gradually between 1982 and 1983 under Islamic supervision.

While the universities were closed, the Cultural Revolution Committee investigated professors and teachers and dismissed

those who were believers in Marxism, liberalism, and other "imperialistic" ideologies. The universities reopened with Islamic curriculums. In 1997, all higher-level institutions had 40,477 teachers and enrolled 579,070 students. The University of Tehran (founded in 1934) has 10 faculties, including a department of Islamic theology. Other major universities are at Tabriz, Mashhad, Ahvaz, Shiraz, Esfahan, Kerman, Babol Sar, Rasht, and Orumiyeh. There are about 50 colleges and 40 technological institutes.

#### 44 LIBRARIES AND MUSEUMS

Public libraries and museums are fairly new in Iran. The National Library at Tehran has a good general collection of about 590,000 volumes as of 2002. The Library of Parliament, with 170,000 volumes, has an extensive collection of manuscripts and an unrivaled collection of documentary material in Farsi, including files of all important newspapers since the inception of the press in Iran. The Central Library of the University of Tehran holds some 650,000 volumes.

Tehran has the Archaeological Museum, overflowing with fabulous treasures from the long cultural and artistic history of Iran, and the Ethnological Museum. Iran's crown treasures—manuscripts, jeweled thrones, and a vast variety of other objects—may be seen at the Golestan Palace. Museums at Esfahan, Mashhad, Qom, and Shiraz feature antique carpets, painted pottery, illuminated manuscripts, and fine craftsmanship in wood and metal; most of these objects date from the 12th to the 18th centuries.

#### 45 MEDIA

Telegraph, telephone, and radio broadcasting services are state-owned. In 1997 there were 6.3 million telephone lines in service. In 1998, there were an additional 265,000 cellular phones in service. In 1996, 25 regional telecommunications authorities were formed to oversee paging services and cellular systems.

Both radio and television were nationalized in 1980. Principal stations are located in Tehran, and other major stations broadcast from Ahvaz, Zahedan, Tabriz, Rasht, Kermanshah, and Bandar-e Lengeh. As of 1999 there were 72 AM and 6 FM radio stations and 28 television broadcast stations. Television of Iran, a privately owned station, began broadcasting in 1956 in Tehran and Abadan. The national radio organization and the government television network were merged in 1971 to form National Iranian Radio and Television (NIRT). After 1979, it became the Islamic Republic of Iran Broadcasting Company. In 2000, Iran had 281 radios and 163 television sets for every 1,000 people. In 2001, there were 250,000 Internet subscribers served by eight service providers.

Until 1979, the local press operated under a law enacted by Parliament in 1955. To obtain licenses, newspaper owners had to have a B.A. degree, good character, and funds adequate for publishing for a stated period. Suspension of publication, fines, and imprisonment resulted from such violations of the law as printing false news or attacks on the royal family, revealing military secrets, and printing material injurious to Islam. At the time of the Khomeini revolution, Iran had 39 daily newspapers with a total circulation of about 750,000. The constitution of 1979 strictly limited freedom of the press; a new press law required publications to be licensed, and their editors were subject to imprisonment for printing reports the religious authorities deemed insulting. Newspapers that had favored the shah were closed down, and others considered unsympathetic to the ruling IRP were banned. In 1985, Khomeini stated "constructive" press criticism of the government would be allowed, but the government severely restricted all media, punishing all instances of criticism against the government or of Islam by imprisonment and beatings. As of 1999, there were reports of continuing government infringement on freedom of the

press. Among Iran's most widely read newspapers are *Ettela'at* (2002 circulation 500,000) and *Kayhan* (350,000). *Alik* (3,400) is an Armenian daily, *Journal de Teheran* (8,000) is in French, and *Teheran Times* (7,700) is in English. There are also several weeklies and special interest magazines. Most print media originate in Tehran.

#### 46 ORGANIZATIONS

Long renowned for their individualism, Iranians now actively associate with modern public and private organizations. Under the shah, the government greatly encouraged the growth of the cooperative movement; the first Workers' Consumers Society was established in 1948. Many villages have founded producers' cooperatives with official advice and support, and consumers' cooperatives exist among governmental employees and members of the larger industrial and service organizations. Rural cooperative societies are wide spread.

Private charitable organizations date from as early as 1923, when the Iranian Red Lion and Sun Society (corresponding to the Red Cross/Red Crescent) was established. Other charitable institutions include the Organization for Social Services and the Mother and Infant Protection Institute. The Islamic Women's institute is active. The Society to Combat the Use of Opium has waged a campaign against use of the drug. The Boy Scout movement in Iran began before World War II. The Chamber of Commerce, Industries, and Mines has its headquarters in Tehran.

#### 47 TOURISM, TRAVEL, AND RECREATION

Principal tourist attractions include historic and beautifully decorated mosques, mausoleums, and minarets. There are many sports and physical culture societies in Tehran and the provinces; emphasis is upon skiing and weight lifting.

Tourism, which had been stagnant since the 1979 revolution, has begun to grow since the death of Ayatollah Khomeini and the government's attempts to establish closer ties with the West. In 1999, 1,320,690 tourists visited Iran, over 50% from Europe. Tourism receipts totaled \$662 million. That year there were 22,321 hotel rooms with 46,826 beds.

According to 1999 UN estimates, the cost of staying in Iran was approximately \$142 per day.

#### 48 FAMOUS IRANIANS

The long history of Iran has witnessed many conquerors, wise rulers and statesmen, artists, poets, historians, and philosophers. In religion, there have been diverse figures. Zoroaster (Zarathushtra), who probably lived in the 6th century BC, founded the religion known as Zoroastrianism or Mazdaism, with Ahura-Mazda as the god of good. In the 3d century AD, Mani attempted a fusion of the tenets of Mazdaism, Judaism, and Christianity. The Bab (Sayyid 'Ali Muhammad of Shiraz, 1819–50) was the precursor of Baha'ism, founded by Baha' Allah (Mirza Husayn 'Ali Nuri, 1817–92).

Persian rulers of the pre-Christian era include Cyrus ("the Great"; Kurush, r.550–529 BC), Cambyses II (Kambuiya, r.529–522 BC), Darius I ("the Great"; Darayavaush, r.521–486 BC), Xerxes I ("the Great"; Khshayarsha, r.486–465 BC), and Artaxerxes I (Artakhshathra, r.464–424 BC). Shah 'Abbas (r.1587–1628) expanded Persian territory and conquered Baghdad. Prominent political figures of modern times are Reza Shah Pahlavi (1877–1944), who reigned from 1925 to his abdication in 1941; and his son, Muhammad Reza Pahlavi (1919–80), who was shah from 1941 until his abdication in 1979. Until his death in 1989, Iran was under the leadership of Ayatollah Ruhollah Khomeini (1900–89).

The great epic poet Firdawsī (Abdul Qasim Hassan ibn-i-Ishaq ibn-i Sharafshah, 940–1020), writing about AD 1000, produced the *Shahnama* (*Book of Kings*), dealing with four ancient dynasties and full of romantic and heroic tales that retain their

popularity today. Omar Khayyam (d.1123?), astronomer and poet, is known in the Western world for his *Rubáiyât*, a collection of quatrains freely translated by Edward Fitzgerald. Important figures of the Seljuk period (11th and 12th centuries) include Muhammad bin Muhammad al-Ghazali (1058–1111), philosopher and mystic theologian, who exerted an enormous influence upon all later speculative thought in Islam; Farid ad-Din ‘Attar (Muhammad bin Ibrahim, 1119–1229?), one of the greatest of mystic poets; and Nizami (Nizam ad-Din Abu Muhammad, 1141–1202), noted for four romantic epic poems that were copied and recopied by hand and illuminated with splendid miniatures. In the 13th century, Jalal ad-Din Rumi (1207–73) compiled his celebrated long mystic poem, the *Mathnavi*, in rhyming couplets; and Sa‘di (Muslih ud-Din, 1184?–1291), possibly the most renowned Iranian poet within or outside of Iran, composed his *Gulistan* (*Rose Garden*) and *Bustan* (*Orchard*). About a hundred years later, in 1389, another poet of Shiraz died, Hafiz (Shams ud-Din Muhammad); his collected works comprise nearly 700 poems, all of them ghazals or lyrical odes.

Poets of the modern period include Iraj Mirza (1880–1926), Mirzadeh Eshqi (d.1924), Parveen Ettasami (d.1941), and the poet laureate Behar (Malik ash-Shuara Bahar, d.1951). Preeminent among prose writers was Sadeq Hedayat (1903–51), author of the novel *Buf i kur* (*The Blind Owl*) and numerous other works, including films.

Miniature painting came to full flower in the second half of the 15th century. The greatest figure in this field was Bihzad, whose limited surviving work is highly prized. The School of Herat was composed of his followers.

#### 49 DEPENDENCIES

Iran has no territories or colonies.

# IRAQ

Republic of Iraq  
*Al-Jumhuriyah al-'Iraqiyah*

**CAPITAL:** Baghdad

**FLAG:** The national flag is a tricolor of red, white, and black horizontal stripes, with three five-pointed stars in green in the center of the white stripe. In 1991 the phrase *Allahu Akbar* ("God is Great") in green Arabic script was added between the stars.

**ANTHEM:** *Al-Salaam al-Jumburi* (*Salute of the Republic*).

**MONETARY UNIT:** The Iraqi dinar (ID) is a paper currency of 1,000 fils. There are coins of 1, 5, 10, 25, 50, 100, and 250 fils, and notes of 250 and 500 fils and 1, 5, 10, 50, and 100 dinars. As of May 2003, 1ID = \$.0008547 (or \$1 = ID1,170) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but weights and measures in general use vary, especially in domestic transactions. The unit of land is the dunam, which is equivalent to approximately 0.25 hectare (0.62 acre).

**HOLIDAYS:** New Year's Day, 1 January; Army Day, 6 January; 14th Ramadan Revolution Day, 8 February; Declaration of the Republic, 14 July; and Peaceful Revolution Day, 17 July. Muslim religious holidays include 'Id al-Fitr, 'Id al-'Adha', Milad an-Nabi, and Islamic New Year.

**TIME:** 3 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Present-day Iraq, comprising an area of 437,072 sq km (168,754 sq mi), corresponds roughly to the former Turkish provinces of Baghdad, Mosul (Al-Mawsil), and Basra (Al-Basrah). Comparatively, the area occupied by Iraq is slightly more than twice the size of the state of Idaho. It extends 984 km (611 mi) SSE–NNW and 730 km (454 mi) ENE–WSW. Iraq is bordered on the N by Turkey, on the E by Iran, on the SE by the Persian Gulf and Kuwait, on the S by Saudi Arabia, on the W by Jordan, and on the NW by Syria, with a total land boundary length of 3,650 km (2,268 mi) and a coastline of 58 km (36 mi).

Iraq's capital city, Baghdad, is located in the east central part of the country.

## <sup>2</sup>TOPOGRAPHY

Iraq is divided into three distinct zones: the desert in the west and southwest; the plains; and the highlands in the northeast, which rise to 3,000 m (10,000 ft) or more. The desert is an upland region with altitudes of 600 to 900 m (2,000–3,000 ft) between Damascus in Syria and Ar-Rutbah in Iraq, but declines gently toward the Euphrates (Al-Furat) River. The water supply comes from wells and wadis that at times carry torrential floods and that retain the winter rains.

Dominated by the river systems of the Tigris (Dijlah) and Euphrates, the plains area is composed of two regions divided by a ridge, some 75 m (250 ft) above the flood plain, between Ar-Ramadi and a point south of Baghdad that marks the prehistoric coastline of the Persian Gulf. The lower valley, built up by the silt the two rivers carry, consists of marshland, crisscrossed by drainage channels. At Qarmat 'Ali, just above Basra, the two rivers combine and form the Shatt al-'Arab, a broad waterway separating Iraq and Iran. The sources of the Euphrates and Tigris are in the Armenian Plateau. The Euphrates receives its main tributaries before entering Iraq, while the Tigris receives several streams on the eastern bank within the country.

## <sup>3</sup>CLIMATE

Under the influence of the monsoons, Iraq in summer has a constant northwesterly wind (shamal), while in winter a strong southeasterly air current (sharqi) develops. The intensely hot and dry summers last from May to October, and during the hottest time of the day—often reaching 49°C (120°F) in the shade—people take refuge in underground shelters. Winters, lasting from December to March, are damp and comparatively cold, with temperatures averaging about 10°C (50°F). Spring and autumn are brief transition periods. Normally, no rain falls from the end of May to the end of September. With annual rainfall of less than 38 cm (15 in), agriculture is dependent on irrigation.

## <sup>4</sup>FLORA AND FAUNA

In the lower regions of the Euphrates and Tigris and in the alluvial plains, papyrus, lotus, and tall reeds form a thick underbrush; willow, poplar, and alder trees abound. On the upper and middle Euphrates, the licorice bush yields a juice that is extracted for commercial purposes; another bush growing wild in the semiarid steppe or desert yields gum tragacanth for pharmaceutical use. In the higher Zagros Mountains grows the valonia oak, the bark of which is used for tanning leather. About 30 million date palms produce one of Iraq's most important exports.

Wild animals include the hyena, jackal, fox, gazelle, antelope, jerboa, mole, porcupine, desert hare, and bat. Beaver, wild ass, and ostrich are rare. Wild ducks, geese, and partridge are the game birds. Vultures, owls, and ravens live near the Euphrates. Falcons are trained for hunting.

## <sup>5</sup>ENVIRONMENT

The major sources of environmental damage are effluents from oil refineries, factory and sewage discharges into rivers, fertilizer and chemical contamination of the soil, and industrial air pollution in urban areas. An estimated 1% of agricultural land is lost each year through soil erosion and salinization.

The government has not developed a comprehensive environmental conservation policy, but it has initiated programs to prevent water pollution, to reclaim land by reducing soil salinity, and to protect wildlife by limiting hunting. As a result of damage from the 1991 Persian Gulf War, water pollution has increased. Purification systems for water and sewage are inadequate. Toxic chemicals from damaged oil facilities contribute to water pollution. Iraq has 35.2 cubic kilometers of renewable water resources with 92% used in farming activity. Only 48% of those living in rural areas have access to safe drinking water.

Iraq ranks among the 50 nations with the world's highest levels of industrial carbon dioxide emissions. Its 1992 emissions totaled 64.5 million metric tons, a per capita level of 3.33 metric tons. In 1996, the total rose to 91 million metric tons. The nation's cities produce on average 6 million tons of solid waste per year.

The Supreme Council for the Human Environment is the principal environmental agency; its implementing body, the Directorate General for the Human Environment, was established in 1975 and is attached to the Ministry of Health. As of 2001, 7 of Iraq's mammal species and 12 of its bird species are endangered. Endangered species include the northern bald ibis, Persian fallow deer, Sa'udi Arabian dorcas gazelle, and Asiatic cheetah. The Syrian wild ass has become extinct.

## 6 POPULATION

The population of Iraq in 2003 was estimated by the United Nations at 25,175,000, which placed it as number 42 in population among the 193 nations of the world. In that year approximately 3% of the population was over 65 years of age, with another 47% of the population under 15 years of age. There were 103 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.68%, with the projected population for the year 2015 at 34,226,000. The population density in 2002 was 54 per sq km (139 per sq mi). Mesopotamia is the most densely populated region.

It was estimated by the Population Reference Bureau that 77% of the population lived in urban areas in 2001. The capital city, Baghdad, had a population of 4,689,000 in that year. Other major cities included Arbil, 2,368,000, and Mosul, 1,034,000. According to the United Nations, the urban population growth rate for 2000–2005 was 3.3%.

## 7 MIGRATION

Immigration into Iraq was limited until the beginning of the 1970s. However, the rise in oil prices and the increase of oil exports, as well as extensive public and private spending in the mid-1970s, created a market for foreign labor. The result was a stream of foreign (mainly Egyptian) workers whose number may have risen as high as 1,600,000 before the Gulf War. During the Iran–Iraq war, many Egyptians worked in the public sector, filling a gap left by civil servants, farmers, and other workers who were fighting at the front. A number of Iraqis from the south, mainly Basra and its environs, influenced by family ties and higher wages, migrated to Sa'udi Arabia and Kuwait. To weaken local support in the north for Kurdish rebels, the government forced tens of thousands of Kurds to resettle in the south; in September 1987, a Western diplomat in Baghdad claimed that at least 500 Kurdish villages had been razed and 100,000 to 500,000 Kurds relocated.

In 1991 some 1.5 million Iraqis fled the country for Turkey or Iran to escape Saddam Hussein's increasingly repressive rule, but fewer than 100,000 remained abroad. Most of the refugees were Kurds who later resettled in areas in Iraq not controlled by the government. In September and October of 1996, around 65,000 Iraqi Kurds fled to Iran due to internal fighting between the Iraqi Kurds.

As of 1999, the UNHCR assisted 31,400 refugees in Iraq. Of these, 19,000 were Iranian Kurds, and 11,300 were Turkish Kurds. Another some 1,100 urban refugees of various nationalities live in Baghdad. In addition to these UNHCR-assisted refugees, Iraq hosts some 62,000 Palestinian refugees and an estimated 10,000 Iranians in the south of the country.

UNHCR also facilitates the voluntary return of Turkish Kurds from Iraq to Turkey. More than half of the Iranian Kurd refugees in Al-Tash have likewise expressed their desire to return to Iran.

In 1999 the net migration rate was zero migrants per 1,000 population.

## 8 ETHNIC GROUPS

Arabs constitute about 75–80% of the total population. The Kurds, an Islamic non-Arab people, are the largest and most important minority group, constituting about 15–20%. A seminomadic pastoral people, the Kurds live in the northeastern Zagros Mountains, mostly in isolated villages in the mountain valleys near Turkey and Iran. Kurdish opposition to Iraqi political dominance has occasioned violent clashes with government forces. Other minorities (5%) include Turkomans, living in the northeast; Yazidis, mostly in the Sinjar Mountains; Assyrians, mainly in the cities and northeastern rural areas; and Armenians.

## 9 LANGUAGES

Arabic is the national language and is the mother tongue of an estimated 79% of the population. Kurdish—the official language in Kurdish regions—or a dialect of it, is spoken by the Kurds and Yazidis. Aranaic, the ancient Syriac dialect, is retained by the Assyrians. Another Syriac dialect, Mandaean, is the liturgical language of the Sabaeans. The Turkomans speak a Turkic dialect. Armenian is also spoken.

## 10 RELIGIONS

Islam is the national religion of Iraq, adhered to by some 97% of the population according to a 1997 census. About 60–65% of Muslims belong to the Shi'a sect and 32–37% to the Sunni sect. Traditionally, the Shi'a majority has been governed and generally oppressed by members of the Sunni minority, which since the late 1970s has become increasingly concerned about the export of Shi'a militancy from Iran. There are also some syncretic Muslim groups, such as the Yazidis, who consider Satan a fallen angel who will one day be reconciled with God. They propitiate him in their rites and regard the Old and New Testaments, as well as the Koran (Qur'an), as sacred.

About 3% of the population are adherents to Christianity and other religions. More than 500,000 of the Christians were Roman Catholic, and nearly all the remainder belonged to various branches of Oriental Christianity. The Assyrians (who are not descended from the ancient Assyrians) are Nestorians. In the 19th century, under the influence of Roman Catholic missions, Christian Chaldaeans, originally also Nestorians, joined the Uniate churches, which are in communion with Rome; their patriarch has his seat in Mosul. The Sabaeans, or Mandaean, are often called Christians of St. John, but their religious belief and their liturgy contain elements of many creeds, including some of pre-Christian Oriental origin. Since baptism is their main ritual, they always dwell near water and are concentrated on the riverbanks south of Baghdad. Iraq's Jewish community, which had its origins in Babylonian times and which produced outstanding scholars during the first millennium AD, dwindled from about 90,000 in 1948 to 200 in 1990, virtually all Iraqi Jewry having emigrated to Israel by the early 1950s.

## 11 TRANSPORTATION

Major cities, towns, and villages are connected by a modern network of highways and roads which have made old caravan

LOCATION: 29° to 37°30' n; 39° to 48°e. BOUNDARY LENGTHS: Turkey, 305 kilometers (190 miles); Iran, 1,458 kilometers (906 miles); Persian Gulf coastline, 19 kilometers (12 miles); Kuwait, 254 kilometers (158 miles); Saudi Arabia, 895 kilometers (556 miles); Jordan, 147 kilometers (91 miles); Syria, 603 kilometers (375 miles). TERRITORIAL SEA LIMIT: 12 miles.

routes extinct. The city of Baghdad has been reshaped by the development of expressways through the city and by passes built since the 1970s. By 2002, Iraq had 45,550 km (28,304 mi) of roads, of which 38,400 km (23,861 mi) were paved. There were some 1,422,032 cars and 332,026 commercial vehicles in use as of 2000.

Railroads are owned and operated by the Iraqi State Railways Administration. A standard-gauge railroad connects Iraq with Jordan and Syria, and nearly all the old meter-gauge line connecting Irbil in the north with Basra, by way of Kirkuk and Baghdad, has been replaced. In 2002, there were about 2,339 km (1,453 mi) of railway lines.

Iraq had 150 airports in 2002, of which 77 had paved runways. However, an unknown number were damaged during the March–April 2003 war. Baghdad, Basra, and Mosul have international airports. Iraq Airways is the state-owned carrier; in the 1980s, its international flights landed only at night because of the Iraqi–Iranian war. The war also virtually closed Iraq's main port of Basra and the new port of Umm Qasr on the Persian Gulf. Iraq has some 1,015 km (630 mi) of waterways; the Shatt al Arab is usually navigable by maritime traffic for 130 km (81 mi); the Tigris and Euphrates has navigable sections for shallow-draft boats, and the Shatt al Basrah canal was navigable by shallow-draft craft before closing in 1991 because of the Gulf War. Expansion of Iraq's merchant marine, which totaled 1,470,000 GRT in 1980, was halted by the war with Iran and again by the Persian Gulf War; by 2002, the merchant marine totaled only 25 ships with a total capacity of 186,709 GRT.

## 12 HISTORY

Some of the earliest known human settlements have been found in present-day Iraq. Habitations, shrines, implements, and pottery found on various sites can be dated as early as the 5th millennium BC. Some sites bear names that are familiar from the Bible, which describes the region of the Hiddekel (Tigris) and Euphrates rivers as the location of the Garden of Eden and the city of Ur as the birthplace of the patriarch Abraham. Scientific exploration and archaeological research have amplified the biblical accounts.

Recorded history in Mesopotamia (the ancient name of Iraq, particularly the area between the Tigris and Euphrates) begins with the Sumerians, who by the 4th millennium BC had established city-states. Records and accounts on clay tablets prove that they had a complex economic organization before 3200 BC. The reign of Sumer was challenged by King Sargon of Akkad (r.c.2350 BC); a Sumero-Akkadian culture continued in Erech (Tall al-Warka') and Ur (Tall al-Muqayyar) until it was superseded by the Amorites or Babylonians (about 1900 BC), with their capital at Babylon. The cultural height of Babylonian history is represented by Hammurabi (r.c.1792–c.1750 BC), who compiled a celebrated code of laws. After Babylon was destroyed by the Hittites about 1550 BC, the Hurrians established the Mitanni kingdom in the north for about 200 years, and the Kassites ruled for about 400 years in the south.

From Assur, their stronghold in the north, the Assyrians overran Mesopotamia about 1350 BC and established their capital at Nineveh (Ninawa). Assyrian supremacy was interrupted during the 11th and 10th centuries BC by the Aramaeans, whose language, Aramaic, became a common language in the eastern Mediterranean area in later times. Assyrian power was finally crushed by the Chaldeans or Neo-Babylonians, who, in alliance with the Medes in Persia, destroyed Nineveh in 612 BC. Nebuchadnezzar II (r.c.605–c.560 BC) rebuilt the city-state of Babylon, but it fell to the Persians, under Cyrus of the Achaemenid dynasty, in 539 BC. Under his son Cambyses II, the Persian Empire extended from the Oxus (Amu Darya) River to the Mediterranean, with its center in Mesopotamia. Its might, in turn, was challenged by the Greeks. Led by the Macedonian conqueror Alexander the Great, they defeated the Persians by 327 BC and penetrated deep into Persian lands. The Seleucids, Alexander's successors in Syria, Mesopotamia, and Persia, built their capital, Seleucia, on the Tigris, just south of Baghdad. They had to yield power to the Parthians, who conquered Mesopotamia in 138 BC.

The Arabs conquered Iraq in AD 637. For a century, under the "Orthodox" and the Umayyad caliphs, Iraq remained a province of the Islamic Empire, but the 'Abbasids (750–1258) made it the focus of their power. In their new capital, Baghdad, their most illustrious member, Harun al-Rashid (ar-Rashid, r.786–809), became, through the Arabian Nights, a legend for all time. Under

Harun and his son Al-Ma'mun, Baghdad was the center of brilliant intellectual and cultural life. Two centuries later, the Seljuk vizier Nizam al-Mulk established the famous Nizamiyah University, one of whose professors was the philosopher Al-Ghazali (Ghazel, d.1111). A Mongol invasion in the early 13th century ended Iraq's flourishing economy and culture. In 1258, Genghis Khan's grandson Hulagu sacked Baghdad and destroyed the canal system on which the productivity of the region had depended. Timur, also known as Timur Lenk ("Timur the Lame") or Tamerlane, conquered Baghdad and Iraq in 1393. Meanwhile, the Ottoman Turks had established themselves in Asia Minor and, by capturing Cairo (1517), their sultans claimed legitimate succession to the caliphate. In 1534, Süleyman the Magnificent conquered Baghdad and, except for a short period of Persian control in the 17th century, Iraq remained an Ottoman province until World War I.

Late in 1914, the Ottoman Empire sided with the Central Powers, and a British expeditionary force landed in Iraq and occupied Basra. The long campaign that followed ended in 1918, when the whole of Iraq fell under British military occupation. The collapse of the Ottoman Empire stimulated Iraqi hopes for freedom and independence, but in 1920, Iraq was declared a League of Nations mandate under UK administration. Riots and revolts led to the establishment of an Iraqi provisional government in October 1920. On 23 August 1921, Faisal I (Faysal), the son of Sharif Hussein (Husayn ibn-'Ali) of Mecca, became king of Iraq. In successive stages, the last of which was a treaty of preferential alliance with the United Kingdom (June 1930), Iraq gained independence in 1932 and was admitted to membership in the League of Nations.

Faisal died in 1933, and his son and successor, Ghazi, was killed in an accident in 1939. Until the accession to the throne of Faisal II, on attaining his majority in 1953, his uncle 'Abdul Ilah, Ghazi's cousin, acted as regent. On 14 July 1958, the army rebelled under the leadership of Gen. 'Abd al-Karim al-Qasim (Kassim). Faisal II, Crown Prince 'Abdul Ilah, and Prime Minister Nuri al-Sa'id (as-Sa'id) were killed. The monarchy was abolished, and a republic established. Iraq left the anti-communist Baghdad Pact, which the monarchy had joined in 1955. An agrarian reform law broke up the great landholdings of feudal leaders, and a new economic development program emphasized industrialization. In spite of some opposition from original supporters and political opponents, tribal uprisings, and several attempts at assassination, Qasim managed to remain the head of Iraq for four and a half years. On 9 February 1963, however, a military *junta*, led by Col. 'Abd as-Salam Muhammad 'Arif, overthrew his regime and executed Qasim.

Since 1961, Iraq's Kurdish minority has frequently opposed with violence attempts by Baghdad to impose authority over its regions. In an attempt to cope with this opposition, the Bakr government passed a constitutional amendment in July 1970 granting limited political, economic, and cultural autonomy to the Kurdish regions. But in March 1974, Kurdish insurgents, known as the Pesh Merga, again mounted a revolt, with Iranian military support. The Iraqi army countered with a major offensive. On 6 March 1975, Iraq and Iran concluded an agreement by which Iran renounced support for the Kurds and Iraq agreed to share sovereignty over the Shatt al-'Arab estuary. The new regime followed a policy based on neutralism and aimed to cooperate with Syria and Egypt and to improve relations with Turkey and Iran. These policies were continued after 'Arif was killed in an airplane crash in 1966 and was succeeded by his brother, 'Abd ar-Rahman 'Arif. This regime, however, was overthrown in July 1968, when General (later Marshal) Ahmad Hasan al-Bakr, heading a section of the Ba'ath Party, staged a coup and established a new government with himself as president. In the 1970s, the Ba'ath regime focused increasingly on economic problems, nationalizing the petroleum industry in

1972–73 and allocating large sums for capital development. Bakr resigned in July 1979 and was followed as president by his chosen successor, Saddam Hussein (Husayn) al-Takriti.

Tensions between Iraq and Iran rose after the Iranian revolution of 1979 and the accession to power of Saddam Hussein. In September 1980, Iraq sought to take advantage of the turmoil in Iran by suddenly canceling the 1975 agreement and mounting a full-scale invasion. Iraqi soldiers seized key points in the Khuzistan region of southwestern Iran, captured the major southern city of Khorramshahr, and besieged Abadan, destroying its large oil refinery. The Iraqi army then took up defensive positions, a tactic that gave the demoralized Iranian forces time to regroup and launch a slow but successful counterattack that retook Khuzistan by May 1982. Iraq then sought peace and in June withdrew from Iranian areas it had occupied. Iran's response was to launch major offensives aimed at the oil port of Basra. Entrenched in well-prepared positions on their own territory, Iraqi soldiers repelled the attacks, inflicting heavy losses, and the war ground to a stalemate, with tens of thousands of casualties on each side.

Attempts by the UN and by other Arab states to mediate the conflict were unsuccessful; in the latter stages of the war, Iraq accepted but Iran regularly rejected proposals for a compromise peace. Although most Arab states supported Iraq, and the Gulf oil states helped finance Iraqi military equipment, the war had a destabilizing effect both on the national economy and on the ruling Ba'ath Party. France also aided Iraq with credits to buy advanced weapons (notably, Super Étendard fighters and Exocet missiles), and it provided the technology for Iraq to construct the Osirak nuclear reactor near Baghdad. (In June 1981, this installation was destroyed in a bombing raid by Israel, which claimed that the facility would be used to produce nuclear weapons, a charge Iraq denied.) Other Western countries provided supplies, financing, and intelligence to Iraq but denied the same to Iran.

In February 1986, the Iranians made their biggest gain in the war, crossing the Shatt al-'Arab and capturing Fao (Al-Faw) on the southernmost tip of land in Iraq. In early 1987, they seized several islands in the Shatt al-'Arab opposite Basra. The war soon spread to Persian Gulf shipping, as both sides attacked oil tankers and ships transporting oil, goods, and arms to the belligerents or their supporters.

The war ended on 20 August 1988 after Iran accepted a UN cease-fire proposal on 18 July. Having suffered enormous casualties and physical damage plus a massive debt burden, Baghdad began the postwar process of reconstruction. Before and after the war, there were scores to settle, primarily against the Kurds, some of whom had helped Iran and were the victims of Iraqi poison gas attacks. Many border villages were demolished and their Kurdish populations relocated.

When Iraq's wartime allies seemed unwilling to ease financial terms or keep oil prices high and questioned Iraq's rearmament efforts, Saddam Hussein turned bitterly against them. Kuwait was the principal target. After threats and troop movements, Iraq reasserted its claim (which dated from the days of the monarchy) to that country and on 2 August 1990, invaded and occupied it. Saddam Hussein was unflinching in the face of various peace proposals, economic sanctions, and the threatening buildup of coalition forces led by the United States.

A devastating air war led by the United States began on 17 January 1991 followed by ground attack on 24 February. Iraq was defeated, but not occupied. Despite vast destruction and several hundred thousand casualties, Saddam's regime remained firmly in control. It moved to crush uprisings from the Shia in the south and Kurds in the north. To protect those minorities, the United States and its allies imposed no-fly zones that gave the Kurds virtually an independent state, but afforded much less defense for the rebellious Arabs in the south whose protecting

marshes were being drained by Baghdad. There were several clashes between allied and Iraq forces in both areas.

In 1996, in an effort to boost morale in Iraq and bolster its image abroad, Iraq conducted its first parliamentary elections since 1989. However, only candidates loyal to Saddam Hussein were allowed to run. A government screening committee reviewed and approved all 689 candidates, who either belonged to Hussein's Ba'ath Party or were independents who supported the 1968 coup that brought the party to power.

The Iraqi economy continued to decline throughout the 1990s, with the continuation of the UN sanctions, imposed in 1990, which prohibited Iraq from selling oil on the global market in major transactions and froze Iraqi assets overseas. The deteriorating living conditions imposed on the Iraqi population prompted consideration of emergency measures. In 1996 talks were held between Iraq and the United Nations on a proposed "oil for food" humanitarian program that would permit Iraq to sell a limited quantity of oil in order to purchase food and basic supplies for Iraqi citizens. The United States and Britain wanted money earmarked for Iraq's Kurdish provinces funneled through the existing United Nations assistance program there. They also raised the issue of equity with respect to Iraq's existing rationing system. In December 1996, the UN agreed to allow Iraq to export \$2 billion in oil to buy food and medical supplies. Iraq began receiving 400,000 tons of wheat in the spring of 1997.

Since the end of the Gulf War, Iraq had demonstrated cooperation with UNSCOM, the special UN commission charged with monitoring weapons of mass destruction. However, Saddam Hussein refused to dismantle his country's biological weapons and had stopped cooperating with UNSCOM by August 1997, leading to increasing tension and a US military buildup in the region by early 1998. Personal intervention by UN Secretary General Kofi Annan helped diffuse the situation temporarily. However, renewed disagreements arose in the latter half of the year, ultimately leading to a December bombing campaign (Operation Desert Fox) by US and UK forces, with the goal of crippling Iraq's weapons capabilities. In late 1998 the US Congress also approved funding for Iraqi opposition groups, in hopes of toppling Saddam Hussein politically from within.

In 1999 the oil for food program was expanded to allow for the sale of \$5.25 billion in oil by Iraq over a six-month period to buy goods and medicine. As of 2000, most observers agreed that the decade-long UN sanctions, while impoverishing Iraq and threatening its population with a major humanitarian crisis, had failed in their goal of weakening Saddam's hold on power.

The situation in Iraq intensified in 2002. In his January 2002 State of the Union Address, US president George W. Bush labeled Iraq, along with Iran and North Korea, part of an "axis of evil"—states that threatened the world with weapons of mass destruction and sponsored terrorism. Throughout 2002, the United States, in partnership with the UK, brought the issue of the need to disarm the Iraqi regime of weapons of mass destruction (WMD) to the forefront of international attention. On 8 November 2002, the UN Security Council unanimously approved Resolution 1441, calling upon Iraq to disarm itself of all biological, chemical, and nuclear weapons and weapons capabilities, to allow for the immediate return of UN and International Atomic Energy Agency (IAEA) weapons inspectors (they had been expelled from the country in 1998), and to comply with all previous UN resolutions regarding the country since the end of the Gulf War in 1991. UN and IAEA weapons inspectors returned to Iraq, but the United States and UK were neither satisfied with their progress nor with Iraq's compliance with the inspectors. The United States and the United Kingdom began a military buildup in the Persian Gulf region (eventually 250,000 US and 45,000 British troops would be stationed there), and pressed the UN Security Council to issue another resolution authorizing the use of force to disarm the Iraqi regime. This move

was met by stiff opposition from France, Germany, and Russia (all members of the Security Council at the time, with France and Russia being permanent members with veto power); the diplomatic impasse ended on 17 March 2003, when the United States, the United Kingdom, and Spain withdrew from the Security Council the resolution they had submitted that February that would have authorized the use of military force. War began on 19 March 2003, and by early April, the Iraqi regime had fallen.

The post-war period proved to be a difficult one for the United States and the United Kingdom, as their troops attempted to prevent looting and violence, to disarm Iraqis, and to begin the process of reconstruction. Especially contentious was the issue of the formation of a new Iraqi government: Iraqi exiles returned to the country, attempting to take up positions of power; Kurds demanded representation in a new political structure; and Shi'ites (who make up some 60% of the Iraqi population), agitated for recognition and power. The United States initially installed retired US Army Lt. Gen. Jay Garner as head of the Office of Reconstruction and Humanitarian Assistance, to oversee Iraq's civil administration while a new government was to be installed. Garner was replaced by former US State Dept. official L. Paul Bremer III in May 2003 in what some called an effort to put a civilian face on the reconstruction effort. European and Arab states called upon the United States and the United Kingdom to provide for a central role to be played by the UN in reconstructing Iraq, but the scope of that role was undefined as of June 2003. Many Iraqi political figures in June labeled the allied campaign to remove the Saddam Hussein regime more like an "occupation" than a "liberation," and called for elections to a national assembly that would produce a new constitution for the country.

### 13 GOVERNMENT

The coup d'état of 14 July 1958 established an autocratic regime headed by the military. Until his execution in February 1963, 'Abd al-Karim al-Qasim ruled Iraq, with a council of state and a cabinet. On 27 July 1958, a fortnight after taking over, Qasim's regime issued a provisional constitution, which has been repeatedly amended to accommodate changes in the status of the Kurdish regions. Since the 1968 coup, the Ba'ath Party ruled Iraq by means of the Revolutionary Command Council, "the supreme governing body of the state," which selected the president and a cabinet composed of military and civilian leaders. The president (Saddam Hussein from 1979–2003) served as chairman of the Revolutionary Command Council, which exercised both executive and legislative powers by decree. He was also prime minister, commander-in-chief of the armed forces, and secretary-general of the Ba'ath Party. A national assembly of 250 members that was elected by universal suffrage in 1980, 1984, 1989, 1996, and 2000, had little real power. Most senior officials were relatives or close associates of Saddam Hussein; nevertheless, their job security was not great.

The precarious nature of working in the regime of Saddam Hussein, even for relatives, was made evident in 1995 when two of his sons-in-law defected to Jordan along with President Hussein's daughters. The defection was widely reported in the international media and considered a great embarrassment to the regime as well as a strong indicator of how brutal and repressive its machinations were. After a promise of amnesty was delivered to the defectors by Iraq, the men returned and were executed shortly after crossing the border into Iraq.

In the aftermath of the 2003 war, Iraq was effectively ruled by the US-installed Office of Reconstruction and Humanitarian Assistance. US and British troops occupied and policed the country until a new government, run by Iraqis and severed from the Ba'ath Party, would be formed. As of June 2003, the whereabouts or survival of Saddam Hussein was unknown.

### 14 POLITICAL PARTIES

Under the monarchy, Prime Minister Nuri as-Sa'id dominated Iraq with the support of the upper-middle and upper classes. Tribal, religious, and local loyalties took precedence over any sense of Iraqi nationalism. Faisal I considered the existence of parties desirable for the political development of Iraq. During the decade 1935–45, however, they were ineffective as political factors. In 1946, five new parties were founded, including one that was Socialist (Al-Hizb al-Watani al-Dimuqrati, or the National Democratic Party), one avowedly close to communism (Ash-Sha'b, or the People's Party), and one purely reformist (Al-Ittihad al-Watani, or the National Union Party).

The response to these parties alarmed the conservative politicians. The Palestine War (1948) provided the pretext for suppression of the Sha'b and Ittihad parties. Only the National Democratic Party functioned uninterrupted; in 1950, with the lifting of martial law, the others resumed work. In 1949, Nuri as-Sa'id founded the Constitutional Union Party (Al-Ittihad ad-Dusturi), with a pro-Western, liberal reform program to attract both the old and the young generations. In opposition, Salih Jabr, a former partisan of Nuri's turned rival, founded the Nation's Socialist Party (Al-Ummah al-Ishtiraki), which advocated a democratic and nationalistic, pro-Western and pan-Arab policy. In 1954, however, Sa'id dissolved all parties, including his own Constitutional Union Party, on the ground that they had resorted to violence during the elections of that year.

After the coup of 1958, parties "voluntarily" discontinued their activities. In January 1960, Premier Qasim issued a new law allowing political parties to operate again. Meanwhile, the Ba'athists, who first gained strength in Syria in the 1950s as a pan-Arab movement with strong nationalist and socialist leanings, had attracted a following among elements of the Syrian military. In February 1963, Qasim was overthrown and executed by officers affiliated with a conservative wing of Iraq's Ba'ath movement. In November, a second coup was attempted by Ba'athist extremists from the left, who acted with complicity of the ruling Syrian wing of the party. With the 1968 coup, rightist elements of the Ba'ath Party were installed in prominent positions by Gen. Bakr. Since then, the Ba'athists, organized as the Arab Ba'ath Socialist Party, were the ruling political group in Iraq. In the national assembly elections of 1980, the Ba'athists won more than 75% of the seats at stake; in the 1984 elections, they won 73% of the seats. Elections were again held in March 1996, with only Ba'athists or independent supporters of Saddam Hussein allowed to run for seats in the Assembly. Altogether, 220 seats were contested by 689 candidates. Only Ba'ath Party members and supporters of the Saddam Hussein regime were allowed to run in the March 2000 elections as well. In the 1990s and into the new century, most real party activity in Iraq involved the country's Kurdish minority, which had established a number of political groups, most of them in opposition to the central government.

In 1991, the regime issued a decree theoretically allowing the formation of other political parties, but which in fact prohibited parties not supportive of the regime. Under the 1991 edict, all political parties had to be based in Baghdad and all were prohibited from having ethnic or religious affiliations.

Outside of Iraq, ethnic, religious and political opposition groups came together to organize a common front against Saddam Hussein, but they achieved very little until 2003. The Shi'a al-Dawa Party was brutally suppressed by Saddam before the Iran-Iraq war; its remnants are now based in Tehran. In the aftermath of the 2003 war, certain Shi'a clerics, including Grand Ayatollah Ali al-Sistani and Ayatollah Muhammad Bakr al-Hakim, emerged as political and religious leaders for the Shi'a community. Shi'a demonstrations were staged against US and

British forces, and Western observers were concerned Shi'a groups would attempt to establish an Islamic theocracy in Iraq.

The two main Kurdish political parties as of 2003 were the Kurdistan Democratic Party (KDP), led by Massoud Barzani, and the Patriotic Union of Kurdistan (PUK), led by Jalal Talabani. Long rivals, the two parties have been called upon to reconcile differences so as to provide for a viable future for Iraq's Kurds. The Iraqi National Congress, based in Salahuddin in northern Iraq and in London, is led by Ahmad Chalabi. The group aimed to unite all Iraqi opposition groups, and sees itself as the legitimate representative of the people of Iraq.

## 15 LOCAL GOVERNMENT

Iraq until 2003 was divided into 18 provinces (three of which formed an autonomous Kurdish region), each headed by an appointed governor. Provinces were subdivided into districts, each under a deputy governor; a district consists of counties, the smallest units, each under a director. Towns and cities were administered by municipal councils led by mayors. Baghdad's municipality, the "governorate of the capital," under its mayor, or "guardian of the capital," served as a model municipality. A settlement reached with the Kurds in 1970 provided for Kurdish autonomy on the local level. In 1974, the provisional constitution was further amended to provide the Kurdistan region with an elected 80-member legislative council; elections were held in 1980 and 1986, but, in fact, the Iraqi army controlled Kurdistan until the imposition of a UN-approved protected zone in the north at the end of the Gulf War. In May 1992, Kurds held elections there for a new 100-member parliament for the quasi-independent region. This marked the only relatively free elections held in Iraq in several decades.

Local governing authority broke down following the fall of the Iraqi regime in April 2003. US and British troops were responsible for policing the country, and for restoring electricity, running water, sanitation, and other essential services.

## 16 JUDICIAL SYSTEM

The court system until 2003 was made up of two distinct branches: a security component and a more conventional court system to handle other charges. There was no independence in the operation of the judiciary; the president could override any court decision.

The security courts had jurisdiction in all cases involving espionage, treason, political dissent, smuggling and currency exchange violations, and drug trafficking. The ordinary civil courts had jurisdiction over civil, commercial, and criminal cases except for those that fell under the jurisdiction of the religious courts. Courts of general jurisdiction were established at governorate headquarters and in the principal districts.

Magistrates' courts tried criminal cases in the first instance, but they could not try cases involving punishment of more than seven years in prison. Such cases were tried in courts of sessions that were also appellate instances for magistrates' courts. Each judicial district had courts of sessions presided over by a bench of 3 judges. There were no jury trials. Special courts to try national security cases were set up in 1965; verdicts of these courts could be appealed to the military supreme court. In other cases, the highest court of appeal was the court of cassation in Baghdad, with civil and criminal divisions. It was composed of at least 15 judges, including a president and two vice-presidents.

For every court of First Instance, there was a Shari'ah (Islamic) court that ruled on questions involving religious matters and personal status. Trials were public and defendants were entitled to free counsel in the case of indigents. The government protected certain groups from prosecution. A 1992 decree granted immunity from prosecution to members of the Ba'ath Party. A 1990 decree granted immunity to men who killed their mothers,

daughters, and other female family members who had committed "immoral deeds" such as adultery and fornication.

The judicial system is currently in transition following the April 2003 defeat of the Saddam Hussein regime.

## 17 ARMED FORCES

The Iraqi armed forces were estimated at 389,000 men in 2002. Reservists numbered around 650,000. The army had a strength of approximately 350,000 with 2,000 tanks; the navy had 2,000 men; and the air force had 20,000 men with perhaps 316 combat aircraft. The army included 6 Republican Guard divisions. The Air Defense Command numbered around 17,000 and was given priority since 1991. It is suspected that Iraq is in the process of developing a nuclear capability and possesses long-range strike capabilities and biological and chemical weapons. The paramilitary, numbering some 44,000 included security troops, border guards, and Saddam's *Fedayeen* forces. Opposition forces number around 33,000. The defense budget was estimated at \$1.3 billion in 2000.

## 18 INTERNATIONAL COOPERATION

Iraq is a charter member of the UN, having joined on 21 December 1945, and participates in ESCWA and all the nonregional specialized agencies. A founding member of the Arab League, Iraq also participates in G-77 and OPEC, and has signed the Law of the Sea. Iraq has given both military and economic support to Arab parties in the conflict with Israel. The war with Iran preoccupied Iraq during the 1980s, and Iraq's relations with other countries in the Arab world has been varied. During the 1980s, Iraq maintained friendly relations with some Western countries, notably France, a major arms supplier to Iraq. In November 1984, diplomatic relations between Iraq and the United States were renewed after a break of 17 years, but were broken off again when Iraq invaded Kuwait in August of 1990. The United States and its allies launched an air war against Iraq after diplomatic efforts and economic sanctions failed to convince Iraq to leave Kuwait. Iraq's international standing deteriorated badly and the nation was placed under an international trade embargo. Iraq was attacked by US and British forces beginning on 19 March 2003, and the regime led by Saddam Hussein was defeated by those forces that April. In the post-war period, the country is undergoing reconstruction and the government is in transition.

## 19 ECONOMY

In 1973, just before the first oil shock, Iraqi oil revenue was \$1.8 billion. In 1978, as the second oil shock was taking hold, its oil revenues peaked at \$23.6 billion. In 2002, it is estimated at about \$15 billion. GDP growth was in double digits from 1973 to 1980 with the exception of 1974, when it was 7.2%. It was from these lofty heights that the regime of Saddam Hussein launched two wars whose effects on the Iraqi economy, even aside from the tragic human costs, proved devastating to the Iraqi economy. The Iraq-Iran War 1980 to 1988 began with Iraq's attempt to seize control of the economically and strategically important Shatt-al-Arab from Iran, which the countries had agreed to divide in a treaty in 1975. Saddam miscalculated that Iran could be easily dismembered during its revolutionary upheavals, and when the war ended, eight bloody years later, the Shatt-al-Arab, and all other border issues, returned to the status quo antebellum, leaving Iraq with no material gain and a debt of over \$100 billion, much of it owed to Kuwait. Annual oil revenues for Iraq and Kuwait were roughly even—averaging about \$16 billion a year—but Kuwait, instead of spending on armaments, had invested sizeable amounts in the West essentially doubling its returns. Kuwait refused to see the debts owed it by Iraq as money spent for its own defense, and insisted on being repaid, providing the economic trigger for Iraq's second disastrous foray—the

invasion of Kuwait 2 August 1990, and its absorption as the 19th province of Iraq. For the first and, so far, only time the UN Security Council agreed to support collective action against an aggressive power, and Iraqi forces were driven out of Kuwait in the first Gulf War, February 1991. The UN imposed comprehensive economic, financial, and military sanctions, placing the Iraqi economy under siege. Acting on its own, the United States also froze all Iraqi assets in the United States and barred all economic transactions between US citizens and Iraq. Many other countries imposed similar sanctions on top of the UN-imposed embargo. UN Security Council resolutions authorized the export of Iraqi crude oil worth up to \$1.6 billion over a limited time to finance humanitarian imports for the Iraqi people.

The effect of war in Kuwait and continuing economic sanctions reduced real GDP by at least 75% in 1991, on the basis of an 85% decline in oil production, and the destruction of the industrial and service sectors of the economy. Living standards deteriorated and the inflation rate reached 8000% in 1992. Estimates for 1993 indicated that unemployment hovered around 50% and that inflation was as high as 1000%. Because UN costs and reparations for Kuwait were taken out of permitted oil sales before being handing over to the Iraqi regime, the government's revenues were lower than total oil sales. The Organization of Arab Petroleum Exporting Countries (OAPEC) reports that Iraqi oil revenues at current prices were \$365 million in 1994, \$370 million in 1995 and \$680 million in 1996. It should be noted that since the first Gulf War Iraq has refused to provide economic data to the UN or any other international organization, and all estimates are subject to wide variability and questions of reliability. Uncertainty is increased by a flourishing black market that has been responsible for an increasing share of domestic commerce. There were widespread expectations that the Hussein regime would soon fall from the weight of its disastrous political and economic miscalculations, but this did not happen, and by 1995 it had become apparent that the tight restrictions on oil sales were resulting in serious harm to the Iraqi people. The UN passed its first oil-for-food program (which the Iraqi regime refused to accept until 1996) allowing oil worth \$5.26 billion to be sold every six months, with strict controls over how the money was spent. OAPEC reports that Iraqi oil revenues were about \$4.6 billion in 1997 and \$6.8 billion in 1998. In December 1999 the UN Security Council lifted the limits on Iraq's oil production, which then rose from 550,000 bbl/d in November 1996 to an average of about 2.6 million bbl/d during 2000. The CIA estimates that real GDP growth fell by 5.7% in 2001 due to the slowdown in the world economy and lower oil prices. Per capita income in 2001 is estimated at about \$2,500 by most sources.

By mid-2002, crude exports from Iraq had fallen below its normal capacity (about 2 million bbl/d) to an average of 630,000 bbl/d. According to the UN assessments, this low export level created a \$2.64 billion shortfall in the oil-for-food program. One cause of the reduced exports was a stoppage of all oil exports by Baghdad for one month beginning 8 April 2002 as a protest against Israel. Iraq had urged all other Arab oil exporters to join the shutdown, but no other country followed Iraq in this attempt to use oil as a weapon to pressure Israel and its supporters. Low exports were also blamed on illegal surcharges of about 15–45 cents per barrel being levied by Iraq from about December 2000, and the tactic of “retroactive pricing” adopted by the United States and the United Kingdom in January 2001 to combat these surcharges. Both the surcharges and the retroactive pricing—whereby the price charged for Iraqi oil was revealed only after the sale, and then set at a level too high for a surcharge to be paid and still make a profit—raised the price and reduced demand for Iraqi oil. The concerns by the United States and the United Kingdom were that the surcharges were being used to fund a secret military build-up by Iraq. UN estimates are that from 1996

to 2002 the “oil-for-food” generated about \$60 billion. The US government estimates that through smuggling and illegal surcharges the Iraqi government secured about \$6.6 billion from 1997 to 2001. On 14 May 2002, after Iraq had resumed oil exports, the UN Security Council approved a change in the oil-for-food program to add an extensive list of “dual-use” goods (goods that could be used for military as well as non-military purposes) that Iraq could not purchase with its oil revenues.

On 16 October 2002, President Bush signed the resolution passed by the US Congress authorizing the use of force in Iraq. On November 8, 2002 the UN Security Council unanimously adopted Resolution 1441 demanding UN arms inspectors be given unconditional access to search anywhere in Iraq for banned weapons, and requiring a “accurate, full and complete” accounting of all of its weapons of mass destruction within 30 days. After failure to secure a second resolution from the UN Security Council in February 2003 explicitly supporting a military invasion of Iraq—all members of the current Council were opposed except the United Kingdom—the United States and United Kingdom held to their intention to act without the UN. The attack was launched 20 March 2003, beginning with a surgical strike aimed at killing Saddam Hussein, which may or may not have succeeded, but in any case did not induce a surrender by the regime or the people. Holding as it does the second-largest oil reserves in the world, Iraq's economic future after the war was the subject of intense concern well before the war was opened, much less concluded. A December 2002 study by the James A. Baker Institute for Foreign Policy on Iraq's oil sector concluded, among other things that a “bonanza” of oil was not to be expected from Iraq in the near future because, among other things, the poor state of the sector's infrastructure and further likely damage from the war. In April 2003, the estimates were that contracts amounting to between \$20 to \$100 billion would be at play in the rebuilding of Iraq after the war, to be paid for with Iraqi oil.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2001 Iraq's gross domestic product (GDP) was estimated at \$59 billion. The per capita GDP was estimated at \$2,500. The annual growth rate of GDP was estimated at -5.7%. The average inflation rate in 2001 was 60%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 6% of GDP, industry 13%, and services 81%. Foreign aid receipts amounted to about \$5 per capita.

## 21 LABOR

The Trade Union Organization Law of 1987 established a centralized trade union structure of committees linked to trade unions, which in turn are part of provincial trade union federations under the control of the Iraqi General Federation of Trade Unions, and ultimately are controlled by the ruling Ba'ath Party. Although workers are legally allowed to strike upon informing the Labor Ministry, no strike has been reported in over 20 years.

Child labor is strictly controlled and in many cases prohibited. The minimum working age is 14, although economic necessity and lack of government enforcement have increased the number of children of all ages that are employed. There is a six-day, 48-hour workweek, although this does not apply to agricultural workers. Historically, working women have been accepted in Iraq, but the number of women in the workforce dramatically increased because of the prolonged war with Iran as well as the Persian Gulf War, as women replaced men in the labor market.

In many cases, rural labor and farmers employed in government projects get reasonable salaries and good housing, but small, independent farmers receive fewer benefits. Since 1958, the Iraqi government has passed a number of agrarian reform laws. As a general rule, however, the quality of life differs greatly between rural areas and the cities, especially that in Baghdad. This differential has resulted in massive rural to urban migration.

## 22 AGRICULTURE

The rich alluvial soil of the lowlands and an elaborate system of irrigation canals made Iraq a granary in ancient times and in the Middle Ages. After the irrigation works were destroyed in the Mongol invasion, agriculture decayed. Today, about 13% of the land is considered arable.

Under various agrarian reform laws—including a 1970 law that limited permissible landholdings to 4–202 hectares (10–500 acres), depending on location, fertility, and available irrigation facilities—about 400,000 previously landless peasants have received land. Agrarian reform has been accompanied by irrigation and drainage works, and by the establishment of cooperative societies for the provision of implements and machinery, irrigation facilities, and other services.

Agricultural production in Iraq declined progressively because of the war with Iran and the Persian Gulf War. In 1992, wheat production was estimated at 600,000 tons compared with 965,000 tons in 1982, but by 1999 was only 800,000 tons. The comparable figures for barley were 400,000, 902,000, and 500,000 tons; for cotton, 5,000, 8,000, and 9,000 tons. Dates, Iraq's most important agricultural export, increased from 374,000 tons in 1982 to an estimated 600,000 in 1999. Crops grown for domestic consumption include millet, lentils, beans, cucumbers, melons, figs, potatoes, corn, sugarcane, tobacco (a government monopoly), and mulberries.

Because of the international embargo placed on Iraq for its invasion of Kuwait, the government has attempted to establish firm control over the distribution of domestic agricultural production. Farmers, however, have been reluctant to adhere to directives requiring them to sell the entirety of their harvests to the state marketing boards set up after the war, since food fetches a considerably higher price on the black market than the state is able to pay. In the early years after the war, the government engaged in terror tactics to intimidate recalcitrant farmers. These essentially stopped by 1995, but the government continued to issue veiled threats to farmers through the media. Nonetheless, most Iraqis were forced to seek about 50% of their food needs on the black market. In 2001, agricultural imports exceeded exports by \$1.59 billion.

## 23 ANIMAL HUSBANDRY

Animal husbandry is widespread. Sheep raising is most important, with wool used domestically for weaving carpets and cloaks. In 2001, Iraq had an estimated 6.1 million sheep; 1.6 million goats; 1.4 million head of cattle, and numerous donkeys, camels, mules, buffaloes, and poultry. In 2001, of the 300,000 tons of milk produced by all livestock, 58% came from cows, 28% from sheep, 10% from goats, and 4% from buffaloes.

## 24 FISHING

Centuries of overfishing without restocking reduced the formerly plentiful supply of river fish, but the fishing industry has rebounded since the early 1970s. The 2000 fish catch (including salmon and, especially in the Tigris, carp) was 20,766 tons. Since the 1990/91 war, and the closure of Iraq's ports because of fighting, the Iraqi fishing fleet has been dispersed around the world and does not operate in the Persian Gulf.

## 25 FORESTRY

Forests of oak and Aleppo pine in the north cover less than 2% of Iraq's entire area and have been depleted by excessive cutting for fuel or by fires and overgrazing. Since 1954, indiscriminate cutting has been prohibited, and charcoal production from wood has ceased. The forestry research center at Irbil has established tree nurseries and conducted reforestation programs. Output of roundwood was estimated at 110,000 cu m (3,882,000 cu ft) in 2000.

## 26 MINING

Iraq's minerals industry was dominated by the production of hydrocarbons. Crude oil was Iraq's sole export commodity in 2002, and construction materials comprised another leading industry. Other than oil, mineral resources were limited. In 2001, Iraq produced hydraulic cement, nitrogen, phosphate rock (from the Akashat open-pit mine), salt, and native Frasch sulfur (from underground deposits at Mishraq, on the Tigris River, south of Mosul), and probably produced clay, gypsum, lime, limestone, industrial sand (glass or silica), sand and gravel, and stone. In 2001, the State Organization for Minerals reported the discovery of sulfur deposits in the Western Desert, near Akashat. Production figures for 2001, in tons, were: phosphate, 100,000, down from 300,000 in 1999; sulfur, 98,000, down from 475,000 in 1996; and salt, 300,000. Production of all mineral commodities has fallen since the 1990 UN embargo on international trade. Damage to the minerals industry from Iraq's 1991 and 1980–88 wars has been substantially repaired. Geological surveys have indicated usable deposits of iron ore, copper, gypsum, bitumen, dolomite, and marble; these resources have remained largely unexploited, because of inadequate transport facilities and lack of coal for processing the ores.

## 27 ENERGY AND POWER

Iraq has the second-largest petroleum reserves in the Middle East (after Saudi Arabia), with proved deposits estimated at 112.5 billion barrels in early 2002. Oil revenues help to balance the budget, stabilize the currency, establish a surplus balance of payments, and finance the development program. Oil concessions were first granted in 1925, and the first production began two years later. The three major oil companies operating in Iraq by the early 1970s were the Iraq Co. for Oil Operations (ICOO), the Basrah Petroleum Co. (BPC), and the Iraq National Oil Co. (INOC). By 1975, as a result of nationalizations carried out starting in 1972, state-owned operations controlled 100% of national oil production.

Major drops in crude oil production accompanied both the war with Iran and the 1991 Gulf War. Output dropped from 3,476,900 barrels per day in 1979 to 897,400 barrels daily in 1981, and from 2,897,000 barrels per day in 1989 to 305,000 barrels daily in 1991, following an embargo on Iraqi oil exports. In January 1992, the Al-Bakr oil export terminal, the only outlet to the sea, was reopened at half capacity; by August, the full capacity of 1.6 million barrels per day was restored, even though UN sanctions prohibited Iraq from exporting its oil.

In September 1991, the UN proposed a plan to allow Iraq to raise revenue for humanitarian purchases and war reparations by exporting limited quantities of oil. Iraq repeatedly rejected the plan claiming that it would violate sovereignty, but in January 1996 began negotiations with the UN on implementation of the plan. By May 1996, Iraq and the UN agreed on how to carry out UN Resolution 986, which allows Iraq to sell \$1 billion worth of oil every 90 days for a 180-day trial period (called the "Oil for Food" program). Proceeds from the sales were to go into a UN-managed escrow account and be used to provide humanitarian assistance to Iraq under UN supervision. In 1998, the UN Security Council voted to raise Iraq's six-month export quota to

\$5.26 billion, in Resolution 1153. In 1999 the UN removed all restrictions on the amount of oil Iraq could export. For most of the 1990s, the US-imposed trade embargo reduced Iraqi access to oil industry technology, supplies, and investment. Early in 2002, a government official indicated that of Iraq's 73 oil fields, only 24 were actually in production. In 1998, construction was authorized for a 100,000 barrel per day pipeline to pump Iraqi crude oil to Jordan's Zarga refinery. In 2000 oil production was an estimated 2.5 million barrels per day.

The most important fields are at Kirkuk, with lesser fields at Naft Khaneh, Ayn Zalah, and Butmah in the Mosul area, and at Az-Zubayr and Ar-Rumaylah near Basra. Oil for export was formerly piped to the Mediterranean through Syria and Lebanon, or to the Persian Gulf, but Syria closed the pipeline when Iraq invaded Iran, which Syria supported, and Iran closed Iraq's Gulf shipping. A new pipeline through Turkey transported more than half of Iraq's oil exports in the early 1980s; this was expanded by additions in 1985 and 1987, supplemented by a pipeline completed in 1985 running to Saudi Arabia's Red Sea port of Yanbu al-Bahr; the pipeline was closed during the Persian Gulf War.

The development of both hydroelectric and thermal capacity proceeded rapidly during the 1970s. In Baghdad, electricity is supplied by a thermoelectric fuel-oil plant installed by British and Belgian firms but was later nationalized and supplemented by a second plant. Other cities generate power in small municipal power stations. Iraq's power installations were repeated targets of Iranian air attacks in the 1980s, and were badly damaged during the conflict in the Persian Gulf in 1991. As much as 90% of Iraq's power grid, as well as a substantial portion of its power infrastructure, was damaged or destroyed. At the beginning of 2002 Iraq had 3.1 trillion cu m of proven natural gas reserves, plus another 4.2 trillion cu m in probably reserves. Nearly three-fourths of Iraq's oil reserves are associated with oil fields. In 2000, Iraq produced 3.1 billion cu m of natural gas.

Total electricity production in 2000 was 31,700 million kWh, of which 98% was from fossil fuels and 2% from hydropower. The country's generating capacity was about 9,500 MW in 2001.

## 28 INDUSTRY

Main industries are oil refining, food processing, textiles, leather goods, cement and other building materials, tobacco, paper, and sulfur extraction. Iraq has ten oil refineries, all managed by the government's Oil Refineries Administration. The Iraq-Iran and Gulf wars seriously affected Iraqi refining. Iraq has total refinery capacity of 350,000 barrels per day (the Iraqi government claims 700,000), with the largest refinery, Baiji North, rated at 150,000 barrels per day. The second-largest refinery, at Salaheddin, has a capacity of 140,000 barrels per day. The bulk of Iraq's refinery capacity is concentrated in the Baiji complex.

In 1964, the government took over all establishments producing asbestos, cement, cigarettes, textiles, paper, tanned leather, and flour. Public-sector industrial establishments include a sulfur plant at Kirkuk, a fertilizer plant at Basra, an antibiotics factory at Samarra', an agricultural implements factory at Iskandariyah, and an electrical equipment factory near Baghdad. In the 1970s, Iraq put strong emphasis on the development of heavy industry and diversification of its current industry, a policy aimed at decreasing dependence on oil. During the 1980s, the industrial sector showed a steady increase, reflecting the importance given to military industries during the Iran-Iraq war. By early 1992 it was officially claimed that industrial output had been restored to 60% of pre-Gulf War capacity. The UN oil-for-food program has allowed limited oil sales in 1999 and 2000, despite economic sanctions resulting from the Gulf War.

## 29 SCIENCE AND TECHNOLOGY

Iraq has imported Western technology for its petrochemical industry. The Scientific Research Council was established in 1963 and includes nine scientific research centers. The Nuclear Research Center (founded in 1967) has conducted nuclear physics experiments and produced radioisotopes with equipment supplied by France. In 1982, the French government agreed to help rebuild the institute's Osirak reactor, knocked out by an Israeli air attack the previous year. Eight universities offer degrees in basic and applied sciences. In addition, the Ministry of Higher Education has 18 incorporated technical institutes. The Agriculture and Water Resources Research Center (founded in 1980) and the Iraq Natural History Research Center and Museum (founded in 1946) are both located in Baghdad. The Iraqi Medical Society (founded in 1920) is headquartered there.

## 30 DOMESTIC TRADE

Modern shops and department stores are spreading throughout the country, replacing traditional bazaars. Baghdad, Mosul, and Basra, as well as other large and medium-size cities, all have modern supermarkets and branches of the official department store, "al-Makhazin al-Iraqiyyah." Baghdad leads in wholesale trade and in the number of retail shops.

The previously state-owned economy has been suffering since the 1980-1988 Iran-Iraq War. The 1990 Kuwait invasion and the subsequent international military intervention caused even greater damage to the infrastructure and resulted in international sanctions that crippled the economy. With the 2003 ousting of Saddam Hussein by international coalition forces, the way is paved to reopen the Iraqi economy to international trade. However, the nation will likely be highly dependent on foreign aid and investment for a number of years.

Normal banking hours in summer are 8 AM to noon, Saturday-Wednesday, and 8 to 11 AM on Thursday; winter openings and closings are an hour later.

## 31 FOREIGN TRADE

Iraq's most valuable export is oil, which has historically accounted for almost all of its total export value. Rising oil prices during the 1970s created increases in export revenues. However, the drop in world oil prices and Iraq's exporting problems due to international sanctions essentially put an end to Iraqi oil exports. The UN imposed trade restrictions on non-oil exports in August 1990. Non-oil exports (often illegal) were estimated at \$2 billion for the 12 months following the March 1991 cease-fire. Iraq was traditionally the world's largest exporter of dates, with its better varieties going to Western Europe, Australia, and North America.

Until 1994, the UN committee charged with supervising what little international trade Iraq is permitted to engage in—food and medicine, essentially—kept records on the amount of goods it approved for import in exchange for oil. In the first half of 1994, the committee recorded \$2 billion in food imports, \$175 million in medicine, and an additional \$2 billion in "essential civilian needs," a term that at that time referred to agricultural machinery, seeds, and goods for sanitation.

In 1995, the Iraqi government rationed its people only one half of the minimum daily requirement in calories. In 1997, the UN permitted Iraq to expand its oil sales to increase its purchasing power of food and other sources of humanitarian relief. In the spring of that year the country received 400,000 tons of wheat to help feed its suffering population, who had been living under strict food rations for four years. Limited exports were organized by the UN, and the oil-for-food program brought in revenues during 1999 equaling \$5.3 billion.

In 1998, Iraq exported crude petroleum (80%), refined petroleum products (18%), and natural and manufactured gas

(2.0%). Principal trading partners in 1998 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	1,237	117	1,120
France	671	281	390
Spain	452	16	436
Italy	366	42	324
Netherlands	297	11	286
Austria	122	11	111
Taiwan	108	n.a.	n.a.
Portugal	107	n.a.	n.a.
China (inc. Hong Kong)	54	115	-61
Australia	33	216	-183

### 32 BALANCE OF PAYMENTS

The US Central Intelligence Agency (CIA) reports that in 2001 the purchasing power parity of Iraq's exports was \$15.8 billion while imports totaled \$11 billion resulting in a trade surplus of \$4.8 billion. Following the 2003 war, a representative government was forecast to be in place by 2005, which would promote the stabilization of the economy. Although substantial imports in the second half of 2003 were forecast to limit the trade surplus, oil output was forecast to rebound in 2004, driving GDP growth and creating a current account surplus of 8% of GDP.

### 33 BANKING AND SECURITIES

When Iraq was part of the Ottoman Empire, a number of European currencies circulated alongside the Turkish pound. With the establishment of the British mandate after World War I, Iraq was incorporated into the Indian monetary system, which was operated by the British, and the rupee became the principal currency in circulation. In 1931, the Iraq Currency Board was established in London for note issue and maintenance of reserves for the new Iraqi dinar. The currency board pursued a conservative monetary policy, maintaining very high reserves behind the dinar. The dinar was further strengthened by its link to the British pound. In 1947 the government-owned National Bank of Iraq was founded, and in 1949 the London-based currency board was abolished as the new bank assumed responsibility for the issuing of notes and the maintenance of reserves.

In the 1940s, a series of government-owned banks was established: the Agricultural Bank and the Industrial Bank, the Rafidayn Bank, the Real Estate Bank, the Mortgage Bank, and the Cooperative Bank. In 1956 the National Bank of Iraq became the Central Bank of Iraq. In 1964, banking was fully nationalized. The banking system comprises the Central Bank of Iraq, the Rafidain Bank, the main commercial bank, and three others: the Agricultural Cooperative Bank, the Industrial Bank, and the Real Estate Bank. In 1991 the government decided to end its monopoly on banking. Data on the financial situation in Iraq are not generally available as the main source of official statistics, the Central Bank of Iraq, has not released figures since 1977. However, data from external authorities are available. After 1991, six new banks were established—the Socialist Bank, Iraqi Commercial Bank, Baghdad Bank, Dijla Bank, Al-Itimad Bank, and the Private Bank—as a result of liberalizing legislation and the opportunity for large-scale profits from currency speculation.

Preference for investing savings in rural or urban real estate is common. Major private investments in industrial enterprises can be secured only by assurance of financial assistance from the government. The establishment of a stock exchange in Baghdad was delayed by practical considerations such as a lack of computers, but it was eventually inaugurated in March 1992. Trading has not been heavy, and no exact statistics are available.

During the US-led war and subsequent occupation of Iraq, the financial sector essentially disappeared. The banking district of Baghdad was wrecked by the bombing campaign, and until a

provisional government is set up, it appears that financial activity remains at a standstill. Of course, occupation officials saw rejuvenation of Iraq's banking system as a high priority, and have been taking steps toward the establishment of a new central bank that will have the power to issue new currency and set interest rates, in the hopes of managing the country's massive debts. USAID gave loans of up to \$250,000 to small businesses and entrepreneurs in order to jumpstart the economy. Fortunately, Iraq's banking system had been one of the region's most advanced prior to the war, so the foundations have already been laid for a sound financial sector.

### 34 INSURANCE

The insurance industry was nationalized in 1964. The State Insurance Organization supervises and maintains three companies: the National Life Insurance Co., the Iraqi Life Insurance Co., and the Iraqi Reinsurance Co. Third-party motor vehicle liability insurance is compulsory. In 1999, Iraqis spent \$42 million on insurance.

### 35 PUBLIC FINANCE

There are several budgets: the ordinary budget, under which the regular activities of the government are financed; separate budgets for the Iraqi State Railways, the Port of Basra Authority, the Al-Faw Dredging Scheme, and the tobacco monopoly; municipal budgets requiring government approval; and allocations for semi-independent government agencies. In addition, there is a separate development budget, as well as an undeclared budget for the military believed to have absorbed over half of state funds during the war with Iran. Since 1980, the decline in oil exports and huge war expenditures forced Iraq to borrow and to raise funds from abroad. Iraq's invasion of Kuwait in 1990, with the consequent infrastructural damage, UN sanctions, and oil embargo, have severely diminished revenues. The future of the Iraqi economy is highly uncertain. Until a stable government is in place, it will be very difficult for any commercial activity to take place. Certainly Iraq will be borne into independence with huge external debts.

### 36 TAXATION

Direct taxes are levied on income and on property. The rental value of dwellings, commercial buildings, and nonagricultural land is taxed, with a certain tax-free minimum. In 1939, graduated income tax rates were established on income from all sources except agriculture. Most agricultural income is not taxed.

Indirect taxation predominates. The land tax must be paid by all who farm government lands with or without a lease. Owners of freehold (lazimah) land pay no tax or rent. Much farm produce consumed on the farm or in the village is not taxed at all, but when marketed, farm products are taxed.

### 37 CUSTOMS AND DUTIES

Since about 1950, tariffs have been used primarily to protect Iraqi industry or to stimulate industries that might eventually reduce the need for foreign imports. This tariff system levies duties on luxury items but has reduced rates on industrial equipment and on certain raw materials and foodstuffs. Iraq has a single-column tariff, with duties collected at Basra and Baghdad. In October 1992, Iraq banned the import of 157 "luxury items," including cheese, onions, shampoo, matches, shoes, and carpets. In 1989, Iraq joined the newly formed Arab Cooperation Council with Egypt, Jordan, and Yemen. The ACC's goals included formation of a common market and economic integration in other areas. The international embargo levied against the nation after it invaded Kuwait has essentially ended Iraq's participation in the ACC. Egypt, one of its partners in the Council, was a leader in the military coalition that liberated Kuwait.

### 38 FOREIGN INVESTMENT

UN sanctions have effectively frozen all of Iraq's foreign transactions for the near future. In October 1992, the UN Security Council permitted these frozen assets, including Iraqi oil in storage in Turkey and Saudi Arabia, to be sold without the permission of the Iraqi government. About \$1 billion of frozen assets were to pay for compensation to Kuwaiti victims of the invasion and to cover UN operations inside Iraq.

### 39 ECONOMIC DEVELOPMENT

The government both controls and participates in petroleum, agriculture, commerce, banking, and industry. In the late 1960s, it made efforts to diversify Iraq's economic relations and to conserve foreign exchange. As an example, it was announced in 1970 that contracts for all planned projects would be awarded to companies willing to receive compensation in crude oil or petroleum products. The government also undertook to build an Iraqi tanker fleet to break the monopoly of foreign oil-transport companies.

Iraq has an estimated foreign debt of more than \$87 billion. The imposition of sanctions against Iraq has destroyed all attempts to stabilize Iraq's payments. Iraq also faces reparation claims. Iran is separately pursuing its claim for massive separation payments arising from the 1980–88 war. Iraq is also obligated by UN resolutions to pay for various UN agency activities.

### 40 SOCIAL DEVELOPMENT

A social security law passed in 1971 provides benefits or payments for disability, maternity, old age, unemployment, sickness, and funerals. This law applies to all establishments employing five or more people, but excludes agricultural employees, temporary employees, and domestic servants. This social insurance system is funded by employee contributions of 5% of their wages, and employer contributions of 12% of payroll. Oil companies are required to pay 25% of payroll. Men may retire at age 60 and women at 55 after they have worked for 20 years. Maternity benefits for employed women include 100% of salary for a period of 10 weeks. Work injury is covered and unemployment assistance is available.

The government claims to support equality for women, who make up about 20% of the work force. Laws have been passed protecting women from sexual harassment, permitting them to join the police and armed forces, and equalizing their rights in divorce, land ownership, taxation, suffrage, and election to political office. Despite these government claims of legal equality, severe discrimination against women remains. Women are not allowed to travel abroad unaccompanied. In 1990, a decree was passed that provides immunity to men who kill female family members who have committed an "immoral" act.

Although Iraq's constitution guarantees individual rights, the government sharply limits political freedoms and tolerates little public expression of dissent. Suspected political offenders are subject to arbitrary arrest and imprisonment, and torture is common in such cases. The government executes perceived or alleged opponents. Amputations of limbs and branding are used to punish those accused of serious crimes. In 1995, the death penalty was established for persons found to be in possession of stolen goods.

Gross human rights violations continue to be committed. Iraq's minority Kurd population faces serious forms of discrimination and human rights abuses. The Iraqi government continued to harass and threaten relief workers and UN personnel in the area. The Iraqi government has refused to cooperate with international human rights organizations or to allow the establishment of independent local ones. Human rights monitors are denied visas to enter the country and must base their reports on published

material and interviews with emigres and political opposition groups.

### 41 HEALTH

There are many well-trained Iraqi physicians; however, their effectiveness is limited by a lack of trained nursing and paramedical staff. Between 1985 and 95, 93% of the population had access to health care services. Private hospitals are allowed to operate in Baghdad and other major cities. Considerable effort has been made to expand medical facilities to small towns and more remote areas of the country, but these efforts have been hampered by a lack of transportation and a desire of medical personnel to live and work in Baghdad and the major cities. In 2000, 85% of the population had access to safe drinking water and 79% had adequate sanitation. Dentists and other specialists are almost unknown in rural districts. Child nutrition has been negatively affected by the aftermath of the Gulf War and UN sanctions. In a study of Iraqi children shortly after the war, 24% were malnourished or classified as stunted and 8% were in the wasted category. The UN Children's Fund has documented that 4,500 children under five die every month from hunger and disease. UN officials also estimate that the international trade embargo and the relative indifference of the regime cause the premature deaths of 4,000 to 5,000 sick and old Iraqis each month.

In 1991, Iraq had 10,900 physicians, 13,206 nurses, 1,719 pharmacists, and 1,628 dentists. As of 1999, there were an estimated 0.5 physicians and 1.4 hospital beds per 1,000 people. Iraq's 2002 birth rate was estimated at 34 per 1,000 people. Of married women (ages 15 to 49), 14% used contraception in 1989. Life expectancy in 2000 averaged 61 years. The fertility rate decreased from 7.2 in 1960 to 4.3 children in 2000 for each woman during childbearing years. In 1997, immunization rates for children up to one year old were: tuberculosis, 90%; diphtheria, pertussis, and tetanus, 92%; and measles, 98%. In 1999, there were 156 reported cases of tuberculosis per 100,000 people. The infant mortality rate in 2000 was 93 per 1,000 live births, and the general mortality rate was estimated at 6 per 1,000 people in 2002. As of 1999 the prevalence of HIV was less than 0.01 per 100 adults.

Tobacco consumption remained static between 1984 and 1994, when 3.1 kg (6.8 lbs) a year was consumed per adult.

### 42 HOUSING

In the last 20 years, living conditions for the vast majority of the population have improved greatly. Electricity and running water are normal features of all Iraqi villages in rural areas. Mud huts in remote places are rapidly being replaced by brick dwellings. Major cities like Mosul, Basra, and especially Baghdad have most of the amenities of modern living. Traditionally, Iraqis have lived in single family dwellings, but in the last 15 years, the government had built a number of high-rise apartments, especially in Baghdad. It had done so to control urban sprawl and to cut down on suburban service expenditures. From 1980–88, total housing units numbered 2,478,000 with 6.5 people per dwelling.

The 2003 invasion of Iraq by international coalition forces caused destruction and damage to a large portion of the housing sector, particularly in and around Baghdad. The UN responded to the crisis by providing construction materials through the Oil for Food Program. The housing sector had been part of this program since 2000. Through the program, about 64,932 housing units were built to accommodate about 551,922 people.

### 43 EDUCATION

Six years of compulsory primary education have been in effect since 1978. An estimated 44% of adults were illiterate in 2000 (males, 34%; females, 54%). In 1996, 2,903,923 students

attended 8,145 primary schools, with 145,455 teachers. Student-to-teacher ratio stood at 20 to 1. In that same year, 1,160,421 students attended secondary schools, with 62,296 teachers. The pupil-teacher ratio at the primary level was 21 to 1 in 1999. In the same year, 93% of primary-school-age children were enrolled in school, while 33% of those eligible attended secondary school.

Primary schools provide a six-year course, at the end of which the student must pass an examination to be admitted to secondary school. The curriculum is based on Western patterns but also includes religious teaching. The language of instruction is Arabic. Secondary schools have a three-year intermediate course, followed by a two-year course in preparation for entrance to college. A national examination must be passed at its end. Secondary education for girls dates from 1929. Traditional Quranic schools are nearly extinct.

Education at all levels from primary to higher education is free, and no private schools are permitted to operate. There are seven universities in Iraq, four of them in Baghdad. The University of Baghdad is the most important higher education institution in the country. Other universities include Mosul, al-Mustansiriyah, Basra, and as-Sulaymaniyah. In addition to these universities, there are 19 technical institutes throughout Iraq. In 1988, all higher-level institutions had 209,818 pupils and 11,072 instructors. Education in Iraq is under the control of the Ministry of Education and the Ministry of Higher Education and Research.

#### 44 LIBRARIES AND MUSEUMS

The National Library in Baghdad, founded in 1961, housed 417,000 volumes in 2002. Two noteworthy academic libraries are the Central Library of the University of Baghdad (700,000 volumes) and the Central Library of the University of Mosul (943,000 volumes). One of the country's outstanding libraries is the Iraqi Museum Library (founded 1934), with modern research facilities and more than 229,000 volumes, many of them rare editions. The Directorate of Antiquities in Baghdad housed a library of 38,000 volumes. There are public library branches in many provincial capitals. Arsonists and looters ransacked the libraries of Iraq in 2003 following the war, and it is believed the damage is extensive.

With the exception of the National History Research Center and Museum and the National Museum of Modern Art, museums are under the control of the Department of the Directorate-General of Antiquities in Baghdad. Two of the most outstanding collections are at the Iraqi Museum in Baghdad, which contains antiquities dating from the early Stone Age, and the Mosul Museum. The Abbasid Palace Museum and the Museum of Arab Antiquities, both located in Baghdad, are housed in restored buildings from the 13th and 14th centuries, respectively. Iraq's museums and antiquities suffered extensive damage following the war in 2003. Looters and arsonists devastated the country's cultural heritage.

#### 45 MEDIA

In 1997, there were about 675,000 main telephone lines in use throughout the country. The government's Radio Baghdad transmits in Arabic from 39 transmitters, and also has English, Kurdish, and some other foreign-language broadcasts. As of 1998 there were 14 AM and 51 FM radio station and 13 government-operated television stations. In 2000, there were 222 radios and 83 television sets per 1,000 population. In 2001, there were 12,500 Internet subscribers served by one service provider. Access is made primarily through Internet cafés.

All communications media are owned and controlled by the government, and criticism of government policies is not permitted. Newspapers that failed to observe strict government censorship have been suspended. The two leading Arabic newspapers in 2002 were *Al-Thawra* (*The Revolution*,

circulation 250,000) and *Al-Jumburiyah* (*The Republic*, 150,000); the only English-language daily was the state-sponsored Baghdad Observer (22,000).

#### 46 ORGANIZATIONS

Chambers of commerce are active in Baghdad, Basra, and Mosul. Cooperatives, first established in 1944, have played an increasingly important social role, especially under the post-1968 Ba'ath government. There are many youth centers and sports clubs. Scouting programs are active. The General Federation of Iraqi Youth and the General Federation of Iraqi Women are government-sponsored mass organizations. The Women's Union of Kurdistan (WUK), established in 1989, works toward improving the lifestyle and social development of women by publishing educational magazines and presenting educational seminars on health, education, and legal issues. Red Crescent societies provide social services in many cities and towns.

#### 47 TOURISM, TRAVEL, AND RECREATION

Tourism declined sharply during Iraq's occupation of Kuwait and the Gulf War. In 1998, 340,000 visitors arrived in Iraq, and tourist receipts totaled \$13 million, down from \$55 million in 1990. In 2000, 78,457 tourists visited Iraq. Many visitors from other Arab states are pilgrims to Islamic shrines. The other principal tourist attraction is visiting the varied archeological sites. Popular forms of recreation include tennis, cricket, swimming, and squash.

According to 1999 UN estimates, the cost of staying in Baghdad was approximately \$100 per day. The cities of Dohok, Erbil, and Suleimaniyah required an estimated daily expenditure of \$80.

#### 48 FAMOUS IRAQIS

The most famous kings in ancient times were Sargon (Sharrukin) of Akkad (fl.c.2350 BC), Hammurabi of Babylon (r.1792?-1750? BC), and Nebuchadnezzar II (Nabu-kadurri-utsur, r.605?-560? BC) of Babylon.

Under the caliphs Harun al-Rashid (ar-Rashid ibn Muhammad al-Mahdi ibn al-Mansur al-'Abbasi, r.786-809) and al-Mamun (abu al-'Abbas 'Abdullah al-Mamun, r.813-33), Baghdad was the center of the Arab scholarship that translated and modified Greek philosophy. A leading figure in this movement was Hunain ibn Ishaq (d.873), called Johannitius by Western scholastics. His contemporary was the great Arab philosopher Yaqub al-Kindi, whose catholicity assimilated both Greek philosophy and Indian mathematics. The founder of one of the four orthodox schools of Islamic law, which claims the largest number of adherents in the Muslim world, Abu Hanifa (d.767) was also a native Iraqi. Another celebrated figure in theology, 'Abd al-Hasan al-Ash'ari (c.913), who combated the rationalist Mu'tazila school, also lived in Baghdad; his influence still prevails in Islam. Al-Ghazali (Ghazal, d.1111), though Persian by birth, taught at the Nizamiyah University in Baghdad; he is one of the best-known Islamic philosopher-theologians. Iraq also produced famous mystics like Hasan al-Basri (642-728) and 'Abd al-Qadir al-Jilani (1077-1166); the latter's followers are numerous among Asian Muslims, and his tomb in Baghdad draws many pilgrims. Modern Iraq has produced no artist or writer famous outside the Arabic-speaking world.

Gen. Saddam Hussein (Husayn) al-Takriti (b. 1937), served as chairman of the Revolutionary Command Council and president of the country from 1979 until his ousting in 2003.

#### 49 DEPENDENCIES

Iraq has no territories or colonies.

# ISRAEL

State of Israel

[Arabic] *Dawlat Israel*  
[Hebrew] *Medinat Yisrael*

**CAPITAL:** Jerusalem (Yerushalayim, Al-Quds)

**FLAG:** The flag, which was adopted at the First Zionist Congress in 1897, consists of a blue six-pointed Shield of David (Magen David) centered between two blue horizontal stripes on a white field.

**ANTHEM:** *Hatikvah (The Hope)*.

**MONETARY UNIT:** The new Israeli shekel (NIS), a paper currency of 100 new agorot, replaced the shekel (IS) at a rate of 1,000 to 1 in 1985; the shekel replaced the Israeli pound (IL) in 1980 at the rate of 10 pounds per shekel. There are coins of 5, 10, and 50 agora, 1 and 5 shekels and notes of 10, 50, 100, and 200 shekels. NIS1 = \$0.21978 (or \$1 = NIS4.55) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but some local units are used, notably the dunam (equivalent to 1,000 square meters, or about 0.25 acre).

**HOLIDAYS:** Israel officially uses both the Gregorian and the complex Jewish lunisolar calendars, but the latter determines the occurrence of national holidays: Rosh Hashanah (New Year), September or October; Yom Kippur (Day of Atonement), September or October; Sukkot (Tabernacles), September or October; Simhat Torah (Rejoicing in the Law), September or October; Pesach (Passover), March or April; Independence Day, April or May; and Shavuot (Pentecost), May or June. All Jewish holidays, as well as the Jewish Sabbath (Friday/Saturday), begin just before sundown and end at nightfall 24 hours later. Muslim, Christian, and Druze holidays are observed by the respective minorities.

**TIME:** 2 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in southwestern Asia along the eastern end of the Mediterranean Sea, Israel claims an area of 20,770 sq km (8,019 sq mi), extending about 320 km (200 mi) N–S and 110 km (70 mi) E–W; at its narrowest, just north of Tel Aviv–Yafo, it is 19 km (12 mi) across. This total includes the Golan Heights area (1,176 sq km/454 sq mi), captured from Syria during the Six-Day War in 1967 and annexed on 14 December 1981; the annexation (technically described as the extension of Israeli “law, jurisdiction, and administration” to the region) was condemned by Syria and by unanimous resolution of the UN Security Council. The Labor Government in 1984 indicated that some (possibly all) of the Golan could be returned to Syria in a peace agreement. Other territories captured in 1967 and classified as administered territories were the West Bank (Judea and Samaria), 5,878 sq km (2,270 sq mi), and the Gaza Strip, 362 sq km (140 sq mi). (The Gaza Strip and Jericho area were transferred in 1994 to Palestinian administration). East Jerusalem, captured in 1967, was annexed shortly thereafter.

Israel is bordered on the N by Lebanon, on the E by Syria and Jordan, on the S by the Gulf of Aqaba (Gulf of Elat), on the SW by Egypt, and on the W by the Mediterranean Sea. Comparatively, the area occupied by Israel is slightly smaller than the state of New Jersey. The total land boundary length is 1,017 km (632 mi) and the coastline is 273 km (170 mi).

Israel’s capital city, Jerusalem, is located near the center of the country (including the West Bank).

## <sup>2</sup>TOPOGRAPHY

The country is divided into three major longitudinal strips: the coastal plain, which follows the Mediterranean shoreline in a southward widening band; the hill region, embracing the hills of Galilee in the north, Samaria and Judea in the center, and the

Negev in the south; and the Jordan Valley. Except for the Bay of Acre, the sandy coastline is not indented for its entire length. The hill region, averaging 610 m (2,000 ft) in elevation, reaches its highest point at Mt. Meron (1,208 m/3,963 ft). South of the Judean hills, the Negev desert, marked by cliffs and craters and covering about half the total area of Israel proper, extends down to the Gulf of Aqaba on the Red Sea. The Jordan River, forming the border between Israel (including the West Bank) and Jordan, links the only bodies of water in the country: the Sea of Galilee (Yam Kinneret) and the heavily saline Dead Sea (Yam ha-Melah), which, at 408 m (1,339 ft) below sea level, is the lowest point on the earth’s surface.

## <sup>3</sup>CLIMATE

Although climatic conditions are varied across the country, the climate is generally temperate. The coldest month is January; the hottest, August. In winter, snow occasionally falls in the hills, where January temperatures normally fluctuate between 4° and 10°C (40–50°F), and August temperatures between 18° and 29°C (65–85° F). On the coastal plain, sea breezes temper the weather all year round, temperature variations ranging from 8° to 18°C (47–65°F) in January and 21° to 29°C (70–85°F) in August. In the south, at Elat, January temperatures range between 10° and 21°C (50–70° F) and may reach 49°C (120°F) in August. The rainy season lasts from October until April, with rainfall averaging 118 cm (44 in) annually in the Upper Galilee and only 2 cm (0.8 in) at Elat, although dewfall gives the south another several inches of water every year.

## <sup>4</sup>FLORA AND FAUNA

The Bible (Deuteronomy 8:8) describes the country as “a land of wheat and barley, of vines and fig trees and pomegranates, a land of olive trees and honey.” The original forests, evergreen and

maquis, have largely been destroyed, but some 200 million new trees have been planted during this century, in a major reforestation program. Vegetation cover is thin except in the coastal plain, where conditions are favorable to the cultivation of citrus fruit, and in the Jordan Valley with its plantations of tropical fruit. Among surviving animals, jackals and hyenas remain fairly numerous. There are wild boar in the Lake Hula region. With the growth of vegetation and water supplies, bird life and deer have increased.

## 5 ENVIRONMENT

As of 2000, water pollution and adequate water supply are major environmental issues in Israel. Industrial and agricultural chemicals threaten the nation's already depleted water supply. Israel has only 1.9 cu km of renewable water resources with 64% used for farming activity and 7% used for industrial purposes. About 80% of the people living in rural areas have pure water. Air pollution from industrial sources, oil facilities, and vehicles is another significant environmental problem. In 1996, Israel's industrial carbon dioxide emissions totaled 52.3 million metric tons.

Reforestation efforts, especially since 1948, have helped to conserve the country's water resources and prevent soil erosion. Israel has reclaimed much of the Negev for agricultural purposes by means of large irrigation projects, thereby stopping the desertification process that had been depleting the land for nearly 2,000 years. Principal environmental responsibility is vested in the Environmental Protection Service of the Ministry of the Interior.

In 2001, 13 mammal species and 8 bird species were endangered. Nineteen species of plants were threatened with extinction. Endangered species included the northern bald ibis, South Arabian leopard, Saudi Arabian dorcas gazelle, and three species of sea turtles. The Mediterranean monk seal, cheetah, Barbary sheep, and Persian fallow deer became extinct in the 1980s. The Israel painted frog and Syrian wild ass have also become extinct.

## 6 POPULATION

The population of Israel in 2003 was estimated by the United Nations at 6,433,000, which placed it as number 98 in population among the 193 nations of the world. In that year approximately 10% of the population was over 65 years of age, with another 28% of the population under 15 years of age. There were 98 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 2.02%, with the projected population for the year 2015 at 7,772,000. The population density in 2002 was 314 per sq km (812 per sq mi).

It was estimated by the Population Reference Bureau that 91% of the population lived in urban areas in 2001. The capital city, Jerusalem, had a population of 668,000 in that year. Tel Aviv-Jaffa had a metropolitan population of 2,170,000 in 2002. Other large cities are Haifa, 249,800; Holon, 162,800; Bat Yam, 145,300; Petah Tiqwa, 150,800; Beersheba, 134,700; Rishon LeZiyyon, 150,400; and Netanya, 141,800. According to the United Nations, the urban population growth rate for 2000–2005 was 1.8%.

## 7 MIGRATION

In 1948, 65% of Israel's Jewish population consisted of immigrants; many of these 463,000 immigrant Jews had fled from persecution in Russia and, especially during the Nazi period, Central and Eastern Europe. Israel's declaration of independence publicly opened the state "to the immigration of Jews from all countries of their dispersion," and the 1950 Law of Return granted every returning Jew the right to automatic citizenship. The Nationality Law specifies other ways—including

birth, residence, and naturalization—that Israeli citizenship may be acquired. In the years 1948–92, Israel took in 2,242,500 Jewish immigrants; during 1948–51, the flow was at its heaviest, averaging 171,685 per year, about evenly divided between Eastern European Jews, who were war refugees, and Oriental Jews from ancient centers of the Arab world. In the years 1952–56, most immigrants came from French North Africa; in 1957–58 there was a renewed inflow from Eastern Europe. After a lull in 1959–60, the flow of immigrants was renewed, reaching substantial proportions by 1963, when 64,364 Jews arrived. Immigration fell to an annual average of 20,561 persons for 1965–68, rose to an average of 43,258 per year for 1969–74, then declined to an average of 24,965 for 1975–79. The number declined further to an average of 15,383 for 1980–89. As of March, 1995, around 525,000 immigrants had arrived in Israel since 1990. Most of these immigrants came from the former Soviet Union; this was the largest wave of immigration since the independence of Israel. In May of 1991, 14,000 Ethiopian Jews immigrated due to the Operation Solomon airlift. The proportion of Jewish immigrants from Europe and North America (as opposed to those from Asia and Africa) varied during the 1960s, but it rose from 40.4% in 1968 to 97.3% in 1990. (For this purpose the Asiatic republics of the USSR were counted as part of Europe). In 1984–85, some 10,000 Ethiopian Jews, victims of famine, were airlifted to Israel via Sudan. In 1992, the Jewish immigrant population was 39.4% of all Israeli Jews and 31.8% of all Israelis. A certain amount of emigration has always taken place, but the pace increased after 1975. In a typical year after 1980, about 10,000 Israelis were added to the number who had been away continuously for more than four years. From 1967 to 1992, Israel established 142 settlements in the occupied territories; about 130,000 Jews were living there by 1995.

Considerable Arab migration has also taken place, including an apparent wave of Arab immigration into Palestine between World War I and World War II. During the 1948 war there was a massive flight of an estimated 800,000 Palestinians. As of 1997 there were 3.2 million Palestinian refugees living in the West Bank, the Gaza Strip, Jordan, Syria, and Lebanon under the mandate of the Gaza-based United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA). In 2000, the net migration rate for Israel was 9.1 migrants per 1,000 population. This is a significant drop from 18.7 per 1,000 in 1990. The number of migrants living in Israel in 2000 was 2,256,000. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

Of the estimated population of 5,749,760 in 1999, 80.1% were Jewish (European/American-born 32.1%; Israeli-born 20.8%; African-born 14.6%; Asian-born 12.6%) and 19.9% were non-Jewish (mostly Arab).

The traditional division of the Jews into Ashkenazim (Central and East Europeans) and Sephardim (Iberian Jews and their descendants) is still given formal recognition in the choice of two chief rabbis, one for each community. A more meaningful division, however, would be that between Occidentals and Orientals (now also called Sephardim). Oriental Jews, who are in the majority, generally believe themselves to be educationally, economically, and socially disadvantaged by comparison with the Occidentals.

The minority non-Jewish population is overwhelmingly Arabic-speaking, but Israel's minorities are divided into a number of religious groups and include several small non-Arab national groups, such as Armenians and Circassians. The government of Israel has declared its intention to strive for equality between the Arab and Jewish sectors of the population. Israel's Arab citizens do not share fully in rights granted to, and levies imposed on, Jewish citizens. The rights of citizenship do not extend to Arabs

in the administered territories. The living standards of Arabs in Israel compare favorably with those of Arabs in non-oil-producing Arab countries, but they are considerably below those of the Jewish majority, especially the Ashkenazim. As a consequence of repeated wars between Israel and its Arab neighbors and the development of Palestinian Arab nationalism and terrorism, tensions between Jews and Arabs are a fact of Israeli daily life, especially in the West Bank and Gaza Strip.

## **9**LANGUAGES

The official languages are Hebrew and Arabic, the former being dominant. Hebrew is the language of most of the Old Testament; modern Hebrew is the biblical language as modified by absorption of elements from all historical forms of Hebrew and by development over the years. Arabic is used by Arabs in parliamentary deliberations, in pleadings before the courts, and in dealings with governmental departments, and is the language of instruction in schools for Arab children. English is taught in all secondary schools and, along with Hebrew, is commonly used in foreign business correspondence and in advertising and labeling. Coins, postage stamps, and bank notes bear inscriptions in Hebrew, Arabic, and Latin characters.

## **10**RELIGIONS

The land that is now Israel (which the Romans called Judea and then Palestine) is the cradle of two of the world's great religions, Judaism and Christianity. In the Hebrew Scriptures, Jewish history begins with Abraham's journey from Mesopotamia to Canaan, to which the descendants of Abraham would later return after their deliverance by Moses from bondage in Egypt. Jerusalem is the historical site of the First Temple, built by Solomon in the 10th century BC and destroyed by the Babylonians in 586 BC, and the Second Temple, built about 70 years later and sacked by the Romans in AD 70. Belief in the life, teachings, crucifixion, and resurrection of Jesus of Nazareth (who, according to the Christian Scriptures, actually preached in the Second Temple) is the basis of the Christian religion. Spread by the immediate followers of Jesus and others, Christianity developed within three centuries from a messianic Jewish sect to the established religion of the Roman Empire. Jerusalem is also holy to Islam: the Dome of the Rock marks the site where, in Muslim tradition, Mohammed rose into heaven.

Present-day Israel is the only country where Judaism is the majority religion, professed by 80% of the population; over one-fourth of all the world's Jews live there. Most in the Jewish population describe themselves as secular or traditional Jews. About 5% are Haredi (ultra-Orthodox) and about 13% are Orthodox. There are also a number of adherents who claim affiliation with Conservative, Reform, and Reconstructionist branches of Judaism, but these are not officially recognized.

Most Arabs are Sunni Muslims (14.6%). Christians (2.1%) are largely Greek Catholic or Greek Orthodox, but there are also Roman Catholics, Armenians, and Protestants. Other religions are claimed by the remaining 3.2% of the population. The Druzes, who split away from Islam in the 11th century, have the status of a separate religious community. The Baha'i world faith is centered in Haifa.

Freedom of religion is guaranteed. The Ministry of Religious Affairs assists institutions of every affiliation and contributes to the preservation and repair of their holy shrines, which are protected by the government and made accessible to pilgrims. Supreme religious authority in the Jewish community is vested in the chief rabbinate, with Ashkenazim and Sephardim each having a chief rabbi.

## **11**TRANSPORTATION

In 2002, there were an estimated 15,965 km (9,920 mi) of paved highways, including 56 km (35 mi) of expressways. With the

building in 1957 of a highway extension from Beersheba to Elat, the Red Sea was linked to the Mediterranean. Trackage of the state-owned railway totaled 647 km (402 mi), all standard gauge, in 2001. Railways, buses, and taxis formerly constituted the principal means of passenger transportation; however, private car ownership nearly tripled during the 1970s. In 2000 there were 1,754,058 motor vehicles, including 1,422,032 private cars and 322,026 trucks, taxis, and buses.

As of 2002, Israel had 16 merchant vessels, with a total capacity of 593,319 GRT. Haifa can berth large passenger liners and has a 10,000-ton floating dock, but Ashdod (south of Tel Aviv) has outstripped Haifa in cargo handled since the early 1980s. Elat (Eilat) is also a seaport with full freight services.

Israel had 54 airports in 2001, 28 with paved runways. Israel Inland Airlines (Arkia) provides domestic service. Israel Airlines (El Al), which was founded shortly after Israel became a nation in 1948 and is almost entirely owned by the government. Ben-Gurion International Airport between Tel Aviv and Jerusalem is the center of passenger and cargo operations; Israel is building a new Ben-Gurion International Airport Terminal. Another principal airport is J. Hozman at Eilat. In 2001 3,989,500 passengers were carried on scheduled domestic and international airline flights.

## **12**HISTORY

Archaeologists have established that the world's earliest known city was Jericho, on the present-day West Bank, built about 7000 BC. The formative period of Israel began in approximately 1800 BC, when the Hebrews entered Canaan, and resumed in approximately 1200 BC, when the Israelite tribes returned to Canaan after a period of residence in Egypt. At various times, the people were led by patriarchs, judges, kings, prophets, and scribes, and the land was conquered by Assyrians, Babylonians (or Chaldeans), Persians, Greeks, and Romans. The ancient period neared its end in AD 70, when the Roman legions conquered Jerusalem after an unsuccessful revolt and destroyed the Temple, and it ended in AD 135, when the Roman Empire exiled most Jews after another unsuccessful revolt, led by Simon Bar-Kokhba, and renamed the region Syria Palaestina, which eventually became Palestine. During the next two millennia there were successive waves of foreign conquerors—Byzantines, Persians, Arabs, Crusaders, Mongols, Turks, and Britons. Most Jews remained in dispersion, where many nourished messianic hopes for an eventual return to Zion; however, Jews in varying numbers continued to live in Palestine through the years. It is estimated that by 1900, only about 78,000 Jews were living in Palestine (less than 1% of the world Jewish population), compared with some 650,000 non-Jews, mostly Arabs.

Modern Zionism, the movement for the reestablishment of a Jewish nation, dates from the late 19th century, with small-scale settlements by Russian and Romanian Jews on lands purchased by funds from Western European and US donors. The movement received impetus from the founding of the World Zionist Organization in Basel, Switzerland, in 1897, under the leadership of Theodor Herzl. Zionist hopes for a Jewish national homeland in Palestine were greatly bolstered when the British government pledged its support for this goal in 1917, in the Balfour Declaration, which was subsequently incorporated into the mandate over Palestine (originally including Transjordan) awarded to the UK by the League of Nations in 1922. Under the mandate, the Jewish community grew from 85,000 to 650,000, largely through immigration, on lands purchased from Arab owners. This growth was attended by rising hostility from the Arab community, which felt its majority status threatened by the Jewish influx. In 1939, shortly before the outbreak of World War II, the British mandatory authorities issued a White Paper that decreed severe restrictions on Jewish immigration and a virtual freezing of land purchase and settlement. Armed Jewish

LOCATION: 29°29' to 33°17' n; 34°16' to 35°41' e. TERRITORIAL SEA LIMIT: 6 miles.

resistance to this policy, as well as growing international backing for the establishment of a Jewish state as a haven for the survivors of the Nazi Holocaust, finally persuaded the British government to relinquish the mandate.

Armistice agreements concluded in 1949 failed to provide the contemplated transition to peace, and sporadic Arab incursions along the borders were answered by Israeli reprisals. Tensions were exacerbated by Arab economic boycotts and by Egypt's nationalization of the Suez Canal on 26 July 1956. On 29 October 1956, Israel (with British and French support) invaded Egypt and soon gained control of the Gaza Strip and the Sinai Peninsula. Fighting ended on 4 November; Israel, under US pressure, withdrew from the occupied areas in March 1957 and recognized borders consistent with its military position at the end of the 1948 war. A UN Emergency Force (UNEF) patrolled the armistice line. On 29 November 1947, the UN General Assembly adopted a plan for the partition of Palestine into two economically united but politically sovereign states, one Jewish and the other Arab, with Jerusalem as an international city. The Arabs of Palestine, aided by brethren across the frontiers, at once rose up in arms to thwart partition. The Jews accepted the plan; on 14 May 1948, the last day of the mandate, they proclaimed the formation of the State of Israel. The next day, the Arab League states—Egypt, Iraq, Jordan, Lebanon, Saudi Arabia, and Syria—launched a concerted armed attack. There followed a mass flight of hundreds of tens of thousands of Palestinian Arabs abroad. The war left Israel in possession of a much larger territory than that awarded the Jews under the UN partition plan; the planned Arab state failed to materialize, as Jordan annexed the West Bank. Meanwhile, the Palestinian refugees were resettled in camps on both banks of the Jordan River, in the Gaza Strip (then under Egyptian administration), in southern Lebanon, and in Syria.

Violations by both sides of the armistice lines persisted, and in May 1967, Egypt, fearing an Israeli attack on Syria, moved armaments and troops into the Sinai, ordering withdrawal of UNEF personnel from the armistice line, and closed the Strait of Tiran to Israeli shipping. On 5 June, Israel attacked Egypt and its allies, Syria and Jordan. By 11 June, Israel had scored a decisive victory in the conflict, since termed the Six-Day War, and had taken control of the Sinai Peninsula, the Gaza Strip, the Golan Heights, and the West Bank (including Jordanian-ruled East Jerusalem). The Security Council on 22 November unanimously adopted UK-sponsored Resolution 242, calling for establishment of a just and lasting peace in the Middle East, withdrawal of Israeli armed forces from territories occupied during the war, and acknowledgment of the "sovereignty, territorial integrity, and political independence of every State in the area and their right to live in peace within secure and recognized boundaries free from threats or acts of force." Israel indicated that return of the captured territories would have to be part of a general settlement guaranteeing peace; in 1967, the Israeli government began Jewish settlement in these areas; due in good part to the later encouragement of the Likud governments, by 1997 there were some 160,000 settlers in the occupied territories.

Serious shooting incidents between Egypt and Israel resumed in June 1969, following Egypt's declaration of a war of attrition against Israel. In response to a US peace initiative, a cease-fire took effect in August 1970, but tensions continued, and Palestinian Arab guerrillas mounted an international campaign of terrorism, highlighted in September 1972 by the kidnap and murder of Israeli athletes at the Olympic Games in Munich.

On 6 October 1973, during Yom Kippur, Egypt and Syria simultaneously attacked Israeli-held territory in the Sinai Peninsula and the Golan Heights. The Arabs won initial victories, but by 24 October, when a UN cease-fire took effect, the Israelis had crossed the Suez Canal and were 101 km (63 mi) from Cairo and about 27 km (17 mi) from Damascus. Under the impetus of

the “shuttle diplomacy” exercised by US Secretary of State Henry Kissinger, formal first-stage disengagement agreements were signed with Egypt on 18 January 1974 and with Syria on 31 May 1974. On 4 September 1975, a second-stage disengagement pact was signed in Geneva, under which Israel relinquished some territory in the Sinai (including two oil fields) in return for Egyptian declarations of peaceful intent, free passage of nonmilitary cargoes to and from Israel through the Suez Canal, and the stationing of US civilians to monitor an early warning system.

The 30-year cycle of Egyptian-Israeli hostilities was broken in November 1977, when Egyptian President Anwar al-Sadat (as-Sadat) paid a visit to Jerusalem on 19–21 November 1977, during which, in an address to parliament, he affirmed Israel’s right to exist as a nation, thereby laying the basis for a negotiated peace. In September 1978, at a summit conference mediated by US president Jimmy Carter at Camp David, Md., Israeli Prime Minister Menachem Begin and Sadat agreed on the general framework for a peace treaty which, after further negotiations, they signed in Washington, D.C. on 26 March 1979. The treaty provided for the withdrawal of Israeli forces from the Sinai over a three-year period and for further negotiations concerning autonomy and future status of Arab residents of the West Bank and the Gaza Strip, territories still under Israeli occupation. Israel withdrew from the Sinai oil fields within a year, and from the remainder of Sinai by 25 April 1982. However, the two countries failed to reach agreement on Palestinian autonomy in the West Bank and Gaza, and Israel continued to establish Jewish settlements in the West Bank despite Egyptian protests.

Israel’s relations remained tense with other Arab countries, which ostracized Egypt for signing the peace accord. In March 1978, Israel (which had long been supporting Lebanese Christian militias against the Palestine Liberation Organization—PLO—and its Muslim backers) sent troops into southern Lebanon to destroy PLO bases in retaliation for a Palestinian terrorist attack; Israel withdrew under US pressure. In April 1981, Israeli and Syrian forces directly confronted each other in Lebanon; Israeli jet aircraft shot down two Syrian helicopters in Lebanese territory, and Syria responded by deploying Soviet-made anti-aircraft missiles in the Bekaa (Biqā’) Valley, which Syria had been occupying since 1976. On 7 June 1981, Israeli warplanes struck at and disabled an Iraqi nuclear reactor under construction near Baghdad; the Israeli government claimed that the reactor could be employed to produce nuclear bombs for use against Israel.

Hostilities between Israel and the PLO and Syria reached a climax in early June 1982, when Israel launched a full-scale invasion of southern Lebanon, citing continued PLO shelling of the north and terrorist acts elsewhere. An estimated 90,000 troops rapidly destroyed PLO bases within a 40 km (25 mi) zone north of the Israeli border, captured the coastal towns of Tyre (Sur) and Sidon (Sayda), and then moved on to bomb and encircle Beirut by 14 June, trapping the main force of PLO fighters in the Lebanese capital and causing massive casualties and destruction. Meanwhile, Israeli warplanes destroyed Syria’s Soviet-built missile batteries in the Bekaa Valley—the announced objective of the invasion. A negotiated cease-fire was arranged by US envoy Philip Habib on 25 June, and more than 14,000 Palestinian and Syrian fighters were allowed to evacuate Beirut in late August. A multinational peacekeeping force of British, French, Italian, and US military personnel was stationed in the Beirut area.

Within Israel, the Lebanese war was divisive, and there were protest rallies against the Begin government. The protests increased when, after Israeli troops moved into West Beirut in the wake of the assassination of Lebanese President Bashir Gemayel, Christian militiamen were allowed to “mop up” remaining resistance in the Palestinian camps. The ensuing massacres, for which an Israeli government investigating commission

determined that some of Israel’s civilian and military leaders were indirectly responsible, led to the resignation of Ariel Sharon as defense minister. Subsequent Israeli attempts to extricate its occupying forces from Lebanon by negotiating an agreement for the withdrawal of all foreign forces were rejected by Syria. In September, Israel pulled back its forces from the Shuf Mountains, east of Beirut, to south of the Litani River. In 1985, withdrawal from southern Lebanon took place in stages over six months, punctuated by terrorist acts of Shi’i Muslim militants against departing Israeli troops, resulting in retaliatory arrests and detention of hundreds of Lebanese. Negotiations over a Trans World Airlines (TWA) jetliner hijacked en route from Athens to Rome by Shi’i militants in June 1985 led to gradual release by Israel of its Shi’i prisoners. In 1986, troubles continued despite the occupation of a swath of southern Lebanon, which Israel continued to term a “security zone,” as Shi’i militants and infiltrating Palestinian guerrillas continued to launch attacks. The war was a drain on the economy, already suffering from hyperinflation and huge foreign-exchange deficits. Prime Minister Begin resigned because of failing health in the autumn of 1983 and was replaced by Yitzhak Shamir, who, after inconclusive elections in 1984, was replaced on a rotational basis by Labor Party leader Shimon Peres. In 1986, a ground-breaking summit meeting took place when Prime Minister Peres traveled to Morocco for two days of secret talks with King Hassan II. In that year, Israel also improved relations with Egypt when Prime Minister Peres conferred with Egypt’s President Hosni Mubarek in the first meeting of the two nations since 1981. Shamir replaced Peres as prime minister in October 1986. Elections were again held with equally inconclusive results in November 1988, leading to a coalition government of the Labor and Likud parties. Four years later, Labor edged Likud in elections and was able to form a government supported by left-wing and religious parties. Yitzhak Rabin became Prime Minister with Shimon Peres as Foreign Minister; both were committed to reaching peace agreements with Arab antagonists.

In December 1987, unarmed Palestinians in Gaza began what became a multi-year series of stone-throwing riots against Israeli troops in the occupied territories. In this uprising (or *intifada* in Arabic), well over 1,000 Palestinians were killed and—by Palestinians—several hundred Israelis and Palestinian collaborators. Israeli use of lethal force, curfews, deportations, destruction of houses, and ten thousand detentions failed to stop the demonstrations while producing criticism abroad and anxiety at home. Waves of Jewish immigrants from the collapsing Soviet Union further provoked Palestinians.

During the Gulf War of 1991, Israel was hit by Iraqi missile attacks, demonstrating for some the state’s vulnerability and need to move toward peace with the Arabs. Prime Minister Shamir, who opposed the return of occupied territory, reluctantly accepted a US and Russian invitation to direct peace talks in Madrid in October 1991. These and subsequent negotiations produced few results until, under a Labor Government, Israeli and Palestinian representatives met secretly in Oslo to work out a peace agreement involving mutual recognition and transfer of authority in Gaza and Jericho to interim Palestinian rule with the final status of a Palestinian entity to be resolved in five years. The Oslo Accords were signed at the White House in Washington on 13 September 1993. Promises of international aid for the new Palestinian units poured in but the agreement was opposed by extremists on both sides and further set back by a massacre of 30 Muslims at prayer in the Hebron mosque on 25 February 1994 by a militant Israeli settler. Finally, delayed by several months, the withdrawal of Israeli forces from certain sectors and establishment of Palestinian self-rule took place on 18 May 1994. By 1997, six West Bank cities had been turned over to the Palestinian Authority. Israel balked at turning over control of Hebron even though it agreed to do so. A 1997 Hebron Protocol

split the city between Palestinian rule in one part of it and Israeli rule in the remaining 20%, to guarantee the security of settlers living in Jewish enclaves. All seven of the major cities controlled by the Palestinian Authority were reoccupied by Israel in 2002.

In November 1995, the greatest setback to the peace process occurred when a militant Israeli assassinated Prime Minister Yitzhak Rabin in retaliation for slowing Jewish settlement in the occupied territories and for his generally dovish policy toward the PLO. The nation then entered into a tumultuous period as Shimon Peres, Rabin's co-prime minister, took control of the government. Peres was not as popular as Rabin had been and in response to civil protest he called for early elections, which were held in May 1996. For the first time in these elections, Israelis were given the opportunity to directly elect their prime minister, and Peres, Likud, and Benjamin Netanyahu fought a bitter campaign, focusing mainly on the status of the occupied territories and the threat of terrorism from radical Palestinians. The prime minister race was very close and some news reports early on suggested, based on exit polling, that Peres had won. By morning of the next day, however, Netanyahu had emerged as Israel's first directly elected prime minister and Likud emerged with a slight majority (in coalition with a range of right wing parties) in the Knesset. Netanyahu immediately took a tough stance on the occupied territories, increasing the construction of Jewish settlements and enraging the Palestinians and the international community.

As expected, progress in the Middle East peace process slowed under Netanyahu. Hostilities between Palestinians and Israeli soldiers in the fall of 1996, following the opening of a tunnel in the Old City of Jerusalem, were the worst to occur since the days of the intifada. In 1997 and 1998 peace talks stalled over the terms of Israeli withdrawal from the West Bank. A new agreement, the Wye Memorandum, was reached at an October 1998 meeting in the United States between Netanyahu, Yassir Arafat, and President Bill Clinton. It set up a timetable for Israeli withdrawal from the West Bank. However, Netanyahu faced stiff opposition to the plan at home, and by the end of 1998, his governing coalition had collapsed, and implementation of the Wye plan was suspended until a new government could be formed following national elections the following May.

Labor candidate Ehud Barak triumphed in the May 1999 elections and formed a coalition government in July. In September, Barak and Arafat signed an agreement reviving the Wye accord (the Sharm el-Sheikh Memorandum), and in December peace talks between Israel and Syria—broken off in 1996—were resumed. In May 2000, Israel unilaterally withdrew from the nine-mile-wide security zone in southern Lebanon.

At the end of 1999 and into early 2000, three-way negotiations took place between Israel, the Palestinians, and the United States as mediator. In July 2000, President Clinton invited Barak and Arafat to Camp David, Md., for peace talks. The summit began on 11 July and ended on 25 July without an agreement being reached. President Clinton was determined to achieve a peace agreement before he left office, however, and he hosted talks with Israeli and Palestinian teams in Washington in December 2000. Negotiations between Israeli and Palestinian delegations were also held in Taba, Egypt, in late January 2001. By then President Clinton was out of office and incoming President George W. Bush took a position of nonengagement in the conflict.

On 28 September 2000, Likud leader Ariel Sharon visited the Temple Mount (Haram al-Sharif) in Jerusalem in what was seen as a provocative move, setting off large-scale Palestinian demonstrations, beginning the al-Aqsa intifada. By the end of 2000, Barak was presiding over an extremely violent situation. On 9 December 2000 Barak resigned, making a special prime ministerial election necessary, in which he stated he would seek a new mandate to pursue peace with the Palestinians. On 6 February 2001, Sharon was elected prime minister in a landslide

victory over Barak. Barak announced he would resign his seat in the Knesset, step down as head of the Labor Party as soon as a new government was formed, and retire from politics.

The intifada intensified, with Israel assassinating Palestinian militants and conducting air strikes and incursions into Palestinian self-rule areas; Palestinian militants increased suicide bomb attacks in Israeli cities. In spring 2002, Israel launched its largest military offensive in 20 years, since the invasion of Lebanon. In December 2001, Israeli forces besieged Arafat's headquarters in Ramallah, and as of February 2003, Arafat remained confined in his compound. Under Sharon, Israeli settlements in the occupied territories have increased, and he has demanded Arafat be replaced.

On 28 January 2003, Sharon's Likud Party won a strong victory in parliamentary elections, defeating the Labor Party and its chairman Amram Mitzna. The Shinui or "Change" Party, which campaigned on a platform of curtailing privileges and benefits the state offers to highly observant Orthodox Jews, also registered a clear win.

### 13 GOVERNMENT

Israel is a democratic republic, with no written constitution. Legislative power is vested in the unicameral Knesset (parliament), whose 120 members are elected for four-year terms by universal secret vote of all citizens 18 years of age and over, under a system of proportional representation. New elections may be called ahead of schedule, and must be held when the government loses the confidence of a majority of parliament.

The head of state is the president, elected by the Knesset for a five-year term. The president performs largely ceremonial duties and traditionally chooses the prime minister from the ruling political party. In 1996, however, a new law went into effect whereby the prime minister would be directly elected by the people. In May of that year, Benjamin Netanyahu became Israel's first directly elected prime minister. Three years later he was succeeded in that post by Ehud Barak. In March 2001, the Knesset voted to change the system of direct elections and restore the one-vote parliamentary system of government that operated until 1996. The law went into effect with the January 2003 elections, won by Likud. The cabinet, headed by the prime minister, is collectively responsible to the Knesset, whose confidence it must enjoy.

### 14 POLITICAL PARTIES

Israel's multi-party system reflects the diverse origins of the people and their long practice of party politics in Zionist organizations. The first five Knessets were controlled by coalitions led by the Mapai (Israel Workers Party), under Israel's first prime minister (1949–63), David Ben-Gurion, and then under Levi Eshkol (1963–69). The Mapai formed the nucleus of the present Israel Labor Party, a socialist party, which in coalition with other groups controlled Israel's governments under prime ministers Golda Meir (1969–74) and Yitzhak Rabin (1974–77 and 1992–95).

In September 1973, four right-wing nationalist parties combined to form the Likud, which thus became the major opposition bloc in the Knesset. Unlike the Israel Labor Party, the core of support of which lies with the Ashkenazim and older Israelis generally, the Likud has drawn much of its strength from Oriental Jewry, as well as from among the young and the less well-educated. Besides the State List and the Free Center, the Likud consists of the Herut (Freedom) Movement, founded in 1948 to support territorial integrity within Israel's biblical boundaries and a greater economic role for private enterprise, and the Liberal Party, formed in 1961 to support private enterprise, a liberal welfare state, and electoral reform. The Likud originally advocated retention of all territories captured in the 1967 war, as a safeguard to national security. It won 39 seats in

the 1973 elections and then became the largest party in the Knesset by winning 43 seats in the May 1977 elections, to 32 seats for the Israel Labor Party–United Workers (Mapam) alignment. Likud leader Menachem Begin became prime minister of a coalition government formed by Likud with the National Religious Party and the ultraorthodox Agudat Israel.

In elections on 30 June 1981, Likud again won a plurality, by taking 37.1% of the popular vote and 48 seats in the Knesset, compared with the Labor coalition's 36.6% and 47 seats. Begin succeeded in forming a new government with the support of smaller parties. The elections of July 1984 again left both Labor (with 44 seats) and Likud (with 41) short of a Knesset majority; under a power-sharing agreement, each party held an equal number of cabinet positions in a unity government, and each party leader served as premier for 25 months. Labor's Shimon Peres became prime minister in 1984, handing over the office to Likud's Yitzhak Shamir in late 1986. Elections in 1988 produced a similar power-sharing arrangement. In 1989, rotation was ended as Likud and Labor joined in a coalition. After a vote of no confidence, Likud formed a coalition of religious and right-wing parties which held power for two years until 1992. Elections in June gave Labor 44 seats (32 for Likud) and enabled it to form a coalition with Meretz (a grouping of three left-wing parties) and Shas (a religious party) and the support of two Arab parties.

After Netanyahu's governing coalition collapsed at the end of 1998, new elections were called for May of 1999. In the election for a new prime minister, Ehud Barak, heading a Labor-led center-left coalition (One Israel), defeated Netanyahu 56% to 44%. In the legislative elections, Barak's One Israel/Israeli Labor Party coalition won a plurality of 26 seats, followed by 19 for the Likud. After Barak resigned in December 2000, Ariel Sharon won a special prime ministerial election in February 2001 with the largest vote margin ever in Israeli politics. He took 62.4% of the vote to Barak's 37.6%. In 1995, Prime Minister Yitzhak Rabin was assassinated by an extremist Jew. Shimon Peres became Prime Minister and called for early elections, which were held in May 1996. The main issue of the election was Israel's response to terrorist attacks and the disposition of the occupied territories. Labor favored continued and increased negotiations with the PLO and the Palestinian Authority (PA), while Likud favored a tougher stance, increased settlement on occupied lands, and a rethinking of the Oslo accords—at the very least a slowing of the process of land-turnover. The elections were extremely close with the Likud-Geshe-Tsamet coalition winning a slim majority, or 62 seats. In a separate election, Benjamin Netanyahu was directly elected prime minister, the first such election in Israeli history after the passage of a 1996 law.

In March 2001, the Knesset voted to replace the system of direct election for the prime minister established in 1996 back to the parliamentary system. In parliamentary elections held in January 2003, Likud won 29.4% of the vote to Labor's 14.5%. The Shinui, or "Change" Party, came in third with 12.3% of the vote. Overall, the distribution of seats in the Knesset after the election was as follows: Right-wing parties held 45 seats (Likud 38, National Unity 7); center-left parties held 34 (Labor-Meimad 19, Shinui 15); left-wing parties held 17 (Meretz 6, Hadash 3, Am Ehad 3, Balad 3, United Arab List 2); religious parties accounted for 22 seats (Shas 11, National Religious Party 6, United Torah Judaism 5); and the immigrant party Israel Ba-Aliya held 2. Ariel Sharon was chosen prime minister.

## 15 LOCAL GOVERNMENT

Israel is divided into six administrative districts: Jerusalem, Tel Aviv, Haifa, Northern (Tiberias), Central (Ramle), and Southern (Beersheba). The occupied Golan Heights is a subdistrict of the Northern District. Each district is governed by a commissioner appointed by the central government. At the local level, government is by elected regional and local councils, which

govern according to bylaws approved by the Ministry of the Interior. Local officials are elected for four-year terms. Until 1994, Israel governed all of the occupied territories through the Civil Administration, which is responsible to the Ministry of Defense. Palestinian towns have Israeli-appointed mayors. Israeli settlers in the territories are subject to Israeli law. In 1994, Israel withdrew its forces from Gaza and Jericho in favor of an interim Palestinian self-governing authority. Those regions were reoccupied in 2002.

## 16 JUDICIAL SYSTEM

The law of Israel contains some features of Ottoman law, English common law, and other foreign law, but it is shaped largely by the provisions of the Knesset. Judges are appointed by the president on recommendation of independent committees. There are 29 magistrates' courts, which deal with most cases in the first instance, petty property claims, and lesser criminal charges. Five district courts, serving mainly as courts of appeal, have jurisdiction over all other actions except marriage and divorce cases, which are adjudicated, along with other personal and religious matters, in the religious courts of the Jewish (rabbinical), Muslim (*Shari'ah*), Druze, and Christian communities. Aside from its function as the court of last appeal, the supreme court also hears cases in the first instance brought by citizens against arbitrary government actions. The number of supreme court justices is determined by a resolution of the Knesset. Usually, twelve justices serve on the supreme court. There is no jury system. Capital punishment applies only for crimes of wartime treason or for collaboration with the Nazis, and has been employed only once in Israel's modern history, in the case of Adolf Eichmann, who was executed in 1962. In the administered territories, security cases are tried in military courts; verdicts may not be appealed, and the rules of habeas corpus do not apply. There are also labor relations and administrative courts.

There is no constitution, but a series of "basic laws" provide for fundamental rights. The judiciary is independent. The trials are fair and public. Legislation enacted in 1997 limits detention without charge to 24 hours. Defendants have the right to be presumed innocent and to writs of habeas corpus and other procedural safeguards.

## 17 ARMED FORCES

The defense forces of Israel began with the voluntary defense forces (principally the Haganah) created by the Jewish community in Palestine during the British mandate. Today Jewish and Druze men between the ages of 18 and 26 are conscripted for 36 and 24 months, respectively. Drafted Jewish women are trained for noncombat duties. Christians and Muslims may serve on a voluntary basis, but Muslims are rarely allowed to bear arms. All men and unmarried women serve in the reserves until the ages of 54 and 24, respectively. Men receive annual combat training until age 45.

In 2002, the Israeli army had 120,000 active duty soldiers and could mobilize as many as 530,000 more soldiers. Armaments included 3,750 main battle tanks. The navy had 6,500 regulars and 11,500 reservists; vessels included 3 submarines and 48 patrol and coastal combatants. The air force had 35,000 regulars, and 57,000 reserves. There were 454 functional combat aircraft, with 250 aircraft in reserve, and 135 armed helicopters. It is believed that Israel maintains a nuclear arsenal of more than 100 weapons. The reserve forces can be effectively mobilized in 48–72 hours. In addition, there are 8,050 paramilitary border police. The Ministry of Defense's expenditure was \$8.9 billion in 2001 or 8% of GDP.

## 18 INTERNATIONAL COOPERATION

Israel was admitted as the 59th UN member on 11 May 1949 and subsequently joined all the nonregional specialized agencies. It is also a permanent observer with the OAS and a member of the WTO. During the 1970s and early 1980s, Arab governments sought through the "oil weapon" to isolate Israel diplomatically and economically, but Israel's 1979 peace treaty with Egypt helped ease some of the pressure. The United States is Israel's major political, economic, and military ally. A number of African countries reestablished diplomatic relations with Israel in the 1980s; these ties had been broken in 1973, following the Arab-Israeli war. After signing peace accords with the Palestinians in 1993 and 1994, Israel opened liaison and trade missions in certain Arab countries, including Qatar and Oman. Israel also signed a peace agreement with Jordan in 1994, and the two nations exchanged ambassadors in 1995. Violence between Israel and the Palestinians resulting from the *intifada* that began in September 2000 increased tensions with the Arab world. In November 2002, 18 of the 22 members of the Arab League agreed to reactivate a half-century-old ban on trade with Israel.

## 19 ECONOMY

Since independence, Israel's economy has been faced with serious problems. The government makes large outlays for social welfare purposes, but is obliged to divert a considerable portion of its income to defense. In addition, traditional Middle Eastern sources of supply (e.g., of oil and wheat) and nearby markets for goods and services have been closed off. Israel must export on a large scale to maintain its relatively high standard of living; hence, it remains dependent on a continuing flow of investment capital and of private and public assistance from abroad.

The economy is a mixture of private, state, and cooperative ownership and holdings of the labor movement. In the first 35 years of Israel's existence, the number of industrial enterprises more than doubled; over 700 agricultural settlements were established; and there were notable advances in housing, transportation, and exploitation of natural resources. From 1975 to 1980, GNP grew at an annual rate of 3.1% (at constant prices). Between 1980 and 1985, real GNP growth was 10%. In the period 1990–1996, real GDP growth averaged 2.6%. It was below this average in the period after 1989 when the country had to absorb more than half a million new immigrants. Most of these immigrants were relatively well educated, however, adding to Israel's already considerable base of technologically aware workforce and population. Real growth in per capita income was 2% in 1990 and 1991, and increased to 3% in 1992, but then fell back to .9% in 1993.

The Oslo Peace Accords were signed 13 September 1993 between Israel and the PLO, ending the first *intifada* (uprising) that had begun in 1987. The Peace Treaty with Jordan followed quickly, signed 26 October 1994. The Oslo Accords granted the Palestinian Authority (PA) limited sovereignty over areas in the West Bank and Gaza within the context of a timetable of confidence-building expansions. From the inception of the Oslo process, the Israeli economy has wavered between hopeful spurts of growth and cooperation, as openings and investor confidence increase, and recession, as extremists on both sides have sought to shut the process down. The accords brought to a formal end the Arab Boycott of Israel (BOI), in place since 1951, with the shutdown of the Central Boycott Office (CBO) in Damascus. From 1992–95, Israeli exports to Asia grew by 86% and by 1999 accounted for 20% of Israel's total exports. In October 2000, however, following the eruption of the second *intifada* in September, the Arab League passed a resolution calling for the reinstatement of the BOI. This time, however, agreement was not unanimous among the 22 members, and international pressure is strong against it. In May 2002 in a meeting in Damascus 19 Arab

states drew up a list of firms to be blacklisted, but did not publish it. Tourism also benefited from the Peace Accords. Tourism grew to be Israel's second- or third-largest industry, reaching \$4.3 billion in 2000. In October 2000, however, the month following the eruption of the renewed *intifada*, the number of tourists declined 43%. An estimated 50,000 workers in the tourist industry were laid off, helping push unemployment from 8.8% in 2002 to 9.3% in 2001 and an estimated 10.5% in 2002. In 2002, the Israeli Ministry of Tourism estimated that revenues from tourism had fallen by over half, to \$2.1 billion. Foreign investment, once very hard to obtain, also grew substantially in years following the signing of the Oslo Accords.

The Oslo Accords were both a political agreement and an economic program that explicitly acknowledged that peace could not be attained or sustained without the establishment mutually beneficial economic relationships. Two annexes to the Oslo Accords laid out protocols for joint economic cooperation and regional development, listing specific projects to be pursued, including a Gaza seaport, a Gaza airport, a Mediterranean-Dead Sea Canal (MDSC) project, (that would also provide water desalinization and farm irrigation), and a Red Sea-Dead Sea Canal (RSDSC) project (similarly aimed at providing desalinization and crop irrigation), as well general provisions for the establishment of border and local industrial estates to encourage economic cooperation and investment. International donors pledged more than \$2.4 billion over the years 1994–99, much of which was to be used on the infrastructural projects identified in Oslo protocols. While the canal projects, which had been under consideration for many years, remained tied up in political and economic controversies, construction proceeded on the sea port and airport for Gaza, and the Kami Industrial Estate on the Gaza-Israeli border, funded primarily by aid from the US and the EU. In the years immediately following the Peace Accords, 1994 to 1996, real per capita GDP growth in Israel was propelled to a relatively high sustained average of 4.1% despite the continued heavy influx of immigrants from ex-Soviet countries. In 1995, the political process moved a step forward with an interim agreement, Oslo II, providing for elections under the PA. However, in November of that year, Israeli prime minister Yitzhak Rabin, who had received the Nobel in 1994 for his work on the Oslo Accords, was assassinated by a fundamentalist Yemeni Jew.

The process became increasingly hobbled by rising violence and distrust on both sides, and required the constant vigilance of both its external supporters, primarily the United States and the EU, as well as its domestic supporters, to keep it from being derailed. In May 1996, Likud leader Benjamin Netanyahu defeated Israel's other Nobel Prize recipient for the Oslo Accords, Shimon Peres, by less than 1% under revised election laws that provided for the direct election of the prime minister. For the next three years, real GDP growth moderated to an annual average of 2.87% in part because of the conservative government's greater wariness about moves to greater economic openness and cooperation. Also important, however, was the government's determined adherence to tight monetary and fiscal policies aimed at subduing Israel's chronically high inflation rate and tax burden. In the early 1980s, after the second oil shock, Israeli inflation had soared to triple digits, reaching a peak of 373.8% in 1985, the year before world oil prices collapsed. In 1986, inflation fell abruptly to 48%, and then, from 1987 to 1996, yearly inflation ranged from 10% to 20%. In 1997, Israel experienced its first single-digit level of inflation (9%) since 1970. Inflation rates continued to fall in 1998 and 1999, to 5.4% and 5.2%, respectively. Strict monetary policies were not reversed by the return of a Labor-led government in 1999, as inflation fell to a record low of 1.1% in 2000 despite a spurt of real GDP growth of 6.4%. In the recession that accompanied the emergence of the new *intifada* in 2000, inflation has remained low to moderate, at

1.1% for 2001 and an estimated 3.5% for 2002. The moderate real GDP growth 1997 to 1999 was not sufficient to prevent per capita income from declining during this period because of continued immigration from Russia and other Eastern European countries. Although down from earlier peaks, Israel reported 64,164 immigrants in 1998 and 77,000 in 1999. Per capita GDP, at \$17,720 in 1997, declined 2.5% to \$17,068 in 1998, and a further 1.8% to \$16,756 in 1999.

In 2000, increased investments, foreign and domestic, as well as decreased immigration, helped produce a 6.9% increase in per capita income, which reached a record \$17,913. In the political unrest that has ensued, however, per capita income has fallen back, first moderately, to \$17,158 in 2001 and then sharply, to \$15,895 in 2002, according to official government estimates. Israel's privatization program, begun in 1986, was given a strong impetus after the election of the Likud-led government in 1996, highlighted by the 1997 divestment of Bank Hapoalim, the country's largest bank. Privatization continued in 1998 and 1999 and the election of a Labor-led coalition in 1999 did not result in a reversal of the privatization initiatives.

Between 1986 and 2000, according to government statistics, the total extent of privatization amounted to \$7.7 billion, with 60% raised from 1998 to 2000. A total of 77 companies ceased to be state-owned during this period. In 1999, elections by a margin of over 12% replaced Netanyahu with Ehud Barak of the Labour Party, who reopened peace negotiations on virtually all fronts, seeking a final status agreement. Barak and Arafat signed the Sharm El-Sheikh Agreement on 5 September 1999 finalizing border adjustments in the peace accord with Jordan and setting the Oslo Accord's seventh anniversary, September 13, 2000, as the target for reaching a final status agreement.

For the first nine months of 2000, both Israel and the areas under PA control experienced strong growth spurts. Per capita income growth in Israel was in double digits, and there was aggressive investment in new businesses, stimulated by Israel's unilateral withdrawal from southern Lebanon in May 2000. Exports surged ahead 23% on top of increases of 11.6% in 1999 and 6.6% in 1998. In the same nine months, in the areas under PA control, GDP grew 7% and unemployment dropped to an estimated 10%, down from highs of 30% in the West Bank and almost 40% in Gaza in 1996. In July, 2000, however, Palestinian negotiators broke off US-sponsored negotiations at Camp David over the status of Jerusalem, scuttling progress toward final agreement. On 28 September 2000, opposition leader, Ariel Sharon, and some other Knesset members, paid a visit to the Temple Mount/Haram al-Sharif (i.e., the Noble Sanctuary, Arab name for the 35-acre complex that includes the remains of the Jewish temple), to symbolically assert their position that these holy places should remain under Israeli sovereignty. The day after Sharon's visit, on 29 September 2000, the second *intifada* erupted, bringing with it an abrupt reversal of the economic progress that had marked the first part of the year. Urgently renewed US-sponsored status negotiations failed to produce an agreement and were in any case allowed to lapse by the in-coming Bush administration.

On 6 February 2001 Ariel Sharon was elected prime minister, and on 4 March, three days before he assumed office, the violence of the *intifada* was ratcheted up to a new level as Hamas (the Islamic Resistance Movement) announced that they had not only sponsored the suicide bomb attack that took place that day in the resort town of Netanya, that it was only the first of 10 it had planned. The proliferation of suicide bomb attacks and Israel's retaliatory incursions into the Palestinian areas brought economic decline on both sides, particularly after the conflict was effectively globalized in the 11 September 2001 attacks on the World Trade Center in New York and on the Pentagon in Washington, D.C. Official statistics estimate that Israel's economy declined 0.6% in 2001 as foreign investment fell by 7%

and exports fell 16.7% from \$45 billion in 2000 to \$37.65 billion in 2001.

In 2002, the economy continued to stagnate at an estimated real GDP growth rate of .7%, and a decline in per capita income of over 11% from the peak reached in 2000. However, if the Israeli economy has stagnated under the impact of the renewed *intifada* and the closely related global slowdown following the 11 September terrorist attacks, the economy under PA control has all but collapsed. A World Bank report on Palestine in 2002 estimated that unemployment had risen from 10% in 2000 to 26% by December 2001, and that the average income had fallen 40%, from \$1,716 to \$1,030, well below the \$1,400 that had been reached five years before in 1996. Tourism, which is Israel's second- or third-leading industry, is the leading industry in PA areas, and it has doubly suffered from the loss of security and the destruction of infrastructure in Israeli retaliatory incursions. Virtually all of the projects built under the protocols of the Oslo Accords, including the Gaza seaport, Gaza airport, and Kami Industrial Estate, have been significantly damaged or destroyed in the fighting. In 2003, there are reports of a million Palestinians facing hunger. Although experience under the Oslo Peace process demonstrated that significant opportunities exist for economic growth and development, at the beginning of 2003, as a war with Iraq loomed on the region's horizon, it was unclear how permanent the damage had been to the peace process and to the possibilities of economic recovery.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2002 Israel's gross domestic product (GDP) was estimated at \$122 billion. The per capita GDP was estimated at \$19,000. The annual growth rate of GDP was estimated at -1.1%. The average inflation rate in 2002 was 5.7%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 3% of GDP, industry 30%, and services 67%. Foreign aid receipts amounted to about \$27 per capita.

The World Bank reports that in 2000 per capita household consumption (in constant 1995 US dollars) was \$10,684. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the same period private consumption grew at an annual rate of 4%. Approximately 23% of household consumption was spent on food, 11% on fuel, 2% on health care, and 6% on education. The richest 10% of the population accounted for approximately 28.3% of household consumption and the poorest 10% approximately 2.4%.

## 21 LABOR

In 2000 the estimated workforce was 2.4 million people. Approximately 31% were employed in public services; 20% in manufacturing; 13% in commerce; 13% in finance and business services; 6% in transportation and communications; 6% in agriculture, with the remainder in other industries. The unemployment rate in 2002 was an estimated 10%.

The majority of Israeli workers, including those in agriculture, are union members belonging to the General Federation of Labor (*Histadrut*, founded by Jewish farm workers in 1920), which has a membership of 650,000. *Histadrut's* collective bargaining agreements are also available to non-members. The right to strike is exercised; 15 days notice must be provided to the employer. Palestinians in the occupied territories are permitted to organize their own unions and have the right to strike.

Children under 15 are not permitted to work except for school holidays. Employment for those between the ages of 16 to 18 is

restricted, and these laws are regularly enforced. The law provides for a maximum eight-hour day and 47-hour week, and establishes a compulsory weekly rest period of 36 hours. By collective agreement the private sector has a maximum workweek of 45 hours, and the public sector went to a 42-hour week. The minimum wage is adjusted periodically for cost of living increases. As of 2002, the minimum wage was about \$760 per month and was supplemented by allowances to provide a family with a decent standard of living.

## 22 AGRICULTURE

Between 1948 and 1998, the cultivated area was expanded from 165,000 to 437,000 ha (from 408,000 to 1,075,000 acres). Principal crops and 1999 production totals (in tons) were wheat, 80,000; cotton, 53,000; peanuts, 24,000; sunflowers, 20,000; and pulses, 9,000.

Owing to the uniquely favorable soil and climatic conditions, Israel's citrus fruit has qualities of flavor and appearance commanding high prices on the world market. Total citrus production in 1999 was 869,000 tons, with grapefruit accounting for 39%. Exports of citrus in 2001 generated \$123 million. Other fruits, and their 1999 production amounts (in thousands of tons) included: apples, 103; bananas, 109; avocados, 66; table grapes, 89; peaches, 47; olives, 45; plums, 20; pears, 24; and mangoes, 22.

The main forms of agricultural settlement are the *kibbutz*, *moshav*, *moshav shitufi*, and *moshava* (pl. *moshavot*). In the *kibbutz* all property is owned jointly by the settlement on land leased from the Jewish National Fund, and work assignments, services, and social activities are determined by elected officers. Although predominantly agricultural, many *kibbutzim* have taken on a variety of industries, including food processing and the production of building materials. Devoted entirely to agriculture, the *moshavim* (workers' smallholder cooperatives) market produce and own heavy equipment, but their land is divided into separate units and worked by the members individually. This form of settlement has had special appeal to new immigrants. The *moshavim shitufiyim* are 47 collective villages that are similar in economic organization to the *kibbutzim* but whose living arrangements are more like those of the *moshav*. The *moshavot* are rural colonies, based on private enterprise. They were the principal form of 19th century settlement, and many have grown into urban communities.

New immigrants settling on the land are given wide-ranging assistance. The Jewish Agency, the executive arm of the World Zionist Organization, absorbs many of the initial costs; agricultural credits are extended on a preferential basis, and equipment, seeds, livestock, and work animals are supplied at low cost.

Israeli agriculture emphasizes maximum utilization of irrigation and the use of modern techniques to increase yields. A national irrigation system distributed water to 199,000 ha (491,700 acres) in 1998, down from 219,000 ha (541,100 acres) in 1986 but still far exceeding the 30,000 ha (74,000 acres) served in 1948. Water is transported via pipeline from the Sea of Galilee to the northern Negev. More than 90% of Israel's subterranean water supply is being exploited. Agriculture accounts for over 60% of Israel's water consumption.

## 23 ANIMAL HUSBANDRY

There is little natural pasturage in most areas, and livestock is fed mainly on imported feeds and farm-grown forage. Domestic beef production only satisfies between 33% and 40% of demand. Livestock farmers are aided by subsidies. There are 2,500 sheep and goat farms raising 452,000 head, 42% by the Bedu population, 36% by the Jewish sector, and 22% by the Arab and Druze populations. In 2001 there were 29,275,000 chickens, 5,000,000 turkeys, 390,000 head of cattle, 155,000 pigs, 11,000

equines, and 5,300 camels. About 84,560 tons of eggs, 244,000 tons of poultry meat, and 56,500 tons of beef were produced in 2001. That year, milk and honey production were 1,211,000 and 3,000 tons, respectively.

## 24 FISHING

Jewish settlers introduced the breeding of fish (mostly carp) into Palestine. The total fish catch was 5,818 tons in 2000. In addition to carp, important freshwater fish include catfish, barbel, and trout. The marine catch consists mainly of gray and red mullet, rainbow trout, grouper, sardines, and bogue.

## 25 FORESTRY

Natural forests and woodlands cover about 132,000 ha (326,000 acres), mostly in the north. About 180 million trees were planted between 1902 and 1986. Roundwood production in 2000 was 113,000 cu m (4 million cu ft). Forestry production in 2000 included 109,000 cu m (3.8 million cu ft) of plywood and 58,000 cu m (2.1 million cu ft) of particleboard, and 275,000 cu m (9.7 million cu ft) of paper and paperboard.

## 26 MINING

Although Israel was not richly endowed with mineral resources, the Dead Sea was one of the world's richest sources of potassium chloride (potash), magnesium bromide, and other salts; more than 1% of the world's refractory-grade magnesia came from the Dead Sea. Israel was the second-largest producer of bromine, ranked sixth in potash production, and seventh in phosphate rock. The production of potash and phosphates was Israel's third-leading industry in 2002; ranking fifth through seventh were, respectively, the production of caustic soda, cement manufacture, and diamond cutting (from imported rough diamonds). Cut diamonds ranked third among export commodities in 2002, and chemicals ranked fifth. In 2000, the value of nonmetallic mineral products fell by 8.3%, and the value of production in the mining and quarrying industry fell by 2.3%. Mining and quarrying accounted for 2.7% of industrial production, while nonmetallic minerals accounted for 3.7%. Fertilizer exports earned \$418.4 million, out of \$28.3 billion in total exports; metal exports earned \$279.3 million, and crude fertilizers and minerals, \$175.2 million.

Mineral production in 2001 included: beneficiated phosphate rock, 3.51 million tons, down from 4.11 in 2000; potash, 1.77 million tons, up from 1.49 in 1997 (87% was exported); elemental bromine, 206,000 tons (90% was exported); caustic soda, 44,900 tons, up from 41,200 in 1999; and silica sand, 306,000 tons, up from 275,000 in 1997. Israel also produced, primarily for the construction sector, crude steel, refined secondary lead, magnesium metal, hydraulic cement, brick and kaolin clays, gypsum, lime, magnesia, marble, phosphatic fertilizers, phosphoric acid, salt (mainly marine), sand, crushed stone, sulfur, sulfuric acid, and crude construction materials. No fire clays were produced in 2000 and 2001, and no nitrogen in 1999–2001. Dead Sea Works Ltd., a subsidiary of Israel Chemicals Ltd., was the world's fourth-largest potash producer, and planned to increase capacity to 3.25 million tons per year, from 2.8. Although Israel did not mine diamonds, in 2001, 1.37 million carats of imported diamonds were cut, down from 2.37 million in 1997.

The Negev Desert contained deposits of phosphate, copper (low grade), glass sand, ceramic clays, gypsum, and granite. Most of the phosphate deposits, located in the northeastern Negev, were, at best, medium grade, and were extracted by open-pit mining. The government was the principal owner of most mineral-related industries. Privately held industries included the diamond cutting and polishing industry, and cement and potassium nitrate manufacturing.

## 27 ENERGY AND POWER

Israel's energy sector is largely nationalized and state-regulated, ostensibly for national security reasons. Since the return to Egypt in 1980 of the Sinai oil fields, Israel has had almost no fossil fuel reserves of its own, until the discovery of offshore natural gas reserves beginning in 2000. The reserves are estimated at 85 to 142 billion cu m. Natural gas reserves have also been discovered in Palestinian territorial waters off the Gaza Strip. Israel imports almost all its oil. In 2001, the country produced only 200 barrels per day of crude petroleum (compared with 1,000 barrels per day in 1986), while consumption of crude oil amounted to 278,000 barrels per day in the same year. Oil has been produced in the Negev desert since 1955, and exploration there continues.

A \$1.3 billion, 100,000-barrel-per-day oil refinery in Alexandria, Egypt, developed as an Egyptian-Israeli joint venture, began operations in April 2001. In June of the same year, Israel sold its 20% stake in the project to Egypt in a move widely regarded as related to the renewed hostilities between Palestinians and Israelis that had begun the previous autumn.

Nearly all electricity is supplied by the government-owned Israel Electric Corp., which uses imported oil and coal. Electricity is generated principally by thermal power stations. Generating capacity has quadrupled since 1970, reaching 9,136 MW by 2001 (70% coal-fired, 25% oil-fired, 5% gas fired); total production in 2000 amounted to some 40.4 billion kWh, of which nearly 100% was from fossil fuels. Consumption of electricity in 2000 was 34.9 billion kWh.

## 28 INDUSTRY

More than half of the industrial establishments are in the Tel Aviv-Yafo area, but a great deal of heavy industry is concentrated around Haifa. Most plants are privately owned. State enterprises are mainly devoted to exploitation of natural resources in the Negev; some other enterprises are controlled by the Histadrut. Israel is research and development-oriented. Hundreds of foreign companies have invested in Israel during the 1990s, the bulk in strategic high-technology projects in such fields as aviation, communications, computer-aided design and manufacturing (CAD/CAM), medical electronics, fine chemicals, pharmaceuticals, solar energy, and sophisticated irrigation. Over 88% of the increase exports in the 1990s.

Major expansion has taken place in textiles, machinery and transport equipment, metallurgy, mineral processing, electrical products, precision instruments, and chemicals. However, industry remains handicapped by reliance on imported raw materials, relatively high wage costs, low productivity, and inflation. Incentive schemes and productivity councils, representing workers and management, have been set up in an attempt to increase work output. Whereas in the past Israel's industry concentrated on consumer goods, by the 1980s it was stressing the manufacture of capital goods.

## 29 SCIENCE AND TECHNOLOGY

Israel manufactures and exports an expanding array of high-technology goods, especially for military purposes. In 1987-97, Israel spent 2.4% of GNP on research and development in science, engineering, agriculture, and medicine. National and local governments and industry shared equally in the funding. A privatization program, begun by the government, has resulted in the creation of many science and technology parks and high technology towns, like Migdal He'Emck. Israel has an advanced nuclear research program, and it is widely believed that Israel has the capacity to make nuclear weapons.

Among scientific research institutes are seven institutes administered by the Agricultural Research Organization; the Rogoff-Wellcome Medical Research Institute; institutes for petroleum research, geological mapping, and oceanographic and

limnological research directed by the Earth Sciences Research Administration; institutes of ceramic and silicate, fiber, metals, plastics, wine, and rubber research directed by the Office of the Chief Scientist, Ministry of Industry and Trade; the Institutes of Applied Research at the Ben-Gurion University of the Negev; the Israel Institute for Biological Research; the Israel Institute for Psychobiology; the National Research Laboratory; and the Soreg and Negev nuclear research centers attached to the Israel Atomic Energy Commission. The country has eight universities and colleges offering courses in basic and applied sciences; among them are the Weizmann Institute in Rehovot and the Technion-Israel Institute of Technology in Haifa. In 1987-97, science and engineering students accounted for 49% of all college and university students.

Immigration into Israel may be its best science and technology policy. Some consider this a "brain drain" in reverse and claim that it will help Israeli high technology competitiveness in the future. In 1998, high technology exports were valued at \$4.2 million and accounted for 20% of all manufactured exports.

## 30 DOMESTIC TRADE

Banks, commercial institutions, and the Histadrut have their headquarters in Tel Aviv-Yafo, the business capital. Supermarkets and department stores are on the increase; installment sales are widespread. Packaged goods are becoming more common, but many sales are still made in bulk. Cooperative societies market the agricultural produce of their affiliated settlements and farms. Tnuva, the Histadrut agricultural marketing society, sells most of Israel's farm products. Advertising media include newspapers, periodicals, posters, billboards, radio broadcasts, and motion picture theaters.

Larger shopping centers and malls are becoming more popular in the country. In 2002, there were about 200 malls nationwide, construction plans for several others. At least half of all food sales are through supermarket and retail chains, but small, open-air produce markets are still common. Foreign franchises have been well established since the mid-1980s, primarily in the fast-food and hardware industries.

Saturday closing is the custom for all shops, offices, banks, public institutions, and transport services, except in the Arab areas. Office hours are generally Sunday to Thursday, 8 AM to 5 PM. Retail hours run from 9 AM to 7 PM Sunday through Thursday and 9 AM to 2 PM on Fridays. On days preceding holidays, shops shut down about 2 PM, offices at 1 PM. Banks are open 8:30 AM to 12:30 PM and 4 to 5:30 PM; they close at noon on Fridays and days before holidays and have no afternoon hours on Wednesdays.

## 31 FOREIGN TRADE

Israel is a relatively small country with limited natural resources and an affluent, bourgeois citizenry; as such, it is highly dependent on international trade, both to supply its industry with natural resources, and to purchase its value-added products. In 2000, foreign trade amounted to 27% of national income. Exports that year totaled \$31.4 billion, up 19% from the previous year. Imports, meanwhile, also grew to \$35.7 billion. The vast majority (66%) of Israeli exports are manufactured goods and their primary destinations are the US and the EU, which together buy 65% of Israel's exports. Imports are primarily industrial resources (63%)—other large sectors are capital goods (19%) and consumer products (11%).

Cut diamonds top the list of Israel's export commodities (25%), reflecting 17.5% of the world's total diamond exports. Machinery and equipment, including telecommunications equipment (13.6%) and other electrical machinery (11.3%) are important exports.

In 2000 Israel's imports were distributed among the following categories:

Consumer goods	10.6%
Food	4.5%
Fuels	9.8%
Industrial supplies	38.9%
Machinery	26.7%
Transportation	9.2%
Other	0.3%

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	11,734	6,641	5,093
Belgium	1,873	3,548	-1,675
China (inc. Hong Kong)	1,646	1,501	145
Germany	1,521	2,672	-1,151
United Kingdom	1,358	2,712	-1,354
Netherlands	899	1,437	-538
Italy	803	1,721	-918
France	754	1,158	-404
India	557	535	22
Switzerland	502	1,918	-1,416

### 32 BALANCE OF PAYMENTS

Israel's foreign trade has consistently shown an adverse balance, owing mainly to the rapid rise in population and the expansion of the industrialized economy, requiring heavy imports of machinery and raw materials. The imbalance on current accounts has been offset to a large extent by the inflow of funds from abroad. Deficits are often offset by massive US aid and American Jewish philanthropy. Even with these funds, however, Israel has in recent years been running increasingly larger deficits, reaching 4.7% of GDP in 1995. Financing this deficit is easier on Israel than on many nations primarily because of its relationship with the US. Foreign direct investment reached a record \$5 billion in 2000, and total foreign investment stood at a record \$9 billion.

The US Central Intelligence Agency (CIA) reports that in 2002 the purchasing power parity of Israel's exports was \$28 billion while imports totaled \$30.8 billion resulting in a trade deficit of \$2.8 billion.

The International Monetary Fund (IMF) reports that in 2001 Israel had exports of goods totaling \$27.7 billion and imports totaling \$30.9 billion. The services credit totaled \$12 billion and debit \$12.6 billion. The following table summarizes Israel's balance of payments as reported by the IMF for 2001 in millions of US dollars.

<b>Current Account</b>	<b>-1,852</b>
Balance on goods	-3,264
Balance on services	-572
Balance on income	-4,414
Current transfers	6,399
<b>Capital Account</b>	<b>681</b>
<b>Financial Account</b>	<b>-110</b>
Direct investment abroad	-1,135
Direct investment in Israel	3,224
Portfolio investment assets	-1,199
Portfolio investment liabilities	656
Other investment assets	-2,850
Other investment liabilities	1,194
<b>Net Errors and Omissions</b>	<b>1,477</b>
<b>Reserves and Related Items</b>	<b>-196</b>

### 33 BANKING AND SECURITIES

The Bank of Israel, with headquarters in Jerusalem, began operations as the central state bank in December 1954. Total banking assets at year-end 2001 were NIS435 billion. The bank issues currency, accepts deposits from banking institutions in Israel, extends temporary advances to the government, acts as the

government's sole banking and fiscal agent, and manages the public debt. Among the largest commercial banks are the Bank Leumi, the Israel Discount Bank, and the Histadrut-controlled Bank Hapoalim. There were 24 licensed commercial banks in 1997; one investment bank; and nine mortgage banks. There are also numerous credit cooperatives and other financial institutions. Among the subsidiaries of commercial banks are mortgage banks (some of which were also directly established by the government). The largest of these specialized institutions, the Tefahot Israel Mortgage Bank, provides many loans to home builders.

Industrial development banks specialize in financing new manufacturing enterprises. The Industrial Bank of Israel, formed in 1957 by major commercial banks, the government, the Manufacturers' Association, and foreign investors, has received aid from the IBRD and has played a major role in the industrial development of the Negev area. The government-owned Bank of Agriculture is the largest lending institution in that sector. The Post Office Bank, similar to France's La Poste, is concerned mainly with clearing operations, savings, sale of savings certificates, and postal orders.

The structure of the banking industry is based on the central European model of "universal banking," whereby the banks operate as retail, wholesale, and investment banks, as well as being active in all main areas of capital market activity, brokerage, underwriting, and mutual and provident fund management. However, the banks are barred from insurance operations, other than as owners of insurance agents, and have only recently been allowed to enter the pension market.

The Bank of Israel's power to fix the liquidity ratio that banks must maintain against deposits has been an important instrument in governing both volume and types of loans. Legal interest rate ceilings formerly were 10% on loans to industry and agriculture and 11% for commercial loans, but in the early 1980s, rampant inflation caused the large commercial banks to raise the interest rate to 136%. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$9.0 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$114.2 billion. In the financial sector, the banks have benefited from a very slow program of financial deregulation and the absence of foreign competition; until 2000, the only foreign bank licensed to operate in Israel was the Polish PKO Bank, more of a historical curiosity than a serious commercial consideration. However, as deregulation progressed, the prospect of foreign ownership of Israeli banks, in part or whole, grew more real. In 2000, Citibank set up a full branch in Israel, the first major international bank to do so; HBSC followed soon afterward, and Bank of American has also set up a branch office there.

Growing activity on the Israeli securities market made it necessary to convert the rather loosely organized Tel Aviv Securities Clearing House into the formally constituted Tel Aviv Stock Exchange (TASE) in 1953. A further expansion took place in 1955, when debentures linked either to the US dollar or to the cost-of-living index-with special tax privileges-made their first appearance on the market. The market is largely devoted to loans of public and semipublic bodies, with provident funds and banks acquiring most of the securities placed. There is only one quotation daily for each security.

By 1983 the price of bank shares was steadily becoming more detached from their true value. When it became obvious in 1983 that the government would have to devalue its currency, many people began to liquidate their holdings of shekel-denominated assets in favor of foreign currency. The assets most widely held and most easily liquidated were bank shares. The selling wave began in the summer of 1983 and peaked in October, forcing the government to intervene. The closing of the TASE, on 6 October

1983, became known as the “economic day of atonement” and represented the end of the speculators’ paradise created and supported by leading Israeli banks.

By the mid-1990s, as Israel moved to liberalize its economy, the banking sector underwent significant reconstruction which continues as 2002. In two sell-offs in 1997 and 1998, the government divested itself of a majority of Bank Hapoalim. It also sold sizeable shares of United Mizrahi Bank, Israeli Discount Bank, and Bank Leumi, in the hopes of shedding all remnants of ownership in these banks. In addition to bank privatization, the Israeli government moved to reduce capital markets regulations.

### Occupied Territories

In 1994 the Palestinian Authority (PA) began to take over the management of an economy with a limited capacity to support its expanding population. The PA has acted within the constraints of the economic protocol to revive the financial sector. The reconstruction effort requires the creation of financial markets and institutions that perform the key functions of supplying liquidity, encouraging savings and investments, and facilitating the management of risk.

In expectation of a boom in the financial sector, a number of Jordanian and Palestinian banks opened, or reopened, branches in the West Bank and Gaza. By 1996, 42 branches of 10 banks were operating. The banks have mainly limited themselves to establishing checking accounts and accepting deposits, specifically non-interest bearing accounts. Despite their success in attracting deposits from Palestinians, the banks have maintained a limited role in lending; at the end of March 1995, total outstanding loans by the banks accounted for only 30% of total assets and 35% of total customer deposits. The reluctance to invest locally stems from doubts over the political environment and it is widely believed that banks are investing abroad, particularly in Central Bank of Jordan treasury bills.

A key factor in the success of the banks will be the supervisory activities of the Palestinian Monetary Authority (PMA), set up as a result of the Paris protocol. The PMA has most of the functions of a central bank. It is empowered to act as the PA’s adviser and sole financial agent; to hold its foreign currency reserves; to regulate foreign-exchange dealers; and to supervise the banking sector, as the self-rule areas come under PA jurisdiction. However, in the absence of a Palestinian currency, the PMA’s ability to be a lender of last resort is questionable. In 1996 the reality was that the PMA had no influence over the areas still under Israeli control and lacked a proper regulatory framework. Yet, since 1995, all money-changers have been required to put up capital of between \$200,000 to \$1 million, to pay permit and other fees, and to deposit 30% of their capital with the PMA.

At the end of 1996, plans for a Middle Eastern Development bank, supported by Jordan, Egypt, Israel, and the PA, were close to collapse, just a few weeks after the bank’s official registration at the UN. This was the verdict following the US Congress’s refusal to include provision for financing for the bank in an appropriations bill.

The Arab Palestine Investment Bank (APIB), scheduled to open in early 1997, held its first annual general meeting in Ramallah on 15 September 1996 and its first board meeting in Amman the next day. The bank, with paid-up capital of some \$15 million, has four principal shareholders, Jordan’s Arab Bank (55%), the International Finance Corp. (25%), the German Investment and Development Co. (15%), and the Palestinian private-sector Enterprise Investment Co. (5%). Total deposits of the Palestinian banking system expanded by over 125% during the year ended June 1996, reaching \$2.06 trillion. However, it is estimated that over half the local deposits are invested abroad, while only \$300 million have been loaned internally to the Palestinians.

## 34 INSURANCE

The State Insurance Controller’s Office may grant or withhold insurance licenses and determine the valuation of assets, the form of balance sheets, computations of reserves, and investment composition. Automobile liability insurance, workers’ compensation, and aviation liability are compulsory. War-damage insurance is compulsory on buildings and also on some personal property.

The insurance sector is dominated by a few large firms, of which Migdal and Clal Insurance are the most prominent. However, the easy, cartel-like conditions that have characterized the sector for many years are beginning to crumble and new direct insurance companies are gaining market share. In 1997, the US-based AIG group entered the fray, via a direct insurance joint venture with an Israeli communications company, Aurec, which signaled the opening up of the industry to much greater competition from both domestic and foreign entities.

## 35 PUBLIC FINANCE

Israel has the most advanced economy in the Middle East, although the country has been plagued with political and social woes for much of its independence. The onset of the intifada in September 2000 threatened to reverse much of the economic progress that had been made in the prior few decades. The violence has left several industries, especially the tourism sector, in critical states. Also, Israel’s sizeable external debt, which was equivalent to about 38% of GDP in 2000, has put a damper on the economy’s expansion.

The US Central Intelligence Agency (CIA) estimates that in 2000 Israel’s central government took in revenues of approximately \$40 billion and had expenditures of \$42.4 billion. Overall, the government registered a deficit of approximately \$2.4 billion. External debt totaled \$42.8 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

REVENUE AND GRANTS	100.0%	40,000
Tax revenue	82.9%	33,161
Non-tax revenue	11.5%	4,610
Grants	5.6%	2,230
EXPENDITURES	100.0%	42,441
General public services	2.3%	967
Defense	17.1%	7,255
Public order and safety	3.6%	1,538
Education	13.9%	5,912
Health	13.5%	5,705
Social security	28.0%	11,864
Housing and community amenities	3.0%	1,279
Recreation, cultural, and religious affairs	0.9%	369
Economic affairs and services	5.7%	2,418
Other expenditures	0.9%	368
Interest payments	11.2%	4,765

## 36 TAXATION

Israel’s population is heavily taxed. There are personal income taxes on gross income from employment, trade, business, dividends, and other sources, with limited deductions. Rates range from 15–50%, with the highest rate for amounts over NIS172,800 per year. Special tax concessions are granted to residents in border settlements, new settlements, and the Negev. Taxes of salaried persons are deducted at the source; self-employed persons make advance payments in 10 installments, subject to assessment. Also levied are a value-added tax (VAT) of

17%, a purchase tax, various land taxes, and a national health insurance premium tax on a rising scale to 4.8%.

Municipalities and local and regional councils levy several taxes. There is an annual business tax on every enterprise, based on net worth, annual sales volume, number of employees, and other factors. General rates, a real estate tax (commonly based on the number of rooms and the location of the building), and water rates are paid by the tenants or occupants rather than the owners.

### 37 CUSTOMS AND DUTIES

Israel has a single-column import tariff based on the Brussels nomenclature classification. Ad valorem rates predominate, although specific and compound rates are also used. Most basic food commodities, raw materials, and machinery for agricultural or industrial purposes are exempt from customs duties. The highest rates are applied to nonessential foodstuffs, luxury items, and manufactured goods that are of a type produced in Israel. There are also a 17% value-added tax (VAT), which is levied on virtually all commodities except fresh fruits and vegetables, and a purchase tax ranging from 5–90% on most consumer goods.

A free-trade agreement between Israel and the then-European Community (today, the European Union) took effect on 1 July 1975. Under this agreement, EC tariffs on Israel's industrial exports were immediately reduced by 60% and were subsequently eliminated. Preferential treatment has also been extended to Israel's agricultural exports. In return, Israel has granted concessions to the European Union on many categories of industrial and agricultural imports and agreed to gradually abolish its customs duties on imports from the European Union.

Israel also belongs to the World Trade Organization (WTO) and operates its trade regime according to WTO guidelines. Most significantly, the WTO calls for the elimination of non-tariff barriers. Israel also signed a free trade agreement with the United States in 1985, which called for the elimination of all remaining duties on US-made products by 1 January 1995. However, Israel and the United States differ on the interpretation of the treaty and it has yet to be fully implemented.

### 38 FOREIGN INVESTMENT

Apart from reparations, capital imports mainly consist of long-term loans and grants designed for investment by the government or the Jewish Agency.

A 1951 law was designed to encourage foreign investment in those industries and services most urgently required to reduce Israel's dependence on imports and to increase its export potential. Applying mainly to investments in industry and agriculture, the law offers such inducements as relief from property taxes during the first five years, special allowances for depreciation, exemption from customs and purchase tax on essential materials, and reductions in income tax rates. In a further effort to attract foreign investment, the government approved the "Nissim Plan" in 1990. This plan gives the investor the option of state loan guarantees for up to two-thirds of a project or the bundle of benefits offered under the "Encouragement of Capital Investments Law." A 1985 US–Israeli Free Trade Area (FTA) agreement reduces tariffs and most non-tariffs barriers for US firms. Israel also has an FTA agreement with the EU under which tariffs on industrial products and certain agricultural products fell to zero on 1 January 1989. In 1995, the most current year for which statistics are available, Israel attracted \$2.5 billion in foreign investment. This figure came on the heels of several years of economic growth and fiscal austerity.

### 39 ECONOMIC DEVELOPMENT

Economic policy is dictated by goals of national security, full utilization of resources, integration of immigrants, and institution of a broad welfare program. The urgency of these goals imposes

responsibilities on the government for planning, financing, and directly participating in productive activities. And, in fact, government infrastructure development since 1990 has played a large part in Israel's powerful economic performance in recent years. Major government projects include an expansion of the Ben-Gurion Airport, a subway for Tel-Aviv, a tunnel through Mt. Carmel, and a major new north-south highway.

In the years immediately following independence, the government influenced the setting in which private capital functions, through differential taxation, import and export licensing, subsidies, and high protective tariffs. The 1962 revaluation of the Israeli pound was accompanied by a new economic policy aimed at reduction of protective tariffs, continued support of development, planning and implementation of long-range development, and maximization of efficiency. Subsequently, the government has periodically decreed further monetary devaluations, new taxes, and other austerity measures designed to curb consumption and stimulate exports. By the mid-1990s, the Israeli government was actively engaged in an economic liberalization program that is a stark contrast from the largely state regulated economy of Israel's first few decades.

### 40 SOCIAL DEVELOPMENT

Aside from supervising a wide network of public and private social welfare agencies, the Ministry of Labor and Social Welfare maintains special enterprises employing blind and handicapped people, operates institutions for mentally and physically handicapped children, and administers a nationwide preventive service for problem children and youth.

Special legislation has established the legal right to assistance of persons incapacitated for work, of survivors of those who died in state service, and under certain conditions, of persons whose claims antedated their immigration to Israel. Pensions have thus been paid to persons disabled while fighting with the Allied forces in World War II and to those invalidated as a result of Nazi persecution.

Israel has a universal social insurance system that covers all residents aged 18 and over including housewives. Benefits include old age pensions, disability, medical care and monthly allowances for large families. Employee-based programs include maternity benefits, worker's compensation for injuries, and unemployment benefits. These programs are funded by contributions by employees, employers and the government. Pensions are set at a rate of 16% of average wage; 24% including income supplement. The National Insurance Institute is directly under the minister of labor and is governed by a 42-member council representing government, labor, and employers.

The Jewish Agency is primarily responsible for the initial phases of reception and absorption of immigrants. Hadassah provides vocational guidance and training to youth, and the Women's International Zionist Organization is active in family and child welfare. Mo'etzet Hapo'alot (Women's Workers Council), a Histadrut affiliate, is active in this area, along with Youth Aliyah, which operates a system of children's villages.

A series of laws have been enacted to protect women's rights including the Equal Rights for Women Law (1951) and the Employment of Women Law (1954), which requires equal pay for equal work. In practice, women receive lower wages than men. Legislation mandating affirmative action in the civil service and in government-owned companies was passed in 1995. Legislation has also been passed to protect women outside of the workplace. In 1991, the Domestic Violence Law strengthened the ability of the courts to protect women from abusive husbands. In 1993, common law spouses were permitted to take their partners' family names, and a new law barred discrimination in unemployment compensation for elderly female citizens. However, discrimination against women persists in many family and divorce matters. The courts that deal with these cases are

bound by religious laws that generally favor men. A 1995 law gave rabbinical courts the power of imposing expanded civil sanctions on husbands in cases where the wife has ample grounds for divorce but cannot obtain one. Jewish women are subject to military draft, and can volunteer to serve in combat units.

The subject of human rights in Israel and the administered territories has aroused much controversy, with international organizations citing police harassment of Arabs, especially on the West Bank and the Gaza Strip, and Israeli government officials pointing to the Arab terrorist threat. Within Israel, freedom of political expression is fully protected, and all shades of opinion are expressed; such guarantees do not extend to the administered territories, however, and the press, including foreign correspondents, is also monitored and censored for security reasons. Israeli Arabs face some discrimination in employment, housing and education.

The use of limited physical force during interrogations has been legal, but a high court ruling banned a variety of specific abuses, including sleep deprivation and violent shaking. Administrative detention without trial remains legal, but it is rarely used. Prison conditions for Palestinians have improved but still do not meet all international standards.

#### 41 HEALTH

The Ministry of Health supervises all health matters and functions directly in the field of medical care. As of 1999 total health care expenditure was estimated at 9.5 % of GDP. The Arab Department of the Ministry of Health recruits public health personnel from among the Arab population and its mobile clinics extend medical aid to Bedouin tribes in the Negev. In 2000, the infant mortality rate was 6 per 1,000 live births. Life expectancy was 78 years for both men and women. The fertility rate has decreased steadily over the years from 3.9 in 1960 to 2.8 children in 2000 for each woman during childbearing years. As of 1999, there were an estimated 3.9 physicians and 6 hospital beds per 1,000 people. The Ministry of Health also operates infant welfare clinics, nursing schools, and laboratories. The largest medical organization in the country, the Workers' Sick Fund (Kupat Holim, the health insurance association of Histadrut), administers hospitals, clinics, convalescent homes, and mother-and-child welfare stations.

The infant mortality rate was 6 per 1,000 live births in 2000. The maternal death rate is the lowest in the Middle East and North Africa. In 1998, 8 maternal deaths per 100,000 live births were documented. As of 2002, Israel's birth and death rates were estimated respectively at 18.9 and 6.2 per 1,000 people. Between 1990-94, immunization rates for children up to one year old were: diphtheria, pertussis, and tetanus, 92%; polio, 93%; and measles, 95%.

As of 1999 the number of people living with HIV/AIDS was estimated at 2,400 and deaths from AIDS that year were estimated at fewer than 100. HIV prevalence was 0.08 per 100 adults.

Tobacco consumption has decreased from 2.6 kg (5.7 lbs) to 2.4 kg (5.3 lbs) a year per adult in 1995. Between 1986 and 1994, 38% of men and 25% of women were smokers.

#### 42 HOUSING

Israel suffered from a severe housing shortage at its creation. Despite an extensive national building program and the initial allocation of some abandoned Arab dwellings to newcomers, in early 1958, nearly 100,000 immigrants were still housed in transit camps. By the mid-1960s, however, the extreme housing shortage had been overcome and newcomers were immediately moved into permanent residences. From 1960 to 1985, a total of 943,350 housing units were constructed. In 1986, 94% of all housing units had piped water, 58.2% had flush toilets, and 99% had electric lighting. Between 1990-2001, a surge of immigration

from the former Soviet Union and Ethiopia resulted in a dramatic increase in housing demand. The government responded with mortgage packages making it possible for new immigrants to afford housing.

As of the 1995 census, there were about 1,639,410 residential dwellings throughout the nation. In 1996, about 38,000 new dwellings were added. Homelessness and overcrowding are serious problems in the West Bank and Gaza/Palestinian settlement areas.

#### 43 EDUCATION

Education is compulsory for 11 years and free for all children between 5 and 15 years of age. Primary education is for six years followed by three years of lower secondary and three more years of upper secondary education. A state education law of 1953 put an end to the separate elementary school systems affiliated with labor and religious groupings, and established a unified state-administered system, within which provision was made for state religious schools. Four types of schools exist: public religious (Jewish) and public secular schools (the largest group); schools of the orthodox Agudat Israel (which operated outside the public school system but were assisted with government funds); public schools for Arabs; and private schools, mainly operated by Catholic and Protestant organizations. The language of instruction in Jewish schools is Hebrew; in Arab schools it is Arabic. Arabic is taught as an optional language in Jewish schools, while Hebrew is taught in Arab schools from the fourth grade.

In 1996, primary schools had a total of 631,916 students. Secondary level schools had 541,737 students and approximately 54,000 teachers in the same year. The pupil-teacher ratio at the primary level was 13 to 1 in 1999. In the same year, 100% of primary-school-age children were enrolled in school, while 88% of those eligible attended secondary school.

Israel has eight institutions of higher learning. The two most outstanding are the Hebrew University (founded in 1918) in Jerusalem and the Israel Institute of Technology (Technion, founded in 1912) in Haifa, both of which receive government subsidies of about 50% of their total budgets; the remaining funds are largely collected abroad. The Tel Aviv University was formed in 1956. Other institutions include the Bar-Ilan University in Ramat-Gan, opened in 1955 under religious auspices; the Weizmann Institute of Science at Rehovot, notable for its research into specific technical, industrial, and scientific problems; Haifa University; and Ben-Gurion University of the Negev in Beersheba. An Open University, promoting adult education largely through home study, was established and patterned on the British model. In 1996, universities and equivalent institutions enrolled 198,766 students. Adult illiteracy rates for the year 2000 were estimated at 3.9% (males, 2.1%; females, 5.7%). As of 1999, public expenditure on education was estimated at 7.7% of GDP.

#### 44 LIBRARIES AND MUSEUMS

Israel's largest library, founded in 1924, is the privately endowed Jewish National and University Library at the Hebrew University in Jerusalem, with three million volumes. Important collections are housed in the Central Zionist Archives and the Central Archives for the History of the Jewish People, both also in Jerusalem. There are more than 950 other libraries, and the Ministry of Education and Culture has provided basic libraries to hundreds of rural settlements. The Ben Gurion University of the Negev (1966) holds 720,000 volumes. Tel Aviv University holds two million volumes, including a Holocaust Studies collection.

The country's most important museum is the Israel Museum, opened in 1965 in Jerusalem. Found in the museum are the Bezalel Art Museum, with its large collection of Jewish folk art; a Jewish antiquities exhibit; the Billy Rose Art Garden of modern sculpture; the Samuel Bronfman Biblical and Archaeological

Museum; and the Shrine of the Book, containing the Dead Sea Scrolls and other valuable manuscripts. The Rockefeller Archaeological Museum (formerly the Palestine Museum), built in 1938, contains a rich collection of archaeological material illustrating the prehistory and early history of Palestine and Transjordan. There is also in Jerusalem the Central Archives for the History of the Jewish People, containing documents from Jewish communities and organizations around the globe. The Tel Aviv Museum of Art, founded in 1926, has more than 30,000 paintings, drawings, and sculptures. Among Israel's newer cultural institutions are the Museum of the Diaspora in Tel Aviv-Yafo, founded in 1978; the Bible Lands Museum in Jerusalem, founded in 1992; the Museum of Israeli Art in Ramat Gan, founded in 1987; and the Tower of David Museum of the History of Jerusalem at the Jaffa Gate in Jerusalem, founded in 1989.

#### 45 MEDIA

The state owns and operates the major telephone communications services, although radio and television are increasingly privately owned. The state radio stations include the government's Israel Broadcasting Authority (*Shidurei Israel*), the army's Defense Forces Waves (*Galei Zahal*), and the Jewish Agency's Zion's Voice to the Diaspora (*Kol Zion la-Gola*), aimed mostly at Jewish communities in Europe and the US. The purchase of color television sets has become widespread since taxes on imported receivers were cut and the government stopped filtering out the color from imported television programs. In 1999, there were 2.8 million mainline telephones and 2.5 million cellular phones in use. In 2000, there were 526 radios and 335 television sets for every 1,000 people. As of 1998 there were 23 AM and 15 FM radio stations. In 1995, there were 17 television stations. In 2001, there were 1.9 million Internet subscribers served by 21 service providers.

All newspapers are privately owned and managed. Most newspapers have 4–16 pages, but there are weekly supplements on subjects such as politics, economics, and the arts. The largest national daily Hebrew newspapers (with their average 2002 circulations) are *Yediot Achronot* (*Latest News*, 300,000), *Ma'ariv Evening* (*Evening Prayer*, 160,000), *Hadashot* (*The News*, 55,000), and *Ha'aretz* (*The Land*, 65,000), all published in Tel Aviv. Also out of Tel Aviv are two Russian papers, *Nasha Strana* (*Our Country*, 35,000) and *Tribuna* (*Tribune*, NA); the Polish *Nowiny Kurier* (12,000); the German *Hadashot Israel*; the Hungarian *Uj Kelet* (20,000); and the Romanian *Viata-Noastra* (30,000). The English-language *Jerusalem Post* (30,000) is published in Jerusalem.

Although there is no political censorship within Israel, restrictions are placed on coverage of national security matters. Individuals, organizations, the press, and the electronic media freely debate public issues and often criticize public policy and government officials.

#### 46 ORGANIZATIONS

The World Zionist Organization (WZO) was founded by Theodor Herzl in 1897 for the purpose of creating "for the Jewish people a home in Palestine, secured by public law." The organization is composed of various international groupings represented in its supreme organ, the World Zionist Congress. The Jewish Agency, originally founded under the League of Nations mandate to promote Jewish interests in Palestine, comprises the executive arm of the WZO; since 1948, it has been responsible for the organization, training, and transportation to Israel of all Jews who wish to settle there. The United Israel Appeal (*Keren Hayesod*) is the financial instrument of the Jewish Agency; it recruits donations from world Jewry. The Jewish National Fund (*Keren Kayemet le'Israel*) is devoted to land acquisition, soil reclamation, and reforestation. Hadassah, the Women's Zionist Organization of America, is also active in Israel;

it sponsors the Hadassah Medical Organization, which provides hospital and medical training facilities.

There are numerous cultural and religious societies and organizations. The Israel Academy of Sciences and Humanities promotes public interest in science and cooperates with foreign academies in research and dissemination of information.

The main labor organization is the General Federation of Labor (*Histadrut*), a large economic complex whose interests include some of the largest factories in the country, an agricultural marketing society (*Tnuva*), a cooperative wholesale association (*Hamashbir Hamerkazi*), and a workers' bank.

An important youth organization is Youth Aliyah, founded in 1934, which has helped to rehabilitate and educate children from all countries of the world. Other national youth organizations include the Israeli Boy and Girl Scouts Federation, National Working Youth Movement of Israel, Orthodox Youth Movement of Israel (*Ezra*), Socialist Youth Movement of Israel, Sons of Akiva Youth Movement of Israel, Tel Aviv University Students' Association, Trumpeldor Covenant Youth Movement of Israel, United Kibbutz Youth Movement of Israel. Young Herut, Zionit Youth Movement, and chapters of the YMCA/YWCA.

First aid services in Israel are organized by the Red Shield of David (Magen David Adom), which cooperates with the International Red Cross. Other international organizations include Defence for Children International, and Amnesty International.

#### 47 TOURISM, TRAVEL, AND RECREATION

Principal tourist attractions are the many holy and historic places which include sites sacred to three religions: Judaism, Islam, and Christianity. In particular, the Old City of Jerusalem contains the Western ("Wailing") Wall, the Dome of the Rock, and the Church of the Holy Sepulchre; nearby are the Mount of Olives and Garden of Gethsemane. Another holy place is Bethlehem, the birthplace of both King David and Jesus. Also of great interest are the ruins of Jericho, the world's oldest city; the caves of Qumran, near the Dead Sea; and the rock fortress of Masada, on the edge of the Dead Sea Valley and the Judean Desert. Tourists are also drawn to Israel's rich variety of natural scenery, ranging from hills and greenery in the north to rugged deserts in the south, and including the Dead Sea, the lowest spot on Earth. The most popular team sports are football (soccer) and basketball; popular recreations include swimming, sailing, and fishing.

A valid passport is required for tourists, with visas issued at time of entry. In 2000, 2,416,756 tourists visited Israel, over 50% from European countries. There were over 45,594 rooms in hotels and other establishments with 106,782 beds and a 60% occupancy rate. Tourist receipts totaled \$3.8 billion. The Tourist Industry Development Corporation fosters tourism by granting loans for hotel expansion and improvement.

According to 2002 US Department of State estimates, the average daily cost of staying in Tel Aviv was \$314. Estimated daily expenses in Jerusalem were \$312 per day.

#### 48 FAMOUS ISRAELITES AND ISRAELIS

The State of Israel traces its ancestry to the settlement of the Hebrews in Canaan under Abraham (b.Babylonia, fl.18th cent. BC), the return of the Israelite tribes to Canaan under Moses (b. Egypt, fl.13th cent. BC) and Joshua (b.Egypt, fl.13th cent. BC), and the ancient kingdom of Israel, which was united by David (r.1000?–960? BC) and became a major Near Eastern power under Solomon (r.960?–922 BC). A prophetic tradition that includes such commanding figures as Isaiah (fl.8th cent. BC), Jeremiah (650?–585? BC), and Ezekiel (fl.6th cent. BC) spans the period of conquest by Assyria and Babylonia; the scribe Ezra (b.Babylonia, fl.5th cent. BC) and the governor Nehemiah (b.Babylonia, fl.5th cent. BC) spurred the reconstruction of the Judean state under Persian hegemony. Judas (Judah) Maccabaeus

("the Hammerer"; fl.165–160 BC) was the most prominent member of a family who instituted a period of political and religious independence from Greek rule. During the period of Roman rule, important roles in Jewish life and learning were played by the sages Hillel (b. Babylonia, fl.30 BC–AD 9), Johanan ben Zakkai (fl.1st cent.), Akiba ben Joseph (50?–135?), and Judah ha-Nasi (135?–220), the compiler of the Mishnah, a Jewish law code; by the military commander and historian Flavius Josephus (Joseph ben Mattathias, AD 37–100?); and Simon Bar-Kokhba (bar Kosiba, d.135), leader of an unsuccessful revolt against Roman rule. Unquestionably, the most famous Jew born in Roman Judea was Jesus (Jeshua) of Nazareth (4? BC–AD 29?), the Christ, or Messiah ("anointed one"), of Christian belief. Peter (Simon, d.AD 67?) was the first leader of the Christian Church and, in Roman Catholic tradition, the first pope. Paul (Saul, b.Asia Minor, d.AD 67?) was principally responsible for spreading Christianity and making it a religion distinct from Judaism.

The emergence of Israel as a modern Jewish state is attributed in large part to Chaim Weizmann (b. Russia, 1874–1952), the leader of the Zionist movement for 25 years, as well as a distinguished chemist who discovered methods for synthesizing acetone and rubber. Theodor Herzl (b. Budapest, 1860–1904), the founder of political Zionism, is buried in Jerusalem. Achad Ha'am (Asher Hirsch Ginsberg; b. Russia, 1856–1927) was an influential Zionist and social critic. Vladimir Jabotinsky (1880–1940) was a dedicated advocate of Jewish self-defense, both in his native Russia and in Palestine. David Ben-Gurion (Gruen; b. Poland, 1886–1973), also a leading Zionist and an eloquent spokesman on labor and national affairs, served as Israel's first prime minister. Golda Meir (Meyerson; b. Russia, 1898–1978), like Ben-Gurion a former secretary-general of Histadrut, became well known as Israel's prime minister from 1970 to 1974. Other prominent contemporary figures include Pinhas Sapir (b. Poland, 1907–75), labor leader and minister of finance; Abba Eban (Aubrey Eban; b. South Africa, 1915–2002), former foreign affairs minister and representative to the UN; and Moshe Dayan (1915–81), military leader and cabinet minister. Menachem Begin (b. Russia, 1913–92), the former leader of guerrilla operations against the British, was prime minister from 1977 to 1983 and received the Nobel Peace Prize in 1978. He was succeeded by Yitzhak Shamir (b. Poland, 1915) in 1983, who gave way to Shimon Peres (b. Poland, 1923) in 1984. Shamir succeeded Peres in 1986. Yitzhak Rabin (1922–1995) was instrumental in the peace accords with the PLO signed in 1993 in Washington.

Israel's foremost philosopher was Martin Buber (b. Vienna, 1878–1965), author of *I and Thou*. Outstanding scholars include the literary historian Joseph Klausner (1874–1958); the Bible researcher Yehezkel (Ezekiel) Kaufmann (b. Ukraine, 1889–1963); the philologists Eliezer Ben-Yehuda (b. Lithuania, 1858–1922) and Naphtali Hertz Tur-Sinai (Torczyner; b. Poland, 1886–1973); the archaeologist Eliezer Sukenik (1889–1953); and the Kabbalah authority Gershom Gerhard Scholem (b. Germany, 1897–1982).

The foremost poets are Haim Nahman Bialik (b. Russia, 1873–1934), Saul Tchernichowsky (b. Russia, 1875–1943), Uri Zvi Greenberg (b. Galicia, 1896–1981), Avraham Shlonsky (b. Russia, 1900–1973), Nathan Alterman (b. Warsaw, 1910–70), Yehuda Amichai (b. Germany, 1924), and Natan Zach (b. Berlin, 1930); and the leading novelists are Shmuel Yosef Halevi Agnon (b. Galicia, 1888–1970), a Nobel Prize winner in 1966, and Hayim Hazaz (b. Russia, 1898–1973). Painters of note include Reuven Rubin (b. Romania, 1893–1975) and Mane Katz (b. Russia, 1894–1962). Paul Ben-Haim (Frankenburger; b. Munich, 1897–1984) and Ödön Partos (b. Budapest, 1907–77) are well-known composers. Famous musicians include Daniel Barenboim (b. Argentina, 1942), Itzhak Perlman (b. 1945), and Pinchas Zukerman (b. 1948).

Significant contributions in other fields have been made by mathematician Abraham Halevi Fraenkel (b. Munich, 1891–1965); botanist Hugo Boyko (b. Vienna, 1892–1970); zoologist Shimon (Fritz) Bodenheimer (b. Cologne, 1897–1959); parasitologist Saul Aaron Adler (b. Russia, 1895–1966); physicist Giulio Raccah (b. Florence, 1909–65); rheologist Markus Reiner (b. Czernowitz, 1886–1976); gynecologist Bernard Zondek (b. Germany, 1891–1966); and psychoanalyst Heinrich Winnik (b. Austria-Hungary, 1902–82).

## 49 DEPENDENCIES

Beginning at the end of the 1967 war until the 1990s, Israel administered the West Bank and the Gaza Strip. The Golan Heights, captured from Syria during the same war, was annexed in 1981; the Sinai Peninsula, taken from Egypt, was restored to Egyptian sovereignty in 1983, in accordance with a 1979 peace treaty. In 1994 Israel returned small pockets of some of the land captured in the war, to be administered in a less than totally sovereign fashion, by the Palestinian Authority. The move was in accord with a peace agreement (the Israel-PLO Declaration of Principles on Interim Self-Government Arrangements or DOP) signed in Washington, DC, on 13 September 1993 by representatives of Israel and the Palestine Liberation Organization (PLO). In January 1996, a Palestinian Legislative Council was elected to form the foundation for the interim self-government for the West Bank and Gaza Strip. In May 1994, a new agreement (the Israel-PLO 4 May 1994 Cairo Agreement on the Gaza Strip and the Jericho Area) transferred responsibility for the Gaza Strip and Jericho to the Palestinians. Over the next several years, agreements between Israel and the PLO transferred responsibility for West Bank territory from Israel to Palestinian control. According to the terms of the DOP, Israel was to continue to provide security for the territories transferred to Palestinian control during the period of transition. In 1999, negotiations to set the terms for permanent status for the West Bank and Gaza began, but a number of factors—continuing expansion of Israeli settlements in territory transferred to Palestinian control, outbreaks of violence and terrorism beginning in 2000 and continuing for the next two years, instability in the Palestinian Authority, and severe reaction on the part of the Israeli military—combined to undermine further progress. The estimated population of the West Bank in 2002 was 2,163,667, not including an estimated 187,000 Israeli settlers; the estimated population of the Gaza Strip that year was 1,225,911, not including an estimated 5,000 Israeli settlers.

# JAPAN

Nippon

**CAPITAL:** Tokyo

**FLAG:** The Sun-flag (Hi-no-Maru) consists of a red circle on a white background.

**ANTHEM:** (de facto) *Kimigayo (The Reign of Our Emperor)*, with words dating back to the ninth century.

**MONETARY UNIT:** The yen (¥) of 100 sen is issued in coins of 1, 5, 10, 50, 100, and 500 yen, and notes of 500, 1,000, 5,000, and 10,000 yen. ¥1 = \$0.0083 (or \$1 = ¥120) as of May 2003.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Adults' Day, 15 January; Commemoration of the Founding of the Nation, 11 February; Vernal Equinox Day, 20 or 21 March; Greenery Day, 29 April; Constitution Day, 3 May; Children's Day, 5 May; Respect for the Aged Day, 15 September; Autumnal Equinox Day, 23 or 24 September; Health-Sports Day, 10 October; Culture Day, 3 November; Labor-Thanksgiving Day, 23 November; Emperor's Birthday, 23 December.

**TIME:** 9 PM = noon GMT.

---

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated off the eastern edge of the Asian continent, the Japanese archipelago is bounded on the N by the Sea of Okhotsk, on the E and S by the Pacific Ocean, on the SW by the East China Sea, and on the W by the Sea of Japan. The total area of Japan is 377,835 sq km (145,883 sq mi). Comparatively, the area occupied by Japan is slightly smaller than the state of California. It extends 3,008 km (1,869 mi) NE-SW and 1,645 km (1,022 mi) SE-NW and has a total coastline of 29,751 km (18,486 mi).

The five districts are Honshu, Hokkaido, Kyushu, Shikoku, and Okinawa. Each of the five districts consists of a main island of the same name and hundreds of surrounding islands.

Of the thousands of lesser islands, four are of significance: Tsushima, in the straits between Korea and Japan; Amami Oshima, of the northern Ryukyu Islands at the southern end of the Japanese archipelago; Sado Island in the Sea of Japan off central Honshu; and Awaji Island, lying between Shikoku and Honshu. Two groups of islands returned to Japan by the United States in 1968 are located some 1,300 km (800 mi) due east of the Ryukyus: the Ogasawara (Bonin) Islands, about 885 km (550 mi) south of Tokyo, and the Kazan (Volcano) Islands, directly south of the Ogasawara group.

Japan's principal island is Honshu, on which are located the capital city of Tokyo, the principal cities and plains, and the major industrial areas. This island is divided into five regions: Tohoku, from north of Kanto to Tsugaru Strait; Kanto, embracing seven prefectures in the Tokyo-Yokohama region; the Chubu, or central, region, from west of Tokyo to the Nagoya area; Kinki, including the important cities of Kyoto, Osaka, Kobe, and Nara; and Chugoku, a narrow peninsula thrusting westward from Kinki between the Sea of Japan and the Inland Sea, which lies between southern Honshu and the island of Shikoku.

The Japanese government maintains that the Habomai island group and Shikotan, lying just off Hokkaido and constituting fringe areas of the Kurils, belong to Japan and should be returned to Japanese administration. These islands and the Kuril Islands

are currently occupied by Russia, whose claims are not formally recognized by Japan.

Japan's capital city, Tokyo, is located on the east coast of the island of Honshu.

## <sup>2</sup>TOPOGRAPHY

The Japanese islands are the upper portions of vast mountains belonging to what is sometimes called the Circum-Pacific Ring of Fire, which stretches from Southeast Asia to the Aleutian Islands. Mountains cover over 75% of the land's surface. Landforms are steep and rugged, indicating that, geologically speaking, Japan is still a young area. Through the central part of Honshu, running in a north-south direction, are the two principal mountain ranges: the Hida (or Japan Alps) and the Akaishi mountains. There are 25 mountains with peaks of over 3,000 m (9,800 ft). The highest is the beautiful Mt. Fuji (Fuji-san), at 3,776 m (12,388 ft). Japan has 265 volcanoes (including the dormant Mt. Fuji), of which about 20 remain active. Earthquakes occur continually, with an average of 1,500 minor shocks per year. One of the world's greatest recorded natural disasters was the Kanto earthquake of 1923, when the Tokyo-Yokohama area was devastated and upward of 99,000 persons died.

The plains of Japan are few and small and cover only about 29% of the total land area. Most plains are located along the seacoast and are composed of alluvial lowlands, diluvial uplands, and low hills. The largest is the Kanto Plain (Tokyo Bay region), about 6,500 sq km (2,500 sq mi). Others include the Kinai Plain (Osaka-Kyoto), Nobi (Nagoya), Echigo (north-central Honshu), and Sendai (northeastern Honshu). There are four small plains in Hokkaido. The population is heavily concentrated in these limited flat areas.

Rivers tend to be short and swift. The longest is the Shinano (367 km/228 mi) in north-central Honshu, flowing into the Sea of Japan. The largest lake is Lake Biwa, near Kyoto, with an area of 672 sq km (259 sq mi). Lake Kussharo, in the Akan National Park of Hokkaido, is considered the clearest lake in the world, having a transparency of 41 m (135 ft). Good harbors are limited because in most areas the land rises steeply out of the sea.

Yokohama, Nagoya, and Kobe are Japan's most prominent harbors.

The Ryukyu Islands, among which Okinawa predominates, are the peaks of submerged mountain ranges. They are generally hilly or mountainous, with small alluvial plains.

### 3 CLIMATE

Japan is located at the northeastern edge of the Asian monsoon climate belt, which brings much rain to the country. The weather is under the dual influence of the Siberian weather system and the patterns of the southern Pacific; it is affected by the Japan Current (Kuroshio), a warm stream that flows from the southern Pacific along much of Japan's Pacific coast, producing a milder and more temperate climate than is found at comparable latitudes elsewhere. Northern Japan is affected by the Kuril Current (Oyashio), a cold stream flowing along the eastern coasts of Hokkaido and northern Honshu. The junction of the two currents is a bountiful fishing area. The Tsushima Current, an offshoot of the Japan Current, transports warm water northward into the Sea of Japan.

Throughout the year, there is fairly high humidity, with average rainfall ranging by area from 100 cm to over 250 cm (39–98 in). Autumn weather is usually clear and bright. Winters tend to be warmer than in similar latitudes except in the north and west, where snowfalls are frequent and heavy. Spring is usually pleasant, and the summer hot and humid. There is a rainy season that moves from south to north during June and July.

Average temperature ranges from 17°C (63°F) in the southern portions to 9°C (48°F) in the extreme north. Hokkaido has long and severe winters with extensive snow, while the remainder of the country enjoys milder weather down to the southern regions, which are almost subtropical. The Ryukyus, although located in the temperate zone, are warmed by the Japan Current, giving them a subtropical climate. The typhoon season runs from May through October, and each year several storms usually sweep through the islands, often accompanied by high winds and heavy rains.

### 4 FLORA AND FAUNA

Hokkaido flora is characterized by montane conifers (fir, spruce, and larch) at high elevations and mixed northern hardwoods (oak, maple, linden, birch, ash, elm, and walnut) at lower altitudes. The ground flora includes plants common to Eurasia and North America. Honshu supports a panoply of temperate flora. Common conifers are cypress, umbrella pine, hemlock, yew, and white pine. On the lowlands, there are live oak and camphor trees and a great mixture of bamboo with the hardwoods. Black pine and red pine form the typical growth on the sandy lowlands and coastal areas. Shikoku and Kyushu are noted for their evergreen vegetation. Sugarcane and citrus fruits are found throughout the limited lowland areas, with broadleaf trees in the lower elevations and a mixture of evergreen and deciduous trees higher up. Throughout these islands are luxuriant growths of bamboo.

About 140 species of fauna have been identified. The only indigenous primate is the Japanese macaque, a small monkey found in the north. There are 32 carnivores, including the brown bear, ermine, mink, raccoon dog, fox, wolf, walrus, and seal. There are 250 breeding bird species and 8 species of reptiles. Japan's waters abound with crabs and shrimp; great migrations of fish are brought in by the Japan and Kuril currents. There are large numbers and varieties of insects. The Japanese beetle is not very destructive in its homeland because of its many natural enemies.

### 5 ENVIRONMENT

Rapid industrialization has imposed severe pressures on the environment. Japan's Basic Law for Environmental Pollution

Control was enacted in 1967 and the Environment Agency was established four years later.

Air pollution is a serious environmental problem in Japan, particularly in urban centers. Toxic pollutants from power plant emissions have led to the appearance of acid rain throughout the country. In the mid-1990s, Japan had the world's fourth highest level of industrial carbon dioxide emissions, which totaled 1.09 billion metric tons per year, a per capita level of 8.79 metric tons per year. Air quality is regulated under the Air Pollution Control Law of 1968; by 1984, compensation had been provided to 91,118 air-pollution victims suffering from bronchitis, bronchial asthma, and related conditions. However, the "polluter pays" principle was significantly weakened in 1987 as a result of years of business opposition. Nationwide smog alerts, issued when oxidant density levels reach or exceed 0.12 parts per million, peaked at 328 in 1973 but had declined to 85 (85% of which took place in the Tokyo and Osaka areas) by 1986, following imposition of stringent automobile emissions standards.

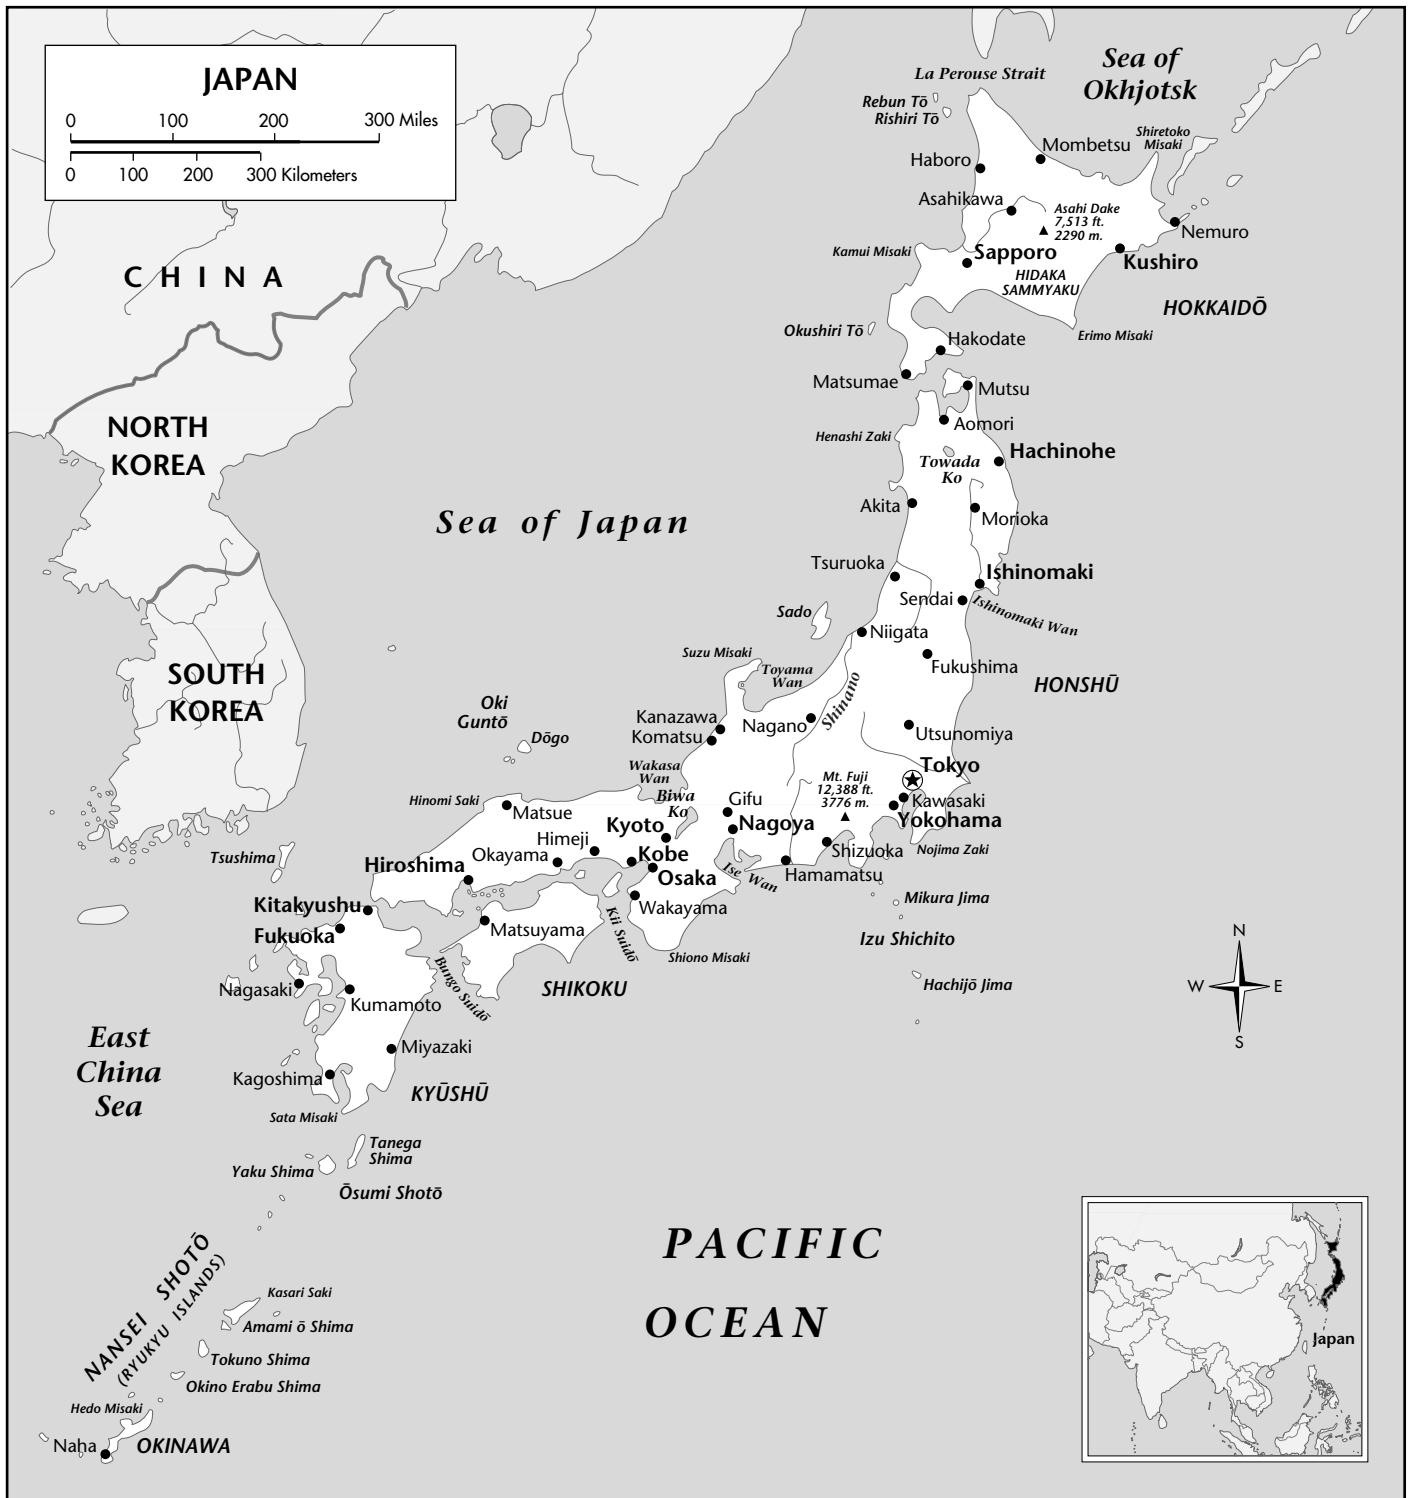

Water pollution is another area of concern in Japan. The nation has 430 cu km of renewable water resources with 64% used in farming activity and 17% used for industrial purposes. Increase in acid levels due to industrial pollutants has affected lakes, rivers, and the waters surrounding Japan. Other sources of pollution include DDT, BMC, and mercury. Environmental damage by industrial effluents has slowed since the promulgation of the Water Pollution Control Law of 1971, but there is still widespread pollution of lakes and rivers from household sources, especially by untreated sewage and phosphate-rich detergents. Factory noise levels are regulated under a 1968 law. Airplanes may not take off or land after 10 PM and the Shinkansen trains must reduce speed while traveling through large cities and their suburbs.

Most of the nation's forests, which play a critical role in retarding runoff and soil erosion in the many mountainous areas, are protected under the Nature Conservation Law of 1972, and large areas have been reforested. Parks and wildlife are covered by the National Parks Law of 1967. In 2001, 6.8% of Japan's total land areas was protected. Japan, one of the world's chief whaling nations, vigorously opposed the 1982 resolution of the IWC calling for a phaseout of commercial whaling by 1986/87. However, since most of its trading partners, including the United States, supported the measure and threatened retaliatory measures if whaling continued, Japan finally agreed to comply with the ban.

Of Japan's mammal species, 29 are endangered, as are 33 bird species, and 537 plants. As of 2001, endangered species in Japan included the Ryukyu sika, Ryukyu rabbit, Iriomote cat, Southern Ryukyu robin, Okinawa woodpecker, Oriental white stork, short-tailed albatross, green sea turtle, and tailless blue butterfly. The Ryukyu pigeon, Bonin thrush, Japanese sea lion, and Okinawa flying fox have become extinct.

### 6 POPULATION

The population of Japan in 2003 was estimated by the United Nations at 127,654,000, which placed it as number 9 in population among the 193 nations of the world. In that year approximately 18% of the population was over 65 years of age, with another 14% of the population under 15 years of age. There were 96 males for every 100 females in the country in 2003. According to the UN, the annual population growth rate for 2000–2005 is 0.14%, with the projected population for the year 2015 at 127,224,000. Japan is the only Asian country thus far with a birthrate that has declined to the level of industrial areas in other parts of the world. The estimated 10 births per 1,000 population in 2000 compares with about 343 births per 1,000 population in 1947. The steep drop since 1950 has been attributed to legalization of abortion, increased availability of contraceptives, and the desire to raise living standards. The

LOCATION: 122°56' to 153°59' E; 20°25' to 45°33' N. TOTAL COASTLINE: 29,751 kilometers (18,486 miles). TERRITORIAL SEA LIMIT: 12 miles.

population density in 2002 was 337 per sq km (873 per sq mi). Even with the low birth rate, Japan is one of the most densely populated countries in the world. Urban density rates were 5,500 per sq mi (14,245 per sq mi).

It was estimated by the Population Reference Bureau that 79% of the population lived in urban areas in 2001. The capital city, Tokyo, had a population of 26,356,000 in that year. Other major metropolitan areas include Osaka, 10,609,000; Nagoya,

3,377,000; Sapporo, 1,827,000; Kyoto, 1,703,000; Kitakyushu, 2,898,467; Hiroshima, 912,677; and Sendai, 821,000. According to the United Nations, the urban population growth rate for 2000–2005 was 0.3%.

### 7 MIGRATION

Japanese nationals living in other countries totaled more than 600,000 in the 1990s, including some 250,000 in the United

States and over 100,000 in Brazil. More than one million Japanese have emigrated since 1880; about 70% of them arrived on the US mainland and in Hawaii during the decades prior to World War II. Emigration continued after the war, encouraged by government policy as a way of relieving population pressure. By the mid-1960s, emigration had considerably decreased, as economic opportunities and living standards in Japan improved. Since the early 1970s, however, the number of emigrants has again risen sharply, reaching 82,619 in 1992 (compared to 12,445 in 1975 and 34,492 in 1985).

Immigration to Japan is generally small-scale, although in recent years the illegal entry of workers from neighboring countries has come to be regarded as a problem. Since 1975, 10,000 Indo-Chinese refugees have settled in Japan. In the mid-1990s there were 1,300,000 registered aliens, of which 690,000 were Koreans. The number of illegal aliens may be even higher. Some 150,000 Chinese constituted the second-largest group. Nearly 42,000 foreigners entered as permanent residents per year. Because citizenship is based on nationality of parent rather than place of birth, registered aliens may have spent their entire lives in Japan. In 1999 the net emigration rate was 0.34 migrants per 1,000 population.

Internal migration, providing a steady exodus of people from farm and mountain communities to the cities and suburbs, has been accelerating since 1952. Most such migrants flocked to the three major population centers—the Tokyo, Osaka, and Nagoya metropolitan areas. As pollution and congestion in these areas increased, the government instituted programs to decentralize industry by directing new growth to smaller cities of the north and west, and also began efforts to improve rural living conditions and employment opportunities.

## 8 ETHNIC GROUPS

In 1999, 99.4% of the population was Japanese while only 0.6% belonged to other ethnic groups (mostly Korean). Although it is known that the Japanese are descended from many varied peoples of Asia, there is no agreement as to origins or specific ethnic strains. In physical characteristics, the Japanese belong to the Mongoloid group, with faint admixtures of Malayan and Caucasoid strains. Waves of migration from the continental hinterland reached Japan during the end of the Paleolithic period, blending into a complicated and diverse ethnic, linguistic, and cultural system. It is believed that the Japanese have their roots in the Old Stone Age race of at least 30,000 BC. A major migration appears to have taken place in the second and third centuries AD, and by the fourth century this group, called the Yamato clan, had established a monarchy in the present Nara prefecture. Other ethnic strains may have come from Indonesia and China in the south, Korea in the west, and Siberia and Alaska in the north.

The one remaining distinct ethnic group in Japan is the Ainu. These people, living on the northern island of Hokkaido, are physically distinct from the contemporary Japanese, having Nordic-like features, including more pervasive facial and body hair. There is no agreement as to their origins; their current population is less than 20,000.

## 9 LANGUAGES

Japanese is the official language. Most linguists agree that Japanese is in a language class by itself, although there is some inconclusive evidence that traces it to the Malayo-Polynesian language family. In vocabulary, Japanese is rich in words denoting abstract ideas, natural phenomena, human emotions, ethics, and aesthetics, but poor in words for technical and scientific expression. For these latter purposes, foreign words are directly imported and written in a phonetic system (*katakana*). A distinct characteristic is the use of honorifics to show proper respect to the listener and his social status.

Written Japanese owes its origin almost entirely to Chinese forms. Having no indigenous script, the Japanese since the fifth century have used Chinese characters, giving them both an approximate Chinese pronunciation and a Japanese pronunciation. In addition, the Japanese invented phonetic symbols (*kana*) in the ninth century to represent grammatical devices unknown to the Chinese.

Attempts have been made to reduce the complexity of the written language by limiting the number of Chinese characters used. The government has published a list of 1,850 characters for use in official communications. Newspapers adhere to this list.

## 10 RELIGIONS

According to a 2000 report by the Agency for Cultural Affairs, about 50% of the population practice Shintoism and 44% practice Buddhism. Religious identities are not mutually exclusive, and many Japanese maintain affiliations with both a Buddhist temple and a Shinto shrine.

Shinto, originally concerned with the worship of spirits of nature, grew under the influence of Chinese Confucianism to include worship of family and imperial ancestors, and thus provided the foundation of Japanese social structure. Shinto became an instrument of nationalism after 1868, as the government officially sponsored and subsidized it, requiring that it be taught in the schools and that all Japanese belong to a state Shinto shrine. After World War II, Shinto was abolished as a state religion, and the emperor issued an imperial rescript denying divine origin. Today, Shinto exists as a private religious organization.

Buddhism is considered by some the most important religion in Japan. Introduced through China and Korea around AD 552, Buddhism spread rapidly throughout Japan and has had considerable influence on the nation's arts and its social institutions. There are 13 sects (*shu*) and 56 denominations, the principal *shu* being Tendai, Shingon, Jodo, Zen, Soto, Obaku, and Nichiren. Japanese Buddhism was founded on the Mahayana school, which emphasizes the attainment of Buddhahood, whereas the Hinayana Buddhism of India emphasizes obedience to commandments and personal perfection. The great temples and gardens of Japan, the famous Japanese tea ceremony (*chanoyu*), and Japanese flower-arranging arts (*ikebana*) owe their development to the influence of Buddhism.

Religions designated as other are practiced by about 6% of the population (including 0.8% practicing Christianity). Christianity, introduced to Japan by the Jesuit St. Francis Xavier in 1549, was first encouraged by feudal lords but then banned in 1613, often under penalty of death. After that time, a unique sect known as "hidden Christians" developed, with no tradition of churches or public displays of faith and a syncretic doctrine that incorporated local ideas and history. The prohibition against Christianity was in force until 1873, following the reopening of Japan to international relations in 1854. Following World War II, when the emperor lost his claim to divinity, some Japanese gave up Shinto and converted to Christianity or Judaism.

After World War II, a considerable number of new religious groups sprouted up. One of these, the Soka-Gakkai, a Buddhist offshoot, controlled a political party (*Komeito*), the third-strongest political group in Japan, until politics and religion were officially separated in 1970. In addition to the established and new religions, Confucianism, an ethical system originating in China, has strongly influenced Japanese society since the earliest periods, providing underpinnings for some characteristically Japanese attitudes.

## 11 TRANSPORTATION

Despite its rugged terrain, Japan has a highly developed transportation system. In 2002, Japan had 23,654 km (14,699 mi) of railways, of which about 90% is 1.067 m narrow gauge,

and 15,895 km (9,877 mi) is electrified. The government-owned Japan National Railways (JNR) was privatized in April 1987 and divided into six railway companies; feeding into these six lines were 144 other private railroads. Like their counterparts elsewhere, Japan's rail lines face increasing competition from automotive, sea, and air transport, as well as rising operating costs. High-speed lines, however, have been successful in partially meeting these problems; the most famous of these is the Shinkansen, which opened to traffic in October 1964 between Tokyo and Osaka and was extended in March 1975 to Fukuoka in northern Kyushu; in 1984, the Shinkansen superexpress trains covered the 1,069 km (664 mi) between Tokyo and Fukuoka in less than seven hours, with maximum speeds of 210 km/hr (130 mph). In 1982, the first section of the northern Shinkansen line, between Tokyo and Omiya, began operations. This line was extended in 1983 to Niigata and to Morioka, in northern Honshu. By far the longest railway tunnel in the world, the 54.2 km (33.7 mi) Seikan tube linking Honshu with Hokkaido, was opened in 1983 and completed in 1985; the tunnel, lying beneath the Tsugaru Strait, cost well over \$2 billion. A bridge linking Honshu and Shikoku was recently opened. Subway lines serve nine cities—Tokyo, Osaka, Nagoya, Kobe, Yokohama, Sapporo, Kyoto, Fukuoka, and Sendai. There are 410 km (255 mi) of track, with 196 km (122 mi) in Tokyo's 11 lines. Since 1964, downtown Tokyo has also been linked with that city's Haneda Airport by a monorail transport system, and several other monorails have been put into operation. In addition, a 7 km (4.3 mi) monorail serves the city of Yokohama.

Roads have become the most important means of domestic transport. Motor vehicles in 2000 numbered 52,438,000 passenger cars and 20,214,843 commercial vehicles, up from 25,848,000 and 8,306,000, respectively, in 1985. To speed traffic flow, a total of 6,070 km (3,772 mi) of expressways were open to traffic in 1996. In 2002, there were about 1.15 million km (715,981 mi) of roadways, of which about 863,003 km (536,270 mi) were paved.

Japan is one of the world's great maritime nations. The chief ports are Yokohama (for Tokyo), Nagoya, and Kobe. In 2002, Japan's merchant fleet included 615 ships, totaling 10,995,839 GRT. Since 1959, Japan has emerged as the world's leading shipbuilder, but output declined in the late 1970s and 1980s in the face of a worldwide recession and increased competition from the Republic of Korea (ROK).

Japan had 173 airports in 2001, of which 141 had paved runways. Principal domestic airports include Haneda in Tokyo, Itami in Osaka, Itazuke in Fukuoka, and Chitose on Hokkaido. Principal international facilities include Kansai International at Osaka and New Tokyo International at Tokyo. Japan Air Lines (JAL), the nation's major domestic and international airline, began operations in 1952 and inaugurated international flights in 1954. All Nippon Airways, established in 1957, began as a domestic system serving smaller areas of the country and acting as a feeder line to JAL but now serves overseas routes; it began to carry freight in 1987. In 2001, Japan's airlines performed 7,627 million freight ton-km (4,739 million freight ton-mi). In the same year, 107,870,200 passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

Recent archaeological discoveries revealed the existence of paleolithic humans in Japan when the islands were connected to the Asian continental landmass. Little is known about the origins of the earliest Japanese beyond the fact that they migrated from the continent. The first distinctive Neolithic culture, the Jōmon, existed in Japan from 11,000 BC to 300 BC. The Jōmon was displaced by the Yayoi culture, which introduced new agricultural and metallurgical skills from the continent. Tradition places the beginning of the Japanese nation in 660 BC with the ascendance

to the throne of the legendary Emperor Jimmu. It is generally agreed, however, that as the Yayoi developed, the Yamato clan attained hegemony over southern Japan during the first three or four centuries of the Christian era and established the imperial family line. Earlier contacts with Korea were expanded in the fifth century to mainland China, and the great period of cultural borrowing began: industrial arts were imported; Chinese script was introduced (thereby permitting the study of medical texts), the Chinese calendar and Buddhism also arrived from China. Japanese leaders adapted the Chinese governmental organization but based power upon hereditary position rather than merit. The first imperial capital was established at Nara in 710. In 794, the imperial capital was moved to Heian (Kyoto), where it remained until 1868, when Tokyo became the nation's capital.

Chinese influence waned as native institutions took on peculiarly Japanese forms. Outside court circles, local clans gained strength, giving rise to military clan influence over a weakening imperial system. The Minamoto clan gained national hegemony as it defeated the rival Taira clan in 1185, and its leader, the newly appointed Yoritomo, established a military form of government at Kamakura in 1192, a feudal system that lasted for nearly 700 years. Under the shogunate system, all political power was in the hands of the dominant military clan, with the emperors ruling in name only. The Kamakura period was followed by the Ashikaga shogunate (1336–1600) which saw economic growth and the development of a more complex feudalism. For over 100 years, until the end of the 16th century, continuous civil war among rival feudal lords (*daimyo*) ensued. During this time, the first contact with the Western world took place with the arrival in 1543 of Portuguese traders, and with that, the first guns were imported. Six years later, St. Francis Xavier arrived, introducing Christianity to Japan.

By 1590, the country was pacified and unified by Toyotomi Hideyoshi, a peasant who had risen to a top military position. Hideyoshi also invaded Korea unsuccessfully, in 1592–93 and in 1598, dying during the second invasion. Ieyasu Tokugawa consolidated Hideyoshi's program of centralization. Appointed shogun in 1603, Tokugawa established the Tokugawa shogunate, which was to rule Japan until the imperial restoration in 1868. Tokugawa made Edo (modern Tokyo) the capital, closed Japan to foreigners except Chinese and Dutch traders (who were restricted to Nagasaki) and occasional Korean diplomats, and banned Christianity. For the next 250 years, Japan enjoyed stability and a flowering of indigenous culture, although from the end of the 18th century onward, Japan came under increasing pressure from Western nations to end its isolationist policy.

The arrival of Commodore Matthew C. Perry from the United States in 1853—with his famous “black ships”—started a process that soon ended Japanese feudalism. The following year, Perry obtained a treaty of peace and friendship between the United States and Japan, and similar pacts were signed with Russia, Britain, and the Netherlands based on the principle of extraterritoriality. A decade of turmoil and confusion followed over the question of opening Japan to foreigners. A coalition of southern clans led by ambitious young samurai of the Satsuma and Choshu clans forced the abdication of the Tokugawa shogun and reestablished the emperor as head of the nation. In 1868, Emperor Mutsuhito took over full sovereignty. This Meiji Restoration, as it is known, signaled the entry of Japan into the modern era.

Intensive modernization and industrialization commenced under the leadership of the restoration leaders. A modern navy and army with universal military conscription and a modern civil service based on merit formed the foundation of the new nation-state. The government undertook the establishment of industry, by importing technological assistance. In 1889, a new constitution established a bicameral legislature (Diet) with a civil cabinet headed by a prime minister responsible to the emperor.

By the end of the 19th century, irreconcilable territorial ambitions brought Japan into open conflict with its much larger western neighbors. The Sino-Japanese War (1894–95) was fought over the question of control of Korea, and the Russo-Japanese War (1904–05) over the question of Russian expansion in Manchuria and influence in Korean affairs. Japan emerged victorious in both conflicts, its victory over the Russians marking the first triumph of an Asian country over a Western power in modern times. Japan received the territories of Taiwan and the southern half of Sakhalin Island, as well as certain railway rights and concessions in Manchuria and recognition of paramount influence in Korea. The latter became a Japanese protectorate in 1905 and was annexed by Japan in 1910.

During the Taisho era (1912–26), Japan participated in a limited way in World War I, in accordance with the Anglo-Japanese Alliance of 1902. Japan was one of the Big Five powers at the Versailles Peace Conference and in 1922 was recognized as the world's third-leading naval power at the Washington Naval Conference. The domestic economy developed rapidly, and Japan was transformed from an agricultural to an industrial nation. Economic power tended to be held by the industrial combines (*zaibatsu*), controlled by descendants of those families that had instituted the modernization of the country decades earlier. In 1925, universal manhood suffrage was enacted, and political leaders found it necessary to take into consideration the growing influence of parties.

In 1926, Emperor Hirohito ascended the throne beginning the Showa era. By the 1930s, democratic institutions atrophied and the military-industrial complex became dominant. With severe social distress caused by the great depression, an ultranationalist ideology emerged, particularly among young army officers. Acting independently of the central government, the military launched an invasion of Manchuria in 1931, eventually establishing the puppet state of Manchukuo. In 1932, a patriotic society assassinated the prime minister, bringing an end to cabinets formed by the majority party in the Diet. Japan withdrew from the League of Nations (which had protested the Manchurian takeover) in 1933, started a full-scale invasion of China (the Second Sino-Japanese War, 1937–45), and signed the Anti-Comintern pact with Germany in 1936 and a triple alliance with Germany and Italy in 1940. The military leadership, viewing the former USSR and the United States as chief barriers to Japanese expansion, negotiated a nonaggression pact with the USSR in April 1941, thus setting the stage for the attack on Pearl Harbor and other Pacific targets on 7 December of that year. Thereafter, Japanese military actions took place in the context of World War II.

With its capture of the Philippines on 2 January 1942, Japan gained control of most of East Asia, including major portions of China, Indochina, and the southwest Pacific. Japanese forces, however, could not resist the continued mobilization of the US military. A series of costly naval campaigns—including battles at Midway, Guadalcanal, and Leyte Gulf—brought an end to Japanese domination in the Pacific. By 1945, the Philippines had been recaptured, and the stage was set for a direct assault on Japan. After the US troops captured Okinawa in a blood battle, President Harry S. Truman argued that a full invasion of Japan would prove too costly and decided on aerial attacks to force Japan into surrendering. After four months of intense bombardment with conventional weapons, the United States dropped an atomic bomb on Hiroshima on 6 August 1945 and a second bomb on Nagasaki on 9 August. An estimated 340,000 persons died from the two attacks and the subsequent effects of radiation.

On 14 August, Japan accepted the Potsdam Declaration for unconditional surrender with formal surrender documents signed aboard the USS *Missouri* on 2 September. The subsequent occupation (1945–52), under the direction of General Douglas

MacArthur, Supreme Commander for the Allied Powers, began a series of ambitious reforms. Political reforms included the adoption of a parliamentary system of government based on democratic principles and universal suffrage, a symbolic role for the emperor as titular head of state, the establishment of an independent trade union, and the disarmament of the military. Economic reforms consisted of land reform, the dissolution of the *zaibatsu*, and economic and political rights for women. A new constitution was promulgated on 3 November 1946 and put into force on 3 May 1947.

### The Postwar Period

Heavy economic aid from the United States and a procurement boom produced by the Korean War, coupled with a conservative fiscal and monetary policy allowed the Japanese to rebuild their country. The Japanese economy rapidly recovered, and the standard of living quickly surpassed the prewar level by a substantial margin. The state of war between the Western powers and Japan was formally ended by the San Francisco Peace Treaty, signed in September 1951 by 56 nations. The allied occupation ended officially when the treaty went into effect in April 1952. Japan renounced claims to many of its former overseas territories, including such major areas as Taiwan and Korea. The Amami island group, comprising the northern portion of the Ryukyu Islands, nearest to Kyushu Island, was returned to direct Japanese control by the United States in December 1953; the remainder of the group, including Okinawa, was returned to full Japanese sovereignty in May 1972. The Ogasawara (Bonin) Islands and Kazan (Volcano) Islands were returned to Japanese sovereignty in June 1968. The former USSR never signed the San Francisco Peace Treaty, and Japan and Russia continue to dispute sovereignty over the Kurile Islands, to the northeast of Hokkaido, which the USSR occupied in 1945. In 1956, Japan and the former USSR agreed to establish diplomatic relations.

In 1956 Japan was elected to UN membership. A revision of the 1952 defense treaty with the United States, under which a limited number of troops were to remain in Japan for defense purposes, was signed amid growing controversy in 1960. On 22 June 1965, Japan signed a treaty with South Korea normalizing relations between the two countries. The US-Japanese Security Treaty was renewed in 1970, despite vigorous protest by the opposition parties and militant student organizations. In 1972, Japan moved to establish full diplomatic relations with the People's Republic of China. Formal diplomatic links with the Nationalist Chinese government on Taiwan were terminated by this move, but Japan's economic and cultural links with Taiwan nonetheless have survived virtually intact.

While Japan defined its new role in East Asian affairs, its remarkable economic expansion raised it to the level of a major trading power. Based on strong government support of export industries, political stability under the Liberal-Democratic Party (LDP), and public policy guidance from a powerful bureaucracy, Japan experienced a dramatic rise from the ruins of World War II. From 1955 to 1965, Japan experienced a nominal growth rate of 10–20% annually and real growth rates (adjusted for inflation) of 5–12%. In 1968, it surpassed the Federal Republic of Germany (FRG) to stand second after the United States among non-Communist nations in total value of GNP. The oil crisis of 1973—a combination of shortages and rising prices—revealed the crack in Japan's economic armor, the lack of domestic petroleum resources. A second oil crisis during the late 1970s, was met by a reappraisal of Japan's dependence on foreign fuels and the institution of long-range programs for energy conservation and diversification.

The yen declined in value in the early 1980s, causing Japanese exports to become cheaper in overseas markets and leading to huge trade surpluses with the United States and other leading trading partners, who began to demand that Japan voluntarily

limit certain exports and remove the barriers to Japan's domestic market. During 1985–87, the yen appreciated in value against the dollar and, by 1994, the dollar had hit a post-World War II low, but Japan continued to register substantial trade surpluses.

Political stability, maintained since the 1950s by the majority LDP, began to unravel in the 1970s, following the retirement from politics of Prime Minister Eisaku Sato in 1972. Sato's successor, Kakuei Tanaka, was forced to resign in December 1974 amid charges of using his office for personal gain in the Lockheed Corporation bribery scandal. Takeo Miki succeeded Tanaka and Takeo Fukuda became prime minister when Miki resigned in December 1976. Fukuda was defeated in intraparty elections by Masayoshi Ohira in 1978. When Ohira died in June 1980, he was succeeded by Zenko Suzuki. Suzuki stepped down as prime minister in November 1982 and was replaced by controversial and outspoken Yasuhiro Nakasone. Noboru Takeshita became prime minister in November 1987.

Policy regarding military force has been a major political issue in the postwar years. According to Article Nine of the 1947 constitution, Japan renounced the belligerency of the state but soon developed a Self-Defense Force with US encouragement. In 1986, breaking a long-standing policy, the government increased military spending to over 1% of the GNP. The Diet (parliament) approved a bill allowing the deployment of troops abroad for international peacekeeping in 1992 (with the United Nations in Cambodia).

Emperor Hirohito died of cancer on 7 January 1989, at the age of 87. He was succeeded by the Crown Prince Akihito, who was enthroned as the Heisei emperor in a formal ceremony in November 1990. The sense of entering a new era brought increased controversy over the assessment of Japan's role in the earlier part of the century, particularly during World War II. Some denied that Japan had committed atrocities during the war and there were attempts to further soften the wording of school textbooks. In March 1989, Prime Minister Takeshita apologized to North Korea (DPRK) for the suffering Japan caused over the 36 years of occupation of Korea (1910–45) and Emperor Akihito expressed similar regrets to President Roh Tae Woo of South Korea (ROK) in May 1990. In the same month, the government removed the requirement for fingerprinting of people of Korean descent living in Japan. In 1992, Prime Minister Kiichi Miyazawa apologized for the forced prostitution of Korean, Chinese, and Japanese women in Japanese military brothels during World War II.

The 1980s ended with a major scandal involving illegal stock trading and influence peddling by the Recruit Cosmos Company. Between the summer of 1988 and the closing of the case in May 1989, the scandal led to the implication and resignations of prominent business people and politicians in top government positions, among them then-finance minister Kiichi Miyazawa, and the former prime minister, Yasuhiro Nakasone. Scandals continued into the 1990s with stock rebates for politicians in 1991 and then in 1992, contributions to politicians from a trucking company linked to organized crime became public knowledge.

The economy entered a period of major stagnation and distress in the early 1990s. In 1990, the stock market declined more than 25% from January to April. Then, during the spring of 1992, the stock index fell rapidly again, until by the summer, the index was at its lowest point in six years at 62% below the record high of 1989. By the end of 1993, Japan was in the midst of its worst economic downturn in at least 20 years.

Against the background of scandals and an economic recession, the political landscape began a major change. Taking responsibility for political problems caused by the Recruit scandal, Noboru Takeshita resigned as prime minister in April 1989, to be succeeded in May by Sosuke Uno, who abruptly resigned when a sex scandal became public amidst the LDP loss

of its majority in the upper house of the Diet. The next prime minister, Toshiki Kaifu, served his term from August 1989 to October 1991, but the LDP did not support him for a second term. Instead, Kiichi Miyazawa became prime minister in November 1991. When the lower house gave Miyazawa a vote of no confidence in June 1993 for abandoning electoral reform bills, Miyazawa dissolved the lower house and called for elections.

In the election for the 511 seats of the House of Representatives on 18 July 1993, the LDP, for the first time since its own formation in 1955, failed to secure the 256 seats needed for a majority. Without a majority, the LDP was unable to form a government and the new prime minister, Morihiro Hosokawa (JNP), was chosen on 29 July 1993, by a seven-party coalition of LDP defectors, Socialists, and conservatives. Hosokawa, too, was tainted by questions regarding personal finances and stepped down as prime minister to be replaced by Tsutomu Hata (Shinseito) in April 1994. Just as Hata took office, the Socialist Party left the governing coalition, leaving the prime minister as the head of a minority government for the first time in four decades. Hata soon resigned and, in a surprise move, the LDP and the Socialist Party, traditionally opponents, allied to form a new coalition, which also included the Sakigake. The coalition selected as prime minister Tomiichi Murayama, the head of the Socialist Party and the first Socialist prime minister since 1948. Within the coalition, the LDP was the dominant factor, but the decades of LDP rule appeared to be over and the nature of the LDP itself changed. The dissolution of the House of Representatives and the ensuing election on 18 July 1993 marked a major turning point for Japanese politics as the LDP lost its political dominance as new parties formed. One new party, the Japan New Party (JNP), was formed by Morihiro Hosokawa, a former LDP member, in May 1992. On 21 June 1993, 10 more members of the LDP, led by Masayoshi Takemura, left to form the Sakigake (Harbinger Party) and another 44 LDP members quit two days later to create the Shinseito (Renewal Party) with Tsutomu Hata as its head. By 28 June, one-fifth (57 members) of the LDP bloc of the dissolved lower house left the party.

In June 1994, Tomiichi Murayama became prime minister in a coalition consisting of the LDP, the Social Democratic Party of Japan (SDPJ), and Sakigake. In an unprecedented move, Murayama recognized the legal right for the existence of the Japanese Self-Defense force, much to the disapproval of left-leaning party members. The tumultuous reign of Murayama included the Kobe earthquake and political scandals which led to the resignation of the Justice Minister and the director of the Management and Coordination Agency. Elections in October 1996 resulted in a victory for the LDP, but the party still failed to obtain a majority of seats, only capturing 239 of 500. The Sakigake and Democratic Party of Japan agreed to support Prime Minister Ryutaro Hashimoto. In July 1998, Hashimoto resigned after a poor performance of the LDP in the House of Councilors election and was replaced by Keizo Obuchi. During the Obuchi regime, the Japanese economy showed signs of recovering with major fiscal stimuli including a massive public works program. The LDP also orchestrated and implemented a plan to bail out failed and ailing banks with taxpayers funds.

In April 2000, Obuchi suffered a stroke, entered into a coma, and was replaced by Yoshiro Mori who called summarily for elections. On 25 June parliamentary elections were held for the House of Representatives. Mori was re-elected prime minister, with a ruling coalition of the LDP, the Buddhist-backed New Komeito, and the New Conservative Party (NCP). In early 2001, the Nikkei stock average fell to its lowest level since 1985 and unemployment rates reached 4.9%, the highest since the end of World War II. Plagued by scandal and the depressed economy, Mori resigned in April 2001. Junichiro Koizumi won control of the LDP and became prime minister on 26 April, promising to reinvigorate Japanese politics and radically reform the economy.

He appointed members of his cabinet without seeking nominations from major factions of the LDP, as had been the practice in the past.

Koizumi immediately raised controversy by making a visit to the Yasukuni Shrine. Dedicated to Japan's war dead, it served as a symbol of nationalism during World War II and has been a lightning rod for anger among Asian nations that suffered under Japan's military aggression. He visited the shrine again in April 2002. Japan was also the target of international criticism over its Education Ministry's approval of junior high-school textbooks that allegedly glossed over Japan's aggression in China and its annexation of the Korean Peninsula.

Koizumi's coalition dominated the July 2001 elections for the House of Councilors, with the LDP taking 65 of the 121 contested seats, its best performance in the House of Councilors since 1992. The victory was seen as a mandate for Koizumi. However, the economy remained in recession throughout 2002, which reduced his popularity.

In 2002, Japan began a diplomatic initiative to improve relations with North Korea. In September 2002, North Korean President Kim Jong Il apologized to Koizumi for North Korea's kidnapping of Japanese citizens during the 1970s and 1980s. Japan pledged a generous aid package to North Korea in return. However, in October, North Korea revealed that it had ongoing a uranium-enrichment program for the making of nuclear weapons. This was widely seen as a violation of the Nuclear Nonproliferation Treaty and a 1994 US-North Korea nuclear pact signed during the Clinton administration. On 10 January 2003, North Korea withdrew from the Nuclear Nonproliferation Treaty, and on 23 January, North Korea and South Korea agreed to find a peaceful solution to the crisis.

### 13 GOVERNMENT

Japan follows the parliamentary system in accordance with the constitution of 1947. The most significant change from the previous constitution of 1889 was the transfer of sovereign power from the emperor to the people. The emperor is now defined as "the symbol of the state and of the unity of the people." The constitution provides for the supremacy of the National Diet as the legislative branch of the government, upholds the separation of legislative, executive, and judicial powers, and guarantees civil liberties.

The executive branch is headed by a prime minister selected from the Diet by its membership. The cabinet consists of the prime minister and 17 state ministers (as of February 2003), each heading a government ministry or agency. At least half the ministers must be selected from the Diet, to which the cabinet is collectively responsible. Upon a vote of no confidence by the house of representatives, the cabinet must resign en masse.

The National Diet is bicameral. The house of representatives (the lower house) has a membership of 480, with terms of office for four years, except that all terms end upon dissolution of the house (a law promulgated in February 2000 reduced the composition of the House from 500 to 480 members). From 1947 through 1993, Representatives were elected from 130 "medium" (multiple-member) constituencies, apportioned on the basis of population. The house of councilors (the upper house) has 247 members, 121 of whom are elected from a national constituency on the basis of proportional representation, the remainder from 47 prefectural constituencies. The term of office is six years, with one-half elected every three years. The lower house holds primary power. In case of disagreement between the two houses, or if the upper house fails to take action within 60 days of receipt of legislation from the lower house, a bill becomes law if passed again by a two-thirds majority of the lower house.

Suffrage is universal, the voting age being 20 years, with a three-month residence requirement. The 1947 constitution granted suffrage to women. In January 1994, the Diet passed an

electoral reform bill. In addition to new laws on campaign financing, the legislation abolished the multiple-member districts and replaced them with 300 single-member districts and 200 multimember districts. Currently, the number of multimember districts stands at 180. The 1996 elections resulted in the weakening of minor parties, in particular the SDPJ and Sakigake. Elections for the house of representatives took place in 2000 and those for the house of councilors in 2001.

### 14 POLITICAL PARTIES

The Liberal-Democratic Party (LDP) represents a wide spectrum of Japanese society, but most especially the conservative elements. Formed in 1955 by the merger of the two leading conservative parties, this party held the reins of government since its formation until July 1993.

The Japan Socialist Party (JSP) is Japan's principal opposition party, drawing its support mainly from the working class, but it suffers from personality as well as ideological problems within its ranks. The JSP split into right and left wings over the ratification of the US-Japan Security Treaty of 1952. In October 1955, however, the two factions reunited, preceding the unification of the conservative parties and actually forcing the conservative groups into a unified front, thus creating a formal two-party system in Japan.

Beginning in the late 1960s, a shift took place toward a multiple-party system, with the gradual increase of opposition parties other than the JSP. The Democratic Socialist Party (DSP) represented moderate elements of the working class. The Komeito (Clean Government Party), professing middle-of-the-road politics, was the political wing of the Soka-Gakkai, a Buddhist sect. The Japanese Communist Party, founded as an underground group in 1922 and legalized after World War II, experienced major shifts in platform. The party had traditionally sided with China in the Sino-Soviet ideological dispute, although in recent years the Japanese Communists have focused instead on social conditions at home.

The LDP continued to hold its majority in both houses until 1993. Traditionally, the LDP has functioned as a coalition of several factions, each tightly organized and bound by personal loyalty to a factional leader. In the mid-1970s, policy differences among the factions and their leaders became acute, with the resignation under pressure of Prime Minister Tanaka in December 1974.

In the summer of 1993, after five years of scandals involving corruption, sex, organized crime, and in the midst of economic recession, the old political order disintegrated as dozens of younger LDP members defected to form new parties. Chief among these was the Japan New Party (JNP), formed in May 1992, and the Sakigake (Harbinger Party) and the Shinseito (Renewal Party), both formed in June 1993. A watershed election in July 1993 for the House of Representatives, the lower house of the parliament, resulted in the loss by the LDP, for the first time since 1955, of its majority. Of the 511 seats, the LDP won 223 seats (as compared with 275 in the 1990 election), the JSP won 70 seats (a loss of half of its previous seats), the Komeito won 51 seats, the Shinseito took 55 seats, the JNP 35 seats, and the Sakigake 13. A seven-party coalition, including new parties of LDP defectors, the JSP, and other conservative parties, formed the new cabinet, which governed for a year until the prime minister (Morihiro Hosokawa, JNP) resigned over a financial scandal. The coalition formed a new government, led by Tsutomu Hata of the Shinseito, in April 1993. However, the JSP, finding itself maneuvered out of any voice in the coalition, broke away and Hata, then with a minority in the House of Representatives, resigned after one month in office.

The next government was formed by a new, unorthodox coalition of the traditional opponents, the LDP and the JSP, as well as the Sakigake. Tomiichi Murayama, head of the JSP, was

chosen prime minister in June 1994, the first Socialist to head a government since 1948, although the LDP appeared to be dominant in the coalition. This unusual partnership caused strains, leading to further defections, within the LDP and within the JSP. The Shinseito emerged as a serious focus of opposition, standing for an internationally more active Japan, including use of the military overseas, for a revision of the constitution, and for removing protective regulations to open the domestic economy to competition. The left wing of the JSP, unhappy with the alliance with the LDP, held that the Self-Defense Forces were unconstitutional, and that the North Korean government (DPRK) was the legitimate government of all of Korea, and advocated abolition of the security treaty with the United States.

The parliamentary election that took place on 20 October 1996 combined the 300 single seat constituencies with the proportional representation for the remaining 200 seats. After the dissolution of Shinshintō, a highly fractionalized party system emerged. Going into the 2000 election, the LDP had 266 seats, with the largest opponents being the Democratic Party of Japan (DPJ) with 94 seats, the Komeito with 52, the Liberal Party with 39, and the Communists with 23. The LDP worked closely with the Komei party and the Liberal Party, effectively making the DPJ the only significant opposition.

The 2000 House of Representatives election produced the following distribution of seats: LDP 233, DPJ 127, Komeito 31, Liberal Party 22, Japan Communist Party (JCP) 20, Social Democratic Party (SDP) 19, New Conservative Party (formed in 2000) 7, and 21 other seats. In the 2001 House of Councilors vote, the seats fell as follows: LDP 110, DPJ 59, Komeito 23, JCP 20, SDP 8, Liberal Party 8, New Conservative Party 5, and independents took 14 seats. The newest party in Japanese politics is the New Conservative Party, formed in March 2000 by members who split off from the Liberal Party. Since April 2001, the party has been part of the Koizumi coalition government. The next elections for both houses are to be held in 2004.

## 15 LOCAL GOVERNMENT

Local government throughout Japan was strengthened by the Local Autonomy Law of 1947. Administratively, Japan is divided into 47 prefectures. Within these prefectures there are 670 cities and 2,562 towns and villages. The local chief executives, mayors, and village heads, together with prefectural assembly members, are directly elected. The city of Tokyo comprises 23 wards.

Local public bodies have the right to administer their own affairs as well as to enact their own regulations within the law. The National Diet cannot enact legislation for a specific public entity without the consent of the voters of that district. Local governments control school affairs, levy taxes, and carry out administrative functions in the fields of land preservation and development, pollution control, disaster prevention, public health, and social welfare. The Japanese government is seeking to decentralize power away from Tokyo by allowing prefectures to exercise greater fiscal and budgetary autonomy.

## 16 JUDICIAL SYSTEM

The 1947 constitution provides for the complete independence of the judiciary. All judicial power is vested in the courts. The system consists of the supreme court, eight regional higher courts, district courts in each of the prefectures, and 438 summary courts. In addition, there are family courts, on the same level as the district courts, to adjudicate family conflicts and complaints such as partitions of estates, marriage annulments, and juvenile protection cases.

The supreme court consists of a chief justice and 14 other justices. The chief justice is appointed by the emperor on designation by the cabinet; the other justices, by cabinet appointment. All appointments are subject to popular review at the first general election following appointment and every 10

years thereafter in public referendum. Judges of the lesser courts also are appointed by the cabinet from lists of persons nominated by the supreme court. Their term of office is limited to 10 years, with the privilege of reappointment.

The supreme court is the court of last resort for determining the constitutionality of any law, order, regulation, or official act that is challenged during the regular hearing of a lawsuit. Abstract questioning of a law is prohibited and thus there is no judicial review. The constitution affords criminal defendants a right to a speedy and public trial by an impartial tribunal. There is no right to a trial by jury. The constitution requires a judicial warrant issued by a judge for each search or seizure. Japan accepts compulsory jurisdiction of the International Court of Justice with reservation.

## 17 ARMED FORCES

The reestablishment of Japanese defense forces has been a subject of heated debate in the period since World War II. Article 9 of the constitution renounces war as a sovereign right and the maintenance of "land, sea and air forces, as well as other war potential." During the Korean War, General MacArthur recommended the establishment of a national police reserve. Following the signing of the San Francisco Peace Treaty, the reserve force was reorganized into a National Safety Agency (1 August 1952). Laws establishing a Defense Agency and a Self-Defense Force became effective on 1 July 1954, both under firm civilian control.

The strength of Japan's armed forces in 2002 was 239,900 active personnel including some 10,400 women. The Ground Self-Defense Force had 148,200 personnel, organized into one armored and 10 infantry divisions. There were also 47,000 personnel in reserve components. The Maritime Self-Defense Force, consisting of 44,400 personnel, had 54 surface combatants, 16 combat submarines, and an air arm of about 80 combat aircraft and 90 armed helicopters. Air Self-Defense Force personnel numbered 45,600 with combat aircraft totaling 280. Japan has a paramilitary coast guard of 12,250 operating 333 patrol vessels.

Although Japan's defense budgets—about \$41 billion in 2001—rank high by world standards, they are modest in relation to gross domestic product (about 1%). The US maintains extensive military facilities and 40,000 troops in Japan. Japan participates in peacekeeping missions in East Timor and the Middle East.

## 18 INTERNATIONAL COOPERATION

Japan was admitted to UN membership on 18 December 1956, and it holds membership in ESCAP and all the nonregional specialized agencies. It is a member of the WTO and signatory to the Law of the Sea, participates in the Colombo Plan, and has permanent observer status with the OAS. In 1963, Japan became a member of IMF and the OECD. It is also a charter member of the Asian Development Bank, which came into operation in 1966; Japan furnished \$200 million, a share equal to that of the US. Japan has been actively developing peaceful uses for nuclear energy, and in 1970 it signed the Geneva Protocol, which prohibits the use of poisonous and bacteriological weapons. In June 1976, Japan—the only nation to have suffered a nuclear attack—became the 96th signatory to the international Nuclear Nonproliferation Treaty.

Japan has been extending technical and financial aid to many countries, and in 1974 it established the Japan International Cooperation Agency to provide technical assistance to developing nations. Japan also was instrumental in establishing the Asian Productivity Organization, the objective of which is to organize national productivity movements in various Asian countries into a more effective movement on a regional scale. Japan has entered into cultural agreements with many European and Asian nations

and maintains an educational exchange program with the US. Through the Japan Overseas Cooperation Volunteers, Japan sends youths to work in developing countries.

## 19 ECONOMY

Japan's economy is the most advanced in Asia and the second most technologically advanced in the world, behind the United States. Total GDP in nominal terms in 2001, at \$4.147 trillion, was also second only to the United States, but in purchasing power parity (PPP) terms, given the high price level in Japan and the low price level in China, Japan's estimated GDP of \$3.45 trillion (PPP), according to the US Central Intelligence Agency (CIA), put it third behind the United States and China. In per capita GDP, measured in purchasing power parity terms, Japan was fifth among the major nations of the world: \$27,200 (PPP) put it behind only the United States, Switzerland, Denmark, and Ireland according to the CIA estimates. Japan was the first Asian country to develop a large urban middle-class industrial society. It was also the first Asian country where a sharp reduction in birthrate set the stage for notable further increases in per capita income.

Since 1952, the number of farmers has fallen sharply, while expansion has been concentrated in industry and trade. The agriculture sector in 2001 accounted for only 2% of the GDP, although it remains somewhat subsidized, employing a relatively high 5% of the labor force. Domestic raw materials are far too limited to provide for the nation's needs, and imports must be relied on for such basics as many raw cotton, raw wool, bauxite, and crude rubber, with fuels and foodstuffs heading the list materials. The primary engine of Japan's modern growth has been the need to pay for these basic imports with manufactured exports. The exchange of high value-added finished products for low value-added commodities and raw materials has been the basis for both its high level of industrialization and its persistently high trade surpluses. Up until the mid-1980s, economic development depended on continued expansion in exports. With the steady appreciation of the yen in real terms since 1985, however, the country's economic structure has undergone some adjustment. Business investment became the second major engine of growth. Facilitated by growing wage rates, favorable credit conditions, cuts in personal and corporate income tax rates and other stimulative measures by the government, domestic demand as well as direct foreign investment have played an increasingly important role as a source of growth in recent years.

During the late 1980s, a 70% appreciation of the yen's value against the US dollar helped narrow Japan's trade surplus by 19% for two consecutive years in 1988/89 and 1989/90. This was accompanied by low rates of unemployment as well as strong growth in consumer spending and private investment, in turn contributing to a healthy 5% annual growth rate in the GNP between 1987 and 1990. The end of the period of lowered growth, 1975 to 1990, coincided with the collapse of the Cold War confrontation. The period that has followed, 1991 to 2003, has been characterized by very low to stagnant growth, and three dips into recession. The investment boom of the late 1980s, known retrospectively as the bubble economy, had its corresponding bust 1991 to 1994, leaving mountains of debts that still constitute a major drag on the economy because the government continues to hesitate to implement the major restructuring reforms urgently urged on it by outside observers to clear up credit lines for new investment and new forms of business organization. GDP growth rates fell to 1.0%, .3%, .6%, and 1.5% in the period 1992 to 1995. A spurt of recovery to 5% in 1996 was cut short by the Asian financial crisis, and Japan saw its first recession year since 1974 when GDP declined 1% in 1998.

Recovery from the Asian financial crisis was itself cut short in 2001, with the onset of a global slowdown and the aftershocks of

the 11 September 2001 terrorist attacks on the United States: real GDP growth, according to IMF estimates, dropped from 2.2% in 2000 to -0.5% in 2001. Whether 2002 will be a third recessionary since the collapse of the bubble economy remains to be seen. Strong growth in the first quarters of 2002 driven by strong exports were followed by signs of weakening towards the end, as the yen began to strengthen against the dollar, and unemployment reached a new high of 5.4%. The depth of recessions have been minimized by massive stimulus packages and tax cuts across the period of stagnant growth. Recently, major tax cuts have been made in 1999 and 2003, and in 2001, the government implemented its ninth massive stimulus package since 1992, this one for ¥11 trillion (about \$960 billion). The annual budget deficit has been above 7% of GDP since 1999, and is forecast at 7.3% of GDP for 2002. Total national debt, at 146% of GDP, is proportionately the highest among developed countries.

The weakness of the banking sector has become an increasingly acute issue as the stock market, the other major avenue of business capitalization, has virtually collapsed in the context of the 2001–2002 global retrenchment in stock market prices, losing about 80% of its value since 1992. Accompanying corporate scandals and spectacular bankruptcies have done nothing to convince the cautious Japanese that they should forsake their conservative practices like the postal savings programs for riskier stock investments. The Japanese propensity to save has traditionally been high, even before World War II, when it was measured at 12.5% in 1925. Since the World War II, the propensity to consume, the obverse of the propensity to save, has steadily decreased as the economy moved from recovery to high growth to low growth to stagnation: from 95% in 1947 to an estimated 74% in 2001. High savings are matched by high individual indebtedness, due mainly to long term mortgage loans.

The relatively young Prime Minister Koizumi seemed to promise more radical economic reform, but whatever his intentions, the reversals in the global economy in 2001 and 2002 have constrained him to more of the “muddling through” that has characterized Japanese economic policy for the past decade. After a period of recovery following World War II (from 1947 to 1960), Japan entered into about 15 years of rapid growth (1961 to 1975) that was arrested by the world oil crisis, signaled by the first oil shock in 1973. In 1974, for the first time since World War II, the GNP fell (by 1.8%). The recession was cushioned, however, by the nation's ability to improve its trade balance (by \$11 billion) by increasing exports while reducing imports. The recovery of the mid-1970s was slowed by the second oil shock, in 1978–79, and although the Japanese economy continued to outperform those of most other industrial countries, growth in GNP slowed to an estimated 4.1% yearly in real terms for 1979–82, compared with 8.9% for 1969–72.

Meanwhile, the continued stimulation of exports, especially of automobiles and video equipment, combined with Japan's restrictive tariffs and other barriers against imports, led to increasingly strident criticism of the nation's trade practices in the United States and Western Europe. As early as 1971, Japan agreed to limit textile exports to the United States, and in the 1980s it also imposed limits on exports of steel, automobiles, and television sets. Similar limits were adopted for exports to Canada, France (where criticism focused on videocassette recorders), and West Germany. Nevertheless, Japan's trade surpluses with the US and other countries continued to swell through the mid-1980s, helped by a number of factors, most notably the misalignment of major currencies, particularly between the dollar and the yen.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2002 Japan's gross domestic product (GDP) was estimated at \$3.55 trillion. The per capita GDP was estimated at \$28,000. The annual growth rate of GDP was estimated at -0.3%. The average

inflation rate in 2002 was -0.9%. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange. It was estimated that agriculture accounted for 1% of GDP, industry 31%, and services 68%.

According to the United Nations, in 2000 remittances from citizens working abroad totaled \$505 million or about \$4 per capita. Worker remittances in 2001 totaled \$1.037 billion.

The World Bank reports that in 2001 per capita household consumption (in constant 1995 US dollars) was \$24,306. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. Approximately 12% of household consumption was spent on food, 7% on fuel, 2% on health care, and 22% on education. The richest 10% of the population accounted for approximately 21.7% of household consumption and the poorest 10% approximately 4.8%.

## 21 LABOR

The labor force in 2000 numbered 67.7 million persons. The distribution of employed workers in 2002 was as follows: services, 70%; industry, 25%; and agriculture, 5%. The unemployment rate in 2002 was 5.4%. Employers tend toward traditional paternalistic, often authoritarian, control over their workers, but in turn most regular workers have traditionally enjoyed permanent status.

Union membership was always less than half a million before World War II, but jumped to 6.2 million in 1955, and was 11.5 million in 2002. However, the rate of union membership has been decreasing in the past three decades, with 22% of all eligible workers unionized in 1999, compared to 39% in 1955. Union strength is greatest in local government employees, automobile workers, and electrical machinery workers. Most members are organized in units called enterprise unions, which comprise the employees of a single firm. Virtually all organized workers are affiliated with national organizations, of which the largest is the Japanese Trade Union Confederation (Shin-Rengo), established in 1987 following the dissolution of the Japanese Confederation of Labor (Domei), and incorporating the General Council of Trade Unions (Soyho) as of 1989. Collective bargaining is widely utilized, and the right to strike is available to most workers.

Strict enforcement of child labor laws as well as societal values protects children from exploitation in the workplace. Children under age 15 are not permitted to work, and those under 18 are restricted. As of 2002, the minimum wage ranged from \$14 to \$18 per hour, depending on region. Labor legislation mandated a standard workweek of 40 hours.

## 22 AGRICULTURE

Crop production is vital to Japan despite limited arable land (13% of the total area) and the highest degree of industrialization in Asia. Steep land (more than 20°) has been terraced for rice and other crops, carrying cultivation in tiny patches far up mountainsides. With the aid of a temperate climate, adequate rainfall, soil fertility built up and maintained over centuries, and such a large farm population that the average farm has an area of only 1.2 ha (3 acres), Japan has been able to develop intensive cultivation. Agriculture exists in every part of Japan, but is especially important on the northern island of Hokkaido, which accounts for 10% of national production. Since World War II (1939–45), modern methods, including commercial fertilizers, insecticides, hybrid seeds, and machinery, have been used so effectively that harvests increased substantially through the 1970s. Japan is the second-largest agricultural product importer in the world (after the US), with total agricultural product imports of \$34.6 billion in 2001. At \$32.1 billion, Japan had the largest agricultural trade deficit in the world that year.

Almost all soybeans and feedstuffs and most of the nation's wheat are imported. In 1999, Japan produced 11.5 million tons of rice, the chief crop. In that year, rice accounted for about 93% of all cereal production. About 39% of all arable land is devoted to rice cultivation. Overproduction of rice, as a result of overplanting and a shift to other foods by the Japanese people, led the government in 1987 to adopt a policy of decreasing rice planting and increasing the acreage of other farm products. For many years the government restricted imports of cheaper foreign rice, but in 1995 the rice market was opened to imports, as the government implemented the Uruguay Round agreement on agriculture. Other important crops and their annual production in 1999 (in thousands of tons) include potatoes, 3,400; sugar beets, 3,803; mandarin oranges, 1,360; cabbage, 2,400; wheat, 583; barley, 205; soybeans, 187; tobacco, 64; and tea, 91.

As a result of the US-occupation land reform, which began in late 1946, nearly two-thirds of all farmland was purchased by the Japanese government at low prewar prices and resold to cultivators on easy terms. By the 1980s, nearly all farms were owner-operated, as compared with 23% before reform. A more telling trend in recent years has been the sharp growth in part-time farm households. Farmers are aging, and 77% of farm income is derived from other sources, such as industrial jobs. Although agriculture accounts for only 2% of GDP, about 10% of the population lives on farms. Despite increasing urbanization, 59% of all farms still cultivated less than one ha (2.7 acres) in 1999. As a result, Japanese agriculture intensively utilizes both labor and machinery for production. In 1998, Japan had 2,210,000 tractors and 1,208,000 combines.

## 23 ANIMAL HUSBANDRY

Livestock production has been the fastest-growing sector in Japanese agriculture, with meat production increasing from 1.7 million tons in 1970 to three million tons in 2001. In 2001, Japan imported \$8.3 billion in beef, pork, and poultry meat. In 2001 there were 9,780,000 hogs, 4,531,000 head of beef cattle, and 292 million chickens. That year, pork production reached 1,241,000 tons (up from 147,318 tons in 1960); beef, 458,000 tons (142,450 tons in 1960); milk, 8,301,000 tons (1,886,997 tons in 1960); and eggs, 2,514,000 tons. Japan is the single largest recipient of US agricultural exports; over a third of Japan's meat imports come from the US.

## 24 FISHING

Japan is one of the world's foremost fishing nations, accounting on average for about 8% of the world's catch. In 2000, the total catch was 4,989,354 tons, ranking third in the world. The waters off Japan include cold and warm currents in which fish abound. In 1990, there were 416,000 registered fishing boats which sailed both on nearby waters and in other fishing grounds in the Pacific Ocean, the South China Sea, and the Indian and Atlantic oceans. In 1989, per capita daily consumption of fish and shellfish was about 198 gm, one of the world's highest such averages. Annual per capita fish and shellfish consumption from 1988 to 1990 averaged 72 kg (158.7 lb). In 2000, despite domestic fish production, about \$15.5 billion in fish and shellfish was imported in order to satisfy domestic demand.

Whales have been prized in Japan as a source of both food and a variety of byproducts, and Japanese whalers caught 2,769 whales in 1986. Japan ended commercial whaling in 1987, following the imposition of a worldwide ban on the hunting of endangered species of whales by the International Whaling Commission, but announced that it would catch 875 whales for "research" purposes. The 2000 Japanese whale catch of over 16,700 toothed whales of various species represented about 82% of the world's whale catch.

Competition for overseas fishing privileges has at various times brought Japan into conflict with Canada over salmon, with the

former USSR over fishing in the Sea of Okhotsk and other Soviet waters (between 1905 and 1945 Japan had special treaty privileges in these waters), with the ROK and China over their limitations on Japanese fishing operations, with Australia over pearl fishing in the Arafura Sea, with Indonesia over fishing in what Indonesia regards as inland waters, and with the United States, especially over fishing in north Pacific and Alaskan waters. Japan has been adversely affected by the adoption of the 200 mi fishing zone by the United States and more than 80 other world nations. Fishing in waters claimed by the United States (where about 70% of the Japanese catch originates) or by many other nations now requires payment of fees and special intergovernmental or private agreements.

Fish culture in freshwater pools, as well as in rice paddies, has long been practiced in Japan. Aquaculture provides an additional 1.5 million tons of fish annually. The leading species cultivated are laver (*nori*), yesso scallops, Pacific cupped oysters, and Japanese amberjack. Seaweed culture provides winter season activity for many fishermen. Pearl culture has for more than half a century been the foundation of a valuable export industry.

## 25 FORESTRY

Forests cover nearly 64% of the total land area of Japan and in 2000 supplied about half the domestic demand for lumber and wood pulp. Of 24 million ha (59.5 million acres) of forest, the Japanese government owns 30%, which it maintains under strict regulations limiting overcutting. On private forest lands, cutting is less controlled. About 6.6 million ha (16.3 million acres) are reforested with trees less than 20 years old. Forest management and erosion control are urgent necessities in a land where gradients are very steep and flooding is frequent. Japan was the world's third leading producer of paper and paperboard in 2000 (after the United States and China), at over 31.7 million tons.

About 45% of the forest area consists of plantations. The Japanese cedar (*sugi*), which grows in most of Japan, is the most exploited species, followed by Japanese cypress (*hinoki*) and Japanese red pine (*akamatsu*). These three species grow on 10 million ha (24.7 million acres) of plantation forest and were first planted in the 1950s and 1960s. In 2000, roundwood production totaled 18.1 million cu m (639 million cu ft), as compared with 49.1 million cu m (1.7 billion cu ft) in 1965. Domestic roundwood production met 48% of Japan's total wood fiber demand that year; the rest was supplied by imports. In 2001, Japan's 11,692 sawmills processed 17 million tons of logs.

During the 1980s and 1990s, Japan became more reliant on imported wood to satisfy domestic demand. In 2000, Japan imported \$13.3 billion in forest products, second only to the United States. Japan is the world's dominant importer of softwood and tropical hardwood logs, and has become one of the largest importers of softwood lumber, which is mainly used for housing construction.

## 26 MINING

The mining sector was the smallest of Japan's industrial-based economy, accounting for 0.16% of GDP in 1999. The mineral-processing industry, however, was among the world's largest and most technologically advanced, accounting for 5.15% of Japan's GDP, and it played a key role in supplying steel, nonferrous metals, and chemicals for the country's world-class manufacturing sector, as well as to those of the region. Japan was the world's largest producer and consumer of cadmium, the leading producer of selenium metal, electrolytic manganese dioxide, and titanium sponge metal; the second-leading producer of iodine, pig iron, nickel metal, and crude steel; the third-largest producer of copper metal, diatomite, and zinc metal; and the fourth-largest producer of cement. Japan also produced and had considerable resources of limestone, carbonate rocks (construction aggregates and dolomite), clays (bentonite and fire

clay), pyrophyllite, and silica. Since the beginning of the 20th century, most mineral production has undergone a steady decline, and Japan was a net importer of minerals, relying heavily on imports for petroleum, iron ore, chromium, cobalt, copper concentrate (Japan was the world's largest importer), copper metal, primary aluminum, ilmenite, rutile, natural gas, gallium (Japan was the world's largest consumer), uranium, manganese (for all its requirements), indium (the world's largest consumer), nickel (world's largest consumer), and coal, although coal accounted for slightly more than half of all mineral production by value. The construction sector continued its slowdown in 2000, and, with the exception of gold and zinc, Japan's ore reserves for other minerals, especially oil, gas, and metallic minerals, were very low.

Of Japan's \$479.2 billion in total exports in 2000, minerals, mineral-related chemicals, and processed minerals products were valued at \$34.8 billion; iron and steel products, and nonferrous, rare, and other base metals totaled \$23.8 billion; processed mineral products of asbestos, cement, ceramics, glass, mica, and stone, \$5.0 billion; mineral-related chemicals and fertilizer, \$2.2 billion; precious and semiprecious stones, and precious metals, \$1.9 billion; salt, sulfur, earths, stone, plastering materials, lime, and cement, \$312 million; and ferrous and nonferrous metal ores, slag, and ash, \$35 million. Chemicals were Japan's fourth-leading export commodity in 2002.

Among metal minerals, Japan produced 8,400 kg of mine gold (metal content) in 2000, and 103,781 kg of mine silver (87,180 in 1997). Sumitomo Metal Mining, the main producer of gold and silver, planned to boost its output of gold (from 36 tons per year, to 60) and silver (from 300 tons per year, to 480) by 2003, and to expand its copper refining capacity to 400,000 tons per year. In addition, Japan produced the metal minerals alumina, antimony oxide, high-purity arsenic, bismuth, mine copper, germanium oxide, iron ore, iron sand concentrate, mine lead, manganese oxide, rare-earth oxide (including oxide of cerium, europium, gadolinium, lanthanum, neodymium, praseodymium, samarium, terbium, and yttrium), elemental selenium, high-purity silicon, elemental tellurium, titanium dioxide, mine zinc, and zirconium oxide. Gold ore reserves totaled 178,762 kg (metal content); and zinc ore (metal content), 3.25 million tons.

Among industrial minerals, output totals for 2000 were: hydraulic cement, 81.07 million tons (94.49 million tons in 1996); elemental iodine (mostly from Chiba Prefecture), 6,157 tons; diatomite, 190,000 tons; limestone (crushed and broken), 185.6 million tons (201.4 million tons in 1997); dolomite (crushed and broken), 3.54 million tons (4.01 in 1997); bentonite, 415,155 tons (495,646 in 1997); crude fire clay, 506,314 tons (577,666 in 1998); pyrophyllite (from Nagasaki, Okayama, and Hiroshima prefectures), 692,998 tons (913,822 in 1997); silica sand, 2.75 million tons (3.56 in 1996); and silica stone (quartzite), 15.58 million tons (19.03 in 1996). In addition, Japan produced asbestos, elemental bromine, kaolin clay, feldspar, apatite, gypsum, quicklime, nitrogen, perlite, salt, sodium compounds (soda ash and sulfate), sulfur, talc, and vermiculite. Reserves of iodine totaled 4.9 million tons; limestone, 57.9 billion tons; dolomite, 1.19 billion tons; pyrophyllite, 160.4 million tons; silica sand, 200.95 million tons; white silica stone, 880.7 million tons; and kaolin, 36.03 million tons.

Japan's mineral industry consisted of a small mining sector of coal and nonferrous metals, a large mining sector of industrial minerals, and a large minerals-processing sector of ferrous and nonferrous metals and industrial minerals. Mining and mineral-processing businesses were owned and operated by private companies. There were 13 operating metal mines in 2000, and 515 operating industrial mines, employing a total of 12,103 people. The mineral-processing industry produced, among other things, inorganic chemicals and compounds, ferrous metals, industrial minerals, nonferrous metals, petrochemicals, and

refined petroleum products—for domestic consumption and for exports. To clean up mining and mineral-processing sites where soils were contaminated by heavy metals, volatile organic compounds, and petroleum hydrocarbons, Dow Mining Co. Ltd. established a soil remedy business unit to investigate such treatment technologies as incineration, bioremediation, soil washing, and chemical treatment.

In a massive reorganization of the government, 23 ministries and agencies were to be reduced to 13 in 2001, and the Ministry of International Trade and Industry (MITI) would become the Ministry of Economy, Trade and Industry (METI), into which were rolled many agencies and institutes that dealt with mining, geology, metals, chemicals, and the environment. The government, through its Metal Mining Agency of Japan (MMAJ), collaborating with the Japan International Cooperation Agency, continued to promote overseas mineral exploration by providing loans and technical assistance, and by carrying out basic exploration. Among projects supported by MMAJ were reconnaissance surveys for copper, gold, lead, and zinc in the southern Andes region of Argentina, and for copper and gold in north-central Mongolia; exploration for gold in Alta Floresta, Brazil, for copper, gold, and molybdenum in Chile, for copper, gold, and zinc in Umm Ad Damar, Saudi Arabia, and for copper and gold in Papua New Guinea, Bolivia, the Philippines, and Oman; discoveries and further exploration for gold in Baoulé-Banifing and Kekoro, Mali; and regional development planning for lead and zinc in Krib-Mehéz, Tunisia. In line with its mineral policy to secure and diversify its long-term supply of raw materials, Japan was expected to continue its active search for direct investment in joint exploration and development of minerals in developed and developing countries. The targeted minerals were antimony, chromium, coal, columbium (niobium), copper, gold, iron ore, lead, lithium, manganese, molybdenum, natural gas, nickel, crude petroleum, rare earths, silver, strontium, tantalum, titanium, tungsten, vanadium, and zinc.

## 27 ENERGY AND POWER

As of 2002, Japan was the second-largest energy consumer in the world, topped only by the United States. Japan's primary energy needs in 2001 were supplied by oil (52%), coal (15%), natural gas (13%), nuclear power (15%), hydroelectricity (4%), and other renewable sources (1%). With nearly no oil reserves of its own, in 1999 Japan depended on imports for more than 79% of its primary energy. However, exploration for petroleum continues in the East China Sea and the Sea of Japan. Japan ceased coal production in 2000, when it closed its last operating mine, at Kushiro. To meet the growing requirements for steam coal by power plants, Japanese trading companies and energy firms are seeking long-term supply contracts with Australia, China, Colombia, New Zealand, South Africa, and the United States.

To reduce its reliance on oil and its carbon dioxide emissions, Japan has aggressively pursued development of nuclear power since the 1980s, with nuclear production doubling between 1985 and 1996. As of 2002 Japan ranked third, behind the United States and France, in nuclear power production and planned to increase the percentage of nuclear-generated electricity to 30% by 2010 in spite of growing public opposition fueled by a series of accidents at nuclear power plants, especially the event at the Tokaimura uranium processing plant in September 1999. As of 2002, Japan had 51 reactors in operation, with a total capacity of 45 GW. These included the world's first Advanced Boiling Water Reactor, which came online in 1997.

In 2000 Japan had an output of 1,015 billion kWh of electricity, of which 60.1% was from fossil fuels, 8.5% from hydropower, 29% from nuclear power, and under 2% from renewable sources. Electricity is provided by several private companies, with the public Electric Power Development Co. and the Japan Atomic Power Co. playing supplementary roles in

distribution. As of 2001, total electricity generating capacity stood at 234.5 million kW.

In 2002 Japan imported some 5.3 million barrels of oil per day, primarily from the UAE, Saudi Arabia, and Indonesia; 145 million tons of coal, mostly from Australia and Canada; and 74.7 million cu m (2.64 billion cu ft) of natural gas, primarily from Indonesia.

## 28 INDUSTRY

Manufacturing has been a key element in Japan's economic expansion during three periods of phenomenal growth. First, during the 50-year rise of Japan from a feudal society in 1868 to a major world power in 1918, output in manufacturing rose more rapidly than that of other sectors. Second, during the 1930s, when Japan recovered from the world depression earlier and faster than any other country and embarked on an aggressive course in Asia, manufacturing, especially heavy industries, again had the highest rate of growth. Third, in the remarkable recovery since World War II, manufacturing, which had suffered severely during the latter stages of the war, was again a leader, although commerce and finance expanded even more rapidly.

Japanese industry is characterized by a complex system of exclusive buyer-supplier networks and alliances, commonly maintained by companies belonging to the same business grouping, or *keiretsu*. Such a system utilizes a web of vertical, horizontal, and even diagonal integration within the framework of a few large conglomerations. Keiretsu firms inhibit the foreign acquisition of Japanese firms through non-transparent accounting and financial practices, cross-holding of shares among keiretsu member firms (even between competitors), and by keeping a low proportion of publicly traded stock relative to total capital.

During the 1970s and early 1980s, the rate of Japan's industrial growth surpassed that of any other non-Communist industrialized country. Of the 26 largest industrial companies in the world in the mid-1980s—those with sales of \$20 billion or more—four were Japanese: Toyota Motor, Matsushita Electric, Hitachi, and Nissan Motor. In addition to spectacular expansion in the volume of output, Japanese industry has also achieved impressive diversity, with maximal application of efficiency standards and technological input. In 1997, industry accounted for about 38% of GDP and 33% of the total labor force. However, the Asian financial crisis that beset the region as Hong Kong was formally transferred to China impacted Japan's industrial production growth, which went from 9.6% in 1997 to -6.9% in 1998. Growth was still negative in 1999, but only by -0.1%, and in 2000 positive growth had returned as industrial production rose 5.3%. The recovery was short lived. The global slowdown of 2001 compounded by the economic aftershocks of the 11 September 2001 terrorist attacks on the United States contributed to a relatively massive 8.3% decline in industrial production in Japan in 2001. Estimates are that the decline continued in 2002, but only by .1%. In the meantime, the percent of Japan's labor force in industry had dropped from 40% in 1997 to 30% in 2001.

A brief recession forced production cutbacks in 1965; a deeper recession in 1974, related to rising world oil costs and diminished supplies, slowed Japan's economy in 1973-75 and again in 1978-80. At the same time, wage rates rose substantially, thereby reducing Japan's competitive advantage vis-à-vis other industrialized nations and prompting a major government effort to promote high-technology industries capable of making the most efficient use of the high educational level and technical competence of the Japanese labor force. Japan's industrial strategy, which involves close cooperation between business, government, and labor, was coordinated by the Ministry of International Trade and Industry (MITI). Particular emphasis was given by MITI and other government agencies to encouraging

and assisting research and development of new products and technologies.

Facing increasingly stiff competition from overseas trading partners in the 1980s, Japanese firms responded with several strategies, including product diversification, increased investment in overseas plants, as well as a greater focus on production for the domestic market. Despite declining profits with the economic downturn of the early 1990s, Japanese companies continued to make large investments in new plants and equipment; in 1992, these outlays amounted to over 20% of the GDP, well outstripping the level of private investment in the United States. Since 1992, the government has implemented nine massive stimulus packages, including large investments in public projects like roads, bridges, and airports, in its efforts to spark renewed growth, or, at least, prevent a deeper recession.

Manufacture of electrical machinery ranks first in value added, accounting for about 18% of the total in 1991. Nonelectrical machinery ranks second, accounting for 12% of total manufacturing value added, followed by transportation equipment (10% of MVA) and chemicals (9% of MVA). The electronics industry grew with extraordinary rapidity in the 1980s and now leads the world. Radio and television sets and household appliances have been exported in large quantities since World War II; in addition to generators, motors, transformers, and other heavy equipment, the industry now produces automatic devices, electronic computers, videocassette recorders, tape recorders, calculators, and communications and broadcasting equipment. Major electronic products in 1991 included 4.5 million facsimile machines; 18.2 million telephones; 3.0 million computers; 28 billion transistors; and 17.7 billion semiconductor integrated circuits. Also produced that year were 11.2 million radios, 15.6 million television sets, and 30.7 million videocassette recorders. Other manufactures in 1991 included 389.8 million watches, 17.7 million 35-mm still cameras, and 4.3 million microwave ovens. Japan plays an increasingly important role in the computer industry. The production value of Japanese personal and general purpose computers totaled ¥2.4 trillion in 1991. By 1987, Japan was fiercely competing with the US in developing high-tech products, such as superconducting materials.

Japan is the world's leading shipbuilder; more than half the ships built are exported, including some of the world's largest oil tankers. Rapid increases in shipbuilding capacity by Brazil and South Korea reduced demand for Japanese-built ships from a peak of 38 million gross tons of new orders in 1973 to 7.0 million gross tons in 1991. The decline prompted direct government intervention in the ailing industry and the closing of close to 37% of dockyard facilities in 1980.

Passenger car production expanded rapidly in the 1970s, as Japan moved to fill rising demand for fuel-efficient cars in the US and Europe. In the early 1980s, Japan emerged as the world's leading automobile producer, topping the US for the first time in the history of the industry. Dominant industry giants are Nissan and Toyota, which together produced about three-fifths of all passenger cars in the mid-1980s. In 1995, a total of 10,195,536 passenger cars, trucks, and buses were manufactured (down from a high of 13,486,796 in 1990). Restrictions imposed on Japanese automobile exports have promoted a marked increase in Japanese investment in automobile manufacturing facilities (engine manufacture, assembly as well as research and development) in the United States, Western Europe, and other overseas markets. In recent years, Japanese manufactures have also sustained growth through greater focus on producing for the booming domestic motor vehicle market, currently the second-largest in the world. Japan's superior technology in the design of bicycles, motorcycles, buses, and high-speed trains has been another major factor in the growth of the transport industry.

The chemical and petrochemicals industry has been another of the economy's key growth sectors since the late 1960s, in part due to rising domestic demand. Products include industrial chemicals such as sulfuric acid, caustic soda and fertilizers, as well as plastics, dyestuffs, paints, and other items for domestic use. Polyethylene production increased by 10–15% annually during the late 1980s; output in 1991 was 2,982,000 tons. Japan must import much of the iron ore and coking coal used in its steel industry, which ranked second only to the former USSR's in the mid-1980s. Output of crude steel peaked at 119.3 million tons in 1973 but declined to 101.6 million tons in 1995.

Textiles and apparel, Japan's main exports during the years immediately following World War II, have steadily declined in importance and accounted for only 2.5% of total value added in 1991 (as compared with 3.5% in 1985). Output of cotton and woolen fabrics, yarns, and rayon and acetate remains substantially below 1965 levels. The Japanese textile industry has been especially hard hit by rising wage rates and competition from developing nations, especially the other industrializing countries of East Asia.

Japan's semiconductor business has grown in size and profit due to the trade pact between Japan and the United States. While some argue that this pact had a negative effect on Japan's domestic chip market, it now appears, that these chip companies have become more efficient and therefore more profitable. Both the United States and Japan have become so intertwined in the semiconductor area that neither could afford to terminate the relationship.

During the severe recession of the 1990s, Japan's industrial production rate declined by 6.9% in 1998. Japan's major industries continue to be steel production, heavy electrical equipment, automobiles and parts, telecommunication equipment, chemicals, ship building, and processed foods. Japan's fishing industry is the largest and most productive in the world, and Japan has surpassed the United States as the largest manufacturer of automobiles.

## 29 SCIENCE AND TECHNOLOGY

The Japanese rank second only to the United States in spending on scientific research and technology development. However, in Japan, 80% of all research and development is carried out by industry, in contrast to the United States, where industry undertakes about half of all research and development (the US government supports the rest). This is important because industry is more likely to support the type of research that will result in new technologies and products. For many people, this breakdown of research and development funding explains why Japan has become such an economic powerhouse: much more of the total research and development budget is focused on near-term and commercial science and technology. Some of the more successful applications of the fruits of Japanese research and development include high-speed trains, robotics, semiconductor chips, telecommunications, cancer research, and environmental technologies.

In 1987–97, science and engineering students accounted for 21% of college and university enrollments. Nearly 5,000 scientists and engineers per million population worked in research and development in 1987–97. Despite Japan's economic downturn in the 1990s, it is likely that investments in both equipment and personnel will grow. In 1998, high-tech exports were valued at \$94.8 billion and accounted for 26% of manufactured exports.

In terms of the Japanese government's role in national science and technology, three ministries are important. The Ministry of Education, or Monbusho, provides most of the support and funding for scientific education and training at the university level in Japan. In the 1990s, Monbusho led a national effort to improve science and technology education at universities,

particularly in "basic" research (areas where research does not necessarily have to pay off in commercial products). Another organization, the Science and Technology Agency (STA) promotes science and technology policies, and acts as the Prime Minister's leading policy and budgetary agency. It performs this function through annual "white papers" which describe the current state—and future goals—of Japanese science and technology. The Ministry of International Trade and Industry (MITI) is probably the ministry best known by Americans. MITI promotes and protects Japanese industry by sending them signals and giving guidance to those firms which undertake research and development. MITI has been instrumental in providing close government-industry cooperation in many high technology fields, including computers, electronics, and biotechnology.

Regional research institutions such as Tskuba Science City and Kansai Science Park also play a role in fostering Japanese research and development. Their growth since the 1970s has begun to shift some of the focus and power of the national government and industry in Tokyo to the regional prefectures. International cooperation with the United States in areas like global warming and space launches may create new opportunities for greater scientific research at local, regional, and national levels in Japan.

Japan has numerous universities and colleges that offer courses in basic and applied sciences. The country's National Science Museum, founded in 1877, is located in Tokyo. The University of Tokyo has botanical gardens that were established in 1684.

### 30 DOMESTIC TRADE

At least half of all consumer goods are purchased through small, privately owned and operated shops. Street hawkers and peddlers provide certain foods and small consumer items; street stalls offer food, clothing, and household and other goods. Specialty shops exist in great profusion, and about 100 associations of such shops represent common interests. There are chain stores owned and operated by a single management and there are voluntary chains of independent stores operating in association. Japan also has numerous cooperatives, principally consumer, agricultural, and fishing. Recent revisions in the large-scale retail store law have loosened government regulation of the distribution system, allowing the establishment of large foreign discounters and mega-stores such as Toys-R-Us, which are likely to offer growing competition to smaller retailers in the future. As of 2002, Japan's franchise industry was the fourth largest in the world with over 900 chains accounting for about 10% of all retail sales.

A key characteristic of the country's distribution system has been the long term and carefully cultivated nature of the supplier and wholesaler or retail store relationship, necessitating considerable commitment of time and outreach effort by foreign companies wishing to enter the Japanese market.

In retail trade, cash transactions have been traditional, but various forms of installment selling are increasingly being used, especially in the sale of durable goods. The use of charge accounts is growing rapidly. Promotion by displays, advertising, and other methods used in Western countries is increasing rapidly in Japan. Advertising appears in the daily press, in the numerous weekly and monthly magazines, and in special publications of many kinds. Radio and television also carry extensive advertising, excepting those channels run by the government's Japan Broadcasting Corporation.

Normal shop hours are 10 AM to 8 PM, seven days a week, although department stores shut their doors at 7 PM and are closed one day a week; government offices are open 9 AM to 5 PM, Monday through Friday, and from 9 to 12:30 on the first and third Saturday of every month only. Banks are open from 9 AM to 3 PM Monday through Friday, and are closed on Saturdays and Sundays.

### 31 FOREIGN TRADE

Foreign trade remains essential to the Japanese economy. Imports consist mostly of fuel, foodstuffs, industrial raw materials, and industrial machinery. Exports are varied, but manufactures now account for nearly all of the total. Cars represent a leading export product, with the United States, Canada, Australia, Germany and the United Kingdom as the main markets. The export of office machinery, scientific and optical equipment is also important. South Korea, China, and Taiwan are among the main buyers of Japan's iron and steel, while plastic materials and fertilizers are shipped primarily to South Korea and the Southeast Asian countries, and woven fabrics are supplied to China, the United States, Hong Kong, and Saudi Arabia. Only a small fraction of Japan's total exports (around 0.5%) consists of food items, mainly fish.

In light of growing overseas concern about Japan's continuing large trade surplus, the US and Japanese governments collaborated on the Structural Impediments Initiative of 1989. Steps taken in the wake of the Initiative's 1990 report have included a variety of import and direct foreign investment promotion measures, including deregulation, accelerated government spending on public infrastructure, and support services for foreign businesses.

Manufactured products make up most of Japan's commodity exports, and 15% of the world's total manufactured exports. The automobile is the country's most important industry (12%), along with computers and electronic equipment (6.6%). Japan also makes 26% of the world's exported ships. The top 10 exports of 2000 were:

	% OF COUNTRY TOTAL
Automobiles	11.8
Transistors, valves, etc	8.9
Telecommunications equipment	6.4
Electronic microcircuits	5.7
Car parts	3.6
Office machine parts	3.5
Computers	3.1
Switchgear	2.8
Engines	2.5
Ships and boats	2.1

In 2000 Japan's imports were distributed among the following categories:

Consumer goods	16.3%
Food	10.9%
Fuels	20.3%
Industrial supplies	22.6%
Machinery	23.8%
Transportation	4.5%
Other	1.6%

Principal trading partners in 2000 (in millions of US dollars) were as follows:

COUNTRY	EXPORTS	IMPORTS	BALANCE
United States	143,977	72,509	71,468
China (inc. Hong Kong)	57,562	55,100	2,462
Korea	30,699	20,446	10,253
Singapore	20,819	6,433	14,386
Germany	19,996	12,723	7,273
United Kingdom	14,830	6,577	8,253
Malaysia	13,886	14,493	-607
Thailand	13,633	10,594	3,039
Australia	8,571	14,800	-6,229
Indonesia	7,594	16,380	-8,786

### 32 BALANCE OF PAYMENTS

Beginning in 1981, surpluses in Japan's current accounts increased rapidly, reaching \$49 billion in 1985 and \$86 billion in

1986, the latter being 18 times the level of 1981. These huge surpluses resulted largely from the high value of the dollar relative to the yen; price declines of primary goods, such as petroleum, also enhanced Japan's favorable trade position. Japan's mounting surpluses and the rising deficits of the US forced the US and other leading industrial nations to attempt to realign their currencies, especially the dollar and the yen, in September 1985. Within two years the yen rose 70% against the dollar. The yen's appreciation increased the competitiveness of American products and contributed to the reduction of Japan's external imbalances through 1990, when the current account surplus fell by 37.4%, due to higher expenses for imported oil and rising expenditures by Japanese traveling abroad. Whereas long-term capital outflows exceeded Japan's current account surplus from 1984 through 1990, by 1991 the outflow shifted predominantly to short-term capital, and overseas direct investment slowed.

The US Central Intelligence Agency (CIA) reports that in 2002 the purchasing power parity of Japan's exports was \$383.8 billion while imports totaled \$292.1 billion resulting in a trade surplus of \$91.7 billion. Japan had the highest trade and current account surpluses in the world in the early 2000s; however, Japan is less open to trade than other highly developed economies. As a percentage of current-price GDP, the value of Japan's two-way foreign trade in 2001 was just 16.8%, compared with Germany's 57% and China's 42.4%. This is due in part to restrictions on merchandise imports to protect the country's less efficient industry sectors. Due to this lack of openness to trade, the country's economy has stagnated, and companies in the nontradable sectors have not been productive.

The International Monetary Fund (IMF) reports that in 2001 Japan had exports of goods totaling \$384 billion and imports totaling \$313 billion. The services credit totaled \$65 billion and debit \$108 billion. The following table summarizes Japan's balance of payments as reported by the IMF for 2001 in billions of US dollars.

<b>Current Account</b>	<b>88</b>
Balance on goods	70
Balance on services	-44
Balance on income	69
Current transfers	-8
<b>Capital Account</b>	<b>-3</b>
<b>Financial Account</b>	<b>-48</b>
Direct investment abroad	-39
Direct investment in Japan	6
Portfolio investment assets	-107
Portfolio investment liabilities	61
Other investment assets	47
Other investment liabilities	-18
<b>Net Errors and Omissions</b>	<b>4</b>
<b>Reserves and Related Items</b>	<b>-40</b>

### 33 BANKING AND SECURITIES

Japan's highly sophisticated banking system continues to play a dominant role in financing the country's and the world's economic development, despite Japan's decade long recession. In the mid-1980s, while the US was becoming a debtor nation, Japan became the world's largest creditor. Banks provide not only short-term but also long-term credit, which often in effect becomes fixed capital in industry. In terms of sheer size, Japanese banks occupy some of the top spots in worldwide bank ratings.

The controlling national monetary institutions are the Bank of Japan (founded in 1882) and the Ministry of Finance. The Bank of Japan, as central bank, has power over note issue and audits financial institutions to provide guidance for improving banking and management practices. Ceilings for interest rates are set by the bank, while actual rates, commissions, and discounts are

arranged by unofficial agreements among bankers and other financial institutions, including the National Bankers' Association. A new banking law, replacing the National Banking Law of 1928, was adopted in 1982. Its objectives were to increase competition in the financial world by enabling banks to sell bonds and by authorizing both banks and securities firms to sell commercial paper and certificates of deposit.

Eleven important city banks, with branches throughout the country, account for about two-thirds of all commercial bank assets, the rest accruing to 131 regional banks, 7 trust banks, and 83 foreign banks. In addition, 112 foreign banks have representative offices in Japan. Of special interest are the postal savings facilities, which are used by many Japanese families and have assumed many of the aspects of a huge state-owned banking business.

The Foreign Exchange Law was changed to totally liberalize cross-border transactions in 1998. Important foreign exchange banks include the city banks, long-term credit banks, trust banks, major local banks, major mutual loan and savings banks, and the Japanese branches of foreign banks. Such governmental financial institutions as the Japan Export-Import Bank, the Central Bank for Commercial and Industrial Associations, and the Central Bank for Agriculture and Forestry also participate in foreign exchange markets.

The rapid expansion of bank lending and the importance of land and stocks as assets in Japan's financial sector have exposed its financial institutions to the risks stemming from falling asset prices. Thus one of the root problems of Japan's difficulty in returning to a trend rate of GDP growth lies in the fragility of the financial sector. Banks and other financial institutions have been rocked by the huge sums of non-performing debt, stemming from an earlier lending spree based on inflated land values as collateral. In the aftermath of the collapse of the "bubble economy," many of the generous loans extended, especially to land and property developers, cannot be repaid or even serviced. Japan's 21 major banks, including the 11 city banks, wrote off about ¥11 trillion (\$102 billion) of bad debts at the end of March 1996.

The bad debt held by the seven failed "jusen" (housing loan companies established by banks and agricultural financiers), which were liquidated partly at public expense, led to huge secondary losses in other areas of the financial sector. The liquidated *jusen* moved their assets to the newly established Housing Loan Administration Corp., which had the responsibility, from the beginning of its operations in October 1996, of recovering loans from the seven companies. This was unlikely, however, since not only would many property companies go bankrupt, but also much of the bad debt was extended illegally or to companies associated with *yakuza* (gangsters). Consequently, several *jusen* executives were arrested in 1996 on charges of alleged aggravated breach of trust.

The most dramatic merger was that between the Bank of Tokyo and Mitsubishi Bank in April 1996. This "mega-merger" created the world's largest bank, which became highly competitive in global financial markets. In 1999, three Japanese banks: Dai-Ichi Kangyo Bank, Fuji Bank, and IBI, announced a merger worth more than \$1.3 trillion, surpassing all other large financial institutions. The other premier Japanese banks in 1999 were Sumitomo Bank, Sanwa Bank, and Sakura Bank. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$2,318.7 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$5,293.5 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 0.06%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 0.1%.

Major securities exchanges are in Tokyo, Hiroshima, Fukuoka, Nagoya, and Osaka; small regional exchanges are in Kyoto, Niigata, and Sapporo. Although prior to World War II most stocks were held by large business firms (zaibatsu), stocks are now available for public subscription. The Tokyo Stock Exchange, the largest in the world, is the most important in Japan.

In the late 1980s, there were three categories of securities companies in Japan, the first consisting of the "Big Four" securities houses (among the six largest such firms in the world): Nomura, Daiwa, Nikko, and Yamaichi. The Big Four played a key role in international financial transactions and were members of the New York Stock Exchange. Nomura was the world's largest single securities firm; its net capital, in excess of US\$10 billion in 1986, exceeded that of Merrill Lynch, Salomon Brothers, and Shearson Lehman combined. In 1986 Nomura became the first Japanese member of the London Stock Exchange. Nomura and Daiwa were primary dealers in the US Treasury bond market. The second tier of securities firms were affiliates of the Big Four, while some were affiliated with banks. In 1986, 83 of the smaller firms were members of the Tokyo Securities and Stock Exchange. Japan's securities firms derived most of their incomes from brokerage fees, equity and bond trading, underwriting, and dealing. Other services included the administration of trusts. In the late 1980s a number of foreign securities firms, including Salomon Brothers and Merrill Lynch, became players in Japan's financial world.

The Tokyo Securities and Stock Exchange became the largest in the world in 1988, in terms of combined market value of outstanding shares and capitalization, while the Osaka Stock Exchange ranked third after Tokyo and New York.

### 34 INSURANCE

After 56 years, the Japanese Insurance Business Law was revised in 1997. The purpose of the newly revised law is competition, to protect policy holders, and to promote greater management efficiency. The law allowed, for the first time, cross entries of life and nonlife companies into each other's sector through the establishment of subsidiary companies. In response to this development, six life and eleven nonlife insurance companies set up subsidiaries. Firms may not engage in life and nonlife insurance at the same time. In 2000, leading Japanese nonlife insurance firms included Tokio, Yasuda, Mitsui, Sumitomo, Nippon, Dai-Tokyo, Nichido, and Chiyoda. Leading life insurance companies included Nippon, Cai-Ichi, Sumitomo, Meiji, Yasuda, and Asahi. Direct premiums written in 2001 totaled US\$445.845 billion.

Life insurance is by far the most extensive of all classes of insurance; premium income is more than three times that of all nonlife premium income. In 2001, life insurance premiums written totaled US\$356.731 billion, while nonlife insurance premiums totaled US\$89.114 billion. Japan is the world's largest holder of life and health insurance. More than 90% of the population owns life insurance, and the amount held per person is at least 50% greater than in the United States. Nippon Life Insurance Co., the world's largest insurance firm, had US\$46.6 billion in gross premiums written in 2001.

In the nonlife field, automobile insurance is the largest sector. (Automobile liability insurance is compulsory.) Personal accident insurance was next in importance, followed by fire, marine cargo, and marine hull insurance.

In the mid-1990s the combined Japanese life and nonlife insurance market had the world's largest share with 30.8% of the world total premium. The life insurance market was 42.6% of the world market, and the nonlife market with 15.2%, the second-largest in the world after the United States. The Japanese nonlife insurance market consisted of 29 domestic companies and

the life insurance market consisted of 36 domestic companies in 1997.

### 35 PUBLIC FINANCE

Plans for the national budget usually begin in August, when various agencies submit their budget requests to the Ministry of Finance. On the basis of such requests, the ministry, other government agencies, and the ruling party start negotiations. The government budget plan usually is approved by the Diet without difficulty, and the budget goes into effect in April. Deficits, financed by public bond sales, have steadily increased in size since the 1973 oil crisis. As a result, the ratio of gross debt to GNP has risen from 8% in 1970 to 60% by 1987. By 1990, debt servicing was absorbing over 20% of budgeted expenditures.

Since 1982, Japan has pursued tight fiscal policies and has attempted to constrain government debt. In June 1987, however, as a response to appeals from other nations to reduce international imbalances, Japan initiated a \$35 billion public works spending package, followed up by \$10 billion in tax cuts. In recent years, however, fiscal stimulus policies have contributed to an increasing budget deficit. Japan's government deficit was 3% of GDP in 1994 and reached 4.3% of GDP in 1995, due to ongoing high levels of public sector borrowing. The government's focus on fiscal policy to compensate for a tight monetary policy has restricted spending on infrastructure, yet by 2002, the deficit had reached 7.8% of GDP.

The US Central Intelligence Agency (CIA) estimates that in 2002 Japan's central government took in revenues of approximately \$441 billion and had expenditures of \$718 billion including capital expenditures of \$84 billion. Overall, the government registered a deficit of approximately \$277 billion.

The following table shows an itemized breakdown of government revenues and expenditures. The percentages were calculated from data reported by the International Monetary Fund. The dollar amounts (millions) are based on the CIA estimates provided above.

<b>REVENUE AND GRANTS</b>	<b>100.0%</b>	<b>441,000</b>
Tax revenue	81.1%	357,735
Non-tax revenue	14.9%	65,827
Capital revenue	0.6%	2,513
Grants	3.4%	14,924
<b>EXPENDITURES</b>	<b>100.0%</b>	<b>718,000</b>
General public services	2.4%	17,157
Defense	4.1%	29,484
Public order and safety	1.2%	8,885
Education	6.0%	43,276
Health	1.6%	11,479
Social security	36.8%	264,217
Housing and community amenities	13.8%	98,788
Recreation, cultural, and religious affairs	0.1%	1,013
Economic affairs and services	3.3%	23,996
Other expenditures	30.6%	219,705

### 36 TAXATION

After World War II, Japan adopted a tax system relying mainly on direct taxes, like those in the United States and the United Kingdom. The most important of these are the income tax and corporation tax. General government revenues amounted to 29.3% of GDP in 2001 according to IMF estimates, the lowest figure among the major industrialized countries. Expenditures amounted to 36.6% of GDP the same year, creating a deficit amounting to 7.3% of GDP, the highest among the major industrialized countries. Since the mid-1960s, when Japan abandoned a balanced budget policy, the government has relied on bonds to finance its budget deficit.

The National Tax Administration Agency, a branch of the Ministry of Finance, administers income and corporation tax laws. In addition, the Tax System Council files recommendations

for revision of the system every three years. Individuals are subject to a national income tax as well as local (prefectural and municipal) residence and business taxes. In 1996, income tax rates ranged from 10% on taxable income of ¥3.3 million or less to 50% on income over ¥30 million. By 2001, the top rate had been reduced to 37%. Combined local taxes are applied at the rates of 5% to 15%. In 1993, the national corporate income tax rate was 37.5%, with a local inhabitants tax of 17.3% to 20.7% and a local enterprise tax of 6% to 13.2%. By 2001, the corporate income tax rate had been reduced to 30%. These rates are exclusive of temporary surtaxes and a capital gains tax.

Additional national taxes include customs duties; a 5% value-added tax; a stamp tax; inheritance and gift taxes; a monopoly profits tax; a sugar excise tax; taxes on liquor, gasoline, and other commodities; and travel, admissions, and local road taxes.

### 37 CUSTOMS AND DUTIES

The Japanese tariff system is administered by the Customs Bureau of the Ministry of Finance. Under pressure from trading partners alarmed over their trade deficits with Japan, the government in 1979 agreed to implement over an eight-year period (subsequently accelerated) a series of tariff cuts and associated market-opening measures known as the Tokyo Round Mutual Tariff Reductions. The Tokyo Round lowered the effective overall tariff rate from 3.7% to 3%, one of the world's lowest, with nearly half of all imports entering without levy. As of 1997, the tariff was 2%. However, import duties remain relatively high for certain agricultural and manufactured goods. In 1987, tariffs were removed from tobacco and liquor (except beer and sake), and the rates on aluminum products were lowered. Quantity quotas and tariff quotas are still applied to some goods. There is a free trade zone at Naha, on Okinawa; no free trade zones function on the main islands.

### 38 FOREIGN INVESTMENT

Cumulative foreign investment in Japan (since 1950) totaled \$37,918 million as of 1995, of which US firms held 41%; Netherlands, 9%; Switzerland, 6%; Germany, 5%; Canada, 4%; UK, 4%; and others, 31%. In 1995/96, most foreign direct investment in Japan was directed towards the manufacturing sector (40%, half of it in machinery), followed by services (31%), retail and wholesale trade (22%), and finance and insurance (4%). Annual new investment into Japan rose from \$2.78 billion in 1989/90 to \$7.08 billion in 1995/96; average annual new investment between 1989/90 and 1995/96 was \$4.19 billion. Due to continued recession, new foreign direct investment slumped to \$5.53 billion in 1997, the last year for which statistics are available.

Japanese investments abroad have expanded steadily since the 1970s, the result both of liberalization on the outflow of capital and of the prosperity of the Japanese economy. It has also been due in part to increased investment in the US and EU as a conciliatory move to lessen the trade gap between Japan and the two industrial regions. Net annual direct investment outflows remained near \$5 billion in the late 1970s but climbed steadily between 1985 and 1991 when they reached \$48 billion, declining somewhat to \$30.7 billion in 1992. Overseas direct investments made by Japan totaled \$41 billion in 1993/94 and \$51.4 billion in 1994/95. In 1996, Japan reportedly invested \$50 billion overseas and attracted only about \$7 billion in inward direct investment. Of the total Japanese overseas investment of ¥5,409.4 billion outstanding in 1995/96, ¥2,478.9 billion was invested in the US (up from ¥1,852.5 billion in 1993/94), ¥387.3 billion in the UK, ¥282.8 billion in China, ¥272 billion in Indonesia, ¥167.5 billion in Hong Kong, ¥158.1 billion in Thailand, ¥125.6 billion in Singapore, ¥123.8 billion in the Netherlands, ¥117.3 billion in the Cayman Islands, and ¥113.7

billion in Panama. In 1995/96, some 48% of Japanese investment was in North America (up from 32% in 1985), 24% in Asia, 9% in Latin America and the Caribbean, 15% in Europe, 2% in Oceania, and the remainder in Africa and the Middle East. About 42% of the investment total in 1995/96 was in manufacturing: electronics accounted for 14%; transportation equipment, 8%; metals, 5%; chemicals, 4%; machinery, 3%; and other manufacturing, 8%. Nonmanufacturing sectors (58% of total investment) included: finance and insurance, 16%; real estate, 13%; commerce and trade, 10%; services, 8%; transportation, 4%; mining, 3%; and other sectors, 4%.

Foreign investment in Japan is far less than in other G-7 countries. One reason for this is that in the past, the Japanese government discouraged foreign investment. A second but perhaps more significant reason is the high cost of doing business in Japan, which, in turn, reduces profits. Some of the barriers are now less significant with the signing of the US-Japan Investment Accord signed in July 1995.

There is still a marked imbalance in Japan's investment in other countries compared to other countries investing in Japan, i.e., the former is far greater than the latter. As an example, in terms of million of dollars invested by Japan in 1994 and 1995 Japan invested \$17,331 million in the US in 1994 and \$22,649 million in 1995. During those same two years, the US invested \$1,915 million and \$1,837 million, respectively, in Japan. During those same two years, Germany invested \$502 million and \$174 million in Japan, respectively, while Japan invested \$727 million and \$550 million, respectively, in Germany. In 1996 Japan's ratio of inward to outward foreign direct investment flows was 1:9.77.

South Korea invested \$71 million and \$68 million in Japan during 1996 and 1997, respectively, while Japan invested \$415 million and \$443 million in South Korea during those same years. The imbalance between China and Japan is even greater. During 1994 and 1995, China invested \$19 million in Japan, while Japan invested slightly over \$7,000 million in China. One should not conclude that barriers account for this imbalance.

### 39 ECONOMIC DEVELOPMENT

Japan's phenomenal economic growth since the 1950s has been based on an efficient blend of two economic tendencies. First is government activism in national planning and implementation, with guidance of the largely free economy via sophisticated and powerful monetary and fiscal policies. Second is the distinctively Japanese way of coupling largely private ownership of assets with conservative, public-spirited management. Especially significant is the role of the Ministry of International Trade and Industry (MITI), which coordinates national industrial policies consistent with economic and social growth. In a unique government-industry collaboration sometimes referred to overseas as "Japan, Inc.," MITI selects and nurtures industries targeted as important to Japan's future economic growth. Industries so targeted have included chemicals, iron and steel, shipbuilding, and transistor radios in the 1960s; automobiles and electronics in the 1970s; and computers, computer chips, and other high-technology industries for the 1980s. In addition to stimulating new industries, MITI also smoothes the way for plant closings and worker retraining in industries targeted for de-emphasis, such as textiles in the 1970s and the ailing coal-mining and shipbuilding industries in the 1980s. Most recently, MITI has also assumed an active role in lessening Japan's positive trade imbalances through a variety of import promotion measures, in collaboration with both domestic companies and foreign firms. Close ties between government and industry are illustrated by the ministries' issuance of informal "administrative guidance" to Japanese companies, the frequent placement of retired bureaucrats in Japanese companies and trade associations, and the delegation of

quasi-regulatory authority to trade associations (which are often allowed to devise and regulate their own insider rules).

The objectives of maintaining rapid GNP growth, controlling inflation, and developing Japan's social and industrial infrastructure have been the concern of the Economic Planning Agency, which produced the successful Ikeda plan (to double the national income between 1961 and 1970) and releases projections of key indicators at frequent intervals. In the main, the Ikeda plan consisted of a series of projections of growth in a free market economy, with the basic assumption—the continued growth of Japan's overseas trade—largely outside of government control. During the plan's 10-year span, an annual growth of 11% in GNP was realized, as against the forecast rate of 7.2%. An economic and social development plan (1967–75) accomplished a GNP growth rate of 10.6%, as against 8.2% projected.

A second economic and social plan (1970–75) projected a continued annual growth rate of 10.6%. The 1973 world oil crisis and its aftermath severely shook Japan's trade-dependent economy, however; in 1974, the GNP actually shrank by 1.8%, the first such negative growth in three decades. In 1975, the cabinet approved a new economic and social plan for 1979–85 calling for an average annual growth rate of 5.7%. However, the impact of the second oil crisis in 1978 necessitated downward revisions of projected growth targets. Plans to stimulate the economy by increasing public-works spending and cutting taxes were approved in October 1983 and in May 1987. Also enacted in 1989 was a value-added tax to strengthen the government's revenue base while allowing reductions in personal and corporate income tax.

In 1988, a five-year plan was adopted to sustain real GNP growth at 3.8% per year, maintain low unemployment (2.5% per year), contain inflation, reduce the country's trade surplus, and improve the quality of life through a shorter work week and stabilized property prices. Many these objectives were achieved or surpassed in the closing years of the decade. After 1992, however, the economy's downturn was likened by some analysts to the 1974 recession in its severity and length. Economic indicators included steep declines and sluggish recovery in the stock market index since 1989, falling real estate prices, as well as a shrunken rate of GNP growth, despite surging exports. To prompt a recovery, the Ministry of Finance approved large stimulus packages for 1992 and 1993, totaling \$85.6 billion and \$119 billion in expenditures, respectively. Under the Structural Impediments Initiative, the government sought to sustain growth while also reducing the country's external trade imbalances. Among the main steps taken under the Initiative was a 10-year program targeting the expenditure of up to \$8 trillion for the construction or renovation of airports, bridges, roads, ports, telecommunications systems, resorts, retirement communities, medical facilities, and other forms of public infrastructure development. Real growth during the 1990s hovered around 1% a year. The reasons for this are not as clear as in the 1970s when oil interruptions slowed the pace of development. Since Japanese wages have been rising, wage pressures are creating a higher cost for business, which would tend to make Japan less competitive in a world that is becoming increasingly more competitive. The Asian Tigers such as Singapore, Taiwan, or Hong Kong, have seen their economies grow at a much higher rate than Japan and China's economic growth rate of 10% a year during the 1990s. In 1999, Japan began a tentative recovery from its longest and most severe recession since the end of World War II.

Japan's financial assistance to developing countries and international agencies has grown significantly in recent years, making it one of the world's leading donor countries and its largest net creditor. The government has committed itself to large

increases in official development assistance to developing countries and multilateral agencies since the late 1980s. In 1991, ODA totaled \$11.0 billion, as compared with \$3,797 million in 1985. Private outflows in 1991 totaled \$11.1 billion, as compared with \$8,022 million in 1985. ODA projects in the construction sector totaled \$9 billion in 1997. Among the top recipients of bilateral ODA from Japan were Indonesia, China, the Philippines, Thailand, Bangladesh, and Malaysia. Japan's increasing financial assistance to developing countries like China and Indonesia is an indication that the Japanese government is willing to sacrifice short term gain for longer term prosperity and stability. In essence, Japan is helping to create viable trading partners; and since Japan is a trading state, this strategy will enhance Japan's economic development over the long term.

## 40 SOCIAL DEVELOPMENT

Living standards reflect Japan's rapid economic development since the mid-1960s. Greatly contributing to the social stability of the nation is the strong sense of family solidarity among the Japanese; virtually every home has its *butsudān*, or altar of the ancestors, and most elderly people are cared for in the homes of their grown children. A further source of social stability has been Japan's employment system, noted for its "lifetime employment" of workers from the time they enter the company after completing their education to the time they retire. Traditionally, layoffs and dismissals of employees were rare, even during times of recession. With Japan's economic downturn of the early 1990s, however, companies were forced to downsize. By 1997 the nation's unemployment rate had climbed to a record 3.5%, and a number of middle-aged workers who had expected to remain with the same firm until retirement found themselves job hunting.

The present social insurance system includes national health insurance, welfare annuity insurance, maternity coverage, unemployment insurance, workers' accident compensation insurance, seamen's insurance, a national government employees' mutual aid association, and day workers' health insurance. It also provides pension plans designed to maintain living standards for the elderly, based on years of employment, and for families of deceased workers. Per capita expenditure on social security programs remains low, however, in relation to expenditure in many other industrial nations. There is a family allowance for all residents with children under the age of three.

Nearly the entire population receives benefits in one form or another from the health insurance system. Health insurance is compulsory for those employed at enterprises with five or more workers, and premiums are shared equally by the insured and their employers. Those not covered at work are insured through the National Health Insurance program. Other sickness and health insurance is in force among farmers, fishermen, and their dependents. Unemployment coverage is obligatory for all enterprises regardless of size; workers' compensation must also be provided by employers.

The Daily Life Security Law laid the groundwork for an ever-growing livelihood assistance program. Out of this have come laws pertaining to child welfare, physically handicapped persons' welfare, social welfare service, welfare fund loans to mothers and children, aid to the war-wounded and ill, and aid to families of deceased soldiers. The system provides direct aid for livelihood; education; housing; medical, maternity, and occupational disability; and funerals. More than a thousand welfare offices throughout the nation are staffed by full-time, salaried welfare secretaries and assisted by voluntary help. Institutions have been established to care for the aged, those on relief, and those needing rehabilitation. Numerous private organizations assist government agencies.

In 1985, a two-tiered pension system was mandated by law. The first tier consists of “national pension insurance” paid to all residents at a flat rate; the second tier consists of employment or earnings-related coverage. There are special pension programs for public employees, private school teachers and employees, and employees of agricultural, forestry, and fishery cooperatives.

An increasing number of women pursue permanent careers, although very few have attained management positions. The Equal Employment Opportunity Law encourages employers to avoid discriminating against women, but does not establish penalties for noncompliance. Women also retain the responsibility of child care and household chores. Domestic abuse and other violence against women often goes unreported due to societal concerns about shame in the family. The government is taking some action in providing shelter facilities and passing laws to protect victims. There is also an increase in the molestation of women on the railways while commuting. Sexual harassment in the workplace is prevalent.

Discrimination against ethnic Koreans and other non-Japanese minorities also continues. A serious social problem facing children in Japan is the increasing incidence of “*ijime*” or severe bullying at school. Several children are known to have committed suicide as a result of bullying. The Office of Ombudsman for Children’s Rights is attempting to address this problem. Violence against teachers is also a growing problem.

Human rights are generally respected by the government, but there have been some reports of abuse of detainees and prisoners.

#### 41 HEALTH

The Ministry of Health and Welfare has become the central administrative agency responsible for maintaining and promoting public health, welfare, and sanitation. All hospitals and clinics are subject to government control with respect to their standards and spheres of responsibility. In 1990–97, there were 16 hospital beds and 1.8 doctors per 1,000 people. Every practitioner in the field of medicine or dentistry must receive a license from the Ministry of Health and Welfare. In addition, the ministry recognizes and authorizes certain quasi-medical practices, including massage, acupuncture, moxa-cautery, and judo-orthopedics, all based upon traditional Japanese health professions.

Expanded examination and treatment have brought about a dramatic decrease in the death rate from tuberculosis, the major cause of death in the 1940s. In 1999 there were 29 cases of tuberculosis per 100,000 people. At the same time, death rates from cancer and heart disease have risen considerably and now rank among the leading causes of death, trailing cerebrovascular diseases. In 1990, the number of cancer patients increased 60% (to 810,000) from 1985. Japanese medical researchers have been working on research for a new cure for breast cancer.

Infant mortality dropped to 4 per 1,000 live births in 1999, in contrast with the 1930 rate of 124. The overall mortality rate was estimated at 8.5 per 1,000 people in 2002. Only 3% of children under age five during 1989–95 were malnourished. The total fertility rate was 1.4 as of 2000. Immunization rates for children up to one year old in 1997 included diphtheria, pertussis, and tetanus, 100% and measles, 94%. Average life expectancy was 81 years in 2000, among the highest rates in the world. The likelihood of death by heart disease after 65 was 213 for a man and 264 for a woman per 1,000 people (1990–1993). In the mid-1990s there were nearly 300,000 deaths per year strictly from cardiovascular diseases.

As of 1999, the number of people living with HIV/AIDS was estimated at 10,000 and deaths from AIDS that year were estimated at 150. HIV prevalence was 0.02 per 100 adults.

A large portion of the male population smokes. Between 1986 and 1994, 66% of men and 14% of women smoked. In 1995, it was estimated that tobacco would cause 12% of all deaths (17% males and 5% females), numbers that are still increasing among

males and, on current smoking trends, will eventually also increase in females.

#### 42 HOUSING

A severe housing shortage plagued Japan after World War II. It is estimated that in 1947, two years after the war’s end, the housing deficit amounted to more than four million units. A construction program resulted in 9.7 million new units by the end of 1965. The following year, the government undertook a five-year plan for the construction of 7.6 million houses by mid-1971; the plan was designed to fulfill the goal of “one house for each family.”

Housing construction peaked at 1.9 million units in 1973; despite efforts to promote construction as a means of stimulating the domestic economy, construction lagged in later years, falling to between 1.1 million and 1.5 million units in the 1980s. The decline reflects not so much a saturation of demand—many Japanese regard their housing as inadequate—as a rapid rise in land and construction costs, especially in the Tokyo, Nagoya, and Osaka metropolitan areas, which has put new housing out of the reach of potential buyers.

In the mid-1990s, the average salaried worker in Tokyo could only afford a house 40 km outside the Tokyo metropolitan area. Condominiums and prefabricated homes provided much of the nation’s new housing in the 1980s. In fiscal 1987, low interest rates pushed new housing starts to 1.729 million units; they declined in 1988 to 1.6 million, and fell to 1.343 million in 1991 with the start of the recession. However, in 1998, there was a total of 50.25 million dwellings, representing 13% more than the number of households. About 61% of dwellings are owner occupied. Most dwellings are relatively small by international standards. In 1998, about 1.1 million rental properties had under 60 square meters of floor space.

#### 43 EDUCATION

Japan’s entire educational system was reorganized along US lines after World War II, adhering to a six-three-three-four plan (six years of primary school, three years of lower secondary school, three years of upper secondary school—full-time, part-time or correspondence—and four years of college). Education is compulsory and provided free of charge for the first nine years, from age 6 through 14. Coeducation has become an accepted principle. Virtually the entire adult population is literate. As of 1999, public expenditure on education was estimated at 3.5% of GDP.

Entrance into high schools, the stage following the compulsory level, is by examination only, and most of these schools charge tuition. Would-be national and local public university students must pass entrance examinations in Japanese, English, mathematics, science, and social studies. There are three types of institutions for higher education—universities, junior colleges and technical colleges, all of which receive prefectural and national support or annual subsidies. There are 95 national universities, with each prefectural capital having one school; the remainder are in the principal cities. The largest religious bodies, both Christian and Buddhist, maintain important universities and other educational institutions. There are many special schools for the handicapped.

Enrollment at both the compulsory elementary and secondary levels is very high—virtually 100%. Approximately 29.1% of students continued on to university level education in 1990.

In 1998, 7,855,387 students were enrolled in 24,376 elementary schools, with 420,901 teachers. In 1995, 9,878,568 students were enrolled in secondary schools, with 702,575 teachers. The pupil-teacher ratio at the primary level was 21 to 1 in 1999. In 1995, there were a total of 401,509 teaching faculty and 3,917,709 students enrolled in all higher educational institutions.

Educational activities for adults and youths are organized both by government and private bodies. There is a board of education in each of the 47 prefectures and 3,000 municipalities and these serve as the local education authority. The central education authority is the Ministry of Education, which provides guidance and financial assistance to the local bodies. In 1996, approximately 3.6% of the Gross Domestic Product was allocated to education.

#### 44 LIBRARIES AND MUSEUMS

In 1948, the National Diet Library Law established the National Diet Library to provide reference service to the Diet, other libraries, and the general public. In 1949, this library absorbed the Ueno Library (the former national library) as one of its branches. The National Diet Library acts as a legal depository for Japanese publications and is also a depository library for the UN. There are over 7.3 million volumes in the library's collection. The University of Tokyo (Tokyo Daigaku) has 7.6 million volumes, and Keio University, also in Tokyo has libraries with holdings of over one million volumes.

Public libraries are beginning to find their place in Japanese life. Prior to the enactment of the Library Law of 1950, 70% of those who utilized libraries were students and scholars. Today, libraries are information centers, and increasing numbers of citizens are patronizing them.

Except in large cities, typical Japanese museums take the form of the treasure halls of shrines or temples, botanical gardens, and aquariums. Important museums include the National Science Museum, Museum of Contemporary Art, Calligraphy Museum, and the Tokyo Metropolitan Art Museum, all located in Tokyo. Also in Tokyo are the Baseball Hall of Fame and Museum, a criminal museum, and a clock museum. In 2002 the Hyogo Prefectural Museum of Art opened in Kobe. Osaka houses a museum of natural history and the National Museum of Ethnography, and Kyoto, the former capital, has many historical sights and monuments. Yokohama is home to an equine museum and Kanazawa Bunko, a general museum dating back to 1275 and featuring Zen Buddhist documents.

#### 45 MEDIA

Telephone and telegraph services are offered by Nippon Telephone and Telegraph, which was privatized in 1986, and by Japan Telecom and other companies that entered the market after Nippon Telegraph and Telephone's monopoly ended in 1985. In 1997, Japan had 60.3 million mainline telephones. In 2000, there were an additional 63.8 million cellular phones in use nationwide. Telex, fax, and international telegram services are provided by Kokusai Denshin-Denwa (KDD).

A semigovernmental enterprise, the Japan Broadcasting Corp. (Nihon Hoso Kyokai—NHK), plays a large role in Japan's radio and television communications. Many commercial stations are connected with large newspaper companies. Started in 1935, Radio Japan is also beamed by NHK throughout the world. NHK initiated television broadcasting in 1953. As of 2001 there were 215 AM and 89 FM radio stations. In 1999, there were 211 television stations. Color television broadcasting began in 1960; multiplex broadcasting, for stereophonic or multiple-language programming, was made available in Tokyo and other metropolitan areas in 1978. In 2000, there were 956 radios and 725 television sets for every 1,000 people. With about 315 personal computers in use for every 1,000 people, Internet access was available from 73 service providers in 2000. By 2001, there were 47.08 million Internet subscribers.

The Japanese press is among the world's largest in terms of newspaper circulation and is also a leader in ratio of copies to population.

The leading Japanese dailies, with their 2002 circulations, are as follows:

CIRCULATION	MORNING	EVENING
TOKYO		
* <i>Yomiuri Shimbun</i>	10,224,70	4,183,130
* <i>Asahi Shimbun</i>	8,322,050	4,070,610
* <i>Mainichi Shimbun</i>	3,976,360	1,708,910
* <i>Nihon Keizai Shimbun</i>	1,796,310	959,730
* <i>Sankei Shimbun</i>	1,997,700	907,370
* <i>Tokyo Shimbun</i>	653,120	348,750
OSAKA		
<i>Hochi Shimbun</i>		438,420
<i>Osaka Nichi-Nichi Shimbun</i>		225,000
OTHER CITIES		
* <i>Chunichi Shimbun</i> (Nagoya)	3,075,320	1,247,820
<i>Nishi-Nippon Shimbun</i> (Fukuoka)	841,460	187,530
<i>Hokkaido Shimbun</i> (Sapporo)	677,550	387,520
<i>Kyoto Shimbun</i> (Kyoto)	504,600	319,730
<i>Kobe Shimbun</i> (Kobe)	546,080	269,640
<i>Chugoku Shimbun</i> (Hiroshima)	732,730	89,310

\*Indicates nationwide circulation figure.

There are two domestic news agencies: the Kyodo News Service, with 50 domestic bureaus and with foreign bureaus in every major overseas news center; and the Jiji Press, serving commercial and government circles.

The constitution of Japan provides for free speech and a free press, and the government is said to respect these rights in practice. The Japanese press enjoys the reputation of having the most vigorous and outspoken in the world. It operates under the constitutional provision of absolute prohibition of censorship.

#### 46 ORGANIZATIONS

There are an enormous number of organizations in Japan, including such standard bodies as the Japan Red Cross, Japan Chamber of Commerce (with regional and local branches), General Council of Trade Unions, Congress of Labor Unions, Federation of Employers Associations, Rotary Club, Japan Medical Association, Japan Actors' Society, Motion Picture Association of Japan, Japan Athletic Federation, All-Japan Boy Scouts League and Girl Scouts League, Japan YMCA and YWCA, and Japan Youth Association.

The Institute of Art Research and the National Institute of Japanese Literature are important in the cultural field. The Society for International Cultural Relations, established in 1934, is active in the publishing field and in cultural exchange. There are associations and societies representing promoting research and advancement in nearly all major fields of science and medicine. Trade unions and professional associations are very active.

#### 47 TOURISM, TRAVEL, AND RECREATION

Tourism in Japan is regarded as a major industry, since many foreign visitors as well as the Japanese themselves tour the country extensively. In 2000, Japan had an estimated 4.7 million foreign visitors. Tourist expenditures for that year totaled approximately US\$3.3 billion. Japan's estimated 1,580,226 hotel rooms had a 69% rate of occupancy in 2000.

Japan's chief sightseeing attractions are in the ancient former capital of Kyoto: Nijo Castle, Heian Shrine, the 13th-century Sanjusangendo temple and the Kinkaku-ji (Temple of the Golden Pavilion), the Ryoan-ji (Temple of the Peaceful Dragon), famed for its garden of stones and raked sand, and numerous other ancient Buddhist temples and Shinto shrines. Nearby sights in the vicinity of Nara include the Great Buddha, a huge bronze statue originally cast in the eighth century; the Kofuku-ji pagoda; and Horyu-ji, the seventh century temple from which Buddhism spread throughout Japan. There are few historic sites in the capital—Tokyo was devastated by an earthquake in 1923 and virtually destroyed in World War II—but nearby attractions include Mt. Fuji and the hot springs of Fuji-Hakkone-Izu

National Park; Nikko National Park, site of the Toshogu Shrine, where the first Tokugawa shogun is entombed; and the summer and winter sports facilities in the mountains of central Japan—the so-called Japan Alps. The Hiroshima Peace Park and Peace Memorial Museum commemorate the destruction of the city by an atomic bomb in 1945.

Baseball is Japan's national pastime; there are two professional leagues, each with six teams. Sumo, a Japanese form of wrestling, is also popular, with tournaments held six times a year. Golf, an expensive sport because of the lack of open space, is used mainly as a means of entertaining business clients. Other pastimes include judo, karate, table tennis, fishing, and volleyball. Gardening is the most popular hobby among men and women alike.

The costs of traveling in Japan, among the highest in the world, were reduced slightly when a 3% tourism tax, in effect since 1960, was abolished on 1 April 2000. According to 2002 US Department of State estimates, daily expenses in Tokyo were approximately \$289 per day. Daily expenses were about \$225 in Okinawa, \$177 in Kanazawa, and \$278 in Osaka-Kobe.
