The main form of art is body adornment. Women make bead necklaces out of organic pods, bones, shells, and little sticks. They also sew skins into skirts which are also sometimes adorned with beads. For many years the Hadza have been getting glass beads from their neighbors such as the Maasai. They will use these to make headbands, which they were doing as long ago as the earliest photographs in the 1930s. Men will carve various items

such as a fertility stick or arrow, or will sometimes carve geometric designs in a gourd used to carry water or honey. Another form of art is singing and dancing, which the Hadza do often. The only musical instrument is the voice. A few men occasionally play a *zeze*, a stringed instrument made with a gourd, or an *mbira*, a finger piano made from wood and metal, both of which have been adopted from their Bantu neighbors.

Men will sit making arrows and talking for hours while in camp. Women will sit together talking, sewing, and processing food, for example, pounding baobab seeds, or grooming each other and children. They will pick lice out of other's hair and eat them. They will also cut each others' hair and eyelashes. Men do not groom or get groomed as much, but sometimes a wife will groom her husband and men will groom a child.

RELATIVE STATUS OF MEN AND WOMEN

Men are only slightly dominant over women. A man may occasionally hit his wife, though others may disapprove and her kin may intervene. Wife-beating appears to be rare, but increases whenever men drink alcohol which they sometimes get from their agro-pastoralist neighbors. They make no alcohol themselves. Hadza women speak their mind, especially at home. They are quite independent and capable of feeding themselves and children, especially since they usually live with their kin.

SEXUALITY

Sex is considered natural. Women are modest and do not talk openly about sex, though some will answer questions about sex in private. Men are less private but still do not talk about sex publicly very much. There is usually premarital sex before a man and woman start living together. In fact, sex play occurs from an early age and by 10–12, males and females may actually copulate. Certainly in their early to mid teens some are having sex. This continues until a girl becomes pregnant or gets married. Very often, girls become pregnant before they get married and there is no disapproval of this.

All murders of Hadza by Hadza (prior to frequent alcohol consumption) appear to be related to male jealousy. This may be when a man discovers that his wife has had an affair, in which case he may kill the other man and beat his wife, or kill both of them. More often, however, it is when two men are competing for the same single woman. Since marital infidelity is dangerous for females, and they never leave camp alone, it is probably fairly rare. Men, according to Hadza opinion and practice, are more likely than women to philander.

COURTSHIP AND MARRIAGE

During their teens, girls and boys begin courting. This often begins with a boy sending a go-between, such as his sister, to let the girl know he likes her. If he receives a positive response, they will sneak off at night for a sexual rendezvous. If they like each other enough, they begin living together and are then considered married. Sometimes the young man will need to talk to the young woman's parents and both males and females seek parental approval. Parents rarely object strongly and a couple can ignore their parents' wishes if they choose to. Good hunters find it easy to get married because women's parents want them as sons-in-law and encourage them to move to their camp and marry their daughter. Occasionally, parents will object to their daughter marrying a man if he has a reputation as a bad hunter and honey forager and if he sleeps around too much.

Age at first marriage is 17 or 18 for females and 19 or 20 for males. Median age at first reproduction is 19 (N. Blurton Jones, personal communication). Women experience far fewer menses than American women since they are usually pregnant or nursing an infant and thus less likely to be ovulating. One is not supposed to marry anyone who shares 12.5% or more of one's genes (parent, child, sibling, grandparent, grandchild, uncle, aunt, nephew, niece, half-sibs, first cousins). However, as with the few other rules the Hadza have, this is sometimes ignored and one man married his granddaughter with no repercussions. The practice of the levirate is common. When a man dies, his brother, especially if unmarried, often marries his widow and takes on his children.

There is no overt polyandry, and in fact, when some young woman has two male suitors at the same time, it is seen as a problem that affects everyone. A meeting may be called to tell the woman to choose one because there is a danger that one man may kill the other. Many women say that polygyny is acceptable, even if their husband

wants a second wife; however, when women catch their husbands pursuing another woman they get mad and yell and throw things at them. Only about 4% of marriages are polygynous and these usually last only a year or two. Divorce is fairly common, especially in the first few years (Blurton Jones et al., 2000), and serial monogamy is the rule.

About 5% of women marry non-Hadza men. However, many of these return to live in a Hadza camp and bring any children from that marriage with them. They appear to experience little if any stigma. The reason they return, and perhaps why there is not more female exogamy, may be because Hadza women cannot put up with the sort of treatment they get from non-Hadza men, where they are forced to work long hours and may be beaten, and not just on the rare occasion when their husband is drunk, as with Hadza men.

Husband–Wife Relationship

Husbands and wives sleep together on a skin on the ground close to a hearth with their young children. Once a child is about 12, he or she may begin sleeping with other similar-aged same-sex groups. Husbands and wives show no outward signs of affection, no hugging or kissing, but they say that they feel love for each other. When they sit together they often talk at length.

Women never go anywhere out of camp alone, except to relieve themselves. They are either with other women, or with a brother, father, or husband. This is probably less because there is any danger of being raped by a Hadza than being raped by a non-Hadza, or even captured and taken off. It may also be partly simply because without bows and arrows, women would be vulnerable to predators. At least when they are in a group and have their digging sticks, they can cooperate to defend themselves.

Women often do not know exactly when they have reached menopause since they are nursing their last child and so would not be menstruating anyway. After a woman is a few years beyond menopause, her husband may leave her for a younger woman. A very low percentage of women over 60 have husbands and some of them express bitterness that their husbands have left them. However, most postmenopausal women appear to embrace whole-heartedly their role as an important provider of food and care to their grandchildren.

Other Cross-Sex Relationships

A man usually wants to impress his mother-in-law. If she thinks that he is not bringing in enough meat, for example, she may advise her daughter to look for someone else. The pressure men feel shows up in the stories they tell. Several stories feature mothers-in-law who transform into monstrous beasts, chasing them and biting hunks of flesh from them as they flee up a tree. A woman tends to talk little to her father-in-law.

Change in Attitudes, Beliefs, and Practices Regarding Gender

These days, especially near the one large village in Hadza country, women are becoming much more promiscuous. They sometimes become quasi-prostitutes, sleeping with non-Hadza men in exchange for money or gifts. Near the village, men are drinking alcohol more and more. This results in more wife-beating, even wife-killing occasionally. Some men go into the village with their wives and let them sleep with village men in exchange for free alcohol. This promiscuity is bound to result in increasing rates of sexually transmitted diseases and death from AIDS.

Han Chinese

William R. Jankowiak

ALTERNATIVE NAMES

The alternative name is Han.

LOCATION

China is located in East Asia and with a land area that is larger than the United States. There are geographical differences between eastern and western China. Eastern China borders the Pacific Ocean. It is sometimes referred to as China Proper due to the high concentration of Han people (who make up 94% of contemporary Chinese ethnic population). The western region has been historically less populated and it is the home of some of China's largest ethnic groups (e.g., Tibetians, Mongols, and Uygurs). Since the 1950s China has sought to "fill up" this region through encouraging internal Han migration. The policy has been successful. Today, the Han outnumber local minority populations in every autonomous region.

There are 22 provinces and five autonomous regions (e.g., Inner Mongolia, Xinjiang, Tibet, Zhuang, and Ningxia). The capital is Beijing, located in northern China. Shanghai, located in the lower Yangtze region, is the largest and most developed city in China.

China's climates are seasonal. In the north the winters are long and are characterized by extreme cold, while in the south (all land south of the Yangtze River) the climate varies from a persistent damp chill in the high and low desert environments to mild and frost free along the southern coast. The Pearl River plain around Guangzhou (Canton) is the most important as well as the most densely populated in the region. With over 1.4 billion people, China's population is the largest in world.

CULTURAL OVERVIEW

China is an agrarian civilization in the process of becoming a urbanized society. Its image of the ideal family is intertwined with a rural heritage organized around the principles of patrilineal descent and patrilocal residence. In many parts of China, there were surname organizations, based on descent from a common ancestor that was reckoned exclusively through males, with memberships ranging from several hundred to over ten thousand. These associations provided the foundation of community organization (Johnson, 1983, p. 8). On the maternal side, kinship ties had significance primarily among the very rich (who use marriage to foster political and economic alliance) and the very poor (who needed mutual cooperation networks to survive) (Johnson, 1983, p. 8).

In practice, family structures varied geographically and with social class. Nevertheless, there were a few commonalities that are pan-Chinese. Women who left their natal family at marriage were viewed by the male's family as outsiders. It was not until the birth of a male child that a woman's status became more secure. Even then, she embraced her children as the primary source of emotional comfort and future security. Men, on the other hand, were linked to their father's patrilineage while remaining emotionally bonded to their mothers. Many Chinese mothers were perpetually anxious about being emotionally replaced by their daughters-in-law.

The urban Chinese family is organized primarily into two different forms: nuclear and stem. While the nuclear family is the preferred form of family arrangement, most Chinese, at one time or another, will enter into some form of stem family arrangement (i.e., a family with a married couple, children, and another relative, usually a parent). In urban China the family is organized around notions of bilateral descent and neolocal residence practices. The conjugal bond is embraced over the extended family.

CULTURAL CONSTRUCTION OF GENDER

Contemporary China is striking in its emphasis on gender. Masculinity and femininity are clearly defined social categories. In fact, people assume that the traits associated with a particular sex are innate qualities of a particular

gender. This is a recent phenomenon. Historically, gender was one principle among many (e.g., kinship, generation, age, and class) that determined a person's position in the family and in society.

In traditional cosmology men and women were assigned values referred to as yin (female) and yang (male) which were regarded as opposite through not necessarily in opposition to one another. Together they form an integrated whole. Although the yin–yang construction is linked to a particular gender, it is not absolute. Women as mothers were seen as having more yang essence in relationship to her children, while a greater yin essence in relationship to their husband. In this way yin–yang construction is more about hierarchy than it is about an immutable gender essence. This cosmological assumption did not mean that the Chinese were incapable of perceiving sex differences. They did. It only means that they did not, as today, make a linguistic distinction between masculinity and femininity.

Every culture makes tacit, if not explicit, assumptions about the relations between genitalia and behavior. The Chinese recognize that there is sexual dimorphism, that females reach sexual maturity earlier and that males may have a longer reproductive career, and tend to have a higher preferred rate of copulation.

In Imperial China, femininity was intertwined with notions of virtue. A husband's sexual prerogative as head of a patriarchal family was closely linked with a moral interpretation that defined women's behavior as based in obedience (Mann, 2002, p. 53). In this milieu, women were expected to be chaste and obedient. The state did its part in upholding this ideal. For example, the Qing dynasty (1644–1911) promoted a cult of female chastity through giving honorific plaques and money to women who did not remarry (Mann, 2002, p. 47). The state also constructed ceremonial arches and shrines for widows who refused to remarry or committed suicide upon the deaths of their husbands.

Today, there are clear gender categories that are organized around promoting sexual difference. It is appropriate to acknowledge sexual attractiveness. Nubile women with symmetrical faces and a pale complexion are considered physically attractive. It is fashionable for women at any age to wear their hair long or short (in the 1980s young women wore braided hair and married women wore short cropped hair); short skirts, dresses, and pants are also deemed appropriate. These images of contemporary femininity are readily found on billboards and in magazine and television advertisements. For women, a man's relative age is not a primary factor in accessing his relative physical attractivess. Women appear to use a more complicated calculus that includes facial symmetry, relative age, and social position in assessing a man's overall physical appearance.

Masculinity is organized around a notion of *wen–wu*. *Wen* is based on the ideal of cultural attainment or gentility, whereas *wu* is anchored in the qualities of martial valor. Historically *wu* qualities were favored over *wen*. However, the advent of Confucianism contributed to promoting *wen* attributes which were embraced by the scholarly educated government officials. During the 1960s, the *wu* ideal which favored the worker and peasant over the scholar was promoted. Contemporary actors such as Bruce Lee, Jet Li, and Jackie Chan are representative of non-scholarly *wu* tradition. It is the dynamic tension between *wen* and *wu* that allows for numerous forms of masculinity to be expressed in Chinese society (Louie, 2002, p. 20).

GENDER OVER THE LIFE CYCLE

Women and men move through various stages in life from the youngest to teenagers to youth to married and old age. People in the countryside readily acknowledge that girls mature faster than boys but that in the end boys surpass girls in talent and accomplishments. In China's larger cities this distinction, especially among young people, is no longer firmly held. Most young men believe that women are equal to men in most things. For males and females, marriage and motherhood are the primary markers signifying the transition from youth to adulthood. In the past, marriage was central to defining adulthood so that women in their late twenties were referred to as old maids, while unmarried males were not teased until their mid-thirties. However, both sexes were expected to marry and have a child. In old age women tend to have greater authority due to the emotional bonds they have developed and maintained with their children. On the other hand, once they retire, men tend to have less authority within the family. During ritual occasions they are treated with respect, and then all but ignored.

In the Chinese family the status of women varies with the different phases of their lives. For rural women, there are two phases that are most critical. The first is marriage and subsequent entrance into her husband's

family. The next phase occurs during middle age when her son takes a wife. In both phases women, first as brides and then as mothers-in-law, perceive a loss of control over their lives. The fragility of these transitional periods is reflected in the high suicide rates for women in their early twenties and mid-forties.

Because a woman is an outsider and only gains status through bearing a son, there is a strong incentive for her to form a kind of "uterine family" (Wolf, 1972) that is organized around an intense emotional bond between mother and child. It serves as a kind of a private shelter from the structural restraints imposed by patriarchal ideology.

Men's change in status is more gradual. Marriage is an important identity marker as in obtaining a good job in the city. A man's responsibilities gradually increase as he gets older. The measure of a man is often determined by how well he fulfills his numerous family duties.

Socialization of Boys and Girls

Throughout the history of Imperial China males were preferred over females. Female infants suffered infanticide at a higher rate than males. Today, female infanticide remains high in the countryside but not in the city. When a girl is born, people will call the event "small happiness," but when it is a male the event is called "big happiness." In China's largest cities this distinction is less apparent. Given the realities of the one-child policy combined with new residence and descent practices, urban girls are highly valued.

A "long life celebration" ritual for 100-day-old infants, regardless of gender, is practiced in the countryside. In this ritual close female kin gather together for food and conversation that ends with them lifting the infant through a large circular loaf of bread (*mantou*) calling out as they do so: "Have a long life." In northern China, some mothers might prepare an ordinary dish of noodles in which an extra long noodle is placed to signify "have a long life." This event is private and only the mother and father are present. Today individual birthdays, especially in the urban areas, are increasingly celebrated in the home or in upmarket public restaurants. In place of kin there are now classmates, and family friends are the primary people invited to attend the event.

Boys are given greater freedom and are not controlled in the same way as girls. Obedience is emphasized in rural China and, after the age of 5, corporal punishment, especially for boys, is pervasive. In larger urban settings there is less use of corporal punishment. Parents emphasize guidance over obedience in child-rearing practices. Daycare/preschool starts for most urban children when they reach 30 months of age. Teachers acknowledge that they discipline boys more than girls because boys misbehave more than girls. In the late 1990s teachers started to acknowledge that girls were becoming as mischievous as boys.

Puberty and Adolescence

Adolescence (*nianqing*) is regarded as a youth stage. This stage is between early teen years and extends to the mid-twenties. There are three paths of socialization into adulthood. In the countryside the most common is learning how to farm (Chau, n.d.). Some young women might be able to marry into a wealthier home. If not they marry locally and prepare for a life of farming. The second path is to receive schooling and then obtain a state-assigned job. Girls and boys are sent to primary school in equal numbers, but middle school, which is more expensive, usually finds parents investing more in their son's education. In addition, education investment seldom pays. It is more difficult for rural residents to obtain nonfarm employment. The third path is to run a business or to seek employment in the service sector (Chau, n.d.). For rural residents this means leaving the village to work in small township or moving a great distance to nearby cities.

For urbanites there are only two paths. Most prefer to attend primary and middle school and then be assigned to a state enterprise corporation. The college educated prefer to obtain employment as a manager in an international firm.

Attainment of Adulthood

The most notable shift to adulthood is marriage, which begins in countryside when a girl turns 21 and a boy is 23 years old. In more remote regions, girls often marry at 16 or 17. In this way, girls reach adulthood earlier than boys. In the cities obtaining a job and a separate apartment away from one's parents marks adulthood. However, complete adulthood is not truly gained until the urbanite marries and has a child.

Middle Age and Old Age

Except for major political leaders, retirement comes relatively early in China. Women retire at the age of 55 and

men at the age of 60. Old age is celebrated symbolically with the eldest person being placed in the center of picture. In the countryside, once an elderly person can no longer function, he is relegated to the level of symbolic status with the day-to-day affairs being managed by his son.

Unlike their rural counterparts, urban married couples, in setting up a household, start by forming a nuclear family. Later, upon the death of one of their parents, the family structure changes to incorporate the living parent. However, this reincorporation does not lead to the elderly parent becoming the head of the family. While an elderly parent is referred to as the head of the family on ceremonial occasions, and given the seat of honor whenever a photograph is taken or a special dinner is cooked, the fact is that he or she is perceived to be an important but, sometimes, burdensome duty.

Elderly persons often lament that, although their physical needs are taken care of, they still do not receive the respect they desire or feel they deserve. Some elderly even talk as if their children have abandoned them. Significantly, fathers complain more often than mothers about the loss of their children's active attention and freely given respect. Observations of elderly parent–offspring interaction found that mothers were, in fact, treated with greater tenderness, attention, and respect than fathers. Obviously, mothers, and not fathers, are able to draw upon the strong intimate child–parent bonds which they established and maintained throughout their life span. Without property and other "resources of power," fathers who took little or no interest in their children's development are unable to command their children and therefore receive only a ritualistic admission of deference and a nominal articulation of love. The new emphasis on the market economy and the value of money will enable some elderly to command respect from their family and strangers.

PERSONALITY DIFFERENCES BY GENDER

The Chinese believe that the difference between men and women is a byproduct of biological and cultural forces. Masculine attributes are rough (*culu*), crude language (*maren hua*), "absent mindness" (*madaha*), self-confident (*zixin*), serious (*yansu*), adventurous (*furou jishen*), clever (*congming*), easy-going (*madaha*), quiet (*anjing*), aggressive (*haoshun xinsheng*), hide emotion (*han shu*), strong

(*shang zhuang*), and ambitious (for a promotion) (*you ye xinde*).

Feminine attributes are pretty (*piaoliang*), soft voice (*rou sheng*), not very strong (*rou wo*), gossip (*chuan xian hua*), dress well (*daban*), timid (*paixu*), use polite language (*limaohua*), gentle (*wen rou*), anxious (*danshide*), sentimental (*you yu*), slim figure (*miaotiao*), incline to make a fuss out of nothing (*cheng suifu*), and cannot do hard work (*taizhaoqi*).

The sum of women's images for an ideal husband (*hao zhangfu*) were as follows: a man who is tall (over 1.6 m), healthy, handsome, strong, intelligent, brave, well-mannered, and kind; a man who has status and could provide for a family. In the late 1990s, more in response to the forces of globalization, another trait was added: the absence of a double eyelid fold. The sum of men's images for an ideal wife (*hao qizi*) were as follows: a woman who is beautiful, tall, healthy, soft, kind, well-mannered, loyal, and virtuous; a woman who is skilled in domestic crafts (e.g., sewing, cooking, etc.) and can take care of children.

Whenever men and women engage in casual flirtations the gender traits are dramatized and exaggerated, and they strive to present an image that the opposite sex finds most attractive. Outside the sexual context (in their interactions with siblings, parents, classmates, and the public at large), men and women are more prone to assert non-gender-relevant traits. It is in these contexts that women do not, nor are they expected to, act timid, passive, mild, or coy; likewise, men are not expected always to appear confident, ambitious, and work-oriented. The central difficulty for individuals, of course, is living in social settings that are devoid of the other gender's participation.

An enjoyable activity for young Chinese men is to rank a woman's relative physical beauty. The sexual delight that men take in being aroused visually often leads them to buy pornography or, sometimes, make their own. The male's ability to become sexually aroused by visual stimuli can often result in extremely inappropriate social behavior. The male preference for beauty also affects the pace and growth of their involvement. Chinese men, like American men, fall in love quicker than women.

GENDER-RELATED SOCIAL GROUPS

For much of Chinese history, the social landscape was gendered. The villages were organized around families

that were often organized into lineages that extended into clans. In every way this was a patriarchal-based society. Women exerted indirect influence only within the family. There was, and continues to be, a pronounced sexual division of labor.

Unlike their rural married counterparts who usually live their entire lives in the same village with or near the husband's parents, urbanites tend to live scattered through various neighborhoods. The neolocal (new) and not patrilocal (father's) residence norm is the most common. Because housing units are packed so closely together, living space cannot always be expanded to embrace a new nuclear unit. When there is a shortage of available housing, any apartment is better than no apartment. This pragmatic concern contributed to the Chinese rejecting the traditional patrilocal resident rule in favor of the more flexible neolocal norm.

GENDER ROLES IN ECONOMICS

There is a clear-cut sexual division of labor that is organized around a notion of complementary. In rural China women were and are busy all day—cooking food, drawing water, pounding rice, minding the farm, serving their mother-in law, suckling babies (Mann, 2002, p. 109). In the north, there is seasonal work. In the summer women sell produce in the local markets, while the men harvest the crop. In the winter most of the sellers in the produce market are men. In south China, which has three growing seasons a year, women work in the rice paddies as well as in the produce markets, small clothing shops, or restaurants. Most long-distance traders are men, though there are unmarried groups of females who sell various products. If married women participate, it is usually with their husbands who will be staying in a particular location for a considerable length of time.

Recently, many rural young women who want to increase their autonomy have migrated to other regions. Most of the young factory workers (commonly referred to as maiden workers) in south China are women (Lee, 1998). Throughout China the majority of shop assistants, waiters and waitresses, and hotel employees are rural migrants. Urban women and men generally refuse to take what they considered demeaning jobs. Instead, they hope to obtain a position in a state-run enterprise or work in an upmarket business.

PARENTAL AND OTHER CARETAKER ROLES

For much of Chinese history, the family was organized around an ideology of filial piety that encouraged total obedience, respect, and loyalty toward the father. By controlling the distribution of the family inheritance, a father could affect a special, if not psychological, dependency on the part of the child. On the other hand, a mother's parenting style was seen as much a result of being considered an "outsider" as it was of a "natural" attachment fostered through childbirth and early childcare. Given her lower status in her husband's family, the mother needed a friend, an ally, and what better one than her own child. In this way, the different access to and use of economic and psychological "resources" contributed to the elaboration of the two complementary parenting styles: the father as an aloof spouse and disciplinary provider, and the mother as an equally aloof spouse but, toward her children, an intimate nurturer.

Chinese have a clear sense of gender-specific duties. This sense is patterned by the setting, timing, and manner of parental interaction with the child. A child's age and sex affected the frequency and style of parental interaction. There are several developmental stages of parent–child interaction: early infancy, late infancy (*yinger*), and early childhood (*ertong*). During the infant stage the mother is the more involved parent, whereas the father's involvement increases when the child reaches the childhood stage (3–6 years old). This is especially so if the father is highly educated.

There are gender differences in parent–child caretaking styles. For example, women typically hold a child close to their body, while men hold the child away from their body. Mothers and fathers also differed in their degree of patience toward a stubborn child who refuses to move. Mothers waited twice as long before picking up a recalcitrant child. Men and women also differ in their style of walking with their child. Women rarely walked ahead of the child, while men did. The style of conversation also differs between mothers and fathers. If a mother holds the child she rarely talks to it, but as soon as she starts walking, she breaks into a continuous mode of verbal coaching and patter (this pattern is less common in southwest China). The mother cares for a sick child, dresses the child for school, and scolds the child when he or she misbehaves. The father remains somewhat aloof

and only enters into the disciplinary role when something serious occurs. As a child enters late childhood parents are sensitive about touching him or her in public. This is especially so for father–daughter relations but not for mother–son interaction.

LEADERSHIP IN PUBLIC ARENAS

Within the village the major leadership positions are male. In the cities it varies. At national, regional, and local levels the top political leaders are male. Within various governmental departments there are some mature women officials who occupy an intermediate position of leadership. There is also a Women's Federation that is designed to transmit Communist Party doctrine to women. It is run by and for women. It has several administrative tiers and can be found at all levels of society (e.g., village, neighborhood, county, province, and national). Its ability to counter policy instituted by other branches of the government is minimal.

GENDER AND RELIGION

The Chinese folk cosmology reflects ordinary society. With the exception of the goddess of mercy or health (*guanyin*) and the mother ancestor (*masu*), the most significant deities are male (e.g., the war god (*guan gong*), the god of wealth (*caitse*), the earth god (*tudi gong*), the kitchen god (*jiao yangye*), and the laughing Buddha). The fox spirit is a mischievous female deity that assumed the shape of a pretty female in order to seduce men, killing them only after they had fallen in love with her.

At the community level, rural residents continue to practice ancestor worship (or reverence) that may or may not be linked to a lineage or ancestor association. Ancestor worship is based on the notion that there is an ongoing reciprocity between the living and the dead. At the level of the lineage, membership is determined by land and/or monetary contributions that are used to upkeep the ancestor hall. In this setting, only men occupy positions of leadership. In the family, ancestor reverence focuses only on immediate deceased kin or ancestors (i.e., those who have died in the last five generations). It is overseen entirely by women who are responsible for the upkeep of the family altars.

LEISURE, RECREATION, AND THE ARTS

In the city, men's and women's activities tend to overlap so that there are few exclusive all-male or all-female activities. There are activities that one gender tends to favor or the other. For men, it is basketball, soccer, and video games, while for women it is window shopping. Both genders prefer to hang out either as a couple or in a unisexual group at a restaurant, play cards and mahjong, go to the movies, play pingpong, and, in rural areas, attend temple fairs. Some of the more solitary activities favored by men and women are talking on the cell phone, window shopping, watching television, browsing the web in an internet café, reading, and going to a dance hall. In northern China, both genders enjoy singing and story telling.

RELATIVE STATUS OF MEN AND WOMEN

Men formally occupy a higher social position in rural China. In the cities, men informally occupy more leadership positions (e.g., government and business corporations) than women. Within the domestic sphere there is an enormous difference between rural and urban women's ability to command influence. Prior to and after marriage, a rural woman is instructed to obey her mother-in-law and husband. The emphasis is on obedience and deference. A newly married woman is reminded that, in time, she will become a mother-in-law and thus gain authority and independence over the incoming wife. Before this time, a woman must rely on deception and guile, whereas men, secure within their natal family, do not hesitate in openly expressing their opinions and demands. In effect, the prevailing view in the countryside is that women can only gradually, over the course of a lifetime, expand their authority in the family.

In urban China the theme of a powerful woman and the henpecked husband is a source of much joking. Chinese men believe that, in the past, husbands had an easier time controlling their wives than they do today. One man remarked that, "In the past the mother-in-law was fearsome, now the wife is fearsome". The frequency with which this expression is invoked suggests that males are more ambivalent and less secure than in the past with their position within the family and society.

The idea that relations between spouses should be based on equality and parity is increasing among rural and urban youths. However, marriage still places greater restrictions on women's behavior. On the other hand, men also regard marriage as restrictive. Whenever a man leaves or enters his home, for example, his wife will customarily ask him where he is going or has come from. This is not, by any means, a polite ritualistic expression but is motivated by an unspoken but palpable concern that their husband might be seeing someone else.

Because women are saddled with the double burden of working and handling domestic chores and childcare, they often feel overworked, exhausted, and numbed by their duties. Men, on the other hand, believe that it is more their responsibility, and not that of their wives, to gain promotion, increase household income, and expand personal connections. It is a responsibility, an expectation, that they find demanding and take seriously. Failure to perform satisfactorily often results in their wives complaining that their husbands "let the family down." It is a complaint that men do not want to hear because it is perceived as a stigma attacking the core of their gender identity.

SEXUALITY

Sexuality was traditionally regarded as a natural, dangerous, and potentially polluting act. From a naturalistic perspective, sex was conceptualized as an exchange of body fluids necessary to restore health as well as to reproduce. An orgasm was viewed as potentially harmful in that it resulted, especially for the male, in the loss of bodily fluids and thus the depletion of yang. However, if a man could prolong an orgasm or not have one at all, he would obtain valuable yin essence while not giving up any yang essence. It was also deemed dangerous as the loss of too much yang essence (or semen) could result in a weakened body, making it vulnerable to illness. This cosmology gradually gave way to a more scientific or Western-based interpretation of the sex act that saw it as a healthy and important activity. The transformation was gradual. For example, it was only in the 1990s that masturbation was no longer considered harmful; now, like all things sexual, it is deemed immensely healthy.

Until the 1990s virginity was an ideal state that applied equally to females and males in rural and urban China. In the 1980s sexual intercourse took place only after a couple had agreed to marry. A nationwide sex survey, conducted in 1987, found that 62% of all married couples had their first sexual intercourse on their wedding night (Liu, Ngg, Zhou, & Haeberle, 1997, p. 243). By the late 1990s this percentage was significantly lower due to the increased tolerance of premarital sex. Unlike early generations, where premarital sex was usually with one's fiance, the single-child generation (born after 1979) changed the moral code. Sexuality is no longer regarded as a tacit agreement to marry, but instead is perceived to be simply a pleasurable experience that may or may not result in marriage.

Chinese society, though not necessarily the betrayed spouse, has historically been more tolerant of extramarital sex for men. Many men have had concubines, mistresses, and girlfriends and have visited prostitutes. Women have been under tighter community control and thus the opportunities have been less. Today, sexual pleasure is regarded as a fundamental aspect of married life. In China's largest cities, it is easier for women to engage in extramarital sex than at any time in history. This corresponds to increased reports of sexual disharmony among married couples.

The sexual behavior survey in 1987 (Liu et al., 1997) found a pronounced difference in men's and women's response to sexual arousal.

1. Male students reported being more aroused through live visual stimulation, whereas females found sexual situations depicted in movies more stimulating.
2. Educational level and not occupation is the more critical predictor of attitudes toward sexuality (e.g., people with more education change sexual positions more often).
3. Marital satisfaction appears to be similar among farmers and urban couples. However, city women appear to be more disappointed than village women, suggesting that they have higher expectations.
4. Village couples had a higher frequency of sexual intercourse (5.43 vs. 4.66 times a month, or a little more than once a week).
5. There was a relationship between changing sexual position and sexual enjoyment.

Throughout China's history there has been an enormous variation in the attitudes held toward homosexuality. In Imperial China it was not unusual for an emperor to have male and female concubines. However, during the Qing dynasty (1644–1911) this attitude was replaced with a more puritanical view that regarded all forms of extramarital sex as unacceptable. Male homosexuality was regarded as a threat to patriarchal authority, while female homosexuality was not (Brownell & Wasserstrom, 2002).

This attitude continued through much of the 20th century. By the 1990s, homosexuality became tacitly tolerated, albeit with misgivings. There are known homosexual (gay and lesbian) bars in China's largest cities.

As in Mediterranean cultures, homosexuality has clearly defined roles of passive and active sexual roles. The active partner engaged in penile penetration of the passive partner. Unlike in the United States, where older men yield to the wishes of the younger partner, in traditional China, where principles of social stratification shaped people's relation to one another, the younger partner yields to the wishes of the senior partner (Hinsch, 1990, p. 12) .

COURTSHIP AND MARRIAGE

In the early decades of China's post-revolutionary period, marriage required parental approval. However, by the 1980s that was changing. In China's largest cities, a new generation had come of dating age and, through their ideas and actions, had expanded the customary notions of courtship, generating new expectations and demands for emotional satisfaction within marriage. Part of this thinking suggested that if dating could provide some emotional excitement and satisfaction, marriage could do the same. In this way marriage is no longer seen as primarily a vehicle for procreation, but rather it is regarded as the primary institution for achieving happiness, contentment, and emotional security.

The folk notion that love and romance could be combined within marriage is not a recent phenomenon. The two were not perceived as antagonistic or mutually exclusive, barring unfavorable circumstances. What is new is the state's legal endorsement of free choice, and thus love, as a basis for marriage and, more importantly, the eagerness with which that endorsement is being embraced by the younger generation who demand that love and marriage be synonymous or, at least, possible bedfellows.

In the early 1980s dating existed in urban but not rural China. It was organized around two different dating styles involving different conventions which can be called formal and informal and are complementary. Both were entered into with the intention of realizing an immediate practical gain, enjoyment, or marriage. Formal dating (or courtship) differs from informal dating in its emphasis on normative rules, social judgment, and conventional standards for articulating romantic involvement. It is conducted according to rules that organize dating into a semiritualistic sequence of private and semipublic meetings, characterized by incremental increases in the public expression of commitment, usually resulting in marriage.

Informal dating, however, is pursued according to very practical rules, based on shrewd common sense and situational standards. These rules are sometimes provisionally formed by the parties to avoid the pressure of social expectations or the disapproval of one's community. Informal dating may or may not culminate in marriage. Informal dating begins in secrecy, appears to be ad hoc or accidental, and is characterized by public denial of any intimate involvement. In general, informal dating is conducted by individuals who truly love one another but are restricted by prior obligations (e.g., already married, parental or work-unit disapproval, etc.) from publicly acknowledging or expressing their involvement. Within the formal style there can be what we call courtship (a relationship oriented toward marriage) or just plain going out with no stated intent to marry. Although in the case of formal dating an individual may use the services of an introduction agency or friendship networks to find a suitable mate, it should not be construed that this style is devoid of romantic excitement or aspirations.

Once a person decides that a particular individual fits their "ideal," or comes close to most of their criteria, there is a pronounced tendency to fantasize about the other, which can often result in one becoming overwhelmed with romantic anticipation. It was common for individuals who entered into a more formal courtship to become infatuated after a marital agreement had been reached. Romantic infatuation may arise in either form of courtship and is characterized by emotional intensity, a kind of anxiety, expressions of romantic endearment, and the idealization of the other. The two styles differ only in the domain of public expression but not necessarily the intensity of involvement. In the countryside, the two forms of dating continue.

By the 1990s, in China's large and mid-size cities, informal dating had moved away from secrecy to a new ethos of openness. Dating is now regarded as a public declaration of one's independence. It is not usual to see young couples openly hugging and kissing in public. In many ways, the adolescence or youth stage has been pushed back. People no longer marry as easily as they once did. And if they do, they delay starting a family. Today, urban youth regard dating as an opportunity

to play, to seek pleasure, and to delay assuming the responsibilities of marriage.

HUSBAND–WIFE RELATIONSHIP

There are a range of responses to the meaning of marriage and family life. This was not always so. In Imperial China marriage was regarded as an alliance between families with the junior generation serving the senior generation. Thus, children continued to defer to their parents. By the early 20th century this ideal had been modified in the largest Chinese cities. In rural China it was not till the 1990s that marriage and family life was redefined to emphasize conjugal unity over the ideal of the larger extended family. Today, young couples in rural and urban settings share many similar values and life orientations.

In an urban arena there are a wide ranges of response to the meaning of marriage and family life. As a rule, if a couple love one another, they repeatedly strive to maintain mutual consideration. Thus marriage, is seen as "a bond between equals who do not keep secrets and who enjoy each other's company and should prefer to do everything together." Consideration and mutual respect are values used by spouses and outsiders to evaluate the quality and success of a marriage. They are not gender-specific traits. Sacrifice and compromise are not constitutionally foreign to either spouse.

The majority of Chinese assume that the loss of romantic intensity is an inevitable aspect of marriage. Typically, the intensity lessens following the birth of a child, which results in the couple's redefining their roles from lovers to parents. Other Chinese, especially young intellectuals, do not believe that romance has to wane, and tend to resent its waning deeply.

Those couples who enjoy one another's company and accommodate, if not actually enjoy, their spouse's personality style and individual quirks seem to have the more couples in satisfactory marriages. In addition to acceptance of a spouse's personality, couples in satisfactory marriages communicated their anxiety, especially fears of losing the other's love.

CROSS-SEX RELATIONSHIPS

In rural China, the kinship idiom continues to be a primary means by which individuals organize their daily lives.

Relationships between cousins, uncles, and aunts are deemed important. In contrast, in urban areas, kinship is clearly regarded as much as a potential burden as a potential benefit or a familial necessity. Upwardly mobile kin often deliberately cut of blood ties which bind them to their more economically humble relatives. Parents, children, siblings, and other kin tend to work at different kinds of jobs, developing individual skills and thus unconnected networks of job-related friends. As a result, the dependence upon one's kin is greatly reduced in favor of increasing reliance on friends in the workplace. This change requires that Chinese pursue a broad-based strategy of social interaction that includes both kin and nonkin. One insightful informant, when asked to make a distinction between kin and friends, acknowledged that "friends are for mundane matters, family is for ritual affairs."

The rural ideal of the joint or "big family" as the preferred family organization no longer exists in urban China or, if it does, only in small numbers. Within the nuclear family, relations are ideally warm and supportive and, in truth, this ideal is more often honored than breached. In contrast to brothers, who display a great deal of sibling rivalry, brothers and sisters cooperate more than compete, with the closest ties being between an older sister and younger brother. For these ties it appears that a wide age gap is conducive to promoting a type of mentor–apprentice relationship which continues throughout an individual's life.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

In urban China the *gradual* expansion of women's influence within the home has enabled contemporary women to achieve a sphere of power and domestic independence faster than had been the case in their mother's generation.

In the countryside the increasing value of female labor combined with a shortage of female marriage partners (due to the preference for male children) has led to rapid inflation in marriage-related expenditure by the groom's family but not by the bride's family. Before 1949, wife-givers incurred the major expense involved in marriage and families with more daughters than sons tended to become poorer. Now families fall into debt if they have more sons than daughters (Min Han, 2001, pp. 147–167).

There is a pronounced expansion of women's rights and overall respect that is as much due to the government one-child policy as it is to the expansion of economic consumerism and with it a greater emphasis on individuality.

Hma' Btsisi'

Barbara S. Nowak

ALTERNATIVE NAMES

Btsisi' are also known as Ma' Betisék and Mah Meri.

LOCATION

Btsisi' live along the coast in the districts of Kuala Langat and Kelang in the State of Selangor, Peninsular Malaysia.

CULTURAL OVERVIEW

Btsisi' are an *Orang Asli* (Malay, "original people") tribe, who speak Btsisi' or Hma' Heh ("we people"), a South Asiian language belonging to the Mon-Khmer family of Austro-Asiatic languages. Traditionally, moving in and out of various ecosystems including the inland rain forests, mangroves, and the littoral, Btsisi' carried out opportunistic foraging in these environments. In the rain forests Btsisi' hunted and gathered; they would also cultivate small patches of cleared forest with hill rice and other food crops. In the mangroves, Btsisi' fished using nets, hook and line, and poison tubers. They also crabbed using a variety of techniques depending upon the tide. The mangrove forests also provided wood for houses and firewood. Along the strand, Btsisi' gathered clams, cockles, and other bivalves, and fished using long stationary barrier nets raised and lowered with the incoming and outgoing tides. In the Straits of Malacca, Btsisi' fished with long lines and palisade traps. Many of the traditional subsistence activities are no longer practiced, as a result of deforestation and mangrove clearing by commercial agricultural plantations, and commercial overfishing. While Btsisi' still fish and collect mangrove fauna, it is less productive and results in smaller catches. Modern Btsisi' work as wage laborers harvesting oil palm for plantations, while others work at the new international airport and nearby resorts as cleaners and baggage handlers. Cash cropping is now a major economic activity with oil palm, coffee, and fruit as the major crops.

One village has a well-established wood-carving cottage industry marketed to tourists.

Traditionally, Btsisi' lived along the upper reaches of mangrove rivers which gave them easy access to the various ecosystems they exploited. People built stilt houses along the tidal banks and others resided on small boats wandering in the mangroves. Today, a few Btsisi' still live in the mangrove, but most have opted to live inland and travel to the mangroves. With increasing integration into the cash economy, wealthier Btsisi' are beginning to build their houses with cinder blocks on cement floors. Poorer Btsisi' continue to build their houses on stilts using materials from the mangrove; however, building materials are becoming scarce due to the commercial oil palm plantation draining the mangroves.

Villages vary in size but most are no more than 60 households. There are seven island communities, and four mainland villages situated near the coast. There are also a scattering of Btsisi' who still opt to reside in the mangroves in small clusters of two to three houses. The Malaysian government census places the Btsisi' population at around 1,300 people.

Most decisions are reached at the household and kin group level. When a village meeting is called, everyone knows the issue or problem, thus allowing time and opportunity for extensive informal discussions before the formal meeting. People reach their opinions prior to the meeting; a married couple usually reach a joint opinion which the husband presents. Women rarely participate since they do not speak with appropriate decorum. There is no proscription on women learning proper behavior and speech, but they leave this to the men. Women attend meetings sitting amongst themselves, listening to the men. Meetings always end in consensus, highlighting the unity of the community.

CULTURAL CONSTRUCTION OF GENDER

Btsisi' recognize two gender categories: *hma' kdoh* (woman) and *hma' lmol* (man). Humorally, Btsisi'

443

categorize females as "cool" while men are "hot." This makes females healthier than males. The biological role in reproduction requires females to have more strength than men. Since females have different needs than males, they are born with more ribs; they have more *nabi* ("prophets") to assist them and give them strength. Females are therefore born "cooler" or "healthier" than males, giving them more strength. A consequence of this is that females are also perceived of as being "more intelligent" (*akal*) than men. This belief does not translate in any obvious way in daily praxis.

Modern Btsisi' dress similarly to rural Malays. Women wear a sarong and blouse when working around the house or travelling into town. In the mangroves or when sea-fishing women wear a sarong or homemade pants and a blouse. Men wear running shorts and T-shirts during the day and sleep in shirts and sarongs. Traditionally, women went bare breasted, but when outsiders began coming into their communities, they became timid and embarrassed, and began covering themselves. Men keep their hair relatively short, although some younger men are now wearing long hair. Most women wear their hair long, preferring to put it in a single braid or tied up in a clip. Older women can often be seen wearing their hair in a bun at the back of their head.

GENDER OVER THE LIFE CYCLE

Babies and children are called *budek*; if qualification is necessary, people say *budek kdoh* ("female child") or *budek lmol* ("male child"). Adults are known simply as *kdoh* and *lmol* ("female" and "male"), while elders are *manggew* and, if qualification is necessary, the male or female describer is added.

During a person's life cycle, birth, marriage, and death are the only stages publicly or privately marked. Seven days after a newborn's birth, family and friends come together to celebrate. The ritual to purify the newborn, its parents, and midwives is followed by the bestowal of a name and payment to the midwives. The ceremony is no different for a male or female newborn.

Marriage (*nikah*) is the point a person enters adulthood. Slowly, over time a young, newlywed couple begin to accrue the rights and responsibilities of adults. The couple's parents will initially guide them, making sure they learn their new roles. Once they begin separating their household finances out from their parent's or when they begin residing in their own domicile, the couple are considered an independent household with all rights, responsibilities, and power that accompany the adult status. The final life cycle stage Btsisi' mark is death (*kəbuis*). Death and mourning rituals are marked the same way for males and females.

Socialization of Boys and Girls

Btsisi' value all children and feel great joy when a child, boy or girl, is born. There is no feeling of failure if a family has only boys or only girls. However, there is a cultural preference for a girl to be the firstborn. Girls are born "cool," and hence stronger and more likely to survive. Boys at birth are deficient in strength; humorally, they are "hot" and thus weaker and less likely to survive. A "hot" person is in supernatural danger. A girl's coolness will help her survive being born, whereas a boy's natural heat makes his entry into the world precarious and dangerous. A firstborn male child is "lucky" to survive because he was probably a "sickly" child.

Early in a child's life there is little difference in parental care, but once a child begins walking and gains some independence, slight differences in parental responses to boys and girls begin. Parents ask girls to do little tasks around the house, while boys are given more freedom to do what they want. This difference becomes more obvious as children become older. Girls begin to take responsibility in the house—cooking and cleaning. Boys may also be required to take responsibility for younger brothers and sisters, especially if no girls are available to help. It is not unusual to see boys carrying a younger brother or sister on their backs when their parents are busy.

As children reach 10 or 11 years of age they begin to play more consistently in same-sex groups. Boys go wandering around and beyond the village. They build little boats to float in the village drainage ditches and catch small fish in the larger ditches outside the village bounds. Boys begin playing with the older teenaged boys, learning soccer and baseball. Girls, when they can get away from household duties, sit and talk in or around the village community house or at one of their homes. Girls frequently look at magazines and talk about all the images they see.

Puberty and Adolescence

Puberty goes unmarked for boys or girls. Even the commencement of menses occurs without note.

The absence of circumcision for a boy and girl distinguishes Btsisi' from their Muslim Malay neighbors. Btsisi' highlight this as a critical difference between themselves and the Malay community.

Both boys and girls go to local state schools. Parents do not restrict girls from going to school, and strive to find the money to send girls to secondary school where they live in a dormitory setting.

Attainment of Adulthood

Adulthood is reached upon marriage. It is one of the few life stages ritually marked. A tooth-filing ritual performed in the early stages of a wedding ceremony marks the transition into adulthood. The tooth filing occurs for boys and girls who have never been married, marking their transition into the world of adults.

If, by chance, a boy or girl marries before his or her elder sibling, the elder sibling must first have his or her teeth filed since it would be presumptuous for a younger sibling to enter adulthood first. Even though the older sibling's teeth are filed and he or she is technically an adult, the person's behavior, roles, and responsibilities do not alter. Thus, while the tooth-filing ceremony symbolically marks entry into adulthood, the real entry into adulthood is marriage when the youth's roles and responsibilities change.

Middle Age and Old Age

As a person grows older they command more respect from those younger than them. It is *tolah* (a "curse") to be disrespectful to elders; thus the older a person is, the more respect they garner. At community festivals, Btsisi' give men, and especially older men, a position of respect. Men, in general, and older men in particular, are always served food first. As there are usually more plates than people, older women will also eat in the first sitting of a meal, indicating their respected position in the community as well.

Personality Differences by Gender

Btsisi' believe that all people should be kind, gentle, and nonaggressive. Fear of outsiders is instilled in both young male and female infants, but with time boys overcome their fear while girls' reticence increases. As girls pass through puberty they begin to fear sexual advances and sexual assaults by men from other ethnic communities. Btsisi' women talk in front of their daughters about "outside" men, passing on their fears and anxieties.

Btsisi' women have always been more apprehensive of leaving the village. Traditionally, men are characterized as being involved in activities that take them outside the village, while women's center of activity was inside the village. When women left the village on gathering expeditions, they went in large noisy groups to scare away the dangerous animals such as tigers. Btsisi' culture has numerous metaphors highlighting a male–female/outside–inside dichotomy.

As discussed in the section on leadership, women today do not play a central role in community meetings. They remain quiet and listen to the proceedings and rarely, if ever, contribute in an open public forum. Women do not know how to speak in public. They do not speak *halus* ("refined"). This is not perceived as an inherent biological difference but rather a value orientation. Women do not speak *halus* because they do not care to learn how to speak *halus*. If a woman wanted to learn to speak properly and learn appropriate protocol, she could. But women do not care to learn and become a titled elder. They do not desire to speak in public. They leave this to men.

While there are people suffering from mental illness, data suggest that it is not gender specific, although quantitatively more women than men seem to suffer. Alcoholism is an extensive problem for both men and women. Impressions are that more men than women struggle with alcohol abuse, although alcoholism among women is increasing.

Gender-Related Social Groups

When a young couple first marry, they reside ambilocally. After shifting back and forth for a few months, the couple settle in the bride's parent's house. If there is insufficient room they will opt to reside with the groom's family. The couple remain under the watchful eyes of their parents, learning their new roles as husband and wife. They may join the parental household or form their own household, keeping their finances and resources separate. Following the birth of one or two children, the family establishes its own residence. Traditionally, village exogamy prevailed,

but today nearly 80% of all marriages are endogamous; hence, neither bride nor groom is very far from their parents and kin.

Modern preference is for children not only to marry within the village but also within the *opoh* ("family"), the filiative cognatic descent group. Membership in an *opoh* is based on parallel filiation; technically, therefore, brothers and sisters belong to different *opoh* ("family"). Girls belong to their mother's cognatic descent group and boy's to their father's. Preference is for boys to marry their fathers' younger sister's daughter. By doing this, a boy is marrying into his father's *opoh* and a girl into her mother's; therefore they are both marrying kin and reuniting their grandparents' *opoh*.

Gender Roles in Economics

Btsisi' division of labor is prescriptive rather than proscriptive. An ideology of cooperation between husband and wife means that women and men do whatever is necessary for the smooth productive functioning of the household. While ideally women are responsible for household maintenance and men for the provisioning of the household, in reality both men and women work jointly, as a team, cooperating for the household's success.

Women traditionally performed activities occurring within the village area while men took responsibility for those activities outside the village. This meant that women, besides doing the household and childcare activities, were also responsible for taking care of the swiddens and harvesting the fruit from village trees. Men, in contrast, hunted and did wage labor. The inside–outside dichotomy means, for example, that women sell fruit within the village. However, if the same fruit is sold to a middleman outside the village, it is the men who are responsible. Cash from the fruit belongs to whoever, man or woman, owns the trees, but in reality the cash, as all income, is controlled by the women of the household.

While there is a normative gendered division of labor, with men and women assigned different activities, in reality husbands and wives work together as a team. While women do not go gill- and seine-net fishing by themselves or in partnership with other women, they do go with their husbands. Similarly, men go bivalve collecting and hook-and-line fishing with their wives, even though they typically do not go on their own. No one wants to do things by themselves without a friend, and who is your best friend but your spouse!

In their free time, women may weave sleeping mats and baskets. Preparation of the material is time consuming but, once done, the weaving occurs at a leisurely pace. While weaving is categorized as "women's work," a few men, in the privacy of their own homes, might do some weaving on their wife's mat. Wood carving is an important handicraft both traditionally and today as an income-generating cottage industry. It is an activity only men perform.

Traditionally, Btsisi' did not "own" land. There was a notion of usufruct, but people shifted their swiddens and with sufficient land no one was concerned about inheritance. Today, this is not the case. Land scarcity is severe. Most land traditionally used for hunting, gathering, and swiddening is no longer available as it is owned by a large multinational oil palm plantation. Land on the mainland is under pressure from national and state development projects like the new international airport. Land values are skyrocketing and village land is now under threat of state government revocation.

Village exogamy with uxorilocality (matrilocality) is no longer the norm. In the past men were not concerned about next year's swidden land, but today land is planted with cash crops and houses are permanent. Upon the termination of a marriage, men no longer want to return to their natal villages, abandoning their fields planted with cash crops. Village exogamy has been replaced with endogamy; therefore, even with marital dissolution, a man maintains control over land he or his father planted and cleared. Women and men can both own and control land; there is no difference, although fewer women seem to own oil palm trees.

Oil palm harvesting has become an important economic activity. Harvesters, using long bamboo poles with sharp sickle-shaped knives lashed to one end, cut down the fruit bunches which can be as high as 15 ft. Palm fronds are also cut from the trees. Harvesting oil palm is not an activity performed by one person. Typically, it is the work of whole families. While men cut the fruit down, women and children collect the 40 kg bunches into a pile and pick up the small individual fruits which have fallen away from the bunch. While whole families work at this activity, if employed by the commercial agricultural plantation, the employment rosters typically only note the men. Women and children do not receive any separate income for their work.

PARENTAL AND OTHER CARETAKER ROLES

Btsisi' recognize the nurturing role of mothers. Mothers carry a fetus for 9 months and 9 days, and then bring a child into the world with great effort. Mothers feed and carry the newborn almost single-handedly. Unlike single mothers, single fathers will foster their children out to relatives. However, if a widowed man wishes to keep his children, it is his right. But, unless they are sufficiently old and relatively independent, men find caring for children difficult. Upon remarriage following divorce, men only infrequently take their children with them because their new wives are guardedly jealous of their own children's position in the household. Women are pleased and proud if their stepchildren consider them to be "good" mothers.

While people should respect their fathers and grandfathers, Btsisi' do not believe that children must take care of them in old age or sickness, as they believe they must do for their mothers and grandmothers. Fathers do not nurture children as do mothers; consequently, no supernatural punishment occurs for "forgetting" them.

Yet, men are very loving and nurturing of their children. Fathers' child-tending supplements their wives' childcare activities. Time studies found men average approximately 15% of their day performing childcare activities compared with women's 62%. Men's participation in childcare varies according to the developmental cycle of the household. Where there are only young children, men's contribution is greatest. Toddlers whose mothers have younger siblings to care for will spend extensive periods under their fathers' care.

While a father plays an active role in finding his sons a spouse, he must demonstrate caution when organizing his daughters' marriages. It cannot be said that a father "sold" his daughter into marriage; thus a man must show care this does not happen. A man typically leaves his daughter's marital arrangements to her mother's cognatic descent group.

LEADERSHIP IN PUBLIC ARENAS

As mothers nurture their children and sisters nurture their sibling group, the *Batin* (village leader) nurtures the local group. Traditionally, with uxorilocality (matrilocality) and village endogamy, women formed the central core of the local community. The centrality of women in the local village is expressed in women's traditional role as holder of the political office of *Batin*. As a direct matrilineal descendant of the local group's founding ancestor *Batins* symbolize the local descent group. Btsisi' elders remember the last two women *Batin*, both of whom died without heirs. Thus their line was lost and there are no longer any women in the position. But elder women still have an important unofficial role in maintaining community peace and unity. Women will informally come together under the informal leadership of a female elder in the community to discuss issues that directly affect the women of the community.

While women's role was to maintain village life, men maintained external relations. Traditionally, men married into a community. Being "outsiders" they performed activities which took them beyond the village. This outward-looking view was reinforced by men holding the leadership position of *penghulu'*, whose job was to maintain relationships with other Btsisi' communities and the wider outside world.

Today, all titled positions are held by men, inherited through the patrilineal line. However, if the elders consider a man unsuitable for the position, such as being too concerned about his and his family's welfare to the detriment of the community or drinking too much, his consanguineal relative, such as a brother or patrilineal cousin, will fill the position.

GENDER AND RELIGION

Btsisi' place great emphasis on the couple as the most important relationship in Btsisi' society. This notion is followed through in the belief system with God being both female or male. "How could it be anything other than this?," Btsisi' say. Ancestors (*Moyang*), who can be male or female, also have spouses. Two of the most prominent *Moyang*, Moyang Mlur and Moyang Lunyot, are husband and wife. This couple is responsible for providing Btsisi' with the rules of humanity (*adat*), which prescribed who people can and cannot marry. The emphasis on couples persists in the ideology of the shaman's spirit familiar. Most often, the spirit familiar is of the opposite sex of the shaman and has a metaphorical marital relationship with the shaman.

Btsisi' *trimbow* ("sacred origin stories") relate the creation of the world and humanity. The *trimbow* begins

by describing the creation of humanity when God and God's assistant, a *jin* (genie) were alone in the world. The *jin* molded "heavenly earth" into a figure which God gifted with "life's breath." The *jin* then made a second figure to be a "companion" to the first. Both figures were molded from the same substance even though they were created separately. The story is unclear as to whether the male or female figure was made first. These figures were the parents of Pagar Buyok and her younger brother Busuh, the "original siblings" whose descendants populated the world.

Following a great deluge, the original sibling pair circled a mountain, the last remaining dry land, in search of mates. They discovered that they were the only remaining people in the world, so God allowed them to marry. Btsisi' celebrate the sibling couple by singing and dancing the *main jo'oh*. People dance around a *busut* ("mound") symbolizing the center of the world, the mountain the siblings circled around. Women dance in an inner circle around the mound with men in a circle outside the women's. Women in the inner circle are closer to the *busut*, suggesting that they are closer to the cosmic center than men. Women and men dance around the mountain in the same direction to avoid the possibility of brother and sister symbolically meeting.

Shamans are essential to rituals such as weddings and curing ceremonies. Women do not desire to become a shaman. Anecdotal evidence suggests that this is because women have another more direct route to the spirit world through their menstrual blood. Menstruating women do not bathe in rivers. Their blood opens a path directly to the spirit world. Thus women have an innate ability to communicate with the ancestors. Women do become midwives although, as is the case for shamans, fewer and fewer desire to learn the body of knowledge.

Leisure, Recreation, and the Arts

Women and men both work very hard. Time spent in subsistence and income-generating activities changes seasonally and monthly with the tides and weather. Btsisi' who fish and collect animals in the mangrove and on the strand schedule their activity to the tides, leaving in their boats before the tide ebbs and returning with its rise. This might require a 3 a.m. departure.

Leisure time varies depending upon the developmental cycle of the household and people's livelihoods. Women with young children have substantially less leisure time than their husbands, but if women have the help of older children, especially daughters, they have more time to spend working or socializing and resting. Evidence indicates people who work as oil palm harvesters rather than fishing, have more leisure time. However, people who fish have greater flexibility to take a day off if tired.

When men socialize they are more likely to go off to the local toddy house and have a few drinks with their friends. Women also go, but usually not without their husbands. When women go to the shop on their own, they typically buy what they need and then return home, whereas when men go to the store they will linger, talking with friends and relatives.

Relative Status of Men and Women

Even though there are titled elders, all of whom are men, Btsisi' should be viewed as an egalitarian society in which women and men are both considered valued, important, and equal members of the community. Women and men who are knowledgeable about maintaining the health and well-being of people are respected for their knowledge and recognized as valuable community members; however, they do not receive any special rights or privileges as a result of their roles.

Women and men jointly reach decisions that affect their lives. What wage and subsistence activities people do are determined mutually by those involved. Control over resources is shared among owners. If a brother and sister jointly own land, they will jointly determine what the land will be used for. In terms of marriage choices, both young men and young women have a similar ability to control the selection of their partner. The influence a person has is dependent not on whether they are male or female, but on their personality.

While there is officially no "head of household," people say that, if there is one, the woman of the household is the leader. Women are the household financial controllers. Men hand their income to their wives who in turn give their husbands "pocket money." Decisions on household purchases should be reached after discussion between a husband and wife, and a mutually agreeable solution is reached.

SEXUALITY

The topic of sex rarely comes up in everyday conversation with people of the opposite sex, except when people are drinking. While people do not approve of blatant bawdy behaviour, they do not express disapproval of sex or conversations about sex. Btsisi' myths of the origins of sex highlight the fact that sex is fun, and divine intervention was involved in making it easier. Btsisi' do not view sex as debilitating, nor do they perceive women's sexuality as threatening to men. Women seem to dislike sexual activity more than men, but this is because they fear pregnancy. While some women use birth control, not all do. Women who do use contraception say that they enjoy sex. Sexual activity among married couples is limited to no more than once a night otherwise, couples say, "they would be too tired in the morning." Both men and women remain fully clothed during sexual activity.

Extramarital activity occurs often. Men and women are both equally involved in extramarital activity. Men are the primary initiators of sexual activity, verbally alluding to or suggesting a liaison. If women are interested in a man they will attempt eye contact through winking or using other suggestive facial poses. Extramarital relationships do result in conception, which sooner or later becomes public knowledge, even if it is 20 years later. To accuse a spouse of adultery requires "catching" him or her in the act. Hearsay is unacceptable. If caught, the offending parties do not deny the act and give the wronged spouse "evidence" of the wrongdoing. The affronted spouse, whether the husband or wife, has the same rights. The accused lovers have the same rights and obligations. Adultery is insufficient cause for initiating a divorce unless the offending spouse is "caught" at least three times. The wronged spouse can then receive a divorce without being fined; if the injured spouse wishes to leave the marriage without catching his/her spouse three times, he/she will have to pay a fine to the elders.

Notions of modesty have changed with the encroachment of the outside world, especially with Malay morality. Traditionally, Btsisi' women did not wear clothing on their upper body. Today they do. During daylight hours, women no longer walk around their homes wearing just brassieres and sarongs. With more outsiders coming and going in villages, women have altered what they consider modest. Women will no longer even breast-feed outside the village, believing that the Malays will consider this immoral.

Little information is available concerning Btsisi' views on homosexuality; there are no ethnographic examples in the literature. While people seem willing to talk about children born out of wedlock and adulterous relationships, Btsisi' never speak of homosexuality. Cross-dressing is also a topic that is not discussed.

COURTSHIP AND MARRIAGE

Btsisi' youth have ample opportunity to get to know each other. At school, around the village, at the store, on the road, and at festivals youths mingle. Weddings, which are all-night activities, provide young couples great leeway to go off together and get to know each other. Today, youths own motorcycles, giving them the freedom of mobility to visit other villages.

Btsisi' women say that both they and men are attracted to light-skinned people. Fair skin is a sign of beauty. When preparing for a celebration, young women take great care in presenting themselves in an attractive way. They will powder their faces to lighten their complexion, put on red lipstick, oil and scent their hair, and put on their finest clothes. Women say that what most attracts them to a man is his heart, if it is good and kind. Women as well as men say a person's physical appearance is only of minor significance.

There is an expectation that all youths will marry. Extensive census collecting found only one middle-aged man who never married. His rationale for this was that he did not want to provide for a woman's superfluous and expensive desires. This man was never ostracized and he was never considered particularly strange. However, it is atypical.

Over half of all primary marriages are arranged by the couple's parents or grandparents. Girls have as much or as little to say over arrangements as boys. The ability to refuse an arrangement depends upon the child–elder relationship, but if a marriage has been arranged, in most cases it is a fait accompli. Youths rarely say no to their elders' arrangements. Primary weddings are expensive and youths (and parents) need the financial assistance of their families. Refusing the choice of an arranged marital partner will negate the possibility of financial assistance when the youth wishes to marry later.

Most marriages are arranged between kin. Families arrange for boys to marry into their father's *opoh* (cognatic kin group) and girls into their mother's.

Thus, a boy ideally marries his patrilateral cross cousin. Village endogamy is also a common occurrence in over 80% of all marriages.

Marriage ceremonies between *dara* ("never married") are very elaborate, something unique among *Orang Asli*. Ceremonies begin on a Friday night of a full moon. Gifts (*minang*) pass from the groom's family to the bride and her family. The *minang* includes a token amount of money, a small woven basket of cigarettes, and betel nut quid makings which go to the bride's family; clothes and other items that the bride will need to beautify herself for the following days' ceremonies go to the bride. On the following morning, both the bride and groom's teeth are filed, indicating their entry into adulthood. They are then separately sequestered until the night, when an elaborate ceremony takes place to ritually cool the couple, thus ensuring good luck and good health. Celebrants dance and sing through the night. On Sunday morning the groom and his kin, using martial arts, symbolically break through a line of bride's male kin protectors. The groom then "captures" his bride. The couple are then greeted by their parents who wash the feet of their new child-in-law. The couple then learn through action and lecturing what it means to be a wife and husband. They learn what their roles are and how they need to work together as a team. The couple then receive a new married name (*glaw odo'*) which they use to address and refer to each other; the same name is also used by the community. This highlights the cooperative joint status of a conjugal couple.

Widowed and divorced people (*janda'*) remarry. This is particularly the case for widowed men. Older widowed or divorced women will normally wait longer than men before remarrying. Men need the help of a wife more than women seem to need the assistance of a husband. People are free to establish their own secondary marriages. Elders cannot control widows or divorcees as they can young couples. "Customary law" only requires providing a meal to kin and villagers for secondary marriages. But many do not even bother with this.

Btsisi' have a marriage institution called *tukah kdoh* ("wife swapping"). This is when two married couples exchange partners for either a predetermined period of time or permanently. This arrangement is typically the result of an extramarital relationship which a couple wishes to make public, thus ending the worry of "being caught." In permanent swaps, the offended man and woman agree to the swap to avoid the divorce fines they would both otherwise have to pay.

HUSBAND–WIFE RELATIONSHIP

Ceremonies on the third day of a wedding focus on teaching the couple to work together in unison and to share the products of their labor. They are no longer two separate individuals but rather one unit with a shared identity and a shared purpose. They are an *odo'*, a couple, who have a cooperative relationship with shared goals. The relationship between husband and wife is a major venue of male–female relations, shaping the lives of both women and men. Ideally, a married couple should not argue. Life should be harmonious, with spouses helping each other, working together as best friends. A husband and wife must be companions collaborating for success. The traditional Btsisi' word for marriage, *kuyn-hodong*, is the compound of the words *kuyn* ("husband/man") and *hodong* ("wife/woman"). There are many metaphors symbolizing the joint cooperative relationship necessary between husband and wife.

While there is a conceptual scheme dividing men's and women's work into a complementary division of labor, flexibility characterizes the sexual division of labor. Few, if any, restrictions prohibit a person from performing tasks assigned to the opposite sex. Many of the activities Btsisi' perform require a partner. People prefer this partner to be their spouse. In this way resources remain within the household rather than being divided. Even if an activity can be performed individually, who would want to be alone? People want to do things with a friend, and their spouse is their best friend. If he/she is not, then why stay in the marriage? The lack of a rigid sexual division of labor and the need to have a partner reinforces interdependence and cooperation between husband and wife. A Btsisi' man said: "There is no difference in the work women and men do. We all do the same thing and we work together. This way it gets done faster." Working together means that women and men have mutual areas of discourse.

A good wife cares for her children and house, works with her husband in the fields and at sea, and she loves her husband and remains faithful to him. In turn, a good husband should not be lazy, he should be a good provider, and he should love his wife and remain faithful to her.

Polygyny is infrequently practiced. Women do not like their husbands to take a second wife and in most instances the man's first marriage will fail. Cowives do not get along and most often the wives will reside in

different villages. Sororal polygyny is the only type of polygyny which is truly successful. Who can be angry with her sister? Polyandry is prohibited. If caught in such a relationship, the punishment is for the three people to be tied to a stake in the sea and drown with the rising tide.

Divorce is possible for both men and women. Reasons why women and men divorce do not differ nor do the fines for initiating a divorce. It is easier for men to initiate a divorce because they are more likely to have access to the funds needed to pay the fines, but this does not seem to inhibit women, who receive financial support from their families. If old enough, children decide with whom they want to reside. Usually they spend time with both parents, since village endogamy prevails. But fearing stepmothers, children prefer living with their mothers.

OTHER CROSS-SEX RELATIONSHIPS

Sibling bonds, especially the brother–sister bond, are central to Btsisi' culture. The original married couple in Btsisi' *trimbow* ("sacred origin story") were older sister and younger brother. Customary law does not allow brother and sister to marry as the original siblings did.

While the relationship between all siblings is very close, same-sex sibling relationships are generally closer. With parallel filiation, sisters and brothers are not "kin"; they do belong to the same *opoh* ("kin group"). By arranging their children's marriage, especially when it entails a boy marrying his patrilateral cross cousin, the brother–sister pair ensures that their grandchildren will be siblings as they are.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Although Btsisi' culture is undergoing dramatic changes with land loss, resource depletion, and wage labor, the relationship between women and men remains constant. Women and men remain true partners sharing in their work and sharing in their play. This is atypical, but Btsisi' culture has buffered the most common negative impacts of colonialism and development on women's relationship with men. However, there is slight linguistic evidence suggesting that changes are beginning to occur in the cultural construct of the gender balance in Btsisi' society. In the past, terms of reference and address for affinal kin were the same regardless of the sex of the person speaking or the person being addressed. In 2002, the terms of address and reference for men and women are no longer the same; the terms of address and reference for females have altered. Whether this linguistic change foreshadows behavioral changes is not yet known.

Hmong of Laos and the United States

Dia Cha and Timothy Dunnigan

ALTERNATIVE NAMES

Alternative names are Hmoob, Mong, Moob, Miao, and Meo (derogatory).

LOCATION

In the 19th century, groups of Hmong engaged in large-scale migrations into Southeast Asia from the region of southern China, settling largely in the highlands of northeastern Laos. Thereafter, many Hmong fled Laos as the Pathet Lao assumed control of Laos in 1975. After living for a time in refugee camps in Thailand, these Hmong resettled in France, French Guiana, Australia, Canada, and the United States. This article focuses on the Hmong who immigrated to the United States from Laos after the Vietnam War, becoming Hmong Americans. These Hmong were born and/or raised either in the refugee camps of Thailand or in the United States.

CULTURAL OVERVIEW

Linguistic and Cultural Identifiers

Speakers of *Hmoob Dawb* or White Hmong call themselves *Hmoob*, whereas those who speak *Moob Leeg* (no English translation) refer to themselves as *Moob*. The presence versus the absence of preaspirated nasals is only one of the many differences, phonological, syntactic, and lexical, that distinguish these two major and, for the most part, mutually intelligible varieties of Hmong spoken in Laos and North America. Common ethnonyms used by outsiders for Hmong are Meo (in Laos, Thailand, and Vietnam) and Miao (in China).[1] The latter term is a general "nationality" label that applies to a number of groups with distinct languages and cultures (Schein, 2000). Western reporters who covered Laos during the Vietnam War followed the lead of Lao sources in using the denigrating term Meo when writing about the seemingly exotic Hmong or Mong.

Historical Overview

Hmong began moving into Southeast Asia during the 19th century to escape political instability and conflict in southern China. They established villages in mountainous northeastern Laos where they had to deal with Lao and French demands for tribute and labor. In reaction to these oppressive demands, a Hmong man instigated a rebellion that lasted from 1918 to 1922 by prophesying the return of the ancestors and the miraculous expulsion of the French from Indochina. Although French colonial authorities suppressed the uprising and executed its main leaders, they granted the Hmong a greater degree of self-governance. Becoming part of the official government created new problems for the Laotian Hmong when influential individuals and their followers took opposite sides in the political struggles that followed (see Quincy [1995] for more extensive history).

In the 1930s, two powerful Hmong families competed for French recognition near a key Laotian trading center situated near the border with Vietnam. The rivalry led to the formation of pro- and anti-French factions. The former transferred their allegiance to the Western-supported constitutional monarchy when it was established in 1949, and fought in defense of the Royal Laotian Government with extensive help from the Central Intelligence Agency of the United States (C.I.A.) beginning in 1961. The smaller anti-French faction joined with the Lao Issara (Free Lao movement) after World War II in agitating for complete political independence from the West. They subsequently became part of the communist Pathet Lao movement at the time of the Vietnam War when the Laotian military and the C.I.A.-assisted Special Guerilla Units, which were predominantly Hmong, opposed the Pathet Lao and the North Vietnamese Army. Other Hmong tried to encourage the formation of a coalition government, but compromise proved impossible. Almost 15 years of warfare, which was conducted primarily in northeastern Laos, devastated the Hmong population. After the Pathet Lao assumed control of Laos in 1975, a great many Hmong fled to Thailand where they

were placed in camps and forced to live under harsh conditions. Most of these refugees were eventually resettled in Germany, France, French Guiana, Australia, Canada, or the United States (Cha & Livo, 2000; Hamilton-Merrit, 1993; Pfaff, 1995).

Economy and Politics

The Hmong who first migrated to Laos were swidden farmers. They created small tillable plots in the highlands by cutting down and burning the forest vegetation. The principal food crop was originally maize, but dry-land rice became increasingly important over time. Wet (paddy) rice farming was practicable in only a few areas accessible to the Hmong. They grew a variety of vegetables in house gardens, and kept chickens and pigs. Farmers with sufficient land raised horses and cattle. The Hmong planted poppies to obtain raw opium that could be bartered for salt, silver, and a variety of manufactured goods. The production and trading of opium carried no stigma or threat of legal sanctions. It was used domestically as a medicine and an analgesic. Addiction to smoking opium occurred, but was not very common except among ailing elders (Cooper, 1984; Cooper, Tapp, Lee, & Schworer-Kohl, 1996).

Hmong villages tended to be fairly small and temporary. When soil fertility declined and the fields ceased producing good crops, entire villages moved to new areas of virgin or regenerated forest. Where Hmong managed to establish more permanent settlements closer to urban centers, the boys could commute weekly to the city and live together while attending school. Catholic missionaries established an academy that trained several generations of Hmong boys. In order to garner greater political support in rural areas during the period of the Pathet Lao insurgency, which coincided with the Vietnam War, the government provided the Hmong and other non-Lao minorities with more educational opportunities. Hmong boys were encouraged to attend rural schools for at least 3 years, and a few progressed through the system until they received graduate degrees from foreign universities. Hmong girls were much less likely to be sent to school, although women from politically prominent families did graduate from high school in the capital of Vientiane (Yang & Blake, 1993).

The fighting that occurred in Laos between 1961 and 1975 created a large number of internal refugees. A majority of Hmong retreated to more secure areas near military bases. Loyalist Hmong families who stayed in embattled areas came to depend upon food dropped from C.I.A. planes (Garnett, 1974). A great many fathers and sons left their families to serve as soldiers. They learned how to operate modern military equipment, and a select few were given English lessons so that they could communicate with American support personnel.[2] Educated Hmong males were hired by the Laotian government and by international agencies to help carry out economic and social development programs. Comparatively high pay and other perquisites of power were available to men who ascended through the military or administrative ranks.

The U.S. government tried to minimize the impact of refugee resettlement by scattering Southeast Asians across the country. Refugees were pressured to find employment and attain economic self-sufficiency as soon as possible. Rather than staying put, Hmong migrated to mostly urban areas where they could reestablish extended kinship networks, find jobs, and get an education.

Former military officers, government officials, and staff members of international programs were among the first to find employment, often with resettlement agencies. The vast majority of Hmong lacked the language and work skills required for jobs that provided a living wage with adequate benefits. The men engaged in a national Hmong debate about the wisdom of undergoing training in the present in order to qualify for a good job in the future. Some chose vocational training over immediate employment, and became more dependent on the incomes earned by wives for performing unskilled work. Despite efforts to find jobs for Hmong men and women, and the willingness of husbands and wives, including those with small children, to work in shifts at full-time jobs, welfare dependence remained high for many years (Cha, 2000; Lo, 2001; Yang & Murphy, 1994).

Being educated largely or entirely in the United States has not insured economic success for the younger Hmong, but many are fulfilling the aspirations of parents by earning advanced degrees and embarking upon high-status careers. During the early years of resettlement, Hmong parents tended to encourage sons more than daughters to acquire a post-secondary education. This bias appears to be lessening as the economic value and prestige of academically successful daughters is increasing as they assume leadership roles in the community.

Drawing upon their experiences in Laos and Thailand, Hmong have started a variety of businesses in the United States, often by pooling the financial resources

of related families. The possibility of owning a profitable business holds great appeal for Hmong, especially those who have little hope of ever earning high salaries in the corporate world. By contributing their business acumen and labor to these ventures, sometimes as the principal owners, a small number of women have become a force within the Hmong business community.

Cultural Construction of Gender

In Hmong society, only two genders are recognized, male and female. Hmong men are most admired for being tough, intelligent, wise, generous, and commanding. Above all, they must materially support, morally guide, and resolutely defend the family and sublineage. In order to achieve these ends, they also have to negotiate and maintain reciprocities with other kin groups. In this strategy lies a paradox for would-be civic leaders and politicians. They must be perceived as loyal family members who will not use their positions in the community to favor relatives. The appearance of kinship bias in the performance of public duties can seriously undermine a leader's support.

The ideal Hmong woman of one or two generations ago was nurturing, patient, forbearing, industrious, mature, quiet, and not given to gossip. She modestly avoided joking, or even talking, about sex. When faced with a serious tragedy, such as the death of loved ones, she displayed great emotion, but muted her feelings when dealing with the aggravating problems of everyday life. Rather than being assertive, she tended to withhold opinions that might contradict the views of others, particularly those of male leaders. Most of these qualities continue to be valued by Hmong in the United States, but the ascent of women into public positions of authority reflects a trend toward greater gender equality with respect to opinion sharing and problem solving (see Donnelly, 1994; Rice, 2000; Symonds, 1991).

Gender over the Life Cycle

Socialization of Boys and Girls

Guided by the concept of *hlub*, "concerned love of others," Hmong parents are permissive and tolerant toward children younger than 7. Once they demonstrate that they can start assuming productive roles within the family, children receive explicit guidance, and are subject to corporal punishment for serious misbehaviors.[3] More responsibility and discipline are imposed as children mature, and they are expected to be very well mannered by the time they reach adolescence.

In the poetics of Hmong ritual language, the placenta is referred to as the "silver and gold jacket" or the "silk shirt" that a baby sheds at birth and a deceased person puts on again before traveling back to the village of the ancestors. When they lived in dirt-floored houses in Laos, the Hmong buried the placenta of a male child around the base of the central house post, the *tus ncej tas* ("the post of all ancestral relatives"); many rituals were conducted near that post. His early physical association with the main support of the house indicated that he would help continue the descent line, maintain clan and lineage rituals, guide household members, and represent them in dealings with the larger community. The placenta of a female child was buried at a bedpost or under the bed to symbolize her future role in domestic affairs, particularly reproduction. Of course, these symbolic practices have been discontinued in the United States. What has not changed is the fact that Hmong females learn very early that they will leave their natal families and become "other people's daughters" when they marry.

Hmong children in Laos were encouraged to participate in activities appropriate to their sex. Boys began imitating their fathers and older male relatives by playing with miniature agricultural and hunting implements. By the time they were 8 or 9 they had regular farm chores to perform, and sometimes accompanied the men on hunting forays. The adolescent sons of farmers labored in the fields, and learned the wood- and metal-working skills needed to maintain the family operation. Businessmen, typically itinerate traders, kept their sons in school until their mathematical and literacy skills became a business asset. Late adolescence was a time when the importance of learning how to perform family rituals was impressed upon boys. Those who showed musical talent were encouraged to take up instruments like the ceremonially important multipiped *qeej*. Ancestor spirits sometimes brought illness upon a youth as a means of calling him to a type of curing known as *ua neeb*, "working with spirit familiars." He usually waited until adulthood before apprenticing with a *txiv neeb*.

Very young girls began their roles as caretakers and teachers of domestic skills by playing with *nkauj nyab*,

handmade "daughter-in-law" dolls. At 6, or even 5 years of age they started sweeping the house floor and feeding the chickens. Before reaching adolescence, girls know the rudimentary aspects of cooking, keeping house, taking care of young children, maintaining the garden, and tending the smaller animals. Among their female peers, they sometimes spoke *lus rov*, a kind of reversed language that males did not know or bother to learn. This created a gender-exclusive social space that girls maintained until suitors began to show an interest in them. In the company of their mothers, grandmothers, and aunts, they sewed, wove textiles, and plaited baskets. A vast knowledge of domestic medicine was passed down within families from older to younger females. Such information was extremely valuable because a woman who is recognized as a *kws tshuaj*, or "expert in medicine," could command high prices for a variety of treatments, the most important being to increase a woman's fertility. A comparatively small number of women learned the arts of the *txiv neeb*.

Puberty and Adolescence

Late in childhood, brothers and sisters begin to sleep apart. The advent of puberty makes sexual privacy very important. Hmong in the United States, like their parents before them, try to monitor the activities and peer choices of their adolescent children. The prevailing attitude is that girls need close supervision, whereas boys can be permitted greater freedom of movement. Boys are expected to initiate flirting and take the lead in serious courting, but Hmong girls in the United States are becoming considerably less passive in these relationships (see Courtship and Marriage).

Attainment of Adulthood

There is no specific marker or rite of passage to attain adulthood in Hmong society. However, Hmong generally consider a married person, no matter how young he or she may be, as *laus* or old. In other words, marriage seems to mark adulthood or maturity.

Middle Age and Old Age

A woman enters marriage knowing that she must be compliant before her new parents and accommodating to all the *kwv tij* of her husband. (Given the pressures of adapting to, and winning the acceptance of, a new set of kin, it is not surprising that Hmong American women prefer to establish their own independent nuclear families as soon as possible after marriage.) She will be expected to bear at least one son, and preferably two or three. Her status increases as the family grows, and she comes to be regarded as nurturing mother and loyal wife. When a man has shown that he is a reliable family provider, kind father, and considerate husband, the *neej tsa* had a special ceremony to confer upon him a *npe laus*, an elder name, which he afterwards proudly used in conjunction with his given name.

Upon reaching 50 years of age or so in Laos, a couple looked to the youngest son and his wife to take over most of the duties of running the household. The institutionalization of elder care in the United States has caused Hmong to worry a great deal about the depressing prospect of being forced to live with strangers during their declining years. Rather than placing all of the responsibility on the family of the youngest son, infirm parents live, sometimes serially, with daughters as well as older sons. This has increased the value of daughters inasmuch as they and their families might become a major source of support in the future. When parents must be sent to a facility for specialized medical treatment or hospice care, members of the extended kin network, including the *neejtsa* as well as the *kwv tij*, arrange their schedules to be with them as often as possible.

GENDER-RELATED SOCIAL GROUPS

Every Hmong identifies with the *xeem*, exogamous patrilineal clan, of his or her father. (The French colonial administration used *xeem* names as surnames.) A *xeem* is a large descent category rather than a social group. The number of *xeem* distinctions has varied over time, but at least 18 are recognized in the United States. Hmong who are related through males to a common historical ancestor or who practice the same rituals as part of their patrimony consider themselves *ib caj ces*, that is, of "one root and trunk." A *caj ces* could be technically called a lineage. Families headed by males of the same *caj ces* frequently form a durable alliance and refer to themselves simply as a *pawg/pab neeg* or "group." They constitute a localized sublineage. The most influential members tend to be males belonging to a *tsev neeg*, a family or "household," headed by a particularly capable leader. This male

elder functions as the primary spokesperson for the entire group and mediates disputes. He is "one who guides" or "one who puts out fires." Non-Hmong Americans often refer to all of these kinship structures, from *xeem* to *tsev neeg*, as "clans," and mistakenly assume that the *pawg neeg* leader exerts authoritarian control over all members. Patrilineal relatives refer to themselves collectively as *kwv tij*, "younger/older brothers." When a woman marries, she retains her *xeem* identity while following the cultural norms and practices of her husband's family. Her children are of the father's *xeem* and belong to his *kwv tij* (see Dunnigan [1982] and Leepreecha [2001] for more on Hmong kinship).

Gender Roles in Economics

Before war disrupted the Hmong economy in the 1960s, women managed the house and garden, cared for the chickens and pigs, and worked in the fields. Men cleared land, built houses, manufactured tools, helped with cultivation and harvesting, tended the larger animals, and hunted wild game. If traders did not come to their villages, men took their horses, cattle, and opium to distant markets. Because they were in contact with outsiders, Hmong men had many opportunities to learn other languages, particularly Lao (Cha & Chagnon, 1993).

During wartime, the wives of soldiers and war widows functioned as family heads and were very resourceful in supplementing the family income. They became entrepreneurs who ran small restaurants or clothing stores. Others took over commodity trading from their husbands, and even expanded operations.

The period of internment in Thailand further reduced differences in the economic and educational statuses of Hmong men and women. Both attended language and literacy classes in order to prepare for the time when their families would be permanently resettled in another country. Since economic activity was restricted to the boundaries of the refugee camps, there was limited opportunity for agricultural activity. Everyone became dependent upon food and other basic necessities distributed under auspices of the United Nations High Commissioner for Refugees, but there were ways for camp residents to earn money (Cha & Chagnon, 1993; Cha & Small, 1994; Long, 1993).

Already adept at needlework, women started up full-time commercial sewing ventures that generated much needed income. The value of their work persuaded husbands to assume more cooking and childcare responsibilities. Some men took up sewing, and worked alongside the women. Both men and women set up candy, clothing, produce, prepared food, and tailor shops. Blacksmiths made money by forging knives and other tools from the leaf springs of junked military vehicles. Silversmiths fashioned jewelry, mostly necklaces and rings, from silver bars brought from Laos or purchased from Thai merchants. When silver became scarce, they learned how to work aluminum into the same forms of jewelry.

Older men who once held prestigious jobs in the Laotian military, civil service, or private commercial sector had the hardest time adjusting to the new economic realities of camp life. They could not wield as much of influence or demand the same degree of respect as they had in Laos. Their leadership skills, while still useful, no longer guaranteed the security of their families. Younger men, those with a command of English, had a much better chance of being employed by United Nations and private relief organizations that ran clinics and schools in the refugee camps. They were also in a position to sell their services as language and literacy tutors to Hmong preparing for relocation to the United States.

Parental and Other Caretaker Roles

In Hmong society prior to the resettlement in the United States, young girls are socialized at an early age to engage in *poj niam hauj lwm*, or "women's work." This includes cooking, cleaning, sewing, and caring for younger siblings. The Hmong female spends most of her time in such child-rearing activities as feeding, holding, carrying, supervising, furnishing love and encouragement, clothing, and giving shelter to children. The Hmong mother is also responsible for the welfare of any orphans left by her husband's brothers or male relatives, the care of elderly parents, especially in-laws, the care of her husband, both when well and when ill, the care of sick family members, and the care of any and all guests. Mothers and other female relatives are also expected to instill in their daughters a sense of discipline suitable to their future role, and to teach their daughters the sort of behavior appropriate to their gender. The Hmong female may also

be called upon to assume responsibility for the care of all domestic affairs of those related through blood and marriage.

Such activities, while crucial to the child's survival and to the continuity of Hmong society, are "only women's work," and, in a male-dominated society, a man's tasks are ipso facto more important than those of a woman. These tasks are solving family and clan disputes, hunting, and performing rituals. The Hmong father, by his example and the force of his personal authority, engenders for the family a model of respect, prestige, and recognition, all essential to the community status of the family and thus the welfare of the children. Hmong males look after public affairs, devoting themselves to meetings, the purpose of which is the general welfare of the Hmong: *hlub kwv tij neej tsa*.

The young Hmong male without older siblings may occasionally find himself helping parents with child-rearing and household activities, but should he have any siblings who are female, he will be given a wider latitude for play than the girls. To the Hmong father, a son is more valuable than a daughter, and therefore he will not treat a daughter with the respect and high hopes accorded to a boy.

In the United States, these roles are changing as the Hmong confront and come to terms with the social pressures generated by American society, and it is possible to find daughters whose lives are every bit as respected, and even privileged, as those of sons, while there are sons who are accorded neither the variety of privileges nor the latitude of behavior enjoyed by their counterparts in Laos.

LEADERSHIP IN PUBLIC ARENAS

During their early years in the United States, from 1976 to 1980, Hmong utilized the services offered by various volunteer resettlement agencies (Volags). They also competed with them by establishing nonprofit mutual assistance associations (MAAs) that provided some of the same kinds of help directly to refugees. The officers and board members were initially exclusively male. Hmong females educated in Laos formed affiliated organizations that focused on the needs of women. Cooperation between the male- and female-run organizations was sometimes tense. New female leaders began to emerge from a widening base as more women acquired the requisite education and experience in the United States.

Governmental agencies and private foundations pressured their Hmong grantees to give important roles to women. Hmong MAAs responded by recruiting female board members and upper-level staff. Women now exercise considerably more authority within these organizations, but men continue to hold most of the top leadership positions.

Males functioned as the heads of Hmong villages. They also received appointments to district, provincial, and national offices from a government that needed Hmong political and military support after 1961. Several Hmong, including one woman, were elected seats to the National Assembly in Laos. The bureaucratic and legal structures that Hmong instituted at their military bases in Laos and later in Thailand refugee camps were male dominated. Hmong in the United States are just beginning to run for political office outside their local communities, and women are leading the way. A Hmong woman was elected to the St Paul, Minnesota, Board of Education in 1992, and was succeeded by a Hmong man 3 years later. A Hmong female attorney, who is also a wife and mother, became a Minnesota State Senator in 2002.

GENDER AND RELIGION

Hmong ideas about the supernatural represent the confluence of many religious traditions. Some individuals and families claim to practice just one religion, while others conduct ceremonies to solicit help from ancestral and domestic spirits (*ua coj dab*), participate in Buddhist rituals, and worship as Christians depending upon the circumstances. A woman is generally expected to follow the religious practices of her husband's family and lineage. However, men have given up *ua coj dab* and joined the Christian churches of their in-laws.

Hmong who *ua coj dab* divide reality into *yaj ceeb*, the normally visible and material domain, and *yeeb ceeb*, the spirit realm. The latter is also called *dab teb*, a world where tame spirits (*dab nyeg*) protect the house and garden, while dangerous wild spirits (*dab qus*) menace from beyond the pale of human settlement. Hmong also recognize a supremely powerful spirit for whom they have several names. All entities, both human and nonhuman, have spirits called *ntsuj plig*. After a person dies, his or her *ntsuj plig* is said to travel back to the village of the ancestors. Hmong also talk about a deceased's spirit being reincarnated and remaining at the place of

interment, but this does not ordinarily occur within the same discourse.

Hmong say that the span of life is "inscribed" before birth, but do not see it as absolutely fixed. Life can sometimes be extended with the help of *txiv neeb*, who are mostly males (*txiv*) who work with spirit familiars (*neeb*) to keep *ntuj plig* from leaving the bodies of ailing clients. *Txiv neeb* also treat individuals when the *ntuj plig* either flees the body due to a traumatic experience or is captured by wild spirits, the *dab qus* (see Lee [1995] and Lemoine [1996] on Hmong spiritual beliefs and practices).

The cosmology of those who *ua coj dab* reflects the patrilineal descent system and family-oriented structure of Hmong society. Like Hmong Christians, they refer to the greatest supernatural being as a male, but one who has a wife. They are the Guardian Couple, *Nkauj Niam Txiv Kab Yeeb*, who bring children to their earthly parents and protect them throughout their lives. *Ntxwg Nyug* is an imposing and frightening male spirit who, from the highest mountain top in the spirit world, sends illness and death to the living when their allotted time has expired. With the help of *Nyuj Vag Tuav Teem*, his assistant, *Ntxwg Nyug* examines how each dead person treated others during his or her earthly existence, and determines what material form the *ntsuj plig* will join in the next life, and for how long. Several ranks down from these top male spirits is the female *Njauj Iab* who, before allowing the dead to pass into the spirit world so that they can be reincarnated, cleanses them of all memories with pure water. The rarity of important female spirits is paralleled by absence of woman from the performance of *dab qhuas*, rituals that express the unique identities of patrilineal kin groups. Women are rarely *txiv neeb*, and only a small number have become marriage negotiators (*mej koob*). Similarly for Christian Hmong, relatively few women are pastors, choir members, or church soloists.

LEISURE, RECREATION, AND THE ARTS

Hmong needlework is becoming more of a specialty in the United States as fewer females grow up knowing how to produce the ornately paneled clothes that they are expected to wear at weddings and public celebrations. Interest in male crafts and ceremonial roles is also declining. Alarmed by these trends, Hmong MAAs and cultural centers are recruiting recognized experts to instruct youths, both males and females, in a broad range of heritage practices. Although cultural maintenance is the stated goal, new forms of art and entertainment are emerging from a mix of programs that reflect a long and complex history of acculturative experiences.

Hmong boys were introduced to the game of soccer in Laos, and it is probably their most popular organized sport in the United States. Major tournaments are held throughout the country during the summer. Teams also continue to play *kab taub*, a game with both volleyball- and soccer-like elements. A wicker ball is volleyed over a net with head and foot strikes. Measured in terms of total participation, volleyball is eclipsing *kab taub* in popularity. Boys compete at spinning tops less often now than was the case in Laos. Possibly the most dramatic change in Hmong sports activity in the United States is the participation of girls. Unlike in Laos, it is considered normal, even desirable, for girls to spend time playing games like volleyball and badminton, and they have excelled at these sports at interscholastic competitions.

Music associated with courtship is discussed in the section on Courtship and Marriage.

RELATIVE STATUS OF MEN AND WOMEN

Although the construction of gender in Hmong society varies regionally, as well as over time, the privileged status of males within the family appears to be a constant. Because they perpetuate the descent line and remain closer to the parents, sons were, and still are, considered more valuable than daughters. When a boy was born in village Laos, the parents announced that he would be "the little one to shoulder fire wood," that is, he would remain with the parents and carry on the family traditions. A female newborn was called "the one to pluck greens for the pig" and "the other people's daughter." Said more directly, she would help the family until old enough to marry and move out. Patrilocal residence tended to keep male siblings and their male offspring closer together, whereas married females usually resided with their husband's kin group. Ideally, the families of close male patrikin formed *pawg neeg* (see above) in order to share resources and to help one another solve problems. According to one Hmong proverb, "Nine fireplaces are not as warm as the sun; nine daughters do not equal one son" (Vang & Lewis, 1984, p. 71). Metaphors that

downplay the value of daughters are heard less often in the United States, but sons are still considered essential to the completion of a family.

In Laos, men performed the clan- and lineage-specific rituals while women functioned in supporting roles. The handling of a family's most prestigious goods in public was the prerogative of males. For instance, at large feasts associated with funerals and New Year celebrations, women were restricted to preparing common staples like rice and vegetables, even though they prepared all types of food at home. Men assumed the more important task of cooking the meat dishes, which symbolized family wealth and success.

Hmong family celebrations in the United States are becoming smaller as kin, affines, and friends find it increasingly difficult to coordinate their busy schedules. At these increasingly intimate affairs, the women usually prepare the food while the men socialize with guests. This role shift may reflect the fact that the provisioning and preparing of meat has lost some of its symbolic value inasmuch as it is no longer difficult to obtain nor particularly expensive. Hmong men may also be responding to what they see as a prevalent cultural pattern in the United States, that men do not cook inside the home. Some kin groups continue to have male cooks prepare the meat dishes at large celebrations.

COURTSHIP AND MARRIAGE

Courtship

Daily life in Laos presented limited opportunities for romantic contacts between single Hmong males and females. When a young man developed a fondness for a particular girl he tried to work near her in the field and assist her in performing chores such as collecting firewood, fetching water, and gathering pig fodder. Doing these tasks together, usually in the presence of a female relative of the girl, allowed them to gradually learn about each other before making any definite commitment. By helping the girl in an energetic way, the boy demonstrated his industriousness to the girl's parents.

At night, single males circulated through the village trying to engage girls in conversations whispered through the bamboo or loose board walls of the girls' bedrooms. Visits by a boy to a particular girl could become frequent and gradually more intimate. The boy might try to persuade the girl to meet him elsewhere for a tryst, but success was unlikely. If the relationship developed into a strong romantic attachment, the boy asked his father and other close males relatives to visit the girl's family formally to propose marriage. Boys tried to act out their sexual desires, while girls were expected to resist and remain virgins until married. If caught in an apparent tryst, and even if sexual intercourse has not occurred, a couple will often be pressured by their respective families to marry in order to prevent scandal. As an alternative, a compensation payment may be demanded by the girl's side for damages caused to the reputation of the girl and her family.

The arts of courtship in Laos included flute playing, serenading as well as antiphonal singing between all-boy and all-girl groups, using a mouth harp or leaf reed to hum intimacies, competitive riddling, and various forms of stylized teasing. These genres are rarely practiced in the United States, but older Hmong occasionally demonstrate some of them at community celebrations. The get-acquainted game brought from Laos and performed in connection with New Year festivities involves the tossing of a stuffed sack or ball between opposite-sexed partners. Volleyball games between mixed teams at kin group picnics do more in the United States to facilitate intersex bonding.

Hmong boys in the United States still go out at night in groups in order to visit girls, but the encounters must take place in living rooms where there is less privacy. Under these circumstances, the exchanges must be more circumspect, and it is often unclear to the parents which boy is interested in their daughter. Youths, particularly boys, are less inclined to dress in distinctive Hmong clothing and jewelry while participating in the ball-tossing game at New Year celebrations. They see little value in singing Hmong folksongs or playing Hmong musical instruments. When elders speak about the beauty and utility of such accomplishment, young Hmong respond with indifference, and even bewilderment. They prefer listening to popular American music emanating from portable radios, CD players, and computers. Rather than improvising rhyming couplets to fit standard folk melodies, a talent highly valued in Laos, they are more comfortable singing the lyrics and tunes provided by karaoke machines.[4]

Up until the mid-1990s, Hmong males took the initiative in telephoning, writing, and visiting their usually younger love interests. If a Hmong female agreed

to attend a public event with a suitor, she was chaperoned by a family member. It was the male's prerogative to propose marriage, and his fiancée had little to say in the planning of the wedding. Hmong females are now much less hesitant to call boyfriends, and they see nothing wrong in encouraging the attentions of same-aged or younger males. An increasing number are neither abashed nor restricted from going out unescorted with boyfriends. They are more assertive about whom they wish to date and marry, and about how their weddings should be celebrated.

Hmong Americans who have come of age in recent years tend to see marriage not as a joining of families embedded in larger kinship networks, but as a union of two individuals who share a romantic love. Parents and grandparents wonder whether "a house built on two supporting poles can be as strong a one built on four or six supporting poles."

Marriage

Hmong do not want their children to "remain in the garden too long" (like ripening fruits and vegetables) before marrying. Single females risk being viewed by the first generation of Hmong immigrants as *nkauj laug* (old maids) after the age of 18, whereas single males do not start to be considered *nraug laus* (old bachelors) until they reach 30 or so. It is becoming more acceptable for Hmong females to marry in their early twenties as an increasing number see the advantages of first finishing college and starting a career.

Whether they honor the spirits or practice a form of Christianity, Hmong want the marriages of their daughters to be respectfully arranged in their homes. A suitor asks his father and other close male relatives to present a proposal of marriage to the family of his intended bride. This is done through a *mej koob* who advocates on behalf of the suitor's family. The family receiving the proposal enlists their own *mej koob*. If the two sides, including the couple, agree that marriage is a good idea, the *mej koob* negotiate the *nqis tshoob*, a marriage payment that the suitor's relatives make to those of the intended bride. It is in the house (*tsev*) of the bride that marriage is discussed (*hais*). Thus, the phrase *nqis tsev hais* describes the manner in which most Hmong enter into marriage.[5]

Betrothals can be formalized before youths are old enough, or are otherwise prepared, to marry. If opposite-sexed relatives, affines, or close friends want their

children to marry in the future, the boy's side makes a down payment on the *nqis tshoob*. Marriage between first cross cousins is considered by Hmong to be advantageous because it further strengthens relationships between already close kin groups.

Either side may later ask to be released from the agreement (*qhaib*). If just the girl's side is reluctant to go forward, the amount already given must be returned with interest. The family of a replacement suitor usually pays. If the boy's side wants to abrogate the *qhaib*, they forfeit their investment and are charged a fine.

When a young woman wants to get married against the wishes of her family, she elopes or "goes quietly" (*mus ntsiag to*) with her lover to his *kwv tij* (patrilineal relatives). Two male emissaries are sent by the *kwv tij* to the woman's parents requesting a future marriage negotiation. They may refuse but, when their disappointment and anger subsides, the woman's birth parents are likely to accept their new status as *neej tsa*, the family who provided a wife to others, and indicate that they are open to a payment of *nqis*. It is difficult for a young man to defy his parents when choosing a mate if he expects to reside patrilocally after marriage, and to pay a respectable *nqis tshoob* to the *neej tsa*. When faced with parental resistance, he can ask other relatives to help argue his case.

The expression *zij poj niam*, which literally translates into English as "seizing a woman," had a much more restricted meaning before the 1961–75 war in Laos. It applied to instances where a man intercepted a single woman outside her home and held her by the arm at the location of the encounter until her father and other male relatives could be summoned. The intention of the man was to extract a promise that he would at least be allowed to begin the process of *nqis tsev hais*, although his proposal might later be rejected. When a man forcibly carried away a woman whom he wanted to marry, the act was called *nyiag (zij) poj niam*, or "secretly stealing a woman." The old and less violent stratagem of *zij poj niam* is no longer practiced, but many Hmong continue to use the expression as a synonym for *nyiag (zij) poj niam*.

What happens after a woman is taken against her will depends upon whether the captor sends word right away to the woman's parents about what has happened and where their daughter is being held. If the parents are so informed, they have the choice of doing nothing, or going directly to their daughter and bringing her back if she does not want to stay with her captor. Another option

is to hold the woman incommunicado for 3 days or longer in order to convince her parents that the marriage has been consummated and must be accepted. Some women "stolen" into marriage have learned to accept their fate and develop loving relationships with their husbands. Others have endured miserable lives or committed suicide.

It is difficult to say how often *nyiag (zij) poj niam* has occurred in recent times. Although relatively rare, anecdotal evidence suggests that it happened with greater frequency during the 1961–75 Laotian War when men had more opportunities to assert power over others and intimidate the parents of women they desired. A number of "bride captures" were reported in the newspapers during the early years of Hmong resettlement in America. Some of these turned out to be elopements where runaway brides regretted their rash acts and sided with vengeful parents when they complained to the police. In other cases, women held by suitors against their will were not physically violated before being allowed to return home. Actual cases of Hmong men taking young single women by force and having sex with them did occur, but media stories gave the impression that Hmong generally accept such behaviors. In fact, the vast majority regard them as deplorable acts most often perpetrated against vulnerable women whose relatives are too few and weak to retaliate.

In the late 1980s, school authorities in the United States became alarmed over what they assumed to be a "traditional" Hmong practice—adolescent marriage. Compared with other ethnic groups, a surprising number of Hmong high-school students, mostly girls and some younger than 16, were living in marriage-like relationships. Hmong attending U.S. high schools have been pressured into marriage after being discovered in a real or apparent romantic relationship by their parents. Youths may also see marriage as a means of leaving troubled childhoods and assuming positions within the family and kin groups that confer respect and a measure of independence.

Older immigrants have tried to persuade their young people to wait until they finished high school or even college before becoming involved in a permanent relationship. Young people, especially girls, actually receive mixed messages. Besides being advised to wait and get a good education, they also hear that (1) it is a mistake to be single too long because it embarrasses parents to have apparently unmarriageable children, and (2) older and more educated women can expect to have difficulty in finding suitable mates. They are also aware that elders sometimes resent unmarried professionals for being viewed as role models by younger Hmong. Fortunately, the so-called "early marriage problem" seems to be fading as youths realize the advantages of waiting longer before attaining full adulthood, and Hmong parents become somewhat more comfortable with the American concept of unsupervised dating.

When the head of a family died in Laos, it was considered proper for one of his younger brothers or younger paternal parallel cousins (called brothers) to marry the widow and raise the deceased's children. Technically known as the junior levirate, the practice kept important affinal linkages intact and insured the continuation of the descent line. The sons and daughters of immigrants are reluctant to continue this custom, but elders still look within the sublineage to find replacement husbands for young widows with children.

Men able to afford multiple marriage payments and support several households have sometimes added a second or third wife to their families. These can be compatible unions, but conflict-ridden marriages involving multiple wives have resulted in long-lasting enmities between kin groups. When tried in the United States, polygyny has seldom resulted in stable marriages or cooperative joint households. Men have come to see such arrangements as causing more problems for the *kwv tij* than they return in benefits, and women generally regard them as oppressive.

Divorce

Senior male members of the husband's *kwv tij* are expected to intervene when a couple are having serious marital problems. The wife's birth family, the *neej tsa*, becomes involved, short of a divorce action, only when the husband's side either invites their help or ignores the problem entirely. If a marriage cannot be repaired, elders representing both sides must determine fault, decide the disposition of the marriage payment, and levy additional penalties if warranted. Every attempt is made to avoid divorce because of the threat it poses for relationships between the *kwv tij* and *neej tsa*. In Laos, a woman risked losing everything, including her children, if she insisted on divorcing despite efforts at appeasement made by the husband and his *kwv tij*. Access to the courts in the United States has given Hmong women more rights with respect to child custody and support (Thao, 1986).

Infertility or the lack of a male heir has been used by some husbands as justification for divorce or taking a second wife.

In Laos, a Hmong family erected a small house in preparation for the return of a divorced daughter who no longer had any ties to her ex-husband's *kwv tij*. At marriage, her spirit had been placed under the protection of the *caj ces* (lineage) spirits of the husband. If she became ill or gave birth after divorcing, she could not be properly treated within the house of her parents, nor could spirit rituals be performed on her behalf without the involvement of her ex-husband's male relatives. So long as she remained divorced, a woman was considered *tu caj tu ces*, cut off from lineage rituals. If she died in this state, no kin group could give her a proper funeral. Hmong parents in the United States are still uncomfortable taking divorced daughters back into their homes, although it is done.

A woman of good character is often encouraged to remain with the *kwv tij* after separating from her husband, especially if she has a grown son who can provide her a home. This arrangement protects an ex-wife from the stigma of spurning the *kwv tij* and living without spiritual protection. In Laos, the *kwv tij* could claim the right to raise the offspring of women who wanted to leave them. However, a divorced woman who returned to the *neej tsa* was sometimes allowed to keep young children, even boys. In the event that the ex-husband's relatives gave up all claims to the children and the women remarried, the *kwv tij* of the new husband could adopt the children into their *xeem* (clan).

More Hmong are divorcing in the United States than was the case in Laos. It has been difficult for older men to share decision-making responsibilities with their wives, although younger couples are finding a better balance. Wives are now less tolerant, or more openly critical, of male infidelity, while some husbands tend to be uneasy about the kinds of contacts that their wives unavoidably have with other males in the course of their daily activities. The process of marriage dissolution still begins with the involved relatives, and stays there even when a parallel civil action is progressing to a conclusion in the courts. Hmong women are still expected to endure marriages that are loveless and even abusive. Those who resort to divorce can be called a *tus siab phem*, an "evil/wicked liver."

Hmong Americans are trying to deal with cases of domestic abuse by participating in innovative community circle and restorative justice projects where men and women contribute equally. Hmong mutual assistance associations are experimenting with "clan councils" like those established in the refugee camps of Laos and Thailand for the purpose of resolving interfamily disputes. Complaints voiced by Hmong women about the all-male character of these tribunals have prompted funding agencies and non-Hmong advisors to insist on female representation. Although there is still some resistance to this idea, women have been recruited to fill key administrative posts.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Hmong gender relationships began to be profoundly altered 40 years ago as Laos became embroiled in a civil war that was fed by superpower politics. We briefly covered this and earlier periods for two reasons. We felt it important to delineate the origins of important changes that are today strikingly evident in the United States. We also wanted to counter the common presumption that the Hmong exchanged a static custom-bound, traditional existence in Laos for a dynamic life in the United States, requiring adjustments that were totally novel to refugee families. Space limitations prevent us from saying more about the ways in which Hmong culture was affected by global trends before the great migration to the West. Instead, we will simply refer to remarks made by Dr. Yang Dao, who earned a Ph.D. from the Sorbonne and served as a Hmong representative to the short-lived Laotian coalition government before the communist Pathet Lao victory in 1975. On a number of occasions he has told a story about Thai government officials being greatly surprised that Hmong refugees from Laos not only knew about rock and roll, but they also performed it! During an episode of the U.S. television drama *The Trials of Rosie O'Neill*, which aired on November 22, 1991, the leading character claimed that the Hmong did not know about incandescent light and other electrical appliances before coming to the United States.

We have eschewed certain English terms, such as tribal, traditional, animism, ancestor worship, etc., to avoid applying culture-bound and inappropriate concepts to the Hmong. Expressions like these are frequently used to describe Southeast Asian immigrant groups who were

cultural minorities in their homelands. Unfortunately, they project American folk theories on cultural others. We thought a better approach would be to impose on the patience of readers by using Hmong labels for key concepts and providing brief explanations of these terms. Better ways of interpreting Hmong culture in English are still in development.[6]

NOTES

1. In the following description of Hmong culture, White Hmong terms are provided for key concepts whenever English glosses might, if used alone, obscure important meanings or connote ideas not intended. We will employ the most widely used system for spelling Hmong, the Romanized Popular Alphabet (RPA) devised by Christian missionaries in the 1950s for White Hmong (see Heimbach, 1979). In RPA, word final *b, j, v, d, s, m,* and *g* represent, from highest to lowest, seven of eight distinctive tones. Words ending in any other letter are pronounced with a mid-tone. Double vowels indicate a vowel plus an angma or –ng. Thus, the spellings Hmong and Mong fairly well represent how *Hmoob* and *Moob* are pronounced, except for the high *b* tone. Inasmuch as the American public is familiar with the term Hmong, we will use it as the general cover term.

2. Hmong who attended school beyond the third grade before the middle 1960s acquired some knowledge of French, but English became a more popular subject as American military and economic aid to the country increased.

3. In the United States, allegations of excessive and inappropriate corporal punishment have caused legal difficulties for many Hmong parents and other responsible elders who have struck adolescents and young adults for persistent misbehavior, such as "dating" a clanmate. The seriousness of transgressions like intraclan sexual relations is often difficult for non-Hmong to appreciate.

4. Reliance on high tech forms of communication has helped, as well as frustrated, preserve Hmong culture. Families began keeping photographic and documentary records before leaving Laos, and cassette tape recorders were used in the refugee camps of Thailand to make copies of oral histories for family members in case they became separated during final relocation to other countries. Dispersed kin have continued to function as transnational groups via the telephone, mail, and the internet. Video and digital cameras give localized family groups additional ways of documenting their life in the United States. Young Hmong are employing contemporary materials, techniques, and machines to create new literary, oral, and visual art forms that celebrate and further develop their esthetic heritage. Additional information about the unique uses of technology by Hmong can be obtained from websites maintained by the Hmong Cultural Center (www.hmongcenter.org), the Hmong home page (www.hmongnet.org), and the Center for Hmong Arts and Talent (www.aboutchat.org).

5. Minnesota State legislators have been unsuccessful in trying to draft a law that allows Hmong to marry legally without the involvement of clergy, court officers, or other traditional representatives of the state. The plan has been to give *mej koob* the authority to "perform" marriages and the responsibility of making sure that all relevant statutes were being obeyed. Persons who act as *mej koob* see their proper role as one of merely facilitating the process by which the involved families agree to various conditions, such as the amount of the *nqis tshoob*, or "marriage payment." These negotiators do not want to monitor the actions of parents on behalf of the state, and Hmong advocates for women's rights question the fairness of a law that privileges a status role occupied almost exclusively by men.

6. Additional information about Hmong history, culture, and social organization can be found in Hutchinson (1997) and Keown-Bomar and Dunnigan (2002). Koltyk's (1998) short ethnography describes the acculturative experiences of Hmong refugees in a U.S. midwestern city, while Donnelly (1994) focuses on the lives of Hmong women who migrated to Seattle. The intersection gender and generation in Hmong society is the subject of a master's thesis by Hagemeister (1994).

Hopi

Alice Schlegel

ALTERNATIVE NAME

The name Moqui is used in very old literature.

LOCATION

The Hopi are located in northeastern Arizona, U.S.A.

CULTURAL OVERVIEW

The time period under consideration spans from the last two decades of the 19th century to about 1950, although some of the cultural features of that period were present when I did my major field work in the 1970s. Following this cultural overview, I shall use the present tense in describing facets of Hopi culture.

The Hopi inhabited dry plateau country, where rain was scanty and farming relied on trapping run-off and tapping groundwater. Their major crop was corn, supplemented by beans, squash, and a few fruits and vegetables that the Spanish had brought into the Southwest in the 17th century. Men still hunted game, but by the 18th century mutton, from sheep the Spanish introduced, was a major source of meat. Wild plants provided additional food and were used medicinally. In addition to food crops, the Hopi grew a form of cotton that they used for textile production, both for home consumption and for trade with other Indian peoples.

By the 1890s, manufactured clothing was worn by some, paid for by wage labor both close to home, as the U.S. government began the economic development of the Southwest, and away from home in the towns springing up along the recently built Santa Fe Railroad. A few individuals began small-scale trading and carting enterprises, and some made pottery and other craft items to sell to tourists at the Santa Fe train stops. After the Moqui (Hopi) Agency was established in 1887, Hopis were employed at the schools and other government establishments. When government-licensed trading posts opened up, some Hopis sold farm commodities, mostly corn for animal feed, and some craft items.

The Hopi, population about 6,000 in the early 20th century, lived in villages on three mesas, finger-like plateaus extending out from the high tableland of Black Mesa. Village size ranged from about 300 to 2,000. The houses, two or three stories high, were clustered around one or two village plazas, where ceremonies were held, and along the lanes leading out from them. Built of native stone, they seemed to grow out of the rock that supported them. A house consisted of one or two rooms for living plus storage rooms where dried corn and meat and other goods were kept.

With a few exceptions, the villages were politically autonomous. Each village was composed of a number of clans accorded different ranks, and the leading ceremonial and governmental officers came from the high-ranking clans. The government consisted of a village chief and his council, all of whom held ceremonial offices as well. Additional ceremonial officers had no official role in village decision-making, but their influence was very strong as they had the support of both their clans and the sodalities (see below) in which they held office.

A Hopi village could be thought of as a federation of clans. These clans were matrilineal. Each was led by a woman (Clan Mother) and a man (Clan [maternal] Uncle) who were usually actual sister and brother, although all clan members of the same generation called each other "sister" or "brother." The Clan Mother trained one of her daughters, often the oldest, to be her replacement, and one of her sons was usually chosen by the Clan Uncle as his heir to the office.

Clan unity was expressed in several ways. Clans owned the best farmland, the quality of the land roughly corresponding to the rank of its owning clan. This land was distributed to individual clan households for their use. Houses were owned by women, and men left their mothers' homes at marriage and joined the households of their wives. They divided their time between the house of the wife and the house of the mother or sister, where they had considerable authority over the sons of their sisters.

465

Clans also controlled ceremonial offices, and some of the highest-ranking clans controlled the sodalities (ceremonial societies) that put on the major ceremonies of the ceremonial calendar. While anyone could join any sodality, and all Hopis belonged to at least one and sometimes several, only members of the controlling clan could take on leadership roles within a sodality.

Clans often competed for political power and for land, but the village united in producing the ceremonial calendar. They also united in warfare. During this time period there was no intervillage warfare, but there were enemies from other tribes, primarily Navajo, who raided fields and stole animals.

CULTURAL CONSTRUCTION OF GENDER

Like other Pueblo Indian peoples, the Hopi view their world as oppositions in balance: night and day, summer and winter, etc. Linked to all of these is gender: females are associated with earth, summer, life (e.g., plants and fertility), south and west, and soft substances; males are associated with sky, winter, death (e.g., hunting and war), north and east, and hard substances. These forces are in balance. Female force, inherent in the earth and women, contains life, but it has to be activated by male force. This principle is dramatically expressed in Hopi understanding of plant fertility. Crops are planted in the (female) earth, but they do not grow unless they are energized by the (male) celestial forces of sun and rain. These forces are potentially dangerous, however, because the sun can burn the crops and rain can wash them away, if not controlled. Lightning, the most concentrated form of male energy, kills, but the field it strikes will be very fertile.

Like the cosmic principles of maleness and femaleness, men and women have different natures. Women have a single nature, a maternal life-giving one. This does not mean that they are passive, for like mother animals they can be fierce in protecting their children and home, and a favorite mythical figure is the warrior woman who saved the village by rousing the women to defend it when the men were away in battle. Men have a dual nature, being both fathers, that is, providers and protectors, and potential killers. Since life has the highest value, killing of enemies is a necessary evil and its effects are neutralized through ritual. Even the killing of game animals is accompanied by small rituals. While prowess in warfare was respected, the most honored positions for men were the ceremonial ones that had nothing to do with war.

Women and men are respected when they fulfill their duties earnestly and patiently. Women's important role is as mothers, to their own children and to all the people, through care and feeding. Men's role is to provide for their families, and to a lesser degree their matrilineal kin, and to protect the village. Both genders have important spiritual duties that must be performed so that they, their families, and the community will prosper.

GENDER OVER THE LIFE CYCLE

Two stages in the life cycle have gender-specific terms. For women, these are *mano* (girl) and *wuhti* (woman). For boys, these are *tiyo* (boy) and *taka* (man). A girl becomes a woman when she marries, at about age 16–18. A boy becomes a man when he goes through an initiation into one of the four ceremonial fraternities at about age 18–20.

Socialization of Boys and Girls

Before children are able to walk, there is little or no difference in the treatment of boys and girls. Infant girls are given miniature *kachina* dolls, representations of the *kachinas*, or deities, whom the men portray in the public *kachina* dances. The *kachinas* are believed to bring rain and an abundance of all good things like food and fertility. The presentation of the doll to the girl infant and child represents a wish or prayer for her future health and fertility. However, the dolls are not sacred. Little girls play with them as with any baby doll. Infant boys are given miniature bows and arrows, an indication of their future role as hunter and defender.

Mothers make little fuss over toilet training, encouraging toddlers to go outside in the lane to eliminate, and cleaning up any mess the children make in the house. Training in table manners begins by age 2 or 3. Children are instructed to dip their fingers into the communal bowl of stew only to the first knuckle, for to dig in deeper shows greed. Little children are also sent to take a bit of the food and put it outside the door before the family eats, so the spirit beings can consume the essence of the food while humans are eating the substance. Both genders and all ages eat together.

Girls are favored over boys, for several reasons. Ideologically, women are the repositories of life, whereas males are more expendable. It is men's duty to protect and provide for women so that life can continue. In more practical terms, men and women want the women of the clan to be fertile so that the clan will grow and prosper; thus men are interested in the fertility of their "sisters," that is, female clanmates of the same generation, and these women's daughters. Women and men want daughters for personal security, for elderly parents are cared for by the daughters and their husbands who remain in or near the family house. By the time little boys are 7 or 8, they realize that their sisters are more favored than they are, and that they are expected to look after the welfare of these girls. The preference is obvious when a baby is born. Even though Hopis insist that they want children of both sexes, baby girls are greeted with much more rejoicing than baby boys.

Girls and boys differ somewhat in their play pattern. Groups of little girls, sometimes with toddler brothers in tow, play house, using stones to demarcate houses and sheep corrals, and animal bones of different sizes to represent humans and animals. The dusty lanes between the family houses become their playground. As soon as boys are fairly mobile, they join other groups of boys in rough-and-tumble play or competitive games. Older girls also play competitive games together. Girls stay closer to home than boys do, although they are free to go anywhere in the village.

Children are put to work quite early in life. As young as age 4, a boy might be sent to the cornfield to make sure that the donkey does not get into it and eat the corn. One elderly Hopi man told me how, as a child of 4, he was in the cornfield watching the donkey when his attention was attracted by some beetles. He played with them, neglecting the donkey who got into a neighbor's field and ate quite a lot of corn before the boy discovered what was happening and retrieved him. He remembered that his father did not punish him, in fact did not even reprimand him, but loaded up the donkey with dried corn from the family storehouse to replace the corn that was eaten. This man remembered into old age how guilty he felt for his negligence, which meant that his family had less corn against the coming winter.

At about the same age, girls begin to baby-sit infant siblings and help their mothers with various tasks. A couple of years later, her father makes her a small grinding stone and she begins to grind corn alongside her mother. The early results are usually rather unsatisfactory and are fed to the chickens. Also at about age 6 she learns how to make *piki*, a wafer bread, like large rolled sheets of tissue paper, made from a thin batter of corn meal, water, and sometimes additional flavorings. This requires spreading a sheet of batter on a hot stone to cook. Little girls go around with sore burnt fingers until they develop calluses.

Girls spend most of their time at home with their mothers and other female relatives or playing with other girls, in the lanes or in their houses. From about age 6 or 8, Hopi boys start to spend some time in the kivas when they are in use as men's clubhouses. Usually the men, who have gone through their initiation into a ceremonial fraternity, sit in the center of the kiva, and the uninitiated boys sit off to the back. From time to time an elder will recite a legend or cautionary tale, raising his voice so that the youngsters will be quiet and learn. Boys talk among themselves, but if they get loud or rowdy the men will reprimand them.

Children begin to wear gender-specific clothing as soon as they are walking, although little boys may go about naked until age 6 or so if the weather is very hot. Fathers make the clothing for the family, and the gift of a woven dress from her father makes a little girl happy. Both sexes wear their hair short.

All girls and boys go through a ceremonial initiation when they are about age 6–8. Previous to this, they believe that the *kachina* dancers, masked dancers who impersonate the spirit beings called *kachinas*, are the real *kachinas* performing in the kivas and plazas. In this initiation into Hopi ceremonial life, they go through various rituals to impress on them the importance of their future religious duties. The most dramatic part of the initiation process for children comes when they all sit together in a kiva and the *kachina* dancers take off their masks, exposing themselves as the everyday men the children know. Some children already suspected this, finding it odd that a *kachina* had a scar or birthmark just like father's. To many, however, it is a great disillusionment, and some children become quite depressed for a time at what they feel is adult duplicity. After this initiation children begin to take a minor part in the village *kachina* ceremonies, and little boys can begin wearing the masks and dancing in the public performances as soon as they are strong enough.

Puberty and Adolescence

While there are no specific terms for adolescence as a life stage, it is recognized in other ways for girls. Some

time after menarche a girl goes through a small private initiation ceremony. She grinds corn for 3 days, after which a kinswoman puts her hair into a distinctive style of two large coils, one on either side of her head. This indicates that she is now an adolescent and ready to think about marriage and courtship. At this time her life becomes much more restricted. Her mother keeps her at home doing domestic tasks, although girl friends sometimes have corn-grinding parties in one of their homes. She is warned about being alone with an adolescent boy or man, and that she should not run about the village as she did earlier. At the same time, she is supposed to attract a suitable boy for her future husband. This presents a dilemma. The girl's movements are restricted just when her parents and fellow clan members expect her to find a suitor, and relations between mother and daughter often become rather tense.

Boys, on the other hand, experience greater freedom in adolescence than they do at any other time of life. They are required to help their fathers and maternal uncles in farming and herding, but they can do what they like at other times. Groups of boys usually go about together, playing games or just relaxing. After puberty it is quite common for groups of boys to sleep in the kiva when the weather is cold, along with unmarried young men and widowers, and when it is warm, they spend the night sleeping on a house roof.

Although parents are supposed to train adolescent boys to be hardworking, they often indulge their sons, rationalizing that these boys will soon be put to work under the strict supervision of their fathers-in-law. At the same time that adolescence is a time of restriction and tension for girls, for boys it is a time of freedom and male companionship.

Attainment of Adulthood

Girls become women when they marry. Boys become men when they have gone through their initiation into one of the fraternities. For girls, marriage results in a relaxation of the tension brought about by the pressures on her to bring a husband into the house. She hopes to become pregnant soon, thus contributing to the continuity of the household and clan. Her early years of marriage are regarded as a happy time for most women, since she has met her goal and relations with her mother once again become warm and close.

Once a boy is initiated, he is expected to become more responsible and to look for a wife. Marriage itself represents a restriction on his freedom. He lives in a house owned by his mother-in-law and is expected to help his father-in-law diligently and without complaints. He can see his friends in the kiva during leisure hours, but to run about with them would be unseemly.

Middle Age and Old Age

Once adult, there are no terms marking different stages of life. People age gradually, giving over responsibilities to young people when they feel that they can no longer carry them out. This is a slow transition and seems to come to the elderly as a relief rather than a loss of status. However, chronic illness or other forms of incapacity are feared, for one loses status if one cannot contribute. I have seen an old man, so crippled with arthritis that he had to use a walker, hobbling from one corn plant to another as he hoed his corn field. Old people without children will be given some food by fellow clan members, but no one is specifically responsible for this. Parents and grandparents may be loved and cared for, but the elderly do not receive any particular honor or recognition. Old women may fare somewhat better than old men, since women in general are supposed to be provided for more than men are. There are no significant gender differences in the treatment and burial of the dead.

PERSONALITY DIFFERENCES BY GENDER

Hopis of both genders are supposed to be even tempered, hospitable, and good-natured, for "bad thoughts"—sorrow, anger, jealousy, despondency, greed—put one's inner being out of balance and can shorten life. High value is placed on humility, and Hopis are not being disingenuous when they claim that they are only humble persons when they are clearly people of note in the community. Competitiveness is only approved in certain situations, such as when groups of *kachina* dancers compete to put on the best performance.

Even though women and men are expected to behave in more or less the same way, I was often struck by how direct and politely assertive many Hopi women were and how mild and unassuming many Hopi men were. Men sometimes complain that women always get their way, and women are certainly not deferential to

men. Women seem to be well aware of their centrality in the home and clan.

Gender-Related Social Groups

Gender is a critical feature of Hopi social organization. As already indicated, the village is made up of matrilineal clans. Households are matrilocal. Kivas, when not used for ceremonies, function as clubhouses where men spend much of their leisure time. Thus, the genders are socially located in two different kinds of structures, household and kiva.

The household is the domain of women, who remain in or attached to the house in which they were born. Men have dual residence, the house of their mother, or after her death their sister, and the house of their wife. This ambiguity becomes clear on days when public ceremonies are held. It is proper for a man to invite guests to eat at his home; it is the mother's or sister's house that receives a man's visitors, not his wife's and her mother's.

As owner of the house, the woman is its head. Her house receives some or all of its farmland through her clan. When her husband brings the first of the harvest into the house, he presents it to his wife and she thanks him formally. It is hers, even though it is the fruit of his labor. If she wishes to barter some corn for a shawl or other item, he has no control over her decision. If the couple separates, he leaves and returns to his mother's or sister's house.

Kivas are the domains of men when they are not eating, sleeping, or doing necessary work in the fields or at home. They are where men go to relax, taking their handicrafts to work on while they chat and joke. Kivas draw their members from all clans. A boy usually starts attending the kiva his father belongs to. It is possible to switch membership, although that rarely happens unless a new kiva is built and recruits its members from existing ones. It is the kiva groups that put on the *kachina* dances. In the winter dances, each kiva selects the *kachina* it will portray. Kiva groups vie with one another for the best songs and the most polished performances. When the men return to their home kiva after the performances, they tell each other "we really killed them" if they excelled, or ruefully admit that "they killed us" if their performance fell short.

Women and men meet as equal partners within the clan. The Clan Mother is responsible for internal clan matters and prays and conducts rituals for the well-being of its members. Important clan-related ritual paraphernalia is kept in her house. The Clan Uncle represents the clan to the village and negotiates with other Clan Uncles if there are disputes over land boundaries or other matters. One of the Clan Mother's important prerogatives is her final authority over clan land. The men of the clan allocate land to individual households, for as farmers they know the plots and try to divide land fairly. However, if any woman is dissatisfied, she appeals to the Clan Mother. If the Clan Mother agrees with her, the men are obliged to reallocate land to satisfy the needs of the complainant.

Ceremonial societies are to some degree gender based. I shall discuss this below.

Gender Roles in Economics

The Hopi were a society without private property until the Spanish introduced sheep. Even then, their herding was on a very small scale, for subsistence rather than commerce, until they began commercial cattle raising in the early 20th century. Land is owned by the clans, and land unclaimed by clans belongs to the entire village for the chief to allocate to those who appeal to him for use of it.

Men's subsistence tasks are farming and herding, along with some hunting of small and large game. They provide the food for their wives and children, and from the cotton they grew they weave the family's clothing. Women do some gardening on plots close to the village, cultivating plants introduced by the Spanish and later the Americans. They also gather wild plants for food, basketry, and other uses.

Men's crafts are principally weaving, wood carving, and leather work. Before a commercial market opened up for carved *kachina* dolls, their trade was mainly in textiles to eastern Pueblos and other Indian peoples. Women make pottery for home use and some local trade, and it has become a commercial item to tourists. Basketry is an important female craft, for large quantities of baskets figure in the exchange of goods at marriage. Mothers collect baskets at the time of their daughters' weddings, and then spend months or years weaving baskets to pay back the lenders. Women sometimes set up small informal stands in front of their houses, trading a few baskets of peaches or other items for something they wanted. When Navajos enter the village with meat or pinyon

nuts, women barter dried corn and other goods for these products.

Women rarely leave the village. However, men sometimes walk long distances to trade. They make occasional expeditions to the Gulf of California to gather salt.

The only kind of private property of any value consists of sheep. These animals belong to individual men. Fathers and sons often herd together, and sons usually inherit their fathers' flocks.

PARENTAL AND OTHER CARETAKER ROLES

Children are believed to be the products of both parents' bodies, the father's semen and the mother's uterine blood. It is not unusual for a father to help his wife deliver the baby. While mothers take more responsibility for child-care, fathers often mind infants and toddlers, especially when the mother is busy, holding them and singing lullabies and *kachina* dance songs to them. As in many matrilineal societies, the mother's brother is more of an authority figure than the father, especially to boys as they grow older. The father is seen primarily as a protector, provider, and nurturer. Relations between fathers and children are often close and tender, and the word "father" connotes loving protection rather than authority or distance.

The closest relationship for both boys and girls, however, is likely to be with the mother. She is all-loving and all-giving, at least in theory. The maternal grandmother shares some of these features.

Parents begin treating girls and boys differently when they are about 4 or 5. Girls are discouraged from wandering too far from home, while boys are expected to be away much of the time. Mothers train their daughters in domestic tasks, as fathers and maternal uncles train the boys in farming and herding. As indicated above, training for girls becomes more systematic when they reach adolescence. Both parents are somewhat likely to indulge adolescent boys, rationalizing that they have only a few years of freedom. The maternal uncles are expected to do any necessary disciplining.

Parents seem to expect children to pick up what they need to know, rather than giving them a lot of detailed instruction. When children misbehave, they are reprimanded but rarely punished physically except in one way. A parent or other adult might throw a dipper full of water in the small child's face, a startling and unpleasant experience. After a time the adult has only to move toward the water barrel for the child to stop its misbehavior. This punishment is symbolic as well as real, for water is a purifying agent and will help cleanse the child of any antisocial tendencies.

A much harsher punishment, generally reserved for boys, is to smoke the child. Smoke is also a purifying agent. The truly misbehaving boy is held over a smoking (but not hot) fire, gagging and coughing, until his punishers feel that he has had enough. This kind of punishment is generally administered by maternal uncles, not fathers.

Another treatment reserved for boys is something of a punishment but more of a healing ritual. A boy who consistently wets the bed is carried from house to house on the back of a maternal uncle so that people can pour small amounts of water on him. Either girls do not wet the bed often or, if they do, no fuss is made about it.

LEADERSHIP IN PUBLIC ARENAS

Men and women both have leadership roles in the clan as Clan Uncle and Clan Mother. They are expected to make decisions jointly, and one cannot supersede the other in decision-making.

The principal public arenas are political and ceremonial. The chief and his council members are men. These men, in consultation with other important male clan leaders, make the major political decisions for the village, which consist primarily of adjudicating disputes over land. Punishment of miscreants is mainly left to individuals to settle, there being no police force.

While political decision-making may appear to rest in the hands of a few, it is actually quite inclusive. All men belong to kiva groups, and it is there, in the general discussions, that the leaders get a reading of public opinion. Furthermore, men bring to their discussions the opinions of their wives and female clanmates. No man would be so foolish as to make a public pronouncement that his wife and her family disapproved of if he wanted any peace at home, and he certainly would not go against the perceived best interests of his female clan members. Women have considerable political power behind the scenes, although their men speak for them in public.

Both men and women take leadership of religious sodalities. Most of these sodalities are led by the male

leaders of the clans that control them, but three are women's societies and have female leaders. Even those with male leaders have female members, as the women's societies have a few male members whose participation is necessary for the ceremony to be conducted.

GENDER AND RELIGION

I have already discussed the ideology of a balance of oppositions, two of these being male and female. In this respect there is no distinction in value placed on the genders: they are equal and equally necessary to the whole. However, in one respect females have greater spiritual value than males. This will be discussed below under witchcraft. In the pantheon of deities, female deities are as central and powerful as male deities.

In Hopi eyes, all sodalities and their ceremonies are important and necessary for the ceremonial year to be complete. However, some ceremonies are more symbolically loaded than others. Probably the single most important ceremony is Wuwucim, held in November, which opens the ceremonial year. It celebrates the emergence of the Hopi from the Underworld and their establishment as a people on earth. It is during this ceremony that every boy is initiated into one of the four fraternities, each of these symbolically dedicated to one important aspect of Hopi life. Soyal, held in January, is when the chief and his council meet to plan the remainder of the ceremonial year. It is at this time that the first *kachinas* reappear in the villages; after this ceremony, public *kachina* dances take place in the kivas and later in the plaza. Powamuya, held in February, is a celebration of the planting season to come, and it is the time when young children undergo their initiation into Hopi religious life. Niman, in June, is also called the Home Dance, because it celebrates the leave-taking of the *kachinas* until the following year. These ceremonies are organized by male-centered sodalities, as are the Snake and Flute ceremonies held in August.

The three women's sodalities are Marau, Lakon, and Oaqul. Marau is considered to be the women's Wuwucim, and indeed it contains parallels to all of the ritual acts and paraphernalia of Wuwucim. Hopis say that, in earlier times, all females were initiated into it. Lakon and Oaqul are sodalities that put on so-called basket dances, because the female performers dance holding elaborate woven baskets. These dances are held in October and contain symbolism of warfare and hunting, activities that are carried on at this time. It is possible that Lakon and Oaqul originated as women's basketry guilds, both controlling the production of women's wealth and exerting moral control over their members as craft guilds have done in many parts of the world.

Parallel to the sodality ceremonies, and intersecting with them at some points, are the *kachina* celebrations. *Kachinas* are spirit beings somewhat analogous to angels, and they bring abundance of all kinds (although there are some whipper *kachinas* as well, a reminder that bad thoughts and acts are punished by illness and shortness of life). The *kachina* dances, held from Soyal to Niman, are planned and performed by the kiva groups and thus are male-centered, men portraying both male and female *kachinas*.

The fact that men take more roles in ceremonial life than women do does not mean that men have greater or higher spirituality. It is part of their duty as protectors of life, which is inherent in women and the female principle. Through ritual, men give spiritual protection and they propitiate the deities to grant fertility and the abundance of all good things, not only material goods but also social peace, harmony, and well-being.

Witchcraft beliefs indicate the spiritual value of females. A witch is a person, it is believed, who has bartered his or her heart (life force) to some supernatural forces or beings—here Hopi explanations are not very clear—in order to gain temporal power of some sort. This could be used for personal enrichment, for political power, or even to bring rain during a drought, with the result that anyone above average is potentially suspected of being a witch. Having lost his heart, the witch has to steal the heart of another person in order to stay alive. It is said that a child's heart is preferred, since children have a stronger heart, that is, they have a longer life, than an older person. It is also believed that the heart of a girl will give the witch twice as long to live as the heart of a boy. This reflects the value put on females and the life they contain.

LEISURE, RECREATION, AND THE ARTS

Hopis rarely relax without busying their hands with some handicraft or small repair task. Most leisure time, in fact most time when not eating, sleeping, or doing some other home-based activity, is spent with members of one's

own sex. Women, usually relatives and neighbors, gather in someone's home, while men go to their kiva for companionship. Women's closest friends tend to be sisters and other relatives, while men's friends are more likely to include unrelated men whom they know from their adolescence and meet in the kiva. These times with companions, for both sexes, are opportunities to gossip and to discuss village matters. Men acknowledge that there is a lot of joking and teasing in the kivas, particularly about sexual matters ("private wives," "hunting for two-legged deer," etc.). This joking is a kind of verbal horseplay, each trying to outdo the other with veiled allusions to transgressions of the other or the other's female relatives. No one takes this seriously, including the women who have been so accused, and this joking competitiveness enlivens the time in the kiva and provides a respite from the obligations that the Hopis bear.

RELATIVE STATUS OF MEN AND WOMEN

This is a sexually egalitarian culture. Women are more highly valued than men—ideologically as the source of life, and practically for their centrality in the clan and household (see above). Men are responsible for conducting most of the ceremonies, which they view as protecting the village, primarily the women and children. Men also take responsibility for political decisions, but, as we have seen, women are a major power behind the scenes. Nevertheless, women depend on men to fulfill these responsibilities. They also depend on men in a more immediate sense, to farm and provide clothing and other goods for them. Just as men's power is checked by their reliance on wives and sisters, so is women's power checked by their reliance on husbands and brothers. A favorite Hopi expression is *pi um'i*, meaning "it's up to you." No one should try to control another person, and this applies to relations between women and men as well.

SEXUALITY

Sex is good, mainly because it results in children but also because it brings pleasure. It should not be misused in adultery or rape; nor should children be born out of wedlock, for then they do not have the fathers and fathers'

relatives that are so important in Hopi life. However, there is no particular value on virginity, and the ideal feminine beauty is the young mother, not the virgin.

The general attitude toward sexuality is relaxed. No one ever mentioned masturbation to me as a problem in child-rearing, nor did anyone ever remark on adolescent homoerotic play. Women are expected to cover their bodies more than men, but there is no reluctance to breast-feed in public. Men speak rather lasciviously about the Marau dancers, who wear knee-length skirts and thus expose their legs, and sometimes young women are shy about participating because of this.

Homosexuality is regarded as odd and somewhat ridiculous, but not in itself evil or disturbing. The few individuals who have made attempts at cross-dressing are socially accepted but privately laughed at.

For all the gossip and joking about sex that both women and men relish, Hopi life gives little opportunity for much privacy in which to enjoy it. Families sleep together in one room, and couples wait until they think that everyone is asleep before they make love quietly. Suspicions are aroused if any man and woman who are not spouses or close relatives are alone together, and there is little opportunity for this to occur. Nevertheless, there is gossip about men visiting women after dark when husbands are believed to be in the sheep camp or otherwise away from home. (How they eluded others in the household was never explained to me.)

COURTSHIP AND MARRIAGE

In theory, people marry for love and have freedom of choice. In actuality, the girl's family has to approve of the boy she is bringing into the household and who will father children for her clan. A stubborn girl might insist on marrying a boy she loves, but if her family really did not approve they would make life so miserable for him that he would leave. A girl might force an unwelcome marriage on her family, because girls do the proposing since they are inviting the boy to come to them.

Girls propose by presenting the favored boy with a special small corn cake. This is a token that unmarried girls give to any boy or man they like, and men are extremely pleased when a favorite niece or granddaughter presents them with one. It can be viewed as a token of friendship as well as love, rather like a valentine. The boy who receives it must accept, but he can choose to

interpret it as friendship and do nothing further. Even if he loves the girl, self-respect demands that he not jump too quickly. Meanwhile, the girl is tense with anticipation. If he has not accepted the proposal within a couple of weeks, she knows that she has been rejected. If he accepts, the families begin the wedding preparations. There is a feast and an elaborate exchange of gifts between the families, the bride's giving more to the groom's in a kind of groomwealth. I have heard Hopi women remark "we paid for him" about a young male in-law.

Even if the couple are in love, the early days of marriage are hard for young men as they adjust from life with rather indulgent parents to the authority of parents-in-law and the need to prove themselves worthy. It is not unusual for young grooms to return home for several extended visits before they settle in.

Hopis only formally marry once, and the spouse in this life will be the spouse in the afterlife, in the village of the dead. However, informal remarriage is possible for widowed and "divorced," (i.e., permanently separated) people.

Husband–Wife Relationship

The husband–wife relationship is probably at its best in old age after long years of cooperation. It is only then that spouses gently tease one another and openly show affection. Earlier years are burdened with responsibilities, and men can be torn between obligations to their wives and in-laws and to their sisters and sisters' children. The dependence that women have on men to provide for them makes them vulnerable to being left, just as women's control of the home makes men vulnerable to being replaced. If men leave voluntarily or under pressure, they lose close contact with their children. They may see their sons in the kiva, but they may not often have much time with their daughters.

Nevertheless, the relation between spouses is expected to be loving and close, and it often is. They sleep and eat together and are expected to support one another in their political and religious duties.

Other Cross-Sex Relationships

The primary cross-sex relationship outside of marriage is the sister–brother one. This is at the core of the clan.

While discord between spouses is deplored, that between cross-sex siblings is scandalous. The depth of feeling is indicated by witchcraft beliefs, which hold that, since the most precious life for a man is his sister's daughter, she is the preferred victim of his heart stealing.

Mothers' brothers are gentler in exerting authority over their sisters' daughters than their sisters' sons. Fathers' sisters (women of the father's clan) are often close to their brothers' daughters and may be their confidantes, but they have a special relationship to their sisters' sons. This involves the pretense of sexual interest and romantic feelings. There are many jokes and much teasing about a man's "aunts," the English word used for these kinswomen. He is expected to flatter them and make them feel loved and attractive.

Changes in Attitudes, Beliefs, and Practices Regarding Gender

The period postdating this ethnographic sketch has seen major changes in Hopi life. The major ones regarding gender have been the reduction in importance of the clan and the transition to nuclear-family households, with increasing responsibilities for husbands and fathers and decreasing responsibilities for mothers' brothers and brothers. The husband–wife bond has become more central to people's lives over the past 60 years or so, and men spend more time at home with their wives and families.

Some women entered wage labor in the early 20th century, and now it is commonplace. Women also participate in modern political life. Some of the ceremonies have died out, but the three women's ceremonies are still held. While gender roles have undergone considerable change in the last 50 years or so, Hopi remains a sexually egalitarian culture.

Hungarians

Barbara A. West and Irén Annus

ALTERNATIVE NAMES

Hungarians are also known as Magyars.

LOCATION

The Republic of Hungary is located in the center of Europe, between Austria to the west, Slovakia and Ukraine to the north, Romania to the east, and Serbia and Montenegro, Croatia, and Slovenia to the south.

CULTURAL OVERVIEW

The Hungarian people have had a tumultuous history since arriving in their present location in 896 CE. They were invaded by the Mongols, Turks, Habsburgs, and Soviets, they had two major failed revolutions, in 1848 and 1956, and they were on the losing side of two world wars. Yet each time the Hungarians emerged as a people both cognizant of their differences from their neighbors and willing to fight to maintain them. One of the most important of these differences is linguistic. The Hungarian language, Magyar, is a member of the Finno-Ugric language family and thus completely unrelated to the German, Romanian, and Slavic languages spoken by Hungary's neighbors. Hungarians are also predominantly Roman Catholic or Calvinist, and so consider themselves very different from their Orthodox neighbors to the east and south.

The two most significant historical events shaping contemporary Hungary are the loss after World War I of two-thirds of the territory claimed by Hungarians and the 45 years of Soviet domination following Hungary's defeat in World War II. The first event, while it left many ethnic Hungarians living in Hungary's neighboring countries, has also resulted in Hungary being one of the most ethnically homogeneous countries in contemporary Europe. Currently, the population of Hungary is about 95% Magyar.

The creation of a Soviet-style one-party state after World War II provided the context for most of the political, economic, social, and cultural features of contemporary Hungary. Politically, Hungary has had four rounds of free elections since the end of the socialist era in 1990, but no government has been reelected and no political ideology has been able to dominate national discourse for long. Two exceptions to this may be a push for "traditional" Hungarian gender and family roles and the desire to "join Europe." Economically, Hungary was transformed during the second half of the 20th century from a largely agrarian country to an urbanized industrial one. Today, 65% of Hungarians live in cities or towns. Unfortunately, since 1990, both the urban and rural work forces have suffered under high rates of inflation, unemployment, and a restructuring of the social service benefits they had grown accustomed to during the socialist era. Some of the most significant of these are education funding, childcare and maternity benefits, childcare centers, pensions, and healthcare. Socially, many Hungarians have experienced a diminution in the number and depth of friendships since 1989. Culturally, Hungary has been transformed by films, television programs, magazines, advertising, pornography, and other consumer items from the West, as well as by legal and illegal workers, shoppers, and immigrants from the other former socialist countries.

In addition, Hungarians are now unsure about their gender roles. While women were technically "emancipated" by the socialist state, the benefits they received were experienced by many women as hardships (Bollobás, 1993). While the guarantee of paid employment sounds wonderful to Western ears, to Hungarian women it meant a tremendous burden of full-time paid employment and full-time housework without the benefits of most of the machines and products that ease the workload of most Western women. In addition, public discourse critical of women, depicting them as deleterious to men, children, and society, has left many women feeling betrayed, exhausted, and confused about their place in contemporary society (Goven, 1993). Like women, many Hungarian men are also struggling to reconcile cultural

ideals, which depict them as breadwinners, with economic realities that have left many of them unemployed.

Cultural Construction of Gender

The two recognized gender categories in Hungary are woman or girl and man or boy, depending on a person's age. These categories are assumed by most people to be distinct and, despite 45 years of de jure gender equality during the socialist era, also hierarchical. Within the parameters of class, educational, and even regional differences, in Hungary men and boys generally have a distinct advantage. For example, women who are well into their twenties and even early thirties are often referred to as *kis lany*, "little girl" (West, 2002) by older people and the generic word for person, *ember*, is often used to refer to men only. Furthermore, in the past, and even today in some elderly households in rural communities, men's hierarchical position is reflected in women using the formal pronoun and verb endings to refer to their husbands while men use the informal with their wives.

While just a very few Hungarian women continue this practice, many other gender differences continue to be evident throughout Hungarian society. Hungarian boys are freer to join clubs and sports teams while girls are expected to participate in household labor to a greater extent. In adulthood, women's primary responsibilities are to raise at least one child and take care of the home. Most women also expect to work, but in both their own estimation and that of society at large, their economic role outside the home is secondary to their domestic role within it. Even during most of the socialist era, which saw the emancipation of women based on their "right" to work, women were seen primarily as mothers rather than as wives or women (Haney, 1994). Men, on the other hand, are expected to be the main economic providers for their families. Unfortunately, the change in the Hungarian economy has not made this cultural ideal possible for most men, but this fact has not mitigated its social force.

Gender over the Life Cycle

The most important rites of passage that mark the life course of both females and males in Hungary are marriage and having the first child, although graduating from elementary school, leaving school entirely, and retirement are also fairly important. All Hungarian men are also required to spend 6 months serving in the military. Some religious Hungarians also mark baptism, first communion, and confirmation, bar mitzvah, or other similar rituals, but none is as important as marriage and having children.

In addition to the differences in life course due to men's military service and gendered expectations for education, work, and household participation, the life course of Hungarian women and men also differs because women generally have a much longer elderly phase of life. While the average life expectancy of Hungarian women is 75.2 years, for men it is only 66.1 (Pongrácz & Tóth, 1999).

Socialization of Boys and Girls

Much of the socialization that takes place in the home, childcare centers, and elementary schools in Hungary is a process of exposing children to somewhat traditional gender and family roles. For example, although 90% of all children between ages 3 and 6 attend kindergartens (Vajda, 1998) and education is compulsory for all up until age 16 (it will be 18 for children who were 6 or younger in 2002), boys' and girls' experiences are not the same. Elementary school texts highlight the activities of men and present no alternative to the nuclear family with its gender-segregated roles; elementary schools also require students to read no novels written by women (International Helsinki Federation for Human Rights, 2000). This early socialization is very important in Hungary because the kind of high school a student enters, whether academic or vocation specific, depends on choices made when children are very young. Therefore, in a variety of ways, parents and teachers continue to channel students into a somewhat segregated work force (Lobodzinska, 1995), even if this segregation is not as great as it was in the past.

Puberty and Adolescence

For the most part, the path set down for female and male children is merely continued into adolescence, although rural children who want to attend high school must move to a nearby city and live in a dormitory in order to do so. Nonetheless, adolescent girls continue to feel more

pressure from their families to conform to their family's and society's constraints upon them, while boys are given more freedom to explore the world on their own. Mothers, particularly older ones and those in rural areas, continue to want their daughters to entertain boys at home rather than to go out with them (Vajda, 1998), although most girls prefer to go out on dates. Girls generally also experience heavier family sanctions against alcohol use and as a result experience drunkenness less than their male counterparts. Nonetheless, both adolescent girls and boys do drink alcohol, so much so that by 11th grade fully 100% of the boys and 94.9% of the girls in a recent study had tried alcohol (Swaim, Nemeth, & Oetting, 1995).

Another aspect of adolescents' lives that is a continuation from childhood is the emphasis on different kinds of education. Interestingly, this difference has contributed to a positive outcome for more Hungarian women than men during the change from an industrial to a service economy in the 1990s. In Hungary, girls and young women complete academic secondary school and both 3- and 4-year colleges more than boys and young men (Hrubos, 1994). Training in such fields as accounting, clerical work, and languages were predominantly seen as female, while boys were directed via vocational high schools into the industrial work force, with its opportunities for hands-on training and high industrial wages (Koncz, 1995). In addition, currently, more women are entering into formerly male-dominated fields such as economics and computer science (Hrubos, 1994). As a result, younger women make up a greater proportion of the well-educated Hungarian population and tend to have greater educational qualifications than men of the same age (Lobodzinska, 1995).

Attainment of Adulthood

While young men's military service is an important part of the phase between adolescence and adulthood, for both women and men the first phase in the passage to adulthood is their 18th birthday, as that is the age of legal adulthood in Hungary. The most important social marker of adulthood is the *eljegyzés*, engagement. The engagement process in Hungary generally begins with a verbal proposal by the man and the woman's acceptance. Following this proposal, the couple shops together for their wedding rings. These are first exchanged at the *eljegyzés*, which is usually a lunch attended by the couple, their parents, and sometimes their godparents.

At this event, the man formally asks the woman to marry him and seeks the approval of her parents. At this point, both the man and woman wear their wedding ring on their left hand, to indicate that they are engaged. At the wedding, they will exchange these same rings and switch them to their right hands. The woman may also receive an accompanying ring, another piece of jewelry such as a necklace or bracelet, or nothing at all.

After the engagement and wedding, the next most important marker of adulthood is having a child. In a recent Hungarian survey, which has been echoed in the works of many Hungarian sociologists, researchers discovered that 80% of Hungarians believe that not having a child leaves one incomplete (Wolf, 2000). While women more than men think that raising children is their most important function, Hungarians of both genders feel the significant social stigma of not having at least one child (Tóth, 1999b). Indeed, the word for family (*család*) is often used to refer to children, so that a married couple generally do not acquire family status until the birth of their first child.

Middle Age and Old Age

In terms of career development, older age begins in Hungary for both women and men by the time they have reached their mid-30s. At this time, most people find it extremely difficult to change career paths because of discriminatory hiring practices. At the same time, in her delineation of the Hungarian woman's life course, Tóth (1994a) considers the period of child-rearing, late twenties through forties, as middle age. For most Hungarian women, this is also the most difficult time of their lives. Most are attempting to combine raising children, taking care of their home, working outside of the home, and possibly caring for older relatives (Tóth, 1994a).

Retirement and/or having grown children mark old age in Hungary. As of the late 1990s, 19% of the Hungarian population was over 60 years of age (15.8% of the total male population and 21.8% of the total female population) (Földesi, 1998). While there are many reasons for the difference between men and women, a few contributing factors are that many more men than women in this age group smoke cigarettes, drink alcohol regularly, and remain unwilling to change their traditional diet for a healthier one. At the same time, only 1% more of the men in this age group (5% vs. 4% of women) have remained physically active into their old age, which might have

helped offset a lifetime of poor nutrition and bad habits (Földesi, 1998). However, despite the fact that women live significantly longer than men, they are not necessarily healthier or happier. Hungary's suicide and depression rates for people of this age are both amongst the highest in the world and relatively comparable for women and men (women's are slightly higher) (Elekes, 1999).

In addition, a large number of elderly Hungarian women feel that they are the losers in the recent political, economic, and social changes because the system they worked all their lives to support, and which in turn promised to care for them in their old age, has failed them (Földesi, 1998). For example, women receive 23% less pension on average than men (Széman, 1999). Other contributing factors to elderly women's discontent may be that they are alone because they live longer than men by 9 years, they are more likely to live in single-person households, and they face a lack of wide social relations and activities (Széman, 1999). Far more older women (32.2%) than men (13.2%) are also unmarried (Földesi, 1998), because of their greater numbers and men's greater desire to remarry, particularly younger women.

While some elderly Hungarian women are experiencing loneliness and inactivity, many others continue to contribute substantially to their adult children's households. Many older women find themselves retiring, or even timing their own retirement, to coincide with the birth of their grandchildren so that they can provide much-needed childcare (Vajda, 1998). Indeed, most older women take on the role of active grandmother, either taking their grandchildren into their own home or flat and providing meals when the children's mother is at work, or living with their son's or daughter's family to provide constant domestic support. Some women who were mothers in the 1950s feel that they missed out on spending significant amounts of time with their own children and use this active-grandmother phase of life to make up for that earlier loss (Tóth, 1993).

Personality Differences by Gender

On the whole, women in Hungary tend to express their feelings more than men do. This is true of both positive feelings such as affection and tenderness and negative feelings such as anger and frustration. According to a survey in the late 1980s, many Hungarian men would prefer to be more open about their positive personal feelings with other men, but are not sure how to do that. Hungarian women want to be less quick to show anger (Reisman, 1990).

A second area of difference concerns the guilty feelings that Hungarian gender ideologies and society more generally have produced in women (S. Molnár, 1999). Women are often depicted as the cause of Hungary's negative birth rate. They are also held responsible for any problems their children have in school or elsewhere. The greatest area of concern, both for many women and for society more generally, is the balancing act that women must engage in with regard to work and home. Since women's wages are socially seen as supplementary to men's, regardless of economic reality, if they continue to work and family problems arise they tend to feel that they are to blame (Tóth, 1997).

A third area of difference, one that seems somewhat anomalous given the guilt that most Hungarian women feel, is the connection many women feel to their work. In a survey in the early 1990s, 25.1% of Hungarian women said that they enjoy working and would continue to do so even if they did not need to; the figure for men was only 19.3% (Tóth, 1994b). In a related survey in 1997, more men accepted the view that work is for money rather than for personal well-being; this difference was true for all educational groups (Pongrácz & Tóth, 1999). In addition, women are also a bit more optimistic about the future of their jobs than are men (Tóth, 1994b).

Finally, as might be expected in a society that tells women that their work is less significant than men's, women tend to diminish the value of their work and to explain their own successes in terms of luck or outside factors rather than their own abilities or performance (Nagy, 1997). Hungarian men are generally more confident and willing to take credit for valuable work and a job well done.

Gender-Related Social Groups

The single most important social group in Hungary is the family, which refers to members of one's household who share ties of descent or alliance. Fully 85% of the population reside in families (Hungarian College of Catholic Bishops, 1999). Those who do not reside in the same household, whatever their biological relationship, are often referred to as relatives rather than family

(West, 2002). Hungarians do not recognize lineal or other forms of institutionalized extended kin groups. Nonetheless, much of the literature on Hungary from sociology, anthropology, and psychology refers to this society as both child centered and family centered. This is the result of a number of factors, from the traditional value on children to the recent economic downturn that has caused many domestic units to turn inward for respite against the vagaries of unemployment, inflation, and diminished social services (West, 2002). Although this has changed quite a bit since even the early 1990s, many households, or families, in Hungary in the recent past were multigenerational (Buss, Beres, Hofstetter, & Pomidor, 1994). Even in the early 1990s, 75% of young married couples lived with either the bride's or groom's parents or grandparents (Tóth, 1993); this figure is somewhat lower today with the advent of low-interest housing loans.

Other groups that are important in the lives of some Hungarian men are drinking groups, work circles, and peer groups developed during childhood and early adolescence. Hungarian women participate in fitness groups more than men, but less than men in work circles. Fewer women also maintain friendships across the entire life cycle (Reisman, 1990). As in most areas of gender difference, class, education, age, and region are very important in determining an individual's participation in these groups. For example, it is largely young urban women who take fitness classes.

GENDER ROLES IN ECONOMICS

In some ways the economic position of women in Hungary today is stronger than that of Hungarian men (Frey, 1996; Koncz, 1995) and than that of women in most of post-socialist Eastern and Central Europe (van der Lippe & Fodor, 1998). In 1998, unemployment was 7% for Hungarian women and 8.5% for men (Pongrácz & Tóth, 1999). There are many reasons for this difference. First, because of their dominance in the fields of heavy industry during the socialist era, men more than women have lost their jobs due to factory closures. Second, because their earnings have always been seen as secondary, women have been much more willing than men to take advantage of the part-time, temporary, and home-based work opportunities that have opened up since 1990 (Szalai, 1998). Third, traditional gender roles in Hungary have also allowed far more women than men to exit the labor force and yet remain economically active as the recipients of childcare and maternity benefits, "nursing fees" to care for elderly parents and in-laws, and early retirement (Szalai, 1998). Fourth, women in Hungary have been more willing to take advantage of retraining programs (Szalai, 1999). Fifth, Hungarian women began more than 40% of the small private businesses started in Hungary between 1990 and 1998 (Frey, 1999). Finally, many women have been able to combine one or more of these kinds of "supplementary" incomes to support their entire families (Szalai, 1998); 44% of women and 41% of men have other sources of income besides their primary employment (Nagy, 1995). The result of all these factors is that women generally are more likely than their male counterparts to retain the occupational class attained by their fathers (Pongrácz & Tóth, 1999).

At the same time, despite 45 years of de jure gender equality, Hungarian women earn only around 80% of the salaries of men (Pongrácz & Tóth, 1999), leaving women more vulnerable if they divorce (Utasi, 1997) or, as only rarely happens, they remain single. Younger women and women with children suffer much more discrimination with regard to their access to well-paying jobs and prestige (International Helsinki Federation for Human Rights, 2000). During the socialist era, women had much less access to private economy work opportunities, usually because of their responsibilities at home, leaving them with fewer skills and less access to private work today. As a result, women constitute nearly three quarters of the state sector and only one third of the much more lucrative private sector (Koncz, 1994). Women are also less likely than men to move in order to take a higher-paying job (Wong, 1995). Finally, women managers have much less access to top positions. While almost all successful male managers have wives at home to support their efforts, women who are able to engage in the work activities necessary to rise to that level are often divorced or single. In addition, since nearly all Hungarian women want at least one child, they must rely upon mothers and day-care providers for childcare (Nagy, 1997).

PARENTAL AND OTHER CARETAKER ROLES

Since Hungarian marriages have begun to occur at later ages, the age at which women are having their

first child has also increased recently, from 23.1 in 1990 to 25.4 in 1999 (Kamarás, 2000). The primary reasons for these increases are financial instability and increased opportunities for female education and career development.

For both men and women in Hungary, the birth of a first child is the final step in the attainment of full personhood. In recognition of this most important of roles, the Hungarian state allows parents (or even grandparents) with permanent jobs to take 2 years of maternity and childcare leave at 70% of their salary and a third year with a flat amount of 20,000 forints per month. While these kinds of benefits were initially provided in the 1970s to boost Hungary's falling birthrate, they have been maintained despite their failure to affect the birthrate significantly (Lobodzinska, 1995). Today, almost all Hungarian women take at least 6 months of paid leave after the birth of a child in order to breast-feed their infants. Unfortunately, the guarantee that a parent's job will remain after their leave has been eliminated. Therefore, generally the only parents (primarily, but not solely, women) who take advantage of the 2-year leave are those who are fairly certain that their jobs will be eliminated anyway (Jakus, 1993), those who are well to do, or those who have received a guarantee that their jobs will remain available to them.

Since 1989, childcare centers have also been cut way back, forcing more women to rely upon their parents or in-laws for childcare (Lobodzinska, 1995). Because some Hungarians live in extended families anyway, due to housing shortages and a significant lack of nursing homes (Buss et al., 1994), this is not always difficult. However, the contributions of active grandmothers in the household may also encourage the lack of participation of many Hungarian fathers in childcare, particularly with very young children (Vajda, 1998). The presence of multigenerational households may also add to women's workload, since older family members may need a significant amount of care.

Although more fathers today, particularly those with more education, are participating in child-rearing activities than in the past, motherhood and fatherhood continue to be two very different social roles in Hungary. Mothers have historically been seen, and continue to be seen, as central figures not only in households but also in the nation as a whole (Huseby-Darvas, 1996). In addition to providing most of the household labor and childcare, Hungarian mothers also largely determine the cultural level of their children by exposing them (or not) to museums, art, literature, music, etc., while Hungarian fathers largely determine their economic level (Tóth, 1993). Mothers also tend to determine their children's religious affiliation and activity (Tomka, 2000).

LEADERSHIP IN PUBLIC ARENAS

During the socialist era, when the Party held all true leadership and representation was largely for show, women were represented at all levels of national and local governance. In 1987, women made up 21% of Hungary's parliament (LaFont, 2001). With the transition, when political power became real and representation vitally important, women have become less and less visible in formal governing processes. Party politics quickly became male dominated; by 1993 women held only 6.7% of parliamentary seats (8.5% in 1998; Lévai & Kiss, 1999) and masculine issues dominated the agenda (Koncz, 1995). In part because of the history of the socialist state's concern with women and gender equality, since 1990 men and women alike have been reluctant to raise these as political issues. In addition, the few feminist or womanist organizations that developed in Hungary after 1990 have changed their focus or disappeared in the past decade (Szalai, 1998).

Nonetheless, women have not disappeared entirely from the political process in Hungary. First, while the more conservative political circles and parties tend to favor and lobby for traditional gender and family roles, others have run women candidates and appointed women to key positions. For example, in 2002 the Hungarian Socialist Party named a woman as Minister of the Interior, the second most powerful person in the government. Second, women and men have voted in equal numbers in all local and national elections since 1990 (Szalai, 1998). Third, women participate heavily in the professional administration of local governments. They make up 34% of the non-elected members of local social policy commissions (Szalai, 1998) and in that capacity were instrumental in the national parliament's decision in 1993 to pass the most liberal abortion act ever seen in Hungary. Finally, women tend to occupy leadership positions in areas where their subordinates are also women, and thus remain invisible in the national (and international) sphere (Koncz, 1994; Nagy, 1997).

GENDER AND RELIGION

A large proportion of the Hungarian population has been baptized into the Roman Catholic church (almost 7 million members in 1998), the Hungarian Reformed church (just over 2 million members in 1998), or some other Christian denomination (Tomka & Révay, 1998). Yet, aside from some elderly women, many of these people have not had much continued relationship with a church community. During the socialist era, the Party State apparatus actively discouraged religious affiliation and most monasteries and church-run schools were closed. Since 1990, most of these institutions have reopened and religious participation has increased somewhat, particularly at such ritual times as Christmas, Easter, and weddings. In 1997, there were 998 monks and 2311 nuns serving in 91 monasteries and convents in Hungary (Tomka & Révay, 1998).

Churches in general in Hungary tend to favor traditional gender and family roles; however, in 1999 Catholic bishops in Hungary issued a statement calling for happier families. One of their suggestions was for Hungarians to recognize the double-income family as appropriate for the 21st century. They also stated that women have a rightful need to study and work (Hungarian College of Catholic Bishops, 1999).

LEISURE, RECREATION, AND THE ARTS

As is the case elsewhere, Hungarian women have less leisure time per day than men, an hour less on average (Tóth, 1997). Women also have fewer friends than men, are members of fewer organizations that would allow for socializing outside of the home, and sleep less than men (Lobodzinska, 1995). They spend less time on cultural activities and have more home-based leisure activities, such as hobby cooking, gardening, reading, needlecraft, or listening to the radio (Wolf, 2000). However, some younger women in urban areas do participate in aerobics and other fitness classes. The most significant leisure activity for Hungarian women generally, but particularly working women, is watching television (Tóth, 1993). Nonetheless, in 1993, men watched more television per day (159 minutes) than women (139 minutes) (Pongrácz & Tóth, 1999).

Both adult men's and women's friendships are largely instrumental rather than emotional in Hungary (Tóth, 1993), men's even more than women's (Albert & David, 1998). Hungarian men also spend more time in the company of friends and colleagues than women do and they go out more often (Albert & David, 1998). Male leisure activities include home crafts and building, attending sporting events, watching television, and listening to music, and for some younger men, surfing the internet and other computer activities (Wolf, 2000). In addition, heavy drinking is also considered a socially acceptable male activity. Nearly 22% of men in the late 1990s drank alcohol every day; the figure for women was only 2.9% (Pongrácz & Tóth, 1999).

Since the beginning of the transition, Hungarian leisure time has changed fairly significantly. Hungarians had one of the longest work days in Europe in the 1980s (13.4 hr per day at their main jobs), but the economic downturn of the transition has decreased that substantially so that Hungarians now spend only 11.8 hr per day at their main job (Bod, 2000). However, for most people, this has not meant more time for most leisure activities but rather more time searching for work, upgrading their education and skills, and/or working in a garden or at some supplementary job. In addition, more households have turned inward against the economic difficulties of the transition, leaving both women and men with fewer affective bonds outside their families (West, 2002). Like their parents (Vukovich & Harcsa, 1998), children are also now participating at far lower rates in sports activities and other extracurricular activities and watching far more television. This increased viewing has resulted in a broadening of children's horizons beyond Hungary's borders, but has also had a negative effect on both their desire and ability to read (Somlai, 1998).

RELATIVE STATUS OF MEN AND WOMEN

Although women and men have enjoyed equal status under the law since the late 1940s, in real-life situations men usually have a distinct advantage. They make more money than women do, they hold the top positions in government, business, education, and almost all other public arenas, and they are the authority figures in most households. As Hungary is a predominately Catholic country, men make up the entire leadership in religious circles, although a minority in most congregations.

Society and the law also tend to ignore male violence against women, whether in marriage or not, and whether it includes rape, battery, and/or psychological violence. According to one Hungarian study, most Hungarian women and girls have experienced sexual harassment or humiliation, rape, or some other kind of mental or physical abuse at the hands of one or more men. This occurs in the home, at school, at work, and on the streets, so that there are few places in which many Hungarian women generally feel safe (Bollobás, 1993). In addition, threats and violence against women are largely supported by Hungarian gender ideologies. According to Tóth (1999a), 25% of women in Hungary believe that women are responsible for rape, 45% do not know that rape can occur in marriage, 41% of women with less than an eighth-grade education believe that wife-beating should not be punished, and 65% of women who have been raped or the victim of some other violence are so ashamed that they never report it.

One of the few areas in which women do have an advantage over men is in retaining custody of children and holding onto apartments when a couple divorces. Because women are seen by Hungarian society largely in terms of motherhood, mothers rarely lose custody of their children, even if their ex-husbands could provide equal or better child-rearing. In addition, because they retain custody of children, women are also better situated for holding onto a couple's house or flat upon divorce. In 1996, only 10% of all homeless people in Hungary were women (Pongrácz & Tóth, 1999). A second area in which women are currently better situated than men is their ability to remain economically active. While men who are working tend to make more money than similarly situated women, fewer women are unemployed (Szalai, 1998).

SEXUALITY

Sexuality is a difficult subject for most Hungarians to discuss openly due to a number of historical factors: conservative cultural traditions, Catholicism, and socialist morality. While sex education has been presented in schools since the 1970s, it includes only the most rudimentary factual information. As a result, knowledge about sexual relationships, contraception, sexually transmitted diseases, and even sexuality more generally is fairly limited (Hochberg, 1997). But Hungarian women have access to a range of choices for contraception and these are available at relatively low cost. As a result, about 75% of Hungarian women between 19 and 41 use birth control (Jozan, 1999). Abortion is also quite common (Kamarás, 1999), especially for teens and women over 40 (Pongrácz & Tóth, 1999). Since 1993, abortion has been available up to the 12th week of pregnancy almost without restriction. Prior to this time, it was legal, available, and common, but a woman was subject to a waiting period and invasive questioning by her doctor (Jakus, 1993).

Sexuality is an area that has changed significantly over the past two or three decades. While many older women in Hungary continue to live by the double standards with which they grew up, which valued women's virginity, women's sexuality only in the context of marriage, and other conservative norms, younger women tend to see sexuality as a natural part of their relationships with men (Kende & Neményi, 1999). Today, a majority of young people have their first sexual experience by age 18.2 (Kamarás, 1999).

One of the most incongruous aspects of contemporary Hungary is the social and political position of homosexuality. On the one hand, homosexuality has been legal since 1961 and, outside of Scandinavia and The Netherlands, Hungary has one of the most liberal domestic partner laws in the world (Long, 1999). Same-sex couples have most of the same rights as married couples (Farkas, 2000), and in Budapest and a few other large cities gays and lesbians have formed a number of activist and social groups. Yet, at the same time, there is no real national organization, lobbying group, or even lasting local organizing group for gays, lesbians, bisexuals, or transgendered people (Long, 1999). Several organizations have also been prevented from forming because they refused to bar membership to those below 18, the legal age of consent for homosexual sex (it is 14 for heterosexuals) (Long, 1999). Until very recently, there was no real gay and lesbian community in Hungary, in part because of the refusal of gay men to work with lesbians or feminists, in part because there was no consensus on what the community should be or do, and in part because of the relative silence about sexuality more generally (Long, 1999). Despite the increasing visibility of groups for sexual minorities, silence and loneliness continue to be the two most devastating facts of life for gays and lesbians in Hungary (Birtalan, 2000; Sándor, 2000).

COURTSHIP AND MARRIAGE

Marriage patterns in Hungary have slowly changed over the past few decades so that few couples marry before age 20, more couples live together prior to marriage or without any expectation of marrying, and more couples have their first child before marriage. Up until the 1980s, the average age for women to become engaged was 17 or 18; for men it was their early twenties. By the mid-1990s, only 18–20% of Hungarian women married before age 20, primarily due to the expansion of educational opportunities for women (Tóth, 1999b). In 1998, the average marriage age for women was 26.7, while for men it was 29.7 (Pongrácz & Tóth, 1999). Despite waiting longer, most Hungarians marry at least once during their lifetime and remarriage after divorce or the death of a spouse is not uncommon, although less frequent today than a few decades ago (Tóth, 1999b).

In addition, although marriage itself may be modernizing in Hungary, the phrases used in Hungarian to talk about getting married continue to emphasize its hierarchical nature. When a woman marries, the verb used is *ferjhez megy*, to go to a husband, while men either *elvesz*, buy a woman, or *elnõsül*, get "womaned."

HUSBAND–WIFE RELATIONSHIPS

Since 1989, an important advantage of marriage, especially for those with the least education, has been relative financial security. Most women also value it for providing legitimacy for their children (Tóth, 1999b). Men should also value it for improving their morbidity and mortality rates since married men live longer and healthier lives than men of any other marital status. Perhaps as a result, 71% of married men in a recent survey stated that married people are happier than other people; only 58% of married women agreed (Tóth, 1999b). This lower figure for women may be caused by the double burden women experience, the increasing financial opportunities for women without family responsibilities, or the widespread belief that fighting is common between spouses (80% of the time, fights are over money) (Tóth, 1999a). Hungarian husbands spend very little time on such housekeeping chores as cleaning, shopping, and caring for children (Lobodzinska, 1995), although more Hungarian men have become participants in household chores recently. In 30% of households, it is

even the wife's task to manage the family finances, while in 60% the husband and wife manage them together (Nagy, 1999).

Another reason women are less happy in marriage than men may be the traditional acceptance of domestic violence. One third of married women in the late 1990s had been beaten or threatened and only 19% of these women had sought police help, usually in vain since only 5% of that number actually received any assistance (Tóth, 1999a). The Hungarian proverb, "Money is best when counted, a woman is best when beaten," continues to be many people's reaction to evidence of domestic violence and even marital rape (Hochberg, 1997; International Helsinki Federation for Human Rights, 2000).

OTHER CROSS-SEX RELATIONSHIPS

Perhaps the only fairly significant cross-sex relationship outside marriage and parenting for some Hungarians is that between a godparent and his or her godchild. This institution only exists for Catholics and members of the Hungarian Reformed Church, although it is much more a cultural practice than an indication of church membership. The two most significant events at which the institution is visible and important are the child's baptism or christening, when the godparent promises to act as a lifetime moral religious guardian, and the child's wedding, when the godparents often serve as the witnesses.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Since the end of the socialist era in 1990, the most important changes in Hungary with regard to sex and gender have been the almost complete erasure of women's issues from the political scene, an emphasis on women's primary role as homemaker and mother, high male unemployment, and the development of a consumer culture.

The first two of these changes are the result of the degree to which the socialist state made women's employment (as the only path toward emancipation) a political, ideological, and moral imperative. In the anti-communist backlash of the 1990s and beyond, any political voice raising women's issues has been labeled reactionary, ideological, or anti-Hungarian. As a result,

women are as likely as men now to agree that women should not work full time when they have small children (in 1988, far more men than women felt this way) (Tóth, 1997). Some younger women have reacted to this change with pleasure, since they had watched their own mothers struggle with juggling full-time work and full-time housework and do not want to live that life themselves (Kende & Neményi, 1999). Yet, many other women, and some men as well, have reacted with disgust to what is essentially the repoliticization of women's lives under the guise of tradition, family, or choice.

The third change, high male unemployment, is important because of the cultural context that constructs men primarily as breadwinners. Like many women, who are struggling to reconcile their early socialization that directed them into the work force with cultural norms about their roles as mothers and homemakers, men too are struggling to reconcile economic reality with cultural expectations. This struggle may be a factor in the high rates of male alcoholism, suicide, and depression, although women have slightly higher suicide and depression rates than men (Elekes, 1999).

Finally, consumerism has changed most areas of Hungarian life, including gender. Mothers are now under pressure from advertisements that use the voice of male doctors or other "experts" to direct them to purchase disposable diapers, children's vitamins and other supplements, and baby toiletries (Vajda, 1998). The formerly state-run magazine *Nők Lapja*, which had been filled with articles on work and politics, is now equivalent to any Western women's magazine, including many articles on dieting, fashion, and gossip (Haney, 1994; Tóth, 2001; West, 2000). While women are the primary targets of such consumer propaganda, younger, especially well-educated, Hungarian men in certain types of jobs are now also concerned that they smoke the right cigarettes, drink the right alcohol, wear the right clothes, and drive the right car. Just as women are being told that beauty, femininity, health, and popularity are available at a price, men too are confronting a world in which masculinity is only available to the man who can afford to buy the right accessories.

Iatmul

Eric Kline Silverman

ALTERNATIVE NAMES

The Iatmul are also known as the Iatmoi.

LOCATION

The Iatmul are located on the middle Sepik River, Papua New Guinea.

CULTURAL OVERVIEW

Some 25 Iatmul-speaking villages line the middle Sepik River. For Melanesia, these villages are large—upwards of 1,200 people. They are also prosperous, with fertile gardens, access to jungle and grasslands, and a continuous source of water for drinking, bathing, and food.[1] The river, which recedes and floods in an annual rain cycle, provides fish, prawns, and mayflies. Extended families tend small horticultural gardens of taro, yam, sweet potato, and fruit trees (e.g., coconut, banana).

Colonial administrations, beginning in the 1880s, introduced beans, cucumber, pineapple, watermelon, and other crops. Iatmul may also eat chicken, wild bird, turtle, crocodile, snake, frog, sago grubs, lotus seeds, bandicoot, cassowary, and, during ritual, pig, and sometimes dog. Iatmul attribute bodily strength and cultural vitality to sago, a starch produced from the *Metroxylum sagu* palm, which is associated with maternal nurture and, say some men, breast-milk.

Today, trade stores stock rice, canned fish and meat, biscuits, flour, beer, cooking oil, tea, coffee, powdered milk, cookies, and biscuits. Additionally, Iatmul—mainly women—regularly schedule markets with bush-dwelling Sawos-speaking hamlets to obtain sago and sometimes meat (Hauser-Schäublin, 1977). Formerly, Iatmul exchanged fish; now, they mainly pay cash.

Iatmul villages are organized into a nested hierarchy of patrilineal descent groups, sometimes forming totemic moieties. Each patrilineal group justifies its existence on the basis of an exclusive corpus of totemic names that refer to mythic-historic migrations. Men tend to have custodianship over these names.

Yet matrifiliation and maternal sentiment are profound and, in some contexts such as disputes, eclipse the androcentric social structure. Villages are acephalous. Political leadership is male and extends only to the limits of the descent group. Residence is normally patrilocal; marriage generally takes place within the village. Warfare, once endemic, is extinct. But men and women still manifest an assertive, often aggressive, ethos that nonetheless coexists with the high moral value of mothering.

CULTURAL CONSTRUCTION OF GENDER

Gender influences all aspects of Iatmul culture and social life. A major theme of the culture is the clarification of the relationship between male and female as they are defined in terms of a pervasive maternal schema.

Iatmul recognize two genders: male (*ndu*) and female (*tagwa*). From one angle, these genders are exclusive, distinct, and complementary (Weiss, 1994). Men fish with spears, women set traps; men stand in canoes, women sit; men carve, women weave; etc. This omnipresent dichotomy is also natural and biological: men have penises and testicles, women have vaginas and wombs. The traditional and modern person is unambiguously gendered through clothing, personal adornment, treatment of the body, and even gait and verbal intonation. Today, men wear pants and often go shirtless, while women don skirts and, unless elderly, mission-derived floral blouses. Little boys run naked; girls never do. Many men are scarified, as I discuss below, while women may tattoo themselves with soot. During rituals too, men and women are differentiated by ornamentation such as body paint. Even when men and women ritually switch their stereotypical garb, as in the famous *naven* rite that celebrates first-time cultural achievements for everybody (Bateson, 1936/1958), differentiation is preserved.

Yet the symbolism of Iatmul gender, especially in religious contexts (e.g., ritual, myth, art), expands beyond a dichotomy to a "common pool" of dispositions and values. From this angle, both men and women define themselves through competing claims to fecundity, reproductive primacy, and nurture—that is, to the cultural idea and ideal of motherhood (Silverman, 2001). Therefore Iatmul gender is dual and unitary, a matter of difference and emphasis. Men's ritual prerogatives signal their difference from, and superiority over, women. Yet the symbolism of ritual is thoroughly infused with uterine themes (see below). Women, by contrast, never aspire to the culturally perceived bodily capacities and qualities of fatherhood. True, women may desire male privileges. But the symbolism of womanhood does not disclose a wish to become fathers in the same way that the symbolism of manhood discloses the wish to become mothers.

For the Iatmul, dichotomous gender is pervasive and natural. At the same time, Iatmul culture often appears to be a grand irreducible dialogue of ambiguity and ambivalence, voiced in a maternal idiom, concerning the relationship between male and female. For men, maintaining a divided world by excluding women is vital. Women are far less compelled to maintain this gendered dichotomy and often, argues Hauser-Schäublin (1977, p. 260), strive for synthesis and unity.

Attractiveness for both men and women is largely visual: pronounced nose, clear and shiny skin, and bodily cleanliness. Men desire women with firm breasts, while women desire strong muscular men.

GENDER OVER THE LIFE CYCLE

The cultural stages of the Iatmul life cycle are relatively congruent for men and women, with one exception. Men traditionally underwent a male initiation ceremony, which I discuss below. This was the only significant regularly performed rite of passage for either men or women.

There is a tacit sense that postmenopausal women shift somewhat into an unnamed category that is less of a threat to men. The female body, especially her genital secretions, are polluting to men and male ritual—she "cools" the magical "heat" associated with masculine aggressiveness and potency, and the efficacy of spirits. As Iatmul men and women move through the life cycle, they tend to acquire increased politico-ritual rights as well as responsibilities for overseeing a kin group and its residential ward and resources. With age, too, men and women gain prestige and authority, especially in matters of ritual, magic, and, at least today, knowledge of "tradition" or "custom."

Socialization of Boys and Girls

Infant boys and girls tend to be socialized similarly. Both boys and girls interact with the same expansive kin group although grandfathers and mothers' brothers tend to be more interested in boys. The major caretakers and socializers of children are mothers, older siblings (typically female), and matrikin. Infancy and childhood entail no distinct rites for boys and girls, and there are no major gendered expectations.

Boys are valued over girls in regard to the inheritance of totemic names and the reproduction of the patrilineage. Yet girls are prized, since married daughters, more so than sons who are said to be busy with brideservice obligations, care for elderly parents. Furthermore, a son-in-law performs labor for his wife's parents: hews canoes, clears gardens, etc. By contrast, a daughter-in-law is said to be greedy.

Below the age of about 7, there is little gendered differentiation in the tasks of boys and girls (Weiss, 1990, p. 339). But since women are the primary adult caretakers, boys tend to assist their mothers and women more than their fathers and men. Additionally, Mead (1949, p. 112), reported Iatmul boys were somewhat feminine; their play often recalled the events of childhood rather than their future participation in the "splendor" of male life. At the same time, boys seem slightly masculine when they perform female tasks.

The play of little children tends to exhibit little significant gender distinction. Children form autonomous groups, roaming the village and foraging for snacks. However, older prepubescent boys and girls do often enact the gender-specific roles of adults. But this distinction is largely informal; boys and girls do not fully segregate their peer groups until puberty. The possessions of older prepubescent children do somewhat reflect gender (Weiss, 1997). Thus, boys have stools while girls, like adult women, sit on the ground. Boys are more aggressive in their play (e.g, athletics and shooting slingshots). Boys and girls may stage a "ritual" for themselves (Weiss, 1983). Mirroring adults, the boys parade in masked costumes while the girls dance in celebration.

But these youthful outings are less segregated than their grown-up counterparts.

Prior to puberty, there is little formal education or apprenticeship, gendered or otherwise. Caretakers tend to educate, instruct, and discipline boys and girls similarly. Boys seem to be hit more often than girls, and girls seem to get into trouble more often than boys, perhaps because they have greater responsibilities.

Both boys and girls run errands—ferrying messages, fetching things—for adult men and women (Weiss, 1981). But girls have greater responsibility than boys for household chores and supervising younger kin. (I have two enduring images of prepubescents: boys wrestling, and girls holding younger siblings.) Weiss (1990) emphasizes that Iatmul mothers can only perform all their daily tasks (fishing, gardening) if children look after the younger ones. Men are far less dependent on children.

Puberty and Adolescence

Older children, to repeat, begin to manifest gendered patterns of play, games, and leisure. They increasingly model their behavior after adults. At puberty, boys and girls form sex-segregated groups. Today, these groups freely roam the village, often to the annoyance of adults who complain about the erosion of traditional authority and public behavior. These complaints typically mention the sexual licentiousness of young men and women.

Gendered socialization becomes increasingly important with age, especially for boys who, as children, spent most of their time with other youths and women. Adolescents are more self-conscious in their gender identification. Girls continue to assume regular household chores and obligations. Boys, too, begin to participate in the affairs of adult men, especially in regard to ritual. But while girls in their early teens are capable of performing nearly all female tasks, boys do not become fully competent males until their late teens (Weiss, 1990, p. 339).

With the exception of male initiation, which I discuss in the next section, there is general continuity in socialization around puberty.

Attainment of Adulthood

For both men and women, adult personhood is attained mainly on the basis of marriage and the subsequent birth of children. Traditionally, Iatmul men were initiated into adult manhood and the male cult. The bloody painful ordeals of initiation allowed men to emulate the fortitude of women during childbirth, and to "grow" boys into adult males. Although men never attend birth, since they deem it polluting, male initiation is permeated by symbols of parturition and maternal nurture. This way, men effectively supplant the culturally lauded role of motherhood. Cicatrization purges neophytes' bodies of maternal blood, which inhibits the development of a masculine physique. But the resulting scars, which are visible emblems of manhood, are said by men to resemble the breasts and genitals of woman and female crocodile spirits. The rite forges exclusive masculine identity by aggressively exaggerating birth, maternal feeding, and moral mothering. At the same time, male initiation associates the female body with danger, pollution, castration, and somatic atrophy. Initiation thus constructs Iatmul manhood as an identity that opposes yet emulates motherhood.

Women were once initiated if men judged them to be excessively aggressive, if they espied male cult secrets, or if a sonless father wanted a daughter to inherit his totemic esoterica and magic (see also Hauser-Schäublin, 1977, p. 178; 1995). But this practice was rare; it remains poorly understood today by either ethnographers or Iatmul.

Initiation offered novices only a little guidance about adult behavior. However, they were admonished to avoid adultery and practice birth spacing. Upon the attainment of adulthood, men and women are expected to be busy with adult activities, which are almost always gender segregated. Men tend to gather in cult houses and related ritual spaces unless otherwise engaged in occasional subsistence and work activities. Women are responsible for daily fishing, preparing meals, and maintenance of the household.

Middle Age and Old Age

Middle age offers few real changes to men and women. However, old age confers increased respect and prestige. Older men are the custodians of totemic knowledge, myth, kinship, ritual rules, and overall cultural lore. They also tend to supervise major communal labors and ceremonies. Elderly women are also viewed with respect for their lore, magic, knowledge about childbirth and healing, and general cultural erudition. At the same time, elders ponder the inevitability of death and their waning authority as younger adults assume roles of leadership.

Personality Differences by Gender

Bateson (1936/1958) summarized the ethos of Iatmul men as histrionic, aggressive, competitive, and flamboyant. Women were more demur, nurturing, cooperative, and practical. Male personhood is expansive and public; women are more domestic and personal. Women, too, take pride in male kin who uphold the showy self-important swagger of manhood (Hauser-Schäublin, 1977, p. 130). But since men tend to restrict their politico-ritual voice to the cult house, one hears in the village mainly women as they loudly talk, laugh, yell, and fight. The ethos of masculinity notwithstanding, women are far more likely to scuffle than men. In fact, men often attribute social tensions between groups to women, especially female sexuality, which men regard as divisive.

When normal coping mechanisms fail, men may try to kill the source of their frustration. Women may commit suicide (Hauser-Schäublin, 1977, pp. 128–139).

Iatmul women tend to laugh more than men. They also seem to have greater freedom for informal sociability and emotional expression since they are less beholden than men to the strict rules of decorum that govern the male cult. Both men and women are ashamed by dependency. Men, more than women, are driven by dominance. Both genders are shy, or reticent, when making requests, which signals child-like dependence. Men are apt to be more suspicious and guarded, especially in matters of totemic and mythic knowledge. Yet, as elsewhere in Melanesia, men and women habitually refuse to speculate on other people's unstated motivations. Men are particularly prone to prideful insults. However much they attribute conflict to women, men are the ones who constantly require conciliatory gestures.

Men are more likely than women to think about the world in terms of dualities and distinctions (Hauser-Schäublin, 1977, pp. 243–245). They tend, for example, to divide social groups and gender. Cognitively, women strive for unity. Men are greatly concerned with maintaining social and gendered boundaries. They fear the possibility that women might intrude on their all-male spaces. Women exhibit little comparable concern. While women often desire the exclusion of men, it is not because a male presence would threaten the definition of Iatmul femininity. (Women, I sense, simply want time away from male swagger!) Men, however, exclude women from male rituals precisely because a female presence would call into question the procreative, uterine dimensions of Iatmul masculinity.

Iatmul men frequently conceptualize kinship as an abstract system of rules. Women tend to think about kinship in terms of specific relationships and actual persons (Hauser-Schäublin, 1977, p. 152).

Gender-Related Social Groups

All significant social institutions in Iatmul society are structured around males or females. When men and women form a single group, gender defines their respective social roles.

Village residence wards correspond to patrilineal groups, which are largely exogamous. Residence is typically patrilocal. Since Iatmul villages are endogamous, the proximity of natal kin reduces a bride's psychological distress when she relocates to her husband's residence ward. (Some men view the idea of living with affines to be shameful.) Generally, an extended patrilineal family inhabits the house. Men sleep near the central areas and entrances of the dwelling, while women (wives and unmarried daughters) reside along the periphery. This way, the Iatmul house, like the internal spaces of canoes, reflects the gendered spatial organization of the society.

Iatmul gender is also shaped by an opposition between what Bateson (1936/1958) called "patrilineal structure" and "maternal sentiment." Although descent is patrilineal, kinship is more fluid, with men and women using both male and female links to determine relationships. Larger kin groups and ritual moieties tend to be patrilineal. But people do follow matrilateral "paths" when defining group affiliation for some ceremonies and prohibitions. There are no important, or formal, nonkin associations for either males or females.

Gender Roles in Economics

Married women tend to remain and work within their husband's residence ward, gardens, and riverbank. Women, as noted earlier, are responsible for daily subsistence. They fish by canoe with traps and nets, tend gardens, catch prawns, and cook all meals. Because women are associated with the warmth of houses, they also care for the small hearths that smoulder underneath dwellings.

Men, too, work in gardens, but this labor, like other male tasks—felling trees, hewing canoes, building houses, clearing gardens—is intermittent. (I have heard some women complain that men, for all the work they do, are like children!) Men's work is often collaborative, involving different descent groups. Women mainly work individually. When they labor collectively, women generally perform parallel tasks within their natal or husband's group.

Men and women work together, albeit in well-defined roles, when gardening and producing sago. The latter activity is a cultural symbol of gender complementarity. Men chop the pith, which women knead and process through an apparatus of troughs and filters. Women fry or boil the sago—as men say, only women can properly cook it.

Women, reported Mead (1949, pp. 180–181), work more willingly than men, who labor begrudgingly. Economic independence is highly valued in women, especially by men (Hauser-Schäublin, 1977, p. 148).

Traditionally, both men and women participated in prestige exchanges. Women pleated baskets and sleeping mats, cultivated tobacco and tubers, harvested fish, raised pigs, and fed visitors. Husbands exchanged female products for shell valuables and prestige, which also enhanced the status of their wives. However, men do consult with female kin before transactions.

Today, men and women derive intermittent cash income from the sale of tobacco, betel nut, fruit, fish, chicken, pig, crocodile skins, and cocoa. Villages contain small trade stores. They are largely, but not exclusively, owned and managed by men. Many Iatmul men and women migrate to towns and cities for employment as teachers, soldiers, lawyers, mine workers, civil servants, hotel staff, policemen, store clerks, and so forth. They may periodically return and send remittances. My sense is that more men are employed in these capacities than women (in Tambunum, one third more adult women than men reside in the village). But this may reflect more on a capitalist division of labor than Iatmul culture.

Traditionally, neither men nor women labored outside the village environs. Today, Iatmul who relocate for jobs are commonly accompanied by spouses and children. Employed women still remain responsible for female-coded domestic tasks such as cooking (Stanek & Weiss, 1998, pp. 320–321). Because women produce most food in the village, Stanek and Weiss continue, unemployed women who live in town find themselves in a new position of total economic dependence on their husbands.

Tourism is the primary source of income today in the village. Men carve wooden objects such as masks, tables, animals, and ornamented stools, while women create netbags, baskets, and small rattan animals (Silverman, 2000). Often, wives and female kin decorate a man's woodcarvings.[2] Proceeds are dispersed to those who contributed materials and labor, regardless of gender. In the town of Wewak, women rent stalls at outdoor markets to peddle baskets and occasionally woodcarvings. (Travel by truck on the dirt roads to Wewak lasts anywhere from 4 to 15 hours.) Women, too, sometimes with men, vend objects outside a Wewak hotel. A tourist guesthouse in one Iatmul village (Tambunum) employs men and women as security staff, grass cutters, maintenance staff, housecleaners, and cooks. Tourists, too, occasionally pay men as canoe drivers and guides.

Both men and women within the patriline inherit property, which is often gender specific: houses, canoes, outboard motors, fishing nets, cooking implements, storage jars, kerosene lanterns, and sometimes a little cash. Men, not women, tend to inherit totemic names, magic, and ritual prerogatives. A widow remains in her husband's house and continues to have full access to his gardens, property, and so forth. I am unaware of either major disputes between men and women over the inheritance of material property or any eviction after a spouse's death.

PARENTAL AND OTHER CARETAKER ROLES

Caretaking and custodial roles in Iatmul culture are envisioned as forms of mothering. Mothers are associated with food, feeding, cooking, warmth, house-cleaning, flower gardens, dishwashing, laundering, and the like. Mothers breast-feed infants, soothe tears, teach toddlers to walk, bathe children, cleanse their urine and feces, and carry them throughout the village. When men assume these roles (e.g., the socializing mother's brother), they also act maternally. Motherhood is clearly idealized. Yet mothers and not fathers are primarily responsible for punishment, which can be brusque and rough.

In ideology, the father–son relationship is tense and oedipal. Thus it differs dramatically from the mother–child bond. Sons are said to replace their father in the

political–jural order of society. Moreover, sons inherit from fathers a large domestic house—a house that was not only built at considerable expense and labor by the father, but which also symbolizes a mother. Often, sons physically displace their father from his house-mother, consigning him to live out his days in a small shack. Why, then, do fathers build houses only to cede them to their sons? Because fathers fear ridicule, especially from their daughters-in-law.

Men and fathers, far more than women and mothers, tend to shoo children from their activities, especially at the cult house. They encourage children to return to their mothers. I myself was once chastised by a father to "Go walk with your mother! You don't walk with your father!"

Mothers abide by less numerous and restrictive avoidance taboos than fathers in regard to children. Mothers dominate early childhood in terms of education, physical proximity, care, time, supervision, and affection. Fathers have little normative role in formal child-raising other than bestowing magic and totemic names onto sons, arranging (and funding) children's marriages, and ensuring that sons are initiated or otherwise integrated into the male cult. The father is not a primary male socializer. This role belongs to the mother's brother, as a "male mother," and other men from the father's age grade.

Iatmul describe fathers as distant, tense, and unloving. But fathers can be, and often are, quite tender and nurturing. For both mothers and fathers, then, the ideology of parenting often clashes with actuality (see also Bateson, 1936/1958, p. 76; Mead, 1949, p. 114).

Iatmul children and adults highly value individual autonomy and initiative. Children may view daily school attendance as an unjust constraint. If Iatmul parents want their children to attend school regularly, which mainly occurs in urban settings, they may experience shifts in normative parenting. A father may become more active in the everyday affairs of his children. But since childcare is a female role, it is the mother who must discipline the children and restrain their autonomy. Thus she, not the father, clashes in a negative way with Iatmul norms for the parent–child relationship (Stanek & Weiss, 1998, pp. 322–323).

LEADERSHIP IN PUBLIC ARENAS

Most village leaders are men since women are banned from the male cult house, the center of political debate and ritual preparation. Leadership largely arises from totemic erudition, which is mainly restricted to men. Formerly, leaders were also noted sorcerers and warriors, two social roles denied to women. While there are female leaders among women, their prestige and authority is less expansive than male leadership, confined to the domestic organization of a residential ward and household. Women leaders have no public arena on par with the men's house from which to mobilize resources and labor. In short, female leadership lacks equal authority.

GENDER AND RELIGION

The central feature of Iatmul religion is the male cult, which by definition excludes women. However, the Iatmul pantheon is dominated by neither male nor female spirits. The spirits mete out magical punishment to those who transgress social and ritual norms. More broadly, they are responsible for creating and sustaining the cosmos. But the spirits communicate only through men since men alone are the current custodians of magic, flutes, ceremonies, and other sancta. Men, not women, recollect cosmogonic events by chanting totemic names during ritual. Men alone impersonate spirits during religious rites in the guise of bamboo flutes and other sound-producing objects, masked costumes, and various artistic displays. Female religious practices, such as keening before effigies during annual funerary rites, are said to be subordinate to rituals enacted by men.

Virtually all forms of male-enacted ritual are intended to awe (and sometimes seduce) women with beautiful melodies, frightening sounds, and dazzling spirit displays. Women are not supposed to know that spirit expressions are male impersonations. A major concern of men is to prevent women from achieving this revelation.

But men did not always maintain exclusive custodianship over religious rites, sacra, and sprits, at least according to myth. Originally, women blew the flutes— and gave birth. One day, men frightened away the ancestresses with the sound of bullroarers and stole the flutes and ritual paraphernalia. Ever since, men have blown the flutes—although never with the beauty of the original ancestresses. Today, women hear the flutes during ritual—but they must never glimpse them. Otherwise, men say, women might steal them back! Major Iatmul rituals are thus dangerous to men since women might

reclaim their dominance over cosmic forces by unveiling the spirits as men and stealing back their sacra. Ritual, too, is dangerous to women. Their reproductive potential is imperiled if they glimpse the flutes or view "too carefully" the sacred art. In sum, Iatmul religion expresses yet denies male desire for female fertility (see also Hauser-Schäublin, 1977, p. 147; Mead, 1949, ch. 4). While men purloined the flutes from ancestresses, primal women stole nothing from men. The ability to birth children is a considerable source of pride for women. I suggest that, through their rituals, men aspire to the same form of self-respect.

In Tambunum village, an elderly woman must always know the "truth" about the flutes and sacra—that men stole them from women. In another village, all women are knowledgeable about the primal theft and, indeed, they are proud of this former privilege (Hauser-Schäublin, 1977, p. 165). There, too, some female rites mock male ritual. Hence, Hauser-Schäublin (1977, p. 146) describes the flutes as "secretive," not "secret." Yet these women do not view this myth as a model for an egalitarian society. Rather, suggests Hauser-Schäublin (1977, p. 66), the primal theft expresses the cultural value of motherhood, the dominant maternal role in child-raising, and early male cross-sex identity through the close mother–child bond.

The mythic origin of the cosmos—and its possible demise—was aquatic. Water, especially the river, is feminine. Trees, land, and villages, which were created by male culture heroes in mythic history, are masculine. The yearly cycle of rain, flooding, and dryness thus corresponds to a cosmological tension between female watery erosion, which is also linked to death, and masculine stability. Mythic time is also gendered: male time moves forward, while female time moves backwards (Silverman, 1997). Esthetic idioms of watery fluidity and terrestrial permanence, which evoke notions of female and male, pervade the religious system.

Witchcraft, now largely extinct, was attributed to both men and women. Yet most witches were female. Witchcraft was often transmitted from mother to daughter, and menstruating women were particularly prone to this nefarious craft (Hauser-Schäublin, 1977, pp. 139–140). Conversely, only men were sorcerers. Both men and women know myth, but male tales contain totemic names and are thus more "truthful." Still, some men ironically rely on their wives for mythic knowledge. This way, male prestige is supported by female erudition (Hauser-Schäublin, 1977, p. 169). Both men and women can employ magic, but male spells are more potent. Women may call upon male magicians to assist pregnancy and birth.

Today, men and women adhere in varying degrees to Christianity as well as to the traditional religious system. But this new religion tends to empower women by extolling the virtues of cooperation, passivity, and temperance. Still, Iatmul women do not harness Christianity to any sustained critique of the male cult and its religious conceptions.

LEISURE, RECREATION, AND THE ARTS

If, by leisure time, we refer to activities that do not result in material products such as food, then men have considerably more leisure than women. Men often congregate in the men's house, sometimes just to laze in the shade and nap, or to chat about the day's events. Men, too, much more than women, discuss politics, recount myths, plan ritual, and so forth, typically in the men's house. In this respect, adult leisure is gendered.

Still, neither men nor women, in my assessment, are so burdened with daily toil that they are unable to enjoy at least some daily leisure. Both men and women socialize with friends—who, in this society, are kin. Men often socialize during collective work efforts—say, hewing a large canoe. Women do likewise while engaged in productive activity. Hence, a group of women might individually prepare reeds for basketry while chatting about village events.

Women may sing during the day, sometimes dirges to deceased kin. Men may blow flutes during communal labor. In the main, though, music and dancing is confined to ritual, both traditional and Christian. Both men and women sing during "prayer meetings," but men alone play musical instruments.

There is another gendered dimension to art. Ritual carvings and masks, when decorated for display, are wooden "bone," which directly recalls the paternal contribution to conception. The floral ornamentation is female "skin," which derives from the mother's blood. Paint colors are also gendered. Black evokes masculine power. White symbolizes semen. Red recalls menstrual blood or blood shed during warfare, which is masculine. Yellow is the color of birds and femininity.

Tobacco and betel nut are currently used by both men and women. Traditionally, some say, these substances were utilized mainly by men. Beverage alcohol is consumed by men with very few exceptions, and then typically during the honorific *naven* celebration when women assume the demeanor of men.

RELATIVE STATUS OF MEN AND WOMEN

To repeat, the fundamental structures of Iatmul villages are patrilineal: clans, lineages, and sublineage "branches," as well as ritual and sometimes totemic moieties. Inheritance is also agnatic. Leadership is mainly male. It is determined by primogeniture, and reinforced through prestige activities such as totemic erudition, ritual prominence, magical renown, and, formerly, warfare and sorcery. Men have greater access to spirits as well as traditional and modern technology. Some women own sewing machines, but only men use guns, outboard motors, bicycles, and large canoes. Men, not women, regularly gather at an exclusive shelter (the cult house). The male village "path," unlike the female "passageway," is privileged to run through the center of the village or next to the river. Women exercise considerable influence over the economic and social activities of kin groups. But men have greater access to public decision-making processes that affect the entire community and its relationship to other villages. All told, Iatmul men enjoy greater rights, privileges, and authority than women.

Women have considerable autonomy in regard to their sexuality, modern education, marriage, and divorce—but so do men. While elder women, too, accord respect, senior men elicit greater deference due to their ritual, magic, and totemic knowledge.

But the gender hierarchy that is so apparent in Iatmul culture is called into question by the ideology of manhood and mothering. One symbol of male leadership is the wooden "stool." But the real stools, men say, are mothers since only mothers bear and feed children. Likewise, the superstructure of the male cult is female; the roof of the cult house is literally supported by a carved ancestress. In this sense, the relative status of men and women is less clear than it first appears. From one angle, men dominate. From another angle, male superiority is compensation for men's lack of uterine maternal powers.

SEXUALITY

Iatmul sexuality is aggressive (Bateson, 1941, p. 52; Hauser-Schäublin, 1977, p. 135; Mead, 1949, p. 208; Silverman, 2001). For men, erotic passivity contravenes the martial ethos of manhood. Men may even compete with female partners to see who can first induce the other to orgasm. (Likewise, mourning women may "compete" with men during funerary ritual to see whose sounds, keening or flute music, are loudest.) A child's sex is determined by the parent with the "strongest" procreative substance.

Linguistically and culturally, men are sexually active while women are passive. Grammatically, Iatmul can only say: "He (active subject) has sex with her (passive object)." In practice, though, both men and women initiate lovemaking. Yet while women often refuse sexual advances, a man would be ashamed to do likewise since a woman's flirtations challenge his masculinity (see Bateson, 1936/1958, p. 149). Iatmul women often directly approach potential partners. Men are more reticent. They rely on intermediaries and the psychological support of love magic (Hauser-Schäublin, 1977, p. 75). Women also tend to be more bawdy than men in joking relationships (Hauser-Schäublin, 1977, p. 74). Men associate women with uncontrolled sexuality, and themselves with self-restraint (Hauser-Schäublin, 1977, p. 75). But a "bad" woman, Hauser-Schäublin continues, is not promiscuous; she is a neglectful mother.

Men and women view sexuality to be natural and pleasurable. Carnality is neither shameful nor solely reproductive. Sexuality is not, as in some Melanesian cultures, banned from the cultural spaces of the village. Yet men view any sexual contact with women to be potentially depleting and harmful through the loss of semen and, more seriously, contact with polluting vaginal fluids. (Cunnilingus is anathema to men.) Menstrual taboos, men say, protect them from female defilement. However, women view menstruation as purifying, not polluting (Hauser-Schäublin, 1977, p. 137).

Little honor is accorded to female or male virginity. There are no expressed norms against premarital sexuality, and little attempts to censure children's erotic play. Hauser-Schäublin (1977, p. 135) remarks that Iatmul men did not traditionally view women as sexual objects.

Affectionate touching in public occurs solely between the same gender. Men and women deny the occurrence of ritualized or everyday same-gender sexual

relations.[3] Little boys who once exhibited homoerotic interaction were made to fight (Bateson, 1936/1958, p. 291). For men, receptive homosexuality bespeaks an unacceptable feminine identity. What many men find particularly shameful about homoerotism is the possibility of discovery in flagrante delicto by women.[4]

Still, men privately mention the homoerotic activity of their peers. Innuendo is common, especially as insult. Yet same-gender liaisons do occur among men, albeit clandestinely. Male initiation lacks ritualized homosexuality but is replete with homoerotic themes and gestures. These antics, if seen by women, would be highly shameful to men. In the male cult, though, they are shielded from women and lent a cosmological inflection.

Today, both Iatmul men and Iatmul women fear rape by youth gangs that prowl highways and towns (see also Mead, 1949, p. 113). Iatmul women did not engage in prostitution as a means to material benefit (Hauser-Schäublin, 1977, p. 135). Men use sex as a form of violence to manipulate persons, while women use sex as a means to emotional security or love.

Despite the maternal ideology of manhood and cross-sex identification by men, Iatmul society permits no mundane cross-dressing or transvestism. Only during major cosmogonic ritual and the common famous *naven* rite can men and women assume the demeanor of the other gender. A *naven* celebration may climax when a maternal uncle slides his buttocks down his nephew's leg (Bateson, 1936/1958; Silverman, 2001). This gesture flirts with the feminine and homoerotic dimensions of masculinity that are otherwise muted by the ideology of manhood.

COURTSHIP AND MARRIAGE

All Iatmul are expected to marry. Nearly everyone does so except people with physical deformities or cognitive impairments. However, it is particularly important for a man to have a spouse. Hence, there are more single women than single men (Weiss, 1995). Men depend on women for daily meals. Women need male labor only intermittently (Weiss, 1990, p. 338). Unmarried adults are not formally barred from politico-ritual authority. Yet, unless they are elderly widows and widowers, they tend to be marginal.

Iatmul practice several marriage patterns: sister exchange, second-generation cross-cousin marriage

(a man weds his father's mother's brother's son's daughter [FMBSD], a woman called *iai*), and elective marriage. Only the latter formally admits love prior to the union. The other forms of marriage are usually arranged by the spouses' kin. They forge alliances and, most importantly, instance maternal sentiment since, when a man weds his FMBSD, he marries a woman his father calls "mother" (Silverman, 2001). The cultural sentiment underlying *iai* marriage—that a man (the father) should "get his mother back" (his son's bride)—is equally strong for men and women. No marriage can occur unless both spouses consent. Men and women can, and do, refuse betrothals. Today, romantic love and companionship are increasingly important ideals in marriage, especially among the young. This change is part of a wider assimilation of "modern" personhood that includes individualism, the importance of personal choice in a capitalist consumer economy, and the rise of coeducational settings such as schools, urban areas, and disco dances.

Many men wed polygynously—usually two wives, but sometimes upwards of four or five. This way, the husband can draw on a broad economic base of female labor. Today, male prestige is largely detached from the ceremonial exchange of female labor products such as baskets. Therefore it is less clear, even to Iatmul themselves, why some men still desire multiple spouses.

Divorce is acceptable and relatively common. It entails mainly the return of brideprice. The typical divorce occurs while the spouses are young, and the husband weds a second wife. Divorcees tend to remarry. Sometimes, a woman's first husband receives compensation for his brideprice from her second spouse. Widows and widowers can remarry, but surviving spouses who are elderly tend to remain single.

Both genders desire hardworking spouses and complain loudly about laziness. Some Iatmul court to raise their prestige or access to magical and/or material resources.

There is no formal wedding. Typically, the bride publicly spends the night with the groom in his house or garden shelter. Later, her brothers may march to the groom's house to demand a preliminary token of brideprice, which is negotiated by the spouses' kin. Husbands also perform groomservice. Ideally, *iai* marriage entails long-term balanced reciprocity between affines.

Traditionally, there was little premarital sex. Men were initiated into the cult prior to intercourse, and they were admonished to marry before sexual activity.

The brief period after marriage is awkward for both spouses, who must adjust to new relationships, new obligations, and, for one spouse at least, a new residence. There is nothing on par with a Western honeymoon, or even much public interaction between newlyweds.

HUSBAND–WIFE RELATIONSHIP

To the extent permissible in a culture that so consistently segregates the genders and encourages an ethos of aggression, the husband–wife relationship is marked by affection and companionship. But matrimonial gestures of tenderness are often muted—say, when spouses smile while quietly uttering a few words on a village path, or when a husband gently tosses his wife a few betel nuts. Public tenderness is confined to same-gender relationships. Aloofness is common; cooperation is always tenuous and, at least for men, reluctant. Hence, the husband–wife relationship is unable truly to develop into empathetic intimacy and companionship. Traditional Iatmul marriages effected a kind of balance sustained by fear. A wife's behavior influenced her husband's success in warfare. If she acted immorally, he might be killed. Conversely, the husband's behavior influenced his wife's pregnancy. If he erred, she might miscarry. Perhaps it would be best to characterize Iatmul marriage as brief moments of loving affection in a relationship of tolerated, even relished, antagonism.

Husbands and wives almost never eat together. Iatmul households do not value communal dining. When a woman prepares a meal, she offers some food to those who are present. The rest is wrapped in banana leaves or left in the pot for absent kin to partake later. Since women cook, children frequently dine with their mothers. Even then, there is a sense that each person eats alone.

Spouses do not traditionally sleep together under the same mosquito net. Most men spend little time with their wives since they relax, nap, and socialize at the men's house. Yet men and women do make joint decisions, especially about gardening, economic matters, and those major efforts such as ritual and house-building that require the husband to feed other men.

A wife focuses on maintaining household harmony while her husband is more focused on communal affairs such as ritual (Hauser-Schäublin, 1977, p. 134). Matrimonial conflict over sexuality is common, especially when women adhere to postpartum taboos

(Hauser-Schäublin, 1977, p. 127). Husbands and wives may also fight over food.

Either spouse can initiate divorce. (Sometimes a disgruntled cowife will simply relocate to another residence, usually with agnates, but the marriage remains intact.) Custody is fluid. Young children tend to remain with their mother. If a wife leaves her husband, she may forfeit custody. Unless there is an explicit agreement of adoption, the children of divorcees retain membership in their father's patriline and share the inheritance.

The cowife relationship is tense. It often erupts into physical assault and fighting, usually over perceived imbalances in sex, work, and food. When cowives are hostile, suggests Hauser-Schäublin (1977, p. 132), their husband's role in the household becomes more secure. Cowife hostility, too, actually reduces domestic violence since neither woman wants to alienate her husband. Some Iatmul contend that a man's first wife is dominant; others deny the presence of any such rule, or assign this role only to an *iai* wife.

OTHER CROSS-SEX RELATIONSHIPS

There are two other significant male–female relationships. First, as mentioned above, the mother's brother is a key figure in the life of his sister's children, male and female. He constantly interacts with them in a mode of tenderness and affection that is modeled after the ideal of motherhood. However, the avunculate forges a closer relationship with nephews than with nieces. Generally, the amitate has no close relationship to either her brother's son or daughter. The brother–sister relationship is also important. The sister often acts a mother-figure to her brothers, who in turn look after their sisters' welfare. The village is endogamous, some men say, because brothers do not want their sisters to leave the community.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Throughout this entry, I have mentioned the many important changes that have altered gender roles and relations. Despite the introduction of capitalism, modernity, Christianity, citizenship, tourists, etc., men and

women remain opposed, complementary, and antagonistic. Pollution beliefs regarding women, and male initiation, have waned. New economic, educational, and religious opportunities now exist for women. But the essential differentiation remains mostly intact. Likewise, men continue to define themselves in opposition to, yet as a type of, mother.

NOTES

1. Despite sociocultural variation across the Iatmul language group, I generalize, often from my own ethnographic focus which is the Eastern Iatmul village of Tambunum.
2. One young woman in Tambunum village assumed the clothing and habits of men, and was rumored to engage in same-gender sexuality. Like a man, she wore trousers, stood in canoes, and carved wooden objects.
3. Some men report that homosexuality was introduced into the Sepik by colonial Europeans (see also Mead, 1949, p. 113).
4. In ritual, men dramatize a fantasy of an anal clitoris (Silverman, 2001, p. 169).

Ifugao

Lynn M. Kwiatkowski

ALTERNATIVE NAMES

"Ifugao," translated as "hill (or mountain) people" (Barton, 1930/1978) is the term used to denote the ethnolinguistic group of people whose ancestors are from the area that, since 1966, has been designated as the national political unit of Ifugao Province. Ifugao additionally refers to the set of languages spoken by Ifugao people, of which there are three major dialect clusters (Conklin, 1980). Ifugao languages are part of the Austronesian/Malayo-Polynesian language group, and they are not written languages. Prior to and during the Spanish colonization of Ifugao, people living in the area now designated as Ifugao territory did not conceive of themselves as belonging to one cohesive ethnolinguistic group. Instead, district or village names, such as Alimit, Kiangan, Mayoyao, and Banaue, served as the markers of identity and territory, which are still recognized today (Dumia, 1979). The name Ifugao was a term borrowed by the Spanish from lowland Gaddang and Ibanag groups (Conklin, 1980). *Pugao* is another term that was historically used to refer to "Ifugaoland," and other variations of the word Ifugao currently in use are Ifugaw and Ipugaw (Barton, 1930/1978; Conklin, 1980). Spanish colonizers generically labeled all Cordilleran mountaineers, who were generally uncolonized by the Spanish (including Ifugaos), as *Igorots*, meaning "mountain people," though Ifugao people have not fully identified with this name (Barton, 1930/1978; Conklin, 1980; Dumia, 1979).

LOCATION

The Ifugao are one among approximately eight major ethnolinguistic groups living in the Gran Cordillera Central mountain range of northern Luzon Island of the Philippines. The Cordillera mountains lie on the western central portion of Luzon Island, with Ifugao being located on the eastern side of the mountain range (Conklin, 1980). According to the Philippine government census in 2000, 161,623 people live in Ifugao Province, the great majority of whom are of Ifugao ancestry. Ifugao shares a border with the upland provinces of Benguet and Mountain Province, and the lowland provinces of Isabella and Nueva Vizcaya, allowing for easy access to lowland communities and cultures. Ifugao is considered a remote province, as most areas of the province are only accessible by footpath.

CULTURAL OVERVIEW

Ifugao culture has developed historically in relation to the ecological setting of the Ifugao mountainous landscape. Swidden agriculture and wet-rice cultivation on terraced mountainsides are the two main economic activities of Ifugao people, with approximately 75% laboring as farmers. Ifugao is known internationally for its grand rice terraces, which grace the steep mountainsides. The main staple crops produced are rice and root crops, usually sweet potato tubers. Vegetables are also cultivated on the swidden fields, in and around the wet-rice fields, and, more recently, in Western-style home gardens. Farmers also raise fruit trees and plants, and gather wild fruit, vegetables, and insects in the forests for consumption. Agricultural labor is carried out by family groups, except during labor-intensive planting and harvesting periods when community-wide cooperative labor is reciprocated, or paid in kind with bundles of rice or cash. Historically, animals were hunted in the forests, though hunting is no longer viable as a significant source of food and income. Small-animal husbandry is an important source of protein. Ifugao farmers also manage family-owned forests. Other significant economic activities in the contemporary period are marketing, tourism-related employment, craft production, wage labor, and government employment. Many Ifugao people have migrated to areas outside the province and country to acquire land or gain more profitable employment.

Trade with upland, lowland, and coastal ethnolinguistic groups, as well as with Chinese and Japanese traders, has influenced Ifugao culture for several centuries. Ifugao relationships with upland and lowland

groups also included periodic raids, involving headhunting and slave capturing expeditions—activities that were curtailed during the 20th century. The Ifugao area was contacted by the Spanish at least as early as the 18th century, and was visited more frequently by Spanish colonizers and missionaries beginning in the early 19th century. Historically, while the Spanish had tried to penetrate and control Ifugao, as well as other upland territories in the Cordillera Mountain region, they were not highly successful (Conklin, 1980). This allowed for the Ifugao people's greater retention of indigenous beliefs, practices, and forms of social organization by the 20th century. American colonizers administered Ifugao for almost 40 years, beginning in 1903, and had an important impact on Ifugao culture, especially economics, political organization, religion, and education. Japanese soldiers occupied Ifugao during World War II. With national independence in 1946, Ifugao was integrated into the national economy and political culture.

Kinship in Ifugao is bilateral, and kinship relationships created out of consanguineal ties form the most important social bonds for Ifugao people. Other important social bonds are derived from friendship ties based on propinquity, patron–client relationships, and other debt relationships (Conklin, 1980). The nuclear family was historically the most basic and smallest social unit, averaging about six to eight members.

Further social organization was traditionally based on hamlets, which are clusters of homes located near agricultural fields. Irrigation groups managing irrigation systems within the hamlets are also important social groups in local communities. The largest recognized form of traditional social organization are agricultural districts, which are composed of several hamlets that center around the first rice field to have been cultivated in the district, usually owned by a traditionally wealthy person and leader, the *tomona* (Conklin, 1980). Today the Ifugao are also incorporated into the national system of political administration. A group of *barangay*s are organized into municipalities. Ifugao Province, composed of 11 municipalities, is part of the Cordillera Autonomous Region, which administers Ifugao Province along with the national government.

Ifugao traditionally had no system of government, yet they developed an extensive set of laws that were based on taboo and custom and linked to the Ifugao religion. Legal procedures were carried out by and between families, usually with the assistance of a mediator, the *monkalun* (Barton, 1919/1969). The *tomona* continues to serve as a district agricultural leader. Historically, traditionally wealthy owners of wet-rice fields, or *kadangyan*, were considered to be community political and social leaders, who acquired their position through birthright, possession of property, and the performance of specified rituals (Scott, 1982; Brosius, 1988). *Barangay* captains, municipal mayors and councillors, and a provincial governor and board members make up the contemporary official leadership of the province. Today, the Ifugao are also subject to national and local government laws and judicial system.

Ifugao religion, *baki*, combines polytheism, mythology, magic, and animism. Religious beliefs and ritual are integrated into important aspects of everyday life. Ancestor worship is an integral part of the Ifugao religion, playing a central role in Ifugao religious ritual. Catholicism and Protestant religions have had a tremendous impact on Ifugao religious practice and beliefs, with 80% of Ifugaos identifying as Christian by the 1990s. However, most Christians still participate in Ifugao religious rituals.

CULTURAL CONSTRUCTION OF GENDER

Ifugao men (*lala-ee*) and women (*bfwabfwa-ee*) are culturally viewed as distinct from and complementary to each other. Traditional modes of dress specific to each are made from fabric woven by Ifugao women with yarn. Women wear skirts that reach from their waists to their knees (*torkay* or *tapis*), and men wear loincloths (*wanoh*) (Barton, 1919/1969). The woven designs of the clothing are gender specific, as well as evocative of Ifugaos' village and social class identities. Men historically carried a spear with them whenever they traveled from their homes. Male farmers typically wear a machete, or *bolo*, on their belt. Both men and women traditionally adorned themselves with gold neck ornaments and earrings, bead necklaces and hair ties, especially amber-colored glass beads, mother of pearl, brass ornaments, and feathers. Historically, some wore tattoos and filed and/or blackened their teeth as a mark of beauty. *Kadangyan* men and women wore special clothing and ornamentation, indicating their higher status. Men's hair was traditionally styled in a rounded cut above their ears, and women's hair was grown long, but pulled up and tied on top of their

heads with strings of beads or a piece of cloth. Historically, some men wore headdresses at ritual events (Barton, 1930/1978). With modernization processes and the introduction of Christianity during the 20th century, many Ifugao men and women wear Western clothes specific to each gender, with women dressing in a conservative manner. Most young women wear a Western shirt above their *torkay*. Shorts and pants have replaced the *wanoh* for many men. Hairstyles also conform more to currently fashionable Western styles for men and women of different age groups. However, many farmers over 40 years retain the traditional style of dress.

The significance of men and women relating to each other as husband and wife, and the importance of reproduction through their relationship, is given expression in the popular Ifugao oral history about the first Ifugao who populated the Ifugao territory following a massive flood. An Ifugao woman, *Bugan*, and her brother, *Wigan* (or other names), were the sole survivors of the flood. While sexual relations between siblings are forbidden in contemporary society, *Bugan* and *Wigan* conceived a number of children, who later conceived more children who populated Ifugao.

Today, what could be conceived of as new third-gender categories are recognized to some degree among Ifugao people. Men who behave in a feminine manner, engage in both male and female activities, but still dress as males, and, in some cases, are assumed to have a same-sex sexual orientation are referred to as *bakla*, a Tagalog term for a male transvestite. Women who behave in a masculine manner, engage in both female and male activities, sometimes dress in Western male clothing, and, in some cases, are also assumed to have a same-sex sexual orientation, are referred to as "tomboys," derived from the English term.

While physical beauty is an admired attribute, it is not one demanded of Ifugao women. A female marriage partner is most valued for her ability to work hard, particularly in agricultural labor for farmers.

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

Ifugao boys and girls are reared similarly through infancy and childhood. Markers of gender difference are typically hairstyles, cutting boys' hair short and leaving girls' hair long, and dress, with boys wearing shorts and shirts, and girls wearing dresses as well as shorts and shirts. Both infant boys and girls are provided with a *baki* ritual named *bagor* soon after birth, to introduce them to the spiritual beings. Christian Ifugao may also, or only, have their infant children baptized in a Catholic church or participate in a Protestant dedication ritual. Ifugao conduct a *baki* ritual when naming their children. One early rite of passage in which only boys participate is the first cutting of their hair, which includes a *baki* religious ritual and feast (Barton, 1911).

Ifugao "native" houses are one-room wooden structures, with a loft for storage of domestic goods and rice, built on four stilts. Traditionally, beginning at the age of 3 or 4, children slept in a dormitory, located in the houses of widowed women or in empty houses. Boys and girls could sleep together in the girls' dormitory, as long as they avoided their relatives of the opposite sex. The boys' dormitory was limited to boys and young bachelors (Barton, 1930/1978, 1938/1979). Today, dormitories still house children, and an older chaperone usually sleeps with them.

Young boys and girls play together within the area near their homes, with toys fashioned from local materials. Boys practice playing gongs, an important musical instrument played by men during ritual and secular feasts, at a young age.

Young boys and girls are expected to care for younger siblings while their parents work, sometimes as early as age 5. They are also taught to carry out simple tasks at a young age, such as fetching water and carrying small amounts of firewood. As they grow older, boys tend to have more freedom than girls to roam the *barangay*, visiting relatives and friends, and exploring the forest. Since girls begin to learn domestic labor at an early age, such as cooking, hand-washing clothes, and pounding the husks off rice kernels, they are more restricted to the household than boys. As boys grow older, approximately 7–10 years old, they begin to spend more time with their fathers, learning about the labor of men in their community, such as preparing rice fields, plowing, fishing, etc., though boys also learn to perform some domestic chores such as pounding rice and cooking. As girls grow older, also approximately 7–10 years old, they begin to learn some of their mother's tasks in agricultural fields.

Both girls and boys are equally valued as children, as each perform different roles that are helpful to parents. Parents value initiative, particularly in labor, in both boys

and girls, but they expect girls to be more reserved and remain closer to home, and boys to be more assertive and explore their larger community. Most boys and girls acquire some formal education.

Puberty and Adolescence

The onset of puberty is marked mainly by physiological changes that the boys and girls undergo, including their emerging sexuality, and by new labor responsibilities for their families. During puberty, most children decide whether to terminate their formal education during elementary school, or to continue their education through secondary school. Many poor Ifugao children become full-time laborers at this time, working with their natal families. Most who choose to attend secondary school must usually move from their family's home to attend one of the few distant high schools within each municipality. The students live either in school dormitories, or with relatives or other family friends, often while working as domestic laborers for them. Through formal education, young men and women learn modern Filipino and Western ways of thinking and behaving, providing socialization beyond that offered by their parents and relatives. While in the past century more young men attended secondary school than young women, the rates of the latter attending secondary school have increased.

With puberty, young women and men emerge into a period of sexual development and interest. Both tend to become more interested in beautifying themselves, wearing stylish jewelry, clothing, and haircuts.

Labor expectations for young women and men are greatly increased with adolescence. Young girls are expected to be proficient and industrious at domestic labor, including cooking, pounding rice, cleaning, weaving, and hand-washing clothes. Young women also participate in agricultural labor, either full time or part time if they are attending school. The workload for young men is less demanding on a daily basis, though they are expected to gather and carry firewood, fish, feed domestic animals, and carry out agricultural labor and, for some, craft production. Sibling relationships are very significant, as elder adolescent siblings must care for their younger siblings.

Attainment of Adulthood

Transition to adulthood usually entails becoming engaged and marrying, between the ages of about sixteen to the early twenties. With adulthood, both men and women are expected to be serious and responsible in their full-time work inside and outside their homes, to provide well for their families, to move into their own home, and to begin to sponsor rituals expected of families, either *baki* or Christian. Having children confers greater responsibilities for men and women, as well as more social esteem and recognition as adults. Adult elder siblings are responsible for providing emotional and financial support to their younger siblings. Attending college as a single person can also confer adulthood, since college students are viewed as being engaged in a serious professional pursuit as well as living on their own. A person who does not marry but takes on adult work responsibilities, and, for some women, has a child, is also recognized as an adult. While Ifugao adults typically establish their own families, they are expected to request and usually follow the advice of their parents throughout their adult lives.

Middle Age and Old Age

Age ranking is an important feature of Ifugao culture. Therefore, with middle age comes increased respect and responsibility for both men and women. Men, more than women, are expected to contribute to community leadership, though women contribute to this as well.

Middle-aged adults must care for their elderly parents. Many older women and men must work, or choose to work, as long as they are physically capable of doing so, regardless of their social class position. Many elderly women suffer from severe osteoporosis, which results in their being bent almost horizontally. Yet, even many of these women continue to engage in agricultural labor (Hewner, 2001). Older women, more so than older men, care for their grandchildren while the children's parents are working. For poor widows, middle and old age can entail greater respect, but also a period of increased poverty, since women generally earn lower wages than men.

Personality Differences by Gender

Generally, boys are culturally expected to be more active and aggressive than girls. Men are expected to be more proficient at oration than women, and therefore generally appear to be more expressive in leadership roles at social

gatherings than women. Women are expected to repress their anger, and instead cooperate with other family and community members, although in practice some women do express their anger. Women and men are expected to rely on each other, particularly because of their complementary labor, but not to be dependent on one other.

GENDER-RELATED SOCIAL GROUPS

Historically, men participated in a separate group or club, where men would socialize, though men's clubs are no longer formed (Barton, 1930/1978). Peer groups, referred to as *barkadas*, are often sex specific. Residence for married couples is usually ambilocal, with a couple living in the community of either the husband's or the wife's family. Recently increasing rates of out-migration due to population growth and limited employment opportunities has altered this pattern of residence. Most agricultural work is carried out in sex-specific groups, as are some other types of work (i.e., drivers and mechanics are male, and midwives are female). Some Christian religious groups are sex specific. Most other aspects of Ifugao social structure are not male or female oriented.

GENDER ROLES IN ECONOMICS

Ifugao farmers are almost equally male and female. Male farmers traditionally construct and maintain rice fields, plow rice fields (except in the Kiangan area), carry loads of harvested rice from fields to homes, raise and catch fish, hunt, trap, engage in carpentry work and forestry, care for domestic animals, and collect and chop wood. Some men carve wood to make crafts, and smith iron. Historically, men also engaged in pot-making, warfare, headhunting, revenge murder, and capturing and selling slaves. Men also serve as mediators, or "go-betweens" to aid in dispute settlements or transactions between families. Female farmers prepare rice seedlings, weed rice fields, plant and harvest rice, carry harvested rice to homes from fields, raise vegetables, sell food they have cultivated, collect fire wood, and weave. Women's agricultural work involves extensive stooping, probably playing a role in the severe bending of their spines with osteoporosis. Women also engage in weaving, sanding and, less, carving of wood, and other forms of handicraft production. Both men and women perform domestic labor, with women taking on the majority, especially managing finances, cooking, washing clothes, and pounding rice. These gender divisions of labor are typically adhered to, except in special cases that are well accepted, such as widowhood, illness of a spouse, divorce, single-parenthood, single adult status, or migration of a spouse.

Both men and women obtain property, including rice fields, parents' houses, heirlooms, and personal property from their parents, with no distinction being made because of their gender. Property is obtained through assignment while the parents are alive and by inheritance (Barton, 1919/1969). Sibling relationships are based on a system of primogeniture, which also influences patterns of property assignment and inheritance (Barton, 1919/1969; Conklin, 1980). With primogeniture, the largest proportion of property is assigned to the eldest child, and the remaining property assigned proportionally by age rank to younger children. Only wealthy families can provide rice fields to all of their children (Barton, 1919/1969). When children marry and establish a new home, they receive the assigned property from their parents. Married men and women each retain ownership of their own agricultural land and other heirlooms, but jointly own property purchased after marriage. Property is provided from both, or either, father or mother.

Both men and women create and work in swidden fields, raise vegetables in a garden, feed domesticated animals, make baskets, gather wild food, and fetch water. Both have traditionally worked as short- and long-term migrant laborers, either within the Philippines or internationally, due to differential planting and harvesting times in various Philippine provinces, low wage rates, and high levels of unemployment. But more men than women work as short-term migrant laborers, usually during periods of low agricultural labor in their home regions, ranging from a few weeks or months, leaving women to manage their households during these periods. Some men are military soldiers or work on international ships, leaving wives for long periods of time. Married women also work abroad for periods of 2–10 years, usually those with school-age or adult children. Mainly men work as short-term manual laborers on government projects, though some women also do; both make handicrafts; and women wash clothes for other families. Women have traditionally dominated in marketing, working as traders, and as business owners (Barton, 1919/1969; Milgram, 2000, 2001a,b). Women also dominate the professions, yet most women are low-salaried teachers and nurses. Positions

of power, such as government officials, executives, managers, managing proprietors, and supervisors, are predominantly held by men.

PARENTAL AND OTHER CARETAKER ROLES

Children's major caretakers are their parents, and older siblings care for children as well. While both men and women are nurturing toward their children, women are viewed as naturally nurturing, and men are often criticized for being less attentive to their children's needs. Mothers are the primary childcare providers. This is viewed as a natural role for women due to their ability to breastfeed children, their greater patience with and attentiveness to children, a higher value being placed on men's labor outside of the home, and the idea that children naturally feel closer to their mother. Still, fathers play an important role in childcare, particularly when they do not have work demands and their wife is working. While parents raise all of their children, they each emphasize socializing and educating those of their own sex to fulfill their appropriate gender role. Mothers spend a greater amount of time with young children than fathers.

Both mothers and fathers easily publicly display physical affection and love toward their young children. However, physical expressions of love are uncommon between parents and their adolescent and adult children. Grandmothers, aunts, and female neighbors also sometimes care for young children while their parents are working.

LEADERSHIP IN PUBLIC ARENAS

Leadership in the wider community historically and today has been dominated by men, although leadership has never been strictly restricted to men, except in warfare. The traditional community leaders, the *tomona* and a number of wealthy and powerful *kadangyan*, were a group of persons who had influence but no actual authority or power over other Ifugao people. Women historically participated in militarily defending their communities, but did not travel to engage in warfare or headhunting. Headhunting success, to which women did not have access, accorded power and leadership to an individual. This has changed today, with some Ifugao women participating as soldiers in the military wing of the communist New People's Army. Female official political leadership is increasing today, with women having equal authority with men in the same positions, but the great majority of *barangay*, municipal, provincial, and national political leaders are men. Men are perceived to have naturally superior oratory skills, believed to be necessary for successful leadership. Women typically exert leadership in the areas of business, healthcare, education, and social work. Religious leadership involves both men and women, with male leaders having a higher status in the *baki* and Catholic religions, and male and female leaders having generally equal status in Protestant religions.

GENDER AND RELIGION

Historically, all men became *baki* priests, or *mumbaki*, but only certain men do so today, likely due to the influence of modern ideologies and Christianity (Barton, 1940). *Mumbaki* lead *baki* ritual ceremonies, reciting the names of gods, other spiritual beings, and ancestral spirits, reciting myths, becoming possessed by the spiritual beings, and making offerings to them. *Mumbaki* also perform divination rituals. The rituals are performed for most significant life events and practices.

Mama-o, or *baki* female priestesses, play important roles in ritual practice, particularly that of diviners and spirit mediums. They also pray during some *baki* rituals, sometimes in a separate location from the *mumbaki*. While the *mama-o*'s role is complementary to the *mumbaki*'s, women's role in the *baki* religion is more limited than men's. *Mama-o* are highly respected as religious leaders, but a higher status is usually accorded to the *mumbaki*. Boys and girls learn to become *baki* leaders by observation during ritual ceremonies and through apprenticeship, often from their father or mother. If a *mumbaki* has no sons, in some cases he may teach his daughter to become a *mumbaki*. Almost equal numbers of men and women attend *baki* rituals. Exceptions are during the harvest feast, at which men are the primary participants since most women are in the fields harvesting rice, and when women are caring for small children. Male and female participants have different roles to play during *baki*, specific to the type of ritual being performed.

Catholic doctrine allows only men to become priests and only women to become nuns. Protestant religious

leaders are male and female, though fewer are female in Ifugao. Men and women participate in Christian religious services, prayer sessions, and rituals, some of which take on aspects of the structural form of the *baki* ritual.

The pantheon of the *baki* religion consists of more than a thousand male and female gods, other male and female spiritual beings, and ancestor spirits (Barton, 1940; Lambrecht, 1962). The creator god is male and is accorded the greatest importance and status. The primary mediators between the greater god and human beings are a set of male gods, who have wives. Male and female ancestors of both husband and wife sponsoring a *baki* ritual are prayed to, and each are considered equally important, a reflection of the bilateral kinship system.

LEISURE, RECREATION, AND THE ARTS

Men tend to have more leisure time than women, in part due to women's extensive responsibilities in both the home and work place outside the home. Leisure time is spent with one's *barkada*, family members, or friends of both sexes. Sex segregation during leisure time is voluntary. Men tend to spend more money than women on leisure activities, including drinking alcohol, buying alcoholic beverages for their friends, and gambling. Fewer women than men drink beer or gin and become drunk, though women do drink rice wine at rituals and secular feasts. People commonly meet friends of the same sex at a *sari sari*, or small store, to socialize, snack, and drink soft drinks, or beer for men. While males and females listen to music broadcast on radios, adolescent girls especially enjoy radio soap operas. Women occasionally cook special sweet treats during their leisure time that they share with other family and community members.

RELATIVE STATUS OF MEN AND WOMEN

Traditionally, no Ifugao person had authority over another (Barton, 1919/1969). Yet, in everyday social relations, people are ranked according to relative status levels associated with wealth, age, kinship group, religious affiliation, occupation, educational level, and,

historically, warfare and headhunting prowess. Power and prestige is most strongly determined by wealth, particularly, traditionally, ownership of rice fields and the ability to eat rice throughout the year, and, more recently, accumulation of money and other forms of capital (Brosius, 1988). Gender status relations are also constructed in relation to these status categories. Ifugao women's and men's status is situationally variable, depending on the men and women involved, the social position of each, and the kind of status being considered. But in some very important social arenas, especially economic, political, and domestic, the majority of women experience lesser power in gender relations.

For example, Ifugao women maintain autonomy in their work, as they are viewed as holding special knowledge and skills required for their labor. Yet, women's labor in a number of areas, including agriculture, wage labor, and some professional labor, is paid less than men's. Men are viewed as performing more difficult and demanding work than women, resulting in what is also perceived to be a traditional differential pay rate. There are exceptions, as some women are very successful businesswomen, or professionals whose wages are higher than that of many men, or are members of wealthy families (Milgram, 2001a).

There are situations in which women's status can surpass that of particular men. For example, since children acquire property from their parents through a system of primogeniture, the eldest sibling, male or female, who acquires the greatest amount of property and wealth is usually considered to be the family leader, counsellor, and advocate (Barton, 1919/1969). Upper-class women's status position is higher than that of lower-class men's, and older women are highly respected by younger men. Male and female *kadangyan* and *tomona* are regularly consulted, and the *tomona*'s agricultural decision-making for the village is usually unquestioned.

Men generally turn most of their earnings over to their wives, who manage the family's finances, but spouses do not spend the other's earnings freely. The majority of husbands and wives share decision-making in family matters, and each participate in the decisions of their own kin group. Many women feel pressured by their husbands to refrain from using contraception and to have intercourse when they would prefer not to. Women and men participate in religious practices and become educated to the extent that they each choose to.

SEXUALITY

Ifugao men and women perceive sexuality to be a natural aspect of married life, one that brings pleasure to both men and women, as well as the ability to reproduce and generate a family. Traditionally, children were sexually free. Sexuality was accepted among young, unmarried women and men, with couples sometimes sleeping together in the dormitories for the unmarried. Yet young women had to show a good amount of modesty and indifference prior to acceding to a suitor's advances (Barton, 1930/1978). This ideology has generally continued today. Women conceiving children out of wedlock is not uncommon, with a resolution being marriage if the couple agrees. Single mothers are well accepted and integrated into the community, though they often experience economic hardship. Traditionally, children were regularly conceived during a long engagement period, while a couple were living together, sometimes with their in-laws or parents, and collecting the resources needed to finance the marriage ceremonies.

Men are generally viewed as having a greater interest in sexual relations than women, and are accorded greater license to engage in sexual activity prior to and during marriage. However, adultery is not well accepted or widespread. Historically, a person could be killed for committing adultery by the offended spouse. More often a fine was required, and divorce would often occur, particularly if the offended spouse was the man because of his jealously and lesser attachment to his wife. Women usually did not want to learn of their adulterous husband's affairs, in order to be exempt from grieving the adultery. Rape, involving spouses, acquaintances, and strangers, is uncommon in Ifugao, along with incest, although incidences of each have occurred there, historically and in recent years (Barton, 1919/1969). Gang rape of a captured enemy woman was sometimes a part of warfare, believed to bring about a good harvest and fertility of domestic animals (Barton, 1930/1978). A small number of Ifugao women work as prostitutes, the practice having begun during the Spanish colonial period, but most commonly work outside Ifugao in nearby urban areas or Manila (Barton, 1930/1978). A small proportion of Ifugao men hire prostitutes.

Both Ifugao men and women are modest in terms of their bodies, according to Ifugao cultural conceptions of traditional or modern conceptions of modesty, both of which include covering the genitals. Only youths who have lived in urban areas express physical affection toward the opposite sex in public, although this is very common among persons of the same sex. A married woman must be very modest around men other than her husband, lest other people suspect an adulterous relationship.

There is general acceptance of persons having alternative genders (*bakla* and "tomboys") and same-sex sexual orientations, although there is no tradition of these forms of gender and sexuality in Ifugao. Cross-dressing in a Western style is more typical of women than men within Ifugao, as women wearing pants and a male-style shirt are more readily accepted than men wearing a skirt or dress.

COURTSHIP AND MARRIAGE

Marriage is anticipated for all Ifugao people, and the great majority do marry, although marriage is not necessarily expected of *baklas* and "tomboys" today. The duration of a marriage union is undefined, except for Christian marriages which are expected to be lifelong. Polygyny and concubinage were practiced historically in Ifugao, but only among the very wealthy men, the *kadangyan*. The first wife held a higher status than the succeeding wives (Barton, 1919/1969). Monogamy was the norm among other men and women. Polygyny is only practiced informally by a small number of men today, who legally marry one woman and have relationships with one or more other partners. In these modern cases, the women have an antagonistic relationship with each other. This form of marriage and partnership is not highly accepted, as monogamy is the legal and cultural norm today.

Children of the *kadangyan* were historically married at a very early preadolescent age, or even engaged while *in utero*, to a child of another *kadangyan* family through an arrangement made by their parents, with property assignment having been made at that time. This avoided what would be deemed an inappropriate marriage in the future, and created alliances with other wealthy kin groups. For less wealthy families and the younger children of more wealthy families, romance, courtship and premarital sex more commonly led to their deciding independently to marry, at any age. The consent of parents was not required. Today, couples freely choose their spouses. Marriage between siblings and first cousins is tabooed, and historically the marriage of cousins within the third degree was tabooed, but could be overcome (Barton, 1919/1969).

Courtship historically involved visitations to the dormitories by adolescent boys and young men, who played a "lover's harp" and chanted spontaneous romantic phrases, which were similarly responded to by girls or young women (Barton, 1930/1978). Sexual relations often followed a long courtship. Adolescent girls and young women could accept or reject the advances of the suitor, but only accept one suitor at a time. This restriction was looser for young men. Today, young men and women usually socialize and "date" together within a group of peers, and they occasionally meet alone. Courtship sometimes still involves singing modern songs to one's love interest.

There is no traditional religious consecration of the marriage; instead marriages were seen to be civil unions, as well as trial marriages. But *baki* rituals were celebrated throughout the marriage process to ensure prosperity and children for the couple. To initiate the marriage and establish the engagement, a distant relative or friend of the man brought betel nut to the woman's parents to ask for permission to marry her. Four *baki* ceremonies and gifts from the groom's family to the bride's kin were required to fulfill a marriage process. In some Ifugao areas, these involved the groom's family sending one pig for each ceremony to the girl's family, who performed a *baki* ritual and read the bile of a pig to uncover a good or bad omen. The girl's family usually returned smaller gifts to the boy's family (Barton, 1919/1969). These practices varied by economic group and village, and continue to be practiced by some Ifugao people today. For Christian couples today, a Christian ceremony is performed to religiously consecrate a marriage, followed by a secular feast, traditional or modern music, dancing, and gift giving. Ultimately, marriage is viewed primarily as an alliance, wherein spouses' ties to their own kin group remain stronger than their marital ties (Barton, 1919/1969).

Widows and widowers can remarry any nonkin person. But they should wait for a period of a year from the death of the spouse, and they or their future spouse must make a payment to their dead spouse's family to officially terminate the marriage (Barton, 1919/1969).

HUSBAND–WIFE RELATIONSHIP

Husbands and wives generally have respectful, warm, and loving relationships, and they relate to each other as companions. Spouses rarely show affection or touch each other in public. Husbands and wives usually eat their morning and evening meals together, but often eat their lunch apart from each other owing to their busy work schedules. They sleep together, with their infant children in the same one-room house, unless they live in a larger "modern house" and sleep with all their children in the home. Generally, men are expected to perform a dominant role in the household, as the "head of the household." In practice, though, many couples participate equally in domestic decision-making. Men and women can each perform all domestic tasks, yet most of the burden of domestic labor rests with women. Wife-battering and marital rape are rare in Ifugao, although there have been cases of each. Historically, if a couple wished to divorce, either a man or a woman could initiate the divorce, and a *baki* ritual would be performed for this event (Barton, 1919/1969). Divorces were common and easy, and a divorced couple could remarry, but not marry their original spouse (Barton, 1919/1969). With the domination of Catholicism in much of Philippine national law, divorce is currently illegal, restricting Ifugao spouses from legally divorcing. Instead, given the historical acceptance of divorce, a couple may separate, initiated by either the husband or wife, and enter a new committed relationship that resembles a marital relationship. A couple is not required to meet specific standards of reasons for separation today, but historically there were approximately 22 justifications for divorce (Barton, 1930/1978). Children usually remain with their mother upon a couple's separation, although this is not a strict rule. Historically, women had the right to keep the couple's children after divorce, though the husband could raise one or more of their children through a special agreement (Barton, 1919/1969).

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

As discussed above, traditional Ifugao attitudes, beliefs, and practices are changing, including those associated with gender, as Ifugao people become more solidly integrated into the global capitalist market, experience increased international and national development, and migrate outside Ifugao. The Philippine women's movement entered Ifugao in the 1980s, and has had some, albeit minor, impact on women's gender ideologies. For example, some women have begun contesting the

unequal pay rates in Ifugao agricultural and other types of labor. However, fundamentalist Christian ideologies are also increasingly permeating Ifugao culture, offsetting ideas of gender equality promoted by the women's movement. International development projects have often effected the reinforcement or decrease of women's already lower gender status in economic, political, and domestic arenas (Kwiatkowski, 1998; McKay, 1995). Likely, there will be greater variability in gender conceptions among Ifugao people in the future as a result of these outside influences.

Igbo

Daniel Jordan Smith

ALTERNATIVE NAME

The Igbo are also known as Ibo.

LOCATION

In contemporary Nigeria, five states (Abia, Anambra, Ebonyi, Enugu, and Imo) are almost entirely Igbo speaking, and these, along with smaller parts of several neighboring states, constitute the geographic area colloquially known as Igboland. Located in southeastern Nigeria, Igboland is characterized by a tropical climate, with regular rainfall between the months of May and October and mostly dry weather between November and April. Igboland was once covered with thick forest (especially in the southern areas), but high population densities have resulted in extensive deforestation and increasing soil erosion. With one of the highest population densities in sub-Saharan Africa, Igboland is most striking in the degree to which human activities have extended to and had significant effects in all parts of the region. Gradually, the distinction between village and small town is dissolving.

CULTURAL OVERVIEW

Igbo-speaking people are the third-largest ethnic group in Nigeria, numbering approximately 20 million. Perhaps not surprising given the large population, forms of social organization and cultural patterns vary widely across Igbo communities. Inevitably, any attempt to sketch an overview will oversimplify this variation and may appear, from the perspective of particular sections of Igboland, to be inaccurate. With this qualification, a number of cultural features are common and very significant across much of Igbo society.

Prior to British colonization, Igboland was characterized primarily by a large number of self-governing village groups. Though some of these village groups were loosely tied through trade, marriage, and alliance in warfare, in precolonial times Igboland was largely decentralized and each Igbo village group was an independent political entity. Indeed, consensus in the historical literature is that the notion of a pan-Igbo identity emerged only in the context of colonialism (Isichei, 1976). The sense of Igbos as one people was further solidified shortly after independence by the Biafran War (1967–70), during which the predominately Igbo-speaking southeast sought unsuccessfully to secede from Nigeria. A number of scholars have argued that women's political role was greater in precolonial times and that the legacy of the colonial system has continued to have negative consequences for women's status in post-independence Nigeria (Amadiume, 1987; van Allen, 1976).

In the wider Nigerian collective imagination and in scholarly literature, Igbos are perceived to be economically resourceful and successful and highly entrepreneurial (Green, 1947; Isichei, 1976). Much has been written about the Igbos' entrepreneurial spirit, their economic acumen, and their domination of certain sectors of the marketplace across Nigeria. The idea that Igbo culture is "individualistic" and achievement oriented pervades discourse among other groups in Nigeria, and is reproduced and explored in anthropology (Henderson, 1972; Ottenberg, 1971). Individual achievement is certainly highly rewarded in Igbo culture, but characterizing the society as "individualistic" misrepresents the degree to which personal success is valued most as a fulfillment of group expectations that wealth should be shared, with extended family and community of origin being the most important groups for most Igbo people.

Involvement in trade, ranging from large-scale importation of industrial commodities to the sale of goods in informal petty businesses, has contributed to a huge volume of rural–urban migration in Igbo society. At present, most Igbo communities, indeed the vast majority of Igbo households, have members who have migrated to cities and towns across Nigeria. But one of the most significant features of Igbo migration and of social

organization in rural Igbo villages is the continuing tie of migrants to their communities of origin and their kinship groups (Smith, 2001a). Rural and urban Igbo communities are interdependent, with migrants and those who reside in rural villages connected to each other politically, economically, socially, and culturally. Most rural households rely on a combination of subsistence agricultural, small-scale trade, and often some wage labor and employment. In addition, many households depend on their migrant members for remittances, but also for social connections that facilitate access to resources such as education, jobs, business contracts, and government services (Smith, 2001a). Kinship in most of Igboland is reckoned patrilineally, though Igbo groups that are matrilineal and that practice double descent are well documented in the literature (Nseugbe, 1974). Even among patrilineal groups, the importance of women as daughters, wives, and mothers, and the strong ties to lineages other than an individual's own patrilineage are central to understanding the cultural construction of sex and gender in traditional Igbo society and in the present.

The proliferation of formal education, the almost universal conversion of Igbos to Christianity, and the increasing urban influence on people's lives in both rural and urban areas have had significant effects on the organization and meaning of sex and gender. Yet, perhaps obviously, contemporary trajectories of ideas and practices are very much shaped and informed by the past. The Igbo sex/gender system is complex, with gender roles often being more flexible than they appear (Amadiume, 1987), with the statuses of daughter, mother, and wife, for example, entailing quite different meanings for the same gender, and with continuous social change reorganizing the context in which beliefs and behaviors occur and are transformed.

CULTURAL CONSTRUCTION OF GENDER

Strictly speaking, Igbos recognize only two gender categories: male and female. Not only are the categories of male and female sharply distinguished, but these distinctions are manifest in a mostly sex-segregated social system (Green, 1947; Miller, 1982). The structure and character, as well as some of the contradictions, of this system are elaborated in greater detail below. However, it is important to note from the outset that conceptually strict gender categories and the largely sex-segregated social system are, in fact, more fluid in practice than they appear in ideology, particularly when gender is considered in the context of social action rather than essentialized categories. In Igbo society, for example, it is possible for women to marry wives, and daughters can undertake many of the social roles of sons, reversing the typical associations between gender categories and social position (Amadiume, 1987). However, even in cases of these social role inversions, Igbos retain durable and strict ideas about the differences between male and female. "Male daughters" and "female husbands" do not look or, in most respects, behave like men.

Though it is difficult to summarize briefly how Igbos conceptualize male and female gender, perhaps the most useful starting point is to note that the cultural construction of gender is most significantly manifest in the categories and roles of son/husband/father for men and daughter/wife/mother for women. Though certain characteristics of male and female gender connect each of these life-course stages (with men conceived of as more aggressive, independent, and publicly oriented, and women seen as more nurturing, dependent, and domestically oriented), the invocation of a life-course perspective highlights the extent to which gender is significantly tied to social context.

Dress and hairstyle are probably the most obvious culturally inscribed bodily markers of gender. Women generally grow long hair that is braided or styled and men keep short hair. Dress is more variable, but in contemporary Igboland men typically wear trousers in both traditional and Western garb and women are most likely to wear wrappers, dresses, or skirts. Women almost always pierce their ears; men do not. Features that make men and women attractive are extremely variable based on individual taste, and tastes seem to be shifting rapidly with changing fashions, but it is probably fair to say that markers of wealth, such as fine clothing and educated language, are most important.

GENDER OVER THE LIFE CYCLE

Puberty initiation rituals that used to mark the transition from childhood to adulthood for both men and women (Ottenberg, 1989) are no longer practiced in most Igbo communities. The introduction of formal education, now available to and desired for both boys and girls, has meant

that school stages have become among the most important markers of life stage for children and adolescents. Most Igbo families now consider that young persons who have finished secondary school have achieved adulthood. However, traditional categories and roles of son/husband/father and daughter/wife/mother remain extremely important, and it is fair to say that, even now, marriage and parenthood mark the full attainment of personhood for both men and women. Both marriage and childbirth are celebrated with important social rituals, and though marriage ceremonies and child-naming rites are not explicitly about creating and defining gender roles, they certainly serve that function. For both men and women, the transition to elder status (not marked by any specific ritual, but usually closely associated with the achievement of grandparenthood) brings greater respect. In addition, in some ways, elder status mitigates more polarized expectations of gender roles that apply to younger people (e.g., older women are typically outspoken and older men are judicious and patient).

Socialization of Boys and Girls

Igbo people recognize that the birth of a son is extremely important for the purpose of reproducing and maintaining the patrilineage. For women, the birth of a son solidifies her place in her husband's family. Thus, in some respects, the birth of a son (especially the first son) is more eagerly anticipated than the birth of a daughter. Nonetheless, the birth a child of either sex is extremely joyful, and though boys and girls are eventually socialized quite differently, there is little sense in Igbo society that one sex is ultimately preferred over the other. In the first few years of life, socialization of boys and girls is not markedly different, with both sexes closely attached to the mother (Ottenberg, 1989). By and large, both boys and girls assist their mothers with (mostly "female") domestic tasks until at least the age of 10 or 12. However, by school age it is apparent that adults treat boys and girls quite differently and have different expectations regarding their behavior. By the time children go to school (even preschool) gendered dress is common and the use of gendered kin terms (and even playful "sexual" banter) is clearly observable. In general, boys are granted more liberties than girls, especially with regard to venturing and playing outside the domestic compound, though, as children, boys also remain very much under the strict supervision of adults.

In contemporary Igbo society, much of the way gender is socialized clearly takes place at school. Unfortunately, this aspect of gendered socialization in Igboland has not been adequately studied. It is clear, however, that school curricula and social organization are extremely gendered in Nigeria. Though both sexes attend primary school in equal proportions and girls are almost as likely as boys to go on to secondary school, the expectations of what each sex will do with his or her education are quite different.

Puberty and Adolescence

As indicated above, in most parts of Igboland initiation rituals that marked the transition from child to adult (usually occurring at or shortly after puberty) have been abandoned in the wake of formal education and conversion to Christianity. Related to the growing duration of time between puberty and marriage, the concept of adolescence seems to be of recent origin in Igboland (Ottenberg, 1989). Though gendered differences in appearance and behavior are apparent in childhood, they are more significantly marked after puberty. As young people's bodies develop and become more sexually dimorphic, cultural inscriptions of gender difference are also made more elaborate. In adolescence, relations between males and females become obviously stylized in terms of sexuality, and this emphasis on sexuality seems to be part of a process that fixes gender more rigidly. Interestingly, in many secondary schools sexual maturation is marked by relaxed rules of dress and hairstyle. For example, as they reach senior secondary school (usually around age 16), boys are allowed to wear long trousers (instead of short trousers) and girls are allowed to grow their hair.

Attainment of Adulthood

Because marriage and parenthood are the ultimate indicators of full adult status, one could argue that adulthood is being postponed to later and later ages in Igboland. Indeed, many contemporary problems of youth in Nigeria can be related to the erosion of socially sanctioned passages to adulthood, such that many young people spend up to 10 years in a kind of liminal life stage where they have the material ambitions of adults but few of the obligations and responsibilities and little of the recognition that come with marriage and parenthood.

Middle Age and Old Age

There are no universal rites marking passage to elderhood for men and women in Igboland, though many kinds of social ceremonies are related to aging. Generally, only senior men are given chiefly titles, for example, and in Igbo societies that have male age sets, the transition in age sets is a kind of marker of seniority. As mentioned above, aging seems to mitigate and even reverse some of the most dramatic differences in behavior associated with gender—such that, for example, older women become more like men in their outspokenness and irreverence, and older men become more like women in their capacity to mediate and act empathetically. Perhaps most important with regard to aging and gender is that both men and women gain increasing respect in a society that honors seniority. Yet in contemporary Igboland, where young people often question, challenge, and resist tradition, the exalted place of the elderly seems to be eroding.

PERSONALITY DIFFERENCES BY GENDER

From the perspective of non-Igbos, Igbo people, both men and women, have outgoing, even boisterous, personalities. Compared with many other ethnic groups in Nigeria, Igbos appear to be aggressive and outspoken, but also welcoming and gregarious. To a first-time observer, Igbo conversations often sound like arguments, and both men and women are quick to defend themselves against perceived slights. While it is certainly the case that children are supposed to be deferential to adults, and juniors respectful to elders throughout the life-course (regardless of gender), Igbo adults of any age are usually prepared to do verbal battle with someone they believe has failed to accord them appropriate respect or recognition. Within Igbo society, women are expected to be more deferential to men than vice versa, but the extent of this deference is variable and often minimal. It is not uncommon for Igbo women to verbally chastise Igbo men, and men often joke about what a mistake it is to vex women. Perhaps the most striking personality differences by gender are related to the importance of motherhood as the primary locus of family nurturance and affection. Though great variation characterizes men's and women's personalities, it is probably fair to say that women are generally more nurturing and affectionate, especially in relations with children.

GENDER-RELATED SOCIAL GROUPS

Numerous scholars have noted the sex-segregated nature of Igbo social organization (Green, 1947; Miller, 1982). Many social institutions are structured by gender, with men and women often participating in parallel but separate spheres. Because descent is generally reckoned patrilineally and postmarital residence is traditionally patrilocal, women's structural position vis-à-vis kinship groups changes more fundamentally than men's over the life cycle. While both men and women experience significant changes in status as they pass from son/daughter to husband/wife to father/mother to grandparent/elder, for women marriage marks a radical change that can be both empowering and problematic (Smith, 2001b). Because a woman typically moves at marriage from her own patrilineal compound/village to her husband's, she becomes, in a sense, an outsider in her married home. This is particularly the case until she gives birth to a son, and the Igbo language is replete with proverbs about a woman's precarious status as wife and the importance of parenthood in securing her position. While the status of wife is, in part, one of "stranger," the status of mother is perhaps the most valued and emotionally exalted kin position.

In precolonial patrilineal Igbo communities, men of the same lineage group constituted one of the principal structures of local political organization. Other more horizontal forms of male social organization, such as secret societies, age grades, and title societies, cut across lineages, facilitating cooperation at village and village group levels (Ottenberg, 1971). Each of these institutions was characterized by exclusive male membership, and notions of secrecy were related to the perceived power of these groups in regulating community activities—and particularly in controlling women (Ottenberg, 1989). The importance of all-male societies has waned in the postcolonial period, as forms of state authority have usurped many of their original functions, but lineage groups and village development unions remain strong institutions in most Igbo communities, with one of their chief functions now being the management of relations between village residents and their many migrant relatives (Uchendu, 1965a).

For almost every male social group there is a parallel women's group. Though women move away from their

lineages at marriage, they maintain lifelong ties to their patrilineages as daughters and this relationship is formalized through daughters' associations. Contrary to what seems to be implied in some of the literature, and in contrast to implicit ideas in some Igbo (mostly men's) rhetoric about women, as daughters, most Igbo women remain vital members of their patrilineages throughout their lives and their importance is ritually marked at marriage and burial ceremonies (Amadiume, 1987). Women also belong to associations of wives in the place they marry, to women's branches of the village development unions (often in both their natal community and their postmarital place of residence), to groups of women who have married in one community but originate from the same natal community, and to savings–loan unions that can be constituted along any number of lines. The sheer number of sex-segregated social groups and the fact that men and women maintain parallel associations at almost every level is one of the most striking features of gender-related social organization in Igbo society.

GENDER ROLES IN ECONOMICS

Perhaps the most striking aspect of gender roles in economics among the Igbo is the heavy involvement of both men and women in trade. As mentioned previously, Igbos are renowned in Nigeria for being entrepreneurs—traders who dominate major sectors of the marketplace. If anything, women have a longer tradition of managing the marketplace in Igbo society, as they historically dominated trade in foodstuffs (Amadiume, 1987). While men played a role in trade even in precolonial times, it was the growth of international trade and large-scale introduction of nonagricultural (mostly imported) commodities that contributed to men's intensifying participation in trade—a change that some have argued has contributed to a decline in women's economic status (Amadiume, 1987; van Allen, 1976). However, in contemporary Nigeria, both men and women remain heavily involved in trade, and though women are still more involved in agricultural trade and men remain dominant in nonagricultural trade, huge numbers of men and women participate in every form of commerce. The degree to which the proceeds of trade are kept and managed by individual men and women, rather than pooled or handed over to a spouse, is an interesting question with no clear answer. While each sex traditionally managed the proceeds of trade independent of a spouse, in contemporary society, with the diminution of polygyny and the emergence of more conjugal marriages, household budgets are more likely to be shared and more couples embark on joint business ventures.

Though trade is an important component of the Igbo economy even in rural communities, almost all rural households rely significantly on subsistence agriculture. Generally, men are responsible for clearing land in preparation for planting, but women undertake the bulk of agricultural labor. The rise of cassava, generally considered a woman's crop, as the staple in Igboland, replacing yam, which is clearly considered a man's crop, contributed significantly to women's increasing responsibility for agricultural subsistence. Because only men inherit land in patrilineal Igbo communities, women have access to land through their husbands, though their rights of usufruct are well established. The rights of women to land (as well as to other community entitlements) are further secured through the birth of sons, because it is through having a son that a woman can be assured that her "kitchen" inherits its share of the patrimony. The domestic division of labor is strongly gendered in Igbo households, with women (and children) being almost exclusively responsible for tasks such as food preparation, sweeping the compound, and washing clothes.

As Nigeria's economy modernizes and the division of labor becomes more specialized, modern occupations are also gendered. For example, men dominate occupations such as drivers, carpenters, and mechanics, while women fill roles such as nurses, hairdressers, and receptionists. Much of this modern gendered division of labor reflects similar patterns in industrialized societies. Extremely high levels of rural–urban migration sometimes result in women and children being left "at home" in the village while men pursue employment or business in cities. However, a more typical pattern is for husbands, wives, and children to migrate as a unit. The phenomenon of men in the city and women and children in the village is much less frequent in Igboland than has been described in other sub-Saharan African societies.

PARENTAL AND OTHER CARETAKER ROLES

Gender differences in parental roles are large and profound. In Igbo society almost all primary child-rearing responsibilities are undertaken by the mother,

or by another women who acts as a social mother. The maternal role is especially pronounced during the first 4 or 5 years of a child's life, when her/his principal bond is with the mother (Ottenberg, 1989). Fathers are generally more distant figures in children's lives and are often viewed as enforcing discipline. They typically spend much less time than mothers do with children. Recently, with the rise of more conjugal marriages and somewhat more nuclear household structures (especially in cities), many younger fathers are taking a more active and overtly affectionate role in the rearing of children, but the idea that child-rearing is principally a woman's responsibility remains pervasive and influences behavior in even the most modern households. Generally boys and girls are treated quite similarly during the first few years of life, with no obvious preference by gender. Despite the widespread idea that having a male child is essential for the reproduction of the patrilineage, and for the rights and recognition that come with it, in practice girls seem to be equally welcome and valued as boys. However, beginning around the age that children go to school, there are marked differences in the way parents treat boys and girls, with girls increasingly required to carry out more domestic tasks and boys encouraged to undertake more public activities.

LEADERSHIP IN PUBLIC ARENAS

At all levels of Igbo society men dominate leadership in public arenas. Igbo men far outnumber Igbo women in positions and influence in Nigerian federal and state government institutions. While some women are elected or appointed to political office, there have been no female Igbo governors, relatively few female ministers, senators, and representatives at the federal level, and few female commissioners and other political appointees compared with males at the state level. In addition, men clearly dominate the civil service, though less dramatically than political offices. Given Nigeria's postindependence political history, it is important to note that the top posts in military are, and have always been, entirely male.

In local government, women are represented in larger numbers, as local government chairpersons and councilors. But even at the local government level, men dominate. Significantly, at the nexus between traditional community authority and the Nigerian state, where the office of *eze* (chief/king) is a legacy of the British colonial

imposition of a warrant chief system, men are in charge almost entirely. Almost every community in Igboland is ruled by a male *eze*, and most *eze*'s cabinets (the body of local influential leaders who advise him) are almost exclusively male. Typically, an *eze*'s cabinet has one woman's representative and a dozen or so men. Even at the most grassroots level, public leadership is primarily in male hands, so that village and hamlet (the smallest unit above the family/compound) headships are almost universally male in Igboland.

This male dominance of leadership in public arenas obscures two important points. First, both historical and anthropological research suggests that male dominance in the public arena may not have been as prevalent in the precolonial period (Amadiume, 1987). Some evidence suggests that the importance of female deities in traditional Igbo religion and the powerful role of women who held traditional titles associated with these deities placed women in strong positions of public leadership. Further, women's relative domination of the marketplace in the precolonial period may have afforded them more significant public roles. Second, men's monopoly of public leadership positions conceals the extent to which women influence decision-making. Particularly at local levels, through the parallel women's associations and the fact that Igbo men openly acknowledge that women must consent to any decision that is to have significant effect, women have a much greater say in the conduct of Igbo affairs than their lack of prominence in public leadership reveals. Indeed, the historical literature on the Igbo is well known for incidents where women's political action proved effective (Mba, 1982; van Allen, 1976), and anyone who has worked in Igbo communities in contemporary Nigeria has been told by male public leaders how important it is to gain women's collective cooperation. How all this must be weighed in assessing the relative status of men and women is considered further below.

GENDER AND RELIGION

More than 90% of Igbos now identify their religion as Christianity. Though men and women are Christian in almost equal proportions, women's church groups are particularly active and in many, if not most, churches women appear to dominate the everyday activities of the lay congregation. However, men control the official hierarchy of almost every (if not every) denomination.

The impact of Christianity on gender and on the relative status of men and women is a matter of considerable interest and debate. On the one hand, in traditional Igbo religion a number of important deities were considered "female", and women titleholders and priestesses sometimes wielded substantial power. The traditional conception of gods as both female and male contrasts sharply with the Christian belief in a single male god. Some scholars have argued that Christianity, in combination with colonial policies, had the effect of lowering women's status. However, Christianity's role in curtailing polygyny and in promoting more companionate models of marriage may also, arguably, have provided women with new leverage in negotiating relationships with men (Smith, 2001b). Few of the vast majority of Igbo women who are Christian would assert (or accept) that Christianity is to blame for whatever discontents they may have with their social role as women. Indeed, most Igbo women seem to view Christianity and church as a refuge from whatever else might be wrong about the world.

LEISURE, RECREATION, AND THE ARTS

As Igbo people's mode of subsistence becomes increasingly enmeshed in the larger regional and world economy, people seem to have less and less free time. Balancing the continuing demands of subsistence agriculture with involvement in trade and other demands of more urbanized or urban-like work lives means that both men and women spend a lot of time earning a living. Compared with many other parts of sub-Saharan Africa, Igboland strikes the observer as a very busy, sometimes almost frantically paced, place, though much more so in cities and towns than in rural village communities. Nonetheless, leisure and recreation, particularly time spent socializing with friends and family are important aspects of everyday life.

In rural communities men appear to have more leisure time than women because women must combine extradomestic economic work (which is often at least as intensive as men's) with the primary household duties of childcare, food preparation, sweeping, and washing clothes. Women receive significant assistance in these activities from children of both sexes, and the degree to which women manage to combine domestic chores with "leisure" activities such as socializing, singing, and storytelling is significant. But, overall, women clearly have less pure leisure time than men. Igbo men are wont to say that women spend an inordinate amount of time gossiping, but the truth is that both sexes spend a considerable amount of leisure time talking about other people. Men are more likely to spend leisure time playing games. The board game "draughts" (checkers) is popular and men often play it in the early evening. Boys and younger men frequently play soccer. At very young ages, girls sometimes also play, but by the time children reach adolescence the games are almost always all male. Men are much more likely than women to drink beer at local bars or frequent village palm wine sellers, though not all men drink and a significant portion of Igbos who are "born-again" Christians view drinking negatively. Many women also enjoy alcohol, but women's drinking is less frequent and usually not done in public settings such as bars, though this is changing in urban settings. Like other arenas of Igbo cultural life, leisure activities tend to be sex segregated, with the exception of events like "disco" dances or public cultural performances that are enjoyed by men and women together.

RELATIVE STATUS OF MEN AND WOMEN

Considerable consensus exists in the characterization of Igbo society as largely sex segregated in terms of economic, political, and social organization, with men and women often engaging in parallel activities and associations rather than cooperating or competing in the same arenas. However, whether the Igbo sex/gender system values men and women relatively equally in their own terms, or whether this system specifically favors men, has been the subject of debate. Several scholars have argued that colonial policy and Christian missionizing had the effect of reducing women's economic and political decision-making powers by abolishing female titles associated with traditional deities, appointing all male chiefs, and moving men into the previously female-dominated marketplace (Amadiume, 1987; van Allen, 1976). In contemporary Nigeria, men clearly dominate public political decision-making and, through their control of land and ascendancy in the nonagricultural marketplace, they are in command of key economic resources. But women are by no means powerless in Igbo society. In addition to the fact that Igbos strongly value women precisely in their roles as daughters/wives/mothers—roles that are

culturally celebrated rather than denigrated—the fact that Igbo women are organized collectively in associations that parallel men's organizations means that women can wield considerable collective power and often do so when they feel their interests have been compromised.

SEXUALITY

Generalizing about Igbo attitudes toward sexuality is extremely difficult because so much variation exists based on axes of diversity such as age/generation, education, socioeconomic status, religious affiliation, and degree of urban experience, but also because attitudes to sexuality are often contradictory. Broadly, Igbo attitudes about sexuality are much more restrictive for women than for men, particularly with regard to premarital and extramarital relations. With rises in the average age at first marriage over the past several decades, the length of time between sexual maturity and nuptiality has increased dramatically. Though many elders maintain an ideal that sexual intercourse should occur only after marriage (especially for women), and though the association between ideas about sexuality and beliefs about procreation/reproduction are very strong in Igbo society, for many young people premarital sexuality is linked to the construction of a modern identity (Smith, 2000). Most young Igbos, both male and female, engage in sexual relationships before marriage. Though young women's sexuality is more closely scrutinized than young men's, as long as a girl does not have a child before marriage, having had premarital sex is usually no obstacle to marriage. Within marriage, Igbos generally view regular sexual relations as healthy, and the idea that both men and women experience and are entitled to sexual pleasure is widely accepted. The gender disparity in attitudes about sexuality is most profound with regard to extramarital sexuality (Smith, 2001b). Male extramarital sexual relations are common and carry little stigma. In fact, male extramarital sexuality is often symbolically rewarded in male peer groups, particularly in urban and elite contexts. For women, extramarital sexual relations are extremely risky and heavily stigmatized. Once a woman is married, it is expected that she will remain sexually faithful to her husband.

Igbo conceptions of male and female sexuality are in many ways contradictory, especially in male discourse. Men are viewed as needing sex more than women and are supposed to be the initiators or aggressors in sexual relationships. Women are supposed to be more passive, yet the idea that women are sexually dangerous and that men can be manipulated by women's sexual power is also prevalent (Smith, 2001b). Sexual banter between men and women is relatively common, but physical modesty is expected for both men and women. The increasingly immodest dress that is becoming more popular in urban areas is viewed somewhat scandalously by elders and in village communities generally. Some scholarship suggests that precolonial Igbo society was sexually more liberal than during the colonial and early postindependence period, with children and adolescents provided socially accepted avenues for sexual experimentation and both men and women freer to take extramarital lovers (Uchendu, 1965b). In contemporary Igboland the relative taboo of open discussion of sexuality contrasts with the prevalence of nonmarital sexual relations.

Igbo society is quite striking for its lack of any overt cross-sex identification and an almost complete denial of any form of male or female homosexuality. A study of homosexuality in this strongly dual (hetero) sex society is badly needed, though it would be very difficult to undertake.

COURTSHIP AND MARRIAGE

Changes in courtship and marriage are among the most significant ongoing transformations with regard to sex and gender in Igbo society. Whereas men and women traditionally married very young and marriages were mostly arranged by the extended families of the husband and wife, in contemporary Igboland, men and women increasingly choose their own marriage partners (Smith, 2001b). Modern courtship often involves notions of love, and most young Igbos marry with the intention of remaining monogamous. In these romantically cast premarital relationships, gender dynamics are relatively egalitarian because men and women are viewed as equal partners in an individualistic (or at least dyadic) project, and the terms of the relationship are negotiated based on ideas of love, trust, and emotional intimacy. While couples themselves now frequently initiate the process that leads to marriage, once initiated, families and communities become heavily involved in both the wedding ceremonies and the marriage itself. Though polygyny was once common, relatively few people practice it today. Among young people, polygyny is almost universally

rejected and fewer and fewer Igbo marriages are likely to become polygynous.

Despite these changes in patterns of courtship and in the criteria for marriage, three elements remain paramount: the social expectation that everyone must marry, the importance of marriage as an alliance between two kin groups, and the centrality of parenthood as the foundation for a successful marriage. Traditional marriage ceremonies, in which the extended families and communities of origin of both the husband and the wife participate, continue to constitute the principal rite of passage marking marriage. Though many couples now choose to be married in their Christian churches, as well as in the traditional ceremony, the traditional ceremony is obligatory, while the Christian ceremony is optional (though, for many, highly desirable). The years after marriage are characterized by great anticipation of pregnancy and childbirth, and nothing is more important in establishing the stability of a marriage than parenthood. The transformation of a couple's relationship from courtship to marriage, where the roles of mother/father and husband/wife become primary, and where many more people are socially invested in the relationship, has significant consequences for the dynamics of gender (Smith, 2001b), tying women to their roles as mothers. In general, the importance of the quality of a couple's personal/emotional relationship recedes after marriage, especially after the birth of children. In the case of the death of a spouse, the likelihood of remarriage is greatly dependent on age and whether the surviving spouse has children. Traditional practices of levirate are now mostly abandoned, and many women whose husbands die remain unmarried if they already have several children.

Husband–Wife Relationship

The degree to which marriage relationships are characterized by love, affection, and/or companionship is highly variable, though, generally, younger couples are much more likely to emphasize these aspects of the conjugal relationship than their elders. In more traditional marriages, affection and companionship are often quite important and can become very deep over time. However, for older Igbos, the idea that a marriage relationship should be the primary locus of intimacy is much less common than among younger couples. Even in more modern marriages men and women spend a significant amount of time and find a large part of their social satisfaction in same-sex peer relationships and in interactions with a wide range of kin.

Traditionally, Igbo husbands and wives did not eat together, they had separate sleeping rooms, and most social activities were sex segregated. While this is changing in the context of more conjugal marriages (many monogamous couples, e.g, now share the same bedroom), even in relatively modern marriages, a man is more likely to eat separately from his wife and children than with them. In addition, gender roles in the household remain quite polarized, with women almost exclusively responsible for food preparation and childcare.

Bridewealth in Igboland is perhaps the highest of any ethnic group in Nigeria, and once a couple has children, there are few socially acceptable reasons to divorce. If a couple does divorce, the children of the union are generally considered to belong to the husband and his lineage. A man may legitimately seek to dissolve a marriage if his wife has been sexually unfaithful, but a woman will be on much firmer ground seeking divorce if she can show that her husband has failed to provide for her and the children. She will receive relatively little social support if she cites problems in their personal relationship or the man's infidelity. Though divorce is heavily frowned on, in urban areas it is more common now than in any recent time.

Other Cross-Sex Relationships

Cross-sex relationships within kin groups are common and often highly affectionate. These relationships are not (or are at least rarely) sexual, but warm relationships between opposite-sex relatives of various sorts are extremely pervasive. While opposite-sex sibling relationships are sometimes competitive, by and large brothers and sisters (especially of the same mother) are close, and these relationships endure over a lifetime. As adults, siblings remain interested in and protective of each other and each other's children. In addition, cross-sex relationships between various assortments of cousins, uncles/nieces, and aunts/nephews can be extremely affectionate and are frequently characterized by some degree of sexual allusion or joking (most often on the part of the older member of the cross-sex pair and in contexts where actual sexual relations are least likely—e.g., between adult and child). The warmth that characterizes these intrakin cross-sex relationships is clearly a source of great

joy and accounts, in part, for the affective attachment that Igbos feel for their kinship networks.

Iranians

Mary Elaine Hegland

ALTERNATIVE NAMES

Iranians are also known as Persians.

LOCATION

A Middle Eastern and Muslim nation located in western Asia, Iran shares borders with a number of different countries. Starting with the Persian Gulf to the south and going clockwise, Iraq and Turkey lie to the west, Azerbaijan, the Caspian Sea, and Turkmenistan to the north, and Afghanistan and Pakistan to the east.

CULTURAL OVERVIEW

Only a few decades ago, Iranians engaged primarily in agriculture, trade, herding, and crafts. Local and regional political groups organized around control over land, trade wealth and opportunities, and family and kinship connections. Such connections could be through patrilateral or matrilateral lines, created partnerships, and patron–client type relations for political protection and access to means of production. Middle- and upper-class extended families typically lived in large homes with rooms arranged around a central courtyard. Members of wealthier families might have homes located near each other, and peasant and lower-class urbanites might well live with the husband's family at least for a period after marriage. Generally, wives continue to maintain close ties with their natal families. Typically, females socialized with each other, while males went off to work in fields, trade and craft shops, and to herd animals. Outside the family, the genders segregated for weddings, mourning gatherings, outings, religious rituals, and political and economic interaction.

Intent on modernizing Iran, the two Pahlavi shahs attempted to demonstrate Iranian progress and modernity through deveiling women, educating them, and bringing them into the public work force. To centralize political power, the Pahlavis squelched other power centers, such as tribes, religious leaders and organizations, and regional leaders and large landlords. In the 1960s, and even more in the 1970s, the oil boom brought urbanization, industrialization, construction, education, health services, bureaucracy, and westernization. However, the Pahlavis did not institute political liberalization and democracy. Unhappy with the pervasive influence of Western culture and what they saw as modern vulgarity, religious figures with financial support from successful merchants and business people organized to try to regain some lost power. Students and professionals, empowered by education, joined middle- and lower-class people who were influenced by the clergy and unhappy with repression and increasing extremes in wealth to bring about the Iranian Revolution of 1978 and 1979. Under the leadership of Ayatollah Khomeini and then the Islamic Republic of Iran, formed in 1979, governmental and societal gender policies changed radically. Whereas the Pahlavis had attempted to educate women and bring them into the public work world, even making veiling illegal during one period, the Shi'a clerics attempted to reverse these developments. Relying on Shar'ia (Islamic law), the Hadith (traditions of the Prophet Mohammed, provided by his followers and passed on through chains of authority), and cultural traditions, Islamic Republic officials have declared women and men to be different by nature. Men are fit for the rough and tumble of politics and economics. Women, because of their more gentle, emotional, and nurturing characters, should devote themselves to household, husband and children. In return for obedience and service, women are entitled to financial support from men. Islamic Republic clerics reversed family laws beneficial to women and enforced gender segregation and female veiling. However, the war with Iraq (1980–88), gender-segregation policies, and women's political voice forced government officials to recognize the need for a female labor force. Since 1979, in the political competition among Islamists, secularists, and modernists, women and gender have been a focus of contention.

CULTURAL CONSTRUCTION OF GENDER

In Iran, the two gender categories of male and female are recognized. The term *hamjens parast*, or those who are sexually involved with the same sex, refers to homosexuals, but they are nevertheless seen as males and females. Eunuchs likewise were seen as males, but as males unable to procreate. In Iranian Muslim culture, males are seen as stronger, intelligent, wiser, virile, able to control their emotions, just and moral, and fit to handle political and economic affairs. Women are seen as weaker, emotional, susceptible to the pull of personal ties, nurturing, and unable to control their sexuality. Males used the perception of women as weak and foolish as a rationale to forbid them to gain literacy, education, and employment. Men often see women as a whole as manipulative, conniving, and unreliable. However, many men think very highly of their mothers, feel great affection for their sisters, and rely upon their wives. Women often see men as aloof, unable to control their anger, sexually promiscuous, and socially less competent. Because women are viewed as strongly sexed and unable to contain themselves sexually, they are required to veil in order to avoid arousing men sexually, thus leading to family and societal instability.

Iranian men wore a form of trousers, and women wore long skirts over loose trousers and a scarf, although men often also wore ethnic or regional hats. Affluent men could afford to veil and seclude their womenfolk at home, thus demonstrating their status. However, hardworking tribal and peasant women did not wear veils. Reza Shah Pahlavi forcibly removed women's veils—policemen tore off their scarves and veils—to symbolize Iranian modernity and westernization. He encouraged Western dress. Men took on Western clothing: trousers, suit jackets, ties, and hats. Women more often retained ethnic, tribal, or regional dress. Men wear their hair shorter and might have beards and mustaches. As infants and toddlers, mothers dressed girls and boys similarly in homemade shirts and pants, and only began to put dresses or skirted pullovers on girls, rather than boys' shorter pullovers, after the age of 2 or 3. People believe that girls should cover their hair by the age of 7, although girls might beg for a scarf or veil before then. At an early age, girls are expected to stay at home and not roam around the neighborhood with friends, as boys do. Use of make-up visibly marked the transformation of a girl to a married woman. Particularly during the time of Mohammad Reza Shah,

middle- and upper-class urban women took to Western fashions, make-up, nail polish, and beauty shop hair care. In the 1960s and 1970s, girls wore uniforms to school, and generally teachers did not wear veils. Upper- and middle-class women, especially professionals, often did not wear veils except when attending religious gatherings.

All of this distressed Shi'a Muslim clerics. Soon after the 1979 Revolution, Ayatollah Khomeini began to restrict clothing, social integration, and behavior of women. It became illegal to go without veiling or to wear make-up (Moghissi, 1999; Tabari & Yeganeh, 1982). Women were required to wear a veil or a scarf covering all their hair and a long raincoat-like outer garment. Men should wear long sleeves and long, rather loose pants, and to demonstrate that they were "Islami" wear a beard or stubble and avoid the Western tie. Currently, women can show hair under their scarves, and wear make-up and nail polish. Covering tunics are becoming briefer. Particularly for younger females from less conservative families, they may be tailored to fit the form snugly, fall just to cover the hips, and button only to above the waist, allowing the front to swing open and reveal tight pants underneath.

Standards of female beauty have changed drastically over time. Not many decades ago, females were to be plump, with long thick black hair. Now females want to be slender. Middle- and upper-class women may go to the gymnasium and aerobics classes to attain a toned slim body. Many women dye their dark hair lighter colors. Many females have plastic surgery to have a smaller nose, and some even restructure other parts of their faces and bodies.

GENDER OVER THE LIFE CYCLE

Infants may be called by a gender-neutral term, such as *neenee, nozad*, or *baqeli*, and then a bit later called a *bacheh* or "child," although sometimes this term has a male connotation. From birth until marriage, males are called "boys" or *pisar* and females are called girls or *dokhtar*. Circumcision and marriage defined the main stages of life for males. Circumcision, performed before going to school, marks boys as cleaner and better Muslims, and as moving toward manhood. Families celebrate the occasion, and boys receive praise, gifts, visitors, and

special food. Boys do not show embarrassment at the attention focused on their penises. Under Islamic Republic laws, the legal marriage age for girls was lowered to 9 and that for boys to 16. Upon marriage, and thus initiation into sexual activity, females are called "women" or *zan* and males "men" or *mard*. Upon consummation of the marriage, the status of the two changed to that of *arus*, bride or daughter-in-law, and *damad*, groom or son-in-law. In the past, the daughter-in-law became subordinate to the mother-in-law and her competitor for the affections of her son. With the arrival of a child, particularly a boy, the young woman gained some status. The young couple then became *bachehdar*, those who have children, or parents. The parents, and more often the mother, might then be called by the name of her son: Naneh-ye Mohammad or Mama-ne Mohammad—Mohammad's Mother. Generally, the bride's mother provided the first set of clothing for the child. Relatives, especially women, came to congratulate the mother, bringing gifts if possible. As the couple had more children and then married them off and became grandparents, they gained status. In their older years, depending on their vitality and leadership, men could be called *reesh sefid*, white beard, and women, less commonly and with less power connotations, *sar sefid*, white head. Finally, the elderly were called *pir zan*, old woman, and *pir mard*, old man. Although younger people still demonstrated deference to them, they generally lost power and authority.

Socialization of Boys and Girls

Not long ago, families favored boys over girls. A young bride wanted to produce a boy which would increase her own status. A friend told me how her mother had turned her face away, wept, and refused to nurse her first-born daughter in shame that she had not produced a son for her husband, until her aunts and other female relatives urged her to do so. When asked how many *bacheh* (child, although sometimes taken to mean boy) he has, a father may count only the boys. In my experience, when men recited the list of their ancestors and their lineage, they gave the names of males only. Females asked if I wanted them to list the women too, or just the men. Traditionally, mothers and others tended to male infants more than to female infants, breast-feeding them longer, and responding to their crying. Parents generally provided boys with more food, clothing, medical care, and education than

girls (Friedl, 1997). Educated modern couples tend to expend as much care on daughters as sons.

Mothers are the main caretakers of babies, although fathers interact with boys later on. Anthropologist Erika Friedl (1997) found that parents and others in a Lurish village expected girls to be quiet, obedient, helpful, clean, and homebound. From very early on, girls' genital areas are always covered, while little boys may be naked. Mothers taught girls to acquiesce to male domination. Although mothers complained about their sons' devilishness, wildness, and destructiveness, they also saw this behavior as masculine assertiveness.

Puberty and Adolescence

Many urban middle-class Iranian young people now enjoy music, getting together with other young people, and talking with, even dating, the opposite sex. Only a few decades ago, Iranians did not separate out or name an adolescent period, especially for girls, nor did they expect teenagers to display awkwardness, touchiness, or rebelliousness. People might refer to teenage boys as *javanan* or youths and expect them to go out of the house. Girls' menarche, rather than celebrated, is private and polluting. Menstruation makes girls ritually impure, unable to pray or touch the Qur'an.

Attainment of Adulthood

A boy (*pisar*) becomes a man (*mard*) through marriage and initiation into sexuality. In order to marry, he must be old enough to be earning money to support a family. He or his family must have gathered the money to provide gifts to the intended wife and her family as well as to give the bride's father a *mehriyeh* or brideprice. Likewise, a girl (*dokhtar*) becomes a woman (*zan*) through marriage and initiation into sexual activity. In order to be eligible for marriage, or at least before consummation of marriage, a girl must have gone through menarche and thus be able to produce offspring. Part of the preparation of a bride included removal of her body hair, marking her transition from a girl to a sexually active woman. Although customs differ greatly among ethnic, tribal, and religious groups, class, settlement size, and age groups, changes in hair style sometimes mark married women. For example, Kurdish women cut some hair on both sides to frame the face after marriage. In Iran, women have long worn

eye make-up (kohl), and with westernization, began to use other types of make-up, particularly for brides. After marriage, a man is expected to act responsibly and support his wife and children. Men should make sure that their wives and children are respectful to them and careful about family reputation. Married females should industriously clean house, cook, and wait on their husbands and husbands' parents, particularly if they live with them. Until several decades ago, males interacted with males and females with females. People did not expect marriages necessarily to be companionate, but rather a household and children-producing team. Now, even females may find careers, postponing marriage, and receive respect from others.

Middle Age and Old Age

With several children, men and women gain status and respect. As a householder, with a wife and growing children, a man may be called upon for religious or community leadership. Mature men and women who controlled economic, political, religious, and social resources enjoyed the most power and influence. More recently, when younger adults can gain influential and rewarding positions through education, independent jobs, modern expertise, or religious dedication, they may threaten older people's authority. As time goes on, and men begin to lose their strength and abilities, their wives may gain power. When their husbands become frail, wives who are most often some years younger may still be at the height of their powers, managing family and community events and relationships. In the past, elderly parents lived with children and grandchildren who ideally placed them at the center of the family and cared for them with love and compassion. Now, young couples want their independent lives and do not appreciate interference from parents. Old men tend to become relatively marginal and dependent upon others to care for them. Older women are often more resourceful, remaining active in cooking and household work as well as in family, kin, and neighborhood affairs. Now more and more elderly live by themselves in their own homes rather than with children. There are also old people's homes for those elderly whose children cannot or do not wish to care for them. Because divorced or widowed men, more than women, tend to remarry, old men can usually count on wives to nurse them at home. Far more women than men reside in homes for the elderly.

PERSONALITY DIFFERENCES BY GENDER

Shi'a Islam, religious leaders, myths, and rituals all teach men to be brave, to be able to support and defend women, children, and dependants, to be wise, just, combative, and devoted to God and religion, to be able to control themselves, and to participate in the public world of religion, politics, and economics. Women, in contrast, are supposedly weak, delicate, emotional, nuturing, unable to be objective and thus to be just, unable to control themselves and resist sexual temptation, and suited by nature to home, household, and ministering to men and children. In actuality, it is often women who hold the household together and manage interpersonal relations.

Little girls usually are more docile, obedient, and shy. Little boys can behave in a more unruly fashion and hit and act aggressively toward others. Little girls stay at home, whereas boys can more easily escape the house and their mothers' control over them. As they grow older girls should become increasingly deferential to males, work hard for their mothers, behave modestly, cast their eyes downward, keep well covered, and keep any needs and wants to themselves (Friedl, 1997). A boy can order mother, sisters, and younger brothers around and be more assertive about his wishes, although required to demonstrate respect to his father and other older family males.

GENDER-RELATED SOCIAL GROUPS

Male–female separation characterizes much of Iranian social life. Females spend much of their time in the company of other females. Before the employment of many women in the public sector during the 1960s and afterward, females (except the poor) generally stayed at home with female family and relatives, running the household, and interacting with kin and neighbors. Upon marriage, a young couple typically lived with the groom's family, at least for a time. However, the Iranian kinship system is basically bilateral, and wives maintained close connections with their own families and relatives. Male relatives, such as a father and his sons and perhaps uncles and cousins, might well form the basis for political groupings, particularly in tribal and rural areas, and

economic endeavors. However, kinship groups in Iran exhibit a network character of changing alliances rather than a corporate nature. People could also utilize connections through women and partnerships with unrelated persons to form interest groups. During kinship, neighborhood, religious, and political gatherings, wedding celebrations and mourning ceremonies, and religious rituals, men and women gathered in separate buildings, rooms, or spaces. During ad hoc political meetings and economic consultations of men, women might find opportunities to listen discreetly while serving tea and other refreshments. Urban middle-class men often joined one or more *dorehs* or circles, meeting regularly with a fixed membership, although more recently often both husbands and wives attend such gatherings. Segregation along gender lines continues to organize social life. Since the formation of the Islamic Republic, government officials have required the segregation of unrelated women and men.

Gender Roles in Economics

In nomadic tribal groups, men herded the animals. Women milked animals and processed animal products, such as dairy products and wool, making cheese, yogurt, dried yogurt, and various woven products such as tents, saddlebags, rugs, and other textiles. Now, nomadic migrations are virtually a thing of the past. Families do not follow migrating herds, and men handle any animal movement with vehicles.

In agriculture, men generally prepared land, planted, and harvested, although in some areas, such as in rice- and tea-raising areas along the Caspian Sea, and harvesting nuts, women work in the fields. Otherwise, village women cared for children and home, processed and prepared food, and cared for and milked any animals. Generally men worked as traders or in shops. A few rural women, usually widows, did some buying and selling, minor moneylending, and perhaps sewing to earn a little money. Commonly, middle-class homes employed poorer girls and women as maids, often bringing them from villages. Girls and women knotted Persian carpets, although men usually arranged the marketing and managed carpet workshops. Other than knotted, woven, and knitted wool products, men monopolized arts and crafts such as metal and woodwork, silver work and jewelry, tiles, hand-printed cloth, tailoring, and handmade shoes. Now, villagers are less self-sufficent.

Rural people have migrated to urban areas, and those men who maintain their homes in villages frequently commute to work. Village women have fewer animal-tending and food-processing responsibilities. Factory-produced goods have replaced handicrafts. Men dominated the arts as well, writing the poetry so central to Iranian culture, painting Persian miniatures, and working as professional musicians. Since the 1960s, when women gained educational opportunities, they have begun to publish, paint, create, and perform, although less than men. The much-loved female poet, Forugh Farrokhzad, began publishing her poems in the 1950s. The first female novelist, Simin Daneshvar, wife of the outstanding author, Jalal Al-e Ahmad, published her book *Savushshun*, or *The Mourners of Siyavush*, in 1969 (Milani, 1992). Women have become teachers, work in government offices, and serve in medical capacities. Now women work in virtually every type of field and position, although as a minority in non-nurturing areas. Men generally hold the more powerful positions.

Parental and Other Caretaker Roles

According to Islamic dictates, husbands and fathers must maintain their families, providing home, food, and other needs. Fathers procreate and their wives and children respect and obey them. Mothers do the day-to-day care for children, and develop more intimate and informal relationship with their offspring (Fathi, 1985). Generally, mothers call upon fathers' authority for disciplinary purposes. Mothers spend far more time in the company of their children and are usually more openly affectionate with them. When women had little power in a family because of their lack of control over economic resources and cultural expectations, women might cultivate the affection and goodwill of children, particularly sons, to develop some leverage. Fathers may be attached to their daughters but have formal, distant, and uncomfortable relationships with sons. In recent years, as children become educated, gain employment away from the control of fathers and relatives, and wish for more independence, conflicts may develop between fathers and children over whether or not children should accept their fathers' control. Many urban middle- and upper-class young people are finding ways to evade parental control and sometimes associate with other young people.

LEADERSHIP IN PUBLIC ARENAS

Males have generally held leadership positions in Iran, as shahs, provincial and tribal heads, parliamentary and government officials, kinship and extended family heads, and religious figures. Although women work behind the scenes and attempt to influence male relatives, males led the Constitutional Revolution of 1905 and 1906, the nationalization of oil in 1951 and subsequent conflict between Prime Minister Mosaddeq and the Shah who was backed by the United States and the Central Intelligence Agency (C.I.A.), and the Iranian Revolution of 1978–79. In all of these efforts, women played significant roles (Sanasarian, 1982; Paidar, 1995). For example, women formed some half of the people in street demonstrations and marches, the most crucial revolutionary activity, during the 1978–79 Iranian Revolution (Nashat, 1983). However, the roles played by women have usually been supportive rather than pivotal. Even the leftist movements used women as supporters and silenced feminist interests (Moghissi, 1994). During the Reza Shah Pahlavi period, a woman, Farokhroo Parsa, served as Minister of Education. (She was executed in 1979 by the Islamic Republic of Iran.) Since the formation of the Islamic Republic of Iran, women have served as members of parliament, and held several less significant executive positions. Maryam Rajavi, female leader of the Mojahedin anti-regime group is the exception to the general absence of women in leadership positions, but she took the position after the death of her husband, the former head. Women and youth generally voted for the more moderate cleric, President Khatemi, in the 1997 presidential election.

GENDER AND RELIGION

Since the time of the Prophet Mohammad and his 12 successors, male imams have assumed the leadership roles in Shi'a Islam. However, when Imam Husein, grandson of the Prophet, and other males were martyred at Karbala, his sister Zaynab led the womenfolk of the group as they were taken captive to Damascus. Her mourning and speaking kept the memory of Imam Husein and his martyrdom alive as the central Shi'a myth. The highest religious leaders, the ayatollahs, take charge of guiding Shi'a Muslim believers. Very few women have qualified to be ayatollahs, and men are the clerics and preachers or *mullahs*. However, women may lead women's home rituals of Qur'an study, mourning commemorations for the Karbala martyrs, or gatherings featuring food provided in honor of the martyrs or saints. Women make pilgrimages to local shrines and make contracts with the saints in the interests of family members. Older women, especially, may make government-run religious pilgrimages even to Damascus, although men still predominate in making the *haj*, the pilgrimage to Mecca required of Muslims who can afford it. Since the institution of the Islamic Republic in 1979, women have increasingly entered into public religious activities. Now they teach and study religion and some even attend seminaries, formerly a male prerogative. Women sometimes speak in mosques and mixed gatherings and lead neighborhood women's gatherings to discuss the Qur'an and religious issues (Kamalkhani, 1997). Despite these advances, males control the Islamic Republic, its executive positions, and policy formation. Men sit on the Council of Experts who rule on who may become candidates in elections and on other proposed political moves. But many women are now studying religious sources themselves and questioning male interpretations of Islam.

LEISURE, RECREATION, AND THE ARTS

Men have generally enjoyed more leisure time than females, as women are responsible for endless household tasks, childcare, and hospitality. Several decades ago, very few women had opportunities for leisure and recreation outside of socializing with family, relatives, and neighbors. Women interacted with other women at family and life-cycle gatherings or as individuals. Sometimes women sang and danced together, especially at wedding celebrations. Some women might excel at singing or drumming to entertain family and friends. Men often sought out the company of other males, sitting and chatting in sunny spots or teahouses, and perhaps hiking and picnicking outside of settlements. Since the 1960s, some females participated in performances and sports, and might even attend scout camps. With modernization during Mohammad Reza Shah's rule, some females began to attend movies, travel with families to hotels along the Caspian Sea or other tourist areas, travel abroad for education and enjoyment, and participate in the arts and a wider selection of sports. Now, Islamic Republic officials require strict sex segregation during sports and outings, except for family members. Males are not allowed to watch female sports, nor do females attend male sports competitions. However,

women have forced their way into the stadium during an international male soccer match. Women have struggled for equal access to sports facilities, and have obtained women's hours at government-run gymnasiums. Many Iranian women have become sports enthusiasts. Women are coaching, teaching, and serving as referees in women's sports. Women hike, ski, and ride bikes, although in smaller numbers than men.

In general, girls and women tend to spend more time in domestic settings, whereas boys and men are freer to move out of the house for company and entertainment. Even in old age, women busy themselves with household tasks, while old men are at leisure. Outside activities, other than family outings, must be sex segregated. However, urban middle- and upper-class people may host integrated parties behind closed doors. People read novels, magazines, and newspapers, listen to tapes and CDs, watch television and smuggled film videos, log on the internet, and talk on the phone within Iran and to friends and relatives living abroad.

RELATIVE STATUS OF MEN AND WOMEN

Compared with Iranian women, Iranian men have enjoyed much higher status and access to authority, rights, and privileges. Men took public leadership and decision-making positions and control of group and family, and females were supposed to be out of sight and uninvolved. Even when girls and women worked or produced carpets, their male relatives generally controlled their earnings. Usually men owned and controlled land, animals, and businesses. According to Islamic law, women should inherit half the share of male children. However, most often women turned their shares over to brothers, wishing to avoid censure and hoping for their brothers' support. Widows also did not gain access to much inheritance, and usually had to rely on assistance from grown children.

From an early age, girls were taught to control their dress, postures, and interaction with males by the implicit threat of shaming self and family, or worse. Men controlled sexuality and could marry daughters off at age 9 or even younger, although consummation should not take place before the onset of menstruation. Fathers and other family males controlled marriage choices, although sons might inform parents about preferences. Ideally, Muslim law allows girls the chance to refuse chosen mates, but this did not happen often.

Men largely monopolized divorce decisions, but unhappy wives might obtain a divorce in exchange for dropping demands for their marriage settlements. Even if extremely unhappy, most women avoided divorce because it would humiliate them, they often had no alternative support, and they would lose their children. Supposedly, boys could remain with mothers until the age of 2 and girls until 7, although often husbands and their families did not follow these rules.

Fathers decided the level to which boys and girls could go to school, and, for those relatively few who went to university, their majors. From an early age, a boy could lord it over his sisters, younger brothers, and even mother. He was expected to treat his father with the utmost respect and deference, even into middle age. Respect and deference for women might increase somewhat over their life cycle. As competent housewives, loyal wives and mothers, and kinship connection managers, they might gain husbands' trust and children's and other relatives' respect (Friedl, 1989). After modernization in the 1960s, more women gained an education and employment in the public sector, but this did not always translate into more power and authority with husbands.

Since formation of the Islamic Republic of Iran, government policy has attempted to control women's dress, activities, and mobility, insisting that proper Muslim women must be modest and avoid attracting the attention of unrelated men. Islamic Republic leaders overturned laws that had improved women's position and influence in marriage, family, and employment. Women have struggled to work for women's rights and have been able to achieve minor changes. With so many women gaining education and employment, extended family dynamics have changed. Now daughters-in-law are not willing to live with their husbands' families or tolerate much interference from them. Educated sons and daughters do not depend on families for access to economic resources. The ability of parents to run their children's lives has declined.

SEXUALITY

Muslims view sexuality as healthy and good, a necessary part of the human experience, and the means to produce offspring and maintain family continuity. Muslims do not admire abstinence or consider it a way to serve God and attain greater spirituality. Initiation into sexual activity is

viewed as so integral to life, especially to males, that parents whose sons have died before marriage may construct replicas of bridal bowers as part of their mourning activities. People relate sexuality and marriage to having children. In-laws expected brides to become pregnant almost immediately, and if they did not, in-laws and husband might insult them and dissolve the marriage. Recently, however, couples often put off having children and limit their number. Fertility rates have dropped dramatically. Sexual contact pollutes, and people, especially women, must go through religious purification through washing (*qosl*) afterwards. Female sexuality is traditionally viewed as a threat to society. A woman's unfettered sexuality could ruin the honor of her family, relatives, community, religion, and nation (Najmabadi, 1998). To protect men from temptation and society from corruption, as well as to maintain the family's reputation, males needed to control female sexuality (Azari, 1983). Mothers strictly monitored girls' dress, mobility, and interaction with males. Brothers might assist in the overseeing of sisters. Fathers were anxious to marry girls off as soon as possible in order to avoid any potential gossip or scandal. People suspected widows and divorced women, for they had been sexually active but now had lost the male responsible for managing their sexuality. Females could not engage in premarital sex, or even be seen talking with a boy on the street. During the first few decades of the 20th century, people believed girls should not learn to write, as they might use this skill to communicate with boys. After marriage, women should be totally faithful to their husbands. Boys and men enjoyed greater sexual freedom. People generally did not condemn male premarital sexual activity. Males could seek out temporary wives, prostitutes, or loose women. Maids, often young girls from a village, faced the danger of sexual predation from sons of their employing families and even married men. Although parents and others might affectionately touch or refer to little boys' genitals, little girls must cover up. Parents required girls to refrain from notice of their own bodies, except to shame nakedness. Girls could not express sexuality in any way and were supposed to be ignorant about sexuality. Mothers generally did not make any attempts to provide sexual information before marriage. Expected to be a totally asexual creature and prevented from contact with marriageable males, even to the extent sometimes of not seeing husbands-to-be before the marriage night, young women found consummation of marriage on the wedding

night to be extremely traumatic. Often this abrupt and forced initiation to sexuality colored their attitudes toward sex and their husbands for some time. People expected married women to be sexually active with their husbands and to enjoy it. However, men dominated the sexual relationship, and women were not supposed to initiate sex openly or to express their wishes. Even married couples should not display affection to each other or otherwise acknowledge their sexual relationship in front of others. People assumed older people to be less sexually active. If a mother with almost adult or adult children became pregnant again, she would feel embarrassed about this evidence of ongoing sexual activity.

Parents and others reprimanded children who behaved like or engaged in activities characteristic of the opposite sex. People rigidly defined gender-appropriate behavior and activities and disapproved of transgression. But females might dress as males to play male parts and sing, for example, to female audiences at segregated wedding celebrations, or in school performances. Males took the part of female members of Imam Husein's band being marched into slavery at Damascus in commemoration of the Karbala martyrdoms. Otherwise, Iranian culture does not include traditions of cross-dressing, as far as I am aware.

Given sexual segregation and close companionship among same-sex individuals, sometimes male adolescents engaged in same-sex activity. In Iranian tradition, especially among the upper-middle and upper classes, some men valued male adolescent beauty and engaged in sexual activity with male youth. Although generally not publicly discussed, same-sex relations did not bring shame, except to the recipient if he was past youth. If young men did engage in same-sex relations, it was viewed as a stage in life that would end upon marriage. In general, very little research about sexuality has been conducted in Iran. This lack extends to homosexuality, particularly to female homosexual relations. Under the Islamic Republic, homosexuality is illegal and carries the death penalty. The problem of AIDS does not receive adequate attention.

In the last few decades, many aspects of sexual attitudes and activities have changed. During the Pahlavi modernization period through 1978, some young men and women attended coeducational universities and might find their own mates. Especially among urban middle- and upper-middle classes, young people might date. People still expected girls to remain virgins until

marriage, but restrictions on opposite-sex interaction declined, especially for upper-middle- and upper-class youth. With study abroad and the import of foreign ideas, some married couples became more open with each other about sexual expression and wishes, and some wives became more equal sexual partners. Virginity tests that produced a blood-stained white cloth after consummation of marriage became less common, but marriage license offices continued to offer virginity examinations as a free service.

After the formation of the Islamic Republic, lowering the legal marriage for girls, and enforcing modesty and seclusion for women, some of the relaxation of attitudes and practices about sexuality has reversed. Clerics have encouraged temporary marriage as a way to support war widows and prevent the corruption of youth, as they say has happened in the West. Many clerics and more conservative men take advantage of the Shi'a institution of temporary marriage to attain a full sex life. However, for a female, status as a temporary wife is demeaning and will ruin her chances of a good marriage. Poorer women, divorcees, or widows who lack other alternatives may engage in temporary marriage to secure financial support.

More recently, some young people are finding ways to go out together. Despite the clerical rule, sexual mores are easing for some Iranians. Because prostitution has increased, some clerics wish to establish government-run prostitution or "temporary marriage" centers.

COURTSHIP AND MARRIAGE

Several decades ago, when males finished education or apprenticeship, and entered into income-generating activities, their mothers and other female relatives looked for suitable mates, although fathers held formal control over offspring's marriages. After discrete inquiries of the other family as to the response, the groom's family's made a formal visit to the bride's family. Traditionally, the perspective bride came into the room to serve tea. The groom's family acceptance of offered refreshment would indicate their inclinations. Some families might make marriage arrangements and not tell the girl until the marriage date grew close. Generally fathers negotiated about the *mehr*, the financial arrangements for the marriage. Depending on class, the fathers and perhaps other male relatives would attempt to come to an agreement about the money and property which the groom and his family would give to the bride's father. If a large *mehr*

was demanded by brides' families, grooms often had to wait much longer than they wished for the marriage. Families gathered information about the health of the potential spouses and their family standing. Grooms' families wish for pretty, obedient, and modest brides, and brides' families want financially well-off grooms who can provide comfortable lives for their wives. In the past, families almost always arranged marriages. Although, according to Islamic law, girls are supposed to have the right to refuse, this was not always the case. Boys might have more say in the choice of marriage partner.

Marriage ceremonies consist of two main parts. The first is the signing of the marriage contract or *aqd* conducted by a Muslim cleric. If the bride was present, the cleric asked her if she consented to the marriage. An affirmative answer, generally in a low modest voice, or silence meant consent. Alternatively, the girl's guardian or representative came in her stead. The second part, the wedding celebration or *arusi*, might take place shortly after the *aqd* ceremony or some time later. Although families generally kept the *aqd* ceremony small, they wished to have a wedding celebration that was as extravagant as possible. Some decades ago, well-off families might even have had a 7-day celebration. Brides' and grooms' families held separate wedding parties, where males and females sat in separate rooms or separate buildings. People served tea, refreshments, and meals, laying out tablecloths on the floor and setting out dishes of rice and stews and other foods at intervals for people to help themselves. Families hired musicians so people could do circle dances in alley ways or courtyards. Males and females danced in separate lines, but young people could covertly watch each other celebrating. The bride was not supposed to be part of the celebrating crowd, but sat immobile, face downturned. Ideally, she should not eat or drink or move away from her position.

On the afternoon or evening of the *arusi*, the groom's family went to the bride's home, singing and making noise. They brought the bride, traditionally dressed in green, head covered with a pretty cloth, back to the groom's home. Particularly in tribal and rural settings, male relatives shot rifles into the air to celebrate the taking of the bride. The bride and groom might be seated together on chairs for a while in both the male and female sections. Finally, with singing and noise making, the crowd led the couple to the bridal bower or *hejleh*, decorated by the groom's young male relatives with colorful cloth hangings. The groom was then expected to consummate the marriage. He felt pressured to

demonstrate his virility, and the bride was expected to show her modesty and lack of sexual knowledge. The latter was usually not a problem, as girls did not receive any sex education. Indeed, girls' parents ideally would meticulously keep them from any contact whatsoever with unrelated males. A white cloth bloodied with evidence of virginity and penetration might be brought out afterwards to show to guests. In the morning, overnight guests congratulated the groom upon his exit from the bridal room. Ideally, the bride remained in the *hejleh*, and for several days female relatives visited her there. On the morning after the marriage, the bride's mother and other female relatives came to see her, and might bring special foods to strengthen her or even penicillin to guard against weakness or infection caused by sexual initiation. Some time after the marriage, the bride's male relatives traditionally came to escort her to her parents' home, where they would be served a meal by the groom's family. The bride stayed with her family for several days, and then the groom's family came to fetch her.

Parents saw finding suitable mates for children as a main duty in life. Very few people failed to marry, although the disabled faced challenges in finding a mate. The rare single female generally remained in her parents' home.

Husbands could divorce at will, just by declaring three times, "I divorce you, I divorce you, I divorce you." Further, a husband could take as many as four wives, without the permission of any of them, and he could take as many temporary wives (*sigheh* or *muta'a;* Haeri, 1989), as finances allowed, making an agreement for the length of time and the money to change hands. Divorced or widowed men generally remarried within a short period of time. Men did not like to marry divorced or widowed, and thus non-virgin, females. Females did not remarry as often, and remained dependents of fathers, brothers, or sons.

The last few decades have seen radical transformations in courtship and marriage. As the Pahlavi regime developed state education, females left the house. Although educational officials generally tried to schedule classes so that boys and girls were let out of school at different times, the greater mobility of girls sometimes allowed young people to catch sight of each other. Males and females attended university courses together. In particular, those upper-middle-class young people who attended university and then worked in government positions, businesses, or services might chose their own mates. The young people, especially the females, generally had to obtain parents' assent for such marriages.

Even since the formation of the Islamic Republic, when government clerics attempted to reinforce sexual segregation and patriarchy, they have not been able to recreate the social control over male–female interaction that used to be associated with arranged marriages. Depending on class, boys and girls might be able to talk on the telephone or see each other. Middle- and upper-class males and females are sometimes able to co-mingle at wedding celebrations and parties behind closed doors.

HUSBAND–WIFE RELATIONSHIP

Generally brides were one or even several decades younger than grooms. The sexual initiation on the marriage night often left brides shocked and traumatized. Subsequent sexual initiatives by their husbands were distressing. Unless the two were close relatives, they did not really know each other, and might well never have seen each other before marriage. The bridal couple, and married couples in general, did not show affection for each other in front of other people and in fact could hardly talk together in the company of others. Most contact took place during the night hours while others were sleeping. Given the fact that they barely knew each other and yet were abruptly thrown into physical intimacy, both partners, particularly the bride, felt awkward and uncomfortable. Many couples lived with the groom's family for at least a while after marriage. A bride spent much more time with her mother-in-law and other female family members and relatives of the groom than with the groom. Generally, after a few days, if not sooner, he returned to his work. A bride frequently felt alone among watchful strangers waiting to find fault with her. She had to learn to work with her mother-in-law. Conflicts often arose between bride and mother-in-law as they jockeyed over loyalty and support from the groom. Husbands wanted others to realize that they kept their wives under control and that their wives were obedient, hardworking, and competent. The husband's own reputation and that of his family rested on his ability to maintain authority over his wife and children; he needed to exact deference from them.

Producing children, especially sons, gaining household competence, and showing loyalty made her in-laws think better of a young wife. Sometimes affection and respect might develop between the couple. People viewed marriage not as an institution to give companionship and intimacy, but rather for the formation of a household and child-rearing team in order to continue the

family line. People favored marriage between cousins so that they could feel more knowledgeable about the potential spouse and family, and the bride more comfortable in her new home. The groom's family had to give a stipulated amount of the *mehr* upon marriage. In theory, the bride could demand the remaining part of the *mehr* whenever she wished. If the groom decided to divorce his wife, he was supposed to give her the remaining part of the marriage settlement. However, brides often did not receive the *mehr* upon divorce (Mir-Hosseini, 2000). A husband who wished to divorce a wife might make her life so miserable that she finally consented to divorce without receiving the *mehr*. A wife found it humiliating when her husband married a second wife, forcing her to share her husband and his resources with a second younger wife and their children. Wives were afraid of divorce because of the shame and because the *mehr*, even when they obtained it, did not support them for long. An unfavorable marriage was sometimes the only defense against poverty. Upon divorce, the father retained custody of the children; often women stayed in unhappy marriages partly because they did not wish to leave their children. When wives divorced, they frequently cited difficulties with mothers-in-law as a main reason. Husbands or in-laws frequently abused wives physically or emotionally. The Qur'an allows husbands to chastise disobedient wives physically. However, somewhat reminiscent of the English "rule of thumb," the physical chastisement of wives should not be so severe that it leaves a mark on their bodies.

When marriages survived into middle age, they sometimes became partnerships of two people concerned about their children and family interests. As men aged, they often became more dependent on their younger and more socially engaged wives. Therefore women might gain de facto power in the marriage. Even if the husbands had been domineering and self-centered, wives typically nursed their husbands in sickness and old age.

The thought of their husband taking another wife or a *sigheh* (temporary wife) frightened women dreadfully. Women might threaten or even attempt suicide. After Mohammad Reza Shah Pahlavi's Family Protection Act, men were required to obtain their first wife's permission to marry a second wife, although not to take a *sigheh*. Men might find ways of evading this requirement. Especially with *sighehs*, wives might not be aware of the other woman. Generally, cowives felt angry and suspicious of each other, resenting attention and

resources which the man gave to the other wife and her children. Wealthier men might provide different houses for each wife and her children and so keep more of a distance between them. If they lived in the same home, each wife usually had her own room.

The average age of first marriage for females has increased to 27, and the age disparity between bride and groom has decreased. Because young couples are now much more likely to live on their own, the nuclear family has become a more significant unit. For many Iranian wives, these changes translate into a more equal relationship with husbands. However, in other cases, couples left to their own devices feel their dissatisfaction more. Divorce rates have risen.

OTHER CROSS-SEX RELATIONSHIPS

Iranian males often have close relationships with their mothers, who usually had invested time and energy in building their sons' love and attachment. Given the importance of family and relatives and separation between unrelated boys and girls, brothers and sisters frequently became close companions. Parents generally expected their sons to protect their sisters and defend them and thus the family against any potential loss of reputation. Therefore, brothers often oversaw sisters' behavior, dress, and contact with others, and might treat sisters harshly if they suspected any wrongdoing. Usually girls and women felt the need to obey and please brothers because of their dependence on them for assistance. Although daughters should receive half the inheritance of sons, most often sisters handed property over to their brothers, fearing conflict and loss of family reputation if they demanded their rights. Lacking other alternatives, they also hoped for a possible refuge in the case of marital difficulty. Male and female cousins often became friends. They might even live in the same home or complex. As cousins can marry and cousin marriage is favored, parents generally restricted their interaction when they approached puberty.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The last few decades have seen drastic changes in gender in Iran, as previous sections have indicated. Mohammad

Reza Shah Pahlavi wanted to educate women and bring them into the public sphere as a significant symbol of Iranian modernization and westernization. His father even outlawed women's veils and scarfs for a time, forcing most women to stay at home rather than expose themselves. Until the Iranian Revolution of February 11, 1979, Iranian women, especially of the middle and upper classes, were gaining literacy, education, and jobs in the modern public sector, and even traveling abroad for education. Many women, especially in middle- and upper-class urban areas, wore chic Western fashions rather than veils or even scarves. Courtship, marriage, nuclear family organization, level of control of parents, status and power of women, gender and family laws, and women's public roles were all being transformed. Then, with the formation of the Islamic Republic of Iran, conservative clerics attempted to reverse the changes in gender and sexuality, reestablishing sex segregation, females' family roles, and male control over females, sexuality, family, and public space. Females caught wearing lipstick or nail polish or showing a strand of hair or glimpse of skin under their veils or *rupushes* (raincoat-like covering) faced imprisonment and harassment. Family laws did away with the rights women had gained during the Shah's regime. The legal age of marriage for females went down from 16 to 9 again. Recently, more females have been attaining an education, and the majority of university students are now female (Afkhami & Friedl, 1994). Women have found many ways of resisting the new stricter restrictions and to press for changes beneficial to women. With increased access to literacy and Islamic scholarship, some women are questioning male misogynist interpretations of Islamic sources. The legal age of marriage for females has risen to 15, and men are now supposed to pay a *mehr* adjusted for inflation when divorcing a wife.

Women and sympathetic males face great obstacles in trying to modify gender constructions. Clerics point to Iranian females' dress, modesty, and devotion to family and religion as the main markers differentiating Islamic Iranian society from what they view as the corrupt and morally bankrupt West, where women go "naked," sexuality is unfettered, and the family has dissolved. Gender and sexuality lie at the center of reformers' and conservatives' struggle to influence the present and future of Iran (Mir-Hosseini, 1999).

Israelis

Marilyn P. Safir and Amir Rosenmann

ALTERNATIVE NAMES

Israelis are also known as Yisra'elim.

LOCATION

Israel is situated in the Middle East. It is a crossroad between Asia, Africa, and Europe. The Mediterranean forms Israel's western border. It shares its northern border with Lebanon. To the east, it borders with Syria and Jordan, a border that ends at the Red Sea where both Israel and Jordan have outlets. Israel shares a border with Egypt in the south.

CULTURAL OVERVIEW

In 1947 the United Nations passed a resolution to divide Palestine into two separate national entities: a Jewish Israel, and an Arab Palestine. Following this resolution, Israel declared its independence (1948), declaring itself as the homeland of the Jewish people. A war between Israel and the neighboring Arab countries resulted from their rejection of these developments. Although peace treaties were signed with Egypt and Jordan in the 1980s and 1990s, hostilities between Israel and the surrounding Arab states, as well as with Palestinians living in territories Israel occupied following the 1967 war, have been continuous. These hostilities have insured that the Israeli army maintains a pivotal role in Israeli society. Hence, all 18-year-old Jewish men and women are required, de jure, to complete mandatory military service.

The first wave of Jewish settlers fled Eastern Europe to Palestine to escape anti-Semitism by establishing a Jewish homeland in *Zion* (and hence—*Zionism*) in the latter part of the 19th century. The second wave of settlers, who were largely responsible for the egalitarian image of Israeli society, sought personal redemption through a commitment to both Zionist and Socialist values. They believed that physical labor, reclamation of the land, and the establishment of communal settlements in a Jewish homeland would produce a society with social equality. This utopian vision regarding a common good meant sacrificing the rights of individuals and nonhegemonic groups (Swirski & Safir, 1993). This Zionist–Socialist way of life came to fruition with the advent of the "kibbutz", a communal settlement in which inhabitants theoretically share all responsibilities and prerogatives. With the gradual move towards a more capitalistic economy following the Six-Day War and the strengthening of politics and cultural ties with the United States, Socialist Zionism lost its hegemonic status, and other, hitherto disenfranchised, groups started asserting their agendas.

Israel is a land of immigration. Following World War II, Israel's population more than tripled by an influx of Jewish refugees. The trauma of the Holocaust in Europe and the expulsion of Jews from Islamic countries could not but leave a distinctive mark on the new society. The latest major wave of Jewish immigrants has been from the former Soviet Union, primarily in the 1990s. During this period, there was a 25% increase in the Jewish Israeli population.

In addition to these waves of diverse Jewish immigrants, a fifth of contemporary Israel's citizens are Arabs. Within this national minority population, there are distinct religious/cultural groups, the majority of whom (16%) are Muslim, with about 70% living in small villages, Christians (1.9%), who live primarily in cities, Druze (0.9%), members of a secretive religion living in relatively closed communities, and other even smaller groups. These minorities have been increasingly torn between their identification with the Palestinian people and their identification as citizens of Israel (Suleiman & Beit-Hallahmi, 1997).

Following the creation of the State of Israel, Jewish religious law was integrated into state law. As a result, rabbinical courts were granted jurisdiction over personal status. For Muslims, Christians, and Druze too, matters of personal status were left to the jurisdiction of the respective religious courts. While religious law is incorporated into Israeli state law, most Israelis do not define

themselves as religious (Levi, Levinsohn, & Katz, 2000). These are but a few of the factors that combine to make contemporary Israel a bizarre amalgam of a socialist welfare state with egalitarian ideology, a capitalist economy, and strong religious/traditional influences and institutions.

CULTURAL CONSTRUCTION OF GENDER

Israel is perceived by Westerners, as well as most Israelis, as being a part of the contemporary Western world, thus sharing its binary view of gender. Despite this Western orientation, even secular Jewish society is relatively traditional, resulting in a more conservative definition of gender then found elsewhere in the West. In a comparative study of American and Israeli subjects, researchers found Israeli participants to be significantly more conservative, maintaining stronger stereotypes about homosexuality, femininity, and masculinity, and a greater gender role gap (Leiblich & Friedman, 1985). This conservative gender value system is rooted in Jewish traditions and religious beliefs that impact every facet of life in Israel, and is compounded by the centrality of the army in Israeli life (Azmon & Izraeli, 1993).

Israeli society puts greater emphasis on the centrality of the family, family values, and the mothering role of women in comparison with most other Western societies (Azmon & Izraeli, 1993; Safir, 1993a). This can easily be deduced from the average number of children per Jewish mother, which was 2.66 in 2000 (Israel Central Bureau of Statistics, 2001), compared with only 1.87 for the average American woman in the same year (U.S. Census Bureau, 2001). Current social values encourage women to structure their identity within the context of the family so that they willingly put their careers in second place (Leiblich, 1993). Today women comprise over 54% of the labor force, but women's paid work is considered secondary to their husband's work (Fogel-Bijawi, 1999). The prototypical Israeli family generally operates well within the framework of traditional gender roles that are supported by social and state institutions. Whilst husbands may share some of the burden of housework and childcare, these areas are clearly regarded as women's responsibility by both women and men (Safir, 1993a).

The centrality of the traditional family is also evident linguistically. The Hebrew word for "family" (*mishpacha*) is usually applied only to the prototypical

family of mother, father, and children (excluding couples with no children, single-parent households, and same-sex partnerships). Another example is the Hebrew word for "orphan" (*yatom*), which is applied even to a person who lost only one parent. The death of a parent entails a break in the prototypical family, and appears more socially significant in Israel then elsewhere.

Given this preoccupation with traditional family structure, infertility is considered a major tragedy. Every Israeli woman, without regard to an upper age limit, religion, or marital status, is eligible to request unlimited attempts at in vitro fertilization. Complete payments for these treatments are covered by her health insurance, until she has two children. The number of infertility clinics in Israel, per capita, is the highest in the world, with 24 units available to 5.5 million Israelis in the mid-1990s (Kahn, 2000). On the other hand, birth control is not covered by health insurance. Israel also grants special "birth allowances"; large families receive massive monetary incentives from the state (Safir, 1993a).

The Jewish religion, and its traditions detailed in a later section, is one of the major influences that result in great emphasis on family values. Orthodox Jewish patriarchal representatives hold immense political power (Gerabi, 1996), as well as directly influencing Israeli society and values (Safir, 1986).

An additional patriarchal epicenter in Israeli society is the army. As Israel has been in an almost continuous state of war since its establishment, the Israeli Defense Force (I.D.F.) is a primary influence on Israeli society as a whole (Gerabi, 1996). The army also overvalues narrowly defined masculine gender roles. Research describes this militaristic manhood as an antithesis to the stereotypical Jew from the European diaspora, who was viewed as feminine, weak, subservient, and helpless. Many of the early leaders of the Zionist movement strived to "restore manhood" to Jewish men by restructuring it to follow idealized images of European men, healthy in mind and body and willing to fight and die for the nation (Gluzman, 1997). This new "Israeli" manhood, replacing the old "Jewish" manhood, was embodied in two related images—the pioneer, enduring great hardships to reinstate the national home, and the warrior, defending the nation and commanding respect. In contemporary Israel, these ideals of self-reliance, national pride, and self-sacrifice are personified in the combat soldier, whose image constitutes this hegemonic standard of manhood (Lomski-Feder & Rapoport, 2000).

However, in recent years, there have been more opportunities for women to enter previously exclusive masculine roles in the army (Dimitrovsky, Singer, & Yinon, 1989), a trend that has now sparked off a political struggle between liberal and religious parties in Israel. Religious men have refused to serve in units in which women soldiers serve. Regardless of this public debate, ethnographic research demonstrates that greater integration of women in the armed forces is contingent on their assimilation into an all-masculine value system, while devaluating feminine gender roles to the point of subjectively breaking away from female identity (Sasson-Levi, 1997).

In this prototypical masculine world, women are viewed as contributing their part as long as they assist and support the (male) soldier (Bloom, 1993). In this militaristic sphere, women are given voice through their relationships with men who shoulder the strain of battle, via their positions as mothers and wives of warriors (Gillath, 1993). Thus women's protests had been viewed as illegitimate nor had women been perceived as entitled to any form of direct power or influence (Helman & Rapoport, 1997).

Zionist ethos also sustains the myth that in the early days of Israel's statehood, and in pre-state Israel, women and men were truly equal—an equality that meant sharing "male" activities. They are portrayed as pioneers: building settlements, paving roads, farming, and serving in the army (Swirski & Safir, 1993). However, women's integration in these activities was only partial; often they were rejected because they were women. Moreover, the majority of unmarried women worked as maids in the houses of the more affluent Jewish families during this pre-state period (Bernstein, 1987). The overall picture emerging here is characterized by strong pressure toward gender conformity, interlaced with a greater value placed on masculine gender roles (Singer, 1997).

Traditional values are even more central within the Arab minorities. A majority of the Arab population live in traditional cultural and social settings, a setting in which Western ideas about gender equality are frequently irrelevant (Lobel, Mashraki-Pedhatzur, Mantzur, & Libby, 2000). This is especially true for 70% of the Muslim population, who live largely in rural areas and have relatively little interaction with the Jewish majority (Al-Haj, 1995).

The Arab minorities are torn between two cultural vectors. On the one hand, they are linked, with varying degrees of intensity (Abu-Baker, 1985), to Jewish Israeli society, with its "modern" and "Western" aspirations. On the other hand, they are allied with the traditional Arab world, which often opposes and resists the values of the contemporary West (Al-Haj, 1995). According to Al-Haj, Arab society is a developing society coping with changes associated with modernization and at the same time the constraints stemming from being a nonassimilating national minority in a Jewish state.

One result of these contradictory forces can be seen in the cleft between the conspicuous process of individual modernization within the Arab communities, and the persistence of conservative social values and reverential adherence to age-old traditions. While individual modernization is reflected in different fields (the rise of level of education, improvements in standard of living, wide exposure to mass media, and the development of a nationwide leadership), many traditional values persist on the community level (Al-Haj, 1995). The patriarchal/traditional nature of this society is intensified by the subjection of this minority to national, political, social, and cultural oppression (Hassan, 1993).

In this cultural tug-of-war, gender issues are often viewed as an important bastion of authentic Arab tradition, a cornerstone of Arab culture (Soliman, 1985). Those who oppose the pull of Israeli Western-like values may be adamant in their rejection of any liberal or feminist notions. This complete rejection of Western gender-related values can be seen in its most extreme form in the murder of women in the name of "family honor". Although infrequent, such cases surface from time to time in Muslim Arab communities in Israel (Hassan, 1993, 1999). These killings are anathema to liberal values of women's (or indeed human) rights, but are still seen by some as an appropriate reaction to rumors, gossip, and knowledge of sexual misconduct that become part of the public sphere (Glazer & Abu Ras, 1994).

Tradition is also important in governing other less extreme behaviors regarding gender. Many Arab women are expected to devote their lives completely to their roles as homemakers in their extended family or clan (*Hamula*) (El-Mehairy, 1985; Lobel et al., 2000). In this cultural system, strict adherence to such social roles is usually expected of all individuals. In fact, poorer and less educated Arab women may perceive mothering as the only future role open for them (Shtarkshall, 1987).

In sum, Israeli Arab society is highly patriarchal and traditional (Hassan, 1999). Women are largely devalued by this social system, as is evident elsewhere in the Arab world (Crawford & Unger, 2000; El-Saadawi, 1980).

This is most true for the majority of Arab women, living in villages and Arab cities, who rarely have the opportunity to assert themselves in a more liberal context. Women who attain higher education, or live in mixed cities (where there is abundant contact with less traditional Jewish values), seem to be less willing to accept traditional roles ascribed for them by their patriarchal culture (Abu-Baker, 1985; Seginer, Karayanni, & Mar'i, 1990).

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

Israeli society, with its strong connections with Jewish patriarchal traditions, bestows higher status on boys from infancy. The Brit-Mila, or circumcision ceremony, held when the infant is 8 days old, becomes a celebration of the birth of a baby boy. This status is reconfirmed at age 13 when the vast majority of boys participate in a Bar Mitzva (coming of age) ceremony (described in more detail below).

School attendance in Israel is compulsory for both sexes from the ages of 6 to 16 and public school education is free. However, higher cultural regard for boys is evident in teachers' unconscious, but pronounced, preference for boys over girls (Ben Tsvi-Meyer, Hertz-Lazarovitz, & Safir, 1989). This preference impacts on the pupils' evaluation of boys and girls in the earliest years of grade school, so that girls also view boys as more outstanding when evaluating classmates (Safir, Ben Tzvi-Meyer, Hertz-Lazarovitz, & Kuppermintz, 1992). These authors have suggested that the unusual findings indicating boys' superiority on tests of *both* verbal and performance abilities (Safir, 1986), as opposed to girls' superiority in grade-point average throughout all levels of schooling, may be attributed to girls' insecurity in taking ability tests, resulting from this continuous cultural preference of boys.

In contrast to these unusual differences between Israeli boys and girls, the social experiences of children of both genders are generally similar. Unlike other Western countries, Jewish children of both sexes are encouraged, from a very early age, to play in outdoor settings. This early gregarious behavior, in combination with the mild to hot Israeli climate, makes playing outdoors a preferred activity for many girls, as well as boys. Such outdoor games are usually physical and lively, quite the opposite of what is expected of "girls" elsewhere in the West (Safir, Rosenmann, & Kloner, 2003).

Social interaction between the sexes also begins at an earlier age then in other Western countries, because of socialist norms, encouraging women to work outside of their homes (Lavee & Katz, 2003). As a result, day-care facilities are provided throughout Israel for children from age 6 months. For example, in 1988, 67% of 2-year-olds, 92% of 3-year-olds, and 99% of 4-year-olds were in some preschool setting (Izraeli & Safir, 1993).

Additional factors that mitigate behavioral differences between Israeli girls and boys are the "Israeli ethos" and the hegemonic Israeli narrative, which emphasized the importance of enduring hardship for the sake of the common national good. In addition, hiking throughout the country to experience it "hands on" is socially approved, often occurring under the auspices of one of Israel's many scout youth movements, where boys and girls take part in the same activities and are taught the same national values.

These activities, in which young Israeli girls participate, could easily be classified as "tomboyish" in the United States, but are simply the norm in Israel (Safir et al., 2003). Unfortunately, it appears that the ever-increasing cultural impact of American values on Israeli society is changing these gender-blind behavioral patterns. A recent study provides alarming evidence of one such possible negative cultural impact on Israeli children. This study reported an increasing spread of dissatisfaction with body image, as early as elementary school, in both girls and boys (Flaisher-Kellner, 2002).

Puberty and Adolescence

While most Jewish Israelis do not self-identify as religious, the majority participate in some religious ceremonies and traditions (Levi et al., 2000). The most notable example of such ceremony is the *Bar-Mitzva*, which is a religious rite signifying the transition from boyhood to manhood. Following his Bar-Mitzva, a boy is considered an adult man for all religious purposes. It is customary to hold a Bar-Mitzva celebration, to which hundreds of guests are invited for a six-course meal served in special reception halls. In especially lavish celebrations, one often hears the comment "the only thing missing was the bride." While the Bar-Mitzva is a grand milestone on the road from boyhood to manhood, girls' transition usually goes publicly unnoticed (Izraeli & Safir, 1993).

Another factor that maintains the spotlight on boys is the centrality of army in Israeli life, and in its definition of manhood. For teenaged boys, the army has a pivotal role in their transition into manhood and inauguration into the Israeli collective (Lomski-Feder & Rapoport, 2000). In light of looming military service, research has revealed that Jewish Israeli adolescent boys, unlike their Arab Israeli and American counterparts, see their future as inextricably intertwined with the future of their respective national collective (Magen, 1983).

In the Arab community, most teenagers do not serve in the army (Druze and Bedouin are exceptions). However, Arab culture is highly collectivistic because of the intense nature of family ties within this society (Lobel et al., 2000). This produces even greater demands for gender role conformity (Lavee & Katz, 2003). In fact, gender conformity is sufficiently strong in Arab adolescents to bias dramatically their judgment of a highly qualified, albeit feminine, male candidate. Research participants judged this candidate less favorably than an inferior masculine candidate. Judgment bias, based on normative gender roles, was much more pronounced in Arab participants than in Jewish participants (Lobel et al., 2000).

For teenaged Arab girls, this highly gendered culture demands their strict adherence to roles of sexual purity, which becomes central with the start of menstruation. Social supervision of these girls is meticulous, and their behavior is constantly scrutinized (Hassan, 1993).

Attainment of Adulthood

As was previously mentioned, mandatory army service has a pivotal role in defining the Israeli adult, and in particular the Israeli man. Army service, usually commencing immediately following completion of high school, replaces the American experience of "going off to college." For most Israeli boys, army service is the first time they have to fend for themselves away from their families and homes. Girls are usually stationed near to, and continue to reside in, their family homes.

In a more substantial sense, once in the army, young men are expected to make life-and-death decisions. While men are assigned to combat units, women have recently been "awarded" the privilege of volunteering for combat units. A minimal number of women currently serve in these units. This type of service places a great deal of responsibility on the shoulders of the young individual, and is a distinct break from the years of

schooling. Because boys and girls are drafted into the army at age 18, they are considered to be full-fledged adults at this age and are eligible to vote, purchase tobacco, and drink alcohol.

The army is an institution that overvalues masculine traits, and is especially relevant to the construction of the hegemonic Israeli man (Lomski-Feder & Rapoport, 2000). Men who serve in combat positions are viewed as the epiphany of masculinity, maturity, and character. These attributes supposedly make them romantically and sexually appealing to women, and indeed, a few years ago *Shakel* was a slang term widely used to denote a man's man, especially in a sexually context. (This slang term is an abbreviation of "fighting combative bull" in Hebrew.)

On the other hand, men who do not serve in the army are often ostracized by mainstream Israeli society, and are reinstituted as the "other" (Lomski-Feder & Rapoport, 2000). Numerous job offers require completion of army service, thus signaling clearly the line between the normative and the "other": the Arab, the dropout, the inadequate, the outsider.

Middle Age and Old Age

Israeli society's emphasis on familial ties affects the way that elderly people are viewed and treated. The majority of older adults live in close proximity to their offspring, and remain involved in their children's life as long as their health permits. Older parents are frequently consulted by their adult children. They also often take a role of secondary caretakers to their grandchildren, thus easing the load from the parents (Lavee & Katz, 2003). As parents become elderly, they often move in with their children's families. As a result, more then 95% of the elderly who are in good physical shape, and 76% of the disabled, live with their children (Brodsky, 1998; cited in Lavee & Katz, 2003). This appears to be especially true in the more traditional sectors of both Arab and Jewish society.

PERSONALITY DIFFERENCES BY GENDER

In its construction of gender, each society assigns different attributes for each gender, clarifying the role each should adopt. Several studies indicate that Israeli construction of gender-related personality attributes is

different to that found elsewhere in the West (Lobel, Rothman, Abramovizt & Maayan, 1999; Safir et al., 2003; Safir, Peres, Lichtenstien, Hoch, & Shepher, 1982). These studies utilizing gender trait inventories find that the range/number of gender relevant traits is more limited in Israel. It appears to us that, while the range of behavioral traits perceived as overlapping for both genders is greater in Israel than elsewhere, gender-specific behavior is very narrowly defined. Thus, while many traits and behaviors are typical for both women and men, each gender is expected to conform to a very narrow range of stereotyped behavior patterns (Safir et al., 1982). In these studies, the list of masculine and feminine items was similar to those found in the United States, but halved in number. As the range is more limited, deviation is more easily discernible, enabling greater social pressure to conform. This is evident in gender role identity as well: For instance, many more Israeli women, in comparison with American women, self-identified as feminine and fewer self-identified as androgynous (Safir et al., 2003).

Gender Roles in Economics

In 2000, 77.5% of Jewish women and 29.7% of Arab women were in the civilian Israeli labor force (Adva Center, 2002). In contrast, 85% of Jewish men and 79.5% of Arab men participate in the work force. Even with high level of participation by Jewish women, their salaries are 62% of men's wages. However, since women work 35 hours a week, on average, and men 42 hours a week, an hourly comparison reduced the gap to 82% (Adva Center, 2002). This occurs despite the fact that, as early as 1965, laws were passed, for equal pay for equal work (Raday, 1993b).

Efroni (1988), in the most extensive survey of salary differences between male and female civil servants, reported that women earned 78% of what men with similar qualifications earned. She reported that if women were paid on the basis of their qualifications, they should have been paid 102% of men's salaries. Efroni's report was widely read and sparked a public outcry. As a result committees were created throughout all governmental agencies to improve the status of women. Efroni (personal communication, November 14, 2002) informed us that a recent internal examination by the Treasury found that the relative differences in men and women's salaries in civil service (20–30%) remain unchanged today.

In addition to gender differences in earnings, women and men also tend to work in different sectors, with more than half of Jewish women employed as clerical and service workers (Adva Center, 2002), as opposed to only 24.6% of Jewish men. About 35% of both genders are employed in professional, academic, and managerial sectors, but, as elsewhere, men tend to occupy the top positions (Efroni, 1988).

The socialist ideology of the kibbutz viewed the traditional patriarchal family as the cornerstone of capitalist oppression. As a result, men and women were accepted as equal members, and tasks which were typically performed by women in the traditional family became communal responsibility. However, the implicit belief that women are "naturally" better suited to nurturing tasks meant that women were assigned to childcare and teaching, which became long-term jobs. The less fortunate women were rotated through nonprofessional work duties such as laundry, kitchen, and light agriculture work. Although this resulted in a status hierarchy, each person received the same stipend (Safir, 1993b).

Parental and Other Caretaker Roles

As in other Mediterranean countries, lunchtime is the major meal of the day, with businesses closing between 2 p.m. and 4 p.m. Although this practice of closing businesses disappeared in the 1960s, dinner remains a light meal. The short school day reinforces the status of lunch as the main meal, seriously curtailing mothers' ability to take on full-time jobs (Izraeli & Safir, 1993). However, Lieblich (1993) found that Israeli career women were not resentful of their husbands' lack of participation in childcare and housework when compared with a matching American group. As a result, Israeli women experienced less role conflict. These women reported that their careers take second place to their family roles as mothers, wives, and caretakers, roles that are seen as more central to their sense of identity. Mothers often experience increases in their caretaker/nurturing roles when their children serve in the army—especially those with sons in combat units (Azmon & Izraeli, 1993). For example, the army does not provide laundry service, and soldiers' uniforms must be washed and ironed at home over the short weekend. In addition to doing the laundry, mothers are expected to "spoil" their children by preparing special meals and treats that can be taken back to the army.

LEADERSHIP IN PUBLIC ARENAS

In a nation that perceives itself as being under constant threat of extinction, the major focus of Israeli politics is on security issues (Gerabi, 1996). The discourse of national security remains an almost exclusively masculine arena (Gillath, 1993), dominated by men who came to the forefront of national politics following an illustrious military carrier. Since being a general, if not Chief of Staff, appears to be a prerequisite for most high-level political positions in government, women are effectively excluded from the national decision-making processes. In fact, in the 29th Knesset (which has the largest number of women members of Knesset (MKs) ever—16 out of 120), Prime Minister Ariel Sharon, only appointed three women ministers out of 24 available ministerial positions (Knesset Site, 2002).

This republican view of citizenship, which conjoins combat army service and entrance into the political sphere, also denies women's grass-roots social movements their legitimacy (Helman & Rapoport, 1997). When women entered the national debate and dared to voice unpopular antiwar views, they were seen as transgressing against their republican duty to support the fighting men. They were perceived as almost guilty of treason, failing in their duties towards their men and their nation (Herzog, 1996).

The all-encompassing importance of national security issues in Israeli politics was also detrimental to efforts to raise a feminist or women's rights political agenda. These issues were seen as trivial in comparison to the life-and-death questions of security, in particular as they were viewed as apolitical, domestic, and private matters, not pertinent to "serious" politics (Herzog, 1996).

Once introduced into the public sphere, women's agendas usually collide with those of the ultra-orthodox sectors in Israeli society. These sectors wield a great deal of political power because no major political party has managed to obtain a majority in the Knesset without incorporating them into a coalition.

GENDER AND RELIGION

As was previously noted, Israel defines itself as a "Jewish State," referring to both the national and the religious facets of Jewish identity. The fact that Jewish law is incorporated into state law lends great influence to the views of the rabbinical apparatus, which controls all personal legal status—from birth to death. In Jewish religious courts, children, retarded individuals, and women are not considered competent witnesses. It is worth noting that the elaborate state rabbinical system, and the Minister of Religious Affairs, and political appointments in the Ministry of Religious Affairs have been manned solely by men (Swirski & Safir, 1993).

In fact, the religious establishment's rejection of the concept of gender equality is one of the major reasons why Israel does not, to this day, have a constitution. Maintaining the status quo between the religious and secular segments of Israeli society has been deemed more important then signing a binding constitution declaring that women are men's equals in every sense (Raday, 1993a).

This interaction between contemporary ideas and age-old traditions is also evident in the lives of the vast majority of Israelis, who do not define themselves as religious (Levi et al., 2000). Even in the relatively secular portion of society it is the norm, during the High Holidays, to attend prayer services at Orthodox synagogues (which receive state funding, unlike the small number of Reform and Conservative synagogues in Israel). Only men can actively participate in these prayer services as well as perform the Kadish prayer for the dead. In addition, men's daily morning prayer includes the Hebrew phrase *Barukh shelo assani isha* ("Blessed is God for not creating me a woman"). In these Orthodox synagogues, women are hidden from men's sight and are excluded from praying aloud, so that they do not distract the men. Even in the traditional Orthodox wedding ceremony, the woman is not an active but a silent participant.

RELATIVE STATUS OF MEN AND WOMEN

Since Israel is a traditional gender-conservative society, women are disadvantaged in many public arenas. On the other hand, the Israeli woman is glorified as the mother of the nation and, in a family-oriented society like Israel, such a position may provide certain privileges.

SEXUALITY

Aspects of sexuality vary drastically between different segments of Israeli society. For example, while cohabitation is acceptable for secular Israelis, virginity is required of brides in the religious Jewish and Moslem sectors (Lavee & Katz, 2003), and gynecologists have developed a specialization in the reconstruction of the hymen.

When seeking help with sexual problems, Israelis generally emphasize issues pertaining to fertility and not feelings of individual dissatisfaction (Safir, 1999). Despite this, men's potency is a major element in the masculine ideal. A private clinic that treats (im)potence, with branches nationwide, advertises its service on the radio and in daily newspapers. An advertisement direct at middle-aged men has recently been appearing on television indicating that men can be helped to regain their masculinity by asking their doctor to prescribe Viagra.

COURTSHIP AND MARRIAGE

In the Jewish secular sector of Israel, grammar school children use the term "boyfriend" or "girlfriend" to designate special friends of the other sex. However, such relationships are usually kept within the peer group, and the early "couple" will not usually meet outside their peer group. Later, usually in early to middle adolescence, more romantically oriented pairs will form and dating will commence. Casual dating is not encouraged, and usually a couple will date for at least a few months. These young couples sometimes stay together for long periods of time, and eventually marry. Early sexual experiences may be a part of these committed relationships, even at a relatively early age. Many more couples form later, during or following mandatory military service (Lavee & Katz, 2003).

The median age of first marriage has been rising (Table 1). The only exception to this pattern is found for Muslim women (as well as ultra-orthodox Jewish women) whose age of first marriage has remained virtually constant. This finding also indicates the ever-deepening cultural cleavage between secular Western-oriented Israeli sectors, and the more traditional segments of Arab and Jewish societies.

Table 1. Median Age of First Marriage, by Sex and Religion, in Three Time Periods

		Jew	Muslim	Christian
1970	Women	21.5	19.3	21
	Men	24.1	23.4	27
1985	Women	22.7	19.8	22.4
	Men	25.7	23.7	27.3
2000	Women	24.4	20.3	23.1
	Men	26.7	25	28.3

In ultra-orthodox Jewish and Muslim communities the family is heavily involved in matchmaking. The young woman has veto power over the husband candidate. If she accepts him, the marriage is quickly arranged. In these communities, special permission is often sought to enable the young woman to marry at 17. In fact, the minimum age of marriage was set by law at age 18 in order to prevent these communities from arranging marriages for girls aged 15–16, or even younger girls (Hassan, 1993; Lavee & Katz, 2003).

Upon marriage, the wife moves to and becomes part of her husband's family in traditional Arab sectors. As a result, investing in a daughter's education was not seen as relevant, as her family would not benefit from this investment. This attitude is changing in the more socially affluent sectors of Arab society (Mar'i & Mar'i, 1985).

HUSBAND–WIFE RELATIONSHIP

The emphasis on family life is clearly evident, and the vast majority of Israelis of all walks of life do, in fact, choose to marry. The family centeredness of Israeli society also affects couples' priorities in marriage, and many Israelis feel that joint children are a sufficient reason to maintain an otherwise unfulfilling marriage (Lavee & Katz, 2003).

Since religious law governs all personal matters, divorce is not a judicial act, and only men can grant divorce. If the husband does not agree to divorce his wife—she cannot remarry. If she divorces in civil courts outside Israel and remarries, any children born from this new relationship would be considered *mamzerim* (bastards—a child born to an adulteress). Under Israeli Jewish law, these children and their offspring cannot marry for 10 generations. If a married man has a relationship with an unmarried woman, these children have the same rights and standing as his children from his marriage. There are even provisions for a man to marry a secondly wife, if his first wife will not agree to the divorce (Raday, 1993a). The only situation in which a divorce might be granted to a woman without her husband's consent would be if she could prove that her husband is infertile. The fact that the husband can refuse to allow his wife a divorce, thereby placing her in limbo should she wish to have a family with another man, gives the husband great power. It should be noted, however,

that if both partners want a divorce, it is very easy to obtain.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Israeli society is becoming increasing open to liberal ideas about gender equality. This may be attributed to the fact that the early socialist pressure to conform to the collective's needs and values is decreasing. Western, and specifically American, emphasis on civil rights and individualism are reflected in the national discourse regarding social and economic disparities between men and women, and other minority groups (Efroni, 1988). We have also noted that more women are moving into nontraditional positions in the army, and into other male-dominated professions. It appears to us that, unfortunately, these changes are often only "skin-deep." In the case of previously male-dominated professions, such as law and medicine, women are concentrated in the public sector where the work structure is more compatible with their roles as wives and mothers, while men work in the private sector with all the benefits that this entails (Izraeli, 1993).

As noted previously, some minor changes are also occurring in the structure of the Israeli family, with the rising age of first marriage and the increase of divorce rates (Lavee & Katz, 2003). These changes notwithstanding, the family-oriented nature of Israeli society is not presently threatened.

Perhaps the most outstanding changes have occurred in the public sphere, with regard to both mainstream and radical women's movements actively and publicly demanding changes to "right the wrongs." Even the right-wing National Religious Party has guaranteed to hold the fifth seat on its list for a woman in the national elections of January 28, 2003.

As a result of the breakdown of the national consensus following the Lebanon War in 1982, women's antiwar movements have begun to influence issues of national security. Employing their legitimate, almost sacred, status as mothers, several nationwide grassroots women's movements have affected the national discourse on matters of security and international relations (Gillath, 1993). These women evoked their powers as mothers, thus gaining access to mainstream politics. However, they did not contest the basic tenets of the family-oriented Israeli society.

Italians

Victoria A. Goddard

ALTERNATIVE NAME

Italians are also known as Italiani.

LOCATION

Italy consists of a peninsular mainland, the two large islands of Sicily and Sardinia, and a number of smaller islands. The physical environment of Italy is very varied, ranging from the Alps in the north, to the fertile plain of the Po river in the northeast, to the rugged coastline of the Mediterranean. Rome, Italy's capital city, is also the location of the Vatican City, the center of the Roman Catholic Church.

Naples, which is the focus of this chapter, is Italy's third city, with a population of 1.2 million. The city is located in the region of Campania and is the major urban center of the south. Founded by the Greeks, the city came under the domination of many outside forces throughout its history but it also played the role of a political and cultural center to a number of different polities. For example, Naples was the capital of the Bourbon Kingdom until the unification of Italy in 1860. With its spectacular bay, Naples has been a major tourist center since the 19th century. But the city's grand architecture and beautiful natural location have been contrasted with the conditions of life of much of its population, who have gained a reputation for resourcefulness in the face of long-term poverty and underemployment.

CULTURAL OVERVIEW

In much of the anthropological literature, Italy would be included within the Mediterranean ethnographic region, which has been frequently characterized in terms of a cultural system based on "honor and shame." These values are embedded in gender relations and local discourses of sexuality, usually entailing a strong emphasis on male reputation and on the control of women's sexuality (Gilmore, 1987). But although the codes of honor and shame have generated an extensive and interesting literature on gender and sexuality in the area, they are of limited use in the Italian context (Goddard, 1994). Indeed, any convenient characterization of gender ideals and relations is problematic, as Italy is highly diversified in terms of physical, cultural, and social characteristics.

Throughout the modern period the Italian peninsula consisted of numerous political entities, ranging from large kingdoms to small city-states, until the *Risorgimento* movement promoted and supported the unification of Italy under the leadership of Piedmont and the House of Savoy. Unification was accomplished in 1860, bringing together very different kinds of economic, political, and social structures. The incorporation of a semi-feudal south into the new Italian nation-state did little to accelerate the development of the area. On the contrary, the differences between the north and the south have endured and have long been the subject of debate and policy. Today, the standard of living of the southern population has improved dramatically compared with the poverty that prevailed after World War II. But the south remains different from the rest of the country. In a country with amongst the highest rates of unemployment in Europe, the south displays higher levels of unemployment and poverty. Here there are also higher levels of fertility than the rest of the country, more marriages, and larger families.

But despite the continuing significance of the differences between southern and northern regions, a simple north–south dichotomy fails to account for the complexities of Italy. Bagnasco (1977) has made a convincing case for the specificities of the central and northeastern regions, suggesting that there are in fact "three Italies" rather than simply two, each with their distinct history, culture, and economy. These regional differences are also evident at the level of the private domestic arena, there being important differences in family types and in patterns of gender relations between these regions.

Despite drives to create a coherent national whole since the Unification, most notably under the fascist

regime, regional and local variations remain strong. There have been a number of centrifugal forces at work. Observers have pointed to the phenomenon of *campanilismo*, a term derived from *campanile*, the church bell tower, to suggest the importance of loyalties attaching to the vicinity of the local church. A number of political and anthropological works have pointed to the strength of attachment to the locality and of suspiciousness toward outsiders, including representatives of the state (e.g., Silverman, 1975b). Since the 1980s, the decentralization of government to the regions has enhanced regional differences and resulted in significant variations in local policy and the provision of welfare services and support (Bimbi, 2000).

On the other hand, there have also been powerful unifying forces. The Catholic Church and different strands of Catholic ideology have been widely influential and have shaped national policy, particularly with regard to the family, sexuality, and reproduction. The Church has upheld the centrality of the family and has exerted a strong influence on the kind of family and the associated gender roles that are supported by government. The influence of the Church has meant that, in fact, state welfare policy has never seriously challenged the "family paradigm" whereby the family is the principal provider of care, support, and welfare (Bimbi, 2000; Saraceno, 1994).

The term "familism" has often been used in connection with Italian society to refer to the importance of ideologies and practices that place the family unit firmly at the center of individual and social reproductive strategies and ideologies. Some authors have stressed the negative effects of what they have seen as the isolationist effects of familism (Banfield, 1958). Banfield's analysis of a poor rural center in the south of Italy in the 1950s argued that "amoral familism" prevented wider cooperation and was responsible for the backward conditions of the village. Others have focused on the relations of cooperation, pooling, and solidarity that familism is able to sustain and legitimize (Ginsborg, 1990; Goddard, 1996; Saraceno, 1994). Ginsborg uses the term "moral familism" to describe forms of collective action, such as those initiated by the families of the 110 victims of a terrorist attack at Bologna station in 1980 or the organization of a group of mothers to combat the sale of hard drugs to children.

Despite declining birth rates, and Italy has one of the lowest fertility rates in the world, the family continues to be a strong and important institution (Ruspini, 2000). In central Italy the family has been identified as the keystone of a specifically Italian version of capitalism based on small firms and strong family-based solidarity (see Yanagisako, 2002). In the south, the family constitutes a refuge and a safety net in the face of unemployment and poverty (Goddard, 1996; Ruspini, 2000). In either case, the prevalence of the family and the influence of the Catholic Church on the ways in which the family is conceptualized and upheld have important implications for the opportunities open to men and women in Italian society.

CULTURAL CONSTRUCTION OF GENDER

Alongside the regional variations that characterize Italy, there are striking differences with regard to gender roles and ideals, depending on region, class, and generation. But it is possible to make some generalizations, particularly where the connections between the family and gender constructs are concerned. Given the centrality of the family, it is perhaps not surprising that the qualities associated with parenting, and especially with motherhood, shape and inspire ideal gender identities.

Men and women are expected to be different, in terms of physical, cultural, and emotional characteristics. So where men might be expected to be strong and assertive, women should ideally be gentle, sympathetic, and nurturing. But beyond these very general expectations, men and women display a wide range of characteristics and forms of behavior. In Naples, although women may defer to the opinions of men on some subjects, or assume a subdued attitude in the presence of their husbands or other men, in other circumstances they will quite appropriately express their opinions assertively and interact freely with both men and women.

Throughout Italy there are different, or indeed competing, ideals of masculinity and femininity. For example, research in the city of Florence illustrates the ways in which working-class men elaborate alternative measures of masculinity. These enable them (or some of them) to achieve a successful masculine identity in the absence of the means to achieve the ideals dictated by middle-class values and expectations and which are largely promoted by the media (de Bromhead, 1999). Similarly, there are women who occupy influential positions in the public sphere (see "Leadership in Public Arenas"), and work and career are increasingly important

sources of fulfillment and pride for women. However, despite these variations and changes, it is still the case that the family provides a crucial context for evaluating gender performance across the divides of class and region. In particular, ideals regarding women and womanhood are still largely embedded in the family.

GENDER OVER THE LIFE CYCLE

Sydel Silverman's research, conducted in the 1960s in a community in the province of Perugia in central Italy, suggests that the life cycles of women are likely to differ significantly from those of men, being marked more strongly by and in a closer relationship with reproduction (Silverman, 1975a, 1975b). But in Colleverde, where her research was carried out, there were also significant differences amongst women, particularly regarding the points at which life crises occur and the intensity of such crises.

Silverman notes that in general there was little concern over the changes associated with puberty or with menopause. Instead, the critical period in a woman's life was the period of courtship. Courtship initiated a crisis and a state of insecurity that was only partially resolved at marriage and fully resolved only at the birth of the first child. Silverman (1975b) points to a parallel between her findings in this rural area of central Italy, and those of Anne Parsons who was working in Naples at the time. Parsons (1967) also indicated that the years of courtship were the most distressing in a woman's life. The stress and anxiety related to the numerous pressures that the girl was subject to once she was engaged to be married, not least those provoked by the turmoil of the relationship itself. Young fiancées were also vulnerable to gossip. But Silverman shows that in the central Italian area where she carried out research, the intensity of the crisis varied significantly, especially between girls in the villages, for whom a good reputation is an important asset, and the girls belonging to *mezzadri* farming families. The *mezzadria* is a form of sharecropping, in which family labor is a major resource. This meant that the girls living on the farms were valued for their contribution as workers, and their reproductive capacity was a clear asset so that they were less vulnerable to gossip regarding their sexual conduct. For example, in such families a premarital pregnancy might be welcomed rather than be seen as shameful (Silverman, 1975b).

Socialization of Boys and Girls

The socialization of boys and girls needs to be contextualized within the family and the organization of the household. Whereas girls are likely to assist in household chores, this would not usually be expected of boys. In Naples even young girls might take on quite heavy responsibilities in the home, especially when their mothers were at work. However, this situation was reversed in rural areas. Although girls continued to help in the household, boys had a heavier burden of work, helping with the agricultural tasks (Davis, 1973). In either case, the division of labor in the household clearly endorses the sense that boys and girls are different and can expect to have different life experiences and rewards.

Children are highly valued in Italian families. In Naples, babies and toddlers are treated with a great deal of affection and indulgence. Physical affection is shown openly and effusively. It is not unusual for a baby to be passed around a gathering, each person in turn bestowing some form of caress or appreciation on the child. Differences between boy and girl babies are recognized and elaborated. Boys and girls are dressed differently, they are associated with different colors, and given different toys. Boy babies and toddlers in particular elicit a lot of attention. Playful reference to a boy's penis is considered quite appropriate, and a female carer such as the mother, aunt, or older sister might play with a baby's penis while changing and cleaning him, or while playing. Slightly older boys will be teased and tested for what many considered to be desirable masculine traits, such as bravery and defiance and willingness to stand up for themselves and their family. One 5-year-old boy provoked both pride and hilarity when he responded defiantly and courageously to a mock attack on his father, undeterred by the size and age of his opponent. Davis (1973) recounts a similar situation that he witnessed in Pisticci, in the south of Italy, in the 1960s, when a boy was tested through verbal provocation. Other accounts and observations suggest that teasing is used quite widely as a socialization strategy to elicit the appropriate response from a child who is then rewarded when a suitable reaction is forthcoming.

Little girls would not be engaged in the same kind of play as boys. Instead, jokes and comments would focus on what are considered to be a girl's feminine qualities. A little girl is likely to be praised because of her prettiness or her charm, although the qualities of cleverness

and mental and verbal agility are desirable and encouraged in both girls and boys. So, although all children are treated with great affection and receive a lot of attention, the ways in which they are approached and the expectations expressed toward them differ so that in a number of ways boys and girls are encouraged to develop different strengths and qualities.

Puberty and Adolescence

For families who adhere to Catholicism, and even for many who do not, a child's first communion is an important ritual occasion. In theory it marks the transition from childhood into a process leading to adulthood. But first communion takes place when a child is young and it is only loosely and implicitly associated with puberty. In fact, the onset of puberty itself is somewhat unmarked and unremarkable.

The experience of adolescents varies, not least as a result of their family's economic status. It was not unusual for men and women of the poorer districts of Naples born prior to the 1970s to have started working for wages in some form at a very early age, some as young as 8 or 10, many more starting paid employment around the age of 14. Although such children would still live at home and would be expected to show respect for their parents, the work experience could foment a greater sense of responsibility and maturity in them.

Men and women with children in the 1970s and 1980s showed a strong commitment to the education of their children, and rates of completion of schooling have been improving steadily. This means that adolescents spend more time at school and remain dependent for longer, although many will contribute in some way or other. As mentioned, girls are more likely than boys to make a direct contribution to the household by performing household chores and caring for younger siblings or even nephews or nieces. At the same time, throughout Italy girls have entered education and succeeded to the extent that they are surpassing the achievements of boys.

Adolescence is a time when boys and girls may initiate relationships with the opposite sex. Girls, in particular, may become seriously involved in a stable relationship by the age of 16 or 17. If this is the case, the girl's social life will change significantly, as it will tend to revolve more around her fiancé and the families of the young couple than her peer group.

Attainment of Adulthood

The attainment of adulthood is a gradual process and several events can be seen as steps toward adulthood. Earning an income is one such step, although many Neapolitans start their work careers whilst very young and still very much under the authority of their families. For many others work is an erratic and unreliable basis for building a sense of identity. A clearer marker of entry into adulthood is marriage and in particular having a child. With adulthood and parenthood come heavy responsibilities, and the expectations regarding both men and women will change. Although the situation has been changing over the last decade or so and careers are important for women as well as men, having a family of one's own, and in particular having children, is highly desirable and indeed remains a priority. This is evident in the figures that show that many women leave work after marriage and especially after the birth of their first child. So, despite changes in education and the labor market, motherhood and, to a lesser extent, marriage still represent an obstacle to the open and full employment of women (Bettio & Villa, 2000).

For many women in particular, establishing a household of their own is a means of becoming autonomous and exercising some control over their time and space. Even those who were content to live in the parental home generally aspired to having a family at some time in the future. On the other hand, housing shortages in much of Italy mean that many children are forced to remain in the family home well into adulthood.

Middle Age and Old Age

Men and women whose children have grown up, and perhaps had children of their own, continue to play an important role in the life of their families. As mentioned, there are several obstacles to establishing an independent household and adult children may well remain in the parental home for many years. During this time they are likely to expect, and probably receive, care from their parents, especially their mothers.

For many families, especially those that require both partners' involvement in wage work, having access to their children's grandparents can be crucial. In many households in the poorer districts of Naples, grandparents, and especially grandmothers, would take on a great deal of responsibility for their grandchildren. In some

instances meals might be shared by a group of kin to help those who are short of income, or children might eat or even sleep in their grandparents' homes if their own homes were small or inadequate.

So families continue to be an important focus for the individual and, where physical proximity allows it, family and kin will interact on a daily basis. Peer-group socializing is also important for many people. Women will tend to visit friends and family and socialize in each other's homes. Men are more likely to meet outside the home, in coffee bars or in one of the local social clubs associated with political, civic, or religious organizations, where they might play cards and chat. In the older age group there appears to be a greater emphasis on single-sex groups, and socializing as couples appeared to be far less frequent.

PERSONALITY DIFFERENCES BY GENDER

It is important to recognize that in Italy there are currently a number of alternative views of masculinity and femininity, not least those promoted by the media, so that a number of different personality traits are quite acceptable in men and women. However, a fairly "hegemonic" form of masculinity (Cornwall & Lindisfarne, 1994) would usually entail some quite specific characteristics, such as assertiveness and self-confidence, virility, and the ability to support one's family. Depending on the context, this might also entail a certain verbal competence, or the ability to drink without losing control, or to display physical prowess in some field. The counterpart to such a "hegemonic" masculinity would be a gentle, submissive, and attentive woman, a good mother to her children, and a caring partner to her husband. The demands of such a model of masculinity can result in a dichotomous view of women, whereby the "good" and virtuous woman, ideally suited for motherhood, is contrasted with the "bad" sexually and morally loose woman whose behavior is in direct contrast with that of the virtuous wife.

Although these various stereotypes would be recognized in Naples, the differences between "hegemonic" and alternative masculinities on the one hand, and good and bad women on the other were actually blurred and contradictory. A quiet gentle man might be respected as much as, or more than, a confident extrovert. And although many women, wives in particular, might be quietly submissive in the presence of their husbands or fathers, they may equally be talkative, assertive and humorous, and quite ribald without eliciting criticism. In fact, both men and women are expected to participate in, and contribute to, a social gathering. Humor, wit, and self-confidence are qualities that are appreciated in both women and men.

GENDER-RELATED SOCIAL GROUPS

In Italy, personal relations associated with the family and with kinship are important resources for cooperation and social solidarity. This was very clearly the case in Naples, where kinship and neighborhood networks were extremely important sources of support and cooperation, especially for women. Neighbors might help each other in a number of ways—with childcare, lending some crucial ingredient for the preparation of the midday meal, sometimes assisting with work, or providing companionship and support when this was needed.

The relationship between a mother and her children was considered to be especially strong and enduring. Mother–daughter relations were especially important in the everyday life of women, especially in the old quarters of the city where families might live in close proximity. However, a shortage of affordable housing means that many young couples are unable to find accommodation close to their families and are forced to find alternative (and usually better) accommodation on the outskirts of the city, making such intensive contacts extremely difficult.

GENDER ROLES IN ECONOMICS

It is now widely accepted throughout Italy that women have a role to play in the labor market (Bimbi, 1993). However, the opportunities for paid employment are unevenly distributed and in many regions there is an acute shortage of jobs, so that women's aspirations remain unfulfilled. In Naples, a combination of limited work opportunities and the constraints of parenting and domestic duties encouraged many women to become outworkers (Goddard, 1996). In Baunei, a village in north Sardinia, women did aspire to working outside the home but the lack of opportunities meant that only a few managed to live up to this ideal. At the same time, the content of housework has changed. The growth of a

consumer culture has radically altered the technology of domestic work and shaped the aspirations of men and women. These various changes mean that now women who are at home feel frustrated because "to be a housewife with few cash resources of one's own in a consumer society is very different from the role played by the self-respected female heads of household in a subsistence economy" (Assmuth, 1997, p. 17).

As in other parts of Europe, the Italian labor market is markedly gendered. Women tend to fill certain niches and to be concentrated in certain trades such as textiles, garments, and services. But women have played a crucial role in another important dimension of the Italian economy: during the 1980s Italy became known as the exponent of a new version of capitalism, frequently described as "flexible accumulation" (Piore & Sabel, 1984). The principal characteristic of this form of production was its reliance on the family as a basis for entrepreneurial activities. In the north and center of the country the family provided the resources for a successful strategy of accumulation. Although families were also important in the south, for pooling labor and resources, the different conditions in the region tended to act as a brake on the consolidation of successful family enterprises.

The leather trade of Naples was a particularly important source of work for women, whether as workers in the factories or as outworkers working in their own homes. Although the ideal of a male breadwinner was shared by the majority of Neapolitans, the reality of unemployment and insecure employment meant that it was extremely hard to rely on a single income and wives were frequently involved in some kind of income-generating activity (Goddard, 1996). Because the family, and in particular parenting, remained the most valued activity, home-based work was seen as a solution to the conflicting needs of the household, for money on the one hand and attention, and services on the other. Another solution was provided by the assistance of older children (daughters), mothers, mothers-in-law, sisters, and other relatives, who could free up the time of female relatives to enable them to engage in wage work.

PARENTAL AND OTHER CARETAKER ROLES

Parenting is an important and fulfilling task for both men and women. A characteristic of most Neapolitan families was the pleasure openly taken in children, who were always treated with great affection. This attention was not restricted to the child's parents. Other kin, such as grandparents, aunts, and uncles, were likely to be involved in some way in the care and entertainment of children.

Motherhood has had a privileged position within Italian cultural representations. Neapolitans often stated that a person's mother is his or her most trustworthy ally and support. This claim was sustained even by those who had experienced serious conflicts with their mother and their families. Despite the possible shortcomings of specific individuals, mothers were to be respected and loved: "*la mamma è sempre la mamma*" ("the mother is always the mother") was often the concluding remark, even in a tale of family woe.

However, research indicates that some significant changes are afoot in parenting practices, particularly where men are concerned. Bimbi's research in three different regions of the country indicates that ideas about fatherhood have changed (Bimbi, 1993). The figure of the authoritarian father associated with prewar society has given way to a more caring and engaged paternal involvement. Her research also shows that the domestic space is no longer identified as closely with women as in the past and that, just as both parents now play an active role in the care of children, women as well as men are involved in work outside the home.

Changes in parental practice reflect changes in the content of parent–child relations and the aspirations of parents where their children are concerned. Younger couples in Naples frequently expressed the intention to limit family size so as to be able to invest more effectively in their children's education. Parents wanted their children to surpass them in terms of socioeconomic status and achievements.

LEADERSHIP IN PUBLIC ARENAS

During the fascist period Italian women were defined primarily in terms of reproduction, and their activities in the public arena were radically curtailed. A slogan from the period sums up the fascist regime's polarizing view of gender relations: "Maternity is to women what war is to men." However, the experience of authoritarianism and war prompted many women to become involved in the anti-fascist resistance. With the fall of fascism and the establishment of the Republic, many of these defiant

women found a respected place in the world of politics. It was also in the postwar period that the Unione Donne Italiane (the Italian Union of Women) was founded. This organization has played a crucial role in shaping policy regarding women's rights and legislation concerning the family. Then, in the late 1960s, feminism became a small but vocal and influential force and to this day continues to provide an alternative view on all aspects of Italian politics and culture (Bono & Kemp, 1991).

Currently, men occupy the majority of public roles but there are a number of prominent women in parliament and several women hold or have held ministerial positions or other important public positions, such as in Naples where the position of mayor is currently held by a woman.

Interestingly, Silvio Berlusconi, the current head of government, displays many of the qualities associated with hegemonic masculinity: he is successful, supremely confident, his beautiful wife testifies to a successful virility, and, although not a famous sportsman himself, he is the owner of what many consider to be Italy's most famous football club, AC Milan. There are also some parallel flamboyant displays of feminine success in the political arena. Alessandra Mussolini, Benito Mussolini's granddaughter, is a graduate from medical school as well as an actress whose good looks have been widely publicized in the media. She is currently a councillor in the local government of Naples, representing a right-wing party. Like Berlusconi she exudes self-confidence and has a somewhat brash manner not immediately associated with femininity, while maintaining an aura of glamor and feminine attractiveness.[1]

Other women politicians rely on their distinguished career rather than a glamorous profile, as in the case of Emma Bonnino, a Radical who entered the world of politics through her involvement in the campaigns for the legalization of abortion and divorce. Similarly, Tina Anselmi was a prominent member of a number of Christian Democrat governments. As Minister of Employment and, before that, as head of the National Equal Opportunities Commission, she exerted a great deal of influence, undoubtedly facilitating the approval of legislation promoting gender equality in employment.

GENDER AND RELIGION

Italy is predominantly Roman Catholic and has historically strong ties with the Vatican, not least because of the presence of the Papal State within Italian territory. It is undeniable that Catholicism has exercised a strong influence on Italian culture and values. In particular, the Lateran Pacts conceded a great deal of control to the Church, especially in relation to education. The Christian Democrat party, which governed Italy for four decades after World War II, did much to consolidate the interests and values of the Catholic Church by translating them into policies.

The social philosophy of Italian Catholicism placed the family at the center of society and defined the attributes and roles of men and women in relation to the harmonious functioning of the family. Christian Democrat governments embraced this philosophy with varying degrees of conviction, promoting familial roles and values through specific institutional arrangements and policies. However, the capacity of the Italian Catholic Church to have a direct influence on public opinion has waned. An indication of this is the general decline in church attendance. According to Nanetti (1988, p. 66), 80% of women and 57% of men claimed that they attended church almost every Sunday in the mid-1950s. By 1985, the figure had dropped to 19% of men and 38% of women. Other indicators of the limits to church influence and the changing attitudes of the Italian public is the overwhelming approval given by the public in the referendum on the divorce law.[2]

In Naples there was an apparent contradiction between the declared religiosity of people and their equally open distrust of representatives of the Church. Few men attended mass and even many women only attended erratically. Men were quite openly skeptical about the benefits of churchgoing, but women were more concerned about their poor track record. Lack of time was a factor in this and many preferred to fit in their worship around their tasks. For example, they might visit a church briefly while out doing the shopping. Or they might limit themselves to worshipping in private, in their own homes. In fact, it was quite usual for homes in the old city to have small altars where sacred figures were displayed.

The devotion of the inhabitants of the poorer areas of the city is evident in the care bestowed on the shrines that dot the streets and alleys. It was usually women who took it upon themselves to ensure that the shrines were clean, the flowers were fresh, and bills were paid so that the lights would always illuminate the images they encircled. Many shrines are dedicated to various manifestations of the Madonna, reflecting the importance of the

Catholic cult of the Virgin Mary. The Virgin Mary was an extremely appropriate icon for the poor women of the city, and many said that they found inspiration in the compassion and devotion of the Virgin as mother of Christ. Women who were outworkers and largely confined to their homes were prepared to spend part of their meager earnings to support the shrines, finding solace and inspiration in the presence of their Madonnas. The Madonna, they felt, watched over them and their families.

LEISURE, RECREATION, AND THE ARTS

Hospitality is a key quality throughout Italy. In Naples the practice of hospitality is clearly gendered. Men tend to offer hospitality in public spaces such as cafés or bars, while women are responsible for hospitality offered in the home. This could take a number of different forms, ranging from offers of coffee or liqueurs to extensive offerings of food. A special invitation required elaborate and lengthy meals, consisting of a number of different carefully prepared courses that testified to the hostess's generosity and culinary skills. Food is a key component of social interaction, especially among kin, and between mothers and their dependants. Carefully prepared homemade food was also important as the highest form of hospitality.

Television is an important source of recreation and is often at the center of family meals and reunions. Italian cinema has also flourished and has produced many very popular films focused on questions of gender and sexuality. These same themes, with a stronger emphasis on questions of reputation, betrayal, and revenge are common threads in the plots of the Neapolitan *sceneggiata*. This is a traditional form of theater in which the audience is presented with a moral dilemma within a highly charged emotional situation. The audience is expected to express their opinion as to the appropriate outcome of the play: Should the betrayed lover forgive his fiancée? Should he repudiate her? Should he seek revenge?

Some recent cultural products challenge the very premise on which the *sceneggiata* is based, that is, the clarity of domestic roles and the sanctity of the family unit and especially of the mother–child relationship. *L'amore molesto* (Martone, 1995) is set in Naples and deals with the relationship between mother and daughter—so often the basis of moral and material support among the Neapolitan population. In contrast with the jovial and life-affirming approach to sexuality of earlier generations of Italian cinema (pace Pier Paolo Pasolini), *L'amore molesto* unsettles comfortable certainties and subverts expectations of a natural order of gender, kinship, and sexuality.

RELATIVE STATUS OF MEN AND WOMEN

Few people in Italy would assert that women are inferior. On the other hand, a discourse of difference may find acceptance among both men and women. The identity of the sexes is considered quite undesirable, and the differences between men and women and the complementarity of their qualities and their specific contributions are upheld and celebrated. This difference can translate into disparate and lopsided patterns of participation in different activities and social spaces. It also allows scope for double standards, particularly in the field of sexuality.

SEXUALITY

Sexuality is considered to be an integral and important part of the identity of men and women. Sexual fulfillment is considered an important ingredient of personal happiness. In Naples this fulfillment would ideally be realized within established and recognized relationships, preferably within a marriage. This view clearly privileges heterosexual relations above others, and indeed homosexual relations between men were the cause of some hilarity rather than hostility. But circumstances—and attitudes—varied considerably. Attitudes to those who deviated from the heterosexual norm were difficult to predict. On one occasion, during a pilgrimage to a site considered to be holy and miraculous by many Neapolitans (though not by the Catholic Church), I shared the queue with a group of middle-aged women. They spent much of the long time in the queue comforting and encouraging another similarly dressed person who was in fact a transvestite who felt that his presence in a holy site was inappropriate. Instead, the women stood firmly by him, in the certainty that, as they claimed, everyone is welcome in the sight of God.

Although both men and women were considered to have sexual needs, the needs of men were often seen as being more immediate and less mediated by conventions

and rules. Thus, for some, it was acceptable that married men should indulge in extramarital relations, whereas it was far less acceptable for a woman to do so. The explanation for the double standard was once expressed—albeit as a joke—in the saying that "the man is a hunter" and women were limited to being the prey.

Early research in rural areas (Davis, 1973; Silverman, 1975b) suggests that sex before marriage was frequent, and even accepted or encouraged as a guarantee of successful reproductive union. In Naples too there were many instances of jokes, rumors, and open acceptance of pregnant brides. But it was usual and extremely important that, where a premarital pregnancy took place, marriage would follow as quickly as possible. Interestingly, Italy has the lowest rate of single mothers in Europe (Ruspini, 2000).

Courtship and Marriage

Marriage is a highly desirable state for men and women and most expect and want to marry and set up a family of their own. The aspiration is that a successful relationship will be consolidated through marriage.

In Naples many people recognized two forms of engagement. Engagement "outside the home" referred to relationships that might still be on trial, or more casual, and that did not involve the couple's families. Engagement "in the house" referred to an official and recognized relationship. This was achieved through fairly formal visits to each other's homes and meetings between the families. It was expected that the relationship would result in marriage. Once formally engaged, a young woman's social life changes considerably and she is expected to behave with decorum. Parsons' research in the 1950s suggested that the period of courtship was extremely stressful for young women as they are vulnerable both to gossip and to the volatile nature of the courtship relationship (see "Gender over the Life Cycle").

Ideally, married couples will live neolocally, but the shortage of housing and secure jobs poses problems for many young people and courtship can last many years. During the courtship years the couple will prepare for the future. The girl might well have started to put together her *corredo*[3] or dowry even before courtship. But once engaged, the process of accumulating items for the home will be accelerated. An ideal wedding is a white wedding, held in church, although many couples opt for a civil wedding particularly if they are not practicing Catholics.

Husband–Wife Relationships

Parsons' work in the 1960s combined anthropological and psychological approaches to the study of family structures of the poor neighborhoods of Naples. She suggested that, here, economic conditions undermined the authority of adult men as heads of a family. Families were thus strongly matrifocal and the mother's influence had quite specific consequences for the kind of gender identities that were learnt in the context of family life. One of the most significant consequences was the enduring bond between parents and children, especially mother and son, which lasted well into adulthood. The strong attachment of adults to their family of origin made the creation of a new family unit extremely difficult. Characteristically, conflict between husband and wife would maintain a distance between them and reinforce the tendency to invest emotionally in the children rather than the spouse (Parsons, 1967). Thirty years on from Parsons' research, many couples interviewed in Naples claimed that the most important focus of their emotional lives was their children. A number of the men interviewed stated that their love for their children surpassed their love for their partner. Many women would agree with this view, although the comparison might not be made so bluntly.

However, the quality of relations between husband and wife varied considerably, depending on the background and life experience of each of the partners. In a number of married couples the wife would defer to her husband on matters of politics or other "public" issues. However, they retained full confidence in their superiority in the domestic sphere and could derive considerable delight from their husband's shortcomings in this field. In couples where both partners had experience in the field of work or politics, the emphasis was on equality of participation and opinions.

In Italy as a whole, important changes have taken place in the expectations of couples. An egalitarian ideology now informs the lives of married couples, and the expectation is that husband and wife will share in household chores and responsibilities. In fact, men assume little of the burden of housework, so that women still carry most of the responsibility for it, and the input of husbands is most evident in relation to childcare (Bimbi, 1993).

OTHER CROSS-SEX RELATIONSHIPS

According to Parsons (1967), cross-sex relations in the Neapolitan family are more significant than same-sex relations. She was referring specifically to the mother–son and the father–daughter relations that she considered to be enduring and influential. However, my own research indicated that mother–daughter and sister relations were strong and played a crucial role in the lives of many women and their families. And these relationships were not only important from a pragmatic point of view, they were also emotionally significant. Brother–sister ties may also be strong. Traditionally, brothers were held somewhat responsible for the reputations and safety of their sisters, especially if they were unmarried. Nowadays this is much more subject to personality or specific circumstances.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Bimbi (1993) suggests that women born after World War II have embraced a different model of female identity than that of their mothers or grandmothers. The youngest group of women in her research felt that having children or obtaining educational qualifications were rights rather than duties or privileges. In general, attitudes to the roles of men and women in the family and to sexuality have changed very significantly and show clear departures from the position of the Catholic Church. This was evident in the public support for legislation facilitating divorce and abortion in the 1970s and for the changes in family law that have taken place since then. Responding to changes in the attitudes of the public and to organized public pressure, government has granted men and women greater equality not only in public life but in the private domain as well. Changes have taken place not only in legislation but in everyday practice. There have been shifts in parenting patterns, and the value placed on the education of girls has been increasingly placed on a par with the education of boys. However, limited work opportunities in many regions of Italy remain an obstacle for young people despite their impressive educational qualifications.

Changes in gender relations and in the experience and conduct of sexuality are also evident in trends regarding marriage and family size. Marriage rates and family size have declined, and Italy as a whole has registered zero population growth. However, there are important regional differences. Naples and the region of Campania have the highest rate of marriage, the highest average family size in the country, and the smallest increase in the number of illegitimate births.[4] Whilst it remains important and valued, the family is changing in Naples and in Italy as a whole, and, with thus change, the contents of gender roles and the opportunities for men and women are shifting too (Calabretta, 2001).

NOTES

1. It is interesting that Italy is one of the few—or the only—countries where a porn star, Cicciolina, became a political figure. This seems to suggest that the public political domain is currently a form of display or performance—rendered increasingly feasible and desirable with the growth of the media—in which contradictory signifiers of gender and morality have been mobilized in ways that suggest that, although it is difficult to talk about distinct gender and sexual identities, these are nevertheless important in the perception of public life as well as in the experience of private life.

2. In 1974 a referendum was held to measure public feeling about the 1970 bill that legalized divorce, against the position of the Vatican on this issue. A similar situation arose a few years later with the law that legalized abortion in 1977. A referendum in 1981 ratified the law, again against the recommendations of the church to its faithful.

3. There has been an interesting evolution in the *corredo*. Up until the 1970s women in many areas, especially in rural areas, put together a *corredo* that consisted primarily of linens and other household items. In many parts of the country women were expected to produce much of their *corredo* themselves, for example, by crocheting doilies, embroidering pillow cases, and so on. In the cities and as young women gained greater opportunities of paid employment, there was a shift toward buying these items, although an embroiderer might be employed to add some design or initials to customize the factory-produced items. In the 1970s in the urban centers there was also a marked shift away from linens toward domestic appliances, ranging from television sets to kitchen appliances and the like. In other words, there has been a gradual commodification of *corredo* items and a decline in the value of the young women's labor as embodied in these items.

4. The family has declined from an average of 3.3 members in 1971 to 3.0 in 1981. Campania shows the highest average family size in the country with 3.5 members in 1981. Marriage rates have declined in Italy but Campania still has the highest rate in the country. The number of illegitimate children has also risen from 22 per 1000 in 1970 to 48 per 1000 in 1983, but in Campania the increase is from 21 to 35 per 1000 for the same period.

Jamaica

William Wedenoja and Diana Fox

ALTERNATIVE NAMES

The original inhabitants of Jamaica, referred to as Arawak and Taino, are said to have called their island *Xaymaca*, which supposedly meant "land of wood and water."

LOCATION

Jamaica is a famously beautiful island, 82 km wide and 235 km long, located in the Caribbean Sea. It is the third largest island in the West Indies, after Cuba 145 km to the north and Hispaniola (where Haiti and the Dominican Republic are located) 161 km to the east. Most of the island is hilly, mountainous, and verdant, with many rivers, deep valleys, and a narrow coastal plain. The tropical climate is hot and humid year round, with a mean annual temperature of 27°C and a mean annual rainfall of 198 cm.

CULTURAL OVERVIEW

Jamaica was originally settled by a Native American group known as Tainos about 1000 CE. Christopher Columbus landed in Jamaica on May 4, 1494, on his second voyage to the "New World." The estimated 60,000 native inhabitants perished during the Spanish occupation, which ended in 1655 with an invasion by Great Britain. Jamaica was a British colony until 1962, when it gained independence. Plantations were established in the late 17th century, and about 750,000 slaves were brought in from West Africa to work them. The slave trade was abolished in 1807 and the slaves were freed in 1838.

The main industry during slavery was sugar cane. After Abolition sugar fell into permanent decline but is still a significant export today. A strong domestic agriculture system or peasantry, along with an internal marketing system, rapidly took shape after Emancipation and is still very important. Bananas were first exported in 1866, and Jamaica rapidly became the largest producer in the world, but the industry peaked in 1937.

Manufacturing grew rapidly in the 1950s and 1960s, but has struggled since then. The most valuable export over the past five decades has been bauxite ore and its refined derivative alumina, the basis for aluminum. Jamaica became a major supplier of marijuana to North America in the 1970s, as well as a trans-shipment point for cocaine from South America in the 1980s. Tourism, which began with banana boats over 100 years ago, reached 1.2 million visitors in 1998.

The population of Jamaica was estimated to be 2,665,636 in July 2001. The birth rate of 40 per 1,000 in the 1960s fell dramatically to 18 per 1,000 in 2001, with a growth rate of only 0.51% and a total fertility rate of 2.08 children per woman. Many Jamaicans have emigrated over the years in search of greater opportunity, and the Jamaican "diaspora" includes 1–2 million Jamaicans and their descendants now living in Panama, Costa Rica, Canada, the United Kingdom, and the United States.

According to the 1991 census, the population is 90.5% black, 7.5% mixed, 1.3% East Indian, 0.2% white, 0.2% Chinese, 0.1% Syrian (Lebanese), 0.1% other, and 0.1% not stated. Black Jamaicans are descendants of African slaves and mixed Jamaicans are mulatto offspring of white colonials. Indentured servants were brought in from India and China in the mid-19th century to replace freedmen on the plantations. Lebanese emigrated to Jamaica in the early 20th century. The white British population has dwindled as the white American population has grown. The only other significant minority are Jews, who settled in Jamaica after their expulsion from Spain and Portugal in the 17th century.

Slave society was stratified into free whites, mulattoes or free people of colour, and black slaves. After Emancipation, this caste system was transformed into a "colour-class system" wherein white became synonymous with a small elite upper class, mulatto or brown with a small middle class, and black with a vast working-class majority. The Chinese and Syrians attained the status of "honorary whites" after gaining wealth through

business enterprises. Since Independence, Jamaica has struggled to eliminate white colonial bias and privilege and live up to the national motto, "Out of Many, One People," but color and ethnicity are still important symbols of status.

Jamaica enjoyed one of the highest rates of economic growth in the world in the 1960s, when it also had one of the highest degrees of inequality. However, the economy has seen little real growth over the past three decades. During this period life in rural areas basically stagnated, while urban areas became increasingly divided into rich and poor, and the inner city turned violent. Guns, gangs, and drugs have led to what is now the fourth highest murder rate in the world. The violence is generally blamed on poverty and inequality; however, the rate of poverty fell from 30.5% in 1989 to 17% in 1999, and the GINI index, a measure of inequality, is only 36.4, equal to that of the United Kingdom. The gross domestic product per capita in 1999 was $3,561 (U.S. dollars), 78th in the world, on a par with China and Egypt.

CULTURAL CONSTRUCTION OF GENDER

Gender is largely constructed through an understanding of the binary opposition of male and female—notions of masculinity and femininity that revolve around rigid norms of heterosexuality. There is no room for sexual ambiguity: a "man" is masculine and a "woman" feminine only if he or she has sexual relations with the opposite sex. A "chi-chi man" or "batty boy" is a homosexual male, a highly despised category. The attributes of men and women are regarded as both distinct and interdependent.

Men and women enhance sexual dimorphism mainly through dress, hairstyles, and bodily comportment. Differentiation in dress begins early and is distinguished particularly through school uniforms. Schoolboys from "infants" through high school wear khaki uniforms, while schoolgirls wear variously colored jumpers (depending on district and age). In adolescence, girls are encouraged to hold themselves as ladies by walking erect and maintaining restricted bodily movements that express sexual modesty. On Sundays, both men and women dress up; church ladies, young women, and girls put on frilly frocks and wide flowery hats, while men wear suits. Young women spend a lot of time and resources on elaborate hairstyles.

Sexual attractiveness varies by class and subculture. Generally, young men who are part of the reggae/ dance-hall culture are drawn to women who do not hide their voluptuousness and who demonstrate sexual availability. Working- and middle-class men seek out women who are neat and well groomed. Upper-class men seek "ladies" who aspire to a North American ideal: well coiffed, thin, petite, and "white." Even working- and middle-class men prefer women with lighter complexions, as do women who tend to refer to "black, black" men as "ugly." Rastafarians, by contrast, praise "black" women in the spirit of racial pride and "black is beautiful."

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

Having children is considered to be a normal, natural, and essential part of life in Jamaica, where children are generally welcome regardless of one's situation. Indeed, a childless woman is referred to derisively as a "mule." Working-class children grow up in multifamily "yards" in the cities and towns or extended family households in the countryside. Children are cared for not only by their parents, but also by older siblings and adults, kin or nonkin.

According to Sargent and Harris (1992), there is a strong preference for daughters, at least among women in the inner city. Boys are said to be harder to control and more likely to get into drugs, gangs, and crime. Girls generally help more around the house, do better in school, and are thought to be less likely to abandon their parents in old age.

The yard or home is the domain of women, and men avoid spending much time there. Their place is beyond the home, in the fields, the streets in the city, the square in the country, bars, and the work place. The yard is considered to be a place of safety and nurturance while the world beyond is seen as dangerous, especially in the inner city. Young children are closely watched and confined to the home until they are old enough to go to school.

There is little difference in the socialization of boys and girls until they begin "basic school" at the age of 4 or 5. From then on, however, they live in increasingly sexually segregated worlds. Mothers are strict with daughters and burden them with household chores such as cooking, cleaning, and looking after younger siblings. Consequently, girls learn hard work and responsibility at an early age. Girls take pride in their household responsibilities but may resent the privileged position of boys.

Mothers give their sons some household chores, so they can learn to take care of themselves, but not to the same extent as girls. If a chore requires leaving the yard, or if it is "rough work," then it will be given to a boy.

Children are generally believed to be "rude," and are subjected to harsh discipline to teach "manners." Discipline takes the form of verbal threats, "bad words," and "floggings" by the mother or father and other adults in the household. Mothers are generally responsible for the discipline of young children and girls. Older boys are believed to be particularly "rough" and therefore in need of a father's discipline. Although a boy may have little contact with his father, who may not live with or near him, boys receive significantly more punishment than girls and physical abuse is a problem, particularly with stepfathers (Bailey, Branche, McGarrity, & Stuart, 1998).

Puberty and Adolescence

The socialization of boys and girls diverges more sharply in adolescence. Parents try to confine girls to the home to avoid pregnancy, which would bring shame on the girl and her family and interfere with her education and future employment prospects. Boys, on the other hand, are now hanging out on the street, the domain of men, and becoming independent. Mothers know that they should not be too "soft" on boys. If a boy stays at home and does household chores, he risks being labeled a "mamma-boy." Men are expected to be strong, tough, dominant, and providers. Boys need to move to the streets to develop these characteristics.

Girls attend school more often than boys, generally do better in school, and receive more education, mainly because school is essentially a feminine institution. The adolescent boy is learning that a man should be making money to support women, a household, and perhaps a flashy lifestyle. Consequently, boys tend to leave school earlier than girls. However, there are few economic opportunities for adolescent boys who drop out of school, at least in the formal sector. They gather in peer groups, on street corners or at "rum shops," talking, joking, drinking, dancing, gambling, playing dominoes or sports, and making advances to passing girls. Assuming they have money, adolescent males will dress up in flamboyant fashions and sport at dance clubs and bars in the evening. The lack of jobs and pressure to have money lead many in the inner city into drug dealing, gangs, hustling, and theft at a surprisingly young age.

The most pressing concern of adolescence is becoming sexually active. Parents rarely discuss sex with their children, who learn from older peers. While protecting their daughters, parents ignore or at least tolerate the sexual activity of their sons. Male sexual prowess is idealized in the culture. In order to be a man, a boy must become sexually active, preferably with several girls, and is under pressure from his peers to do so. He must also prove his heterosexuality, because men are homophobic. Boys generally become sexually active between the ages of 14 and 15, and girls between 16 and 17.

Attainment of Adulthood

A boy becomes a man when he is able to defend himself, dominate women, and is sexually active. He can then enter into a regular sexual relationship publicly. He becomes an adult when he earns enough money to establish a household and support himself, a woman, and his children. This is particularly difficult for working-class men, owing to a lack of good jobs. Consequently, for many men adolescence is prolonged well into their twenties, during which time they may continue to live with their parents.

A girl starts to become a woman with her first menses. In order to be an adult, she must break free of the generally severe restrictions of her parents. In the middle class, this is often accomplished through marriage. However, in the working-class majority, it is typically achieved through pregnancy, which could be seen as an act of rebellion or defiance. In 1996, 47% of women having their first child were under the age of 20. The first pregnancy for a teenager living with her parents assumes a ritualized process akin to a rite of passage. The pregnancy is first met with strong disapproval by her parents, causing the girl to seek refuge with kin or friends who intercede with her parents on her behalf so that she can return home. After the birth of the child, the girl's mother assumes full control over it, but it is understood that the daughter will be responsible for the care of subsequent children (Chevannes, 1993).

Subsequently, a young woman is freer to enter into the world of the street and adult life and form relationships with men, both casual and long-term, including co-residential unions. Typically, a working-class woman will have several "visiting" relationships in her late teens and twenties, resulting in children from several fathers. Pregnancy sometimes seems to be an attempt to "cement" a relationship (Brody, 1974). The illegitimacy rate is

very high—87% in 1995. Of those born out of wedlock, the father was legally registered in only 41% in 1995, although a majority will acknowledge paternity informally and offer some support.

Middle Age and Old Age

Marriage is an exalted state of union in Jamaica, a special and relatively rare relationship, carrying high prestige. Slaves were not permitted to marry, but missionaries made marriage a priority following Emancipation, and marriage is still a major issue in Christian churches today. In the working class, marriage is the ultimate culmination of a relationship, not the beginning, and so it occurs late, if at all. In fact, marriage tends to occur near the end of, rather than before or during, child-bearing. Eighty percent of the total population is legally single, including 69% of those over the age of 16. On the other hand, many adults are involved in relatively long-term, often stable, co-residential "common-law" unions. The marriage rate has been increasing of late, rising from 4.7 marriages per 1,000 people in 1989 to 10.3 in 1999. The average age at first marriage is 33. According to a recent report in the *Jamaica Weekly Gleaner* (December 20–26, 2001), Jamaica has the latest age of first marriage for women and the second-latest age for men in the world. Marriage is more common, and occurs earlier, in the middle and upper classes, than in the working-class majority. One important reason for the low rate of marriage, and the late age of marriage, is lack of economic stability for men in young adulthood.

Marriage is a sign of conjugal and economic stability, and it garners respect in the community, signified by the use of the honorific titles "Mister" and "Mistress." It is perhaps a prerequisite for active involvement in church and community organizations and affairs.

Older adults often become parents again, in that a great deal of child-shifting goes on. The most common form is for a young working women, in a city or abroad, to send some of her children home to the country to be minded by her aging mother or parents.

PERSONALITY DIFFERENCES BY GENDER

The personality traits of men and women are strongly influenced by sexually segregated parental roles, the socialization of children into those roles, and widely accepted beliefs about male and female "nature." Color, ethnicity, class, and residence shape children's experiences by influencing household composition and children's relationships to kin and nonkin.

In working-class families, both boys and girls stay in their yards where they receive intensive contact with their mothers and female kin. Mothers identify strongly with their daughters. Boys acquire a gender-appropriate identity through separation from their caretakers and active association with older boys and men. When coeducation begins, boys are encouraged to run errands, congregate with other boys, and, in adolescence, acquire sexually aggressive norms of behavior. Girls play with other girls, continue to identify with their mothers and other female kin, take on greater household responsibilities, and assume the traits of a lady.

Men are expected to display dominance in the household, independence, male camaraderie, and sexual promiscuity. Upper-class men may be sexually promiscuous, but are predominantly viewed as caring and faithful family leaders (Douglass, 1992). Women are taught to keep social distance from men, although comfortable joking and banter occurs. Jamaicans distinguish between "women" and "ladies." A lady is the ultimate expression of femininity achieved through education, refinement, attention to a well-groomed appearance, and unobtrusiveness. Hypothetically, a lady can be "white," "black," or "brown," but the lighter the female, the more likely she will be considered a lady (Douglass, 1992).

GENDER-RELATED SOCIAL GROUPS

Caribbean society is often incorrectly characterized as matriarchal. The social institutions of Jamaica—the family, education, medicine, politics, religion, etc.—are generally based on strong female participation, segregation by gender, and male dominance. The family, for example, is often referred to as "matrifocal" or mother centered, because the mother assumes virtually the entire responsibility for the household and childcare, but the man of the house has ultimate authority, even though he spends little time there.

Over 70% of Jamaican women eventually give birth, and the average mother now has three children. In many cases, a woman will have children by more than one man, and maintain relations not only with those men but also with their parents and families, particularly the

"babyfather's" mother, creating an extensive kinship network, although people generally are closest to their mother's kin.

Adolescent boys and young men typically form into same-sex same-age groups and spend a great deal of time together, simply "idling" on the streets, gambling, playing dominoes, cricket, basketball, or football. In the inner city, they are quite likely to become involved in the infamous and violent gang underworld. Girls are less likely to spend time in peer groups, mainly because they are usually restricted to the home and have chores to perform.

There are many voluntary associations in Jamaican society, particularly in the middle-class and urban areas, including football clubs, library associations, professional organizations, trade unions, and political parties. Some are male, some female, and some mixed, and in the latter case the leadership is primarily male even where the membership is predominantly female. This pattern prevails in the church, one of the most important social institutions. A large majority of churchgoers are women, and women are more actively involved in church activities than men; nevertheless, men hold most of the leadership positions.

Education is perhaps the most female-dominated institution in Jamaican society. Sixty-four percent of principals and 92% of teachers in primary and all-age schools are women. The average academic performance of girls is much better than that of boys, and the dropout rate is higher for boys; therefore girls generally advance farther in the system. At the University of the West Indies in Kingston, for example, men made up only 26% of the graduating class of 1998. Errol Miller, Professor of Education at the University of the West Indies, warns that this educational trend is leading to a "marginalization of the black male" in society.

GENDER ROLES IN ECONOMICS

According to the International Labor Organization, 10.3% of men and 22.3% of women were unemployed or without paid work in 1999, and 73% of men and 55% of women were economically active. Women predominate in the informal sector as market women or *higglers* selling farmers' produce which they have purchased, or homemade sweets, clothing, household goods, or school supplies at small stands outside school buildings. Some men are higglers as well, but it is regarded as women's work. Higglers play a central role in Jamaican folk culture as strong independent women, but are nonetheless of low status, along with other female-linked informal sector positions such as domestic workers and prostitutes.

Poor women and some men engage in informal savings institutions known as *pardner*, pooling their money in a common fund and taking turns drawing from it to pay for major expenses such as a car, school fees, or the creation of a microenterprise. Another key strategy for getting out of poverty is migration for both men and women. In 1999, 47% of migrants traveling to Canada and 49% traveling to the United States were male. Female migrants take positions as domestics, nannies, and cooks. Increasing numbers of Jamaicans migrate to work in tourist communities along the north coast. Women work as souvenir and craft vendors and as maids. They may manage small resorts for their husbands and sons, but men are the main beneficiaries of the big money in tourism derived from land speculation and enterprise, as well as drugs. Men also produce and sell woodcarvings and jewelry (McKay, 1993).

The growth of the electronics and textile manufacturing sectors in the 1960s and 1970s led large numbers of young women to relocate to urban areas to work in factories with low wages, few benefits, cramped working conditions, and long hours in insecure jobs. Women continue to work on the factory floor in free-trade zones. They have not been encouraged to join labor unions, even though they are the most exploited workers, receiving the lowest wages and the least opportunities to increase their skills. Both men and women work long hours with little pay on agricultural plantations (e.g., banana, cane, coffee). Throughout the economy, men predominate in managerial and executive positions, and in labor unions.

PARENTAL AND OTHER CARETAKER ROLES

Women are largely responsible for the care of children and they acquire significant status through mothering activities. Many working- and middle-class women without children take in others' children, caring for them as their own. Motherwork, which extends to aunts and grandmothers, includes nurturing and affectionate behavior, mild scolding, and instruction in sex-linked household chores.

Girls learn feminine tasks, such as cooking, clothes washing, sweeping, and sewing, from their mothers.

In rural areas boys help their fathers with farm activities, hauling water, caring for livestock, and collecting wood. In practice, sex role training is fluid in that boys and men will help with household chores and girls also work with their fathers in productive activities outside the home (Fox, 1999).

Fathers are defined predominantly as breadwinners and disciplinarians of children across class lines. Mothers flog their daughters, but fathers protect children, especially sons, from becoming "bad" with the threat and occasional administration of "wicked" floggings (Chevannes, 2001). Although households are mother centered, fathers maintain social dominance even in absentia. Fathers are more likely to be stable members of households in middle- and upper-class families, but their activities also take them away from the household and they are rarely available as emotional resources for boys. In Rastafarian households and communities, fathers try to take on more nurturing and affectionate roles; however, here too they are disciplinarians and women are nurturers.

LEADERSHIP IN PUBLIC ARENAS

Politics is generally considered to be a man's world in the Caribbean, where it is viewed as unfeminine (Senior, 1991). Women, particularly from the working class, are overburdened with domestic responsibilities, leaving them with little or no time for politics. Men, on the other hand, being largely free of domestic responsibilities, can dominate the political arena. Middle-class women are active in political parties, especially in campaigns, but serve mainly in supportive roles, at the lowest levels, as in other spheres of Jamaican life. However, women are beginning to gain greater influence in politics and other public arenas. One reason is that feminism became an active force in the region in the 1970s, generating much research, raising issues of special relevance to women, and spawning a number of organizations for the advancement of women. In addition, women are advancing into middle- and upper-level managerial and professional roles.

GENDER AND RELIGION

Jamaica is an exceptionally religious society. Religious beliefs permeate every aspect of daily life, and the church is often as important to an individual as work and family. Although the leaders of most churches are men, women are in the majority, in attendance and membership, and are much more involved in church activities. As in other areas of Jamaican life, men perform public roles that are typically expressive, conspicuous, performative, and status bearing, such as preaching, while women are responsible for more inconspicuous, typically domestic, tasks. Women are believed to be more "spiritual" than men, that is, more often ecstatic in services, although statistics collected by Wedenoja do not bear this out.

There are four significant forms of religion in Jamaica today. The orthodox Christian churches, including the Anglicans, Baptists, Methodists, and Presbyterians, were established in the early 19th century and hold the allegiance of 25% of the population, according to the 1991 census. Their membership has declined drastically during the 20th century. Revival, an indigenous, folk, or Creole religion (also known as Zion and Pocomania) that developed in the mid-19th century, is not recorded in the census. The Pentecostal Christian churches, which date from at least 1918, have grown steadily and are now the most popular, at 29%. Finally, the famous messianic millenarian Rastafarian movement, which originated in Jamaica in the 1930s, has had a dramatic impact on Jamaican culture even though it accounts for less than 1% of the population.

Orthodox Christianity brought European morality to Jamaica where it became the bastion of middle-class respectability, centering on the sanctity of marriage, the nuclear family, the patriarchal role of the husband as provider and head of the family, and the wife as homemaker and mother. The working-class was thereby excluded, and developed Revival as an alternative. However, when a working class woman gets married, she often joins an orthodox church as a sign of her new status. The orthodox churches are always led by men, and about 45% of their members are male. About half of all Revival churches, on the other hand, are led by women, and men made up only 37% of a large congregation studied by Wedenoja.

Pentecostalism and Rastafarianism both developed in the early 20th century and are markedly gendered (Austin-Broos, 1987). According to the 1991 census, 57% of Pentecostals are women, although the percentage of women at services is generally much greater. In contrast, 81% of Rastafarians are male.

Pentecostal churches attract young single working-class mothers in particular. Although Pentecostal

congregations are led largely by men, women can attain positions of leadership, including that of pastor. The ideology of these churches is essentially a protest against male domination and exploitation of women, particularly male "promiscuity" and "irresponsibility." Women follow strict rules of dress and demeanor associated with modesty. Pentecostalism promises to "cleanse" women from "fornication" and make them "brides of Christ" with the support and protection of the congregation. Jesus is depicted as the faithful dependable husband, apparently lacking in "the world", as well as an alternative role model for male converts who have been "saved" from the "world of sin" on the streets.

The Rastafarian movement seeks to liberate black people from white oppression; ironically, it also promotes male domination and female subordination (Lake, 1994). Men are the designated spiritual leaders of the movement, the heads of households, and the rulers of women. They are to "spread their seed" without regard to their marital status, while their wives must remain faithful. At the same time, however, men should be sensitive to the needs of their wives and develop a close relationship with their children. A woman becomes a Rasta through her man. She should wear a long dress and cover her head. She should not speak in church or talk directly to God, and is subject to menstrual taboos when she is "unclean." One of the main aims of the Rastafari is to reassert the dominance of poor and working-class men, perhaps in response to a matrifocal upbringing. It also offers a new male identity, based on Haile Selassie, the black messiah, possibly as a substitute for the absent father.

Many revivalists practice a popular form of healing known as *balm*, which is usually performed by an older woman referred to as a "Mother," who offers divinations, baths, herbs, candles, incense, and prayers to cure spiritual afflictions. Therefore healing is associated with women, and the healing relationship is modeled on the mother–child relationship. In contrast, *obeah*, the practice of sorcery, is always practiced by men, as is Science, the use of magic for good fortune (Wedenoja, 1989).

LEISURE, RECREATION, AND THE ARTS

Leisure activities are structured according to class and gender. Boys have fewer chores than girls, and learn early on that public space is a domain for male leisure and recreation. In late afternoons after school, adolescent boys can be seen playing football or basketball in schoolyards, while girls play netball.

Men seek leisure outside the home—including sexual satisfaction. Men also engage in drinking, gambling, joke telling, boasting, and story telling. Working-class adolescent boys and men gather in groups known as "crews" or "loafing groups" on street corners and in rum bars, or play dominoes in shops. Upper-class men meet in yacht club bars and engage in bird shooting, sailing, and fishing tournaments. Upper-class "ladies" devote significant time to beautifying practices such as exercising, shopping for clothing and make-up, frequenting spas, and going to the beauty parlor. Middle-class women devote significant leisure time to voluntary social groups.

On weekends, young women socialize on the street as well, since this is the time when "sound systems" are brought out, "DJ" parties take place in town squares or city neighborhoods, and "jerk" stations are set up. Outdoor DJ parties draw large crowds, and usually begin late and last till early morning hours. Many communities also have dance halls, which are frequented predominantly by working-class men and women. Some also house bars and strip joints, which are patronized by men and a few women of low respectability. Many communities host weekend bingo tournaments, which draw large crowds of working- and middle-class men and women.

Marijuana or *ganja* smoking is an important leisure activity in the working class. Men enjoy smoking during breaks at their work sites, in groups away from work, or as a solitary experience in the mornings and late at night in their yards. Rastafarian men engage in "reasoning" sessions where they ritually smoke ganja, philosophize, and reinforce male bonds. Women's smoking is infrequent and generally prior to sexual activity.

RELATIVE STATUS OF MEN AND WOMEN

Women are better educated, have a higher rate of literacy, and a greater life expectancy than men, but in every other respect are marginalized. Men are the heads of households, the leaders in government, politics, and churches, and the managers of businesses and industries. Men control the major institutions of society, including the economic and political systems and the media. Women, regardless of class, are subordinate to men in almost every sphere of life. The main areas in which women

have influence are the home, child-rearing, education, churches, higglering, healing, and nursing.

Male dominance is particularly clear in relationships between the sexes, which have been characterized as "adversarial" and lacking in trust (Bailey et al., 1998). Women are expected to cater to the needs of men. The double standard prevails, in that men but not women can have multiple relationships without sanction. Men also feel free to coerce women physically, and are thought to be "soft" if they do not, although women are not supposed to strike men (Chevannes, 2001). Women suffer a high rate of violence from men, including rape, with little recourse.

Women are free to choose their mates and decide whom they will live with and marry. The home or yard is considered to be women's space and, indeed, women often hold title to the house they live in. Men feel little obligation to help with household chores, which they consider to be demeaning if not polluting. Spouses generally control their own incomes and assets, and keep them separate, at least in the working class. Women typically use their assets for the well-being of their children—to clothe, educate, and provide medical care for them. Women are most highly valued as mothers; indeed, this is a near saintly status.

SEXUALITY

Jamaica is a profoundly heterosexist society in which homophobia is widespread. Discrimination and violence against gays and the absence of a gay rights movement characterize dominant Jamaican attitudes toward same-sex relations. While lesbianism is decried as well, gay men receive the brunt of virulent homophobic sentiment. While there is somewhat more tolerance among the elite, antihomosexuality is a key aspect of the ideology of heterosexual relations in the drawing of distinct boundaries around acceptable definitions of heterosexual masculinity and femininity.

Children are guided toward gender-appropriate sexuality early on. Adult sexuality is familiar to children, many of whom, particularly in rural and poor urban areas, live in close quarters with adults, sharing the same room or bed where they are exposed to sexual behavior. Parental control over boys' sexuality decreases in adolescence when they are encouraged to seek sexual experiences. By contrast, pubescent girls are guided toward

modesty, and control over their sexuality tightens. They are warned about the constant sexual desires of men and the pressure they will receive from them to engage in intercourse. Significant numbers of girls are introduced to sex through rape, which is feared by girls and women.

Children grow up in a sexually paradoxical world, where double standards abound. The church and middle-class morality constrain the sexual expression of women, while sexually explicit lyrics permeate reggae, hip-hop and dance-hall music, referring particularly to women's vaginas as the proper locus of male attention and to chi-chi men as societal scourges. Soft pornographic girly pictures are also rampant in advertising and public spaces. Dance-hall culture, centering on the sexually explicit hip movements of young women, has been adopted by some working-class women as a form of resistance to the constraining respectability of middle- and upper-class values of feminine sexuality. Others view dance-hall as explicitly misogynist (Cooper, 1995).

COURTSHIP AND MARRIAGE

Since 1887, when civil registration for marriage was first institutionalized, marriage rates have remained low among Jamaica's working-class majority. In 1988, the rate was 4.4 per 1,000. Three forms of partnering prevail, including legal marriage, common-law marriage and visiting arrangements. Multiple partnering is also common. It is culturally acceptable for a man to have more than one woman since men are expected to be promiscuous by nature. Women also seek multiple partners as sources of economic support.

The working class tend to marry later in life, typically when men and women are in their forties, can pay for the ceremony and a separate household, and have already produced offspring from previous nonlegal unions. Among the upper classes, marriage is hypergamous and occurs earlier in life, with women in their early twenties and men in their late twenties (Douglass, 1992).

Christian, working-class, and middle-class marriage ceremonies take place in churches with receptions often occurring outdoors at a relative's home. Amidst music arranged by a DJ, toasts are made and "box lunches" of fried chicken or curried goat are served, along with "mannish water" (goat soup). Among the upper classes, church weddings are followed by lavish receptions on the estates of the bride's parents, where extravagant meals of

traditional Jamaican fare are served and men make toasts in honor of their wives.

When working-class women marry they do not expect romantic love, although it does exist. Instead, they "look money" and status, while men "look sex" (Sobo, 1993). Many men and women avoid marriage because of lack of trust, poor communication, and economic wariness. Women believe men will avoid financial responsibility and men fear women's control over them. Common-law arrangements indicate a common household without legal sanction, while visiting relations involve neither legal sanction nor a common household. Common-law is by far the most popular conjugal bond of the working class. Working-class women first enter into visiting relationships in their twenties, but tend to move into common-law arrangements after they have their first child. Visiting relations are a form of extended courtship with a sexual component, involving frequent meetings when couples reside close by. Men are expected to help financially with a woman's children, particularly if the man is her "babyfather." During visiting meetings couples go on outings together to clubs, parties, sports events, the beach, and church (Roberts & Sinclair, 1978).

Children learn by early adolescence that men initiate courtship through the use of their bodies and that women who do so are considered "bad" women, without sexual control. Women are subject to sexual comments by men who "lyrics them," accepting advances by permitting men to hold their hands (Chevannes, 2001).

HUSBAND–WIFE RELATIONSHIP

Although mistrust characterizes many working- and middle-class male–female relationships prior to marriage, affection between men and women grows, especially with age, as reproductive roles become less significant and trust increases (Fox, 1999). Still, a man's influence extends over his family and wives are supposed to listen to husbands. Both legal and common-law marriage are regarded as economic arrangements to share sexually divided work, although this ideal is not as rigidly adhered to as it is described, and husbands and wives often assist one another. Because marriage is a symbol of respectability, legally married couples in particular work to maintain an image of stability, legitimacy, and propriety in the eyes of the community by participating in community life. Love and status are important motivations for marriage

for the upper classes. Middle-class families strive to emulate husband–wife relationships in elite families.

Jamaica ranks tenth on the list of lowest divorce rates in the world. In 1999, there were 4.4 divorces per 10,000. Women instigate divorce more often than men. Divorce remains a stigma for women, many of whom move abroad or away from the community to avoid social isolation (Douglass, 1992). There is a "cultural promiscuity of violence" perpetuated by men who view wife-beating as an expected form of husbandly chastisement for what they regard as insufficient domestic or sexual services, or lack of respect. Men also identify women with children, using violence as a form of punishment for disobedience (Bailey et al., 1998).

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Caribbean feminism began to permeate public consciousness through activist groups in the 1970s. The well-known Sistren Collective is an independent women's cooperative and theater group. Initiated by working-class women, Sistren organizes workshops and presentations around women's work, violence against women, and women's history. Rising feminist consciousness and greater education have led more women to express a desire for economic independence and the greater freedom it affords, including the ability to move out of abusive relationships. Organizations such as the Women's Bureau provide women with links to services such as medical care, agricultural extension, legal aid, and support groups.

In the 1990s, a men's movement led by Professor Barry Chevannes and others at the Mona campus of the University of the West Indies took shape. Chevannes organized workshops for men throughout the island to foster male responsibility, to help men learn to express their emotions, and to discuss their fears about the challenges of fatherhood and partnerships with liberated women. Whereas in the 1980s the popular press featured numerous articles for women on acquiring ladylike mannerisms, newspapers in the 1990s featured the topic of "manhood" extensively. Coverage of the crisis of masculinity, the increase in male school dropouts, crime, and idleness reflected increasing discomfort with traditional notions of male dominance, the turmoil created by women's growing economic independence, and the need to develop new models of male responsibility. Since the

benchmark of manhood has been to provide material support for children, men are expressing mounting frustration in their inability to find gainful employment, even though this objective has always presented a struggle for working-class men in particular. Men insist that they must have work to have women. Since women's opportunities are improving and they can afford to be more selective, tension between men and women is rising.

Shifting relations between men and women have also given rise to new mating practices. Adolescent girls increasingly pursue older men as sources of economic support, eschewing boys of their age by saying that "school boy have pocket change but big man have salary." At the same time, older men are seeking younger girls as part of the myth of the "virgin cure" for HIV. Unfortunately, these relationships are contributing to rising rates of HIV among adolescent girls. In recent years, economically successful single women, including higglers, have sought younger men for sexual satisfaction and status, keeping them in new clothes, lodging, and food. In sum, Jamaican gender relations are in flux, influenced by internal factors as well as transnationalism, industrialism, and globalization, producing a wide range of contradictory results: confusion over gender roles, increased opportunities, status, and independence for women, burgeoning tension between men and women, and a decline in perceptions of male productivity despite of their continued dominance in politics and the formal sector of employment.

Kayapo

William H. Fisher

ALTERNATIVE NAMES

The Kayapo are also known as the Mebengokre, Northern Kayapo, Cayapo, Kaiapo, Mekranoti, Mekrãgnoti, Gorotire, Metuktire, Irã'ãmranhre, Txukarramãe, Xikrin, Kararaô, Gradáu, Gradaho, Tchikrin, Djore, Purucarus, and Chicrís.

LOCATION

The Kayapo are located in the states of Pará and Mato Grosso, Brazil.

CULTURAL OVERVIEW

People of the 16 different villages embraced by the encompassing label "Kayapo" or identified as one of the Kayapo subgroups above all refer to themselves as "Mebengokre" or "people of the watery depression." Population currently stands around 5,000 and has been on the increase for some two decades. The communities mentioned are also classified as Northern Kayapo to differentiate them from the Southern Kayapo.

For some 200 years Kayapo have moved steadily westward from the savannah regions in the state of Tocantins toward areas of tropical forest or forest–savannah margins. Large villages with thousands of residents are known historically. As with other Gê language family speakers, settlement residence alternated with treks involving groups of extended families. Subsistence depends on a range of techniques: collective and solitary hunting and fishing, collecting wild plant foods, and slash-and-burn horticulture. An opportunistic orientation that moves people to food resources predominates.

Kayapo settlements are composed of a ring of houses occupied by extended families built up through matri-uxorilocal residence. A men's house is commonly constructed upon the central plaza. Populations average several hundred but may range from under 100 to nearly 1,000. The village center comprises a ceremonial area where dancing and singing occurs almost daily. These performances are often rehearsals leading over weeks or months to a ceremonial climax of whatever festival is underway. That the Kayapo consider themselves to be part of a slowly unfolding ritual much, if not most, of the time seems to make them fairly unique.

Each village is politically autonomous, although bonds of kinship link individuals of different villages. Formal leadership positions exist in association with age grades and men's clubs. Prominent secular leaders are males who combine a number of attributes, including a knowledge of specialized speech and chants (*ben*) and persuasive and powerful oratorical ability. Leaders drawn from the unmarried men's age grade should be energetic and exemplary workers. Auxiliary women's groupings exist consisting of wives of associated men's organizations, with the wife of the male chief serving as female chief. The visibility of this role is low and appears more as a conceptual counterpart to men's activity and organization rather than a public leadership role. Nevertheless, without a respected wife who exercises her own influence over female public opinion, a man is considered unqualified to lead. Membership in age grades is calculated by social age rather than absolute age, which, in turn, is linked to physical and social maturity, marriage and birth of children, and eventually grandchildren.

Marriage is monogamous and divorce is common, although lifelong spouses are also common and may become extraordinarily close emotionally. Kinship terminology follows an Omaha pattern, but there are no descent groups. Pedigrees may extend back four or five generations, and names are endlessly recycled. Names, ceremonial ornaments, and privileges linked to a name are more important for tracing relationships between living persons than are deep genealogies. Genitors do not name their own children, who receive their ceremonial and nonceremonial names from a class of same-sex social mentors who include genitors' cross-sex siblings and ascending lineal relatives. Both males and females inherit

formal friends from their father and this relationship may be inherited patrilineally.

CULTURAL CONSTRUCTION OF GENDER

Males and females are distinguished according to their different genitalia, as "penis ones" (*me my*) and "vagina ones" (*me ni*). However, human growth is not automatic and the social qualities and physical abilities that allow one to act as an adult man or woman are built up slowly, although transition from one age/gender category to another is abrupt. The formation of the fetus requires repeated intercourse and may involve different men. Different phases of the life cycle are signaled by passage to the next age grade. Each age grade carries distinct standards of proper food consumption, social behavior, including sexual behavior, and distinctive participation in economic and ritual activities. Toward the end of their lives, elderly men and women have acquired quite different knowledge but act in very similar ways and enjoy a similar relaxation of dietary rules and codes of etiquette. Attributes of gendered persons are also differentiated according to age. It is difficult to point to any attribute associated with genitalia that survives the abrupt age transitions unaltered.

Formerly, boys of 7 or 8 would leave their natal houses to sleep in a bachelor's dormitory or men's house; today they sleep in their natal residences as well. Men must marry out of their houses and also leave the village to hunt, make war, or to travel further afield—often today to Brazilian towns and cities. Males thus require specialized knowledge to control the eventual consequences of the supernatural threats to which they are exposed and the development of bodily abilities such as sureness of foot and piercing eyesight in order to be good hunters. New knowledge and abilities come burdened with food and behavioral taboos in order to be effective. The development of men is thought to require more time, effort, and guidance from elders than that of women. However, female bodily abilities and knowledge must also be cultivated in a fashion analogous to those of males. Kayapo cite examples of women hunters and travellers, including those who have made contact with far-flung societies from which they are said to have brought back valuable cultural knowledge. In short, whether male or female, Kayapo can only carry out activities proper to their gender by virtue of their own preparation

and self-transformation. Male assertions of superiority to women, when they occur, refer to socially developed qualities, such as greater propriety and self-restraint, rather than to natural endowments of manhood. As in other Amazonian societies, women do not necessarily acknowledge male superiority, and conflicts between men and women as groups are considered to be normal.

At birth, male and female infants have their ears pierced and a hole is made below a boy's lower lip. By adulthood Kayapo men may have progressively distended this opening to receive a lip disk. While the earlobe holes of both males and females are both distended, only men decorate these with earrings. After childhood, both males and females wear their hair long. Sexually active females traditionally shave the crown of their head, as do children of both sexes and men on the occasion of certain rituals and life crises. Hair is also cut by both sexes to mark mourning periods. Women paint children of both sexes with elaborate geometrical designs and adorn the lower cheeks of men and women with similarly elaborate genipap designs. Formerly, male dress, apart from body paint and ornaments such as bracelets, consisted of a conical penis sheath fitted over the foreskin; females wore belts around the waist. Today most women wear single-piece shifts, and males wear shorts; plastic flip-flops are commonly worn by everyone.

While the gendered attributes of persons shift with age, a stark gender opposition is imposed on the village layout: the public realm of the plaza is considered to be associated with maleness, while the ring of houses forming the circumference of the plaza is a female realm. There are some general behavioral differences characteristic of men and women: adult women keen both as a lament and in welcome, ceremonial speech is used only by adult males, there are some slight differences in male and female vocabulary, and females of any age should avoid contact with bows and arrows and firearms. However, during some life phases and life crises, males, too, should not handle firearms and do not speak publicly.

Bachelors and unmarried nubile women are generally thought to embody the height of sexual attractiveness. Pudginess is attractive in females and men greatly augment their ability to attract sexual partners if they have manufactured goods to distribute or are frequently successful as hunters or fishers. Characteristics such as intelligence are appreciated equally in males and females, and both males and females acquire specialized

knowledge in the use of medicinal plants and both may become shamans. In summary, males and females are born with different genitalia but are formed from identical components—a physical substance shared with both male and female nuclear family relations, knowledge gained from both males or females, and a soul-essence that is unique to each person. Physical and social abilities must be developed in distinct ways in order to acquire characteristics proper to one's age/gender grade.

GENDER OVER THE LIFE CYCLE

Life stages are classified according to age/gender grades, and both males and females make cosmetic alterations or embellishments to the body proper to each grade. Codes of conduct and alimentary rules are also correlated with these social categories. Position in sibling birth order and personality differences are also cited in connection with the public persona, individual vigor, and prestige of different individuals.

The Socialization of Boys and Girls

Before they can walk unaided, infants are never left unattended. Babies are carried in a sling that allows access to the breast, which they are generally offered at the first signs of crying or discontent. Small children are allowed to crawl under close supervision. Children are highly desired and no preference is expressed for either gender. Ideally, a couple would alternate between boy and girl births.

Newborns of both sexes are called "suckling ones" (*kra-karà*) or simply "little ones" (*meprire*). Boy and girl infants are heavily adorned with red cotton bandoliers, cotton bands below the knees, and cotton wristbands and ankle bands, while their faces are covered with achiote and their bodies painted with an identical genipap motif. Parents appear to take delight in strong personalities irrespective of gender. After they learn to walk and speak, even more attention is lavished on both boys and girls; they receive yet more ornaments and have their head crowns shaven and decorated. This stage corresponds to weaning in some Kayapo villages. Bodies of boys and girls are painted with identical motifs which may be seen on adult women in some cases, while identical cheek motifs may be sported by adults and children of both sexes.

From about 3 to 8 years, boys are referred to as *mebôktire* and girls as are referred to as "big children" (*meprintire*). Children play in public space when outside their own household and unselfconsciously adopt postures they have observed all their lives; boys and girls tend to interact in groups that closely match their sex and age. Both genders may play raucous and energetic games, but boys are given little bows and arrows, fishlines and hooks, and model airplanes and whirligigs made of straw, and girls are given little baskets and baby slings. Girls begin to accompany their female relatives to the gardens, tend to smaller children, and carry small burdens, while boys are called on much less frequently to help. Children of both sexes are taught to stand up for themselves vigorously against bullies of both sexes; they may engage in open temper tantrums, and children as old as 7 or more may seek the solace of the breast if they are greatly troubled. All children are encouraged to respect their grandparents and others of their relationship category, called *ingêt* (male) and *kwatỳj* (female) (which includes MB (mother's brother), FZ (father's sister), and MBS (mother's brother's son)), and to choose to learn specific skills and knowledge from them. The senior relative in this relation, particularly of the same sex, should be the one to discipline the junior one, rather than the child's own parents. Parents comment favorably on childrens' signs of independence, such as the desire to sleep separately, although children are also encouraged to sleep with their grandparents from whom they learn tradition and special skills. Children are aware of the sexual activity of couples and unmarried girls who receive lovers in the close quarters of the house. Although boys and girls may remain unclothed, girls are taught to sit with their legs together. Boys who have already demonstrated a propensity to aggressiveness may be given medicines to develop bellicosity further. In general, steps are taken to make boys fierce (*akrê*) and to make girls tame (*uabô*), though individuals may display either quality.

Formerly, it was common for a *meprintire* girls to be betrothed to an older man, who, while taking other women as sexual partners, would occasionally sleep near the girl and give her presents, including meat, so that she would like him. When the girl reached an age appropriate for sexual relations, the marriage would be consumated. Although the girl was not yet fully able to assume the economic role of wife, the son-in-law was incorporated into the division of labor within the uxorilocal household under the direction of his wife's parents, toward whom he would show either deference or avoidance on proper occasions.

Before the onset of puberty, there are radical changes in the lives of both boys and girls. Around 8 years of age boys advance to the *meôkre* grade (the painted ones) and are inducted into the men's house. Here, younger boys are in close contact with older boys and bachelors to whom they listen attentively. They watch as older males slip away for trysts with women, and elders come at night to awaken them with stories or counsel in tradition. Although a boy returns to his natal house to eat, he no longer receives the almost unlimited attention and comfort afforded younger children. No longer is he painted by his mother, but by men. Girls at this age also shoulder more responsibility for subsistence and are less coddled. They begin to develop their own skills in body painting, practicing on dolls and playmates of the same age. The continuity in a girl's life can be seen in her body paint; she continues to be painted with motifs appropriate for children and continues to wear red cotton thread wrapped below the knees. However, *mekurêrê* girls older than about 8 have their hair cut and may begin to engage in sexual relations. They are not old enough to have husbands or to bear children.

Puberty and Adolescence

After a boy reaches puberty, he receives a penis sheath and becomes known as *menõrõnyre* (ones who sleep in a new way). At this time, crown hair, kept cropped since weaning or walking, may be grown out. This period marks the height of a male's independence from the domestic realm, since his life revolves around socializing with other bachelors, dancing, and generally being the energetic and visible emblem of village strength and unity, and he is not yet incorporated into a wife's household. While he accompanies older men in order to learn needed skills, he must not engage in many of their activities. He is susceptible to spiritual dangers of game and, although he often leads the way clearing the trail and gathering raw materials for adornment, such as sweet-scented inner bark, he should not discharge a firearm or eat many foods he will later consume freely. In short, his main task during this phase of his life is to develop physically, through correct adherence to food and behavioral restrictions, in order to develop "strong eyes" and knowledge. As a prospective husband he should learn to weave, among other things, a baby sling, basket, and ceremonial mat from buriti palm thatch. Young men should still have shame, or social reserve, in addressing the assembly of adult men and should be concerned with learning from adults rather than debating with them. Moreover,

their sexual activity heightens the shame they feel, particularly in the presence of their parents. *Menõrõnyre* may be scraped periodically with a comb made of dogfish teeth as a collective discipline of their age grade. Girls are not scraped in this way. However, an older female mentor of the boy may be scraped along with him. Stinging medicine is applied to the long scratches on arms, thighs, and calves to promote speed and strength. Boys knock down wasp nests with their bare hands and have their faces and arms smeared with the carbonized remains of burnt nests to cultivate fierceness.

No special recognition is afforded to defloration or a girl's first menstruation, which is thought to result from sexual activity. There are numerous accounts to support the conclusion that menstruation is thought to be anomalous or akin to illness and should be controlled through the regular use of medicines. When children are desired, other herbal medicines are used to activate fertility. A girl's readiness for child-bearing is signaled by painting with a distinctive motif, *mekrajtyk* (those with blackened thighs). She may receive lovers in the house at night. The shame felt by *menõrõnyre* of the sexual themes in the presence of their elders does not seem to afflict the young women age grade, and this is cited by some males as evidence of their lower level of sociality.

Attainment of Adulthood

The birth of a child represents the entrance into both a married state and adulthood. Either one or several fathers share the state of pregnancy (*metujarô*) with the mother. Once the umbilical cord falls, there are a series of public symbolic procedures involving both relatives and nonrelatives by which the new mother and father are reintegrated into full village life as *mekranyre* (those with new children). However, the postpartum taboo on the woman's sexual relations with her husband remains in force. In past times, it could extend up to 2 years. Nowadays, the norm seems to be several months. During this time, the man commonly takes on a *prõ krô'ã*, or substitute spouse.

The union of parental substance with that of their offspring and the association between what the parents ingest and the characteristics of the child that begins *in utero* is thought to be ongoing and reflected in the coordinated observances of parents on behalf of an ill or ritually honored child. On the other hand, foods off limits to the *menõrõrnyre*, such as certain fish, are perfectly acceptable to parents. Married men are able to hunt

because they are better prepared than bachelors to deal with the supernatural dangers entailed in killing game. Men often know specific medicines to allow them to override the ill effects of prohibited species and for this reason have a greater potential range of diet than their spouses. However, men are expected to be generous suppliers of game and fish to their household.

Married women always have their own garden, since one of the obligations of their husbands is to clear forested areas and assist in preparation and sometimes planting of crops as well. A women is commonly assisted by her unmarried sisters or widowed mother in her garden. Widowed or single women may prevail on a lover to slash their garden. Game distribution is overseen by the house's senior woman.

Middle Age and Old Age

With the birth of three or four children, mother and fathers become incorporated in the *mekrakramtire* (those with many children grade). The social reserve and shame that have constrained a man in both the men's house and his wife's house begins to ease during this life stage, and he may become a public orator and intervene most vigorously in discussion in the men's council. He has probably sponsored a name ceremony for his child which enmeshes him in future obligations to provide food and support to others but also gains him recognition as a peacemaker. Wives of this grade have been ceremonial sponsors along with their husbands and also enjoy the respect accorded parents of honored children. With the birth of grandchildren and the gradual recognition of the diminuition of their own sexual potency, men and women become part of the *mebengêt* (social mentors) grade. As they cease to have young children of their own they are less susceptible to restrictions observed by newer parents. Men of this age are the butchers of large game, and both sexes begin to consume many foods considered deleterious to younger people. Social reserve may be flaunted. Old folks of both sexes make their opinions known, often vocally and to the discomfort of others. *Mebengêt* may also make jokes and assume postures of ridicule during solemn occasions. They are thought to be inept as learners but finally able to verbalize fully and demonstrate what they have learned from their own elders over the course of a lifetime. Men may become heralds during this life stage, exhorting the entire village in the early morning and at nightfall. Finally, some communities

insist on a terminological distinction between sexually inactive and very old men (*kubêngêt*) and women (*abêngêt*), presumably because their own gendered activity no longer serves to make this distinction.

PERSONALITY DIFFERENCES BY GENDER

Kayapo are accepting of a wide range of personality types. The fierceness displayed by men is felt to necessarily be constantly inculcated through magic, ritual, and oratory. Boys and young men constantly engage in verbal and physical contests of one-upmanship, quite differently from their female counterparts. However, by the time men are married, such open competitiveness is frowned upon. Men feel far more affected by rules of social reserve and requirements to act tough and, consequently, women show a more open and easy sociability with other women. Women of different houses, for example, will time their baths in the river so as to socialize together, although this also may act as an impediment to interruptions by menfolk. Every few days women will spend hours painting one another and also gather nightly to sit and chat on the village patio. Men are more openly relaxed outside the more formal constraining context of the village and enjoy nighttime socializing in the men's house precisely because interlocutors remain unseen in the darkness and may be answered with less reserve. In private contexts, both men and women are openly sentimental, particularly when discussing close kin relations. Men notably stress close friendships with age mates to a much greater extent than women.

GENDER-RELATED SOCIAL GROUPS

Social structure may be either male and female oriented depending on where one stands. The major foci of social life are, respectively, houses, or residence units, sharing common ritual and subsistence interests formed by groups of related women and in-marrying men, and the men's house, which is generally off-limits to women. Houses are exogamous and maintain their relative position within the village circle and also commonly during treks. Each has an area for joint cooking by female kin in a stone/earth oven.

The men's house serves as a sleeping place for bachelors and divorced or separated men. It is the site of sitting places for the various male age grades and men's clubs and the focus of male social life. Men may take meals in the men's house as well as in their residences. Decisions affecting the entire community are taken in the men's house.

GENDER ROLES IN ECONOMICS

Married couples are expected to maintain fields in which crops are grown, notably, corn, sweet potatoes, bananas, squash, yams, sweet manioc, and, today, bitter manioc. Females are in charge of harvesting and preparing food, including meat and fish provided by men. Both genders are extraordinarily capable of providing for their own needs without their complement over periods of time that may range to several months.

Various activities are carried out by each gender: males slash underbrush, fell trees, burn the garden area, hunt with bows and arrows and firearms in addition to clubs, and make weapons, basketry, ritual ornaments, household utensils, canoes and, nowadays, "craft" items for sale. They may also collect Brazil nuts, animal pelts, or other natural commodities for sale. Women prepare food in the stone/earth ovens, boil and sieve manioc, make salt from palm stalks, make cotton string (an essential item for ornaments), collect firewood, and plant, weed, and harvest gardens. Both genders cooperate in housebuilding, although men cut the logs needed for houses modeled after the Brazilian backwoods style. Formerly, women erected house structures. Both genders collect wild products, such as piqui, although males specialize in honey (even though many, such as the *menõrõny*, cannot eat it), palmito, bacaba, and assaí. Women tend to focus on other resources, such as wild legumes and chocolate and certain ants and grubs. Men collect stinging ants for use on hunting dogs as well as the feathers, resin, and eggshell used in ritual ornaments. Both men and women may fish with hook and line, although only men handle fish poisons. Men tend to roast food, although women may do so as well; women are susceptible to heated vapors and so will not toast manioc flour over an open fire, although they will participate in other steps of the procedure.

Tasks performed outside the household that involve many people are organized according to age grades. In making manioc flour, unmarried nubile girls may fetch water, bachelors fish for the entire work party, and elderly women split firewood, while younger mothers sieve manioc and collect tapioca starch, married men do the toasting, and men with many children feed manioc through an electric grinder. The least active contributors to subsistence are usually boys and young men (*meôkre* and *menõrõnyre*) who may rarely hunt, fish, or garden, concentrating instead on self-decoration, singing, and dancing.

PARENTAL AND OTHER CARETAKER ROLES

Although childcare falls most heavily on the mother, fathers may hold their small children although feeding and cleaning up are left to the mother. Adults are uniformly expansive and enthusiastic with children regardless of their sex. Once they are weaned, small children of both sexes may accompany their father to the men's house. The caretaker role extends to older siblings as well and encompasses a spiritual dimension because parents and siblings share the vital substance thought to make up part of a person and thus must act as custodians through behavioral restraints and alimentary practices. Children also have the benefit of co-resident mothers and fathers (MZ and MZH), and *ngêti* (MF and MB) and *kwatỳj* (MM, MMZ, FZ) both lavish special attention on their *tabdjwỳ* (reciprocal terms) with whom they come to be identified ceremonially. Wet nursing is common and grandmothers as well as mothers may nurse. Children have numerous *ngêti* and *kwatỳj* and, especially boys, are encouraged to cultivate these relationships, actively because through them they will acquire specialized knowledge and ceremonial valuables. Boys are also initiated into the men's house with the expectation that they will be mentored by older boys. The role of substitute father is prominent in men's house induction, and he may be an important teacher and mentor in a boy's life. Additionally, in arrangements of institutionalized spouse exchange, parents regard offspring of exchange partners as classificatory "children" and, while they may not observe taboos on their behalf, may show them familiar attention.

LEADERSHIP IN PUBLIC ARENAS

Although there is a tendency today for chiefs to inherit the role from their fathers, this is far from the rule, and leadership roles must still be achieved on the basis of

special talent, ability, and energy even when succession is weighted in favor of a leader's offspring. Institutionalized leadership, with the exception of wives of chiefs who act as leaders of corresponding female age grades or women's clubs, is limited to males. These include *benadjwyr* (speakers of ceremonial speech), ritual song leaders, scouts, including those who specialize in tracking specific enemy peoples, and *ngôkonbàri* (Xikrin) or *meôbadjwynh*—leaders of unmarried age grade activities. In the past, courageous raiders were acknowledged for their ability to abscond with goods or even prisoners. Although killing a human enemy or a jaguar is desired as a mark of valor, no special position accrued to a killer, although he did have to undergo a special ceremony on his return to the village. Heralds are also male. Elderly women may be highly respected and quite influential; however, they exercise their influence both through public pronouncement and more informal counsels, particularly with other women. Public oratory in the men's house, where consensus decisions chart the course for future action, is the prerogative of adult men.

GENDER AND RELIGION

As noted previously, both men and women play parallel roles in major great-name ceremonies; although the male versions are more extensive and complex, the names and rituals valuables transmitted in the respective ceremonies are considered equally prestigious. Besides names and ritual ornaments, females inherit the right to raise certain animals as pets, while men inherit the right to claim certain cuts of meat from game animals. When female names are celebrated, females are featured performers, and males take center stage when male children are honored. In other ceremonies, such as the babassu palm ceremony or the new corn ceremony, males also take the lead. Certain ceremonial roles, such as gourd rattle bearers, are limited to males. Men may also dress up as monkeys during certain rituals at which time they make many sexually suggestive and outrageous acts, often aimed at female onlookers. Only mature adult men chant ceremonial speeches which feature a specialized lexicon known only to a restricted number of specialists. The ritual knowledge of songs, names, and ornaments held by both men and, women is greatly valued and, in such matters, the less knowledgeable defer to the more knowledgeable regardless of gender. Both males and females are ritual

sponsors for the children involved and both contribute to gathering the necessary foodstuffs. The *kwatỳj* of honored children are expected to make themselves available sexually to male celebrants during the night of the ritual climax. Rituals may also feature collective sexual intercourse in which younger unmarried women maintain relations with married men and married women do the same with bachelors. One researcher claims to have documented spikes in the birthrate 9 months after great name ritual celebrations.

Although shamans do not have a role in collective ritual, they are considered to be important for the community. They learn new knowledge from outside the village through their contact with spirits. They are also important actors in military campaigns and may locate enemies from afar or provide means for warriors to instill fear in their enemies.

LEISURE, RECREATION, AND THE ARTS

Work and play are not neatly separated and a family outing to the garden to spend the day may be considered a leisure activity. Families may also sit together on mats under the night sky for an hour or two in the evening. Beyond such occasions, males and females do not socialize together. With the current demographic increase the number of young children clearly burden women with almost constant activity. Respite from work generally takes the form of a leisurely dip in the river, often while snacking on sweet potatoes, or when women socialize in front of their houses on the central patio after dark. Every adult woman is an accomplished body painter and has command of a number of motifs that express both socially correct classification of age/gender grade and life crisis state as well as personal style and flair. Every seventh or eighth day—or when the previous genipap application has faded away—adult women gather to paint each other's bodies. During these times men and even children are conspicuously absent and these are often gay occasions when much information is exchanged. Men's painting of their own bodies and women's painting of men is much more cursory; however, the painting of a child can take several hours. Women also raise pets (birds, monkeys, and even tapirs!), often as an inherited ceremonial privilege.

Hunting is valued both as a prestigious activity and also because it allows men to relax away from the formality and constraints of the village. Men do not hunt

or go to the gardens daily, as do women, and they may spend idle time in conversation or doing nothing. While sitting at home or in the men's house they also weave baskets or other items and make weapons, such as clubs and bows and arrows, or ritual ornaments, such as mollusc shell necklaces or feather headdresses. Although such items have essential functions, they are also considered to be beautiful. The techniques for making them are considered essential male knowledge, but some men are noticeably more accomplished than others. It should be noted that to remain without doing anything in the village for an extended time invites gossip and reproach, mainly because to do nothing by oneself is considered antisocial. Although unmarried men seem to engage in less work than others, they make a great show of going around together and in this way avoid such accusations.

Relative Status of Men and Women

Males and females develop knowledge, skills, and bodily qualities that are expressed in different and complementary ways over the course of a lifetime. The arena of male activity—the forest and the world beyond the village and the public men's house—demands a rigorous and lengthy period of restrictions and activities that both men and women believe is more demanding than that to which women must be submitted. Men feel that they have earned a measure of superiority over women by virtue of a more developed and sustained formal decorum within the village and confrontation with dangers outside it. There is at least one myth attributing the invention of important ceremonies to women and the usurpation of these by men. However, public institutions are a major means through which men assert that male age/gender qualities are necessary for the reproduction of the community as a whole and thus on par with or superior to the biological fertility of females. Men coordinate activities that ensure that the younger men will learn the right skills, eat the right foods, and acquire the necessary knowledge for their further development. Women also do this for younger women, but usually in the domestic sphere or as a less ostentatious counterpart to public male activities. Men also defend the village militarily and from supernatural dangers though appropriate chants. The prestigious positions that are limited to males, principally that of chief or "true chanter of the *ben*" is associated with leadership of public institutions. Females and males

possess prestige by virtue of inherited wealth validated in great-name ceremonials, but male institutions alone provide a means of coalescing different kindreds (and cross-cutting them as well). Both sexes have a good deal of autonomy in the choice of spouse, and both girls and boys are warned that if they are lazy or incompetent no one will want them as a marriage partner.

Equally present, and expressed through customary forms, is an ongoing battle of the sexes that gives voice to the dissatisfactions felt and expressed collectively by both men and women. This may take the form of verbal duels or mutual ridicule between groups of men and women. Although adequacy of males and females in pursuit of their gender-specific pursuits is often called into question ("incompetent hunter!" "lazy gardener!"), the escalation of insults can lead to deprecation of masculine sexuality and attractiveness as lovers. Males counter in the same vein, but their barbs do not seem to have the same impact. Men are the ones who initiate violence, organizing mock raids during which women are terrorized or struck with prickly bromeliad leaves. However, women inevitably counterattack, often with firebrands. They may enlist their own children or *tabdjwỳ*, and after a male raid toddlers may be seen stolidly planted in the doorway of their house, minature warclub in hand, to block father's return home. In cases where they feel their interests slighted, women may also act collectively to withhold their labor and resources from activities organized by male age grades that demand a female complement of labor, such as the cultivation of a large garden that may require cuttings from women's domestic plots.

Clearly, Kayapo feel that they are treated in terms of a common status defined by gender, in addition to and apart from statuses of kinship, age, and ceremonial prestige. Status is relative, but both men and women may feel themselves to be the ones having their interests subordinated to their gender opposites. Both genders operate from different positions of strength—women as gardeners living in matri-uxorilocal residences within which food is shared and prepared, and men within the men's house and public sphere. It seems precisely because male assertions of superiority are so ineffective as ideology that men have attempted to make women fear them. The threat of gang rape has been reported by researchers—not as a punishment for any particular trepass but seemingly as an expression of male dissatisfaction with female behavior—and customarily girls are initiated into sex by older men, some reluctantly. The reason why accounts of

the relative status of men and women continue to be differently described in the literature derives from the fact that either side may be temporarily ascendent in the onging war between the sexes. Collective conflict between males and females clearly affects the tenor of husband–wife and son-in-law–parents-in-law relations within the domestic units. The fierceness of adult men qualifies them for political and diplomatic preeminence but does not compel female cooperation.

SEXUALITY

Sexuality, like gender, is thought to be created through proper social activity, and men are thought to make a women's vaginal cavity into an appropriate organ for conception. Menarche, when it occurs, is thought to be the result of sexual activity. There is no regular sexual abstinence associated with menstrual periods. The literature is not clear on what contributes to the capacity of a boy to have sex beyond activities to ensure growth and maturity in general. The sexual act itself is instrumental for stimulating growth of young people of the *meprintire* and *menõrõnyre* grades, and boys are preferably initiated into sex by older women as are girls by older men. However, there are also beliefs expressed in myth that sexual contact between married women and bachelors may be dangerous to the latter. There is no doubt that older men may have self-interested motives to propagate this in order to clear the field of younger sexual rivals. However, unmarried adolescents of both sexes are expected to engage in sex. Males can easily slip out of the men's house at night, and relations may be facilitated for girls by having them bed down near the doorway of their residence where they can receive lovers while others sleep.

Males and females of all ages talk about sex in positive terms. Being attractive to the opposite sex is part of the motive for grooming and cleanliness. Medicines or charms may also be used to enhance attractiveness to the opposite sex. Pursuit of sexual liaisons precedes marriage and continues thereafter until desire subsides in the grandparent age grade. Any time a male and a female not sharing kin ties are alone together, intercourse is assumed to have occurred, and sexual tension exists whenever unrelated males and females co-mingle publicly. Sexual jealously is held to be a major cause of intravillage contention. As mentioned above, sexual liaisons are common during ceremonial climax and sexual intercourse

is required in some ritual contexts. Females commonly mark the arms and shoulders of their lovers (rather than their husbands) with scratches, indicating that passion may be heightened in extramarital trysts. Sexual relations outside marriage entail some form of gift from the male on each occasion. Women may inflate their demands if not presented with a gift at the time of the act. Married couples are expected to enjoy sex, but the post partum taboo when a woman (but not her spouse) is enjoined from sexual activity almost ensures that men will look for other sexual partners as well.

Modesty demands that men keep the glans penis covered (the scrotum and penis shaft may be exposed) and women should not sit with their legs open. Homosexual relations appear to be unknown between women, and although sexual fondling among bachelors is not uncommon, it appears to occur in the context of fantasizing about absent females.

COURTSHIP AND MARRIAGE

Young couples who are openly attentive to one another are assumed to be already married, even if they have yet to bear a child, because public courtship is nonexistent. Flirting, sexual liaisons, and gift-giving on the part of the male may all precede marriage. However, a prospective couple would not be able to spend significant time together before actual co-residence.

Public displays of affection between the sexes are not seen. Marriage is entered into freely by both parties. Extensive kinship relations and relatively small village size may reduce potential (i.e., unrelated) partners to a small number. Marriage may be preceded by exchanges of food between the houses of the potential spouses, and a prospective husband may be expected to show competence in weaving and hunting to the satisfaction of his in-laws. A daughter's mother is said to be particularly attentive to the qualities of potential partners for her offspring but cannot override her daughter's own wishes. The ceremony that openly marks the marriage relationship commemorates the birth of the first child rather than the initiation of co-residence. Second marriages need not be marked in any way other than a transfer of residence, a man usually moving to his wife's house.

Almost everyone gets married at least once during their life, although where a demographic balance exists, women outnumber men. Women who conceive a child

when no man accepts paternity are designated by a specific term (*mekupry*). Although they are accommodated within extended family residences by virtue of kin ties, they generally gain a reputation for promiscuity and a dependence on the gifts they receive in return for sex. Widowed or divorced people are also accommodated within the extended family residences. There is no levirate or sororate, and a brother would only marry the sister of own brother's wife in exceptional circumstances.

Husband–Wife Relationship

The husband–wife relationship is based on a complementary division of tasks between a husband and a wife, common stewardship over the mystical substance they share with their offspring, and overall compatibility between them and the wife's extended co-resident kin. Either party may initiate divorce if dissatisfied. Divorce is particularly frequent after the death of a child. Children almost always remain with the mother after divorce, but there are exceptions when the man may take them back to his natal household. Husbands may choose to spend their time outside the home, particularly in the men's house, and there is wide latitude for how closely couples share common meals or time together. In general, couples marry freely and are expected to like each other, but one may observe a range of emotional involvement. Each person makes decisions regarding his or her own sphere of activity, and jointly when both must be present. This means that a woman and, if co-resident, her mother as well have quite a bit to say about the distribution of food, including fish and game, and the comforts available to a husband in his home. The term *prõ* for W or and *mied* for H is used in reference to any sexual partner.

Other Cross-Sex Relationships

Brothers and sisters ideally should transmit their great names, ceremonial inheritances, and knowledge to their siblings' offspring of the same sex. This entails continuous mutual obligations between siblings throughout their life. Although males leave their homes to be initiated into the men's house, they maintain an interest in the affairs of their sisters and may end up returning to their natal house, particularly in the case of divorce or death of their spouse.

A person should joke with the spouse of a same-sex formal friend toward while showing the latter formality and avoidance. The public joking generally focuses on ribald commentary on sexual comportment.

The relationship between an in-marrying husband and his mother-in-law carries a great deal of formality. While she may address him directly, he must channel any thoughts through his wife, avoid looking directly at her, being alone with her, etc.

Males have more opportunity to interact with their mothers, aunts, and grandmothers (*kwatỳj*) than girls do with their fathers, uncles, and grandfathers. This is because men are absent from home more during childhood when the lives of both girls and boys center around their residence. Consequently, men will cite what they have learned from their mothers (M, MZ) and *kwatỳj* (FZ, MM, FM, MBW), in addition to their fathers (F, FB) and *ngêti* (MB, MF, FF, MBS), while women cite knowledge, such as medicines, they have learned from their husband.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Several related changes are occurring in many Kayapo villages. Trekking is becoming curtailed to shorter time periods. With firearms, canoe travel, and cash and food coming in from outside, as well as opportunities to get outside the village for sightseeing and education, men are better able to meet their economic obligations and have access to resources independently of extensive kinship networks or the collective male activities organized out of the men's house. While these opportunities by and large do not exist for women, who continue to be dependent on domestic relations organized by related females, some females have begun to engage in new activities. Little girls are enthusiastic participants in schools for literacy and mathematics, where these have been established in villages. They have become operators of video cameras, and even sought opportunities to made beadwork or other items that can be sold outside the village. Young people may socialize more freely together and even on occasions set up "nightclubs" where they can dance to the sounds of Brazilian music.

There are more single mothers (*mekupry*) since there are fewer reasons for males to enter into marriage. When they do, they prefer to be less subservient to their in-laws

and may often insist upon separate quarters for the couple and their children. Households also seek to be more autonomous economically, which generally entails more solitary and less collective work. The raising of boys in the men's house, where they were thoroughly inculcated with a distinct male ethos and pride in their fierceness to enemies and their own women alike, has given way to enculturation with less of a boarding-school hazing quality. Boys spend more time in their natal homes and are not so quick to assume fatherhood.

Kazakhs

Cynthia Werner

ALTERNATIVE NAMES

Kazakhs are also known as Kazak (alternative spelling) and as Kirgiz and Kirgiz-Kaisak (alternative names used by Russians until the 1920s).

LOCATION

Kazakhs can be found in Kazakhstan, a country that became an independent nation-state in 1991 when the Soviet Union dissolved. Kazakhstan is located in Central Asia, and shares borders with Russia, China, Kyrgyzstan, Uzbekistan, and Turkmenistan. Significant populations of Kazakhs also live in Russia, China, Kyrgyzstan, Uzbekistan, and Turkey.

CULTURAL OVERVIEW

The Kazakhs descend from nomadic Turkic and Mongol tribes who formerly occupied the Eurasian steppes. According to most sources, the Kazakhs emerged as a distinct ethnic group in the mid-15th century when a number of clans broke away from the Uzbek khanate. Over the centuries, Kazakh culture has been shaped by a nomadic pastoral economy, a tribal social structure, customary laws, a blend of Islamic and shamanic religious beliefs, and Russian and Soviet colonization.

The Kazakh economy was traditionally based on nomadic pastoralism, the seasonal migration of livestock herds to known pastures and water sources. The typical household had a herd that included sheep, horses, camels, cows, and goats. The nomadic economy influenced a gendered division of labor, where men were expected to care for the livestock and defend the territory while women cooked, cleaned, took care of children, served guests, and prepared textiles (Bacon, 1966).

The Kazakhs have a patrilineal tribal social structure. They are divided into three "hordes" (*zhuz*), which are further subdivided into a number of "tribes" or "clans" (*taipa* or *ru*), which are further segmented into tribal lineages (*ata* or *ru*).

Tribal leaders (*khans* and *bais*) had authority over families who lived within their territory and managed relations between tribal groups. Traditionally, conflicts over land, livestock, family, and kinship were resolved through either customary law (*adat*) or Islamic shar'ia law (Martin, 1996).

Islam was first brought to the territory that is now Kazakhstan by Arab conquerors in the 8th century, where archeological evidence shows that it took root among some of the sedentary peoples of the region. But it was much later, in the 15th and 16th centuries, that Sufi dervishes traveled across the steppes and converted many of the Kazakhs to Islam. Since many of the pre-Islamic practices remained predominant, Catherine the Great encouraged Tatar mullahs to provide Islamic education to the nomads, in the hope that it would "civilize" them. Although the Kazakhs have a Muslim identity, many of the characteristics associated with Muslim culture never took hold in Kazakhstan. For example, Kazakh women never wore veils that covered their faces and they do not practice seclusion. Further, a number of Islamic practices and beliefs have blended with pre-Islamic shamanic practices and beliefs (Michaels, 1997).

Russian influence over Kazakh culture begins with the 18th century when a military alliance was formed between a Kazakh khan and the Russian czar. The northern part of the Kazakh steppe increasingly came under Russian influence as the Russians established military outposts in the 19th century, and Russian peasants migrated there in the early 20th century. In 1920, Bolshevik revolutionaries gained control of the land and established administrative control over the region that is now known as Kazakhstan. From 1920 to 1991, the Soviet rulers attempted to transform many aspects of Kazakh culture in ways that conformed with communist ideology. Traditional gender relations, tribal structure, and the Islamic faith were all targets of social change (Bacon, 1966; Massell, 1974; Olcott, 1991).

In 1991, the Kazakh republic of the Soviet Union became an independent nation-state. The newly

independent Republic of Kazakhstan is a multiethnic state, with sizable minority populations, including Russians, Ukrainians, Tatars, Uzbeks, Koreans, and Uighurs. Since independence, the revival of Kazakh traditional culture has been accompanied by less public and government support for measures that improve the status of women in society. Simultaneously, increased exposure to Western cultures has brought new fashions and attitudes that express a greater openness toward sexuality (Akiner, 1997; Bauer, Boschmann, & Green, 1997; Michaels, 1998).

CULTURAL CONSTRUCTION OF GENDER

The Kazakh culture recognizes male and female gender categories. There is a rigid distinction between male and female categories in terms of socialization, division of labor, and dress. Men and women dress differently. Men typically wear Western-style pants and shirts. Women typically wear modest dresses and skirts, but new modern fashions include feminine pants and pantsuits for urban women, and jeans and shorts for girls and younger women. The color red, associated with youth, is only worn by girls and young unmarried women. In rural regions of Kazakhstan, married women may wear a kerchief to symbolize their marital status.

While individual preferences vary regarding hair color, eye color, and other physical features, Kazakhs generally consider tall strong men to be more attractive than short weak men. Kazakhs generally consider women to be attractive if they are of average height with pale skin and long hair. Although robust women were preferred in the past, younger Kazakhs today are more likely to consider thin women to be beautiful.

Sexual preferences are not associated with visual clues. Most homosexuals try to conceal their sexual preferences, including through marriage to a person of the opposite sex.

GENDER OVER THE LIFE CYCLE

In the Kazakh language, there are general terms that refer to a "boy" (*ul bala*) and a "girl" (*qyz bala*), and there are more specific terms for several life stages. Kazakh infants of both sexes are known as *bope* until they are approximately 3 years old, at which point they become known as

toddlers, or *nares*. Around the age of 6, boys are referred to by the general term for boy (*ul bala* or simply *bala*), while girls are known by the general term for girl (*qyz*). By the time a girl becomes a *qyz*, she is expected to help with housework. Kazakhs believe that children reach puberty around the age of 14, at which point a boy is called a *zhigit* and a girl may be called a *boi zhetken*. The next life stage is marked by marriage, rather than the attainment of a certain age. Upon marriage, a girl is referred to as a young bride (*kelinshek*) and a boy becomes a young groom (*er zhigit*). A girl who does not marry by the age of 25 becomes known as an "older girl" (*qary qyz*). Around the age of 30, a married man is known as an *er kisi* and a married woman is known as an *aiyel*. Around the age of 60, a man becomes an old man (*kariya* or *shal*) and a woman becomes an old woman (*kariya* or *kampir*).

The transition from unmarried youth to married adult is the only transition that is publicly marked. A large wedding feast (*uilenu toi*) is held at the boy's house and, in some cases, a farewell feast for the girl (*qyz uzatu toi*) might also be held at the girl's house. The bride and groom are seated at a central stage at both events, where they are expected to stand up repeatedly as they are toasted by each of the wedding guests.

There are two other events that are publicly marked and represent important transitions, yet do not represent the transition from one named life stage to another. First, when a child takes his or her first step, the event is marked with a small family ritual known as the *tusau keser*, where a small rope symbolizing the cradle rope is connected to each of the child's legs and then ritually cut by a respected adult. Second, young boys are circumcised at the age of 3, 5, or 7. This event marks the moment a boy becomes a Muslim. A small ceremony is held on the day of the circumcision, and a large feast (*sundet toi*) is held as early as a month later.

Socialization of Boys and Girls

Kazakhs express a general preference for boy children, because boys have the cultural obligation to help their parents after they marry and boys pass on the family line. This cultural preference is illustrated by several Kazakh girl names, such as *Ulbolsyn* ("Let it be a boy") and *Ulzhan* ("boy's soul"), which indicate a sex preference for the following child. Although Kazakh families strongly desire at least one boy child, there is a preference

to have a mix of boy and girl children, as girls are needed to help their mother with household chores.

Kazakh children do not have a single set of caretakers. Parents and grandparents play an important role in socialization, but in extended family households, aunts, uncles, older cousins, and older siblings may also help to socialize a child. According to Kazakh custom, a couple's first child is given to the man's parents to raise. Although this custom is not followed by all families, it is very common to encounter Kazakh children, especially first-born children, who have been primarily raised by their grandparents, not their parents.

As infants, boys and girls are both traditionally swaddled and placed in a rocking cradle (*besik*), which makes it easy for older children to help care for them. Not all families use the cradle in contemporary Kazakhstan. Families who use the cradle may keep an infant in it for over a year. By the time an infant leaves the cradle, gender socialization becomes more noticeable. To begin, boys and girls play differently. Boys are allowed to run, chase, and wrestle each other, and they are taught to prefer masculine toys, such as cars and trucks. Girls are expected to play more quietly with toys and dolls.

Around the age of 5, boy children are circumcised and the occasion is celebrated by a large feast (*sundet toi*). From the Kazakh perspective, this occasion marks the moment a boy becomes a Muslim. In the Soviet period, the state advocated atheism and did not approve of circumcision, which was viewed as an unnecessary Muslim tradition. In practice, parents with strong affiliations to the Communist Party were less likely to circumcize their children, while other parents were likely to circumcize their sons secretly and hold a small family gathering to mark the occasion. Among Kazakhs, girl children are not circumcized and there is no comparable rite of passage.

Both boys and girls receive 11 years of coeducational public schooling. Families that can afford the additional expense send both boy and girl children to the university.

Although boys and girls may receive the same level of schooling, they are disciplined differently at home. Boys are disciplined or scolded less frequently than girls, who are often scolded for not behaving in a modest way and not helping with household work. While parents want their sons to be hard workers and to help around the house, they expect more help from their daughters. Kazakh parents believe that it is important for a young girl to learn how to help with all household chores and to behave modestly. Such qualities are necessary for a girl to find a good spouse and to have a successful marriage. Girls are expected to help with household work to such an extent that they are perceived negatively if they frequently leave the home for leisure activities, such as visiting friends. These expectations, which relate to a girl's honor and reputation, are much stronger in rural and southern regions of Kazakhstan, where traditional gender ideals have not changed as much as in urban and northern regions of Kazakhstan. In urban and northern regions of Kazakhstan, young girls have become more interested in personal appearance and leisure activities and less interested in household chores and sexual modesty (Michaels, 1998).

Boys and girls are introduced to sexuality in informal ways through friends and relatives, and more recently through global television programs and local print media. Boys often learn about sex by listening to older brothers and cousins talk about such things. Girls are less likely to learn about sex through conversation, and less likely to express an interest in sexuality owing to the cultural emphasis on female sexual modesty. On a girl's wedding day, the girl's sisters-in-law and married friends will take her aside and tell her about sex.

Puberty and Adolescence

At puberty, the general pattern of socialization continues, and the division between the sexes becomes even stronger. Boys, on the one hand, are allowed even greater social freedoms than before, though they are expected to help out with household labor. Girls, on the other hand, are more strictly disciplined than before, as parents are increasingly worried about their daughter's reputation within the community. (As will be discussed further in the "Sexuality" section, unmarried women are not supposed to have sex before marriage.) Girls are expected to help out with household chores and to behave modestly.

Attainment of Adulthood

Men and women are considered to be adults upon marriage. This is linguistically accentuated for women as the word for "girl" (*qyz*) is the same as the word for "virgin," and the word for "woman" (*aiyel*) is the same as the general word for "wife." A girl who does not marry by the age of 25 becomes known as an "older girl" (*qary qyz*).

Older girls work and socialize as adults, but they receive a hard time about their single status. Unmarried men (*boidaq zhigit*) also receive pressure to marry by the time they reach the age of 30.

Upon marriage, a woman takes on several new social roles. In addition to becoming a wife and an eventual mother, a married woman becomes a daughter-in-law (*kelin*). A good *kelin* is expected to respect her in-laws by providing unpaid household services for them. The expectations for daughters-in-law are higher if they are "in hand" (i.e., living in the same household). Nevertheless, expectations exist whether or not the young couple lives with the groom's parents. Further, the English term "daughter-in-law" is somewhat misleading as the social role of a *kelin* is not limited to a woman's relationship with her husband's parents. In other words, the services of a *kelin* can be requested by other relatives on her husband's side. For example, an older woman may invite any younger *kelin* married into her husband's patrilineal clan to come and help her prepare food for guests or to perform other tasks (Werner, in press a).

Married men and women are not expected to be physically or economically independent of the husband's parent's household. Some young couples live with the husband's parents, and almost all couples have some economic ties with their parents. At first, the economic ties might benefit the younger couple, but eventually the younger couple are expected to support the elderly couple.

Middle Age and Old Age

As men and women reach middle age, they become more economically independent. Instead of depending on others, they have several dependents, including children and elderly parents. In connection with this relative economic independence, middle-aged couples tend to have very active social lives. Compared with younger and older couples, middle-aged couples attend and host more feasts and dinner parties. This is one way that they maintain the strong social networks which are critical for household survival (Werner, 1998b). Middle-aged women increase their status when their sons marry and have children, and when their mother-in-law dies.

As men and women reach old age, there is a gradual shift toward economic and physical dependence on their grown children. The transition occurs as they retire and their health begins to fail. Although elderly men and women become more dependent on their children, they are highly respected by all members of society. Elderly men (*aqsaqal*), in particular, are respected for their knowledge and advice. Upon reaching old age, Kazakh men and women are more likely to observe Islamic rites, such as the daily prayers and fasting during the holy month of Ramadan. Although a few Kazakhs adhere to these practices throughout their lives, most consider these Islamic practices to be impractical until they reach old age and have more free time.

PERSONALITY DIFFERENCES BY GENDER

Kazakh women are socialized to act in a nurturing way toward children, guests, and elderly relatives. Women are the ones to care for hurt children and ill parents. Compared with men, Kazakh women are much more social and talkative around friends and guests. At the same time, women may act shyly and modestly toward strangers. Kazakh men, in comparison, are generally very confident and independent when it comes to dealing with outsiders, yet they are not as communicative as women when it comes to dealing with personal relationships. Kazakh men are socialized to become the dominant spouse, the dominant parent, and eventually the dominant head of the household. They express this dominance by making important decisions and commanding others to fulfill their requests.

GENDER-RELATED SOCIAL GROUPS

As explained in the "Cultural Overview," Kazakh society has both patrilocal residence and patrilineal descent. Upon birth, individuals automatically become members of their father's tribal lineage, tribe, and horde. Upon marriage, a woman moves to a residence controlled by another tribal lineage and contributes labor to this new tribal lineage, though she remains a member of her father's lineage. The patrilineal tribes and lineages are loosely associated with territorial divisions and still have importance in contemporary Kazakh culture. A person in a position of power, for example, has some moral responsibility to help other members of the same tribe or tribal lineage. Therefore it is easier to live in a region where one's lineage is a dominant group (Werner, 1998a). Tribal

affiliation is also important when it comes to marriage. Kazakhs are not supposed to marry a relative on the father's side who is less than seven generations removed. In practice, Kazakhs marry outside their immediate tribal lineage to ensure that they do not marry a close patrilineal relative (Werner, in press b).

There are no important nonkin associations for males or females in Kazakh society.

GENDER ROLES IN ECONOMICS

Women's household chores include a number of daily tasks: caring for children, preparing meals, serving tea to guests, cleaning the house, washing clothes, and arranging the daily bedding. Many women also bake their own bread, prepare a variety of dairy products, and sew clothes for their family. Meanwhile, the men help with domestic work by buying groceries and helping with childcare. In rural areas, where there is more household work, women also milk the cows and horses and work in the household garden, and men also care for livestock and help with the garden work. Compared with men, Kazakh women have very little leisure time at home. In order to complete their household chores, many women rely on the help of their children and their daughters-in-law. For children, the boundaries between "female" and "male" household chores are much more flexible. With the exception of food preparation and clothes washing, boys are known to help out with household chores, especially in households that have a shortage of female labor. However, the expectations for boys' help are lower than those for girls' help (Werner, in press a).

Women also work hard to maintain household networks by serving guests, helping others serve guests, and preparing gifts for various occasions. With hospitality as one of the central elements of Kazakh culture, households frequently host dinner parties to socialize with friends and they occasionally sponsor large feasts to celebrate new marriages and male circumcision. These events are enjoyed by women, yet they also burden women with additional responsibilities. Gift exchange is another aspect of women's role in household networking. Different occasions call for different gifts, and women are responsible for selecting and presenting most gifts on behalf of their household (Werner, 1998b, in press a).

In traditional Kazakh society, craft specializations were strictly divided by gender. Women sewed clothing, wove rugs, and made wool and other textiles. Men made ceramic objects, leather objects, and boots (Bacon, 1966).

In modern Kazakh society, there are also gendered patterns for occupational specializations. On the one hand, both men and women work as doctors, teachers, economists, and agricultural workers. On the other hand, women dominate certain occupations, such as day-care workers, shopkeepers, secretaries, nurses, and janitors. In urban centers, women are more likely to be employed as translators and administrative assistants for foreign businesses. There are a few positions that are rarely, if ever, filled by women: policemen, firemen, and military recruits. In addition, the chief positions in any business or government office are usually held by men (Bauer et al., 1997).

Both men and women sell goods in local marketplaces. In the post-Soviet period, as unemployment increases and the availability of consumer goods increases, the number of market vendors has increased dramatically (Bauer et al., 1997). Women dominate the sale of cloth, clothing, and food products, while men are exclusively involved with the sale of livestock although they can also be found selling clothes and food products. Gender stereotypes suggest that women are better at market trade because they have the patience to sit in the bazaar, the skills to persuade others verbally, and the ability to resist friends and relatives who request cash loans. While many merchants buy and sell goods close to home, some merchants travel to distant marketplaces, sometimes in foreign countries, to buy and sell their wares. In some cases, male and female merchants live apart from their families for weeks or months (Werner, in press a).

According to the laws of Kazakhstan, both men and women can buy, sell, and own property, including livestock. In practice, property is more likely to be in the husband's name.

PARENTAL AND OTHER CARETAKER ROLES

A variety of individuals play a parenting role in the life of a child. Mothers are the primary nurturers. They spend the most time with the children, they socialize children to know what is right and wrong, they provide children with tender hugs and encouragement, and they care for children when they are ill. Fathers play a more distant parenting role. They pay less attention to the child on a daily basis, but their advice, admonitions, and praise

carry more authority from the child's perspective. Grandparents also play an important role in the socialization of a child. Grandparents are generally expected to indulge and spoil their grandchildren. In some cases, they take on a more serious role. According to Kazakh custom, the first child is given to the father's parents to be raised. This custom is followed by some families. In these cases, the grandparents tend to be more lenient than the parents toward the child. Aunts, uncles, and older siblings also play a parenting role by scolding younger relatives when they do something wrong and giving them orders to help with household chores.

LEADERSHIP IN PUBLIC ARENAS

Traditionally, men always dominated leadership roles in Kazakh society. At all levels of tribal organization, only men served as leaders. Although tribal divisions do not have the same political importance as they did in the past, men still serve as informal tribal leaders.

Through Soviet affirmative action policies, Kazakh women started to take on leadership roles in the modern political system. As a general rule, women have successfully worked as middle-level managers, especially in the educational and welfare sectors of the government, but they have had more difficulty reaching upper-level positions. Though women can participate in the military, this is rare and female leadership in the military is practically nonexistent. The number of women occupying political positions of power has decreased in the post-Soviet period (Bauer et al., 1997). At the same time, however, women have become disproportionately represented in the growing number of nongovernmental organizations (NGOs), many of which receive funding from the international aid community. Women have also taken on leadership roles in business, establishing and operating their own businesses, and organizing through an association for businesswomen. Finally, a number of Kazakh women have served as leaders for the growing number of charitable funds.

GENDER AND RELIGION

The Kazakhs have a Muslim identity, though their religious beliefs and practices include pre-Islamic elements that involve shamanism and ancestor worship (Michaels, 1997). There are no gendered orders in Kazakh society. Among Kazakhs, it is extremely rare for a woman to serve as mullah, or Islamic prayer leader. However, women frequently receive a calling to be a traditional healer (*tauyp* or *emshi*) (Privratsky, 2001).

Kazakhs believe that the spiritual world entails a three-tiered hierarchy. Allah, or God, is a male at the top of the hierarchy. The second level consists of good and evil spirits, which are primarily female. The third level consists of ancestor-spirits, which are both male and female.

LEISURE, RECREATION, AND THE ARTS

In general, men have more leisure time than women. Teenagers and youth of both sexes enjoy going to discos, bars, and cafés. There are more opportunities for those activities in urban areas. On occasion, they might enjoy nature by going to a park or a lake for a picnic. Grown men spend their leisure time in a variety of ways. In rural areas, they go to the livestock bazaar to socialize with other men, they visit other men's homes, and they play horse sports such as *kokpar* (a polo-like game played with a goat carcass). In urban areas, men play billiards, play sports (especially basketball and soccer), and go to the sauna. In comparison, women have almost no leisure time because there is always more housework to do. Women's leisurely pursuits include visiting other people's homes, going shopping, and taking the children to the park. Certain leisure activities, such as the livestock bazaar and the *kokpar* game, are for men only.

RELATIVE STATUS OF MEN AND WOMEN

Kazakh men have more status and authority than Kazakh women. At the household level, men make the most important decisions, such as whether to purchase an expensive item, whether to send a child to the university, and whether a child's suitor would make an acceptable spouse. Men also have the authority to make decisions regarding important household resources. However, all these decisions are usually discussed between husband and wife, so women do have an influence on major decisions. Control over individual income varies from one household to the next; in some households all income is pooled, while in others individuals retain control over some of their income.

A Kazakh woman's sexuality is controlled by men. Before marriage, her father and brothers monitor her comings and goings to ensure that she does not engage in premarital sex and reprimand her if she does not behave in a sexually modest way. In traditional Kazakh society, fathers also decided who would marry their daughters. Kazakh women today have more influence over their marriage, but most marriages still involve final consent from the girl's parents. After marriage, a woman's husband controls her sexuality, as he has the right to demand sex from his wife. In contrast, men's sexuality is much less controlled. Men are not expected to be sexually modest, and they are not expected to fulfill the sexual demands of their wives. To a certain extent, though, their sexuality is controlled by their parents who still play an influential role in who a boy chooses to marry. Only rarely would a young man marry a girl without his parent's approval. Although girls generally marry with their parent's consent, they are more likely to marry without their father's consent, particularly if the bride is "kidnapped," with or without her consent, by the groom (Werner, in press b), as described below in the section on "Courtship and Marriage."

SEXUALITY

Kazakh men and women believe that sex is natural and healthy, in addition to being important for reproductive purposes. They believe that people who do not have regular sex may experience physical and psychological side effects, such as headaches, bad moods, and aggressive behavior. The only time that sex is considered to be dangerous is during the first 40 days after the birth of a child. Although sex is considered to be important, many Kazakh women are reluctant to discuss their sexual preferences with their husbands.

Attitudes towards premarital and extramarital sex differ for males and females. Women are expected to refrain from premarital sex, though not all do so in practice. Men do not experience any negative social consequences for having premarital sex. Extramarital sex is considered to be morally wrong for either sex, though there is less stigma attached to men who have extramarital affairs.

Sexual modesty is especially important for Kazakh women. There is a tension in Kazakh society between older generations, who believe sexual modesty is very important, and younger generations who are influenced by Western images of sexuality. Teenage girls and unmarried women, especially in urban areas, often act and dress in ways that are considered to be "sexy."

Cross-dressing is a rare and surreptitious practice in Kazakh society. Similarly, Kazakh society does not look favorably toward male or female homosexuality, which is generally viewed as unnatural and dirty. Female homosexuality is considered to be more aberrant than male homosexuality. Nevertheless, some Kazakh men and women identify as "gay" and "lesbian" respectively, and gay bars can be found in large urban centers.

COURTSHIP AND MARRIAGE

Traditionally, Kazakh marriages were usually arranged by parents when the bride and groom were still young children. The bride and groom might not have met more than once or twice before the wedding (Argynbaev, 1978). Patterns of courtship and marriage changed dramatically in the Soviet period, in part due to the state's efforts to reduce gender inequality. Grown men and women receive lots of pressure to marry, and only a small minority of people never marry.

In the contemporary period, marriages are formed in a variety of ways that reflect both the pre-Soviet past and the Soviet legacy. Typically, young couples either meet in school or at university or they are introduced to each other through friends and relatives. Couples often date for several months before the topic of marriage comes up. Parents often influence who their children decide to marry by initiating certain introductions and offering their consent. The amount of influence that the parents have varies from one family to the next. Physical attraction and love are important considerations for the young couple, while parents are more likely to consider the status of the other family, the bride's ability to do housework, and the groom's ability to provide for the future. A Kazakh man is unlikely to marry a woman without his parent's consent.

There are three general paths to marriage in Kazakhstan. First, there is a modern version of the arranged marriage (*quda tusu*), where the bride and groom have as much, or more, input in the marriage decision as their parents. In addition to giving their consent, the parents are expected to deal with the formalities of "arranging" the marriage, which involves a series of

exchanges between the new in-laws. Second, some marriages are formed when the groom kidnaps the bride (*alyp qashu*). This path to marriage is very common in the southern regions of Kazakhstan, and almost nonexistent in the northern regions. The Kazakh word for bride kidnapping (*alyp qashu*, literally "to take and run") is a general term used to refer to both consensual and non-consensual bride kidnappings. Bride kidnapping varies from case to case in terms of the level of consent and the primary motive for kidnapping. Brides who are kidnapped without their consent generally choose to stay, rather than to return home with a tarnished reputation. The third alternative is for a couple to get married in a simpler fashion with an official yet simple ceremony at the civil registry and perhaps a small celebration at home (Werner, in press b).

Most marriages are celebrated with a series of feasts and events, the order of which varies from one marriage to the next. Both sets of in-laws hold a "matchmaker" or "in-law" party (*qudalyq*) in honor of their new relatives. These parties involve numerous exchanges of food and gifts between the immediate in-laws and their core relatives and friends. A "face-opening ceremony" (*betashar*) is held at the groom's house, as a formal introduction of the bride to the groom's family and social network. During the ceremony, the bride stands with her face veiled next to two other women who married into this kin group. A man playing the *dombyra*, a guitar-like instrument with two strings, sings out each guest's name. When their name is called, each guest walks toward the bride and puts a small amount of money in a jar as the bride bows her head in greeting. At the end of the ceremony, the veil is removed and the bride begins her new life as a wife and daughter-in-law (Werner, in press b). The girl's farewell party (*qyz uzatu toi*) is an optional event that takes place at the bride's house. These ceremonies range from an intimate family dinner at home to a large feast with several hundred guests. At the end of a meal, the girl is escorted to the groom's house by the groom and other family members. It is customary for the farewell to be accompanied by ritual wailing.

The wedding feast (*uilenu toi*) is a large family feast sponsored by the groom's family. Several hundred guests are invited to the feast, including the bride's family and friends and the groom's family and friends. In rural regions, the wedding feast is usually held at home. In urban areas, the wedding feast may take place in a restaurant (Werner, 1998a, 1998b). The Islamic marriage covenant (*neke qiyar*) is a small ceremony performed by a mullah at the groom's house. The mullah recites verses from the Qur'an, asks the couple to confess their faith, has the couple and the witnesses drink from a bowl of water (in which two coins have been placed), and then gives his blessing (Privratsky, 2001). A civil ceremony (*ZAGS registratsiya*) is held at a local administrative building or marriage hall. This brief ceremony, directed by a state official, ensures that the couple are legally married. After the ceremony, an entourage of young people travel in cars with wedding ribbons to nearby scenic locations and take numerous photographs.

Legally, divorce can be initiated by the man or the woman. In practice, however, divorce is usually initiated by the man because there are fewer consequences for a divorced man than for a divorced woman. There are a variety of acceptable reasons for a man to initiate a divorce: the wife is unable to bear children, she is a bad housekeeper, she does not get along well with her in-laws, he is in love with somebody else, or he suspects her of infidelity. Women are more likely to initiate divorce in situations where the husband drinks excessively, physically abuses her, or does not provide for the family. Before resorting to divorce, a Kazakh man must consider his parent's opinion and the personal difficulty of living without his children. If the woman is considered to be a good wife, mother, and daughter-in-law, his parents will encourage him to stay in the marriage. If she is considered to be a bad wife, mother, and daughter-in-law, his parents will likely support his decision to divorce. A Kazakh women has additional things to consider before she divorces. She must consider where she will live after the divorce, how she will cover the expenses for herself and her child, and how she will remarry. Many women return to their parent's home after a divorce, but parents do not always welcome them with open arms. Children always stay with their mother, which makes it more difficult economically for women to seek a divorce. Remarriage is possible for both sexes, but there is much less stigma attached to divorced men and therefore remarriage is easier for them.

Widows and widowers can remarry. Young widows are much more likely to remarry than older widows. Widowers, on the other hand, are more likely to remarry regardless of their age, because Kazakhs believe men need a woman to help them with housework. Both widows and widowers are more likely to remarry somebody who was previously married.

HUSBAND–WIFE RELATIONSHIP

Ideally, Kazakh husbands and wives live together in a relationship characterized by mutual affection and respect. Kazakh husbands and wives eat together with other family members and any guests. Married couples always have their own private bedroom in which they sleep together. Infants may sleep in the same room. Couples spend a lot of time together, though men leave the house more often to socialize with friends. Couples vary in regard to whether they make decisions together or not.

Polygamy is illegal in Kazakhstan, though it did exist in the pre-Soviet past. Among the older generation, it is not uncommon to find an occasional polygamous marriage.

OTHER CROSS-SEX RELATIONSHIPS

Brothers and male cousins have a protective relationship with their sisters. In addition, a teasing relationship exist between a girl or woman and her sister's husband. Both sides in this relationship tease each other verbally.

Kuna

James Howe

ALTERNATIVE NAMES

The Kuna (or San Blas Kuna) call themselves Tule (Dule), a word that also means "people," "person," or "indigenous person," although they also use the name Kuna.

LOCATION

The Kuna live along the eastern Caribbean shore of Panama on the coast of San Blas, as well as in and around the cities of Panama and Colón. Other smaller Kuna populations, who are not considered in this article, live in the interior of eastern Panama and northwest Colombia.

CULTURAL OVERVIEW

During the 17th and 18th centuries, the Kuna, then a riverine and forest population in the Darién region of eastern Panama, engaged in intermittent conflict with Spanish colonial authorities while cooperating with Northern European pirates and traders. During a century of peace beginning in the late 18th century, most of the Kuna moved to the northern Caribbean coast of San Blas, and between the middle 19th and early 20th centuries they continued out onto nearby islands.

Today the coastal Kuna inhabit some 50 communities—six on the shore, two upriver, and the rest on coral islets. They grow plantains and bananas, corn, rice, and root crops on the mainland, raise coconuts for sale on the shore and uninhabited islands, and meet their protein needs mostly from the sea. Since 1938 the coast has been a legally recognized indigenous reserve, now called the Comarca de Kuna Yala. It has been governed since 1945 by three "big chiefs" (*sagla dummagan*) or *caciques* and the semiannual Kuna General Congress. As of the year 2000, there were 31,000 Kuna in Kuna Yala or San Blas, and 24,000 in urban Panama (Dirección de Estadística y Censo, 2001).[1]

CULTURAL CONSTRUCTION OF GENDER

The Kuna strongly differentiate man (*machered*) and woman (*ome*) as cultural categories, and they say that many things in the universe, such as panpipes and buildings, come in male–female pairs. The roles and spheres of influence of the two genders are strongly differentiated, though men and women converse and interact frequently with little ceremony or deference on either side, tempering the undeniable but moderate subordination of women in Kuna society.

Male and female dress is strongly differentiated. In the late 19th and early 20th century men wore distinctively cut home-made pants and shirts, gold earrings, bowler hats, and, in the 19th century, long hair. Today they wear store-bought shirts and pants, with baseball caps and other assorted hats for work, and in the case of senior men, fedoras for village meetings.

Women's dress changed radically during the 19th century. A small strip of sewn designs at the waist of a blue blouse expanded to become a reverse-appliqué blouse with complex colorful designs, called a *mola*, today a form of indigenous art sold throughout Europe and the Americas. Kuna women wear red and yellow headcloths and blue, green, and white wraparound skirts, both manufactured abroad for the indigenous trade. Their forearms and lower legs are tightly wrapped with rows of beadwork, and they wear large gold rings in the nasal septum, gold earrings, and chestpieces, and necklaces of silver coins, shells, pods, and beads.

Today, at the beginning of the 21st century, a few villages enforce the wearing of traditional women's dress, but many others leave it to individual choice (see Tice, 1995, pp. 81–82). Probably a majority of girls are now growing up wearing slacks, shorts, and skirts, but a surprising number of women still wear *mola* at least some of the time, even in the city, and overall female dress remains a key marker of Kuna identity.

GENDER OVER THE LIFE CYCLE

The Kuna express a strong desire for both male and female children, and Kuna leaders traditionally urged their followers to *dula omeloge*, "increase the membership." A couple with only male or only female children may take medicine to increase their chances of having a child of the opposite sex or will adopt or foster a child.[2]

Socialization of Boys and Girls

A baby (*goe*, *gwarugwa* "newborn") of either gender receives a great deal of attention and physical affection.[3] Infants are nursed on demand, and they are often carried around and sung to by older sisters and other female housemates as well as by their mothers. Children of any age are almost never struck or spanked, though as they grow older they may be disciplined with shame or harsh words, and they receive less physical affection than before.

When female babies are a few days old, they undergo a small ritual in which their ear lobes and nasal septum are pierced and small pieces of string tied in the holes. Traditionally, parents would mark the piercing by a village-wide celebration (*ikko inna*) with drinking of cane beer, though this ritual has almost disappeared. Today some parents sponsor a long puberty ceremony (*inna suit*) for a young prepubertal daughter, usually as a stratagem to space out the considerable costs of providing these ceremonies for several female children (see below).

In other respects, males and females begin to be treated in significantly different ways when they are old enough to get around easily on their own. Young girls, who traditionally begin to wear little *mola* blouses as soon as they can walk, and soon thereafter skirts and headcloths, are kept close to home. (Today, children of both sexes often start with factory-made underpants and tops.) As they grow older, girls are called on to carry their younger siblings and sing them lullabies, and eventually they begin to help a little with other household work (see Hatley, 1976).

Boys, in contrast, enjoy a great deal of freedom to roam around the village flying kites, catching birds, swimming, fishing off docks, and raising hell; during the first half of the 20th century they went naked or wore shirts but no pants. Sometimes beginning with diminutive canoes of their own, they soon graduate to more serious fishing and eventually to helping in the forest. In the past boys were toughened and made industrious through the bites of leaf-cutter ants and the application of stinging nettles; the latter was also used as a punishment for both adults and unruly boys.

Today, the experiences of male and female children converge more than before, since both typically complete kindergarten and several years of primary school.[4] Boys and girls should be periodically admonished and counseled by village leaders as well as their parents, and traditionally both are administered medicine baths and drinks to make them hard workers, good students, and, in the case of girls, expert *mola* makers.

Puberty and Adolescence

Puberty is the stage at which boys begin to work seriously in the forest with their fathers and brothers, and, during the early 20th century, to put on long pants for the first time. Many also go away for a year or more of migrant labor, and today a large minority continue their schooling through secondary or university levels (see below). As incipient adults, these "youths" (*sapingana*) are exhorted to act like a Kuna man (*Dule machered*) by working hard and defending their people, and pieces of a past warrior ethos surface in, for instance, performances in which pairs of young men dance with stinging nettles grinding between them. Traditionally, many youths would become village constables (*sualibgana*) and within a few years begin apprenticeships in ritual.

Coming of age is much more strongly marked for females. As a young girl approaches puberty, she is called a *dungu*, from the verb *dungue*, "to grow." From her first menses until marriage or loss of virginity, she is a *yaagwa*, "maiden." The kin term for daughter also changes at puberty, from *bunolo* to *sisgwa*.

When a girl has her first period (*sergue*, "to become mature"), her father announces the event in euphemistic language to the village men, who arrive at her house the following day to build a ritual enclosure (*surba emakke*) in which she is isolated. During the next 3 days, she is repeatedly bathed in seawater, her hair is cut short for the first time, and she is painted black with the juice of a plant (*Genipa americana*). The sequence ends with a community-wide feast.

Over the next few years her parents sponsor two puberty ceremonies in her honor, both called *inna* after the *chicha* or cane beer which participants consume

(see Prestán Simón, 1975, pp. 135–230). A 1 day affair called *inna mutiki*, "night *chicha*" used to follow within a couple of weeks after the rituals of first menstruation, but today it is more likely to come last and to be understood as compensation to the village for its efforts in the other puberty ceremonies. The *inna suit* or "long *chicha*," which takes up to 4 days to complete, entails performance of a lengthy chant cycle and numerous component rituals, as well as feasting, dancing, drinking, and merrymaking by villagers. A long Kuna name is chosen for the maiden, and her hair is cut short again. Otherwise, she spends much of the ceremony isolated outside in an enclosure and is more or less ignored.

In recent decades, some girls have received only a single short chicha (called an *inna mutiki dummad*), and some parents avoid the major expense of puberty ritual altogether, especially for daughters who chose to wear Panamanian clothes, merely serving a hot drink to the community to mark the occasion. However, amid the general decline of ritual in recent decades, villages continue to hold a good many chichas.

Today quite a few boys and girls continue on to higher educational levels, though boys are favored. According to the year 2000 national census (Dirección de Estadística y Censo, 2001), 7,272 males and 4,735 females had completed some secondary school, while 906 males and 457 females had attended university. Several dozen individuals have pursued advanced degrees abroad.

Attainment of Adulthood

A girl is considered a full adult woman (*ome*) when she marries and has her first child, which often occurs during her middle teenage years. A boy becomes a man (*machered*) when he is enrolled on the work lists for village labor, and when he marries and has a child.

Middle Age and Old Age

Kuna men and women typically reach the height of their influence, respect, and mastery in middle age and early old age. If all goes well, a woman will have daughters and granddaughters; she will be female household head, midwife, and respected senior woman. A man will be household head, senior ritualist, and perhaps village leader. An individual who has gotten old (*serredgusa*) deserves leisure and support from his or her children and sons-in-law, though in fact many work hard into advanced old age.

PERSONALITY DIFFERENCES BY GENDER

No serious culture and personality studies have been carried out among the Kuna. As a matter of gender stereotypes, men say that women are in general unruly, argumentative, and prone to gossip and quarreling—a male accused of lying or spreading stories may be berated for not acting like a Kuna man (*Dule machered*) (Howe, 1986, p. 231). Women are expected to express emotion, especially during puberty ceremonies and wailing for the dead (Howe & Hirschfeld, 1981). Men, in contrast, are supposed to mourn with stoic reserve and, in the case of political leaders, to maintain a mask of restrained calm in public situations. According to Sherzer (1987, p. 103), "differences between Kuna men's and women's speech are relatively slight" in everyday conversation, though men perform several genres of ceremonial discourse generally closed to women.

GENDER-RELATED SOCIAL GROUPS

Despite the claims of many naive observers, the Kuna do not maintain unilineal descent groups or descent reckoning of any sort, and kinship is thoroughly bilateral. The primary kin-based social group is the uxorilocal or matrilocal household, governed by the rule that upon marrying a man goes to live with his wife. In recent decades households have averaged somewhere in the range of eight to ten members (Howe, 1985; Tice, 1995, p. 117), but earlier in the century they were quite a bit larger (Chapin, 1983, p. 472). Mothers and coresident adult daughters, who work together daily, can be seen as a consanguineal household core, but (Helms [1976] to the contrary) in-married males, except in their first tentative years of marriage, are full members, and the senior male, just like his wife, is seen as progenitor as well as household head.

Village communal labor (which varies considerably from one island to the next) is organized along single-gender lines. Male groups build homes, wharves, public buildings, and airstrips; they work in village-owned stores and coconut groves; and they provide sugar cane, corn, bananas, fish, and other items for communal rituals. Women (often loosely supervised by male task leaders) sweep the streets, tend store, serve refreshments to male workers, and prepare food and drink for feasts and rituals.

Within each village the Kuna maintain an array of voluntary organizations, often called *sociedades*, which are devoted to land-clearing, fishing, cropping of coconuts and subsistence crops, running communal stores, and other purposes. Though single-sex groups outnumber those with mixed membership, the effective units in many nominally all-male *sociedades* are husband–wife pairs. For the last 30 years a women's organization for marketing *molas* has fostered female leadership and organization.

Gender Roles in Economics

Until well into the 19th century, the Kuna followed much the same division of labor as other lowland South American groups: men cut and burned off the forest, and women planted, weeded, and harvested. In roughly the same period that the Kuna moved down to the shore and out onto the islands (see above), men began to take over most agricultural labor—possibly because of the longer distances between home and fields, the great weight of the cash and subsistence staples (coconuts and plantains), male fears for women's safety, and increased labor inputs by women into their clothing (see Brown, 1970; Tice, 1995, pp. 36–38).[5]

Today agricultural labor is overtly recognized as a male domain. A young woman is told at marriage that she has acquired a machete or hand, and men are repeatedly admonished that it is a world of work, in which they must feed their children by raising plants (Salcedo, 1980).[6] Women still participate in some activities, especially at the eastern end of the coast (see Tice, 1995, pp. 115–177); they go with their husbands or with other women to cut bananas and to fetch coconuts, kindling wood, crabs, crayfish, river snails, and tree fruit in season. Out of choice or necessity, a very few women do more, but in almost all subsistence tasks males predominate.

Men and women carry loads very differently. Women bear baskets, bags, bunches of coconuts, and other burdens over their shoulders on their backs (except when they lug them short distances in the way that suitcases are carried), while men fasten them to either end of a pole balanced on a shoulder.

On the water, women very seldom run outboards and only occasionally help their husbands with sailing, but they readily paddle canoes, often visiting the closest mainland river with other women to wash clothes and fetch water. Trips to the river have been important occasions for female socializing (as have all-woman funeral meals at village graveyards), though more than 20 communities have built aqueducts to bring fresh water from the mainland, drastically reducing women's off-island work.[7]

Fishing is heavily gendered as a male activity—a newborn is often announced either as a "fisherman" (*ua soed*) or a "water filler" (*dii baled*)—though quite a few women go out fishing once in a while. Women used to help in catching sea turtles as they laid their eggs on beaches (once a significant source of cash income), but only men netted turtles in the sea, as is the case today for hunting, lobster diving, and catching octoupi used to sell.

The home is seen as the woman's domain, and even more so the kitchen, a smaller structure behind the main sleeping house. Men sometimes help in small ways, by watching children or stirring a pot for a few moments, but they seldom or never sweep, cook, scrub clothes, or fetch wash water from on-island wells (see Tice, 1995, pp. 125, 147). Both men and women husk coconuts. Women spend hours preparing food, especially in making drinks from corn, banana, cacao, and sugar cane (now largely replaced by coffee, cocoa, and Kool-Aid), and in cooking the staple stew based on fish, coconut, and bananas or plantains (for details, see Prestán Simón, 1975, pp. 49–50).

As a key element in gender interdependence, the Kuna insist that a wife or female kinswoman should meet a returning man at the water's edge to help him pull up and unload his canoe and (if their house is some distance away) to carry home its contents. According to Kuna theory, men and women exchange raw fish and produce for cooked food, and, once foodstuffs have passed into women's hands, it is for them to redistribute as they wish (Salcedo, 1980, pp. 66–68). Interhousehold food exchange and hospitality are overtly recognized as key symbols of community and ethnic solidarity, though by the late 20th century fish and bananas had entered the village cash economy, and gift exchange of food had fallen off sharply.

In the field of handicrafts, men make firefans and baskets (a highly gendered activity), fashion utensils of gourds, and carve implements and curing figures of wood. House construction is a male skill, as is canoe building (a semispecialized occupation). Until the middle decades of the 20th century women spun cotton and wove hammocks, and Nordenskiöld, Pérez Kantule, and Wassén, (1938, pp. 38–39) note that both men and women once

made pottery, probably of different sorts. Men used to make pants and shirts on hand-cranked sewing machines, but needlework is otherwise a quintessentially female activity—with the notable exception that in many villages a handful of "womanish" (*omegid*) homosexual men sew (but do not wear) *molas*.

Although fields are initially cleared by men, both sons and daughters inherit, in roughly equal proportions. Some farms are turned over to adult children or assigned to them for later inheritance, but often at least a few parcels are held back by aged parents until they die. Although a man does not inherit from his wife's mother or father, he is highly conscious that his children will do so, and in the meanwhile he typically works his spouse's fields together with his own as, in effect, a lifetime joint estate.

The senior male in a household is often referred to as the *negibed* "master/owner of the house," but if he and his wife divorce, he moves out and she keeps the dwelling. In the normal developmental cycle, junior couples hive off in turn, usually because of quarrels or overcrowding, and at the deaths of the senior husband and wife, the last remaining junior couple takes the house. Modern homes with cement walls and composition roofs are in many cases now being inherited by testamentary disposition.

For a long time the elaborate costume of Kuna women has represented a significant expense for fathers and husbands, but in the 1960s and 1970s *molas* also began to bring in income, as a national and international market developed for blouses and blouse panels (see Tice, 1995, pp. 56–75). Today, in addition to selling used *mola* panels, women make others just to sell to daytrippers, cruise ship passengers, and middle-men who feed the national and international market. The importance of *mola* income to household economies has further increased since the 1980s and 1990s, as blighted palms and international market shifts have drastically reduced returns from the coconut trade. A women's *mola* cooperative (Salvador, 1997; Swain, 1978, pp. 174–182; Tice, 1995, pp. 99–114), though it controls only a fraction of the market, has proved crucial in helping women organize and receive better returns for their labor.

Kuna men have shipped out as sailors since at least the 19th century, and in the 20th century increasing numbers went away for long periods to work in banana plantations, urban restaurants, and U.S. army bases in the Canal Zone. (A few land-poor youths also seek work as agricultural laborers in other Kuna villages.) In recent years men and women with secondary and university educations have secured salaried positions in the city, though unemployment is high and men are favored. For less educated indigenous women, urban money-making opportunities other than *mola* sewing are scarce. Inside San Blas, Kuna men and women have worked as teachers in roughly equal numbers, and (with a tilt towards males) in other government jobs (see Swain, 1978, p. 111; Tice, 1995, p. 53). Holloman (1969, p. 132) recorded 245 such posts in 1967. In the village economy, women, teenage boys, and a few adult men tend radios and airstrips for tiny wages, men work on cargo boats run by five to ten of the villages, and males and females participate in family businesses such as stores, bread-baking, and (for a wealthy minority) tourist enterprises. Both men and women deal with village stores and the crews of Colombian merchant vessels in selling coconuts and buying manufactured goods, and women (especially at the Western end of the coast, where most cruise ships visit) sell *molas* to tourists. However, most women have been reluctant to speak Spanish, even if they have attended school, and many of the Colombian sailors know a little Kuna.

Concerning household finances, this author's data, mostly from the 1970s, indicate that in traditional households with significant income from coconuts, each couple pooled cash in its own box, over which the wife had considerable say, and that the senior couple covered a great part of household expenses, even for their married daughters and grandchildren (cf. Holloman, 1969, p. 176; Tice, 1995, pp. 132, 151). Tice (1995, p. 176) writes that in recent years "Women individually control their own income from *mola* sales," and that men active in lobster diving often fail to devote cash returns to family needs.

PARENTAL AND OTHER CARETAKER ROLES

The Kuna place great emphasis on the mother's role, portraying her as the one person who will always look out for and defend her children. In daily life, female siblings, coresident aunts and cousins, grandparents, and fathers often take turns caring for children, and in properly functioning households, it is expected that fathers and grandparents will provide materially for their dependents.

However, only mothers are thought to give love and care unconditionally.

Leadership in Public Arenas

Men dominate Kuna politics. Each village maintains a hierarchy of offices, with several politico–religious chiefs, secondary officers called *argar*, and village constables, as well as specialized positions for house building and other tasks; some now have a secular administrative chief as well (Howe, 1986). Since the 1980s a few of the largest and most sophisticated islands have instituted women's meetings or elected women as *argar* or administrative chief, though not so far as traditional chief. Two women have run unsuccessfully for the national assembly; the daughter of a famous chief briefly served as governor or intendente of Kuna Yala, and women have played leading roles in establishing at least one urban settlement (De Gerdes, 1995; Tice, 1995, p. 51). In Kuna Yala, women also make their feelings known on key issues, such as the election of a new village leader, and a few regional women's meetings have been held. Nonetheless, the vast majority of office-holders and participants in decision-making, at both the village and regional level, are male.

Until recently most men also participated extensively in ritual, spending years or decades establishing names as puberty chanters, medicinalists, or singers of curing chants (see Chapin, 1987; Nordenskiöld et al., 1938; Sherzer, 1987). One ritual specialty, that of puberty hair-cutter, is reserved for women. Seers or *neles*, who are born into their role, can be male or female, and the tiny handful of women who actually practice as *nele* are also free to master other ritual specialties. Much more significantly, senior women play important but less publicly recognized roles as midwives, funeral mourners, cooks and organizers of village feasts, and curers' wives. The latter, as Chapin (1983, pp. 172–178) shows, actually do much of the work of diagnosis and treatment.

Gender and Religion

Kuna religion, which embodies the assumptions of Kuna gender roles, is carried on primarily by village chiefs called *saila*, who chant to their assembled followers several times a week in a gathering house (see Howe, 1986; Sherzer, 1987). (Today in some villages men and women only meet separately, and attendance has fallen off.) The deities are a married couple: Great Mother, who inspires devotion from the Kuna, was put in place as the earth by the more powerful and fearsome Great Father, who animated her trees and rivers and counseled her on their functions. Individual humans go through a cosmic life-cycle, sent to earth by a celestial midwife Muu (another incarnation of Great Mother), and returning at death to their heavenly parents in "Father's Place" above.

Among the many named actors in Kuna mythology or sacred history, the great majority (other than heroes' wives) are male. In one way or another, the few exceptions reinforce traditional assumptions about gender. They include Gikatiryai, who taught women their crafts and duties; Nagagiryai, who taught designs for *molas*; a female seer who, by inadvertently causing the death of eight successive husbands, led to the dispersal of the proto-Kuna; and a young girl menaced by vampire peoples, embodying the fragility of Kuna ethnicity. Even the notable star-woman Inanatili, who outwrestled her future husband, came to earth to marry and to teach women lullabies and mourning (Howe & Hirschfeld, 1981).

The Kuna feel that all people need frequent counseling on their behavior, and, according to men, none more than women. Often addressed condescendingly in chiefly chants and spoken admonishments as girls (*siamarye*), women are reminded to keep their houses clean, care for their families, and avoid gossip and arguments.

The puberty ceremonies mentioned above celebrate female maturation and offer prominent roles to a few women. Moreover, the occult symbolism of the puberty chant cycle deals with female sexuality and reproduction (Prestán Simón, 1975, pp. 135–230), as do the inner secrets of some curing chants. Here as elsewhere, however, male ritualists predominate, and they pay more attention to each other and the crowd at the *inna* than to the girl for whom the ceremony is given. Moreover, the symbolism could arguably be taken as a male attempt to tame or appropriate female procreative power.

Through the early 20th century, gender roles and many other practices of daily life were hedged around by a profusion of taboos (*ised*) (see Prestán Simón, 1975, pp. 29, 50, 86, 130–131). Today, except in a few areas such as childbirth, these taboos have lapsed, and no ethnographic account exists showing convincingly how they once worked.

LEISURE, RECREATION, AND THE ARTS

Both men and women work hard, but except in cases of special need or hardship, they enjoy daily leisure as well as occasional days off. Women take periodic breaks throughout the day, men take a longer free period after their return home, most often in mid-afternoon, and both are released in the evening from all but minor household tasks. Men and women spend a great deal of time in conversation (in both same-gender and mixed groupings), and both visit friends and kin in other households. Late afternoon visiting, however, has been strongly associated with men, who make several stops on their peregrinations to be given drinks and (in the past) fed meals. Teenage boys—and more recently girls—devote afternoon hours to basketball and volleyball, and in many communities Sunday is now a day of rest or light work.

At sunset and into the evening, adolescents cruise the streets, something they would have been strongly discouraged from doing in the past. Men chat, play dominoes, and sometimes have a beer on the porches of stores and homes. Until recently, almost everyone would attend sacred and secular village gatherings, women on alternate nights and occasional mornings, men almost every night. In the past, men also devoted a great deal of time in the evening or late at night to learning and practicing ritual, and the more ambitious among them would make extended trips to learn away from home. Today, however, apprenticeship has almost ceased.

Women, especially the young and middle-aged, devote much of their time free from other tasks to sewing, to the extent that one of the calls to singing gatherings is "Go sew *molas!*" (*Mormaynamaloe!*). Salvador (1997, pp. 168–170; see also Tice, 1995, p. 124) notes that older women often make it possible for juniors to sew by taking on the most time-consuming household tasks. For some resource- and worker-poor households, *mola* sewing has become a demanding and nearly full-time occupation (Tice, 1995). Almost all women sew *molas*, but only a few are known for cutting top-quality designs.

Every few weeks or months, people stop work to attend a puberty ceremony in their own or a neighboring village. Men and women sit at opposite ends of the *innanega* or chicha house, though they also mix and converse in passing. Both drink heavily of the cane beer (*inna*) and both get drunk, though men are more likely to continue for long periods with purchased rum and aguardiente. (Men also drink much more frequently and heavily than women during national holidays.) In two episodes during the long 4-day ceremonies, men and women dance, both separately and together. Since World War II, several islands have created secular dance troupes (*noga gope*) based loosely on puberty dancing, with practices and performances in the afternoon or evening.

Although women have their own forms of singing (lullabies and mourning), men predominate in the verbal arts. In the realm of material art, the woman's sewn *mola* blouse receives wide recognition at home (chiefs chant that needle and cloth are women's paper and ink) and even more in the wider world. During the 1920s, a program by the Panamanian government to eliminate nose-rings and leg-bindings highlighted the importance of women's dress as an ethnic marker, and today *mola*s—and the women who wear them—are widely taken as key symbols of both Kuna and Panamanian identity.

RELATIVE STATUS OF MEN AND WOMEN

In an early ethnographic study of Kuna female gender, Reina Torres wrote that "within her culture, the Cuna woman occupies a truly exceptional place. During all her life she is the object of the greatest consideration, flattery, and respect" (Torres de Ianello, 1957, p. 3). Torres' opinion has been echoed by many observers since then, especially naive amateurs, who typically describe Kuna society as a matriarchy. Although few social scientists today feel comfortable making such sweeping claims about gender (see Swain, 1978, pp. 43–75), one can say that Kuna women do indeed receive respect from men, mixed with some condescension and even a little scorn. Moreover, the consideration mentioned by Torres constrains as well as protects women

Overall assessments of the Kuna gender hierarchy depend to a great extent on judgments about the significance of art and dress. Kuna women are preoccupied with beauty and fashion—with changing designs in tradecloth skirts and headcloths, new ways of wearing headcloths, expensive gold jewelry, and innovations in blouse form as well as *mola* motifs—all of which might at one time have struck some feminists as a diversion or form of false consciousness. Salvador (1997), on the other hand, speaks for most observers of Kuna society in praising the ensemble of Kuna women's dress as well as *molas* in particular as a notable form of cultural expression.

Men and women are traditionally most equal within the domestic sphere, especially the senior couple in a household, who work in close cooperation. As mothers, women receive devotion from their children. Although women no longer do much agricultural labor, their domestic work is highly valued, they own land and houses, and since the late 20th century they have been making major contributions to household income, though they are often exploited by foreign *mola* buyers and Kuna middle-men.

Women are most subordinate in the public sphere. Men fill most political and ritual roles, and they take the lion's share of power and recognition, to the extent that women's names were often not remembered or known, even by relatives.[8] Male protectiveness has also constrained and confined women, who until very recently were not allowed to travel away from home without a husband or male kinsman—or at all.

In the village gatherings men work to rein in the conduct of women, whom they depict in their speeches as unruly and difficult (see Howe, 1986, pp. 229–233). But such attempts at control ultimately extend to everyone's behavior, including their own, and in the adjudication of disputes and quarrels, senior men enforce the rights (as they understand them) as well as the obligations of women and junior males. Villages vary widely today in their rigor, from those that attempt, for instance, to prohibit divorce and cut off rumors and quarrels, to others that have more or less given up on social control. Quite a few communities have tried to discipline the behavior of members resident in Colón or Panama City, but with only mixed success, and it is in urban settings that Kuna women, especially educated women, have gained the greatest freedom.[9]

Overall, though women use the weapons of the weak to undermine male control, they have seldom challenged public patriarchy directly except in the city and a in few of the most sophisticated island communities. On the other hand, they have great influence in the domestic sphere, and in the game of love (see below) they are as active as men. Perhaps most important, in the small interactions of daily life, the egalitarian ethos of Kuna society overrides gender hierarchy, as men and women speak their minds in the most frank, straightforward, and undeferential manner.

SEXUALITY

In an early ethnography, Stout (1947, pp. 38–39) depicted the Kuna as prudish and straight-laced, which is quite misleading. It is true that adults use euphemisms to discuss childbirth and sexuality, and public speeches condemning moral transgressions can be self-righteous, but in private the Kuna are quite libidinous. They often joke about sex, finding it amusing as well as enjoyable, and women in particular can be quite earthy, especially when intoxicated or in single-gender groups on the mainland. To describe themselves in this context, the Kuna often use the Spanish word *vivo*, "lively."

Traditionally the Kuna have tried to hide the facts of life from preadolescent children. (The author's experience suggests they had little success, even in the 1970s.) Women wear loose-fitting clothes during pregnancy, and they give birth in absolute silence, either in an enclosed corner of a house or more often in a special birth hut— today, they frequently retire to a village maternity clinic.

As noted above, preadolescent and adolescent girls were in the past guarded and isolated, and they married soon after their puberty ceremonies, leaving little room for premarital experimentation (something far from being the case today). Adulterous affairs, on the other hand, have been quite common, according to the experience of ethnographers and other observers since the 1960s, and older informants, speaking frankly, say that earlier generations were even livelier (see also Nordenskiöld et al., 1938, p. 32). Although men are thought to be more aggressive and likely to take the initiative, it is recognized that both men and women enjoy sex, and that both bear responsibility for their actions.

As for marital relations, young couples enjoy little privacy, except in the first weeks of marriage, during which traditionally they slept inside a temporary enclosure. Kuna sleeping houses are large undivided one-room structures filled with hammocks, and movement in one hammock can be felt in others and heard in the creaking of timbers. Young couples are encouraged to visit family coconut groves on the mainland for intercourse. They also slip outside in the dark or arrange to meet at home when the house is empty. In recent decades many houses have been partitioned, and couples may be allowed to build satellite sleeping huts. Moreover, migrant laborers often bring home beds. Nonetheless, marital sex can be as difficult to arrange as adultery.

No serious study has been carried out of Kuna sexuality. The one informant who spoke to the author on sexual practices said that couples often had intercourse with a man sitting on a low stool, so that they could move apart quickly if surprised. (Kuna women's wrap-around skirts come on and off easily.)

Kuna women often wear headcloths in public, pulling them around their faces in bright sun, in the gathering house, in mourning, or in situations in which they feel shy or wish to preserve their modesty and dignity. Women go bareheaded at home, and today young women do so even in public. When washing clothes at the river or near their cookhouses, or at home before dawn and late at night, women often strip to the waist, and men used to bathe naked outside, with their genitals tucked between their legs. Although women should not touch medicines or engage in sexual relations during menstruation, restrictions on menstruating women are otherwise light.

Kuna men take pains to shield Kuna women from life's dangers, especially against sexual threats by outsiders. As Swain (1978, p. 123) notes, "The message of male protector, dealing with the outside world, and female progenitrix maintaining the home, are strongly communicated as ideal Cuna forms." Intense struggles between the Kuna and Panamanian policemen in the early 1920s pivoted on issues of sexual access and intermarriage, and it is only recently that a very few Kuna have begun to marry outside their own ethnic group.

A handful of overtly homosexual and effeminate men, called *omegid*, "womanish, like women," or more slightingly, *amma* (a word that in other contexts means "aunt" or "female genitals"), are found in many villages. Many sew *molas*, and a few even belong to the women's *mola* cooperative, but they do not wear female dress (see Tice, 1995, pp. 59, 72–75). They are generally accepted in Kuna society, although the author has recently heard them denounced in a regional meeting for allegedly spreading the AIDS epidemic. As in much of Latin America, heterosexual males may sometimes have sex with homosexuals without risking much shame so long as they take the dominant role.

Courtship and Marriage

As noted above, girls were married soon after puberty, but boys stayed single until the age of 18 or 20. As unmarried youths, boys were expected to work with their fathers as well as clearing and planting fields of their own. Matches were secretly prearranged by the senior generation, with the bride's parents most often taking the initiative. In a form of marriage by capture called "the dragging" (*gagaleged*), the groom would be surprised and carried off forcibly to be thrown in the hammock of the bride chosen for him. (A young man who objected strongly could flee for a few months to another island.) Then and now, sons-in-law have worked for their parents-in-law for as long as they remain married, though they return frequently, often daily, to their natal households, and they continue to work with their fathers and brothers on family lands.

The dominance of the senior generation eroded sharply over the course of the 20th century. Although the dragging ritual continues in many villages, children and adolescents see each other every day in school, young people flirt and talk in the street, couples typically choose each other, and quite a few girls become pregnant before marrying (see Bonilla, 2000). Young married men still work for their in-laws, but they break free sooner than in the past, and many go off to the city for paid work, leaving their wives and children to be fed by the wife's father, or else, in recent years, taking their families with them to the city while their children are of school age. The percentage of unmarried, divorced, and abandoned mothers in Kuna Yala has risen to alarming levels in recent years (see Tice, 1995, pp. 118, 128–131, 150–152, 166–174).

Husband–Wife Relationship

Kuna often ask, rhetorically, who you should save if your wife and mother are drowning—the answer is your mother, who is irreplaceable, whereas a new wife can be found "like changing clothes" (*mol ogwaedyobi*). Ethnographers have observed considerable instability in early marriages; estranged husbands often return home temporarily to their natal households, and divorce is common. Informants' accounts suggest that this was also the case in the late 19th and early 20th centuries (see Holloman, 1969, pp. 166–168; Nordenskiöld et al., 1938, pp. 31–32): if a young man returned to his wife after three separations, his father-in-law was supposed to hit his head against a housepost, to impart the essence of the post's stability as well as punishing him.

But the Kuna also lay great store by the marriage tie and, over time, couples who stay together very often develop strong affectionate relationships. Along with their children they form a unit within the household in terms of expense allocation, quarrels with other couples, and potential formation of new households. The senior man and wife work together closely in managing household labor, and many examples of strong lifelong attachments can be observed. When Panama achieved independence in 1903, the regional chief Inanaginya

urged his followers to stay with Colombia by comparing their national affiliation with an old and mutually beneficial marriage.

OTHER CROSS-SEX RELATIONSHIPS

Rules and expectations for behavior between kin, whether same or opposite sex, are not strongly codified, except in the case of parents, grandparents, and children. Relations among adult siblings are often partly shaped by seniority, which is linguistically marked in same-sex sibling terms. Brothers should ideally look out for their sisters, and in general the relationship between siblings (*gwenadgan*) is projected as the model not only for kin relations as a whole, but for community and ethnic solidarity as well. It is expected that kin who are or have been coresident will be closer than those who have not. Overall, however, relations between kin depend primarily on individual likes and dislikes, as the Kuna themselves point out.

CHANGES IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The extensive changes in Kuna gender roles discussed throughout this article can be summarized in the following terms:

1. a shift in the 19th century to male agricultural labor and the elaboration of women's dress;
2. through the 20th century, the spread of schooling for both boys and girls, and weakening control by the senior generation of marriage and household labor;
3. since the 1960s, the growth of an international market for women's handicrafts, and since the 1980s, increasing dependence on women's cash income;
4. since the late 1960s, the growth of a female-controlled handicraft cooperative;
5. in the late 20th century, the spread of feminist ideals, especially among educated Kuna, and the opening up of salaried employment for some women as well as men;
6. the great movement of Kuna to urban Panama in recent years.

NOTES

1. As of the year 2000, there were, in addition, 1,700 Kuna in the Darién region of eastern Panama and another 1,400 scattered through western Panama (Dirección de Estadística y Censo, 2001).

2. In the early 20th century midwives often buried infants born deformed or albino (the Kuna have the highest rate of albinism in the world), but there does not seem to have been any differential infanticide favoring male or female children.
3. Some mothers play with their infant sons' penises while nursing them.
4. Out of a total population of 49,143 over the age of 4 in the year 2000, 4,794 males and 8,696 females were without any schooling, reflecting a past gender bias. Numbers for those who had completed some grade school (9,859 vs. 9,643) and who had completed sixth grade (3,818 vs. 3,453) were essentially equal (Dirección de Estadística y Censo, 2001). See below on higher educational levels.
5. Kuna oral history takes note of this change. Brown's (1980) pioneering article, based on secondary sources, has a skewed chronology. Among the Colombian Kuna the old division of labor still held at least as recently as the 1970s. My data suggest provisionally that the San Blas Kuna went through a transitional stage in which both men and women worked in the fields. Tice (1995, pp. 115–177) has detailed contemporary comparisons from different subregions.
6. By the end of the 20th century agricultural production had diminished in much of Kuna Yala.
7. On some islands far from shore or on which women now work intensively sewing *molas* for sale (see Tice, 1995, p. 124), men fetch all or most of the water from the mainland.
8. Some of my male informants could not remember the names of close female relatives, who were identified by kin terms or as so-and-so's wife. Today, however, as both men and women take Hispanic and anglophone names, women are more widely known by name.
9. On the other hand, women who move to the city with their families in search of better schools for their children may find themselves working at home in greater isolation and with weaker support systems than in the islands, though the situation is undoubtedly somewhat better for the several thousand people living in all-Kuna settlements around Colón and Panama City.

Kyrgyz

Kathleen Kuehnast

ALTERNATIVE NAMES

The Kyrgyz are also known as the Kara-Kirgiz and the Alatau Kirgiz.

LOCATION

A land-locked country, Kyrgyzstan is located in Central Asia between the latitudes 39°N and 43°N. Kyrgyzstan borders the Chinese People's Republic to its east. On its other borders are three newly independent states, the countries of Kazakhstan to its north, Tajikistan to the southwest, and Uzbekistan on its western border. The country occupies 198,500 km², and only about 7% of its land is arable. Its climate offers extreme conditions of harsh cold winters (−23°C) and hot, dry summers (+41°C).

Referred to as the "little Switzerland of Central Asia," Kyrgyzstan is located amid the Pamir and Tien Shan mountain ranges, which are among some of the highest in the world, with the tallest peak being Mount Pobeda at 7,439 m. The second-largest mountain lake in the world, and one of the most transparent, Lake Issyk Kul (Kyrgyz for warm lake), is located in the northeastern part of Kyrgyzstan at 1,607 m above sea level and has brackish water that never freezes. Kyrgyzstan lies in a highly active seismic region.

CULTURAL OVERVIEW

The Kyrgyz (over 2 million) are primarily found in one of the recently independent countries of the former Soviet Union, the Kyrgyz Republic (or Kyrgyzstan). To understand the Kyrgyz and their construction of gender, it is useful to mention their diverse historical predicaments during the past 150 years. Until the 1920s, the Kyrgyz were a seminomadic group, thought to have originated in the Yenisei River region in northern Siberia around 900 CE. Throughout the last millennium, the Kyrgyz, along with other nomadic groups, traveled vast distances from the eastern shores of the Aral Sea to the western border of China and south to Afghanistan for the purpose of herding their sheep and horses. Although the Kyrgyz cultural patterns resemble those of the nomadic tribes of Central Asia, nevertheless some among them became sedentary, especially in the southern areas of the country. Here mosques and *madrassas* (religious schools) were constructed in the 12th century. Among the northern tribes, the nomadic Kyrgyz did not significantly convert to Islam until the early 19th century.

Between 1925 and 1991, the Kyrgyz experienced intensive Soviet collectivization. This change had a major impact not only on their livelihood, but also on their family structure and kinship patterns. Prior to 1925, women were primarily illiterate. By the mid-1930s, female literacy rates had reached 35%, and by the early 1990s there was complete literacy of men and women.

It should be noted that among the Central Asian ethnic groups, the Kyrgyz and the Kazakh of Kazakhstan are more closely related in terms of their language, cultural practices, and kinship structures than any of the other major groups (Tajiks, Turkmen, or Uzbeks).

CULTURAL CONSTRUCTION OF GENDER

Gender is recognized by the Kyrgyz through two categories—men and women, or male and female. The two categories are manifested in cultural norms and domestic practices that divide societal responsibilities by gender. In contemporary Kyrgyz culture, both men and women are accustomed to modern dress; thus their clothing tends to be more European or Western than traditional Muslim cloaks or any sort of veiling. In rural areas, some women wear scarves to cover their head, which is seen as a display of modesty, especially among married women. Few women are veiled, as is customary in many religious Muslim countries. In urban centers, women commonly wear facial make-up, particularly on their eyes, lips, and cheeks. Differentiation is age related in regard to visual appearances. Young women are considered more attractive

if they allow their hair to grow long. There are fewer expectations for men's visual appearance, except that they should maintain a sense of cleanliness in dress; despite Muslim influence, most Kyrgyz men are clean-shaven.

During pre-Soviet times, the Kyrgyz lived in a structure called a yurt, which was divided into female and male spaces. To the left of the entryway is a space designated for men (*er jak*); this includes a space for saddles and other horse-riding implements. The right is considered the women's side (*epchi jak*), an area separated by a *chiy* (screen), where domestic items such as pots and utensils were kept.

The Kyrgyz have traditionally practiced arranged marriages along tribal lines, and thus individuals had very little say in their actual marriages. Commonly though, young women under the age of 18 years were considered more attractive or "marriageable," since great importance is placed in Kyrgyz culture on the ability to bear children—thus, the younger the bride, the higher the likelihood of many children.

GENDER OVER THE LIFE CYCLE

The Kyrgyz recognize the following events as important lifestyle passages and publicly mark each event: birth, the first steps of a child, circumcision of a boy, engagement, marriage, retirement, and death. Birthday celebrations are a recent phenomenon, since prior to sovietization birth dates were never recorded or registered. For most Kyrgyz over the age of 75 years (in the year 2000), the date and year of their birth are usually an approximation.

The Kyrgyz names for life cycle stages are as follows: *balalyk*, childhood; *ospurum*, teenager; *jashtyk/ jash ubak*, youth; *tolgonchak*, mature age; *karylyk*, old age. In addition, the names for life cycle events are different for males and females. Male stages: *bala*, boy; *jigit*, young man; *jetilgen chak*, man; *chal*, elderly man. Female stages: *kyz*, girl; *selki*, young woman; *ajal*, woman; *kempir*, elderly woman.

Socialization of Boys and Girls

Boys and girls in Kyrgyz society are reared differently from infancy through childhood by parents and others, including extended family members, other kin, neighbors, and peers. The birth of a boy is considered more of a celebration for a family than the birth of a girl, but the

difference in response is marginal. In part, boys are preferred over girls because they are socially ordained to care for their parents, whereas girls move away from their natal home once they are married. The eldest male is expected to live in the parents' home upon marriage. The youngest male child in the family is responsible for caring for the parents when they are old. Thus the responsibilities and obligations of male children to their natal family are greater than those of female children, who are expected to care for their husband's parents.

Different expectations exist for Kyrgyz girls and boys in the domestic sphere. Boys are expected to have a more leisurely childhood, to play with other boys, to ride horses, to hunt, and to learn to be a man, whereas girls at a young age are given household responsibilities, including cooking, cleaning, sewing, and caring for younger children or elderly adults, as part of their training to be a woman.

The primary caretakers among the Kyrgyz are often the parents or grandparents. Both prior to and during the Soviet period, the extended-family living pattern usually meant that three generations lived together in one dwelling. Sometimes this would include aunts and uncles of the married couple. Grandparents are highly revered and cared for, since many grandchildren actually have a stronger bond with them than with their own parents. Grandparents or an aunt or uncle often take part in the instruction and discipline of children. Boys and girls are disciplined differently; at times girls are more severely disciplined for misbehaviors, since the expectation for their acting appropriately and modestly is much higher than for young boys. Girls and boys learn informally about sexuality and courting rituals.

During the Soviet period, coeducation for girls and boys was normalized. Nevertheless, there were different expectations for performance in schools. In reviewing standardized texts for elementary education, illustrations often equate women with the domestic sphere and men with heavy labor. This is somewhat ironic, since Soviet women were among the most active worldwide in the labor force. Often it was said that women must carry a "double burden," that of both domestic and public work.

Because many of the Kyrgyz customary practices are highly influenced by Muslim customs, it is expected that male children should be circumcised by the age of 5 or 7 years of age (preferably in an odd year rather than an even year). It is generally considered that the earlier the boy is circumcised, the better, since it takes less time for recovery. Even though circumcision was considered illegal

by the Soviets, many Kyrgyz boys were nevertheless circumcised following Muslim practices. In some parts of Kyrgyzstan, circumcision was performed symbolically, and the penis of the child was only touched with a knife.

Puberty and Adolescence

The period of adolescence is recognized by the Kyrgyz, but has only been emphasized in the last century under the Soviet educational system. Except for moving from elementary education into higher grades, schools are the most formalized vehicles for marking this period of time. As mentioned above, adolescent girls are seen as attractive for marriage. Under Soviet law, the legal age for marriage changed from 9 to 16 years of age for girls and from 16 to 18 years for boys.

One of the more recent concerns of adolescent women (*kyz*) today is the revival of the old practice of *kyz ala kachuu* or bride-stealing, which is when a young man abducts a young woman from her home or off the street for the purpose of marrying her. This practice can be found among various ethnic groups throughout Central Asia and the Caucasus. In the rural regions, bride-stealing has long been a common feature of some marriage agreements. Even though it is considered illegal, perpetrators are rarely brought to court, since such actions bring shame to the young bride's family. Furthermore, social norms dictate that stolen brides are expected to capitulate so as not to bring shame upon their relatives. Once a young woman is stolen, she is married that day, so she loses her virginity, leaving her little choice but to stay in her new predicament. The Kyrgyz have a saying that refers to this situation, "*Tash tüshkön jerinde oor*" ("Let the stone lie where it has fallen").

Attainment of Adulthood

The most significant rite of passage indicating a transition from boyhood to manhood and from girlhood to womanhood is marriage, and secondly, giving birth to a child. The latter is particularly important for recognizing a woman as a full-fledged adult, no matter how old she is when she gives birth to her first child.

Middle Age and Old Age

The life cycles of middle-aged and elderly adults have changed dramatically in the last decade, as a result of the declining economic conditions in the country. Many who had looked forward to retirement at 50 years (for women) and 55 years (for men) find themselves working in the informal market instead of enjoying their leisure time. The elderly, many of whom are women, find that the social safety net once in place during the Soviet period is no longer there, and they have few options but to depend on their children for day-to-day assistance.

PERSONALITY DIFFERENCES BY GENDER

Men and women in Kyrgyz society are in many ways far more interdependent in their behaviors than many other Central Asian groups. In part, their nomadic heritage allowed for a much more egalitarian division of roles. While men took the herds to the higher pastures, women were in charge of the home front. As a result, this legacy still permeates domestic arrangements among the Kyrgyz. Women are recognized to be in charge of all issues related to the home and family. This is not just care giving behaviors but also decision-making behaviors. Both Kyrgyz men and women tend to be highly nurturing of their children, which reflects the overall value of children in the society. A young child is readily cared for by his or her father (or grandfather), as much as by his or her mother. Although there are many customary practices that favor male dominance in the society, there is a general mythology that the Kyrgyz share, that at one time the Kyrgyz were a matriarchal tribe, where women had equal or greater power than men. Reflecting this belief system is the general mild manner of the men and the strong presence of capable women. Sometimes stereotypes are communicated that Kyrgyz women are hardworking and Kyrgyz men are lazy. Historically speaking, the Kyrgyz have been significantly influenced by the Soviet egalitarian gender ideals, as well as by the more Islamic gender ideals of powerful men and cloistered women.

GENDER-RELATED SOCIAL GROUPS

Ideal gender types and realities often do not coincide, and in the case of the Kyrgyz many of the Soviet and post-Soviet social institutions were structured around men.

Although many women made significant advancements in politics, economics and medicine, the reality is that women do not have as many opportunities, nor do they receive equal pay.

Much of Kyrgyz society is geared toward the male, including marriage residence, which is exogamous, or living near or with the husband's family. Kin groups are formed through patrilineal lineage system or *bir atanyng baldary*—seven generations of Kyrgyz patrilineal family. Prior to Soviet collectivization, the economic demands of pastoral nomadism required alliances among the Kyrgyz patrilineal kinship groups (*ayils*) in order to maintain grazing pastures and water rights for their horses, sheep, and cattle. One way of solidifying economic relationships with neighboring tribes was through arranged exogamous marriages. Agreements between two groups to exchange their daughters (*kuda söök*) formed the foundation of economic relations that often lasted for several generations, since wives had to be taken from the same *söök* (bones) as their mothers. Members of these two groups were expected to assist one another. They shared grazing lands and protected each other's animals from raids made by neighboring tribes. Often marriages were arranged between tribal groups prior to the birth of children (*bel kuda*). Betrothal of small children who were still in their cradles was called *beshik kuda*. Agreements between the *kuda söök* were honored even in the event of a death, when the customary law of levirate required a brother or a relative to marry the widow.

In Kyrgyz society, social structures tend to be separated by gender. Whether it is a social club, a business association, or a wedding party, men and women tend to seek their own sex for social affiliation.

GENDER ROLES IN ECONOMICS

The division of labor between men and women in making a living, household and domestic work, and occupational specialization is fairly well defined. Despite 70 years of living under Soviet rule, Kyrgyz women are still expected to maintain the household and domestic work, while at the same time having a job outside the home. Men are less likely to perform domestic duties. During the Soviet period, women participated in nearly all labor arenas, except heavy industrial work. Today both men and women are involved in informal trade and entrepreneurial activities, in part due to the economic problems in the region. Women have dominated the "shuttle trade" markets, in which they travel to nearby countries and buy up goods and sell them in Kyrgyzstan at local markets. This is primarily because women seem to be less harassed then men at customs or border stops. Thus, women have gained a significant niche in the market. More and more, men who are from rural villages are moving to the urban centers to find work. This has had a major impact on families, leaving many women to be single parents raising many children, as well as maintaining gardens for household food reserves. Although women are legally able to inherit land, customary law sometimes prohibits them from actually gaining the property.

PARENTAL AND OTHER CARETAKER ROLES

Parental roles are not necessarily preordained in Kyrgyz culture, since birth parents do not always raise their child. Occasionally, extended family members, grandparents, or aunts and uncles play a more day-to-day role in parenting than the actual birth parents. Grandmothers are particularly counted on as a primary caregiver of young children, and many Kyrgyz have closer relationships with their respective grandparents than they do with their own parents. In some instances, the first-born child born of an eldest son is given to the parents in what is called *amanat*. The relationship between the "gifted" child and the aging grandparents is seen as reciprocal, because the child assists the grandparents' household but in turn the grandparents help preserve Kyrgyz traditions by passing their knowledge on to the child. In most cases the child is well aware of the fact that his grandparents are not his biological parents, but nevertheless calls them by the names *ata* (father) and *ene* (mother), and calls his own father and mother "older brother" and "older sister."

During the Soviet period, parental roles shifted from family members to state institutions. By the mid-1950s, the number of *detskii sad* (kindergartens) reached an all-time high as children's centers were set up throughout the urban and rural regions in Kyrgyzstan to care for their children. Every collective farm had its programs where children resided for weeks at a time, while parents worked long hours during the peak seasons of planting and harvesting. The childcare centers addressed one part of postwar economic issues—it helped to free women in order to increase their productivity. Because of the type

of laborious work done by the most physically capable, the parents of young children were rarely available to raise their offspring. It was the grandparents who often nurtured language skills, social values, shared stories, and kept alive various traditions for the young children.

Today the difficult economic predicament means that, typically, both parents work outside the home. Sometimes a niece or a cousin lives with and cares for the younger children of their relatives, or else an older sibling is placed in charge of the younger brothers or sisters.

Both mothers and fathers are much more indulgent of young boys then of young girls. Physical affection is much more common with infants or toddlers than with older children. Children are not necessarily indulged, but instead they are considered a part of the household structure and are expected to contribute to ensuring that the household runs effectively. Children often have many responsibilities, particularly the girls in a family. Both mothers and fathers expect more from a female child. A daughter is engaged in some sort of household work at a very young age, whereas a young boy is often left to play on his own rather than asked to participate in household duties.

LEADERSHIP IN PUBLIC ARENAS

During the past 10 years of national independence, women's leadership in Kyrgyzstan has declined in the public arenas, in part because the quotas for women in government ended with the Soviet era. Since then, women have found that the most viable opportunities for them are found in newly formed nongovernmental organizations, where they have proven to be extremely active. Nevertheless, it is useful to consider that, among the Kyrgyz, there is a mythology or a belief system that the Kyrgyz were once a matriarchal tribe, and that women were expected to be good warriors, fine horseback riders, and excellent statesmen. In this light, Kyrgyz women are sometimes a part of local government institutions, such as village councils (*aiyl okmotu*), but these women tend to be older and have garnered a great deal of respect in the village community.

GENDER AND RELIGION

The Kyrgyz are highly syncretic in their approach to religion. They combine traditions of animism, shamanism, and Islam into their daily lives. The legend of *Umay Ene*, a female deer, tells what happened that when the forest burned (in Siberia) and only one child survived, who was raised by *Umay Ene*. Considered to be the grandmother of all Kyrgyz and the spirit who protects children and animals, many women pray to *Umay Ene*. When shamans (many of whom are women) perform a healing on a child they often say, "It is not my hand but the hand of *Umay Ene* who heals." During the harvest or when cattle and sheep gave birth to calves and lambs, the Kyrgyz say "*Umay Ene's breast gives us milk*." Female Kyrgyz shamans also officiate at life cycle celebrations, such as birth and marriage, and conduct funeral services, but central to their role in the Kyrgyz community is the performance of public and private healing rituals. These usually include the chanting of Muslim prayers, as well as prayers to the deceased or to animal spirits. Infertility and chronic pain are typical reasons for seeking out a shaman. Shamanism, which predates Islam by hundreds of years, survived the Islamic conversion of the Kyrgyz because Sufism, the predominant missionary sect of Islam among the Kyrgyz, was extremely porous and incorporated the shamanistic practices into its Islamic rituals.

The resurgence of Islam during the 1990s in Central Asia has given rise to many men becoming more active in religious practices. In some of the southern regions of Kyrgyzstan it has also meant that the *otines*, the female Muslim clergy, have been given added importance in their role as teachers in the villages (Fathi, 1997). Within the Islamic community, *otines* oversee the religious education of females from birth to adulthood and also conduct religious rituals for births, marriages, and funerals.

LEISURE, RECREATION, AND THE ARTS

The Kyrgyz have many celebrations (*toi*). Both men and women are intricately involved in preparing for such events, which incorporate leisure and recreation, as well as an expression of the arts for them. Elaborate displays of food and energetic sports, such as wrestling, horse racing, and a form of polo, are all a part of making a celebration successful. At the heart of most events is the storytelling and music. The Kyrgyz are renowned for their epic poem, *The Manas*, a story of a medieval warrior who battles his enemies and brings pride to the Kyrgyz tribes. Both men and women sing and play musical

instruments, but dancing is not customary among the Kyrgyz. The Soviets introduced formalized dance movements to the Kyrgyz, but these were not based on cultural practices. The Soviets also introduced chess, which is a popular past-time for men. Segregation in leisure time is voluntary and based on years of the separation of women and men due to their respective work and household duties. Women often work cooperatively on making a *shyrdak* (felted carpet) or weaving a *chiy* (woven reed screen).

RELATIVE STATUS OF MEN AND WOMEN

Men and women in Kyrgyz society have differential authority, rights, and privileges. As mentioned above, the nomadic traditions and the sovietization of the Kyrgyz contributed to the relative egalitarian status between the sexes, especially when compared with other Central Asian groups. Nevertheless, overall men have more status in Kyrgyz society, both formally and informally, except for the domestic concerns, where women are given much more control in decision-making. Men and women are both able to inherit land, but in most instances it goes to a male child of the woman. Kyrgyz women work outside the home and, in these instances, are often in control of the income they make. Studies have shown that most of women's income goes to support the household. As women grow older, and become mothers-in-law, their status increases. It is usually the young daughter-in-law (*kelin*) who has the lowest status in a household. She is expected to do whatever her husband and his mother and father tell her to do. In some instances, domestic violence is not perpetrated by the husband against his wife, but by the mother-in-law physically abusing the young *kelin*.

SEXUALITY

Attitudes toward sexuality in Kyrgyz society are generally natural and healthy, but highly private and modest. Attitudes toward practices of premarital sex and extramarital sex differ for males and females. It is generally expected that men might have premarital and extramarital sex, but it is not necessarily accepted, especially by women. There are definite negative attitudes for women having premarital or extramarital sex, but nevertheless it does occur. To some degree, as men and women age there is more acceptance about extramarital sex, but neither gender expects it in their own marriage. In other words it is done, illicitly. Little expression of sexuality is allowed in childhood, and it depends to some extent on whether a child is growing up in an urban or rural environment; the latter is a little more relaxed about innocent experimenting.

Modesty is shown by women who cover their hair or wear a scarf, especially after marriage. In more traditional regions, it is considered immodest for a woman or a man to show their legs, but this is changing as Western influences infiltrate the younger generation. Overall, the Kyrgyz have very few outward expressions of cross-sex identification, nor are male and female homosexuality publicly acknowledged, although it does exist.

Sexuality is also perceived in relationship to producing children. During the intensive Soviet campaign after World War II, Kyrgyz women were encouraged to produce larger families. This campaign was embraced wholeheartedly by the Kyrgyz, since children are considered a sign of great prosperity as well as security for one's old age. The pressure placed on a Kyrgyz woman to have a large family has always been great, since the fertility of a woman—especially the birth of sons—is considered a sign of good fortune for an extended family (Tabyshalieva, 1997).

COURTSHIP AND MARRIAGE

Several different patterns of male–female courtship and marriage exist among the Kyrgyz. Among rural populations, a more traditional approach toward courtship exists, which often includes some aspects of arranged marriage. In pre-Soviet times, marriages were often arranged between tribal groups prior to the birth of children (*bel kuda*). Betrothal of small children who were still in their cradles was called *beshik kuda*. Agreements between the *kuda söök* were honored even in the event of a death, when the customary law of levirate required a brother or a relative to marry the widow. Today, matchmakers are still used and usually attempt to link families together. Although such arranged marriages were illegal, during the Soviet period, as were the payments of bride-price (*kalym*) and dowry (*sep*), these practices continued throughout the last century and are being revived in the post-Soviet society.

Among more urban Kyrgyz, marriages are the result of a young man and woman deciding on such a union.

Such an approach resembles many modern marriages. They usually seek out a judge to perform the ceremony and, more recently, many are also seeking the blessing of a mullah (Islamic cleric).

Upon marriage, a young couple is often given "guardian parents" for the newly married (*ökül apa* and *ökül ata*—authorized or entrusted mother and father). The parents of the groom arrange for an established married couple to act as sponsors, confidants, and mentors to a newly married couple. It is understood to be a very private and confidential relationship, but it was also kept very private during the Soviet period because it had once been considered anticommunist to have an *ökül apa* and *ökül ata*. According to the tradition, after the *ökül* parents have been identified, contact with them is up to the young couple. If there is no contact, then it is considered a formal process and no gifts are exchanged. But if the young couple seek out the *ökül* parents then the relationship has two aims. One is to provide a good model for the couple, and the second is to make contacts stronger between families, since they are not blood relatives.

HUSBAND–WIFE RELATIONSHIP

The husband–wife relationship among the Kyrgyz is characterized generally by duty and a quiet respect; affection is primarily given to their offspring. They tend to approach their marriage as team members; they rarely display public affection or hostility. The relationship is considered private. Husbands and wives often eat together with their family, sleep together, spend time visiting their respective extended families together, and often make decisions together. There is a fairly defined division of labor when it comes to household tasks and family concerns.

Polygyny occasionally occurs, when a man takes a second wife, but it is unofficial as it is not legal in Kyrgyzstan. In instances where polygyny does take place, Islamic codes are put into effect; the first wife has more status than the second, but it is expected that both wives must be given similar resources to support their respective children. If a marriage is not satisfactory, divorce is often the result and can be initiated by either the husband or the wife. The children typically stay with the mother, but the husband can also seek custody. In pre-Soviet marriages, children of a divorce would go to the husband's relatives.

OTHER CROSS-SEX RELATIONSHIPS

These relationships are discussed under various categories above. The most significant relationship outside marriage is the grandparent–grandchild relationship.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

During the post-Soviet period from 1991 to the present, Kyrgyz society has experienced a confluence of different and contrasting ideologies. Although societal change affects all age cohorts, it certainly affects each group differently. The younger generation is less influenced by gender and sexual egalitarian ideals from the Soviet period, but instead find themselves confronted by two highly contradictory ideals of men and women, that of conservative Islam and that of Western media. These very different approaches to sexuality and gender roles leave a highly contradictory situation in which to examine Kyrgyz norms definitively. The gendered expectations of the middle-aged cohort have been shaped by years of Soviet education, in which men and women were professed to be equal, and in which many of the laws attempted to bring more equality to the sexes. Among older Kyrgyz, gender and sexuality have remnants of pre-Soviet ideals and highly traditional approaches, as well as Soviet expectations that women should participate actively in society.

Lahu

Shanshan Du

ALTERNATIVE NAMES

The Lahu are also known as the Luohei, Mussur, and Mian.

LOCATION

The Lahu are located in Southwest China, Myanmar (Burma), Thailand, Laos, and Vietnam.

CULTURAL OVERVIEW

The Lahu are a Tibeto-Burman-speaking people (Chang, 1986, p. 1; Matisoff, 1988, p. 11) who are divided into several subgroups with mutually intelligible dialects and slightly different subcultures, including the Lahu Na, the Lahu Shi, the Lahu Nyi, and the Lahu Shehleh (Walker, 1974). The Lahu people live in the mountainous region that constitutes a southerly extension of the Tibetan highlands along the border areas of the People's Republic of China (P.R.C.), Myanmar (Burma), Laos, Thailand, and Vietnam. According to the 2000 census, the Lahu population in the P.R.C. was 453,705 (NBSC, 2002, p. 251), which was about two thirds of the total Lahu population (Walker, 1995, p. 7).

The subsistence pattern of the Lahu is typically a mixture of farming, raising domestic animals, hunting and gathering, and fishing. Intensive agriculture (irrigated wet rice) and the growth of cash crops have been greatly increased in the last few decades. Households constitute the center of Lahu village life (Du, 2002; Hill, 1985) and serve as basic units for production and consumption. The Lahu people practice monogamy, and married couples tend to own and manage their households jointly. The Lahu kinship system is fundamentally bilateral, although there are varying degrees of matrilineal or patrilineal skewing in different regions or subgroups. Varying degrees of bilocal tendency mark the patterns of post-marital residence. Most Lahu villages traditionally lacked social stratification and there are no strict markers for hierarchical status except that of generation and age (Du, 2002; Walker, 1995). Similar beliefs in the supreme parental god Xeul Sha prevail in the Lahu indigenous religion, which is also characterized by animism. Lahu of different regions have also been influenced to different degrees by a wide variety of externally introduced religions, including those of Mahayana and Theravada Buddhism, Protestant and Roman Catholic Christianity, and communist atheism (Du, 1996).

The Lahu have historically constituted part of an "ethnic mosaic" with their neighboring groups. Since the 1980s, the Lahu people have been increasingly involved in local, regional, national, and global socioeconomic systems, resulting in drastically intensified interactions with other ethnic groups. Nevertheless, at the turn of the 21st century, many Lahu, especially those living west of the Lancang (Mekong) River, have still maintained a high degree of ethnic homogeneity at the level of the village, and interethnic marriage is uncommon (Lei & Liu, 1999, p. 80; Zhang, Yue, & Zhang, 1996, p. 118). Unless specified otherwise, the following discussions focus on the Lahu of Lancang Lahu Autonomous County in southwest China, particularly the Lahu Na of the Qhawqhat village cluster. Although the lives of Qhawqhat villagers can by no means be regarded as representing a "relic" of "authentic" Lahu traditions, their dominant ideologies and social institutions are widely shared, in various forms and to different degrees, across most Lahu subgroups and regions (Du, 2002).

CULTURAL CONSTRUCTION OF GENDER

The recognized gender categories of the Lahu are "male" (*awl paf*) and "female" (*awl ma*), which are defined by a larger category called *awl cie* ("pair") (Du, 2002). The concept *awl cie* focuses on the dyadic nature of the pair and highlights the similarities and harmony between the two components, which identify with each other through

their shared membership and joint function in the whole. A dyad is comparable to an organic compound consisting of two elements in which neither element has an essential nature of its own and therefore no internally bounded identity. The dyadic orientation of Lahu gender categories minimizes the difference between male and female.

Lahu traditional costumes tend to play down sex differences (Du, 2002). In most Lahu areas, no sex distinction is shown in the traditional headgear, typically a long black cloth tied around the head as a brim. Prior to the 1950s, Lahu men and women in China wore similar adornments, especially silver bracelets and buttons. Whereas traditional Lahu clothes bear obvious gender markers—shirts and pants for males and long garments for females—their loose-fitting styles cover most of the secondary features of the sexes. Not only are female body curves concealed, but also middle or even late stages of pregnancy of Lahu women are usually hidden within their loose garments. In the 1990s, many Lahu elders in both China and Thailand still considered clothes that showed female body curves embarrassing, strange, or ugly. Nevertheless, gender differences in both headgear and clothes have become increasingly salient as more and more Lahu youth prefer to purchase ready-made clothes from local markets.

Men and women are traditionally measured by nearly identical standards concerning their physical attractiveness (Du, 1995, 2002). To be "good-looking," one must first have a well-proportioned body with strong leg and arm muscles. "Your body is as straight as the best tree along the river bank" and "Your calves (and arms) are as thick and solid as the base of a bamboo trunk" are typical analogies used to express the esthetic appreciation for a strong body build in both sexes. In addition, well-proportioned facial features combined with pleasant expressions are considered attractive for both men and women. Poetic phrases used to describe such physical attractions include "You are brighter than the brightest flower in the world that blossoms for three years and becomes brighter and brighter every night" or "Your skin is as white as silver, as shining as gold." For both sexes, personality and the capability and diligence in working, rather than physical appearance, are considered the most important attractions in mate choice. Nevertheless, the concepts of masculinity and femininity have been increasingly introduced into Lahu culture, and some young Lahu women have begun to feel embarrassed when older women praised their thick and firm calves

because such legs are considered masculine and ugly for city girls.

GENDER OVER THE LIFE CYCLE

The life cycle is divided into three major stages: "red-and-naked children" (before one can talk and walk), "young children" (before marriage), and "adults" (after marriage) (Du, 2002). The wedding ceremony publicly marks the transition from childhood to adulthood. In the ideal life cycle, a married couple go through the life journey together, sharing responsibility, prestige, and authority.

Socialization of Boys and Girls

Most Lahu people across subgroups and regions adhere to indigenous values that greatly appreciate children and show preference to neither boys nor girls (Du, 2002; Lei & Liu, 1999, p. 116; Wang & He, 1999, pp. 154, 292), who are raised similarly. Regardless of sex, infants and young children receive enormous attention and affection, often being carried by their parents and other relatives. Being physically strong and "listening to the words of elders" are the most valuable traits for boys and girls alike. Caretakers show no apparent gender distinctions in instructing and disciplining children. Traditional values strongly discourage scolding, let along beating, children. Boys and girls play similar games, including "baby-holding," "cooking," and "hoeing" (Du, 2002). From ages 5 to 8, children typically begin to apply their games to real-life situations, assisting their parents in domestic work such as baby-sitting, carrying water, and washing their own clothes.

Puberty and Adolescence

The Lahu category that is similar to "puberty" and "adolescence" is "unmarried young men and/or young women." The major markers of the onset of this stage are shyness in front of members of the opposite sex and the ability to understand "the talk between boys and girls," including romantic conversations, love songs, and sexual jokes. Most Lahu enter adolescence at 12 or 13 years of age, although the physical and social development of an individual, rather than calendrical age, serves as the essential index for the category. Socialization at this stage

is a continuation of childhood, showing little gender difference.

Attainment of Adulthood

The Lahu threshold for adulthood is the wedding, which unites two socially immature individuals into a single social entity and transforms them into full members of society. Serving as a rite of passage to simultaneously initiate a boy and a girl into adulthood, the symbolism and rituals of the Lahu wedding focus on elaborating the sacredness, endurance, and harmony of a husband–wife dyad. In many Lahu areas, a wedding ceremony consists of two integral parts. The first and more elaborate ceremony is held at the house of the bride's parents, and the second is held at the house of the groom's parents. At each ceremony, a pair of beeswax candles is lit for the paired god Xeul Sha. After the wedding ceremony, the couple simultaneously achieve the social rank of "adult" (*chaw mawd*). Such a cultural definition of adulthood depends solely on one's marital status and is irrelevant to both age and sex.

Middle Age and Old Age

A married couple is counted as a single social entity and progress jointly through each substage of adulthood, which is defined mainly by parental roles. The married couple jointly hold the status, prestige, and authority of each of the hierarchical stages and substages of the life cycle. Revered status and prestige are intrinsically intertwined with a couple's accomplishment of their social responsibilities, especially their responsibility as parents. From their wedding until the birth of their first grandchild, a couple is categorized as "married youth" or "junior adults" (*al niel*, roughly between 20 and 45 years of age). From the birth of their first grandchild until they retire from their joint position of household coheads, a husband and wife are categorized as "elders" (*chaw mawd* in one of its narrow senses, typically between 40 and 65 years of age). When all their children are married and have established their own households, a couple is promoted to the status of "senior elders" (*chaw mawd qo*), which is the last substage of physical life. After fulfilling their joint responsibilities in life, husband and wife are believed to reunite in the afterlife, jointly holding the honorable and authoritative position of "the parental spirits" in the supernatural realm. Parental spirits are believed to play a significant role in the well-being of the households of their children, and they are appeased on most important ritual occasions.

PERSONALITY DIFFERENCES BY GENDER

Lahu ideals of personality show minimal gender difference. The most important virtue, which is referred to by the word *nud* ("soft," "gentle"), is identical for men and women. As an overarching category for most desirable characteristics, *nud* involves both emotional and rational traits, including humility and generosity in relating to fellow villagers, respectfulness toward elders, care of children, compassion for the sick and the weak, modesty, and appropriate manners. In conventional Lahu courting songs, Lahu lovers use *nud* as the highest praise of their partners, addressing each other as "the good (*dar*) and soft (*nud*) young man" or "the good and soft young woman." *Nud* is such high praise that if a family member is praised as "nud," other members share the pride. As the antithesis to the positive *nud*, the term *hie* ("harsh") describes the most undesirable personality and social traits, including aggressiveness, violence, boastfulness, ill manners, and insensitivity. *Hie* is used to describe the negative characters of both men and women, suggesting no belief in innate male aggression. Despite the negative perception of harshness in the Lahu culture, violent behavior (including domestic violence) does exist in village life and has been increasing drastically since the 1980s.

GENDER-RELATED SOCIAL GROUPS

Rather than being male oriented or female oriented, Lahu social structures are oriented towards married couples, who serve as building blocks for kinship relations and interhousehold networks (Du, 2002). Because of the common practice of village endogamy, the vast majority of couples live near both the husband's family and the wife's family. Lahu kinship terminology calculates kin relations from the perspective of a married couple (dyadic ego), which parallels the reference point of an individual ego. The dyadic orientation of Lahu kinship terminology provides a married couple with circles of kin relations accompanied by different rights, duties, and obligations, structurally connecting them with other husband–wife

dyads as well as with single individuals. The bilateral kinship networks between household-head couples regulate the forms and intensity of interhousehold reciprocity in both economic and ritual activities, especially in labor cooperation, assistance during food shortage, and ritual obligations. There are no records of the existence of nonkin associations for males or females in traditional Lahu society.

GENDER ROLES IN ECONOMICS

Sexual division of labor is minimal. Social ideals expect a married couple to jointly "work hard to eat" (*kheor cad*), a phrase that connotes all the tasks involved in feeding a household, from planting to weeding, harvesting, storing, pounding rice, cooking, fetching water and firewood, raising pigs and chickens, and gardening (Du, 2000). Despite the extreme social emphasis on gender unity in labor allocation, gender division still marks a few tasks. Weaving is almost exclusively a female task, and males dominate, almost exclusively, hunting, blacksmithing, and long-distance trade. While men are usually more active in market exchange, which played very limited roles in Lahu village life before the 1980s, married couples jointly engage in nonmarket exchanges. The property of a head couple typically undergoes sequential divisions when their children and children-in-law establish their own households. Typically, a couple divide their farmland equally among all their children except for their primary heirs (one of their children and his or her spouse), who additionally inherit the couple's share. When the couple retire from heading their household, they pass on to their heirs the coheadship, together with the house and its furniture and utensils as well as grain and small livestock. While the socialist transformation in China has deprived head couples of their authority over land ownership since the late 1950s, such authority was restored to a certain degree after state policies granted households the right of land usage in the 1980s.

PARENTAL AND OTHER CARETAKER ROLES

Parental roles are defined mainly by procreation, child rearing, and varying degrees of moral, social, and spiritual responsibility and authority over children

(and children-in-law) at different stages of the life course and in the afterlife. Being defined as a dual-parental team, a married couple is expected to take joint roles as much as possible in all areas of child-related activities, including pregnancy, childbirth, and childcare, as well as teaching children moral and working skills and making decisions for them (Du, 2000, 2002; Lei & Liu, 1999, pp. 142–143). At the beginning of the 21st century, many Lahu villagers in Lancang still adhere to their tradition of husband-midwifery, which expects a husband to serve as the midwife with the assistance of all four of the couple's parents and other relatives. A couple usually carry the infant and/or young child to the field, taking caring of the child while working together. Both parents share similar responsibilities in discipline, education, physical care, affection, and time spent with children. Many couples also receive supplementary childcare on a regular basis from their parents and older children, other relatives, and neighbors. The nonparental caretakers are of both sexes rather than being predominantly female. The behavior of these caretakers towards male and female children shows no consistent patterns of gender differentiation.

LEADERSHIP IN PUBLIC ARENAS

Leadership in kin groups and the political arena demonstrates varying degrees of joint gender roles (Du, 2002; Wang & He, 1999, p. 292). The overlapping of gender roles in leadership is derived from the cosmological and social ideals of male–female coheadship, as expressed by the common saying, "A pair of male–female masters rules together." At the beginning of the 21st century, most Lahu villagers in Lancang still adhere to the traditional institution of "male–female masters of the household," focusing on the joint authority and responsibility of household coheads in making consensus decisions (Du, 2002; Lei & Liu, 1999, p. 246; Wang & He, 1999, p. 114). Whereas indigenous institutions of male–female coheadship at the village and village-cluster levels have been fundamentally disrupted or eliminated in most Lahu areas since the establishment of the P.R.C. in 1949, it has been revived in a few village clusters after the relaxation of state policy in China in the 1980s. For example, parallel to the state-appointed officials, there are three pairs of traditional village leaders in each village of the Fulqhat village cluster. In particular, the village head couple is responsible for maintaining social order both within and beyond the village, especially

enforcement of customary laws. The head couple of spiritual specialists represent the villagers in serving village guardian spirits, especially performing rituals at the temple of village guardian spirits. The leading blacksmith couple performs rituals to assure spiritual security for a village's agricultural production, which is also symbolized by tool-making for the village. At the level of village cluster, there is also a Buddhist monk couple, serving at the pair of Buddhist temples located at the center of the village cluster. Nevertheless, the male coleaders of Fulqhat tend to play more important roles than the corresponding female coleaders, and they receive near-exclusive recognition by the state and outsiders. Although warfare seemed to be an exclusively male role in historical records, elders of some Lancang villages recollect young women's participation in village military defense in the 1940s.

GENDER AND RELIGION

The male–female dyad comprises the core symbolism in Lahu religion. Lahu people across subgroups, regions, and countries share beliefs in a supreme god named Xeul Sha (Du, 1996; Lei & Liu, 1999, p. 57; Walker, 1986). According to various versions of Lahu origin myths in Lancang, Xeul Sha is a pair of cross-sex twins, representing the primordial dyad and the ultimate cosmological order (Du, 2002). The twin gods are often depicted as if they were a single joint entity who created the universe and human beings. While undertaking joint roles in creation, the dyadic supreme gods also demonstrate identical capacity, rationality, emotions, and morality. After making a few male–female pairs to serve as assistants, Xeul Sha created the earth (female) and the sky (male), the sun (female) and the moon (male), the water and the vegetation that cover the earth, and then the animals (Du & Hu, 1996; Lei & Liu, 1999, pp. 57–60). In order to solicit offerings, Xeul Sha also created and raised a pair of demigods called Xeul Sha's Senior Daughter and Senior Son, who were eventually punished with death for their rebellion (Du & Hu, 1996; Hu, 1996). To replace them, Xeul Sha then created the original humans, a pair of twins who came out of a gourd, called Only Man–Only Woman. Xeul Sha raised the first human twins, taught them how to hunt and farm, and instructed them to marry. Xeul Sha looked after the offspring of the first human couple, who became the ancestors of the human population, and taught

them hunting, farming, and customs. Among the Lahu Na of Lancang, villagers also pair the guardian deities at various levels, including the guardian deities of the household, the village, and the village cluster. Villagers recognize the paired nature of these deities in their offerings, which are ritually presented in pairs, as are the offerings to Xeul Sha.

LEISURE, RECREATION, AND THE ARTS

Lahu men and women have little leisure time except during festivals, especially the Lahu New Year Festivals, as well as some ritual occasions. Married couples are expected to enjoy their leisure time together. The traditional ways to spend leisure time include socializing with relatives, feasting, singing, and dancing. Prior to the 1990s, one of the most popular entertainments in festivals and rituals was singing and listening to traditional Lahu songs, which address topics such as origin myths, migration legends, courtship, and love-pact suicide. Such songs are ideally sung antiphonally by a male and a female (Du, 1995) and the audience appreciates the singers' knowledge of conventional verses and their creativity and spontaneity. If a few equally talented singers rotate to sing antiphonally to each other, such singing sessions may last as long as several days and nights, drawing large crowds of thrilled listeners. Since the 1980s, watching television, videos, and movies, as well as playing basketball and billiards, have become increasingly popular, especially among the youth.

RELATIVE STATUS OF MEN AND WOMEN

Unity-based equality marks the status of men and women. The equal value placed on males and females is deeply rooted in the world view that unifies male and female into dyads, in which the two sexes are evaluated according to their joint identity rather than being treated as separate social categories. According to such a dyadic perspective on gender, the foreign term "gender equality" is translated into Lahu as "men and women are the same" (Du, 2002) and is taken as a matter of course in many rural areas (Zhang et al., 1996, p. 119). Applying the dyadic world view to the life cycle, adulthood is defined by entering a monogamous marriage, in which the husband and the wife are bound as a team, sharing

responsibility, authority, and prestige throughout their lives and in the afterlife. Joint gender roles are widely realized in labor allocation and household leadership, and to a limited degree in terms of village leadership. Structurally, bilateral kinship system and interhousehold reciprocity are oriented toward household head couples, empowering men and women as joint social entities.

The ideological and institutional emphasis on the joint identity of male and female in Lahu tradition minimizes differences in decision-making and the influence of men and women in subsistence and economy, family matters, community, kin group, and religion. Accordingly, men and women have neither different rights to important resources nor separate control of the fruits of their labor. As parents and elders, men and women jointly influence the sexuality, education, marriage choice, and divorce of their children and younger relatives. Increasing privileges (such as deference) are paid to a couple as a joint social entity as they are promoted throughout the substages of adulthood and in the afterlife. Despite the discrepancy between ideal and practice, shown especially in the increasing marital disharmony, conflicts, and divorce, gender equality still prevails in the social lives of many rural Lahu at the beginning of the 21st century.

SEXUALITY

Sexuality is generally considered extremely embarrassing and private, an attitude that seems to be embedded in Lahu mythology that links the origin of sexuality with both reproduction and shame. According to Lahu origin myths (Liu, 1988, pp. 44–47), failing in several attempts to inspire and convince Only Man and Only Woman to marry each other in order to reproduce humans, Xeul Sha offered them an aphrodisiac without telling them its function. After drinking it, the original human couple copulated and later jointly experienced intense feelings of guilt and shame for violating the incest taboo. The cultural conception of sexuality is similar for both sexes, except that some local beliefs portray women as having stronger sexual desires because Only Woman took an extra dose of the delicious aphrodisiac drink. While the Lahu people share the moral prohibition against premarital and extramarital sex, the degree of restrictions and punishment on such behaviors varies drastically according to subgroups and regions (Du, 2002; Hill, 1985; Lei & Liu, 1999, pp. 142–143). Nevertheless, in a given local context,

moral expectations and punishment for deviant behaviors are applied almost identically to males and females. For both sexes, shamelessness is attached to public expressions of sexuality, such as making erotic remarks and physical contact with members of the opposite sex, even including holding hands with one's spouse. In accordance with the cosmological order of male–female unity, the Lahu language has no word for "homosexuality." All the Lahu I interviewed in the 1990s stated firmly that they had never heard of such behavior among the people they knew and therefore were unable to offer any moral judgments.

COURTSHIP AND MARRIAGE

Everyone is expected to marry after a certain age. In rural areas, those who are unmarried in their late twenties begin to bring shame to their family and those who die before marriage are treated as marginal, if not lesser, human beings in mortuary rites (Du, 2002). Severe chronic health problems were usually associated with the extremely rare cases in which individuals remained unmarried throughout their lives. The most important considerations of marriage choice are physical strength, diligence and working skills, a gentle personality, and a clean family background, especially not being accused of possessing a dangerous spirit called *tawr*. Most villagers found their own spouses. Typically between the ages of 13 and 16 in the 1990s, and between 15 and 18 prior to the 1980s, Lahu teenagers in rural Lancang started to "play with boys" or "play with girls," activities serving as a prelude to finding a spouse. A traditional courtship ritual is to snatch the headcloth or hat from a member of the opposite sex and run away in a joking manner. Through such a ritual, a boy or girl initiates a semiprivate conversation with someone he or she is interested in or attracted to. While most Lahu youth find their own spouses, there are varying degrees of parental intervention in mate choice. One is called "guided by parents," in which parents offer suggestions with no binding obligations. Another kind is called "matched (arranged) by parents," in which parents arrange marriages for their children regardless of the latter's desires. Although the Chinese state has outlawed arranged marriage since the 1950s, it still occurred sporadically in some Lahu villages until the 1980s, when the strict implementation of family-planning policies required a couple to reach minimum ages before they could marry. Widows and widowers are

free to remarry and there are no normative preferences concerning who they remarry.

HUSBAND–WIFE RELATIONSHIP

Teamwork and companionship characterize husband–wife relationships. Social ideals expect a married couple to function as a single social entity, as expressed by the proverb "Chopsticks only work in pairs" (Du, 2002). In other words, parallel to the two parts of a pair of chopsticks, the husband and wife should coexist symbiotically and function harmoniously within their shared identity in the marriage. Importantly, a married couple is defined as a single labor team that performs a variety of tasks, ideally functioning together as smoothly as a pair of chopsticks. According to this principle, both productive and reproductive tasks are oriented towards the couple's common goal of sustaining their household, submerging the productivity of the husband and wife within the duty of the couple as a whole. Beside working together, husbands and wives are also expected to eat together, sleep together, spend time together, and make decisions together.

The moral discourse of the Lahu across regions and subgroups tends to be against divorce because it fundamentally conflicts with the dominant ideology of gender unity manifested in the cosmological order, the social structure, and core ethics (Du, 2002). Nevertheless, actual restrictions on divorce vary greatly in practice according to local traditions. At one extreme, divorce is granted easily with a simple ritual, and little stigma is attached to the divorcees (Wang & He, 1999, p. 112). At the other extreme, the spouse who insisted on divorce is fined heavily and his or her relatives often have to share consequent strong social stigma and financial burdens (Du, 1996, 2002; Lei & Liu, 1999, p. 87). The major reasons for divorce are that one's spouse becomes addicted to opium or alcohol, steals, is lazy and irresponsible, or is suspected of possessing a dangerous spirit. According to convention, if a couple divorces, daughters belong to the wife and sons belong to the husband (Du, 2002; Lei & Liu, 1999, p. 87; Wang & He, 1999, p. 113).

OTHER CROSS-SEX RELATIONSHIPS

In addition to husband–wife and parent–child, brother–sister is another significant cross-sex relationship and an integral part of the relationships among siblings and their spouses. The common practice of village endogamy, together with the principle of gender unity underlying the bilateral kinship system, provide the structural basis for the perpetuation of strong sibling ties throughout the life course (Du, 2002). Particularly, marriages reinforce, rather than weaken, the brother–sister bond by incorporating siblings and their spouses into the core relatives who are expected to engage in the most intensive interhousehold reciprocity. Ideally, the principle of generalized reciprocity guides the economic interactions between the households coheaded by siblings and siblings-in-law, especially in labor cooperation and coping with food shortage. Such households are also expected to engage in the most intense forms of ritual reciprocity.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Whereas the Lahu people residing in the mountainous areas of border regions retain a high degree of ethnic and cultural homogeneity at the beginning of the 21st century, their gender unitary system has grown more incoherent and less influential (Du, 2002). As a result of the political and economic incorporation of Lahu-inhabited areas into national and global systems, the isolation and cohesion of Lahu culture and society have been increasingly undermined. Specifically, with more and more villages gaining access to electricity, television and other forms of mass media entertainment have replaced the singing of Lahu folk songs in rural life. It is unrealistic to expect Lahu youth who grow up watching Gongfu (Kung-Fu) movies and television shows such as *Baywatch* to develop a coherent world view of male–female dyads as illustrated in Lahu origin myths and other oral literature. In addition, Lahu villagers' increasing involvement in the market economy has greatly intensified flexibility in interhousehold reciprocities, undermining the structural significance of household networks between the head couples.

Maasai

Aud Talle

ALTERNATIVE NAMES

The Maasai are also known as the Ilmaasai.

LOCATION

The Maasai inhabit the savannah borderland between Kenya and Tanzania in East Africa, an area of approximately 100,000 km^2.

CULTURAL OVERVIEW

The Maasai (about 350,000 people) are Nilotic-speaking pastoralists, of the eastern Nilotic branch (cf. Vossen, 1982). Their language *maa* is also spoken by a few other ethnic groups in the region, such as the Samburu and Chamus in Kenya, and the Parakuyu and Arusha in Tanzania (Gulliver, 1963; Little, 1992; Spencer, 1965). The Nilotic-speaking pastoralists constitute a cultural minority within the Kenyan and Tanzanian nation states.

Until recently the Maasai lived a seminomadic way of life, migrating with their livestock herds according to seasonal fluctuations. Today they are less nomadic, but livestock, in particular cattle, are still central to their economy and culture. In Kenya the traditional grazing land of the Maasai has been divided into group and individual ranches, and many group ranches have been subdivided into individual holdings (Talle, 1988). In Tanzania, however, the privatization of pasture land is less advanced than in Kenya. The land adjudication process has contributed to make the pastoral Maasai increasingly sedentary in both countries. Agriculture is of little importance except in the wetter parts of their area, but maize, and to a lesser extent other agricultural products, constitutes a major part of their diet. Earlier, Maasai bartered pastoral products such as livestock, milk, meat, and skins for grain and honey (for ceremonial beer brewing) with their agricultural neighbors. Presently they purchase agricultural foodstuffs in the shops. The traditional habitat of the Maasai has shrunk dramatically during the last half century or so, mainly due to adjudication of common land, land encroachment by other ethnic groups, and expropriation of grazing land into game reserves e.g., Waller, 1993. The contemporary position of the Maasai within the state is one of increasing poverty, economic and political marginalization, and a general insecurity of the pastoral pursuit (Århem, 1985; Hodgson, 2001; Talle, 1988).

Major structural principles in Maasai culture and society are the patrilineal clan organization (pl. *ilgilat, olgilat*) and the male age-set system (pl. *ilajijik, olaji*). The population are divided into several major descent groups or clans, namely the *ilaiser, ilukuma, ilataiyiok, ilmolelian, ilmakesan, iltarro sero*, and *ilmamasita* (Jacobs, 1965). These groups are again subdivided into smaller segments of agnatic subclans and lineages, which in principle are exogamous units. The descent groups are contained in two larger segmentary categories or moieties (pl. *intaloishin, entaloishi*), "those of red oxen" (*odo mongi*) and "those of the black ox" (*orok kiteng*). The two groups represent a dual symbolism in Maasai cosmology (a right-hand and a left-hand side), which is reflected at many levels of Maasai social organization—in lineage and family structure as well as in the age-set system (Fosbrooke, 1948).

The Maasai live in large dispersed settlements (pl. *inkangitie, enkang*) consisting of several families, which together often count 50–60 people. A thick thorn-bush fence encloses the settlement and protects the people and animals inside against nightly predators and livestock thieves. Each family builds its own "gate" (*enkishomi*) in the fence, where they pass to and from the homestead. The people residing together in one settlement are usually related by kinship ties on the male side and/or age-set bonds between male adults (Århem, 1991).

Maasai men of some means (i.e., cattle) conventionally marry several wives, polygyny being the preferred marriage form. The right–left dichotomy noted above is an important structural principle in the organization of the polygynous family and is established by the order of the women's marriages. Successive wives build their houses alternately on either side of the gate coming into the

settlement; the first wife builds her house on the right side, the second on the left, the third on the right, and so on. The people on the right- and the left-hand side, respectively, form a subdivision of the agnatic family into two matrifilial groups. This division is of importance for inheritance of the family's livestock, social identity, and ties of sentiments.

CULTURAL CONSTRUCTION OF GENDER

The Maasai recognize two gender categories: male (*ole*) and female (*ene*). Humans are born male or female, but gendering as a social and cultural process begins as soon as a child is born. For instance, the freshly drawn blood given to a woman to regain strength after birth is taken from a male or a female calf according to the sex of the child. The gender terms also apply to livestock and other animals. The terms are used in naming practices as "son of" and "daughter of," respectively, and furthermore as suffixes of nouns to indicate the noun's gender. The female form may sometimes be used as a diminutive of regular male nouns (e.g., *olaiyoni*, boy; *enkayoni*, little boy).

Maasai sometimes come across indeterminate sex condition in livestock; the word *entopis* (f.) indicates neither female nor male sexual organs or both in one. They acknowledge that such a condition may even occur in humans. The gendering of the androgyne human or animal will be done according to the comparative "strength" of the two elements. Gendering must be done so that social and moral order can be restored. Male and female are complementary entities in Maasai cosmological and cultural thought; the male is stronger than the female, but both are equally important to make a complete and "beautiful" world. Maasai men and women mark gender identity by dress, ornaments, and hairstyle. However, gender differences in personal style are not conspicuous as colors and materials overlap cross-sexually. While the Maasai mark gender differences, they also recognize similarities in the two genders.

The gendering among the pastoral Maasai is most noticeable in terms of formal decision-making power. The age-set system is a crucial principle for the construction of gender relations in the Maasai society: it regulates power relations between women and men as well as relations between elder and younger generations (Hodgson, 2001; Llewelyn-Davies, 1981; Spencer, 1988; Talle, 1998). This system is based upon a division of the male population into corporate age-groups which are arranged hierarchically within a framework of authoritative positions and rules of appropriate behavior, and through which men advance linearly in a highly ritualistic atmosphere. The strikingly colorful Maasai "warriors" (pl. *ilmurran, olmurrani*, anglicized form "moran") and their spectacular ceremonies have been amply described in the literature (e.g., Saitoti & Beckwith, 1980; Spencer, 1988). In fact, the image of the Maasai morans is legendary; from their earliest contact with Europeans up to the present day they have never ceased to be a source of wonder and attraction to outsiders.

The rules emanating from the age-set organization pertain mainly to property rights, division of labor, eating habits, code of dress and conduct, and sexual relations. Women are not structurally integrated into the age-set system since they are not divided into formal corporate age-groups. By definition, then, women are excluded from the control of productive and reproductive recourses; they never reach the "age" (i.e., the social age) whereby they might possess livestock or have full control over their own bodies and procreative capacities.

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

There are many similarities, as well as substantial differences, in how Maasai bring up boys and girls. In the early years of their lives, youngsters, residing with their mothers in their houses, are shown considerable love and care by both women and men. They are slowly and patiently taught how to behave respectfully towards each other, how to greet elders, how to eat properly, and how to tend to the animal wealth of the family. Children of both sexes, and as young as 18 months to 2 years old, may be given a tiny stick and eagerly encouraged to gather kids or lambs straying from the flock.

At about the age of 4–6 socialization practices more clearly differentiate children into two genders: boys are expected to tend to the livestock, bring them to distant pastures, and endure long hours without food and drink when out herding, while girls are attuned toward domestic work and the care of younger siblings. Also, girls are encouraged to care for animals and they often herd together with the boys. Boys, on the other hand, are seldom expected to do domestic work.

In general, Maasai show indulgence toward toddlers and young children, and they are rarely physically abused. However, as children grow up and gradually become responsible for important tasks in the household, physical punishment becomes a disciplinary device. In particular boys may be severely beaten if an animal is missing from the herd of which they are in charge.

Both boys and girls are taught to bear considerable physical pain in order to become "proper" Maasai. Young boys and girls intentionally inflict pain on themselves by decorative scarification patterns on arms, legs, and torso. They employ thorns for lifting up the skin and sharp grass blades for cutting it. There are no specific gender differences in how they decorate themselves, except that boys may be more lavishly decorated. Children of both sexes have their lower incisors removed twice in their lifetime (milk teeth as well as permanent teeth). Boys and girls alike also have their ears pierced around the age of 10. However, the practice of ear piercing has become unpopular among schoolchildren.

Puberty and Adolescence

Circumcision at early puberty for girls and late puberty for boys is considered an ultimate test of pain endurance. Beyond its physical ordeal, the circumcision rite has great social and cultural significance for both genders. At this stage in life boys enter the age-set system and girls enter marriage and their reproductive career.

After circumcision (*emurata*) at about 16 or 17 years of age, the young men become members of the age-grade system as "warriors" (pl. *ilmurran, olmurrani*, "the circumcized one," anglicized form "moran"). During this period, which may last 7–8 years, they live together in separate settlements (pl. *imanyat, emanyata*), secluded from the family homesteads, until they become "elders" and are permitted to marry. The state of moranhood is a transitional phase in the life of Maasai men, separating the young unmarried men from married elders not only spatially, but also by dress, diet, and way of life. During this period of seclusion, age-mate solidarity and equality are expressed and communicated particularly through rituals of slaughter, commensality, and togetherness. The intimate relationships evolving between Maasai men while they are morans continue after they have terminated moranhood and become married elders (pl. *ilpayiak, olpiayi*). Until their circumcision, the boys are merely "boys" (pl. *ilayiok, olayoni*) toiling with herding and

homestead work with very limited rights of personal independence.

Like boys, girls are also initiated into the adult community by a circumcision rite (*emurata*). At about the age of 13–14, or when their breasts are sufficiently developed, girls' genitals (clitoris and labia minora) are excised. It is usually an elderly woman of the community who performs the surgery. The operation signals a new social role for the girl; she is becoming an *esiankiki* ("young married woman") now ready to be married and give birth to children. For the 2 or 3 years preceding puberty and their circumcision rites (i.e., from 10 years onwards) Maasai girls spend time with the morans in their settlements. The prepubescent girls and the young morans entertain each other socially as well as sexually (Talle, 1988, 1994).

The Maasai believe that a girl cannot conceive, or will give birth to deformed children, if her clitoris is not removed. Clitoridectomy transfers the sexually "free" girl of the "sweetheart" category (pl. *isanjan, esanja*) into a potential child-bearer who is subject to restrictions in her sexual behavior. From then on, she may only associate with her husband and members of his age group, that is, men at least l0–l5 years her senior. Her sexual play with the morans terminates at this stage, much to her regret; thereafter, sexual relationships with them are defined as illegitimate.

Attainment of Adulthood

The life cycles of men and women are more or less parallel until circumcision, but after circumcision male and female life career diverges. Girls attain adulthood earlier than boys. The latter are not considered adult until they have finished their moranhood and passed the important age-grade ceremony *eunoto* into elderhood (pl. *ilpayiani, olpayian*). Then they are permitted to marry and to establish themselves as independent household heads. At this stage in life they may have reached 25–30 years of age. Their former sweethearts have already married men of elder age grades.

Middle Age and Old Age

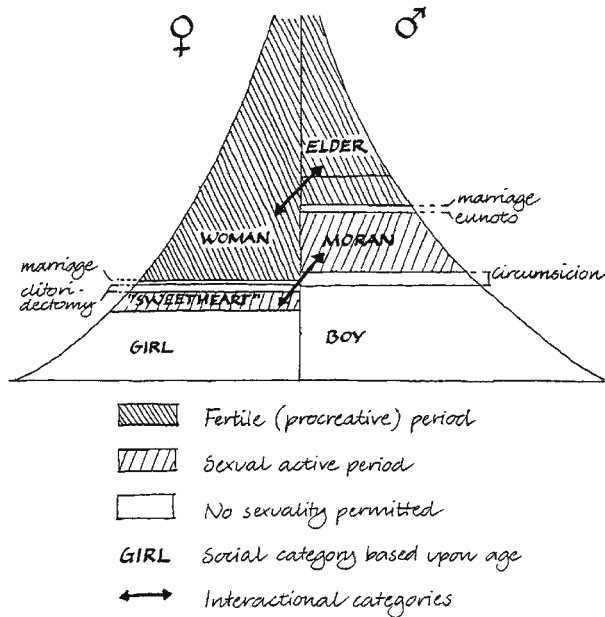
As men and women grow older and begin to circumcize their own children, they pass through new life stages. Men are promoted into senior elders in the age-grade system, and women become *entasat* ("elder women"),


Figure 1. Schematic overview of Maasai life cycle phases.

approaching or beyond menopause. Women of *entasat* category enjoy more autonomy and decision-making power than younger women (see Figure 1 for a schematic overview of life cycle phases).

As Maasai people come of age they become less active sexually. At menopause, women practically terminate their sexual career, while men continue to marry younger women and have sex up to old age. The sexuality of elderly men is primarily oriented toward marital sex and hence toward procreation.

PERSONALITY DIFFERENCES BY GENDER

In general, Maasai of both genders show great tolerance and approval toward each other and are expected to be generous and hospitable to other fellow Maasai. Any visitor to a Maasai homestead must be struck by the propriety of its inhabitants. The concept "respect" (*enkanyit*), implying politeness, generosity, hospitality, and sexual avoidance, is a guiding moral principle in Maasai interpersonal relations. The age-set system and the agnatic kinship structure to a great extent dictate who should show "respect" toward whom. For instance, women as "juniors" to men are

expected to be submissive toward husbands and fathers, and younger men must be polite and generous toward men of elder age sets. Likewise, children of both sexes show unqualified respect toward parents and elder siblings.

One important gender difference in personality is that males are expected to show more aggressiveness and physical prowess than women, particularly in the face of danger. From an early age boys are taught to be courageous and fear nothing in order to defend property and people. During the moran period this bravery and fierceness is tested in collective cattle raids and lion hunts. While Maasai men never disclose any sign of fear, women who are not experienced in fighting often express fear of predators or thieves at nights when husbands and fathers are away. Men are also far more authoritarian than women in their approach toward children.

GENDER-RELATED SOCIAL GROUPS

The Maasai practice patrilocal residence which implies that the newly married couple settle with the husband's patrilineal kinship group. In fact, the wedding ceremony dramatically symbolizes the move of the bride from her own kin to those of her husband (Talle, 1988). Only in the case of poverty and lack of livestock, does the husband move to the wife's family. Over their life-span families may change residence several times, but every time they settle in a new place they seek out relatives or stock friends of the husband. Thus the residence group is a male-related group, but in-married women form strong ties of sentiment and solidarity among themselves (Llewelyn-Davies, 1979).

Married women of the same settlement organize ad hoc cooperative groups to assist each other at delivery and circumcision of girls. These are normally events in a single homestead, except that the circumcizer and individual helpers (often relatives) may come from farther away.

Women of larger neighborhoods consisting of several settlements gather every 3 or 4 years for fertility delegations (*olamal*). When prosperity and growth in people and cattle are said to be receding, women—females being the incarnation of fertility in Maasai cosmology—are instrumental in rectifying the situation by touring the country and begging for sacrificial animals to appease the divine. The delegations culminate in a large and spectacular blessing ceremony (Spencer, 1988).

Women of a neighborhood also collect for punitive delegations (*olkeshuroto*) when husbands or wives have failed to fulfill their reproductive obligations. For instance if a woman, repeatedly refuses her husband sex, without any "good" reason, the other women of the homestead will take action and virtually carry her into bed, waiting there for the husband to perform the act in their presence. The refusal of a wife to sleep with her husband occurs chiefly in the case of young women married to elderly men.

All female-related groups are formed on the basis of proximity in residence, while male-related groups spring out of structural ties through kinship and age-set organization. The strongest gender-related group in the Maasai society is the moran community. During the *emanyata* period, which lasts for several years, they establish a close and intimate relationship that last for the rest of their lives.

GENDER ROLES IN ECONOMICS

The age-set system has a decisive role in defining and regulating the social relations of production and reproduction. Maasai men are not regarded as sufficiently mature to control productive and reproductive resources—livestock, women, and children—until they have reached the elder age-set status and thereby acquired the self-control and personal discipline which are held to be needed to handle the task. The morans, recognized to be the defenders of people and livestock and a reserve labor force in times of distress and drought, are under the authority of elders and are not allowed to marry and reproduce, or to associate sexually with married women. The agnatic lineage system formalizes property rights to animals through inheritance and livestock allocation from fathers to sons. Wives are allocated cattle when they marry and move to the husband's homestead. The foundation of the family's economy is the livestock herd, and the basic unit of production is the polygynous unit consisting of a man, his wife(ves), and children.

Female work is concentrated on tending and minding children, calves, and kids, and on milking and preparing the milk products. All household chores fall to women: home-building, preparation of food, hides, and skins, fetching firewood, carrying water, and shopping. Women also sew the beautiful beadwork for which the Maasai are famous (Klumpp & Kratz, 1993). In most of their work women are assisted by their daughters.

The male-defined tasks revolve around herding and protection of the herd. Men are responsible for grazing and watering the animals, for moving the herds, and for castration, vaccination, and slaughter, as well as for building enclosures and digging wells. Men also make weapons, tools, and certain ornaments of bones and ebony. Furthermore, it is adult men who bring animals to the market and sell them. They also control the cash from the sale. Within the family most of the actual physical labor connected with these tasks is performed by boys and young men, while the elders are mainly responsible for planning, decision-making, and management.

However, the overall gendered division of labor between men-herd and women-house, is to some degree manipulated according to needs and circumstances. When for various reasons there are labor shortages in the family, women assist in such male-defined tasks as herding and watering the animals. For instance, it is estimated that on some group ranches in Kenya female labor in herding amounts to more than 50% (Talle, 1988). However, men seldom engage in domestic work.

PARENTAL AND OTHER CARETAKER ROLES

Children are commonly brought up by their "biological" parents. However, they refer to other person of their parents' generation as "fathers" (*papa*) and "mothers" (*yieyio*), for instance, father's brothers and stepmothers (wives of father) and mothers's sisters, respectively. If parents die, these close relatives take over parental roles. It is also common for relatives to periodically foster each other's children, or for childless women to adopt children from relatives or in-laws. Furthermore, as men of the same age group have access to each other's wives, the father of the child (pater) may not be its biological father (genitor).

Children are nursed until approximately 2 years of age and during this period they stay in close proximity to their mothers. Mothers and nursing children sleep together, and husband and wife are not supposed to resume sexual intercourse until children are weaned. When women adopt children, they often do so as soon as the child is born, and as part of their maternal role, they immediately begin to nurse the child (Talle, 1988).

Fathers usually have a gentle, but distant, attitude toward young children. As elders, men are seldom in the

homestead during daytime, except for early mornings and evenings before they leave or arrive in the homestead, and it is only during these hours that they see their children (Saitoti & Beckwith, 1980).

LEADERSHIP IN PUBLIC ARENAS

Political authority and decision-making power is invested in the male age grade of "elders." While they are in the manyatta, the morans appoint their leaders, and these age-set leaders (pl. *ilaiguenak, olaiguenani*) become important political spokesmen when the morans are promoted to elders. Considering the critical importance of the age-set system in Maasai politics, women are excluded from important public political arenas and leadership roles. Even in the modern political setting, Maasai women seldom participate. However, as women grow older, their decision-making power, at least in household matters, is enhanced.

GENDER AND RELIGION

Among the Maasai, fertile women epitomize the creation of life. The mythical originator of the Maasai, Naiterukop, a creature or "thing" (*entoki*) possessing both human and divine qualities, has a feminine singular relative prefix, *na-* (literally "she who begins the world"). The feminine gender of the originator expresses culturally constituted cognition of the female as "an originating source" (see Hillman, cited by Talle, 1998). In the mythological accounts Naiterukop possesses both human and divine, female and male qualities, the two being simultaneous aspects of the same entity. Thus the duality of the Maasai social order was laid down cosmically from the very beginning.

The term for God, Enkai, meaning rain or sky, is also etymologically feminine (prefix *en-*). God, however, while still being somehow like humankind (*oltungani*) is not comparable to a man or a woman (see Hillman, 1992; Talle, 1998). God is two in one like a husband and a wife, or like a mother and a father (Wagner-Glenn, 1992). Although fixed in some objects (clouds, mountains, sacred groves, trees, sky) Enkai does not have a materiality. Rather, God is an essence or life force that may be invoked by, for instance, individual women's morning prayers and offerings of the first drops of milk from the cows, or collective prayers for children or by offerings of green grass and prayers at shrines.

Maasai religious prayers are for well-being and prosperity. Women are more religious than men are—they pray daily and more often than men do, and the participation of women in communal religious ceremonies is particularly conspicuous.

LEISURE, RECREATION, AND THE ARTS

During the slack working hours, Maasai men and women both enjoy leisure time, men more than women. Men discuss communal affairs and play board games with their age mates; women rest in the shadow of their house with other women and children sewing bead works and chatting. In leisure, men and women are segregated except at dancing ceremonies, where the morans and the young married women are the main participants. Only the male elders are permitted to drink the ceremonial honey beer.

RELATIVE STATUS OF MEN AND WOMEN

The age-set system is the ideological basis of male hegemony in the Maasai society. The control of livestock, the basis of economic and political power, is vested in the elder age set. With the control of livestock goes the control of women and children (Llewellyn-Davies, 1981). This does not mean that women are totally subdued to men, but they have few means of overruling the latter's authority. This applies to daughters toward their fathers as well as wives toward their husbands.

SEXUALITY

To the Maasai, sexuality is a physical act (*erepa*, "to cling") between men and women, or between girls and adolescent boys. Homosexuality and masturbation are virtually non-existent. In fact, the former is an act beyond their comprehension. Whenever the topic is discussed, it raises vehement reactions. Masturbation is practiced by young uncircumcized boys; they are also said to relieve their sexual urges by copulating with donkeys. However, these acts are considered to be activities of children and beneath the dignity and pride of adult Maasai.

The promiscuous "nature" of men is recognized. Just like the bull in the herd, a man will search for mating partners (women) everywhere he goes (*meiki oloing'oni enkang nabo*, "the bull cannot stay in one homestead only"). In contrast, women are expected not to show sexual desire overtly by initiating or taking a lead in the act itself, but they are acknowledged to have their special ways of communicating their wishes.

In Maasai thought, sexuality is closely linked to fertility, but also to pleasure and joy. The sexual relationships practiced within versus outside marriage are conceptualized very differently by Maasai of both sexes. Inequality is built into the relationship between spouses, while lovers are related as equals. Marriages in the Maasai community are traditionally arranged by others than the partners involved, except in the case of elderly men taking a second or third wife. Conjugal sex is first and foremost to have children, prosper, and metaphorically to create "life" (*enkishon*). The obligation of performing marital sex is clearly stated both by men and women; a Maasai man who has several wives will take great care in serving his wives equally in terms of sexual and other favors lest they become jealous of each other. In order not to conceive an "illegitimate" child, women, for their part, avoid receiving their lovers during the days immediately following menstruation, when they think they are most fertile.

While marital sex is for procreation, sex before or outside marriage is looked upon mainly as pleasure and entertainment without child-bearing obligations. The Maasai claim that they enjoy sexual contacts outside marriage because these relationships give them a measure of freedom and choice not inherent in marital sex; people meet secretly and small tokens of love in the form of presents (bead ornaments, money) and love songs are exchanged between partners. A man without lovers—an unthinkable phenomenon in Maasai culture—would not wear the typical Maasai beaded jewelry as it is not common practice for wives to prepare such ornaments for their husbands. Instead, they make them as presents for other men.

In the Maasai culture, sexuality is associated with physical strength, nutritious food (meat, blood), and health. A healthy person is also sexually active. The most "healthy" individuals in the Maasai society are the unmarried men (l6–30 years) of the moran age group. For long periods of time, they withdraw to secluded places in the bush (pl. *ilpul, olpul*, "meat camps") where they devour large quantities of meat, blood, and soup. To enhance their health and bodily strength further, various medicinal herbs are mixed in the soup. While at these "camps," the young men are not permitted to indulge in any sexual activity whatsoever, as it is held to drain their strength. When they "come out" from the bush, however, their sperm or blood (*osarge*) is said to be "hot," indicating that they are now sexually very potent and fertile. Infertile women seek the company of such men, as their virility and potential fertility may bring them luck (Talle, l988).

The sexual debut of Maasai girls occurs at a very young age (10–12 years). From this age and up to puberty, the girls are expected to associate only with the moran age group. They meet to dance and sing in special houses assigned to them in the homesteads (*esoto*) or at designated places in the bush (*oloip*, shade), and it is during these encounters that the girls and the morans have sex with each other. The meetings are conducted in a "romantic" aura, and the love relationships forged may continue clandestinely well beyond one of the parties' marriage to another person. However, owing to the difference in male and female marriage age, these lovers are not marriageable partners.

The Maasai have a rationale for the early sexual debut of girls. They claim that the semen of the morans helps, and is in fact almost a prerequisite for, girls to reach maturity and develop their breasts. Thus the young unmarried men have a direct role to play in women's physical development and achievement of fertility. In comparison, the uncircumcized boys, who are often far beyond puberty when they undergo the surgical operation, do not have any "legitimate" sex partners. They do not dare to associate with the young uncircumcized girls for fear of corporal confrontations with the morans, and in addition, by not being circumcized, they are still "impure" and girls and women shy away from them.

Maasai do not attach importance to the keeping of virginity until marriage. A virgin bride is looked upon as an awkward phenomenon and brings embarrassment on her family. Her virginity signifies that she may be what the Maasai refer to as an *esinoni*, a person who has no luck with the other sex.

COURTSHIP AND MARRIAGE

The Maasai practice arranged marriages, and courtship at young age does not normally lead to marriage (see section on "Sexuality"). Parents, in particular the father or, if he is

absent, another adult guardian on the father's side, are the active actors in choosing marriage partners for their children. Parents decide on bridewealth as well as the practical arrangements of the wedding. The wedding is divided into two sequential events: the departure from the bride's home, and the arrival at the husband's. The major ceremony is upon arrival; the husband's family celebrates the acquisition of a young fertile woman who will bestow many children on their family. In the evening of the wedding ceremony, the bridegroom, his best man, and his age mates gather in the house to bless the girl and give her a new name, a name of the age group to be used only by them. The collective name giving symbolizes their common access to the wife of an age mate.

In the first year of marriage, or until she has built her own house, the young wife lives with her mother-in-law or another adult female in-law in the homestead. The position of a wife in her husband's family and the stability of the marriage are strengthened by the birth of the first child. The number of children a woman has and the way she cares for them are the ultimate measure of her prestige as a woman and of her value to the man and the lineage into which she is married. Therefore the first sign of pregnancy is a great relief to a young wife.

Among the Maasai practically all adults marry, even the physically impaired (Talle, 1995). All Maasai have a moral obligation to multiply and prosper. However, there are a few men (*olsinoni*) who never marry because they have "no luck" with women. There are also girls who remain unmarried in their parents home and conceive by occasional lovers. The children they give birth to belong to their natal family. Often parents of such girls do not have sons, and thus take the children of a daughter (preferably sons) as legitimate heirs to the family herd. Maasai say that some fathers love their daughters so much that they refuse to give them away to authoritarian husbands. The "girls of the homestead" (sg. *entito enkang*) are considered to be proud and obstinate compared with other girls—the reason for this is that they are not ruled by a husband (Talle, 1988).

After marriage, both men and women continue to have sex with other partners. As noted above, men of the same age groups are permitted to have sex with each other's wives at their discretion. Maasai seldom divorce, except sporadically in the case of a barren wife. If a woman runs away from her husband, she has to leave the children behind (unless they are nursing) with the husband and his family. Children are considered the "property" of their fathers and reckoned to belong to their lineage.

Husband–Wife Relationship

The relationship between husband and wife is one of inequality, not only in terms of age but, more importantly in terms of authority and power. If he so wishes, a husband may beat an obstinate wife into submission. The opposite would be unthinkable, as women are not supposed to exercise physical violence against their husbands; besides they do not have sticks with which to beat them. The junior position of wives vis-à-vis husbands is reflected in the fact that the latter refer to their young wives by the term of "children" (pl. *inkera, enkerai*).

Although ideologically and jurally subordinated to men, women are socially and culturally important, particularly through the occupancy and ownership of the house as a site of cultural reproduction, and individual women frequently stand forth as remarkably powerful persons (Chieni & Spencer, 1993; Hodgson, 2001). Husbands often consult their wives in family matters, such as children's marriages, movement of homestead or sale of livestock.

Other Cross-Sex Relationships

Among the Maasai there is a close and intimate relationship between brothers and sisters, particularly those of the same mother. As an expression of their emotional intimacy, they kiss when they meet (which husband and wife never do). Women often find sanctuary in the home of their brother when husbands mistreat them.

Another cross-sex relationship of particular importance is the one between a woman and her husband's best man (*olcepulgerra*). Together with the bridegroom, he collects the young bride from her family and brings her to the bridegroom's homestead at the wedding ceremony. Traditionally, he is supposed to sleep with the bride on the first night after she has entered the husband's home. Later in married life, she may always seek advice or solace from the best man.

Changes in Attitudes, Beliefs, and Practices Regarding Gender

Formal education is gaining importance among the Maasai. Educated men and women have begun to oppose

cultural practices such as forced marriages (especially of schoolgirls) and circumcision of girls more forcefully. There are cases of women taking an authoritarian father or brutal husband to court for such grievances (Hodgson, 2001). There is also an emerging opposition among educated Maasai women to their lack of political influence. Another change is the growing evangelization among Maasai women and the occurrence of spirit possessions among them (Hodgson, 1997).

Manjako

Margaret Buckner

ALTERNATIVE NAMES

Alternate spellings are Manjaku, Manjaco, Mandjako, Manjak, and Mandjaque. Locally, people refer to themselves by place of origin: Bayu are people from Caió (Kayu), Balekis are people from Kalekis (Calequisse), Bater are people from Ter (Jeta), etc. Dialects and culture traits vary among different Manjako lands. This description is based primarily on fieldwork in Caió, and may not apply to all Manjako speakers.

LOCATION

The Manjako live in the coastal areas of northwest Guinea Bissau, West Africa, between the Cacheu and Mansoa Rivers.

CULTURAL OVERVIEW

The main economic activity has traditionally been labor-intensive, wet-rice cultivation in inundated fields reclaimed from coastal mangrove swamps. Earthen dikes are built to keep salt water from invading the fields, especially at high tide. There is also an upland variety of rice which is cultivated in cleared forested areas where other secondary subsistence crops such as peanuts are also grown. Over the last few decades, cashew production has blossomed; cashews are either traded for imported rice or sold for cash. Money sent home by emigrants working in Senegal, France, and Portugal also contributes to the household economy. Cows, goats, pigs, and chickens are also raised, though they are only killed on ritual occasions.

The Manjako "lands" (*ngësaak*) have been referred to as "kingdoms"; each has a "king" who, however, is probably more of a ritual priest than a political authority. Political power is held collectively by the headmen (*basëmcu*) of residential courts (*isëm*), whose succession is matrilineal. Residence is patrilocal, with men continuing to live where they are born, in the courts of their fathers, and women moving in with their husbands upon marriage. When a headman dies, his brother (of the same mother) or his sister's son succeeds him, moving to his court. Just as with residential court headmen, but on a smaller scale, whenever a man dies, his wives, children, and much of his property are, in principle, "inherited" by his younger brother or his sister's son.

Manjako kinship terms show a matrilineal pattern. All men in one's father's immediate matriline (father's siblings, father's sisters' sons, etc.) are one's "fathers." Even a father's sister is called *asininji-ngac*, "my female father." All members of one's matriline are one's "mothers" (the generation above ego, including *anininji-ninc*, "my male mother"), one's siblings (the same generation as ego), or one's children (the generation below ego).

CULTURAL CONSTRUCTION OF GENDER

Gender in Manjako is expressed by two roots: *-inc* "male" and *-kaac* "female." As adjectives they are used for humans and animals alike with the corresponding prefix. Used alone with human prefix *na-*, they mean "man" (*nainc*) and "woman" (*nakaac* or *ngaac*). There are no grammatical gender categories, that is, no separate pronouns for "he" and "she." The human prefix *na-* is not gender specific; for example, *nacaf* is "an elder," whether referring to a man or a woman.

When a baby is born, its sex has no bearing on its welcome into the world; children of both sexes are highly valued. Children of both sexes are also equally susceptible of being a spirit taking temporary human form, or a "problem child" who has died and come back for a temporary visit. There are specific names for a pair of boy–girl twins: the boy is always named "*Kainc*" (<*-inc*, "male"), the girl "*Kakaac*" (<*-kaac*, "female"). Traditional Manjako names were rarely gender specific, though now most babies receive Portuguese names from the Catholic stock, such as Maria, Cristina, José, and Luis.

Both men and women are considered important and are respected for their contributions to society. Women are child-bearers and tie people together, since clan membership passes through them, and since they connect their birth family with the family they marry into. Men found and protect households, and provide religious and social leadership.

The distinction between "male" and "female" is fundamental, and is reinforced both ritually and in everyday life. At dances, ceremonies, meals, and work, the two sexes are informally segregated; the only enforced segregation is at a few principal spirit shrines and certain rituals.

Men and women dress differently. Men wear shorts or trousers while women wear tops and cloth wraps or skirts, though women often wear short pants while working in the rice fields or gathering shellfish in the mangroves. Women may go topless at home in excessively hot weather. However, on ritual occasions, such as funerals, both men and women wear traditional locally woven cloth wraps (*bëlenj*), which play an important ritual role at funerals. Men's hairstyles are short and plain; women wear sculptured braids which are sometimes adorned with beads.

Shortly after birth, girls have their ears pierced and start wearing earrings. In the past, adolescent girls often underwent intricate ornamental scarifications on the stomach and chest area (Carreira, 1961), though nowadays these can be found only in a few elderly women.

For both sexes, character and personality are as important as, if not more than, physical beauty. Industriousness, cleverness, and good humor are also appreciated traits, as is dancing ability.

GENDER OVER THE LIFE CYCLE

The Manjako word for "child," *napooc*, is not marked for gender; the term is used for boys and girls indifferently. After puberty, the distinction is marked: a girl is referred to as *nampili*, and a boy as *upas* (borrowed from Portuguese, *rapaz*, "boy"). Adult men and women are referred to as *nainc* "man" or *nakaac* (alternate *ngaac*) "woman." The difference between children and adults is evident in funerals. The funeral for a young unmarried girl or boy, *ufir*, is shorter and simpler than the funeral ceremony for an adult, *pëum*.

Socialization of Boys and Girls

When still very young, boys and girls are treated the same. They play together in household groups. Children of both sexes are allowed, even encouraged, to explore and run around freely. Once they can obey instructions, they are given gender-specific tasks. Girls are asked to help with household chores and watch younger siblings; 4-year-old girls are sometimes seen carrying an infant on their backs. Boys are often sent on errands and join in the chores of the men of the compound (building fences, reroofing buildings, etc). They are also responsible for making sure that cows remain tethered during the growing season. Boys probably have more play time than girls.

Groups of older boys and girls often form work parties. Boys prepare rice fields for planting or fish with lines and hooks in tidal inlets. Groups of girls transport rice seedlings from nurseries to the fields, or gather shellfish in the mangroves. It is in groups such as these that prepubescent girls and boys start to gel into social groups that will eventually become full-fledged age sets.

When the opportunity is present, parents send both sons and daughters to school. However, dropout rates are very high, especially among girls.

Puberty and Adolescence

In Caió and adjacent Manjako lands, as children reach adolescence, they also become members of an age set (*uran*). Every 4 years or so, boys of approximately 15–19 years of age and girls of approximately 13–17 years of age symbolically "enter the *pëbomën*," a communal ritual hut located at the center of each ward. For the next 4 years, they gather there regularly to have meetings, receive counsel from their elders (members of the age set which preceded them), share meals, have dances, organize work parties, and keep the building and grounds clean and in good repair. They also begin a series of traditional rites by which they form an age set (*uran*). Though it is not considered normal for age mates (*baseenc-*) to sleep together during this period, couples often do form and later marry, though this is not permitted if the girl is already betrothed. After approximately 4 years, this age set is "promoted," pushed out of the *pëbomën* by the next generation of youths who start the cycle all over again and form a new age set.

Small groups of female age mates have assigned male "guardians," usually from the age set above them.

The guardian attends the meetings and dances of the group.

Age-set membership is permanent. Throughout their lives, age mates frequently meet, to drink, to dance, to work, to comfort the bereaved, to aid the needy, and to welcome emigrants home. At certain rituals, especially at funerals, they have special assigned roles and responsibilities. Age mates of one's father are also fathers in a way, as age mates of one's mother are mothers.

Attainment of Adulthood

After the 4 years of age-set formation, a community-wide ceremony (*ka cit uran*) marks the end of the age-set initiation period. The young men, now aged 19–23, start working for a wife (brideservice) who is often still a young girl; they will not marry for 10 or 12 years, during which time the girl grows up and the man establishes a viable home. The women, now aged 17–21, will marry their betrothed who, traditionally, are two or three age sets above them, which means, in arranged marriages, that grooms are 10–12 years older than the brides. Marriage and having children mark attainment of adulthood.

Men are not considered full adults until they have gone through the male initiation rites, which include circumcision (*kambas*). The event is held about once every 10 years, though in the past it was held only every 25 years or so. Male initiation ceremonies take place over a 3-month period. All the initiated men, even emigrants living in Europe, return home to take part, thus renewing their spiritual ties to their homeland. They gather at the kingdom's main spirit shrine, which is off limits to women. There, new initiates are circumcised and acquire the secret ritual and spiritual knowledge of adult Manjako men. Women and girls participate in dances and singing in honor of their sons, brothers, and boyfriends. It is a sacred time, but also a joyous time, when emigrants come home, when families reunite, and when much feasting is done by all. (For a historical account of the male initiation rites in Caió, see Meireles [1949].)

Middle Age and Old Age

As men mature, they marry additional wives, have children, and acquire titles. They are given more and more social and ritual responsibilities, and their word becomes more respected. Many middle-aged men succeed to the headmanship of a residential court when an aged headman dies. They then move their entire household to the court and take over the responsibilities of the new office; they also take part in meetings of the council of headmen. Men who are not called to a matrilineal headmanship remain in their compound of birth, where they acquire more and more authority and have more and more say in clan matters.

As women mature, they are recognized as wives, mothers, and household managers, especially if they are their husband's first wife. As with men, they have more and more say in family and clan matters. They play a very important role in organizing such collective events as funerals.

Old age for both men and women is a time of rest. Old people continue to live with their families, who provide them with meals and other necessities and consult them on family matters. They continue to play an important role in decision-making and are treated with great respect.

PERSONALITY DIFFERENCES BY GENDER

Both men and women among the Manjako are generally outspoken and assertive. They are quick to argue and express opinions. Men are expected to command, and women to obey their husbands. Both can be quick to anger, and yelling matches are not uncommon. When young, both boys and (more rarely) girls get into fights. When this happens, it is treated as a wrestling match. Onlookers surround the pair, keep them from hurting themselves, and allow them to continue until there is a victor.

Men and women both appreciate alcoholic beverages: palm wine, *cana* (a locally made rum), store-bought liquor such as whiskey and vodka, and, as a last resort, cashew "wine"; in fact, at ceremonies all present, including men, women, boys, and girls, are required to partake of at least a symbolic amount of the offered alcoholic beverage. Men regularly drink in public, and a man staggering home drunk is a relatively common sight. However, it does not seem proper for a woman to become drunk in public. Groups of women often gather inside houses or courtyards, especially at times of ceremonial events, and "pass the bottle," but rarely become inebriated.

GENDER-RELATED SOCIAL GROUPS

The residential court is patrilocal; the men who head households there are related, at least theoretically, though the exact relationship is usually lost after several generations. They are classificatory if not real brothers, and show solidarity in economic activities, social events, and religious ceremonies.

While men belong to the residential court by birth, women arrive there as wives. In the best cases, cowives and wives of brothers form very cohesive units and share household chores and economic and social activities. However, women also maintain very strong ties to their own relatives. They frequently visit their birth compound and always participate in important events that take place there.

Female members of age sets, especially the younger age sets, often get together to hold dances, which include drinking and eating and much merrymaking. The male guardian of the group is the only man present.

GENDER ROLES IN ECONOMICS

Women are responsible for preparing meals, keeping the house and courtyard in order, and most childcare. Men are responsible for keeping the house, roof, and fences in repair, for providing food and other necessities for their family, for maintaining dikes year round, and for carrying out the religious ceremonies necessary for maintaining the family's well-being. House work-groups are integrated, though tasks are assigned by sex. For example, all residents will work together to build a house: women carry the mud to the site, while the men mold the mud into walls.

All participate in rice cultivation, but tasks are gender specific. Men maintain the dikes, prepare the paddies, and help with harvest. Women transplant rice from nurseries to the fields, thresh the grain at harvest time, and transport it to granaries.

Usufruct rights to rice fields are distributed by headmen to both men and women, although men, as heads of households, generally have more and larger fields. Wives often have their own rows, granted to them by fathers, uncles, husbands, or sometimes aunts or mothers; they then also have their own granaries. However, they also work in their husband's fields and contribute to his granary.

The introduction of cashew plantations has lessened the economic importance of rice. Men plant the trees, but women gather and transport the nuts. Men also earn extra cash by collecting and selling palm wine. In coastal areas, enterprising women get up before dawn to meet non-Manjako fishermen, just back from a night of fishing, to buy fish and resell it at the market. They may also sell other produce there, such as sweet potatoes, peanuts, eggs, or bananas.

Traditional weavers are men; traditional potters are women.

Since the arrival of the Portuguese in the early 1900s, Manjako men have sought to profit from new economic opportunities. Male emigration is rampant, especially to Senegal, Portugal, and France, where men work in factories, construction, and the service sector. Most Manjako families have at least one member living abroad; in some areas, a very high rate of emigration has led to the demise of the traditional rice economy. It is also now common to find men who retire in their home village after working abroad for 30 years, living off a foreign pension. Women sometimes accompany their husbands abroad, and many women also find work abroad and become financially independent.

Prostitution is also an option for women of the coastal Manjako lands (Buckner, 1999). It offers an alternative lifestyle to women who do not wish to bend to a father's or a husband's will. A woman may work as a prostitute for a few years in order to earn money to compensate a man who has performed brideservice for her but whom she does not wish to marry or whom she wishes to divorce. Also, a woman may enter prostitution if her husband emigrates or dies and leaves her without resources. Women may work for just a few years or may make prostitution a career. Women from families with prostitutes are more likely to work as prostitutes themselves. At all times, the women are in complete control of their practice; they alone decide where and how often they work, the prices they charge, and what they do with their earnings. Manjako women who practice prostitution are almost always at least in their mid-twenties, and they can be as old as 60. They are mothers, grandmothers, single, or divorced; a few are married.

In the most common scenario, a woman rents a room in a house in a city (the women never practice in their home villages), sometimes with other family members. At night, she receives clients there. Exchanges are short, and a woman may have several clients in one night.

This kind of prostitution has probably been going on for well over half a century. It contrasts with a "modern" kind of prostitution by much younger women (usually not Manjako) who attract well-to-do clients at hotels and discotheques and spend the entire night with a single client.

Manjako women who practice prostitution continue to maintain strong ties with their home villages. They send money home and visit there for funerals and other important events. They are not generally stigmatized, especially if they use their economic success to benefit their family and community. Women who once worked as prostitutes often (re)marry and return to live in the home village where they take on traditional roles of wives and mothers.

PARENTAL AND OTHER CARETAKER ROLES

Both men and women participate in child-rearing. Parents are very affectionate with their children, with much holding and cuddling. Both parents discipline their children, though fathers generally have the final say in disciplinary matters. As children grow older, mothers spend more time with their daughters and nieces, and fathers with their sons and nephews. All adults participate in the upbringing of all the children living in their compound and of all their nieces, nephews, and grandchildren. Cowives, especially, are like second mothers to each others' children. Elder siblings are very protective of their younger brothers and sisters, and often play a parental role.

LEADERSHIP IN PUBLIC ARENAS

In both politics and religion, men occupy the highest rungs of authority. The king and his officers are men, as are the heads of residential courts, shrine priests, and ritual specialists. However, women also participate in public debate and are listened to; they do not hesitate to speak out on subjects that are important to them. They also participate in selecting the successors of deceased headmen. A large number of women are diviners, though the most prestigious ones are men. The wives of titled men, such as the king and the head blacksmith, also have very important functions, and ceremonies such as enthroning the king

cannot take place without them. Older women are often seen as repositories of genealogies and knowledge of past events.

GENDER AND RELIGION

Throughout Manjakoland, earth spirits (*ngësai*) live in fixed places marked by uncut groves, silk cottonwood trees, forked sticks, or simply hollowed out places in the soil. They perform services (protection from illness, a good job, vengeance, etc.) in exchange for offerings of livestock, palm wine, and rice dishes. If the contract is broken, that is, if payment is not made for services rendered, the earth spirit sends illness, death, or some other catastrophe. At the more important and powerful earth-spirit shrines, initiated shrine priests perform rites on behalf of the consultants, while at lesser spirit shrines anyone can make a request or a payment, acting on his or her own. Access to the major shrines is forbidden to women and uninitiated men, who wait outside while the shrine priest and male family members act in their behalf. Earth spirits take the inanimate prefix commonly used for animals but also for inanimate objects; they carry no gender.

Bush spirits are also available to perform services for humans, though, as opposed to earth spirits, they are quite mobile and usually enter into private partnerships. The *banjanguran* take the human prefixes *na-* (sing.) and *ba-* (pl.); at least one female "bush maiden" has been mentioned (Gable, 1990, p. 476). Entering into a contract with a bush spirit is dangerous in that, though they are quick to offer their services, they are also ruthless in demanding payment, and will feed on the souls of children of their human "partner's" clan if the latter does not keep them satisfied with food and drink.

Some Manjako of both sexes receive signs such as recurrent illness or extraordinary happenings that they are to become a healer–diviner (*napene*). Through a long series of rituals culminating in "death" and "rebirth" they develop the ability to see and communicate with bush spirits, who help them in their practice. They are more often male than female, though many women are successful diviners. Female diviners tend to specialize in fertility problems and children's health.

Every Manjako homestead has an ancestor shrine consisting of a dozen or so posts (*isaap*) representing the souls of the ancestors, in particular past headmen. Years after a man has died, a post is planted in his honor

and he joins the collectivity of ancestors. Family members constantly consult the ancestors on family matters and offer them libations. Ancestor posts are predominantly male. In recent years, however, more and more women are being commemorated with posts, not as lineage elders, but as wives and mothers.

Leisure, Recreation, and the Arts

Men's labor is intensive, but tends to come in spurts, so men often have spare time to sit with other (usually male) family members and chat and drink palm wine or other locally brewed alcoholic beverages. Women's work is more continuous, but is often done collectively with many breaks for rest and play. Social visits are very common, and relatives, friends, and neighbors—usually in same-sex groups—often sit and chat together during the heat of the noon hour or the coolness of the evening.

Dances are a very popular form of entertainment and are held on every available occasion, including funerals (especially of older folks), age-set parties, weddings, and household feasts. Men and women have different kinds of dancing. Women dance to the *untina*, or water drum, a half-gourd inverted on a basin of water and struck with the hands to play syncopated rhythms. Their dance is executed mainly with the feet, taking small but rhythmically intricate steps, while the upper body remains relatively stable. A semicircle of women clap in rhythm with the drum, while a woman from the group dances solo. Toward the end of her dance, others may join her, and after the final steps, the woman who has danced is embraced by her friends. When the drum begins again, another woman steps up to dance. The dancing is accompanied by improvised songs.

At funerals, men dance to a wooden gong drum and a leather drum, both played by men. They carry long thin sticks, which may represent spears to confront the spirits responsible for the death. The dance involves the whole body, with a sort of hopping as well as gesturing and idiosyncratic movements. There is also a slower collective ritual dance that women perform at funerals to the rhythm of the men's drums.

Older women also get together to dance to the rhythm of the bell (*utapi*), either at weddings or among small groups of friends.

All ceremonies—including, or even especially, funerals—involve feasting and dances, and are seen as occasions for socializing and merrymaking. Usually, however, the two sexes congregate on opposite sides of the compound.

Relative Status of Men and Women

The Manjako (both men and women) acknowledge the right and the ability of men to preside over the household and to hold the important political and religious titles such as headmen and shrine priests. Male clan and lineage elders have authority over rice fields. During male initiation, men acquire specialized ritual knowledge, and only initiated men can enter the principal spirit shrines. Some ritual paraphernalia cannot be viewed by women. During the interrogation of the "corpse" (nowadays, a stretcher covered with a cloth) at funerals, the four corners are supported by male youths (though it is said that two of the corners used to be supported by women).

But the society as a whole also attaches a very high value to women and accords them the same basic rights men have. Women have much say in what goes on in the household, in kin groups, in age sets, and in the community at large; in particular, they participate in the decision-making processes for designating headman successors and spouses for their children. They have a high degree of independence, and expect and receive respect from their husbands and brothers.

In traditional marriage, the bride has less say than the groom. Fathers may betroth their daughters at a young age; the daughters have very little choice in the matter. The men perform brideservice as the girl matures, and when she has reached marriageable age, she is more or less forced to marry her official fiancé or be punished by the spirits. Many young women prefer to flee the area and/or work as prostitutes to earn money to compensate the groom for his brideservice; they can then marry a man of their own choosing, who is closer in age and often in the same age set. Women are also relatively free to divorce, as long as the husband is compensated for brideservice and/or children remain with the husband.

Funerals also reveal the difference in status between men and women. If a man and a woman die in the same period, the man's funeral will take precedence. For example, the royal drum will be played at the man's funeral rather than the woman's.

SEXUALITY

Sex is a very important part of life, both for enjoyment and for reproduction. Even very young children know the mechanics of sexual intercourse and can mimic the action involved. At least one Manjako man stated that regular sexual intercourse helps prevent blindness. Sex during pregnancy—especially the later stages—is discouraged; after giving birth, the mother ideally abstains from sex for up to 3 years during the time she is nursing.

Sex is very much discouraged among adolescents until they have finished their age-set initiation, when the girls are ready for marriage. Teen pregnancy is considered spiritually dangerous. During the 4 years of age-set initiation, many couples form, but sexual inter-course is not condoned. Since teen pregnancy is extremely rare, either couples are indeed abstaining, or they are taking very good care that the girl does not become pregnant or come to term. Young wives are often suspected of continuing to see their sweetheart (*urok*) even after marriage, especially if their new husband is 15 or 20 years older.

In general, men's extramarital affairs, though not condoned, seem to be more accepted than women's, with the attitude that "men will be men." If a man emigrates, he will often leave a wife or wives in the village and take a lover or another wife abroad. Yet the number of children born to women whose husbands are away is proof that women also seek sexual partners outside marriage. Conflicts arising from adultery are common and lead to heated public arguments. Physical violence rarely results; instead, contracts are made with spirits to punish an adulterous spouse and his or her lover (*bësobar*).

There is little if any cross-dressing or cross-sex identification. Homosexuality is not readily conceivable. (E.g., when this researcher tried to ask informants about homosexuality, a long explanation was delivered to incredulous listeners by a Manjako assistant, including a reference to tourists in the Gambia. On another occasion, a Manjako man, when asked about possible female homo-sexuality, asked, "But how would they do it? They don't have the right parts!")

COURTSHIP AND MARRIAGE

A man who wishes to marry a girl speaks to her father, often when she is still a young child. If both families (including the ancestors) are in agreement, the accord is finalized by offerings of palm wine. From then on, the girl is considered betrothed; her father and her future husband are *bayotan*, in-laws. Over a period of up to 12 years, the future husband performs brideservice; that is, he works for his father-in-law several days per year in cultivation, house construction, fence building, or other similar tasks. When the girl is of marriageable age, that is, after she has finished her age-set initiation, a wedding ceremony (*bënim*) is held and the bride moves into her husband's house. Since the wedding ceremony is expensive—it includes feeding and entertaining many guests for several days—it is often skipped or at least postponed for several years until enough money is saved to be able to afford it.

A man and women can also "marry" simply by moving in with each other, without brideservice or wedding ceremony. In this case, they are usually close in age, having met during age-set initiation and become sweethearts, or it is the second marriage for one or both of them. These are love marriages.

The Manjako words for "husband" (*ayin*) and "wife" (*aar*) are used regardless of whether brideservice or a wedding ceremony has taken place. The only differ-ence between them seems to be the woman's freedom to walk out of the marriage. If a woman wishes to divorce a husband who has performed brideservice, she must reim-burse him monetarily and/or live with him long enough to bear him a child. It is often the case that a girl refuses to marry the husband chosen by her father and who has performed brideservice for her. "Divorce" then occurs before marriage; that is, the betrothed girl "pays off" the man who is performing brideservice for her even before the marriage is consummated. Furthermore, if a husband who has performed brideservice dies, his wife is "inher-ited" by his successor, usually a brother or a maternal nephew. If a woman does not wish to marry her deceased husband's brother, she must reimburse him as she would her husband.

Ideally, Manjako marriages are polygamous. Though many men have only one wife, most have at least two at some time in their lives, and often many more. The first wife has authority over other wives, and a wise husband consults his first wife before taking other wives. Since older men often marry young brides, many women become widows; traditionally, widows are "inherited" by their dead husband's successor. Divorce and remarriage are very common. One survey showed that women had

almost as many husbands in their lives as men had wives, though the women were not married to all their husbands simultaneously.

HUSBAND–WIFE RELATIONSHIP

A typical Manjako family lives in a single rectangular house with up to 10 or 12 rooms, each with a door to the exterior. Each wife has her own room where she and her young children sleep. The husband also has his own room. Other rooms may be occupied by relatives, long-term guests, or adolescent children. Each wife has her own kitchen in which she prepares meals for herself and her children. In polygamous households, the wives rotate cooking for their husband. The husband eats alone or with older male children or guests.

Among married couples, there seems to be more of a feeling of companionship than of affection, especially for arranged marriages. But, even within polygamous marriages, many couples are very attached to each other, especially when the woman has chosen her husband herself. Husbands and wives typically show kindness and respect for each other.

In polygamous marriages, when the husband treats his wives and their children equitably, and when each wife accepts and respects her cowives, the household runs smoothly. However, if a husband favors one wife over others, cooperation ends and the compound becomes a very unhappy place.

In the case of irresolvable conflicts, divorce can be initiated by either partner. Common reasons include adultery, a woman never loving her husband in the first place and wanting to marry her sweetheart, a man emigrating and abandoning his family, violence or abuse, and lack of children. In the case of divorce, if brideservice has been performed, the children stay with the father (unless they are very young, in which case they stay with the mother temporarily). However, if there has been no brideservice, the children remain with the mother and her family.

OTHER CROSS-SEX RELATIONSHIPS

Brothers and sisters are very attached to each other, since a woman's children are her brother's heirs. Men look after their sisters' children; their sisters' daughters will carry on the family line. Siblings and cousins of both sexes have much affection for each other.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

As more and more Manjako villages adopt a cash economy, an economic gender gap may be growing. More cash-earning opportunities are available to men than to women (one consequence of which is a high rate of prostitution among Manjako women). As men accumulate wealth, they are more inclined to follow the Western practice of leaving it to their own children rather than to nephews and nieces. The matrilineal system of inheritance has already virtually disappeared in many Manjako lands, and with it, perhaps, a certain degree of women's status.

The age-set system varies greatly from one end of Manjakoland to the other. In the past, according to many accounts (especially Carreira, 1947; Gable, 1990), only male youths entered a ritual hut and, after several years, were promoted to the status of young adults. The system described here, in which male and female age-set members belong to the same set throughout their lives, has probably only existed since the early 1900s; in it, women are full participants.

The practice of brideservice also seems to be dwindling, and has already ended in some Manjako lands. The disappearance of brideservice will surely affect rates of arranged marriages and divorce.

Mardu

Robert Tonkinson and Myrna Tonkinson

ALTERNATIVE NAMES

Mardu ("person") is a collective term used to designate several dialect-named Australian Aboriginal groups, principally speakers of the Budijarra, Gardujarra, Giyajarra, Gurajarra, Manyjilyjarra, and Warnman dialects, whose traditional territories surround a large salt lake, Gumbubindil (Lake Disappointment).

LOCATION

The territories of the Mardu lie on the western side of the Gibson Desert, straddling the Tropic of Capricorn between longitudes 122°E and 125°E. The Gibson and neighboring deserts are part of the vast Western Desert, a plateau averaging 1000 feet in altitude and covering some 500,000 square miles, almost all of which lies within the state of Western Australia.

CULTURAL OVERVIEW[1]

The Mardu are part of Aboriginal Australia's largest single culture area, the Western Desert bloc, which is an extremely difficult environment for human survival. The region is notable for its homogeneity in language, social organization, and culture, and the very low population densities necessitated by aridity and resource scarcity. Deriving in large part from the latter conditions, particularly the unreliability of rainfall, was a major cultural characteristic: the open and highly permeable nature of social and ecological boundaries that facilitated movement and access to resources across large areas of desert. A host of norms and social conventions favored cooperation over conflict, particularly in intergroup relations, reflecting the primacy of unfettered movement in ensuring survival.

Traditionally, the Mardu practiced a hunter–gatherer economy and were seminomadic. Movement was essential for subsistence, and religious obligations also entailed travel over wide areas. Men usually covered more ground areas than women in fulfilling their ceremonial responsibilities, such as accompanying initiates or transporting sacred objects. Social organization was based on the (sometimes polygynous) nuclear family, and several families, generally closely related, constituted the band, which was the basic economic unit. Above the level of the band and of kinship-based local groups that, along with their heartlands, were people's strongest basis for identity, were broader identities deriving from shared membership of the same dialect-named group—which, however, never acted corporately. The business of society writ large was conducted during periodic aggregations, "big meetings," where outstanding disputes were settled and there was much religious activity, centered most often on rituals associated with stages of male initiation.

Australian Aboriginal societies are notable for their complex social organizational forms and religion, founded on the concept of the Dreaming, the creative epoch in which ancestral beings fashioned the landscape, peopled it, and left behind language, culture, and rules for living. Despite their nomadism, people were tied by religion very strongly to their heartland "estates," over whose important sites they exercised guardianship, ownership, and ritual responsibilities. The Mardu live in a universe of kin, and the blueprint for proper behavior, obligation, and responsibility contained within the kinship system remains a major integratory mechanism, along with marriage alliances, shared values, and religion. In the absence of chiefs, leadership was context dependent and largely a function of age and gender, with older men ultimately controlling the religious life. However, the ethos of Mardu society is best described as egalitarian, with all mature adults regarding themselves as equal to all other members of the same gender, but with hierarchical tendencies that favor male social adults surfacing most strongly during domestic disputes and in the conduct of the religious life.

CULTURAL CONSTRUCTION OF GENDER

The Mardu recognise two genders, female and male. There is gender differentiation in the nouns (pronouns are not gender specific) used for children and adults, and for most kin terms. Thus *bundu* man, *wandi* woman, *mama* father, *yagurdi* mother, *nyamu* grandfather, *nyami* grandmother, *gurndili* father's sister, *gaga* mother's brother, *jurdu* older sister, and *gurda* older brother, but *marlaju* younger brother *or* sister.

Conceptions of Gender

The Mardu conception of gender entails a sharp differentiation between men and women in some areas of life, most noticeably in the religious arena. Recognizable male and female domains exist, spatially and in terms of behaviors, prerogatives, and practices. Thus, while the hearth is a shared space for the nuclear or extended family, there are designated male or (much less commonly) female spaces from which members of the opposite gender may be excluded. Rituals secret-sacred to one gender are held well away from living areas, and persons of the opposite gender, as well as the young uninitiated of the appropriate gender, avoid even looking in the direction of those spaces when the initiated are going to or returning from ceremonies. Severe penalties obtain for women who, even unintentionally, enter male sacred domains, and men avoid going near exclusively female rituals. In public areas, avoidance rules result in certain categories of relatives, both affinal and consanguineal, taking care not to be in the same space. Rules govern how people place themselves and interact in public spaces such as meeting rooms, or open-air venues where people may gather. Usually, men and women sit together in single-gender groups, primarily to ensure that avoidance rules are not inadvertently breached.

Dress and Body Adornment

Traditionally, the Mardu wore minimal clothing; women wore pubic coverings, but many men went naked, as did all children, and adorned their bodies only for ritual activities. Today, Western-style clothes have been fully adopted, though women, especially older ones, seldom wear trousers, and the upper body of both females and males is often unclothed during rituals. Postpubertal men sometimes have decorative scarification on their chests, though this is now rare among younger men. Women also sometimes had decorative scars on their arms, but this, too, has all but disappeared. There is considerable variation among men in the length of hair and the wearing of beards. Young men, postcircumcision, left their hair uncut and wore it in the shape of a bun, *bugurdi*; this was also the name of this stage of initiation.

Attractiveness

Mardu discuss attractiveness in terms of smooth and healthy skin for both genders, and among women firm breasts are admired. Plumpness was rare, but regarded positively; today, obesity is common and is sometimes remarked upon negatively. Both women and men would rub their skins with red ocher mixed with fat to beautify the skin and protect the body against illness. Love magic was used by both women and men to make themselves attractive to particular members of the opposite gender; this involves the use of songs and dances as well as of material objects.

GENDER OVER THE LIFE CYCLE

Stages of the life cycle are named differently for each gender, with more stages recognized for males than females. The labels are based on physiological maturation to cover the childhood phase of life; for example, there are separate gender-neutral terms for newborn, unable to sit up, able to crawl, walking but only just, walking properly, no longer breast-fed, no longer carried. Then follows a long period known simply as *ngulyi* "child," until girls whose breasts are developing are called *durndurn* "swelling breasts," and they are considered ready for marriage; boys remain *murdilya* "uncircumcized" until seized as a prelude to circumcision, around age 16. These labels, like kin terms, are frequently used in address and reference as substitutes for personal names. After circumcision, youths live in unmarried men's camps (*girriji*), but continue to eat with their families of orientation. The next stage of initiation is subincision, after which men passed through several more named stages until, in their late twenties, they were considered social adults and ready for marriage.

The stages through which men pass are publicly marked by obvious separation and elaborate ceremony,

particularly at circumcision. Circumcision occurs some time after the youth is seized, has a ceremonial hair-belt put on him, and is taken to other communities to "round up" people for the actual ceremony, which usually takes place some months later. The entire host community, plus these visitors from related communities, assemble for days of public ceremonies that complement the secret male rituals marking the transition to manhood of what is usually a group of age mates. In contrast, no public ceremonial activity surrounded female emergence into adulthood. On marriage, a girl's mother would take her possessions and place them outside the dwelling of her bethrothed husband. Betrothal traditionally occurs when a boy is circumcised and one or more male relative(s) promise(s) him a wife, who at the time would be a small child or even unborn. Nowadays, many young people choose their sexual partners, and traditional arranged marriage is in decline; however, it has not been replaced by formal Western-style marriage.

Preadolescent boys and girls enjoy considerable freedom, with little gender distinction in their rights and responsibilities. As they enter their teens, greater restrictions are imposed, particularly on girls who are held primarily responsible for the maintenance of propriety in sexual activity. Once boys enter the male initiation process, they are also subject to greater scrutiny and tighter limits on their activities. There is gender variation in the status of single people, in that young unmarried men often live together, whereas unmarried young women live with their parents. Divorced and widowed, particularly older, women may share single women's camps. In the past, there was no category of never-married adult women and widowhood was not a permanent state. A widow was prohibited from remarriage until the completion of the reburial of her husband's bones, when a meeting would be held by her brothers and her late husband's patrikin to decide on her new marriage partner, often a brother of the deceased; the older the widow, the greater her say in the decision. After the initial burial and surrounding rituals, a widower was free to take other wives.

Socialization of Boys and Girls

Boys and girls are equally valued as children, and child-rearing practices are not noticeably different for the genders. Infanticide of healthy infant boys or girls was apparently rare. Mardu society is markedly child-centered in that both girls and boys are greatly indulged, and are free from chastisement and the constraints of patterned kinship behaviors (see Hamilton, 1981). Both genders seem to be given equal attention, affection, and entitlements while they are children. From early adolescence, however, they are treated differently and the prolonged transition to full adult status for boys is heavily emphasized. The rituals marking that transition (above) imply a cultural assumption that womanhood is a natural state, achieved unaided, whereas manhood must be defined by physical procedures and rituals that mold boys physically, socially, and psychologically into men.

Adult Expectations Regarding Children.

Children's play seems to follow similar patterns for both genders; both explore their environment and hunt small animals such as lizards, or gather fruits and other easily obtained foods. They simulate family relationships in play. Toy spears, boomerangs, and other weaponry are made for and by boys, who play at hunting and fighting. Both genders play new ball games and traditional games using stones. Small children generally play in mixed-gender groups, but later tend to do more single-sex play. Boys are not permitted to accompany their fathers or older male relatives on hunting trips until they are adjudged old enough to exercise the necessary self-control and restrained behavior. Girls approaching puberty are expected to shed their playfulness during the food quest and concentrate on becoming skilled producers before they are given in marriage; however, no such expectations are held of boys of similar age.

Childhood Rituals, Education, Common Features of Socialization.

Birth was not celebrated ritually, nor was there any elaboration of either postpartum taboos or magical measures to protect the newborn from harm. Life for the first 10 or so years of childhood was devoid of rituals for either boys or girls, but for boys approaching their teens tooth evulsion and the piercing of the nasal septum were a prelude to the more serious and highly ritualized stages of male initiation.

In Mardu society, education was informal and very largely a matter of observation, imitation, and repetition rather than the conscious or formalized transfer of knowledge that Mardu children receive in schools today. Children learn from adults and from their peers, but grandparents, if present, are particularly prominent as educators in the sense of telling them stories, singing

them songs, and indicating the correct kinship behaviors that obtain between categories of kin—thus preparing children for a time in early adolescence when a growing self-consciousness and sense of shame/embarrassment induces them to begin conforming to these behaviors without any adult bidding. In all such "educational activities," boys and girls are treated very much the same. Attempts at sexual experimentation among small children are treated by parents with mild amusement and muted dissuasion. Preadolescent boys and girls alike are allowed great freedom to test their own limits, largely unfettered by adult demands, but they thoroughly absorb basic values such as sharing and watching over younger siblings in the absence of adults. Boys and girls often carry infants and small children around and fuss over them.

Puberty and Adolescence

The Mardu have no word for adolescence per se, and clear gender differentiation in adult expectations occurs at a later stage for boys than girls (see Burbank, 1988). Traditionally, girls were married as preadolescents and assumed the new role of wife, with full adult economic responsibilities as food-getters from that time. However, boys remained carefree and undisciplined until their mid-teens, when their sudden seizure prior to circumcision marked a dramatic transition into silence and total subordination.

Attainment of Adulthood

The group of male novices who are to be "put through the Law" are subject to often harsh treatment by their older male carers in the lead-up to circumcision, which is the most complex and highly elaborated initiation stage in Mardu society, when for a time the novices become the center of attention and concern. Following the actual operation, they experience the first revelations of elements of men's secret-sacred knowledge and begin to gain awareness of the onerous responsibilities that accompany it. The change wrought by this major rite of passage from boys to young men is visible in their behavior and demeanor, as they exhibit a newfound seriousness of purpose. Within a year after circumcision, they undergo a second major physical operation, subincision, which is the mark of full physical adulthood—but with years of further induction and learning ahead of them

before they are deemed ready to marry. For girls, however, the transition from daughter to wife is accomplished without fanfare or ceremony, and was traditionally often aided by the decision of the husband to remain in the band of his new wife for some time after marriage, so as to ease her separation from her family and also allow him to discharge responsibilities to his in-laws by hunting for them.

Middle Age and Old Age

For both men and women, these life stages involve progression through a series of named ritual statuses as more and more religious lore is revealed to them and they are elevated to senior levels of responsibility for the conduct of the religious life. As repositories of vital knowledge, they earn the respect of the community at large, are exempted by their rank from the more vigorous physical activities associated with the religious life, and are valued for their wisdom for as long as their faculties remain intact.

PERSONALITY DIFFERENCES BY GENDER

Regardless of gender or personality, the role any individual plays towards or on behalf of any other is dictated primarily by kinship. As a general rule, adjacent generations interact asymmetrically, with deference and respect owed by the lower to the higher, whereas behaviors towards one's own generation level members, plus those members of the second ascendant and second descendant generations ("grandparents" and "grandchildren"), are characteristically symmetrical and relaxed. One exception is adult siblings, where an asymmetry in kin terminology suggests a status difference favoring older siblings. Children are exempted from kin constraints of this kind, and while boys in their play tend to be rougher and more boisterous than girls, neither gender appears to attempt to dominate the other.

Beyond patterned kin behaviors (modified, of course, by differences in emotional content depending on closeness of relationship) and personality, there are no marked differences in the ways Mardu men and women behave in the course of normal everyday life. Male rhetoric proclaims men's higher status and greater

responsibility for social reproduction, particularly amongst themselves. Women accede to men's religiously validated primacy, and tend neither to boast nor to deprecate men in general, comfortable in the knowledge that their contribution to society is also essential.

With seniority achieved in matters religious, relations between older men and women seem generally more relaxed and symmetrical than in earlier adulthood, when domestic disputes that invoke men's attestations of their greater rights in marriage are more common, as are violent altercations in which women are likely to fare badly. The strongest expressions of status difference, however, occur in the context of male secret-sacred activities when mature men violently berate silent and downcast young novices for their ignorance and irresponsibility, while impressing upon them the enormity of the responsibilities with which they are being invested. The only time women's rhetoric approaches this level of sustained fierceness (verbal and physical) is also in a same-gender context, when they punish young women for sexual indiscretions with men wrongly related (in kinship terms) to them—acts that seriously threaten the social fabric.

GENDER-RELATED SOCIAL GROUPS

Gender is crosscut by most major social institutions, notably bands, local groups, the totemic system, and kinship and category systems. (Mardu are divided into four named categories, or "sections," used largely as labeling devices, and the major ritual moiety division is also based on these sections.) The bulk of the religious life also cuts across the gender divide and involves men, women, and children in interaction. However, the realm of men's secret-sacred life provides the strongest basis for single-sex groupings of initiated males (with novices sometimes also present) to the absolute exclusion of women and children. This constitutes the strongest and most inviolable social boundary, though women also have rituals exclusive to them. The division of labor also favors single-sex groups, as men hunt, alone or in small groups, while women and children tend to seek food in larger groups that enable them to socialize.

Patrilocality seems to be the culturally preferred mode of "residence," because of an expectation that children should grow up in their father's territory so that sons can assume important religious responsibility for its

sites, rituals, and paraphernalia. However, children typically become familiar with sites and accompanying mythology associated with both their parents, and Mardu often express their claims to country via their grandparents on both sides. Local groups tend to have a patrilineal core, but multiple affiliative principles allow people connected through other linkages (e.g., birthplace, initiation place, totemic affiliations, prolonged "residence") to become members. There are no matrilineal kin groups. The most important nonkin associations for males or females are groupings associated with secret-sacred aspects of the religious life.

GENDER ROLES IN ECONOMICS

In subsistence activities, men and youths hunted large game, such as kangaroos, emus, wallabies, and bush turkeys, while women and children collected seeds, fruits, and vegetables. Both hunted smaller game, such as possums, bandicoots, lizards, snakes, small marsupials, and birds, and gathered honey, nectar, fruit, etc. Families tended to obtain food cooperatively, but hunting was predominantly a male pursuit, and gathering predominantly a female pursuit. Women contributed about 60–80% of the total weight of food collected by desert Aborigines who exploited resource zones similar to those of the Mardu (Gould, 1969a, 1969b, p. 258). The spear, spearthrower, and club were associated with males, and the digging stick with females. Although these items could be handled by either gender without penalty, women never used spears to hunt animals. Nowadays, though subsistence does not depend on it, there is occasional hunting and gathering, often in family groups, to augment the diet and satisfy the desire for traditional foods such as kangaroo meat. Food preparation is done mostly by women, though men often partially cook game at the site where it is caught, and the preparation and cooking of larger animals are usually done by men. Mardu use vehicles to hunt game with rifles, and supplement store-bought foods with bush foods.

Men and women possess the full range of skills available to their gender and there is neither craft specialization nor markets, though gift exchange is intrinsic to the obligations of kinship, and at the time of "big meetings" may occur also in group contexts when members of one group exchange weapons, red ocher, hair-belts, and other valuables to foster goodwill with the other. The only

part-time specialist role is that of the male *Mabarn*, "diviner–curer," who treats all those, male or female, who request his assistance (M. Tonkinson, 1982).

Concepts of ownership attached to both individual and group-owned property, with religious paraphernalia of the highest value because of its close associations with creative spiritual powers. The bulk of this secret-sacred property was owned corporately by each local group and maintained by male elders of the senior "caretaker" ritual status. Additionally, every adult man had personal secret-sacred paraphernalia, which would be inherited by his sons or other close male relatives following his death. Senior women also possess ritual paraphernalia. Mundane artifacts were usually broken and then buried along with the body of a deceased person.

PARENTAL AND OTHER CARETAKER ROLES

Parents are the mother(s) and social fathers (i.e., legal husband of the mother) of any given child. In the past, no child would have been born to an unwed mother, and a genitor not also the pater had no parental rights or responsibilities, but these customs are now changing. Nurturance is a major Mardu value and children are cherished. An infant is the center of attention and has all its wants satisfied by a range of close kin, so the social parents, including cowives, are not the exclusive child-rearers. As mentioned above, grandparents are among the kin most heavily involved in nurturant and instructional activities. Men keep away from the birthplace (today, this is usually a hospital), which is a female domain, but once the child is brought into the camp they involve themselves in parenting and show a great deal of love and affection towards their offspring. Clearly, infants and children spend more time in the care and company of mothers and other women and children, but men play caring and nurturing roles. Gender-based differentiation is not apparent in adult behavior toward boys and girls.

LEADERSHIP IN PUBLIC ARENAS

In mundane affairs, women and men participated fairly equally, with women being involved in decision-making that affected the band; for example, when and where to move next, what food to gather and where, etc. There were no chiefs or councils, so informal discussions between all those present at any given time were the norm, and women's opinions counted in such contexts. However, decisions connected with the religious life are made by men, though sometimes in consultation with ritually senior women, since much activity (e.g., the ritual feasting that was integral to most major ritual complexes) concern both genders in cooperative endeavor, but with the men in control. Senior men schedule the timing and sequencing of "big meetings" and their programs, so, if women plan on performing their own rituals, these must fit in with the requirements of the main schedule of events. Older men seemed to enjoy "bossing" women in the context of religious activities, and women generally accepted these enactments of men's political superiority without visible reaction. Men also organize and run public meetings, during which their voices are also more commonly heard. However, women are free to comment and add their voices to discussion and debate, and if, as protagonists, they are reticent men might urge them to speak up. Today, there are elected community councils, and women are regularly among those elected, though they are less active than men in this level of community politics.

Traditionally, women did not initiate or engage in revenge expeditions or ritual killings and were not considered to be sorcery practitioners, though they could be victims of such aggressive acts and could obtain the services of sorcerers. In matters of authority more generally, both men and women consider themselves to be "under the Law" of the Dreaming and therefore subservient to the dictates of the creative beings who founded and structured their society and its norms and laws. It is clear, however, that men have a greater responsibility than women for the maintenance of this heritage, since they control its secret-sacred enabling core.

GENDER AND RELIGION

The Mardu cosmic order is markedly egalitarian in constitution. It contains both female and male creative beings, and they are unranked as to prominence, power, or social importance in the human realm. Collectively, through their endeavors they left behind the first humans and their rules for living, including inequalities that tend to favor men's interests over those of women.

The religious life taken as a whole requires considerable male–female coactivity and fosters harmony and interdependence, but, as Bern (1979) suggests, women are structurally located as a kind of antithesis because they are permanently excluded from the secret life of the initiated men, whereas for youths this is a temporary state. Barring women may be men's way of reinforcing male superiority, identity, and solidarity. Yet there is no evidence that Mardu men or women are anxious regarding their status vis-à-vis the other; for example, pollution beliefs are not culturally elaborated. Mature Mardu men claim that there are powerful and dangerous spiritual forces with which only they can cope. In joint religious activity, senior men revel in their "masters of ceremony" role, which includes controlling and directing women, and they allow them very little autonomy.

Nevertheless, women are vital to success of religious activities. They actively participate in many rituals as singers and dancers, provide major logistical support by gathering and preparing food, and maintain quotidian life while men are ritually preoccupied. They also contribute significantly to men's secret rituals through the preparation of "bread" for ritual feasts. The rank of "cook," which is usually attained by middle-aged and older women, is one of the several grades of a female ritual hierarchy paralleling that of the men. Mardu women possess religious knowledge of their own, and associated secret-sacred objects and rituals, some of which are considered by all Mardu as highly dangerous to men. In common with the men, an important part of women's lore consists of traveling rituals, shared and performed widely across the Western Desert and acquired most often in the normal course of intergroup exchange during "big meetings." Yet the total body of Mardu women's ritual does not approach in either size or scale that of the men, and exclusively female rituals occupy much less time and energy than do male rituals.

Leisure, Recreation, and the Arts

Both Mardu men and women enjoyed considerable leisure time, some of which was spent together in their camps, resting, socializing, and visiting with other families. Traditionally, communal ritual performances featuring singing and dancing were common nocturnal activities. Boys and girls often played in mixed-gender groups. Initiated men differed from women in spending much leisure time away from camp, in "men's country" in the nearby bush, where they sought respite from the hubbub of camp life. There they carved weapons or sacred objects and socialized with others. They spent much time discussing the religious life or carrying out ritual activities. This segregation was voluntary but essential to their role as managers and planners of the society's religious business. There was no concerted art production, and Mardu attribute most of the rock art found in their territory to creative beings or early humans. Most decorative activity occurred in ritual contexts, which required specific body decorations and the construction of a variety of ornaments and sacred objects. While some of these patterns of activity and leisure persist, there are changes consequent on sedentary life, school attendance, paid employment, and other recently adopted practices. Today, men and women travel by motor vehicles for recreational and religious activities, as well as work. Television, alcohol consumption, and other pastimes now feature prominently in the lives of many Mardu.

Relative Status of Men and Women

Given the strong egalitarian ethos pervading mundane life, men and women alike make decisions and express their opinions freely on most matters (see the contributors to Gale, 1978). There is relative equality of access to resources, except for sites and areas designated as "men's country" and strictly off limits to women and children (there is no corresponding female power to place similar taboos). Men generally interrupted the status quo only in times of conflict or during religious activities in order to assert their superior rights over women. Women clearly had far fewer rights than their spouses; for example, they could not divorce their husbands, or practice polyandry, or engage in the equivalent of "wife-lending" by men—rights which men could exercise. Older relatives, most often males, made major decisions affecting women, such as betrothing them in infancy, sometimes without the involvement of their mothers, or choosing new spouses for them after they had been widowed.

Despite their generally greater contribution to the family's diet, women were not accorded a proportional level of power. In the dominant male ideology, the ritual acts of mature men generated the food resources, thus symbolically alienating women from the products of their labors. As a rule, in Mardu society gender-based

differences in status invariably favored initiated males. In certain contexts and circumstances, such as during childbirth and certain subsistence pursuits, women acted autonomously and "equally" in their behaviors toward members of symmetrical kin categories. Also, camp life was typified by relaxed behavior among most band members whose kinship links permitted this. Religion, too, brought both genders together in situations of intense sociality aimed at dramatizing the fact that everyone was equally "under the Law" and ultimately dependent on the Dreaming for their well-being and that of their society.

SEXUALITY

Males and females alike consider sexuality to be a natural, healthy, and unpolluting human attribute, but its expression must be confined to relationships not categorized as incestuous. Women are more susceptible than men to punishment for infractions of kinship rules, because they are accorded greater responsibility than men for sexual propriety. Men and women as categories show no major attitudinal difference regarding premarital and extramarital sex, both of which are tolerated as long as the couple concerned are not in an improper kin relationship and their behavior is not interpreted as threatening a marriage bond. Uncircumcised boys are strongly discouraged from sexual activity with young girls lest their uncircumcised penises cause damage to female reproductive organs. Men are more prudish than women and are reluctant to discuss things physiological; they much prefer to couch discussion of reproductive matters, if it occurs at all, in strongly spiritual terms. It is impossible to say definitively whether Mardu were ignorant of or in denial about the role of semen in human reproduction, but there is evidence that both paternity and prenatal maternity were downplayed in favor of spiritual agency (Tonkinson, 1984). Both male and female sexuality are regarded as inborn. Traditionally, men went naked and women wore pubic coverings, and norms of female modesty were signaled by ways that women sat, and by the fact that sexual intercourse was considered a private act. Children of both genders went naked. There was very little expression of cross-sex identification, and no cross-dressing, though in certain rituals male dancers impersonated female creative beings. Male and female homosexuality seems to have been either minimal or nonexistent in Mardu society—again, apart from occasional dance depictions.

COURTSHIP AND MARRIAGE

Male–female courtship was unknown since all but a small minority of marriages were of the arranged variety, with infant betrothal the dominant form. Elopement as a result of love matches was apparently uncommon, and if the female was already married it was potentially fatal to both partners. There was no status akin to either bachelor or spinster, and all people were expected to marry. There was no element of choice as to when to marry for younger adults, but as people grew older they possibly had greater control over the timing of their remarriage and, for women, over their choice of new partners. Arranged marriages were of two major kinds: a "mother's brother" circumcisor promised a daughter (often an infant) as compensation to the youth he had circumcised, and public gift exchanges formalized the arrangement; or two men would negotiate for one to promise the other a daughter, and the intending recipient would hunt for, and periodically give gifts to, the parents of the girl. A marriage began when a woman took her daughter's possessions and placed them outside the promised husband's camp. Most girls today resist marriage to their betrothed, so this simple ritual has disappeared. Increasingly, young people choose their sexual partners, and traditional arranged marriage is in rapid decline; however, it has not been replaced by formal Western-style marriage.

HUSBAND–WIFE RELATIONSHIP

Mardu spouses spend a lot of time in each other's and their children's company, and in most marriages, particularly between long-married couples, considerable warmth and companionship are evident. Husbands and wives eat together, sleep together, spend leisure time together, and make many everyday decisions together. Within the broad gender-based division of labor, there is considerable interchangeability in a range of household-related tasks, such as child-minding and the getting of water, firewood, brush for windbreaks, and so on. In the minority of marriages that are polygynous, relationships among cowives are usually tranquil and mutually supportive, especially with child-minding, but with older wives in positions of seniority over younger and newer ones. In the hunter–gatherer period, cowives, their husband, and children slept within a single windbreak; in settled conditions, similar arrangements have been observed, but

polygyny is now uncommon. Traditionally, divorce appears to have been rare, and could be initiated only by men, for a variety of reasons; women who eloped or fled from a marriage faced punishment. Divorce occurs more frequently today, and may be instigated by either partner. If there were children, they normally remained with the husband and his other wives; today, this is one of a range of child-rearing arrangements that occur when families break up.

OTHER CROSS-SEX RELATIONSHIPS

Every individual is located at the center of a huge network of kin, with patterned behaviors ranged on a continuum from total avoidance to mandatory joking and horseplay. Thus there are many cross-sex relationships, such as between spouses, between grandparent and grandchild, and between most mother's brothers and sister's daughters, entailing warmth, humor, and a relaxed interaction, and many others typified by restrained behavior that excludes sexual innuendo, touching, or even sitting in the same area, the most extreme form of which applies to mothers-in-law and sons-in-law who practice complete avoidance. Restraint is also displayed among certain adult male relatives, such as fathers and sons, and older and younger brothers, and between cross-cousins of opposite gender who are classed as siblings. However, brother–sister avoidance is not marked, and within some categories there is flexibility according to a range of factors, particularly friendships and emotional closeness. Women enjoy a greater number of unrestrained relationships with one another than do men, and can talk and interact freely with most other female kin, whereas a man's behavior towards parents, siblings, and adult children is more restrained.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Much has happened to the Mardu since they emigrated from the desert and settled along the fringes on stations (ranches) and missions between the 1920s and the 1960s. In recent decades, the pressure towards change exerted by the dominant society has rapidly increased. Welfare payments to individuals, and a range of other changes, have led to greater autonomy among Mardu women, whose structurally unequal status has lessened as their capacity for independent action and their successful (but not uncontested) assertion of this degree of autonomy have increased. Some younger women characterize this change by calling themselves "free agents" to convey this sense of greater freedom. Despite considerable expression of nostalgia for the old days in their desert heartlands, many middle-aged and older women nonetheless seem to favor settlement life, and one reason for this may be that they are now less firmly under the control of men. Young women's refusal to marry the men to whom they have been betrothed, the refusal of widows to remarry at all, and the increasing incidence of "wrong" marriage among younger adults point to an erosion of "traditional" values and the structures of "the Law." Such changes amount to a loosening of the control that mature men as a category can exert over women as a category. Mindful of the many accommodations already enforced as a result of Westernizing pressures, Mardu women are able successfully to contest those aspects of gender relations that they consider unacceptably restrictive. Young men too are freed of some of the strictures to which they would traditionally have been subject, including the choice of sexual partners. However, religiously ordained dictates continue to underpin their identity and security. Both men and women experience negative as well as positive consequences of change. For example, unemployment, alcohol misuse, boredom, violence, motor vehicle accidents, and "lifestyle" diseases all have had a significant impact on both men and women. Mardu of both genders have been vigorous in pursuing land rights and in identifying and adopting coping strategies and new directions for their communities.

NOTE

1. Please note that in this account we describe enduring characteristics of this culture in the ethnographic present, using the past tense to describe practices that no longer obtain, and we endeavor, where appropriate, to highlight features that have changed markedly. In recent decades, as a consequence of colonization, the Mardu have become sedentary and have adopted many new behaviors and customs while continuing to speak their own languages and pursue many of their traditions, albeit sometimes in modified forms.

Marquesans

Kathleen C. Riley

ALTERNATIVE NAMES

The Marquesans are also known as Te 'Enana in the northern Marquesas and Te 'Enata in the southern Marquesas.

LOCATION

The Marquesas are part of French Polynesia in the Pacific Ocean.

CULTURAL OVERVIEW

With a population of approximately 7,700, the six inhabited islands of the Marquesas form the northernmost archipelago of French Polynesia, an autonomous overseas territory of France in the South Pacific. The archipelago was settled over 2,000 years ago by peoples from Samoa and/or Tonga who came in double-hulled canoes bearing the necessities of life (e.g., breadfruit, taro, and pigs) as well as trappings of their Polynesian culture and proto-East Polynesian dialects.

After the archipelago's initial "discovery" in 1595 by the Spanish explorer Mendaña, *te 'Enana* "the people"[1] enjoyed no further contact with Europeans until the late 18th century when regular visits from whalers, sandalwood traders, missionaries, scientists, and military personnel began. France staked its colonial claim in 1842, the population dropped as much as 98% over the next 75 years, and by the end of the 19th century Catholicism had become the official practice of most inhabitants. As a result, many of 'Enana's so-called "savage" practices (e.g., cannibalism and polygamy, "licentious" singing and dancing, "idolatrous" sculpting and tattooing) disappeared or were at least suppressed (Dening, 1980).

Nonetheless, many other traditional cultural forms were maintained or syncretically transformed—for example, their domestic mode of production, speech economy, and household structures. Since the 1960s, some of the more colorful traditions (e.g., dancing, crafts, and tattooing) have been resurrected due to 'Enana's participation in the global explosion of cultural pride movements and the evolving ethnotourism market. However, some of their less sensational cultural systems (e.g., their language, caregiving patterns, and subsistence activities) have been seriously disrupted during this period (Riley, 2001).

Prior to contact, most valleys of the volcanic terrain were inhabited at peak capacity by one or more tribal groups. During the devastation of the 19th century, 'Enana regrouped into three larger towns (population 1,500–2,000) centered around French administrative and religious activities and into a number of smaller villages (population 100–400) in other valleys.

While a number of households now consist of patrilineal patrilocal nuclear families with six or so children, many exceptions to this pattern can be found. Matrilocal and neolocal arrangements are common, extended family compounds are not rare, adoption is still much practiced, and vestiges of polygamy exist.

The once primarily arboricultural economy is now based on a mix of subsistence agriculture, fishing, and husbandry and involvement in cash-based enterprises such as copra-processing, manual and white-collar employment, or tourist-oriented entrepreneurial projects. Throughout the islands, the economy is artificially inflated by French subsidies.

French Polynesians have been negotiating their degree of autonomy from France for the last 50 years when, following World War II, they were granted French citizenship. 'Enana are particularly ambivalent about total independence from France, as this would leave them in the hands of the Territorial government which is located in Tahiti and is largely run by Tahitians.

Locally, the government is headed by *haka'iki* "mayors" who are elected via French protocol but still derive some of their power from elite lineage and charisma—not unlike the precontact *haka'iki* "tribal chiefs" whose position was partially inherited and partially achieved. Similarly, priests and *tumu pure* "prayer leaders" enjoy some of the same prestige and authority once accorded to the traditional *tau'a* "shamans."

CULTURAL CONSTRUCTION OF GENDER

Gender defines and is defined by the social, communicative, economic, and political roles of 'Enana (discussed in other sections). However, one of the most obvious functions of gender in this culture is that of signaling one's availability for and skill at sexual activity. Thus, the terms for the two major gender categories, *vahana* "men" and *vehine* "women," refer both to the man or woman one *noho* "rests" with (whether for a night or for life) as well as to all other men or women (i.e., all others one might have sex with).

Some of the features associated with sexual attraction are applied regardless of gender (physical beauty—understood as firm fat bodies and fair supple skin—and olfactory appeal derived from washing frequently and wearing perfumes and flowers). Nonetheless, a variety of visual and performative clues were and continue to be used to construct gender contrast (see Ferdon, 1993; Handy, 1923; Suggs, 1966).

Prior to contact, men wore a *hami* "loin cloth" and women a *ka'eu* "waist cloth," both made of *tapa* "beaten bark cloth." Additionally, both sexes, but especially women, draped themselves in a *kahu* "robe." At present, women wear a cotton cloth wrapped around the waist (referred to now by its Tahitian reflex *pareu*) for informal wear around the village, and they cover their breasts with a brassiere, T-shirt, or fold of the *pareu*. Some men also wear *pareu* around the house or for cultural events, but most men prefer shorts with or without T-shirts. For more formal occasions, men wear pants and button-down shirts, and women wear Western dresses (either old-fashioned missionary frocks or modern fitted dresses). *Pareu*, dresses, and shirts all sport bright Polynesian floral patterns.

Both women and men used to shave and tie portions of their hair into ornate patterns, with "horns" being specific to males. Present styles are Western: long hair for women (often worn in a bun), and short hair for men (though beards and pony tails worn high on the head have come into vogue). Prior to contact, men and women were also tattooed—men sometimes from head to foot, and women more sparsely on the limbs and genitalia—with a large number of motifs reflecting issues of status and lineage. Owing to the recent revival in tattooing, many men are once again covering their bodies and faces with densely interwoven patterns, whereas women have so far restricted themselves to ornamentation (e.g., anklets).

Other features distinguishing *vahana* and *vehine*, though hidden, have served as signals of sexual preparedness. Girls' genitalia were manipulated and treated with an astringent as early as infancy in order to tighten the vagina and inhibit excretions and odors. Boys underwent supercision—a long cut in the foreskin on the dorsal side of the penis—before being considered ready for sexual intercourse. Despite missionary pressure, both of these practices have been retained into the present.

Finally, gender contrast is encoded in a variety of linguistic forms; for example, male and female beauty are termed *po'ea* and *po'otu*, respectively. Although gender pronouns do not distinguish between male, female, and neuter, many other kin terms and roles do (e.g., *haka'iki* "chief" vs. *ha'atepeiu* "chiefess").

GENDER OVER THE LIFE CYCLE

Some of the traditional gender-loaded terms for males and females throughout the life-cycle have dropped away or been transformed. Similarly, the categories to which these terms refer have changed. However, much has been retained (see Handy, 1923; Kirkpatrick, 1983, 1985, 1987).

Pepe (from the French *bébé*) is now used for babies of either gender (birth to 3 years or so), *tama* for sons, and *mo'i* for daughters. *To'iki* covers all younger children (birth to adolescence); one of its reflexes *po'iti* is applied to boys in particular and *paho'e* to girls. The terms *ka'ioi* and *taure'are'a* (Tahitian) cover the period from early adolescence on into adulthood, with males referred to as *mahai* and females as *poko'ehu*. *'Enana motua* "mature adults" are simply referred to as *vahana* "man, husband" and *vehine* "woman, wife." *Ko'oua* is the unmarked term for the oldest generation (somewhere past the age of 50), while gender is signaled by the contrast between *ko'oua* for "old man, grandfather" and *pakahi'o* "old woman, grandmother."

The characteristics and expectations associated with these age- and gender-graded identities are briefly summarized here (but see Kirkpatrick, 1981, 1983, 1985, 1987; Martini & Kirkpatrick, 1981; Riley, 2001). *Pepe* are assumed to have wills of their own and no judgment. *To'iki* are expected to begin to understand social rules and act as they are instructed, but girls long before boys. Male *ka'ioi* disregard the needs of others, putting their own arrogant desires first, while females hide their wayward behaviors more effectively. *Vehine* and *vahana* are

expected to give up life "on the road" and be "mature householders," capable of "mature reflection" and of actively caring for their growing families. *Ko'oua* resist dependence on the younger generation by adopting grandchildren and working to sustain the family for as long as possible.

Socialization of Boys and Girls

Children are much loved and appreciated; however, some regret may be expressed if a couple repeatedly produces girls rather than boys. The birth of a child was once celebrated with several feasts and rituals (more so for boys than girls), including the burying of the placenta and planting a breadfruit tree to support the child (Ferdon, 1993; Handy, 1923; Suggs, 1966). These two rites are still practiced to some degree, though with minimal fanfare.

Mothers are the primary caregivers for small infants (0–3 months), but older siblings, fathers, grandmothers, and other women begin to hold and watch out for the child after this. As soon as they can be sat up, babies are generally held facing outward and are socialized via triadic participant structures. Caregivers show a lot of *ka'oha* "concern" for infants and toddlers (regardless of gender), accepting their expressions of willfulness with only gentle remonstrances and instead attempting to distract them (Martini & Kirkpatrick, 1981).

By the age of 3 or 4, both boys and girls are scolded when behaving in unacceptable ways (e.g., fighting, making a noise, or playing with others' belongings). However, caregivers seem more resigned to the continued recalcitrance of boys, who by the age of 6 may begin to show some of the wild and confrontative behaviors of the *taure'are'a* (e.g., dirty language and playing further from home). They learn some of this behavior as they accompany their grandfathers, fathers, older brothers, and uncles to work—cutting copra, hunting, or fishing. Through verbal jousting, older males expose boys to the importance of hiding fear, pain, and dependence, and teach them the art of being flexible. However, unable to reproduce these verbal skills so young, boys resort to verbal anger and physical violence with their peers.

By contrast, at an early age girls receive commands and exhortations from older sisters, mothers, aunts, and grandmothers to help out and to show *ka'oha* for others. Thus, by the age of 8 or 9, girls have been socialized to engage in household chores including the care of their younger siblings. However, girls also learn their duties

and orientations through verbal play as older females engage them in teasing and gossip. Not unlike the socialization of boys, girls are taught how to stay independent and strong, hiding weak feelings from all but their most intimate relations, as well as how to ferret out and take pity on the weaknesses of others, aiding them but also exposing their state of dependence (Riley, 2001).

As of the mid-1980s, all villages were equipped with a preschool and primary school providing education from 2 to 14 years. Secondary schooling may commence in the three larger towns and can be finished in Tahiti, where there is also a university. French schooling, as well as access to television in the home, is having a real impact on traditional socialization patterns.

Puberty and Adolescence

Prior to contact, some 'Enana spent at least some period of their adolescence in a grouping referred to as the *ka'ioi*. In the southern islands this group may have consisted only of a subset of young males who sang and danced at festivals, aided in the tattooing of elite males, and served as unranked warriors (Ferdon, 1993; Suggs, 1966). However, it appears that in the northern islands most male and female adolescents passed through this age grade, during which time they learned to perform songs, dances, and sexual moves at traditional festivals as well as at some festivals specifically created for foreigners (Dening, 1980; Handy, 1923). *Ka'ioi* coated themselves in *eka* "saffron," wore flowers, lived together in their own dwellings, and engaged in sexual activities both in private and for public entertainment.

Vestiges of these behaviors are still prevalent as the Tahitian term *taure'are'a* "painted in *eka*" has been adopted to refer to the male youth (aged between 12 and 30 or so) who band together in the night and go out "on the road," drinking (and smoking *pakalolo* "marijuana" since the 1970s), dancing to guitars (or boom-boxes more recently), and attempting to engage girls in sexual intercourse either in the bush or more stealthily in their homes (Kirkpatrick, 1983, 1987; Riley, 2001; Suggs, 1966).

At present this "night crawling" is less apparent because of the increase in public *koika* "festivals" where male and female adolescents may legitimately socialize in the evening and go off together for sex. Sexuality is once again more openly discussed, even by the priesthood, and youth events are orchestrated by Christian organizations in efforts to channel the energies of *les jeunes* "youth."

Traditionally, supercision took place well before puberty (ages 7–10), whereas tattooing was the marker of puberty for elite males and their *ka'ioi* companions and was accompanied by elaborate preparations and feasting. Boys are now supercised later (between 10 and 14), in a group but by medical personnel and without ritual fanfare (Kirkpatrick, 1987; Riley, 2001; Suggs, 1966). For girls, the onset of menstruation was once associated with a ritual intended to deal with the *tapu* nature of the blood (Handy, 1923); however, this event is no longer marked or celebrated in any fashion.

Attainment of Adulthood

Males may not settle down as *vahana* until late in their twenties or even thirties, and usually only after their second child with the same woman. By contrast, females may settle down, becoming *vehine* in their late teens, frequently with an older man, sometimes with his children by another marriage, and sometimes bringing a child of her own into the relationship.

Thus it is not anticipated that settling down into "mature householders" will happen overnight, and many young adults switch households and partners (leaving the offspring with their grandparents) several times before attaining "mature householder" status (not before 40 for some *vahana*).

"Maturity" at this time in history has much to do with finding a way not only to provide food and housing for one's growing family (much of which can be accomplished through unpaid labor), but also to make money to buy children clothes and an education (Kirkpatrick, 1983, 1985, 1987).

Middle Age and Old Age

Ideally, *ko'oua* "older persons" provide leadership for the community and guidance for younger householders, and indeed most *haka'iki* "chiefs/mayors" and *tumu pure* "prayer leaders" are over 40. In reality, most persons over the age of 50 have a diminished role at present, especially given the adoption of Western values that emphasize the acquisition of money and power early in life. However, even prior to contact, first-born sons inherited the property and title of their parents early in life, leaving the latter with little official status (Ferdon, 1993; Handy, 1923).

The decline of *ko'oua* is characterized by their loss of beauty and their growing dependence on their children and French subsidies. Generally, as their physical strength goes, male *ko'oua* have a hard time retaining their authority as capable providers, whereas *pakahi'o* can maintain respect in their role of cleaning house and caring for newly adopted children (Kirkpatrick, 1983, 1985).

Nor are *ko'oua* necessarily "mature" individuals. Some are known for wandering on the road and providing insufficiently for their family's needs (i.e., acting like *taure'are'a*) while their *pakahi'o* are perceived as long-suffering. In other families, strong *vehine* are recognized for having brought their *vahana* into line.

PERSONALITY DIFFERENCES BY GENDER

Both men and women are expected to hide their weak feelings (e.g., pain, fear, sorrow, and dependence) and to learn to engage flexibly in verbal play. However, men are expected to lose control more (especially under the influence of alcohol) and resort to overt expressions of emotion (e.g., anger and jealousy), as well as some displays of physical violence (wife-beating, fistfights, suicide). Women, by contrast, are supposed to be more stoic, to keep smiling and laughing, and to find covert outlets for their sorrows and fears.

Both men and women take pride in being independent and having others depend upon them, but women are more effusive and obviously nurturing in their offerings of *ka'oha* "concern." In dealing with outsiders, women are now (though they were not in the early 19th century) known for being reticent, while men come forward with more apparent friendliness (either formal or joking). However, within the community, women are fully as talkative as men (Riley, 2001).

GENDER-RELATED SOCIAL GROUPS

Patrilineality and patrilocality were probably the rule in the Marquesas prior to contact, but in practice 'Enana tended toward bilateral descent and bi- or neolocality; the formation of intertribal alliances via marriage depended on this sort of flexibility (Thomas, 1987a, 1990). Similarly, in the present, 'Enana draw upon or "discover" common lines of descent, whether on the male or female side, when and if the bond is deemed advantageous. That is, the descent

group is not conceptualized as a well-bounded set of individuals, but can be flexibly extended or deflated as needed (Kirkpatrick, 1983).

Additionally, over the course of the 20th century, 'Enana have become increasingly neolocal in their residence patterns as couples find the means to create their own separate lodging. And while there exists a preference for building on the land of (or at least in the valley of) the man's family, actual construction of new homes depends on which family has more land (Riley, 2001; Suggs, 1966).

Thus, while one does in fact find some patrilineal groupings living close together in villages (even some extended family compounds), one also finds other groupings that follow the female line. In neither case, however, does one find relations between sisters or brothers flowing necessarily smoothly, as competition over the inheritance of land is a constant source of friction (Kirkpatrick, 1983; Riley, 2001).

Some of the more important (if sometimes transient) associations are nonkin based (e.g., artisanal and dance groups, prayer groups, and other Catholic associations) and some, though not all, of these are gender specific. For instance, many women of the village will play bingo together after church on Sundays. Men go out hunting or fishing together. Women make *pareu* and T-shirts; men sculpt.

GENDER ROLES IN ECONOMICS

Traditionally, men left home and faced danger to bring home food while women took care of the household. In recent times, men's roles still take them further from home more often; but women are engaging increasingly in extradomestic activities. Yet, neither now nor in the past were specific occupations the exclusive domain of either gender (Kirkpatrick, 1983; Thomas, 1987a, 1990).

Prior to contact, men tended to be involved in raising pigs, planting and gathering arboricultural and root crops (e.g., breadfruit and taro), fishing, fighting wars, and making tools and structures from stone and wood. By contrast, women were primarily responsible for raising children, cleaning house, and making *tapa* cloth and woven mats, baskets, sails, etc. However, both men and women contributed to the production and preparation of foods (though women were subject to more *tapu* as to when and how they could cook for whom). For both men

and women, one's social class largely defined what one did, with male and female commoners and male craft specialists doing much more of the productive labor than elite men or women.

At present, men fish, hunt (pigs, goats, and cattle), and cut copra; they do at least a year of military service, emigrate for work in Tahiti or France, work as laborers, and make tourist crafts out of wood or stone. Women cook, clean house, and look after the children. However, men do not consider it degrading to help with children or housework, especially food preparation. Meanwhile, women sometimes cut copra, fish from the shore (seldom from boats, an artefact of the old *tapu* against women entering canoes), grow root crops, and process arboricultural crops. More and more women make money from crafts or as salaried employees.

There is a long tradition of women gaining a better education, being more literate, and speaking a more standard French than men. As a result, women find better-paid employment as teachers, nurses, social workers, and office assistants. Nonetheless, the majority of the top positions are still filled by the fewer men who have performed as well and stayed in school as long (Riley, 2001).

Interestingly, women had the right to own property prior to contact (Ferdon, 1993), whereas French law gave women no such rights until the latter half of the 19th century. However, as the French substantially rectified gender-based economic inequalities over the course of the 20th century, coincident with 'Enana's fuller incorporation into the global economy, female 'Enana are now faring relatively well in the economic sphere.

PARENTAL AND OTHER CARETAKER ROLES

Two indigenous social structural traditions continue to affect parenting and caregiving in the Marquesas. First, owing to the widespread practice of adoption, the parental role is not a biological given. Instead, with regular frequency children are parented by adopted parents (grandparents, other family members, or unrelated others). Secondly, much of the daily hands-on caregiving is provided by older children (Riley, 2001).

At present, the cultural expectations of parents (whether biological or adopted) are that they will provide food, housing, and clothing for their children; oversee their education; and help them establish households of their

own (Kirkpatrick, 1983). Men bear more of the normative responsibility for providing food as well as money for food, clothes, housing, and education. Women are responsible for overseeing children's nurture and socialization in the home (e.g., instructing older siblings in how to prepare food and feed babies, wash and dress younger children, clean house, and do schoolwork). These norms are artefacts of both indigenous and French systems.

However, not only do women actually provide food and income in many families, they also participate in decision-making about their children's postprimary education and plans for starting a family. Similarly, men are also involved in hands-on caregiving and socialization (e.g., feeding babies, teaching household chores such as food preparation, and taking sons and tomboy daughters out to learn to cut copra, care for animals, hunt, and fish).

Also, despite their typically "macho" characteristics, fathers (as well as older brothers, uncles, or grandfathers) can be very gentle with and solicitous of babies, male or female. However, they may begin gibing even 2-year-old boys in ways that they would not girls, whereas they will protect their little girls from physical or emotional abuse in ways that they would not defend boys. Mothers (and other female caregivers), by contrast, show *ka'oha* equally to male and female babies, tease young boys and girls equally, but admonish older girls more firmly than older boys (Riley, 2001).

LEADERSHIP IN PUBLIC ARENAS

Male 'Enana traditionally occupied the powerful roles of *haka'iki* "chiefs," *tau'a* "shamans," *tuhuka* "craft specialists," and *toa* "warriors." However, women also had a chance to occupy some (though not all) of these roles and/or manifest their *tapu* status in public ways. Women occasionally fought as warriors; more frequently they became *tau'a*. They were sometimes accorded first-born rights within chiefly landholding families and were sometimes recognized as *ha'atepeiu* "chiefess" (though not *haka'iki*). According to Thomas (1987b, 1990), the post-hierarchical nature of 'Enana politics gave women a chance to manipulate their *tapu*, their wealth, their kin ties, and their skills with oratory and charisma, much as men might.

In certain ways, then, women can be said to have suffered a setback under French rule. Until the second half of the 20th century, the French sociopolitical system put men at the head of the family and the polity. Nonetheless, since contact, women have occasionally been appointed or, more recently, elected to the role of *haka'iki* "mayor" and have taken on some leadership roles in religious, cultural, and educational associations.

GENDER AND RELIGION

Most of the major gods were male, with Atea ("clear space") having created the universe and each thing in it through procreation with a large number of female deities (Handy, 1923). Similarly, the Marquesan islands were created by a male deity, attended by his female mate. Additionally, much of humans' understanding and use of the natural world is ascribed to male culture heroes. For instance, women were taught by Kae, a chief, to have sex with men instead of with pandanus roots and to give birth by way of the vaginal canal instead of through fatal caesareans (Thomas, 1990).

By contrast, the two types of particularly malevolent spirits, *vehine ha'e* and *hanaua*, are female. *Hanaua* were thought to possess and kill pregnant women, and *vehine ha'e* "wild women" were angry ghosts (sometimes the spirits of women who committed suicide when their men were unfaithful) who wandered in the night, shape-shifting and attacking children, and seducing and eating men (see Thomas [1988b] for the political significance of these myths).

Underlying this apparent respect for male deities and fear of female spirits is the complex gender-loaded system of *tapu* (Handy, 1923; Thomas, 1987b, 1990). Translated as both "sacred" and "dangerous," being *tapu* confers a certain status on a being, but also constrains his or her actions in a number of ways. By contrast, being clear of *tapu* or "profane" not only limits one's status, but also endangers and constrains one's movements (within a universe riddled with *tapu* entities).

Generally speaking, most men were *tapu* relative to most women. The common explanation of women's profanity was based on the uncleanness of menstrual blood. However, some men were more *tapu* than most others, and a few high-ranking women were more *tapu* than most men. These apparent inconsistencies can be explained through a deeper analysis (Thomas, 1987a, 1990) of women's contaminating power, which stems from their role as the vaginal gateway between the world of light and life and the *tapu* spirit world of night.

Although most 'Enana are now deeply immersed in Catholic belief and practice, vestiges of this system of *tapu* can be found in the behaviors of 'Enana today (e.g., women's avoidance of gardening while menstruating). Also, some 'Enana still avow a belief in the predatory powers of *vehine ha'e* (or rather whisper that others believe in them). However, just as women could once rise to power as *tau'a* "shamans" in indigenous times, women do sometimes now become nuns. Yet, only men serve as *tumu pure* 'prayer leaders', the dignitaries who lead mass in the absence of the priest.

LEISURE, RECREATION, AND THE ARTS

Prior to contact, elite 'Enana devoted most of their time to leisure, while even commoners enjoyed more leisure than does the average Western worker. The younger set engaged in ball games, top-spinning, kite-flying, making string figures, and playing at the activities of adults (e.g., cleaning house and having sex). All 'Enana enjoyed swimming and bathing frequently. Men also engaged in mock-fighting and stilt-walking competitions. But the single most important form of entertainment was that of singing, drumming, and dancing. Men did much of the drumming and singing at the large-scale *koika* "festivals," while both genders danced; women sang in other settings (Ferdon, 1993; Handy, 1923).

At present, 'Enana enjoy far less leisure as children attend school for large portions of the day, and mature men and women lay constant claim to working hard. However, when not in school, children enjoy a number of pastimes: swimming, surfing, and imitating the occupations of their elders, as well as playing at games such as marbles and jump rope. Youth enjoy organized activities such as soccer, volleyball, and rowing canoes, as well as less formal recreations: hanging out and gossiping, listening to and playing music, getting drunk or high, and having sex. Since the early 1990s, a growing number of 'Enana spend time in front of television sets in their own homes. Yet all 'Enana still enjoy *koika*, whether these are organized around sports competitions, religious holidays, or cultural revival events. Music and dancing are the highlights of festivals, whether this takes the form of indigenous *haka* "dances" to drum and voice or two-step dancing to ukulele, guitar, and spoons.

These recreations are to some degree segregated by gender. Children play all kinds of games together, but tend to team up against each other on gender lines. Boys begin earlier and spend more time wandering around outside home or school than girls. Coed volleyball and soccer teams are not uncommon, and within rowing (once an exclusively male sport) a number of girls' teams has recently sprung up. Bingo primarily attracts women and girls (and *rairai* "transvestites"), and women avoid men's drinking parties (although this is changing). At the *koika*, men still perform more of the music (though there are exceptions, such as, women who are known for playing the spoons and singing), while dancing always involves both genders, each dancing in their own prescribed ways.

RELATIVE STATUS OF MEN AND WOMEN

Female 'Enana's sexual "choices" have always been more pragmatically constrained than men's, their decision-making powers have more rarely been institutionalized, and they have always suffered a lower status at the ideological level. Nonetheless, individual women have enjoyed access to a good deal of informal (and sometimes formal) authority in ways that suggest the general fluidity of gender categories and hierarchies in 'Enana society (Kirkpatrick, 1983; Thomas, 1987a, 1987b, 1990).

Women appear always to have taken some joy in and had some say as to their premarital and marital partners. However, in some situations parents or groups of males appear to have forced the "decision" to couple and/or cohabit. Women's choice of extramarital partners was once hedged by the threat of being killed if they strayed in ways unauthorized by their husbands. Women rarely had recourse to anything but suicide if their husbands sought extramarital relations without their consent. Finally, men appear to have had easier access to dissolving a sexual relationship than did women (Ferdon, 1993; Handy, 1923; Suggs, 1966).

Although wife-beating is still prevalent and was apparently cited earlier in the 20th century as proof of a man's interest in his wife, it is now classified as a "social problem" and discussed at women's meetings led by social workers. In recent years, some women appear to be enjoying a certain freedom of extramarital relations without dire consequences. By now, French law and the Catholic Church no longer support the male advantage in divorce.

With respect to child-bearing, women make use of both traditional and modern forms of birth control, especially since most priests no longer prohibit such interventions. But even in the past women who came to term against their will could easily locate adoptive parents for their offspring, thus alleviating some of the burden of being the gestating agent.

At the ideological level, elite men clearly enjoyed signs of deference denied to most women and commoners. For instance, owing to the system of *tapu*, males probably ate better (e.g., more pork, turtle, or certain fish) than did most females. Similarly, first-born males in elite households were provided with more rituals and signs of status (e.g., tattooing ceremonies). However, women of the elite class received gestures of deference, much as men did, and found methods of furthering their goals in ways that may have laid the groundwork for women's pragmatic powers in the present.

While men are traditionally conceptualized as the heads of households, in reality women strongly influence household decision-making. Just as elite women once wielded control over their land and its produce, so do women now sometimes make more money than their husbands, oversee the household budget, and/or run businesses with or without a husband at their side. Moreover, many women can and do decide when, where, and how they will labor; they control the proceeds from that labor (whether this takes the form of collecting shellfish, drying copra, or selling *pareu*). While more women are better educated and occupy more white-collar jobs than men, more men than women fill positions of institutional authority.

SEXUALITY

Prior to European contact, sex was explicitly taught and was inextricably tied to other valued interpersonal activities (e.g., singing and dancing). Parts of the body considered sexual (mostly genitalia) were covered during everyday activities but were exposed during ritual performances. Quite young boys and girls engaged in sex, and non-monogamous and extramarital sexual activity was frequent and institutionalized. That is, marriages sometimes involved multiple partners and *pekio* "secondary spouses;" and *ikoa* "name" relationships between men entailed an exchange of names and rights, including access to each other's wives. Additionally, 'Enana openly

engaged in homosexual activity and cross-gender identification, the term *mahu* being used to refer to biological males who adopted the domestic roles and semiotic styles of *vehine* (Ferdon, 1993; Handy, 1923; Suggs, 1966).

While Catholic strictures have suppressed or driven some of these practices underground, Western mores have enlarged on others. Thus, Catholicism required that much more of the body be covered in public, outlawed dancing and sex at festivals, and instilled shame for most indigenous sexual activities. Nonetheless, other Westerners introduced sexual institutions (e.g., prostitution) that flourished in the new social order of sin and forgiveness. The result is that sexual ability is still much valued, although the transmission of skills has been inhibited and the exhibition of sexual ability muted in veils of circumspection. Thus, though more covert, youthful experimentation with sex and extramarital sexual relations are still the norm.

The *mahu* category now appears to be merging with that of the *raerae*—the cosmopolitan homosexual transvestite found in Tahiti. Thus, for instance, *raerae* 'Enana are more specifically homosexually oriented by contrast with older *mahu* who have cohabited with wives and conceived children while retaining noticeable female mannerisms. Homosexual activity among non-*mahu* males is also common (Kirkpatrick, 1983; Riley, 2001; Suggs, 1966).

Female homosexuality may be as prevalent but is discussed with more shame, and identification as a "lesbian" appears to be almost nonexistent. By contrast, the label employed for girls who dress and act like boys is the French term *garçon manqué*, used much like "tomboy" to indicate a harmless if slightly odd "stage" in life. I met only one adult woman who dressed and acted in this way; she was a well-educated social worker and was treated almost like a *hao'e* "foreigner."[2]

COURTSHIP AND MARRIAGE

'Enana regard marriage as a natural and important life goal on the way to establishing a household and so fulfilling the role of the mature householder. While celibate *mihi* "missionaries," "nuns," unmarried *mahu*, aging male *taure'are'a*, and unmarried *vahine mako* "shark women" (women available for intercourse with multiple partners) are tolerated, they are denigrated in gossip and sometimes

openly mocked (see Kirkpatrick, 1983; Suggs, 1966). Church marriage is the ideal for most individuals; however, adolescents and young adults may experiment with cohabitation and reproduction long before even a civil marriage is considered.

Sexual attraction plays the largest role in the initial choice of partners. Subsequently, "maturity"—that is, the potential to support and nurture a family in gender-appropriate ways—becomes important in choosing long-term mates (usually after producing a couple of children together). Civil marriage may accompany this stage, while actual marriage in the church, a costly affair, may await years of work and the production of several more children.

Some marital choices are influenced by family pressures in ways reminiscent of traditional times when elite betrothals and marriages were arranged in order to forge intertribal alliances, sometimes while one or both partners were still children (Ferdon, 1993; Handy, 1923; Thomas, 1990). These days parents may play a role in arranging profitable matches (e.g., with "rich" *hao'e* "foreigners" or with land-rich 'Enana in other valleys); more frequently they play a role in sanctioning relationships that are deemed incestuous (see Kirkpatrick [1981, 1983] for marital preferences and proscriptions).

Elite betrothals and marriages were once celebrated through feasting and dancing, with provisions supplied by both the bride's and the groom's families. Additionally, both families engaged in gift exchanges and the chanting of geneologies. At present, church marriages are marked by feasting and dancing.

Traditionally, polyandry was institutionalized. Elite women had one or more *pekio* "secondary husbands" who contributed to the household as laborers while also performing as sexual partners. They "belonged" to both the wife and the primary husband, and their children by the wife were treated as the children of the primary husband. While less discussed in the literature, men too might have more than one wife, and sometimes households consisted of several men and women, all enjoying mutual sexual access (Ferdon, 1993; Handy, 1923; Suggs, 1966; Thomas, 1988a, 1990).

Vestiges of polygamy persist in the way households frequently accommodate one or more younger males who help with copra, fishing, or hunting, and may additionally engage in covert sexual relations with the woman of the house. Similarly, cases of men with more than one wife in more than one valley were still to be found in the 20th century (Suggs, 1966).

HUSBAND–WIFE RELATIONSHIP

The marital relationship is ideally a cooperative partnership geared toward tending the domestic unit and based in part on continued sexual fulfillment and comradeship. However, this partnership is, in reality, riven with some regularity by conflict and violence resulting from the actual or imagined "wanderings" of one's partner.

Couples tend to share the same bed and eat at least one meal a day together. Couples sit in church and engage in some recreational activities together. While labor is generally divided into male and female genres, husbands and wives do sometimes attend to their separate tasks but in each other's presence. They also sometimes help each other out with their respective tasks; for instance, it is not unusual to see husbands and wives cooking a meal together or going off to cut copra together. The degree to which husbands and wives engage in joint domestic decision-making depends on the individuals' personalities.

Prior to contact, divorces were difficult for elites to accomplish (given that so much intertribal business was invested in their marriages), but for commoners cohabitation might cease without any outcry. While the dissolution of nonmarried relationships is still easily and frequently accomplished, the break-up of married couples is complicated by the state and the Church, and the resolution of property rights is also messy. Nonetheless, official divorce is not unusual, while unofficial separation is fairly common (both men and women have been known to initiate the process). In all known cases, one of the partners leaves the valley, the house and children are retained by the partner who remains (usually the one whose family owned the land they settled on), and this partner frequently forms a new relationship though he or she is prohibited from marrying again in church (K. C. Riley, unpublished dissertation).

thinking through the intellectual problems of this particular article, my thanks go to Nicholas Thomas, John Kirkpatrick, and especially Robert Suggs, who at very short notice read and provided comments on a draft (though, of course, I retain all responsibility for any errors to be found here). Also, as always, my gratitude for the *ka'oha* of a number of people around the world but especially in French Polynesia is boundless: Bambi Schieffelin, Vincent Crapanzano, Neil Shepard, Pierre Ottino, Robert and Denise Koenig, Vaha Teikitekahioho (in memoriam), Heidy Baumgartner-Lesage, Yvonne Katupa, Tracy Smith, Moi Tamarii, Manu Teikikaine, Noella Teikivaeoho, Tapu Poihipapu, Teresi Pahuatini, and *paotu te to'iki 'i Hatiheu*. I would like to dedicate this article to Lucien Roo Kimitete (1952–2002): *'O te haka'iki, 'e, 'e, 'e, 'e, 'e, 'e, 'e, 'e, 'e!*

Notes

1. Owing to dialectal variation, people from the northern three islands refer to themselves as *'Enana* while southerners refer to themselves as *'Enata*. As I conducted fieldwork in the northern islands, most terms in this article are derived from the northern dialect.
2. Thanks to Bob Suggs for confirming my perception of the ubiquitous and normative nature of bisexual activity and neopolygamous relationships in the Marquesas, past and present.

Maya of the Yucatán Peninsula

John R. Sosa, Brian Montes, Melissa-Ann Yeager, and Emilio Paqcha Benites

ALTERNATIVE NAMES

The Maya of the Yucatán peninsula are also known as Masehual, Mayero, and mestizos.

LOCATION

The people who name themselves Maya live homogeneously throughout the Yucatán peninsula of Mexico, in the states of Campeche, Yucatán, and Quintana Roo. Although they are in a subordinate socio-economic position, they represent the cultural and demographic majority, except for the hotel region in Cancun and along the eastern coast. Even in the cities of Mérida, Chetumal, Campeche, and Valladolid, many people speak Maya.

CULTURAL OVERVIEW

Maya culture is very ancient and is indigenous to the peninsula. Thousands of ancient cities and settlements are still to be found, some transformed into tourist attractions, while most are overgrown collections of *múulo'ob*, or mounds. Much academic study of this ancient culture and its hieroglyphic writing, calendar system, and monumental architecture has resulted in rather famous imagery associated with "the Maya." However, a Spanish-imposed system of colonial enslavement has created, for most Mayas, a separation between their current lifestyle and that of their ancestors. Moreover, colonially forced cultural change since the early 1500s has removed much of the indigenous social structure. Mayas have adapted to this by refocusing their existence on their village-based food production, regulated by their ancient cosmology. Across the peninsula there is some variation from this rural traditional lifestyle, due to a localized increase in tourism and urbanization. Therefore it is significant to note that this lifestyle, which is most representative of that which is Maya and which dominates the peninsula, will be the focus of this description of gender in Maya culture.

The most conservative core of Maya culture is found in the "Maya zone" of the central part of the state of Quintana Roo, where a network of villages provides a strong regional system of both male and female indigenous leadership and responsibilities. Elements of local leadership are found throughout the peninsula, but the closer one gets to cities, especially Mérida and Cancún, the more the national political system dominates. So in a real sense, the conservation of Maya language and culture, the isolated nature of the peninsula from the rest of Mexico, the rocky consistency of the soil, making Maya digging-stick *kòol* (milpa) agriculture the only kind suited to most of Yucatán, and the sheer size of the peninsula (53,000 square miles), allow Maya identity to continue, even though the world economy puts increasing pressure on young people to pursue lifestyles other than that of their agricultural ancestors.

There are Maya doctors, lawyers, politicians, school teachers, journalists, wage laborers, etc., who often still faithfully conform to Maya cultural norms, although this, of course, is not true for everyone. Those who still go back to fulfill family obligations in the countryside (*k'àaš*), often have spiritual motivations. In particular, those who constitute the Cancún tourist industry labor force, as maids, waiters, construction workers, and prostitutes, often try to reduplicate some of their village solidarity in the slums surrounding Cancún, even bringing in traditional healers and midwives from their home villages.

CULTURAL CONSTRUCTION OF GENDER

Although it is the subject of anthropological debate, it is possible to argue that the Maya, like many indigenous non-Western people, are organized by two somewhat separate yet interdependent worlds for men and women. An ability to perceive this dialectic relationship, where two halves define each other, requires extended field experience and ability not only to speak Maya, but conformity to behavioral norms related to gender.

Maya language and behavior are constantly relying on subtleties, which need to be interpreted on an ongoing basis. Many subjects routinely discussed among men or women cannot be publicly discussed by the other. There is often a taboo against discussing topics related to the other gender even in private. To do so is considered rude and disrespectful. A core Maya concept is that of the correctness of living life along the "correct road." Deviating from this, even in private, is believed by many potentially to result in serious consequences. When misfortune strikes, it is often interpreted as supernatural punishment for some wrongdoing, forcing one to reflect on one's past violation of cultural norms.

Humans can also punish those who do not follow Maya teachings. Until recently, Maya community leaders would be in charge of a process for "educating" wrong-doers. Elders would speak to the person three times to try to "reorient" them. If this was unsuccessful, an increasing series of public whippings would be the next step. If improvement was still not seen, banishment from the community was the last resort. Historical documentation of pre-Columbian Maya punishments for rape or infidelity reveal even more drastic pressure to deter sexual misbehavior from disturbing community harmony. If, for example, a man was found guilty of rape by the council of elders, he was given two choices—to publicly mutilate his genitalia, making it impossible for him to commit this crime again, or to be publicly killed. If the crime was infidelity, the man was always considered the guilty party, and the woman's husband was brought to the center of town, where he held a large rock above the other man's head as he lay on the ground, and was given the option of killing or pardoning him. Obviously, the public nature of these displays went far both in deterring these kinds of violations, and in defining appropriate and inappropriate sexual behavior. Today, elder men can be seen publicly admonishing younger men for not showing women the appropriate respect at fiestas and other events, often claiming that such tendencies come from "outside," and are not Maya ways. The similarity between this kind of oratory at public events and past punishments is striking, and reveals that it is a cultural responsibility of elder Maya men to protect the dignity of Maya women.

As for Maya women, much more research needs to be done to have a clearer picture of their role in setting public behavioral standards, but there is a common contemporary and historical image of the Maya woman as being in charge of the household and having the authority to impose her will on men, especially those who are not members of the family. Today, a man visiting a Maya home for the first time can expect to be treated somewhat gruffly by the woman of the house, especially if he is completely unknown. The woman may even speak in a loud voice, thereby emphasizing that there should be no question but that this is her domain. And when it comes to physically defending her home from attack, the image of the woman scalding would-be intruders by throwing boiling water or soup on them as they come in the door is commonplace. Indeed, the Maya home is typically small, but a powerful symbolic sanctuary, and a woman can be expected to be willing to defend it with her life.

Part of this symbolism is the way that the house represents the combination of the genders as a basic human principle. The number three is widely regarded as a female number, equivalent to the number of stones a woman uses to balance her tortilla-cooking *comal* on the hearth on one side of the house or in an attached kitchen, while four is male, corresponding to the corners of the cornfield or any other Maya space. The combination, seven, is considered the human number as a combination of the male and the female. In ceremonies in the home, seven is often referred to as equivalent to it.

The words *máak* or *winik* can be used to mean a "person" of either gender, while *ši'ib* is used for men and *ko'olel*, or *šč'úupal* is used for women. The *š* prefix is also added to many words, giving a combined female and diminutive meaning. Male and female gender categories are intimately linked to culturally defined work. One is differentiated from the other by the clothes that each wears, the roles that they perform, and their interaction with one another. Women tend to wear their hair long, usually braided, and at times wear a rebozo (most commonly seen in the northern Yucatán peninsula). Most women have maintained the use of the traditional *hipil*, which is a one-piece white cotton dress with colorful embroidering of flowers at top and bottom; however, some teenage girls tend not to wear it. Other women who do not wear it are women who at some point left their communities to go to tourist areas in search of work, or who have converted to the many evangelical religious orders active in the peninsula, or who seem to be making a statement about wanting to "move up" from a Maya image. All such women tend to wear Western-style skirts and shirts and may have short hairstyles. Maya women who refuse to wear Western clothes claim that such an

appearance is "of the city" and "not Maya." Women also wear a lot of jewelry (mainly earrings and necklaces) and also use make-up, or talcum powder, on special occasions. Women often go barefoot while men wear simple sandals. Indeed, it is widely regarded by Mayas that women are much more representative of the culture because of their dress, and men can even be heard to comment that woman are the "guardians of the culture." The majority of men wear Western-style clothing, leaving only a handful of men that still wear their traditional *kulèeš* (calf-length white cotton pants) and a white shirt. These are usually men recognized as holding a major leadership role within their community. Women tend to associate with women during social gatherings and the men with the men. Each of these groups uses words and terms that the others cannot distinguish and/or things are said amongst one another that are not talked about with the opposite gender.

GENDER OVER THE LIFE CYCLE

The progression of *čáampal* (baby), *páal* (child), and *táankelem* (teenager) are the same for both genders. Historical documents reveal that before Spanish arrival there were distinctive puberty ceremonies, that were different for boys and girls, marking their transition to adulthood. These have long since been lost. Today, a boy becomes a man, *ši'ib*, and a girl becomes a woman, *ko'olel*, upon marriage, and receives the corresponding titles of Don and Doña. Adults who are never married remain social children and are even buried as children, with a headdress of flowers which marks a child's funeral.

Socialization of Boys and Girls

As young children, both boys and girls experience a certain freedom from social obligations, enjoying the time spent with family and learning daily behavior by merely watching and playing. Children are often perceived to be born with a destiny, and it is the responsibility of parents to help them find it. More and more, an increasing number of children, both boys and girls, between the ages of 7 and 15 are now attending school either inside their village or leaving home to attend school outside and closer to cities or larger towns. Perhaps the primary defining gender role in Maya children is the socialization into the

division of labor (Restall, 1997, p. 43). From an early age, both girls and boys are taught a "sharp but mutually dependent division of labor which … promotes the solidarity of the family and the stability of the marriage" (Cominsky & Scrimshaw, 1982, p. 48). So at a very young age (4–7) males and females seem to be open and playful.

The boy is permitted and encouraged to accompany the father to the milpa as soon as he can walk distances, and early begins to help in carrying wood and then in the task of the cornfield. The separateness of the man's tasks from the woman's is reflected in the customs of the play, for from the earliest years boys play with boys and girls with girls. (Redfield & Villa Rojas, 1934/1962, p. 190)

Boys and girls can also often be seen playing together: "Much of the play is an imitation of the elders' activities: the boys play at lassoing bulls, the girls at making tortillas, for example … every boy has his rubber sling-shot, and it is also common to make small things (*yuntun*) of henequén fiber, with which small stones are hurled" (Redfield & Villa Rojas, 1934/1962, p. 191). Today, many boys still have rubber sling-shots. Attending school has changed the dynamics of child's play by introducing ball games and team play: "until the coming of the school, there were in villages no activities in which a victor was contrasted with a vanquished, or in which one child's superiority to another was formally measured" (Redfield & Villa Rojas, 1934/1962, p. 191).

The older children become, the more they are expected to help with household tasks. Boys and girls of 6 or 7 years of age carry their smaller brothers and sisters around and, at this age or even younger, the boys fetch firewood and the girls begin to carry water (Redfield & Villa Rojas, 1934/1962, p. 71).

From a young age, girls are encouraged to participate in the domestic sphere and are socialized from the beginning to what their family role should be as women. This includes caring for the house and for younger siblings. The economic role of the young girl is that of mother's helper, learning from an early age to make tortillas, "the most important and consuming of her responsibilities, the provision and preparing of tortillas" (Redfield & Villa Rojas, 1934/1962, p. 174). Men produce corn, and women transform it into food. Sometimes women are referred to as *pak'ač*, which is the act of making tortillas. The girl or young woman is also taught to care for the family's animals and the raised *ka'an če* garden platforms, and to wash, care for, and make women's clothes.

Puberty and Adolescence

Once they reach adolescence, the men's world starts to separate from that of women. Even with strangers, adolescent women tend to be more shy and reserved, although shyness is very common with both genders. Children of both genders, especially teenagers, are expected to provide significant help with childcare. Even young men and teenage boys are frequently seen holding babies and caring for younger children, as well as doing anything that their elders need them to do. Typically they only have to be told once, and they tend to obey without question. A 12- or 13-year-old boy is generally making a separate milpa of his own (Redfield & Villa Rojas, 1934/1962, p. 71). Teenage girls are also typically very responsible in accepting a woman's work load. Whether it be tending the animals, caring for the house garden, caring for clothes and children, or cooking, a young woman essentially does all the work that grown women do.

Attainment of Adulthood

As mentioned earlier, marriage essentially signifies adulthood. Both men and women are socialized to be patient, responsible, and committed to important relationships. Both grow up developing their own signature laughter which identifies them socially as a public marker of a "true person." Laughter is perhaps the most significant way that gender differences are bridged in social interaction. It is a safe way to exchange "happiness inside," which is highly valued.

The Men. Maya men cannot be separated from their work. However, they are under increasing pressure, when young, to choose between school work and milpa work—to feed the family by trying to earn money or by planting the cornfield. Corn is said to give "strength to people's hearts." A man has to feed his family to have worth, either by agricultural or wage labor, with the latter being almost nonexistent in the thousands of villages where Mayas live. The staple crops are maize, beans, squash, and chile, with a wide assortment of other crops, usually in the center of the cornfield. Married women and children will also help weed and harvest. Maya men typically continue producing and working their cornfields until death. It is not uncommon to see men in their eighties and nineties still vigorously engaged in this demanding labor.

The Women. Most of a girl's training is in the domestic sphere as a preparation for marriage, which, depending on locality, can happen as early as 16 or as late as the mid-twenties. More recently, young women are employed by cooperatives, mainly participating in sewing and embroidery.

After marriage, the woman's status changes. As a wife she is now prepared to be a mother. Having children is valued emotionally, economically, and socially, as a woman gains prestige as a mother. In Maya culture, anything that is essential for life is described as *sàantoh, kili'ich*, or "sacred," thereby giving women, as bearers of life, a sacred quality. Upon marrying, most young women are occupied by pregnancy, lactation, and caring for and feeding young children. As the woman matures and her family grows, she garners more respect and prestige. The elderly woman is respected for her age and wisdom, and, as a grandmother, the matriarch of the family and head of many familial decisions.

Middle Age and Old Age

Elders, grandparents, and great-grandparents are called *nohoč máak*, "great people" or "big people." A common saying even when one is becoming elder is *tz'o'ok a nohoč máaktal*, "you are finished becoming an elder." This is not only a potential reference to physical age, but to social behavior, especially in terms of one's willingness to accept responsibility for others. Typically, elders are relied upon for all kinds of guidance, but the recent access that children have to school, television, and "outside culture" is widely seen as responsible for a rapid loss of respect for elders. A visible sadness is expressed by many elders, apparently caused by the discrepancy between how their culture prepared them to be elders, and how they increasingly see that young people are being socialized by Western culture to see their own elders as primitive and vestiges of the past.

Grandfather, *tatič*, and grandmother, *čič*, are still greatly respected, and are terms used even by young people to refer to any given elders in respectful ways. Again, the people of the Maya zone of central Quintana Roo tend to be more culturally conservative, and there is more adherence to the value of respecting one's elders, in how they are addressed, spoken to, and listened to, and how their needs are tended to by the family. Indeed, in Maya culture, one of the great values of having a family is that one has children to provide care when one becomes elderly. Elders who have not been so fortunate are invited

into many people's homes as they walk down the street, to feed them or offer companionship and other help.

Gender-Related Social Groups

The combination of the genders is represented by the *otoč*, home, or *nahil*, house. This is where one's family lives, one's *č'íibal*, one's "people." On a somewhat larger scale is the *kahtal*, which refers either to the extended family's houseplot, containing several homes, or a small community. The term literally means, "becoming life." These large multifamily houseplots tend to be focused on the male lineage, but there is variation from this pattern.

Another important relationship is with one's *compadres*, or coparents, who attain this title by agreeing to be responsible for a child and participate in appropriate ceremonies. One's *compadre*, or cofather, or *comadre*, comother, are extremely close relations who are relied upon for all kinds of assistance.

Gender Roles in Economics

In addition to what was presented earlier, it is important to add that a harmonious home is typically characterized by conforming to the Maya ideal that each gender performs particular roles associated with that gender, and is responsible for making the two complementary. If there is access to a market, women tend to go more, either for purchasing items needed or to sell the fruits and vegetables that they grow. It has also become more common to see men leaving their communities and going to heavily tourist-populated areas in search of work so that they may provide for their families. This is also true for some women. They tend, like the men who migrate, to speak Spanish more fluently than the women who stayed in their communities. Women who have left their communities also often sell handmade *hipiles* or blouses in order to sustain their families. Teenage boys increasingly leave home to find work in the tourist industry. In general, boys are more likely to be wage earners than girls (Kintz, 1990, pp. 14–15, 32).

Leadership in Public Arenas

Men tend to have more public leadership roles, but women can also fill such roles, especially in times of crisis. In general, however, women's power seems to be more private, as is reported in many other indigenous cultures. In public meetings, leadership provided by members of either gender will have the goal of mediating the discussion to result in consensus. Community harmony is not always attainable, but it is highly valued, with men, in public, and women, in private, each contributing in their own way to harmonious relations.

Gender and Religion

The Creator is referred to as Hahal Dios or Tohil K'u, "The True God," Ki'ičkelem Yum, "Beautiful Father," Nohoč Tat, "Grandfather," or Jesu Christo, is symbolically associated with the sun, and is male. The moon, or Mama Luna, is female and often associated with the Virgin Mary. Both men and women can be prayer leaders as well as shamans. In some communities, public prayer groups, or *novenas*, are groups of women who pray together in the evenings, while in others, the prayers are attended by both genders. Men and women will also spend time praying in private, usually at altars in the home, or at an *olatorio* prayer structure outside the home or in the milpa. Women seem to be exclusively responsible for *hol če* ceremonies where offerings of tortillas are placed in trees. Communities that have colonial period churches tend to have these as the focus for certain religious events, often led by women. The male *hmèen*, or shaman, leads ceremonies in the woods (*k'àaš*), in his home, or in other people's homes. The most important of these, the *č'a čàak* rain ceremony, is a purely male event, with women still playing a significant role in preparing ritual foods brought to the ceremony by the men.

Leisure, Recreation, and the Arts

Men and women do not have much leisure time. Even during fiestas, which are major social events that are greatly enjoyed, there is often still much to do unless one is visiting another community's fiesta with one's family. Males do play sports, including baseball, *fútbol* (soccer), basketball, and volleyball.

It is important to emphasize that Maya families spend a significant amount of time together. Working, eating, and reclining in hammocks, is almost always accompanied by talking and laughter. Both males and

females spend significant time conversing, telling stories, and gossiping, so the work–leisure dichotomy familiar in Western culture is often difficult to see. Speaking eloquently is probably the most easily visible cultural art form, with speakers using sophisticated metaphors and playing with subtle differences in meaning as the basis of jokes, the colorful telling of stories, or to make one's points in the teaching of an important lesson. This kind of medium is one of the basic essences of Maya culture, and both genders, young and old, are encouraged to engage extensively in *tz'íikbal*, conversation. Indeed, an ability to speak well enables people of either gender to gain great prestige.

RELATIVE STATUS OF MEN AND WOMEN

Aside from what has already been presented, it is difficult to determine in an absolute sense, the degree to which gender asymmetry or male dominance functions in Maya culture. Whether one is studying the imposition of Spanish colonialism, or listening to Mayas speaking on the subject, it is possible to imagine that there is still an ongoing cultural conflict between two different ways of defining male and female relations. This conflict is even accelerating with the infusion of tourism and its Western cash economy, which tends to accentuate males as wage earners. Certainly more specialized research is necessary in this area, and still one's conclusions would be affected by the researcher's theoretical orientation. But it is still important to note that many women do control their household economy and are in charge of budgeting what money there is. Sons who work in Cancún can give all their earnings to their father or mother when they arrive home every 2 weeks, and are given back their share when they leave to return to Cancún. Perhaps what is most significant is understanding, for a given community or region, what factors are making it possible to adhere to Maya cultural norms, which seem to emphasize the complementary nature of gender relations, and which other factors are causing Western male dominance to be more exaggerated. In an area as large as Yucatán there is a great range of variation in the mixture of social, economic, political, and religious factors which will influence the relative local status of the genders.

SEXUALITY

Given the strict rules defining appropriate etiquette, it is very difficult to discuss these topics with people, and rare to hear such topics being discussed. Sexuality is publicly referred to mostly through humor, with each gender joking about sexuality in its own way. When members of both genders know each other very well, jokes or stories about sexuality have a hilarious effect.

The *k'àan*, or *hamaca*, hammock, of the couple, is where sex takes place, so jokes about sexuality often include references to the *hamaca*. Given that most Maya homes consist of one room, it is therefore normal for parents to have sexual relations in their *hamaca* when the children are sleeping. In other words, there is not much privacy, and it does not seem to matter. Sex is therefore seen as "natural." The ideal time to have sex seems to be after marriage. Although this is not followed all the time, women are expected to wait more than men to have sex after marriage. Female sexuality is a topic mainly for women. Sexuality and issues pertaining to one's body are not openly discussed. For example, it is a sin to discuss menstruation with a young girl before her first menses (Elmendorf, 1976). Older women living alone, or widows, can be visited by young men seeking sexual training. If the young man, usually visiting at night, is allowed inside, the implication is that the woman accepts his advances.

It is not clear how Mayas view what Westerners call homosexuality, although it seems to be considered "one's destiny" if one happens to be born with that sexual orientation. A term that is used is *ki u čhi*, "delicious to his or her mouth."

COURTSHIP AND MARRIAGE

There is usually direct negotiation between the parents of the potential bride and groom with the parents or father of the young man taking the lead. Gifts are brought with the expectation that the initial visits may result in no agreement. This symbolically expresses that the young woman and her family are to be respected, and that the young man's family should expect to prove their seriousness. When an agreement is reached, including with the young woman since no one should be married by force, a more substantial gift is made to the bride (*muhul*), and an additional agreement is reached on the period of bride service (*háankàab*) that the groom will provide to his parents-in-law (Villa Rojas, 1945, pp. 87–89). Today, most couples have a religious wedding ceremony as well as a civil one, mirroring Mexican national practice. The padrinos or godparents of both spouses will usually be present at one

or both, and will publicly lecture the young couple on the responsibilities of marriage and the role of each spouse. When one chooses compadres to be padrinos for one's child, it is in part with this day's function in mind.

Husband–Wife Relationship

The family is an exceptionally strong institution for the Maya, and a man will refer to his wife as in *watan*, "my wife," or in *šuna'an*, "my woman of high status," or in *fáamiya*, "my family." A woman will refer to her husband as in *wíicham*. The husband–wife relationship is extremely private. Husband and wife sleep in the same *k'àan*, hammock, often with small children as well, and make decisions together. The family can eat together, but often the men eat at a small table and the women and children eat around the hearth, partly because a woman is making tortillas for an extended time during the meal. Divorce is very unusual.

The depth of the husband–wife relationship is expressed through the typical way in which a wife gives birth. Either a midwife or the wife's mother will be present with the woman and her husband. The husband is expected to assist the wife throughout the birth process. Again, the hammock is used, with the elder woman instructing the wife to assume various positions. This expectation is not always fulfilled, however, and women have been known to give birth by themselves.

Other Cross-Sex Relationships

One's younger brother or sister is called by the same name, *íitz'in*, while one's older sister is called *kìik* and older brother is *suku'un*. These terms are used as models for social relationships in general, and in using them with nonfamily, one is expressing closeness to others. Such use also expresses that the Maya people can be perceived as one large family. In essence, then, nonkin are ritually made family through use of these terms.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Despite the ongoing changes and encroachments caused by globalization, colonialism, and acculturation, there is still significant Maya adherence to what has been presented above in the many villages where most Mayas live. The Maya man, the *kòolnàal*, "corn farmer," and the Maya woman, the *ko'olel*, or the *pak'ač*, "tortilla maker," are probably the most powerful representations of Maya culture. As long as Mayas remain agricultural, the male and female principals will endure as twin tree trunks, upon which the rest of the culture is supported.

Mehinako

Ulrike Prinz

ALTERNATIVE NAMES

The Mehinako are also known as Meinaco, Meináku, and Meinacu.

LOCATION

The Mehinako are located in the Parque do Xingu, Upper Xingu, Mato Grosso, Central Brazil. The village is located at the headwaters of the Kuluene River, an affluent of the Xingu River, which is a major tributary of the Amazon. The region of Upper Xingu is one of the typical Indian retreat areas, which has been acknowledged as a reservation/*parque indígena* relatively soon (1961–71).

CULTURAL OVERVIEW

Mehinako live in a small village of 180 persons (in 2000), living at the Upper Xingu headwaters.[1] The village is still mainly self-sufficient in the cultivation of bitter manioc and fishing. Mehinako, together with Waurá and Yawalapiti, belong to an Arawak-speaking group; Kamayurá and Auetí are Tupi speaking, Kuikuru, Kalapalo, Nafuquá and Matipu are Carib speaking, and the village of the Trumai is linguistically separate. Despite their different linguistic origins, Mehinako and their neighbors within the Upper Xingu region have so many cultural similarities, that they can almost be considered as a single ethnic group (Lindig & Münzel, 1981). However, each village is politically independent, maintaining a monopoly on a particular craft. The predominantly peaceful association of the Upper Xingu villages emerges from the integration of the individual contributions of each group—cooperation, intermarriage, and kinship, as well as the interchange of material and spiritual/intellectual goods.

Mehinako, like their neighbors, live in a single circular village of several communal houses surrounding a central plaza, with a men's house in the middle. Spatial and social segregation of the sexes is one of the most striking characteristics of the whole Upper Xingu region (as well as in northwest Amazonia). This spatial segregation, together with the threat of "gang rape" for those women who dare to see men playing the "sacred trumpets," has lead to the assumption of a "male dominance complex" in this area and a theory of "sexual antagonism" (Quinn, 1977). The notion of "sexual antagonism" became an important research concept in Amazonia and Melanesia during the 1960s and 1970s (Herdt & Poole, 1982).

The segregation of Mehinako men and women concerns above all the gendered village space as well as the traditional division of labor and gender roles. The gendered division of labor and its complementarity is found in every sphere of life. For example, it occurs in the production of the manioc-scraping spatula and the manioc plant-stick. This manioc ritual in a complex interplay of male and female agencies, letting everybody experience the necessity for men and women to cooperate. However, everyday subsistence depends not only on the cooperation of gender groups, but also on kinship support.

CULTURAL CONSTRUCTION OF GENDER

There are two recognized genders: female and male. The ideal structure of Mehinako gender-relations can be described using the dictum "separate but equal" (Etienne & Leacock, 1980). The ideal balance of gender spheres is also expressed in the representation of the spirits as male–female pairs. Both ritual performance and the everyday behavior of men and women is based on the dual vision of gender that is played out in rites of gender-role reversal. Mehinako men and women state their equality and feel the need for cooperation. Women actively participate in ritual life and perform their own music and dances, although the role of official representation mainly belongs to responsibilities of men. For example, political decision-taking, representational and sponsor duties for the household, and leadership functions for the village undoubtedly belong to men. Female influence is often

described as informal, for example, in "trash-yard" gossip which indeed may become a dangerous tool of female influence and control. If the husband–wife relationship is good, men often consult their spouses. In addition to "gossip," Franchetto (1999, p. 218) identifies "market" and "lovers" as further areas of (Kuikuru) women's power. Women are particularly influential in marriage politics, and in the symbolic importance of situations of birth and death. In everyday relations, the balance of power varies according to the characters and situations and can be subjected to negotiations between the individual men and women.

Mehinako "villagers use the unconcealed anatomical differences between men and women to define 'masculinity' and 'femininity' and justify the differences between the sexes" (Gregor, 1985, p. 40) However, Mehinako do not look upon gender and the process of growing up as a "natural development" but "regard them like other institutions as man-made and on occasion subject to change" (Gregor, 1977, p. 254). Mehinako refer to the growing up of their sons and daughters as an active social and corporal process, which calls for the control of bodily fluids (like semen, blood), and the use of emetics, tobacco, oil and natural pigments (Viveiros de Castro, 1987, p. 32). The "fabrication" of a person in the Upper Xingu region is more than a symbolic "rite de passage;" it has to be acknowledged at the same time as a process of "physical-spiritual" transformation in which the whole village participates. In this context, the categories of age and gender are closely linked together.

Gender differentiation becomes visible at a young age in the different ornaments and hairstyles of boys and girls. Girls grow their hair at least to the shoulders, while boys wear a shorter cut in form of a pot or bowl. At the end of puberty rites, the young women receive the *ulurí* belt, made of *buriti* fiber, described as follows:

It consists of a single band of twine worn around the waist. To this band is attached a pocket watch sized piece of bark in the rough shape of a quadrilateral that sits on the pubis just above the genitals. A long thin cord leads from this bark through the buttocks, to reappear as a kind of protruding tail in the rear. (Gregor, 1977, p. 164)

Also it may be appreciated by men, women today rarely wear the *ulurí* belt, because they find it uncomfortable. They prefer simple belts of *buriti* fiber, that just go round their waist.

Valuable shell necklaces demonstrate the status of a young girl; they generally wear glass bead chains, which also serve as a kind of currency at the women's trading sessions (*uluki*). For ritual occasions women paint a small black sign (*genipapo*) on their cheeks and they may use *pequi* oil to cover their face and body. Women also draw special designs on their legs, using their own black dye made from the juice of a special bark. They mostly apply their own red and black dyes and their own designs. On special ritual occasions they can use male designs or colors; in this case however they rigidly observe the difference in the body parts where these signs are allowed to apply. For example, the use of red urucum paint (*Bixa orellana*)—the main male color—is restricted to a line on the upper forehead and on the feet up to the ankle in ritual occasions.

Body decoration and dress is exclusively male or female, but at the same time they are symbolically related and equated to another. For example, the symbolism of the special markers of puberty rites, the *uluri* belt for the young women and the earrings for the young men (see below), are equally valued and have the same meaning for both gender groups.

Men's decoration is richer in the use of different designs, which refer to world of the spirits. Mehinako have a high regard for well-executed designs and attractive ornaments (Gregor, 1977, p. 155ff.). When dressing for ritual occasion, the young men put on arm and leg bands, belts of shell, and belts of cotton as well as of glass beads. There is a special hair design for men (*teiyu*) which, as well as body paint, has a specific representational and interactional significance. Dress and decorative ornaments indicate the status of the person within the group.

The knee bands mark his age and whether he is a father. The color of his belt declares how old he is, his earrings identify him as having passed through the ear-piercing ritual, his shell belt, collar, and jaguar claw necklace reveal him as a man of some wealth, and his hair and body designs show him to be a shaman or a participant in a ritual. (Gregor, 1977, p. 162)

GENDER OVER THE LIFE CYCLE

During the life cycle a person passes through different stages. These are marked by the changing of names, which indicate at the same time the transformations of the person/body during life. One person can have eight or more different names, which are given to him or her on particular occasions: when a child takes its first steps, at the *pühükā* ceremony, when he/she marries and has his/her first child, and when he/she reaches old age (Gregor, 1977, p. 256). The names a person/receives are

passed on to him/her simultaneously by the maternal and paternal sides, mostly reverting to the names of the grand-parents' generation and avoiding the duplication of names. Since the father of a child cannot speak the name of his father-in-law, for reasons of respect and/or shame (the same applies to the mother), the child gains two names at the same time—one maternal and one paternal. During the first months of life a child is called by a nickname which both mother and father may pronounce without violating name taboos. There is a great deal of flexibility in the reading of genealogies and the naming system (Gregor, 1977, p. 256).

Every change in the stage of life-cycle concerning social and/or corporal transformation is marked by a new name, which will be announced to the public after an official ritual occasion. Life stages are the same for both sexes and the passage of puberty rites is celebrated equally for boys and girls, differing only in symbolism (see below).

The "metamorphosis" of girls and boys at the age of adolescence is the most important passage in the life cycle. The girls ritual is called *kaxatapa* (*akajatapa*), and the corresponding ceremony for boys is *pühükã*. Social change and physical transformation are ritually "per-formed" by the whole village, including participation by neighboring villages, and is followed by an individual phase of puberty seclusion, which lasts from at least 3 months up to 3 years.

For both genders, puberty rites and seclusion not only mark the change of status, but also a physical trans-formation. The more time the person spends in seclusion, the more beautiful and sexually attractive his/her body becomes. The body of the secluded person gains a new shape through the control of bodily fluids, treatment with emetics and tobacco, the application of special medicines and designs, and bodily techniques such as scratching the body with a special *cuya* scraper and tying the upper arms and below the knee with cotton strings.

Socialization of Boys and Girls

Mehinako appreciate children of both genders equally. A slight preference is expressed for girls, especially as the first born. This is because residence patterns, although they are handled quite flexibly (Gregor, 1977, p. 266), favor matrilocality and parents expect their oldest daugh-ter to care for them in old age.

At the birth of the first child, both parents have to observe strict couvade rules (Gregor, 1977, pp. 270–273).

These rules apply to diet and the restriction of special actions, mainly concerning subsistence activities. (During the couvade period the parents of the young couple are supposed to take care of them.) The restric-tions applied to the father help to stop the flow of the post-partum blood and protect the child. It is believed that up to 1 year of age the life of the newborn child is inti-mately connected to the conduct of its parents because its "soul (ĩyeweku, literally, shadow) is not yet fixed and could easily be taken away by a spirit" (Gregor, 1977, p. 270). The restrictions are very precisely for a year for the first child; post-partum seclusion is reduced to 3 months for the subsequent children. Illness or handicap of a child will always be traced back to a prohibited activ-ity by the father. For example, the father may not go out to fish or build a house (Gregor, 1997, p. 272). After the most dangerous period, the infant is carried around in the rest of the house and is called by a nickname. Both par-ents and the elder sisters take care of the small children. When it starts to walk it receives its first names. At about the age of 5 years children become more independent and begin to explore the nearer surroundings. A few years later, when they have grown out of the control of their older brothers and sisters, they play mostly in separate peer groups of boys and girls. Educational ideals are the same for both genders: they should be balanced in char-acter and avoid extreme reactions. On the other hand, "angry" girls or boys are also appreciated. However, "angry" persons are not desirable for leadership, for a good leader is supposed to be balanced and good-natured and to abstain from gossip.

Puberty and Adolescence

When the parents become aware of the growing interest of their boy or girl in the opposite sex, they start to instruct them in their duties as future wife or husband. The girl has to carry water and is instructed in craft production and other skills. From now on she receives the special attention of her mother. During this period boys seem to enjoy more freedom. They can demonstrate their abilities as good fishermen and wrestlers. However, if a boy shows too much interest in the opposite sex without favoring one girl, the parents may intervene and arrange a marriage. When brideservice starts, the young men have to comply with their duties and usually have to work for their fathers-in-law for about 2 years. Brideservice is called "payment for the vagina" (Franchetto, 1999,

p. 209). Extraconjugal relations also have to be "paid for" (see below). In general, a young man moves to the house or village of his future wife about a year before the wedding; he continues to perform brideservice for one year after the wedding.

Attainment of Adulthood

Mehinako explain the need to arrange an initiation ceremony (*pühükã*) for boys when their behavior changes and they start to become interested in girls. However, becoming a "ripe" marriageable man or woman involves a complex ritual process for the whole community. After the ceremony every boy or girl gains two new names. The attainment of adolescent status is the most important for both genders, providing central personal and physical transformation and change.

The intertribal ritual is organized by the chief's family when one or two of their boys reach the age of puberty. The same is true for the girls. The rest of the boys, whose families cannot afford such effort and costs, take advantage of the occasion. In September 2000 nearly all the boys in the village aged between 5 and 17 years participated in the initiation ceremony.

The *pühükã* (piercing) ritual[2] for boys not only makes a social change but also their gradual corporal transformation. To my knowledge, the corresponding ceremony for the girls (*kaxatapa*), when they receive their first *ulurí* belt, has never been described before. The Mehinako told me that the last *kaxatapa* was held for Yamuni about 25 years ago. During this ritual the girls wear masculine paraphernalia. This indicates that the two rituals of adolescence—similarly to the gendered rituals of *yamarikumã* and the "sacred trumpets"—have a parallel construction and complement each other. They ritually invert gender roles and play with them. As in the ritual of the "holy trumpets," the *pühükã* ritual demands exclusion of women during the moment of ear-piercing of the initiands.

The *pühükã* ritual consist of three parts: the first involves preparation of the feast and collective fishing, welcoming the guests, exchanging goods and the climactic *hukã-hukã* wrestling. During this first period the whole village is engaged in singing and dancing.

At the beginning of the second phase the guests should have already left. Now special importance is given to the initiands. They shift between two opposing situations: between rich ornamentation as celestial birds, accompanied by singing and dancing by the whole

village, on the one hand, and nakedness plus silence, on the other. This phase concludes with ear-piercing, and passes into the third stage when the initiands are totally cut off from the rest of village in the seclusion apartment. The younger boys are allowed to return to their families after a week of *pühükã* seclusion. However, for the main initiands it is the beginning of a long phase of silence and corporal and spiritual transformation.

Middle Age and Old Age

Mehinako men and women gain influence and authority due to their experience and their abilities which they can pass on to the younger generation. Married men and women, who regularly participate in ritual performance, can become special ritual leaders within their own gender group. Rhetorical talent and the knowledge of ceremonial forms increases with age. Elder men and women can gain influence and authority, but reaching old age does not seem to be specially honored. Old men are not taken seriously because they forget and mix up everything. If there is no daughter to look after them, old men have a particularly hard life.

PERSONALITY DIFFERENCES BY GENDER

The same virtues are esteemed for both men and women: to be well balanced, full of activity, and rich in knowledge. For men, there exist different rhetoric forms and styles of speaking. Women are more reserved, but like to comment on what men say. They are described as the "owners of gossip" or "lies." It is believed that women "by words of mouth weave a network of alliances and conflicts permeating the entire village" (Franchetto, 1999, p. 208).

GENDER-RELATED SOCIAL GROUPS

Social structure is defined over the double relationships in which the positions of both parents are given equal weight (Gregor, 1977, p. 288ff.). This bilateral system opens a field of interpretation and manipulation of kinship, but at the same time it speaks for the ideal of equality of the sexes. As in the naming of the children, where both family lines are transmitted, Mehinako

society also gives equal weight to both genders in kinship questions.

The rule of matrilocality is applied for marriage. However, it can be relaxed in special cases, such as for the young men who are expected to take over a political or spiritual leadership role in the village.

The men's house in the center of the village provides a gathering place for men. It also serves as seclusion chamber for future shaman aspirants and as the store for the "holy trumpets," which women are not supposed to see while they are being played. Women are not provided with a comparable institution; their gathering places are the "trash-yards"—kitchens behind each longhouse—where they visit one another to exchange news.

GENDER ROLES IN ECONOMICS

Mehinako division of labor does not stand out from that in other lowland societies in South America. It comprises the "classical" roles for men—fishing, clearing the fields, wood carving, and feather work. Women process bitter and sweet manioc, prepare food, and engage in the production of hammocks, bead belts, and sometimes clay figures and pots.[3] Within the range of their economic activities, both sexes are independent. Men as well as women have their own bartering sessions (*ulukí*) and they freely make decisions about their own products and properties.

Although labor is separated by gender, the result of this division is the insight that cooperation is needed. Myth and ritual display this system of reciprocal dependency. The production of manioc tools (*tunuyai* and *kuté*), for example, is associated with a ritual lasting several days, during which the different gender roles and their relatedness are displayed. As the Mehinako say: "The spirit of manioc *kukuhë* likes to play with the women." Men and women engage in ritual dancing and singing, denouncing the sexual insufficiency of the partner. These dances are repeated every second evening and lead to insults and scolding of the partners. During daytime men go ahead to manufacture the manioc tools while women ritually welcome the men returning from the woods and bring them food to eat at the center. At the end of the ritual process men ceremonially present the manioc tools to the women of their choice. In this way the ritual process plays out and appeases partnership frustrations and at the same time produces manioc tools, which are, through the spirit of *kukuhë*, closely linked to the sexual activity of the villagers and fertility.

PARENTAL AND OTHER CARETAKER ROLES

Parental roles are partly defined by the "production" of a child, that is, the contribution of semen which the Mehinako believe will form the fetus. The transformation or "passage" of life is not looked upon as something "natural" but as a process that is closely linked to the "right" behavior of the couple. In the first months both parents engage in the rearing of the newborn child. Later, brothers and sisters, as well as the closest (mainly maternal) kin, living in the same maloca participate in the socializing of the child. The ideal for both boys and girls is a well-balanced person who does not exhibit extreme behavior or temperament.

LEADERSHIP IN PUBLIC ARENAS

Leadership, like nearly every element of Mehinako life, is confined to separate gender groups, but exists equally for both of them: each group has its own leader. However, the official part of political leadership is clearly dominated by men. At first sight, the leadership of women seems more for fulfillment of the needs of symmetry than comprising real authority. Nevertheless, it should be mentioned here, because little attention has been paid to this symmetrical structure and because the status of the male political leader is not as "formal" as it would seem to the Western spectator. Influence and authority, although it is passed from father to son, is not completely due to heritage. It always depends on negotiations and decisions taken at the men's house. The role of the male leader is played out in nearly every ritual, whereas the female leader's role seems to be confined to women's rituals like *yamarikumã*. Even in the girl's initiation ritual *kaxatapa* (*akajatapa*), men play the dramatically significant roles (Gregor, 1985, p. 111). The role of women in the Upper Xingu villages has generally been underestimated, and until today there has been little fieldwork relating to female ritual and musical traditions.

GENDER AND RELIGION

Religion in the Upper Xingu region involves ritual performances and "spirits" or even "monsters"

(Barcelos Neto, 2000). Ambiguous beings can take the forms of humans (independently of their sex), animals, plants, or even artifacts. They are able to transform and can cause people to become seriously ill. If the person survives the attack, she/he builds up an intimate relationship with the spirit, which consists in feeding it regularly and manufacturing masks or performing dances in its honor throughout at least a year.

As to the perception of ritual and myth, the gender representations in the Upper Xingu region, especially at Mehinako village, have been of special interest over the past 20 years. They have been interpreted as male dominated and antagonistic (Gregor, 1985, 1988). This position seems to be supported by the existence of a men's house and the so-called "trumpet cult," where the *kauka* "flutes" (a set of aerophones that are kept securely in the men's house and played in special ritual performances) are not supposed to be seen by women.

Myths refer to a time when women owned these flutes until the men discovered their "secret" and their "fraud." The men took over the instruments from the women and even today the women are forbidden to watch the *Kauka* being played under the penalty of gang rape. This ritual and mythical complex provides the basis for the opinion that there are antagonistic and even hostile relationships between men and women in the Upper Xingu Region (Franchetto, 1999; Gregor, 1985, 1988; Gregor & Tutzin, 2001). However, McCallum suggests that the interpretation that the extreme penalty of gang rape enables the men to gain power over their women, is a Western projection of naturalizing sexuality: "Gang rape in the Alto Xingu—whether as an idea or as an event—is many things: what it is not is a manifestation of a supposed universal male desire to overpower and humiliate women" (McCallum, 1994, p. 110).

Recent interpretations of myth and ritual of "gender-war" (Gregor, 1985, p. 119ff.) in the Upper Xingu have gone beyond the debate of "antagonism" and the related "male dominance complex." Female researchers have revealed the existence of a corresponding female tradition that has been invisible or underestimated for a long time. The research of Basso (1985) on the Kalapalo and Monod-Bequelin (1982, 1987) on the Trumai emphasize the complementary structure of the gender-related rituals in Upper Xingu. These researches stress the existence of a female ritual called *yamarikumã*.

In the *yamarikumã* ritual women act like men in ritual performance, using male body design and wearing their feather crowns. Both gendered rituals require the exclusion of the opposite gender (Basso, 1985) and at the same time complement one another. They must be understood in relation to another; both exist as a simple village performance, as well as an intertribal ritual involving larger groups of women, independently of their village affiliation.

The *yamarikumã* ritual has been interpreted as a reflex or answer to the male "trumpet cult." However, it is not just a copy of male tradition, but is acknowledged by Mehinako men and women as the origin and model for the male trumpet melodies. At Mehinako village there exist at least two explicitly female musical traditions (*yamarikumã* and *tünexekumã*) for which women are responsible (Prinz, 2002; Prinz & Grubner, 2001).

Aggressive conduct of men towards women (by the threat of gang rape) or by women towards men (by scratching and beating men who dare to come too close) during the rituals cannot be explained in terms of anxiety about the opposite gender group, as suggested by Gregor (1985) and Basso (1985). Why should women ritually transform into men in order to express their sexual aggression? I suggest that the gendered rituals have a different role—secret play with the agency of the opposite gender/sex. In "antagonistic" gender rituals men and women play with the agencies of the opposite sex, subverting and transgressing the strict gender roles (Prinz, 1999, pp. 270–271). Ritual escape from role conventions allows both men and women to step out of their own position and experience the opposite one. When men play the *kauka* trumpets and women dance decorated with male paraphernalia, they not only play with gender roles, but during the performance they also turn into the powerful spirits of *kauka* and *yamarikumã*, respectively for the duration of the ritual, the performers (of *kauka* or *yamarikumã*) submit to its transformative powers. However, transformation is a very dangerous process that must be invisible. If it becomes visible to the opposite sex, the limits between spirit performance and spirit condition fuse. Men transform into enraged "spirits" and this may lead to gang rape. Such an extreme event must be understood as transgression, and not as a powerful tool for men to keep women in their place.

Myths show that the reason for transformation is not hostile gender relations, but the fraud (Prinz, 1999, pp. 273–274) of the social contract, which basically consists in the exchange of food, handicraft, love, and labor. Myths also tell us that women vested as men is

a fraud in the same way that the playing of the *kauka* is a fraud. Nevertheless, men play with female agencies (*kauka* "trumpets") and women play with male agencies. The play with these agencies can best be interpreted as an attempt to gain control over the opposite agencies in the condition of the spirit, and not as a means of overpowering the opposite sex (Prinz, 2002).

LEISURE, RECREATION, AND THE ARTS

When asked about their daily work, Mehinako women assured us that they really work hard and that men also work hard. They did not understand the question: "Which sex worked harder." Perhaps the symmetrical gender structure inhibits comparison of the two separate contributions that are honored equally and are so intimately linked together. In their leisure time, both men and women engage in gender-specific handicrafts or they may lie in their hammocks for a while to rest. Couples converse together and go to take a bath; single people play with their friends in gender- and age-related groups or try to make arrangements with their lovers (see below). In the afternoon the young men play football at the central plaza. In the evenings the men gather in front of the men's house. The younger generation—men, women, and children—like to watch television (see below).

RELATIVE STATUS OF MEN AND WOMEN

As stated above, the status of men and women is generally equal; they do not compete in different domains and activities because the spheres are carefully separated. Therefore the question of status only arises within one gender group and is defined to a great extent by kinship. Women wear a special tattoo to show their affiliation with the chief family. A person also gains respect through the attainment of special knowledge.

SEXUALITY

Mehinako men are very outspoken about their sexual relations and extramarital affairs are one of the favorite subjects of discussion in the village (Gregor, 1977). Lovers who meet outside the village give each other presents in exchange for sexual relations. During the bartering sessions (*ulukí*) the sexual activity of a particular woman is quickly revealed to the rest of the women by the abundance of her glass bead necklaces.

Men describe the odor of menstrual blood as disgusting, but in the village a menstruating women only keeps away from the kitchen and subsistence activities for a short time.

It is believed that many sexual acts, sometimes with different men, are necessary to form a fetus. Several Mehinako women complained about the extreme pain during the birth of their first child; one of them decided to take a special medicine for contraception, and another living outside the village in Canarana choose to take the contraceptive pill.

COURTSHIP AND MARRIAGE

According to Basso (1973) and Gregor (1977) there are two forms of marriage. The first is called "bringing up one's bride." In this form, the newly adolescent girl is brought to her future husband's house, where she has to spend the time of seclusion. This implies high payments to her relatives and is held to be very prestigious (Gregor, 1977, p. 282). In the second form the hammock of the future husband is publicly carried into the house of the girl. Before the second form of marriage, Mehinako boys and girls have considerable freedom to engage in sexual experience. Lovers give each other presents such as fish, belts of glass beads, or little carvings in the shell of the coconut. Ideal marriage partners are cross cousins. Sometimes marriage is arranged by the parents to discipline their children's conduct. If the young man, for example, does not accept his parents' choice, he refuses to sleep with the girl and does not give her any food to eat. To resolve the conflict, either the boy has to abandon the village or he marries the girl and later takes another wife of his own choice. Polygyny (mainly sororal polygyny) is accepted within the "chief" family. Husband and wife can equally initiate divorce.

HUSBAND–WIFE RELATIONSHIP

The husband–wife relationship depends on many individual factors: the acceptance of the (external) husband in the house of his father-in-law and in the village, personal ideas about love, and the sexuality of the couple.

Harmonious marriages seemed to be relatively common, but it is judged foolish to show love and affection openly. Despite the strict gender division of labor, spouses do spend a great deal time together, taking baths together, or visiting the gardens (places where couples can have some private conversation as well as sexual relations). A couple's hammock positions and the taking of meals (together or separated) reveal the conditions of their relationship. "When enraged at her husband, a wife may take a machete and cut down her husband's hammock …" (Gregor, 1985, p. 28). Various young men complained and planned separation, although one of them already had offspring.

Only newly married couples may express their affection openly and sleep together in a large hammock (Gregor, 1985, pp. 26–27). Although there seems to be no need for conjugal fidelity, marriage is the basis of an important economic unity and a bond to assure social status and the ability to participate in public ceremony. A single person is a source of disturbance to the system of reciprocal dependency. The situation for bachelors and widows may become difficult with increasing age if they do not succeed in finding new partners.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Telecommunication has not stopped at the gates of Upper Xingu. Three of the nine longhouses have a television set, but only one of them is regularly used provided that permission is obtained from the generator's owner. The generator and the television set belong to different people who have to agree to and be recompensed for their use. When there are no ritual performances, a group of young men and women gather to watch the news, football, and/or the "*telenovela*" (daily soap). Some men translate the series for their wives, and news from the outside world is sometimes intensely discussed. Watching television seems to compete with the gatherings at the men's house. The influence of the *telenovela* together with experiences of Mehinako men outside the Xingu region is likely to lead to some changes in interpersonal relations within the younger generation. Some of the young men express their discontent about the strict separation of gender spheres and the common rule not to show affection, as well as the strong influence of the parents in marriage

decisions. However, Western-style romantic love is still considered to be ridiculous.

Notes

1. Mehinako village-life has been described in an outstanding monograph *Mehinaku: The Drama of Daily Life in a Brazilian Indian Village* by Thomas Gregor (1977). Gregor and his wife carried out intensive research in 1967 and various visits during the early 1970s. For some of the issues I refer to his excellent data, trying to update some of his information. However, with respect to gender relations, changing research concepts of recent decades and the focus on women's perspective has led to some different conclusions, particularly in the interpretation of the gendered rituals—the "trumpet cult" and the corresponding female *yamarikumã* ritual— which will be discussed below.

2. This ritual is mentioned by Oberg (1953) and Murphy and Quain (1955). A short description is given by Myazaki (1964) and a short interpretation is given by Gregor (1985, p. 186ff.). I was lucky enough to be invited to a *pühükã* ceremony in September 2000 at the Mehinako village (Prinz, 2004).

3. Strictly speaking, the production of clay pottery is the monopoly of Waurá village. But since Waurá and Mehinako (both Arawak speaking) are tightly linked through kinship, Waurá women like Takulalu, the wife of Yumuin, together with some other women of the village engage in manufacturing clay.

Mexicans

Julia Pauli

LOCATION

Mexico's northern border is the United States. It shares its southern border with Guatemala and Belize. The Pacific Ocean limits Mexico to the west while the Gulf of Mexico is on the east.

CULTURAL OVERVIEW

With an estimated 97 million people (INEGI, 2000) currently living in Mexico, the country is the largest Spanish-speaking nation of the world. The country has experienced several significant changes in the 20th century, for example, a tremendous rate of urbanization and a substantial population growth (Canak & Swanson, 1998, pp. 141–149). However, fertility has started to decline. Total fertility rates have dropped from 6.8 children in 1970 to 3.8 children in 1986 (Mier y Terán, 1996, p. 326). Mexico is a highly stratified country and there are marked differences by class, region, and ethnicity. Here the focus will be on the so-called Mexican mestizos (Canak & Swanson, 1998, p. 85). The term mestizo is not unproblematic. It is mainly a scientific term that is used to refer to the great majority of Mexicans who do not define themselves as Spanish or Indian but of mixed descent. Mestizos speak Spanish and no Indian language. The vast majority of the population profess to be Catholics. The kinship is organized bilaterally. Nuclear and male-headed families are most common, although female-headed and extended households do exist.

CULTURAL CONSTRUCTION OF GENDER

Two cultural concepts figure prominently in Mexican mestizo gender imagery: the macho man and the mother. Whereas the macho man is stereotyped as hard-drinking, promiscuous, easily angered, violent, and aggressive, the most important defining trait of the mother stereotype is her suffering on behalf of her children's well-being.

Being perceived as a macho does not only have negative connotations. Local practices reveal that being a macho can also mean being a responsible and respected father and provider of the family (Gutmann, 1996; Howell, 1999, p. 105; Melhuus, 1996, p. 243, 1998, p. 360). Here, the gender roles of men and women are viewed as complementary, with the man working outside the home, being the main breadwinner and protector of the family, and the woman staying home and taking care of household and children. The opposite of this kind of macho is the *mandilón* (apron wearer), a female-dominated man (Gutmann, 1996, p. 221). Being publicly viewed as dominated and provided for by the wife is perceived as an insult by both men and women (Del Castillo, 1993). How influential the norm of male breadwinning on actual behavior can be is demonstrated in a study on working-class men and women from Mexico City (Del Castillo, 1993). Even if women de facto provide for the household and are the main breadwinner, both husband and wife pretend that this is not the case and continue to fulfill the normative gender roles in public.

Female gender roles are centralized around the Mexican concept of motherhood. When people are asked which persons are closest to them, the mother is mentioned far more frequently than any other role independent of the origin and sex of the informant (Finkler, 1994, p. 56; Pauli, 2000, p. 182). Also, many women from rural and urban regions and different social strata consider motherhood as their main gender role and source of identity (García & de Oliveira, 1997). This kind of female gender construction is strongly influenced by popular images of the Virgin (Franco, 1989; Martin, 1990; Melhuus, 1993, 1996, 1998). The Virgin of Guadalupe is not only one of the most prominent national symbols, she also serves as a female role model. She combines the two most valued female traits: being a virgin and being a suffering mother. Suffering is viewed as inherent in motherhood. Finkler's (1994, 1997) study of urban women's pains and sicknesses demonstrates that the ideology of the suffering mother pervades Mexican mestizo society and is actually reinforced by women's everyday life.

Women's virtues have to be guarded constantly and it is considered inappropriate for a woman to live alone (Del Castillo, 1993). Being married and under the guardianship of a husband or being unmarried and under the guardianship of a father or brothers can, in society's view, guarantee a woman's honor and virtue (Howell, 1999, p. 105; Melhuus, 1993, p. 244). Being viewed as a respectable woman means being a decent woman (Melhuus, 1998, p. 364). The opposite of a decent woman is a bad or loose woman, a *mujer mala* (Finkler, 1994, p. 57; Howell, 1999, p. 105, Melhuus, 1998, p. 364). Sexual connotations, like having no shame and being open, are inscribed in the concept of the bad woman (Melhuus, 1998, p. 364).

The strong dichotomization of the female gender concepts—decent and indecent women—can be understood in relation to the male gender concepts. Virility is one important aspect of being a macho. Being a respected husband and protector of an honorable wife and family is another. Taken together, in order to confirm his masculinity, a man needs honorable women (his mother, his sisters, his wife, and his daughters) and *mujeres malas*, "loose" women (Melhuus, 1996, p. 244).

Clothes, make-up, and hairstyle are important ways of visually marking gender difference. It is very common to pierce a girl baby's earlobes, but this is probably the only permanent body mark to express a person's sex (Prieur, 1998, p. 144). Further, social classes vary in their strength of highlighting a person's gender. Middle and upper classes tend to stress a more restrained and reserved femininity (Prieur, 1998, p. 150) whereas the working class has kept an ideal that Prieur (1998, p. 145) describes as "Marilyn Monroe" like. Big breasts and buttocks are viewed as beautiful, and clothes that emphasize these perceived advantages are favored. Light skin, a straight nose, and height are also viewed as beautiful and sexually attractive (Prieur, 1998, p. 145). To fulfill this visual stereotype, the effeminate homosexuals studied by Prieur (1998) manipulate their bodies through surgery, female hormone therapy, and oil injections.

GENDER OVER THE LIFE CYCLE

In an idealized form, it is possible to divide the female life cycle into four stages: childhood (*niñez*), adolescence (*estar señorita*), married life (*la vida de casada*), and old age/widowhood (LeVine, 1993). There is no publicly marked transformation from childhood to adolescence, but during the second stage a ritual is performed to express a girl's entry into the adult world. On her 15th birthday a fiesta may be given for a girl, who is called a *quinceañera*, to mark that she is now an adult and has reached marriageable age. The beginning of married life may be expressed through a public wedding ceremony and fiesta. However, many women start their conjugal life without such a ceremony and live for years in what is called an *unión libre*, or consensual union. Old age and sometimes widowhood again lack a public ritual and are more gradual processes. Ideally, the children start to provide for their aged parents, reversing the former support flow. An idealized version of the male life cycle varies only slightly from this schema. The second stage of the male life cycle lacks the public ritual, the *fiesta de quinceaños*, which marks a girl's entry into adulthood.

Socialization of Boys and Girls

Both boys and girls are gender socialized early. In rural settings, girls are taught household tasks, such as the preparation of tortillas, as early 4 or 5 years of age. It is common for young girls to take care of small children. These tasks also prepare girls to become capable of running a household on their own (Howell, 1999, p. 104). Boys often accompany their fathers in their daily activities and learn how to work in the field. In general, girls and boys are dressed and treated according to normative gender roles early in life. Girls are dressed in light colors, are scolded if they play in the dirt, and have their earlobes pierced as babies. Boys are allowed to be noisy and get dirty (Prieur, 1998, p. 119).

Differences between boys and girls are expressed in everyday practices. Whereas beauty is stressed when talking about a baby girl, a baby boy is referred to in terms of physical strength, intelligence, and even reproductive capacity (Gutmann, 1996, p. 105). Also, it is common to address boys and girls as little mothers and fathers (*mamacitas* and *papacitos*). At least on an elementary level, girls and boys are given the same educational opportunities (Finkler, 1994, p. 64; Gutmann, 1996, p. 163; LeVine, 1993, p. 22). Boys and girls rarely spend their leisure time together. It is common for men to play sports on Sundays, especially soccer and baseball. On these occasions, fathers take their sons but not their daughters. Daughters often stay with their mothers and other female kin like female cousins. In general, freedom

of movement is far more restricted for girls than for boys, and it is considered normal for girls to be chaperoned and for male kin to guard them. There are several secular and religious rituals and fiestas during childhood. Probably the most prominent Catholic ritual is baptism. A very popular secular fiesta is the celebration of a child's third birthday. These rituals and fiestas are celebrated irrespective of gender.

Gender preferences vary in urban and rural settings (LeVine, 1993, p. 178). In rural areas, a preference for sons is common. Sons, and given the diffusion of ultimogeniture, most often the youngest son (Robichaux, 1997), are expected to take care of the parents in old age. However, this picture changes for the urban population, and daughters gain in importance. In the urban working-class context, there is often no property to be inherited and the dyad between son and father may become more superficial (Lomnitz, 1977, p. 123). But the mother–daughter dyad remains strong after the daughter's marriage and it is not uncommon for a daughter's family to reside with the daughter's mother or nearby (Del Castillo, 1993; LeVine, 1993, p. 179).

Women are mainly responsible for children's socialization (e.g., Marroni de Velázquez, 1994). Sometimes the mother exchanges help with other women, mainly kin or fictive kin, *comadres*. Although most child care is still done by women, mainly by the mother of a child, important variations have emerged. First, Gutmann (1996, ch. 3) demonstrates the increasing importance of the father. Secondly, working mothers are increasingly using paid childcare, such as nannies or day-care centers (Howell, 1999).

PUBERTY AND ADOLESCENCE

Becoming a *señorita* is marked by the onset of menstruation. When girls start to menstruate, the chaperoning by male kin can become even stricter than before (LeVine, 1993, p. 77). Many girls are not informed about the biological background of menstruation and they may think that they are going to die (LeVine, 1993, p. 77). Often, virginity is viewed as the most important trait for an unmarried girl, and fathers, mothers, and brothers alike guard the honor of a girl (LeVine, 1993; Melhuus, 1996). Nevertheless, there are significant variations. Because of economic necessity, it is not uncommon for young girls to have to work. In these cases, complete

chaperoning is impossible. Also, given the increased level of education at present and thus longer time in school, more and more girls interact with boys within the school setting and without the observation of their families (LeVine, 1993, p. 78).

ATTAINMENT OF ADULTHOOD

Only for girls is there a publicly marked ritual of entrance into adulthood. The celebration consists of a mass to thank God followed by a fiesta (Napolitano, 1997, p. 281). Originally, this ritual was only celebrated by the upper and upper-middle class and served the purpose of presenting a now marriageable girl to society (LeVine, 1993, p. 60; Napolitano, 1997, p. 281). According to LeVine (1993, p. 60), this custom was adopted by the middle class after the Mexican Revolution (1917), and by the 1950s working-class parents had also begun to celebrate the *fiesta de quinceaños*. Today, upper- and middle-class Mexicans often prefer not to celebrate the ritual and instead opt for expensive presents like a car or a trip to Europe (Napolitano, 1997, p. 282). Among the working class and in rural areas the celebration is very common. Girls are proud to be honored in such a way (LeVine, 1993, p. 77; Napolitano, 1997). However, their new status also involves more restrictions on a girl's freedom (Napolitano, 1997, p. 290). The fear that a girl may lose her virginity is countered by protecting and watching her as much as possible until she marries. Ideally, with marriage or a consensual union, a woman advances another step in her attainment of adulthood, but this passage may be viewed as completed only with motherhood. For boys, the attainment of adulthood is even more gradual than for girls. In rural areas at least, a young man has not reached full adult status until he is married or living with a woman in a consensual union.

MIDDLE AGE AND OLD AGE

The "cult of motherhood" (Finkler, 1997, p. 1152) has direct effects on the lives of middle-aged and old women. To be considered a woman, it is important to become a mother (Melhuus, 1993, 1996). Thus, children are central to most women's lives after marriage. It is through her children that a woman gains respect and is able to engage in social relations. Married women without children tend

to be very isolated (Pauli, 2000). It is often only through the birth of children that the social networks of women start to enlarge. Fictive kin relationships, especially between a mother and her comothers, her *comadres*, are central in middle age. These are the most important sources of reciprocal help. In old age, fictive kin may still be important. However, the now grown-up children become the most important source of help. Also, a woman's adult sons may protect her from a violent husband (Finkler, 1997, p. 1153).

PERSONALITY DIFFERENCES BY GENDER

In an oversimplified way, women are expected to be nurturing and reticent whereas men are viewed as dominant and often aggressive. Again, the prominent cultural stereotypes of the virile macho and the suffering mother explain these gendered inscriptions. Being sociable is generally viewed as positive. However, there are certain limits. Women can be blamed for engaging in what is considered as gossip (Villarreal, 1996). Husbands and mothers-in-law often severely restrict a woman's movements. They may explain their action as a form of prevention against the woman's engagement in gossip.

GENDER-RELATED SOCIAL GROUPS

Patrilocal residence is common (Fowler-Salamini & Vaughan, 1994; Robichaux, 1997). Nevertheless, the length of time a couple may live in the husband's father's household varies. If it is the youngest son, the couple will inherit the house. For all other sons, the length of stay depends on the economic background of the family (González Montes, 1994). For households with alternative income sources and no land, the period tends to be short (González Montes, 1994; Robichaux, 1997). The incoming wives often hope for rapid establishment of a separate household, given the fact that the time living with the husband's kin is often the most conflict-laden period in a woman's life (Pauli, 2000). In rural areas, the localized patrilineal groups (Robichaux, 1997) are often important support networks and pressure groups. Especially within the *ejido* system, the communal land administration, large male kin groups can be very influential.

However, more and more sons prefer neolocal residence after marriage. With the income generated through international migration, they are able to establish an independent household before marriage (Mummert, 1994; Pauli, 2000). There are few cases of matrilocal residence in rural areas (Robichaux, 1997). Living near or with the wife's mother's family seems to be more common in urban areas (Del Castillo, 1993). One explanation is the general lack of land to be inherited in this setting and thus a weaker bond between father and son (LeVine, 1993, p. 179; Lomnitz, 1977, p. 123).

Another important feature of social structure is the fictive kinship system, the *compadrazgo* system (White, Schnegg, Brudner, & Nutini, 2002). This system of godparenthood not only stresses the bond between godparents and godchild but also the bond between godparents and parents. On a structural level, groups are formed on the basis of couples. Yet, in everyday life, divisions along gender lines become important. Social interaction seldom occurs between couples but more between mother and comother (*comadre*) and father and cofather (*compadre*).

GENDER ROLES IN ECONOMICS

Stereotypically, man is the main breadwinner working outside the household, whereas the woman is in charge of children and household chores. Deviations from this norm are often viewed negatively. A working woman may imply that the husband is not able to provide, which, in turn, can be viewed as a detraction of his honor (Melhuuss, 1996, p. 245). There are pejorative terms to describe men doing household chores, like *mandilón* (apron-wearer).

A growing number of women now engage in wage labor. The economic activities of women are increasingly important for the survival of the household (e.g., González Montes, 1994; Pagán & Sánchez, 2000). Nevertheless, these women are often viewed as marginal (Chant, 1997). If women work outside the home, they are generally paid less and their jobs are considered less prestigious than those of men (e.g., Benería & Roldán, 1987; Brown, Pagán, & Rodríguez-Oreggia, 1999; Howell, 1999; Rothstein, 1999). Aside from work in export manufacturing, women often work in commerce, such as making and selling food. Other domestic tasks are also done by women for income generation, such as washing,

ironing, and sewing (Chant, 1997). Besides engaging in paid employment, most women are expected to undertake a major share of the housework (Bennett, 1995).

The division of labor by gender is also reflected in international migration strategies (Massey, Alarcón, Durand, & González, 1987, p. 199). Most migrants to the United States are men, yet a growing number of mainly young and childless women have started to migrate internationally. Nevertheless, the majority of rural women stay in Mexico. Duration of time in the United States varies according to the aspired aims. Given that most of this migration is illegal and therefore that crossing the border is costly, migrants often stay for several years. Migration is directly linked to the life cycle (Massey et al., 1987, p. 200). Often the process starts when men are young and unmarried. After marriage, many men stop migrating but start again with the arrival of children. In older age and when the children are grown up, international migration is normally ended.

Female migration generally takes place within Mexico. In rural areas, it is common for unmarried women to migrate to urban areas to work as a *muchacha* (maid). A high proportion of women work in tourism and in "maquiladorized industry" (e.g., Kopinak, 1995, p. 30; Tiano, 1994), which is characterized as employing mainly unskilled assembly workers not organized in unions.

Within the *ejido* system, mostly men hold land titles (Brunt, 1992, p. 78). Thus inheritance of land is predominately patrilineal and all sons may be heirs (González Montes, 1994). For a family's house, ultimogeniture is widely practiced (Robichaux, 1997). In urban areas, both daughters and sons may inherit property, yet there is often a bias toward male inheritance (Gutmann, 1996, p. 73).

PARENTAL AND OTHER CARETAKER ROLES

Parental norms and actual behavior are not always in accord. On a normative level, the father's main obligation is to provide for the family economically. The mother should care for the children and the household (Gutmann, 1996, p. 74). Mothers in general spend more time than fathers with child-rearing. Certain child-rearing tasks like washing and feeding infants are mostly done by mothers. But fathers may also play an important role in the children's socialization. This is especially true for

socialization of boys. If possible, fathers take their sons with them to work. Mothers more often than fathers discipline and even beat their children (Gutmann, 1996, p. 77; LeVine, 1993, p. 159). Affection is not necessary a motherly trait, but can even be viewed as characteristic of a father–child relation (Gutmann, 1996, p. 76). Supervising homework and the child's formal education can be done by either parent, yet religious education and church attendance are generally the mother's domain. Class may affect parenting. As Gutmann (1996, p. 85) notes, middle- and upper-class fathers are less likely to take part in childcare than working-class fathers. This is because most childcare in the upper and middle class is done by a *muchacha* (maid, cook, and nanny).

Parent–child interactions are changing (LeVine, 1993, p. 158). Middle-aged people comment that they still address their parents as *Usted* (the formal "you") and not as *tú*, as is typical for their children. Also, relations between parents and children have generally become more affectionate (Gutmann, 1996, p. 76; LeVine, 1993, p. 158).

LEADERSHIP IN PUBLIC ARENAS

Women are excluded to a large extent from holding political office although since 1953 they can vote and be voted for. Formal politics are male dominated (Browner, 1986, p. 95; Brunt, 1992, p. 78; Canak & Swanson, 1998, p. 78). Yet although leadership in public arenas, such as an *ejido* commission or the governance of a municipality, is male dominated, there are several examples of direct female influence. Martin (1994) describes the pressure that a group of women in rural Mexico exercised on local politics. The women went so far as to occupy the town hall for several days to promote a politician favored by them. Women played a prominent role in the social movement to secure new housing for the displaced families after the calamitous earthquake in Mexico City in 1985 (Finkler, 1994, p. 70). In the past, women participated as leaders and soldiers in the Mexican Revolution (Chant, 1997, p. 126).

Most of women's political involvement and leadership in public arenas is associated with female household roles (Bennett, 1995; Martin, 1990). Several women have led protests for better community services (e.g., Fowler-Salamini & Vaughan, 1994). The numerous female upheavals pleading for installation or improvement of water services in Monterrey, northern Mexico, are an

example of this type of social protest (Bennett, 1995). Yet, there are class differences. Collective action like the public water protest is more typical for working-class women.

One reason why men dominate formal politics on the local as well as on the national level lies in the different make-up of male and female social networks (Brunt, 1992, p. 98). Female networks are mainly horizontal. They are built on exchange and help within the domestic sphere. Male networks, on the other hand, are more often related to a man's occupation and are more vertical in nature.

Gender and Religion

Everyday religious activities, like going to Sunday mass or taking care of the family's shrine (e.g., displaying a picture of Christ and often statuettes of the Virgin of Guadalupe or other saints), are practiced more often by women than by men. Older women especially devote a significant amount of their time to religious activities (LeVine, 1993, p. 107). Yet, religious offices in the *cargo* system are almost completely held by males.

Leisure, Recreation, and the Arts

Gender segregation is practiced during most leisure-time activities. In rural areas, it is common for men and boys to engage in sports, while women gather with other women and girls, mainly kin. Religious or lay festivals are the most common forms of sociability and enjoyment for women. They are almost the only form of entertainment permitted to women beside watching television and listening to the radio (Marroni de Velázquez, 1994). Participation in these events is governed by the rules of gender separation—women decorate the church and provide the costumes and food, while men provide music and drinks and make speeches (Marroni de Velázquez, 1994). Both male and female teenagers enjoy commercial dances and private fiestas (e.g., the celebration of a *fiesta de quinceaños*). Normally, unmarried children stay with their families or other kin and only interact with nonrelated girls while dancing.

Men often like to spend their leisure time with their *cuates*, their drinking buddies (Gutmann, 1996, p. 177; Lomnitz, 1977, p. 175), in a *cantina*, preferably a males-only bar. Drinking with *cuates* within the house is almost never tolerated by wives or mothers.

Relative Status of Men and Women

Rights and decision-making powers vary significantly across the life cycle for men and maybe even more so for women. Publicly, men are viewed as the decision-makers for most of the important areas of everyday life, such as use of resources, community representation, or family and kinship matters. However, unmarried men and married men residing patrilocally are limited in their decision-making capacities by their father's authority. Equally, parents and in-laws often severely limit the freedom of their daughters and daughters-in-law to make decisions on almost all matters, ranging from the way to perform domestic chores to the use of birth control (Shedlin & Hollerbach, 1981). Not surprisingly, the establishment of an independent household generally enhances the decision-making power of husband and wife. However, the wife remains under the control of her husband. It is common that a woman exercises a significant amount of authority and decision-making influence only when her sons have reached adulthood and bring in daughters-in-law.

Female participation in the labor market does not necessarily result in enhancement of their influence and decision-making power. Husbands from lower-income classes sometimes feel threatened by a wife's entry into the labor market as this may signal publicly that a man is not able to provide for his wife (Benería & Roldán, 1987). One consequence may be that, although the wife is the main breadwinner, she does not exercise the corresponding rights over the resources. Publicly, and sometimes also privately, the husband remains the main decision-maker (Del Castillo, 1993). However, well-educated working wives of the upper-income class report an increased say in household matters (Hubbell, 1993). International migration can also enhance the decision-making power of women. In the absence of their husbands, wives start to make decisions normally considered part of the male domain, like decisions on planting the field or supervising house construction (Finkler, 1994, p. 65).

Sexuality

A widespread view held by men and women alike is that men love to have sex and as many orgasms as possible (Gutmann, 1996, p. 143). Women are often perceived as not having sex for their own pleasure. Instead, they are

thought to agree to it in exchange for something else, like affection, upkeep, or money (LeVine, 1993, p. 89; Prieur, 1998, p. 81). Also, women's menstrual blood may be viewed as polluting (Gutmann, 1996, p. 122). This logic is sometimes applied to excuse male infidelities.

The wife is expected to be devoted to her husband, whereas the husband may be unfaithful. Although this perception is changing, many women still knowingly tolerate extramarital affairs by their husbands as long as they fulfill their economic role as provider for the family (LeVine, 1993, p. 195). Men may even maintain more than one family, an institution called *casa chica* or small house (Finkler, 1994, p. 59).

Before marriage, young men generally have had sexual experiences, sometimes with prostitutes. Unlike young boys, adolescent girls are often unaware of how their bodies function. They are frightened when they start menstruating; they do not know how to use contraception and are thus at risk of becoming unwillingly pregnant (LeVine, 1993, p. 66).

Talking about sexuality seems to be very common in the working class. Men and women alike joke and tease each other using ambiguous and sometime openly vulgar expressions (Gutmann, 1996, p. 142; Prieur, 1998, p. 65).

To define homosexuality (and also heterosexuality), the way that intercourse is practiced is crucial. Being masculine implies being the one who is active and penetrates. Conversely, being feminine means being passive and penetrable (Carrier, 1995; Melhuus, 1996, p. 240, 1998, p. 359; Paz, 1961; Prieur, 1996, 1998). Thus, the one who penetrates is not regarded as homosexual. He is viewed as a man regardless of the sex of his partner. The one who is being penetrated is viewed as feminine (Prieur, 1996, p. 86).

COURTSHIP AND MARRIAGE

The vast majority of adult mestizo Mexicans are living in some kind of conjugal union (Mier y Terán, 1996). Age at the first birth is, on average, around 20 (Mier y Terán, 1996, p. 327). Ideally, the potential groom is expected to visit the woman's parents with his father and godfather and make a formal request for her hand. If the parents consent, the couple should be married by civil and canon law. The bride should be a virgin. The groom's family or the groom himself will pay the costs. The legal age for women to marry is 14; for men it is 16. However, the

reality is that a significant number of couples live in what is called a *unión libre*, a consensual union (Del Castillo, 1993). Couples may also elope without notifying their parents in order to force a marriage of which their parents may disapprove.

Sometimes, men maintain more than one family, an institution called *casa chica* (small house) in contrast to the *casa grande* (big house), which belongs to the legal wife and children (Finkler, 1994, p. 59). Although monogamy is the norm, this type of de facto polygyny is common, especially for the middle and upper classes who also have the necessary resources to finance it (Finkler, 1994, p. 59; Gutmann, 1996, p. 140). Often the man does not take the responsibility for his out-of-wedlock offspring and refuses either to divorce his wife or to set up a *casa chica*. Accordingly, the number of single mothers, *madres solteras*, has risen (LeVine, 1993, p. 92).

Expectations and realities of marriage often diverge. Girls dream of a harmonious marriage on the basis of love and trust (LeVine, 1993, p. 81). However, the early years of marriage can be especially depressing due to severe misunderstandings, infidelity, domestic violence, and alcoholism (Finkler, 1994; LeVine, 1993, pp. 79–89). Opportunities to meet a potential *novio* (fiancé) are more numerous for girls today, although significant variations between rural and urban areas still exist (LeVine, 1993). Today, girls have more opportunities to meet boys because they are in school longer.

Given the high numbers of conjugal unions, an unmarried childless adult living on his or her own is a rare thing. Often, widows and abandoned wives do not remarry; rather, they stay with their children (Melhuus, 1996).

HUSBAND–WIFE RELATIONSHIP

A loving and harmonious marital relationship is an ideal that girls hope for (Finkler, 1994, p. 60). If this ideal relationship does not occur, but instead the wife is abused, her focus of affection will most likely shift from husband to children (Finkler, 1994, p. 60; LeVine, 1993, p. 136). Younger women are more willing to fight for an egalitarian marital relationship than older women, who are more often resigned to the situation (LeVine, 1993, p. 196).

The amount of time a couple spends together can vary tremendously. Often husband and wife eat breakfast and supper together and sleep in the same bed. During the day, the husband is at work. However, many men migrate

to either the big metropolitan areas or to the United States, and thus this schema only applies temporarily. Divorce became legal in 1917. Apart from mutual consent, divorce is permissible for a number of reasons, such as adultery or sterility (Chant, 1997, p. 126). However, a significant number of women remain in seemingly unbearable relationships (Chant, 1997, p. 126; LeVine, 1993, p. 95). Catholic ideology and the social and economic difficulties of lone motherhood explain this in part. Children of divorced parents are almost always raised by the mother.

Mormon Fundamentalists

William R. Jankowiak

LOCATION

There are numerous polygamous communities located in the western United States: the Allred group in Salt Lake Valley and Montana (Bennion, 1998; Young, 1954), the Johnson–Barlow group in Colorado City (Bradley, 1993; Quinn, 1991); the Timpson–Hammon Group in Centennial Park (Jankowiak & Allen, 1995; Jankowiak & Diderich, 2001); the Blackmore group in Canada and the Kingston Group in Salt Lake Valley (Quinn, 1991); the Manti Community in Manti, Utah and the Le Baron group in the Chihuahua Valley of northern Mexico (Jankowiak & Woodman, 2002).

CULTURAL OVERVIEW

Mormon polygyny is based on the writings and teachings of Joseph Smith who, in the 1820s, advanced the idea that God is married and the heavenly family is a polygynous or plural family. God is a polygynist who loves all his children but confers on men, and not on women, an elevated spiritual essence which insures that "righteous" living men will obtain a higher spiritual standing. Men occupy leadership positions in their families and on the church council, and have the potential, in the next life, to become a godhead with dominion over all their descendants. Women are not capable of Godhood but can elevate their status through marrying a would-be God. Salvation can only occur if people create in their earthly life God's ideal family—a patriarchal organized plural family. This vision was further expanded upon under the leadership of Brigham Young, and then later under the leadership of John Taylor. In response to Taylor's insistence on following Joseph Smith's mandate to form plural families, numerous fundamentalist communities were formed in remote regions. Today, Morman fundamentalists do not consider themselves members of the Church of the Latter-Day Saints (L.D.S.), but rather as authentic Mormons who follow the teachings of the prophet Joseph Smith. They differ further from the L.D.S. Church in their belief that Adam is not a man but rather the Father or God of the planet earth. Fundamentalism rests on the presumption of infallibility in scripture as the ultimate source of moral truth. For Mormon fundamentalists this means that the Book of Mormon, the Book of Covenants and Ordinances, and, where deemed appropriate, the Bible are the primary sources.

In the early 20th century Mormon fundamentalists broke with the L.D.S. Church to form an underground church. In various remote geographical regions throughout the Rocky Mountain ridge people sought to pool their financial resources and create a United Order through the development of strong affective solidarity sustained by cooperative exchanges of food, money, labor, and daughters.

Each community is governed independently and maintains only nominal contact with the others. The populations range from around 350 to over 10,000 (Salt Lake City and its surrounding suburbs). The largest and oldest polygynous settlement in North America is located in three separate geographical locations known as Hildale–Colorado City–Centennial Park (until the 1960s the region was referred to as Short Creek).

Each settlement is an intentional community where its members live, or expect to live, in a polygynous or plural family. The percentage of contemporary fundamentalist families with more than one wife range between 85% and 35%, depending upon the community and historical era. This is a higher percentage than the 15–20% reported for 19th century Mormons. To date, most communities are able to hold on to most of their daughters, who continue to reside in the community, and thus they have increased in population (Quinn, 1991).

Although mandated by scripture to live a polygynous life, there is no consensus as to how best to achieve this ideal. There is a lot of variation within and between communities. For example, some communities tolerate first-cousin marriages (e.g., Montana, Mexico, and Colorado City), while Centennial Park is adamant in its disapproval. Certain families have a history of child sex abuse; others do not. There is variation in living arrangements.

"Big House" polygyny, whereby a man and all his wives live together in a single dwelling is common among the elite families in Colorado City and Centennial Park. The other fundamentalist communities overwhelmingly practice "hut" polygamy, whereby each wife has her own dwelling with the man rotating between residences. Rotation systems range from a fixed schedule to allowing the husband to follow his personal preference. In the latter case, some wives have infrequent sexual relations.

CULTURAL CONSTRUCTION OF GENDER

Men's and women's characters are believed to be inherently different. Women are thought to be subservient to males. This is due to males receiving God's blessing or the "priesthood" after puberty. Within the home, gender identification begins with boy and girl infants wearing gender-specific colors and clothes. In the toddler stage (2 years old) it is common to see a boy sit next to his father when he drives to the store, while young girls sit next to their mother when they travel somewhere. In the youth stage, dress style is designed to uphold an image of modesty. Therefore tight-fitting clothes are taboo. Females wear two pairs of panty hose under their dresses. Boys and men also follow a conservative dress code. Many men wear the specially designed Mormon underwear (long johns coded with religious insignia), are clean shaven with short hair, and wear long-sleeve shirts to cover their arms even when playing a round of golf or a competitive game of basketball.

Ideally, attractiveness is based upon spiritual concerns that are centered on a person's character. Kindness, loyalty, patience, and willingness to sacrifice for the greater good are considered admirable qualities. In practice, people recognize female beauty as having physical aspects that closely mirror mainstream American culture. Women with symmetrical faces, youthful complexion, large eyes, and full lips are considered to be more attractive. Men are regarded as attractive if they are tall (over 5 feet 11 inches [1.8 m]) and hold an important position in the religious hierarchy or have a significant source of income.

GENDER OVER THE LIFE CYCLE

The names for the stages passing through the life cycle are similar to those in mainstream culture. There is an infant stage, with the "age of reason" beginning around the age of 7. Baptism, which takes place at the age of 12, marks the transition to young adulthood. For girls, it is a time to think about marriage, while for boys it signifies that they are no longer children but spiritual adults of the church.

After marriage, motherhood marks the next transformation in a woman's social identity. Young women often become more assertive in stating their needs and desires. They will also, especially if they are from nonelite households, more readily complain about their husband's shortcomings in providing for his family. During this stage many women will seek employment to support themselves and their children. The increase in income enables some women a greater voice in determining how family resources are allocated.

The next transformation stage is when a husband takes a new wife. Women have to learn to accommodate another woman's needs and interests. Men also have to adjust, albeit it in different ways. The final stage is old age. It is a time that women will readily acknowledge they enjoy. The community tends to idealize those grandmothers it regards as exemplary. Given their newfound status, the senior women are reluctant to criticize either the religion or the experience of living in a plural family. Men, especially if they are from elite families, seldom embrace the grandparent stage of life. These men usually have younger wives who are reproductively viable and thus remain fathers until almost the end of their lives. Their interaction with their grandchildren tends to be perfunctory. Only the nonelite men appear to be able to make the transition from a husband to a grandfather. With the exception of funerals, most of the life-stage ceremonies are conducted in secret.

Socialization of Boys and Girls

There are distinct differences in parenting style in every fundamentalist community. Some styles are more laissez-faire, others stress a discipline- or obedience-oriented approach, while others employ a more hands-on instructional approach. Women in elite households usually have large families and thus a more obedient approach is favored, while uneducated women living alone, or in a household with one or two cowives, tend to adopt a laissez-faire approach. College-educated women, living alone or with a number of cowives, overwhelming prefer a more hands-on instructional approach.

Young boys and girls are taught in very similar ways. Although boys have higher religious status, in daily

interaction boys and girls are equally valued. There is no evidence of female infanticide in any of the Mormon fundamentalist communities. At the age of 5, children are expected to be obedient. At the age of 7, children are instructed to memorize scripture, do well in school, if they go (many are home schooled), and be able to sing songs (Bennion, 1998, p. 82).

In large families much of the daily childcare duties are overseen by older siblings who tend to be less sensitive to the needs of younger siblings. Boys commonly play with toy guns, watch football on television (especially in Centennial Park), and engage in rough-house games of tag. Girls prefer to play with dolls, coloring books, and household items. Both genders enjoy watching cartoon videos and jumping on large trampolines.

Young girls tend to "work inside at cooking, cleaning and sewing and outside at food producing tasks such as tending the gardens and canning fruit. Daughters help mothers with washing, ironing, and other chores" (Bennion, 1998, p. 82). Fathers instruct sons in caring for animals, carrying firewood, moving heavy machinery, construction, carpentry, auto repair, and, at times, babysitting (Bennion, 1998).

All children eat and play together in a common family room that may or may not be supervised by their birth-mother, while an infant will sleep with his or her birth-mother. Young children (3–9 years old) often hang out in their birth-mother's bedroom. Thus, children from different birth-mothers often pass the day in close geographical proximity, while spending the early mornings and late evenings with their birth-mother and thus their other full siblings. Children evaluate a comother's favoritism, which serves to reinforce a sense of separateness. Teens can readily recall instances when their non-birth-mother discriminated or showed favoritism (e.g., giving more candy, or letting house rules slide for their children, but not for comother's children). In addition, birth mothers established borders by taking their children to their own bedroom and reading to them, watching television together, or talking with them. All these small, yet noticeable, activities communicate a distinct sense of differences and thus contribute to the formation of a separate family identity within the larger family.

Puberty and Adolescence

There is a strong continuity between puberty and adolescence. Prior to the 1990s young women (14–16 years old)

were immediately placed, that is, married. Usually this was to a man who already had wives. The young bride was referred to as a plural wife. Young men, especially those from nonelite families, had to wait significantly longer, and in many cases forever, to prove that they were worthy to marry. Under this system females tend to mature more quickly. By the 1990s the marriage age in the Salt Lake and Centennial Park communities had moved back to 17 or 18 years, with some women waiting until they were in their early twenties before marrying.

Until recently, and then only in some communities, a young woman's marital choices were limited. She could finish high school and then get married, or leave the community, which resulted in disgracing her family while also condemning her to eternal damnation (Bennion, 1998). In the Colorado City and Centennial Park communities a kind of underground support system has emerged whereby youth who leave the fundamentalist community can connect with other individuals who have also left.

Boys obtain deacon status at 12, teacher status at 14, and priest status at 16. At 19 a male has become an elder and can now participate in the weekly Melchizedek priesthood meetings.

Unmarried boys from elite families who decide to stay in the community often participate in local missionary work for a few years (e.g., weeding, repairing roads, building homes, and clearing drainage ditches). Because the communities fear condemnation from the outside world, they do not, like the mainstream Mormon church, send their youth to live outside the community.

Middle Age and Old Age

Middle age (i.e., the forties) finds women less reproductively viable and thus focused on their youngest children. Having more time, they can provide them with something they could not give the middle children—attention. Middle-aged women discover the pleasures of being a grandmother and assisting their oldest daughters with daily chores. Middle-aged men, on the other hand, are focused more on obtaining a new wife with which to continue their reproductive careers. Men enjoy telling homage tales of elderly men (over 70) who father a child.

As long as a woman's husband remains alive, she will remain in his home. After her youngest child has moved out, she will often be asked by religious leaders to move into a smaller apartment so that a younger family

may have room to expand. The leaders are also the administrators of the religious trust that controls the distribution of all community property. It is in old age that many men come to appreciate how much they are mutually dependent upon their wives and children. In this stage even fiercely independent and patriarchically inspired men often become less assertive and more tolerant of their own lives and others around them.

PERSONALITY DIFFERENCES BY GENDER

The Mormon polygynous communities share many of the gender stereotypes found among other American fundamentalist groups. Men have greater strength and are thought to be "more logical, assertive, physical aggressive, competitive" (Bartkowski, 2001, p. 40), whereas women are regarded as more interested in reproductive concerns which makes them more "nurturing, relational, emotionally expressive, gentle, … and [inclined toward] humble obedience" (Bartkowski, 2001, p. 40).

During the 19th century, women's natural callings as wife and mother were prominent themes in leading fundamentalists sermons. "The patriarchal family [therefore] envisioned a divine hierarchy that featured, in descending order of authority: God, Christ, man/husband/wife, children" (Bennion, 1998, p. 28). In every way women's role was perceived to be that of a supportive wife and self-sacrificing mother.

There is a striking difference between men and women concerning risk-taking. Young men are overwhelmingly prone to take chances that have resulted in serious bodily injury and death. These risky behaviors range from taking illegal drugs, binge drinking, recklessly driving a vehicle, flying a small one-man airplane with two men on board, to having sex with a married woman.

GENDER-RELATED SOCIAL GROUPS

Every patriarchically organized community is based on theological axioms which uphold men as the religious and scriptural authority in the family. In addition, the social dynamics of polygynous family life make men, as fathers and husbands, the pivotal axis around which wives and children organize attention and internalize family identity.

Although church leadership actively discourages clanism (or the ranking of families into hierarchies of relative social worth), status competition flourishes unofficially. Family members strive to advance their father's or brother's reputation and thus, indirectly, their own standing. There is an ongoing struggle to heighten and diminish certain male reputations within a family and within the community as a whole. This dynamic is at odds with religious ideals.

High-status families continue to hold periodic gatherings in which men and women socialize while discussing family or clan business, and other related concerns. These family gatherings also reveal the value placed on family unity and loyalty, stressing cohesiveness. The value of family solidarity is further evident in the formation of family schools, named after a founding family ancestor, and dedicated to teaching local family history as well as the basic skills of reading and writing. Clanism has undermined community unity and resulted in social fragmentation.

Given the community value placed on purity of blood lines, there is a strong incentive to trace descent to famous men who founded the community or the fundamentalist religion. This pragmatic concern encourages a bilateral orientation and, when combined with the absence of private property in the community, effectively undercuts the patriarchical impulse to form a patrilineal descent system. People raised in polygynous communities know to whom they are related and are readily able to articulate their relative position within their father's and mother's genealogical line. The primary reference point is the birth-mother's family, with the larger father-centered family forming an important, albeit secondary, frame of reference.

When women marry, they move to the home of their husband or they build a new home. If the woman is widowed and takes a new husband who does not have a house, he will move into her house. Although the patriarchical ideology insists that once a woman is married she is no longer to have frequent contact with her natal family, this is an ideal that is upheld in theory more than in practice. Most polygynous families are in constant need of resources so that bilateral networking is tolerated, if not encouraged.

Compared with men, women interact more often with friends and relatives. Once the father dies, adult siblings are less inclined to eat together but, instead, preferred to hold "family" gatherings at their birth-mother's

home. In contrast, men's friendships are more isolated and fragmented. Apart from their children and favorite wife, many men have no true friends they trust.

GENDER ROLES IN ECONOMICS

There is a clear-cut sexual division of labor. Women are in charge of upkeeping the home and thus take turns cleaning the kitchen and bathroom, and vacuuming floors. Men will chop wood and bring it into the house, take out the trash, do yard work, and repair things around the house that are broken. Ideally, men run the financial side of the family but in practice mature women actively monitor household income. If women are employed outside the home, they often have a voice in how the family's income is spent. If they are on public assistance they tend to have a diminished voice in family affairs.

Different communes are better off depending upon the overall development of the region. Outside the home men work in construction, metal-working, education (as teachers and administrators), retail business, finances, and in the insurance industry. In every plural family, with the exception of the truly wealthy, husbands cannot always feed and clothe their families. Women are compelled to find employment outside the home, often working in nearby towns to which they commute daily.

Given the limitation of finance, there is strong incentive for women to do most of the work themselves. Therefore, women will can fruit and vegetables, stitch quilts, sew bedding and clothes, and buy bulk foods and goods whenever possible (Bennion, 1998, p. 29). In some families, men are absent from home for a long period of time, and to cope with this women form a support system among themselves (Bennion, 1998). This is especially true for women living in the Le Baron and Allred Montana communities.

PARENTAL AND OTHER CARETAKER ROLES

Because cowives are often in competition for their husband's attention, they contribute to the idealization process of the husband by vying with each other for predominance. In this struggle, the children are often used as a means to an end—becoming the desired object of their husband's attention. This can be deliberate as well as unconscious. Because the wives focus their attention on their husband, their children, wanting to please both their mother and father, follow suit. By cultivating father adoration, a mother hopes to demonstrate her superior worth among the cowives. A mother instructs her children to love and cherish their father, while at the same time she strives to fulfill his expectations of her. This effort, along with the child's own desire to bond with the father, enhances the father's stature and esteem. The cultural emphasis on the spiritual and administrative authority of the father serves to promote family solidarity. It is in "the name of the father" that cowives and their offspring are told to suppress their rivalry and come together as a cohesive family unit.

In daily socialization there is an emphasis on corporal punishment (e.g., using the belt or stick on a child that misbehaves) and religious training. Women who live alone with their children tend to be more actively engaged in rearing them. Women living in plural families tend to prefer an obedience approach to child-rearing. There is an idealized ethos of "children are to be seen and not heard." Cowives care for each other's children. However, there is a tacit fear that a cowife might retaliate against another wife by punishing her children. Thus, a mother pays a great deal of attention to a cowife's treatment of her child.

LEADERSHIP IN PUBLIC ARENAS

Women are excluded from the most important spheres of social power and knowledge. The Church is the central institution in the community, and it is organized around an exclusive male leadership that justifies as natural female inferiority and the male's right to assert their opinion. In some communities women form associations that celebrate female autonomy and female interdependence (Bennion, 1998, p. 129). In the Allred groups in Salt Lake and Montana, as well as in the Le Baron community in Mexico, there are women's prayer circles where women meet to pray for one another's requests. Other all-female meetings also take place during Sunday school, the Sacrament Relief Society, and morning community prayer (Bennion, 1998, p. 10). These associations are absent in the Colorado City–Centennial Park communities which tend to be more adamant in applying patriarchal axioms to ordinary life. In every polygynous community pain, suffering, and pioneer struggles are

constant themes that are told and retold to heighten motivation and uphold commitment to the religion.

GENDER AND RELIGION

There are several nonnegotiable tenets at the core of Mormon theology that provide an ideological foundation for promoting and securing family unity. The first holds that the father is charged with the duty of managing and expanding his kingdom here on earth, and ideally in the hereafter, by entering the institution of plural marriage (Musser, 1944).

A second tenet asserts that the father–son relationship is the core axis for the transmission of cultural and spiritual essence (Clark & Clark, 1991, p. 286). It is based on the belief of a Melchizedek priesthood whose lineage, extended back to Adam, is the only legitimate religious authority. It is also the primary legitimization of men's insistence that the only acceptable foundation of religious expression is a patriarchal social organization.

A third tenet holds that a man's celestial rank is determined primarily by his ability to live righteously and to adhere successfully to God's will, with the highest rank of virtue reserved for those who enter into a plural family. In contrast, women achieve salvation through obedience, first to their fathers, and then to their husbands by becoming a sister-wife (i.e., a cowife) within the plural family that is also a celestial family. Because the family unit extends beyond the grave into an eternal world, it is believed that everyone, especially cowives, must learn better interpersonal skills and increase cooperative behavior in order to achieve family harmony in this world and the next.

It the Montana Allred community it is believed that women have unique revelations not given to men (Bennion, 1998, pp. 51–53). In this community women believe in the idea of an exalted spiritual sisterhood. Moreover, they also believe in a "deity" called Mother Eve who was the mother of all living things and thus, because of her, women also formed a complementary relationship with all living things. This idea is not found in other polygynous fundamentalist communities.

LEISURE, RECREATION, AND THE ARTS

In most fundamentalist communities recreational activities revolve primarily around religious events and activities. It is common for men and women to join the church choir, engage in long-distance telephone conversations, and attend an occasional community dance. Events that appeal primarily to women are attending prayer groups, quilting bees, and family gatherings. In the privacy of their home many people listen to the radio and CDs, and watch television (a favored activity in the Salt Lake and Centennial Park communities). The Centennial Park community is the most liberal of all the fundamentalist groups; they conduct monthly lecture series where outsiders are invited to speak on various topics. The community also produces theatrical plays with the actors selected from the local community. Men form softball leagues, participate in an occasional pick-up game of basketball, a round of golf, or the annual married versus unmarried Thanksgiving Day football game. The more liberal families will travel to nearby city and watch the latest film release or rent a video to watch together at home. In both the Colorado City and Centennial Park communities, a woman expects to be taken somewhere special on her birthday and wedding anniversary.

RELATIVE STATUS OF MEN AND WOMEN

The community is organized around principles of hierarchy and submission. In many ways it mirrors a small corporate or military organization with its focus on obedience to appointed authorities. In this arena, males dominate all forms of public leadership. God holds men accountable for exercising familial leadership in keeping with biblical principles (Bartkowski, 2001, p. 55). The Prophet, or leader of the community, plays a "strong role in arranging marriages, sometimes without consulting prospective partners or families" (Bennion, 1998, p. 89).

As young infant males are treasured above females, but upon entering their teenage years most young men are held in less esteem, due in large part to their being regarded as potential competitors in a highly restricted pool. In every polygynous society, women are a limited good. In the 1960s local law enforcement officers in Colorado City routinely harass nonelite young men into leaving the community. Today this is no longer practiced and there is a growing pool of unmarried men who continue to live in the community.

Women do control their sexuality. Many women do not want to become pregnant and thus refuse to have sex with their husbands. Moreover, women know that if they

leave their husband, they will become available for marriage to other men, who want to elevate their religious status through having numerous wives. The drive to gain greater celestial glory is an added incentive for men to accept women into their family. This is not true in every case; some men, especially if they have a good working family, will hesitate in bringing in a new wife as it may undermine the harmony of the home.

SEXUALITY

The Mormon concept of true love closely resembles that prevalent in 19th century Victorian England. In practice, however, sexual love in fundamentalist Mormon society is often highly eroticized, as it was in Victorian society. Sexual pleasure is an appropriate desire provided that it is the by-product of spousal affection and marital love. Most fundamentalists, while disapproving of premarital sex, firmly believe that sexual pleasure should be an enjoyable aspect of every marriage. This attitude is stronger among the younger generation than among their grandparents.

Ideally, women should never use birth control. Rather, they should use self-control or abstinence. In the Montana community it is forbidden to have "sexual activity during lactation, pregnancy or menstruation" (Bennion, 1998, p. 81). In Colorado City and Centennial Park some women continue to have sex long after they are pregnant or lactating. Many women and men engage in sexuality as a communicative and pleasure-seeking activity. However, there are examples of women who found that their husbands were no longer interested in sleeping with them after they had a hysterectomy.

Neither sex should engage in extramarital sex. If a man sleeps with his fiancée before the marriage ceremony it is considered an adulterous act. There are cases of wives leaving their husband upon discovering this act. Given the value placed on reproductive vitality, it is not surprising that, as a woman grows older, she loses some of her esthetic value. This does not necessarily mean that she loses her influence over her husband. In fact, in Centennial Park I never found a single family where the favorite wife was the youngest wife. A wife's aging does not appear to undermine either the love bond (provided that she has already developed one) or her position within the family. It only affects her desirability as a sex partner.

There is a fear of sexual abuse in the community. Adults often suspect that children over the age of 7 years will play with the sex organs of the opposite sex. In Colorado City and Centennial Park this is referred to as "doing the nasties." This behavior is considered to be unnatural and something that must be prevented. In these two communities it is common for teenagers to sneak out of the house and engage in midnight drinking parties and dancing. A few of the youths have been known to engage in heavy petting and sexual intercourse.

Homosexuality is regarded as a terrible sin against the laws of God. Given this judgment, no one would openly admit to having these inclinations. Bennion (1998) found lesbianism to be rare, but not unknown, among women in the Montana community. In the Colorado City–Centennial Park communities I found only one instance in which a man was thought to be a homosexual. In every fundamentalist community homosexual behavior between males is considered more threatening to the community than that between females.

COURTSHIP AND MARRIAGE

Romantic passion is not a prerequisite for marriage. In Centennial Park, half of the marriages are not based on romantic love. In these marriages, individuals, particularly teenage women, followed the matrimonial recommendations of their parents and the priesthood council. Not being deeply emotionally involved with a spouse, the individual enters marriage expecting, as in many cultures, that in time "love will come."

Mormon cosmology holds that, before birth, everyone lives with God as a spirit. In this preexistence state, men and women were promised to one another for time and eternity. Therefore individuals must strive to find their "true love." Failure to strive in such a way can potentially lead to an awkward situation whereby one's earthly spouse will differ from one's heavenly spouse. To ensure that death will not result in the separation of the spouses, it is imperative that the couple follow God's will. To this end, the advice of priesthood's council members as God's representatives is eagerly sought in matters of the heart. One of the council's most important functions is to help community members find their celestial mates.

Nevertheless, dilemmas do arise. There are times when parents disapprove of a daughter's (though seldom a son's) choice or, more importantly, the priesthood

council considers the relationship inappropriate. When this occurs, individuals must reconcile their romantic feelings with their deep-seated religious beliefs, which include the importance of the priesthood council in guiding the community and its members to salvation and eternal happiness. In the face of such resistance many couples break up and marry whomever the priesthood council recommends. Other couples, whose love is deeper, often prefer to resist the council's recommendation. There are numerous precedents of individuals asserting that their romantic experience is authentic and thus sanctioned by God. Because Mormon theology is derived, in part, from 19th century transcendentalism, it holds that God's will can be known through acts of private introspection and personal revelation. Accordingly, it honors individual conviction and this religious tenet gives romantically entangled couples solid ground on which to argue that the council might be mistaken in its judgment. Although an individual's testimony of being divinely inspired is never directly challenged, the common response is to wonder whether God or the Devil is the real source of the inspiration. Still, the notion of "agency," or personal choice, serves as an effective counterpoint to the community's formal organization—its male-centered priesthood council.

Marriage negotiations take place between the priesthood council and the couple, with the woman serving as both the object, and the arbitrator, of the negotiations. If the bride-to-be cannot be persuaded to change her mind, the council will often, albeit reluctantly, support her marital choice. For, as one informant said, "Who can deny God and God's love" (i.e., choice). However, in those instances where either the parents or the council refused to sanction the marriage, the individuals will either recognize and submit to the council's authority or they will elope and marry outside the community. Once a suitable time has elapsed, they return as a duly legitimized couple.

Men maintain a stoic, if not cynical, posture toward romantic love. Many men dismissed the emotion altogether, stressing that it was, at bottom, an illusion and not the best basis for a marriage. However, more in-depth probing found that two thirds of the men interviewed had been romantically rejected as young men in high school (Jankowiak & Allen, 1995). The experience was so distressing that they became determined never to become emotionally involved again.

Younger men are more consistently concerned than older mature men with finding their true love. Without the financial backing of their families, young men are economically unable to compete with the more established mature males. The only resources they have, being unmarried, are those not immediately available to older married men: access and the opportunity to offer exclusive attention to a particular woman. Because most male–female relationships begin in high school, many young men are able to form substantial emotional bonds. Although lacking economic means of support, a young man can often convince a woman that she would be happier marrying him rather than a middle-aged man with several wives. If the young woman falls in love with the young man, she will probably marry him. If he is unsuccessful in attracting a high-school sweet heart, he will ultimately leave the community to find a wife.

HUSBAND–WIFE RELATIONSHIP

The Colorado City–Centennial Park communities distinguish between two types of families: elite or "united polygyny" (i.e., live together in one house) and commoner or "divided polygyny" (i.e., living in separate homes). The cultural ideal is to live together in one large house, but the reality is that only the local elite families are able consistently to accomplish this.

Within the family, the religious principles are centered on the notion of harmonious or familial love. Harmonious love encourages respect, empathy, helpfulness, and lasting affection; therefore it often serves as the principal means to bind and unite the polygynous family. Its nondyadic focus stands in sharp contrast to romantic love, a tolerated but seldom glorified emotional experience.

There is a continuum in men's and women's involvement in plural marriage that ranges from shared equality to outright favoritism. Men, as the symbolic center of the family, must balance each wife's emotional and economic interests. Conscious of the impact of favoritism on the harmony of the family, men strive to modify some of its harmful impact. To this end most husbands are diligent in spending quality time (e.g., dinners and trips), if not equal time, with each cowife. In this regard, women intently study and assess their husband's actions and are quick to note acts that suggest favoritism. If a husband can avoid pursuing his interests and struggle or, in their words, "sacrifice" in order to uphold the religious principles, the household ambience will be relatively harmonious and content.

The most delicate and potentially dangerous situations arise when a new wife enters the family. This is the most unstable time in a fundamentalist household and often tests a woman's religious convictions and, in turn, her willingness to participate in a plural marriage. During this liminal state, the new wife usually receives the husband's undivided attention, and cowives do not complain about their husband spending a lot of time with the new wife. It is understood that the honeymoon intimacy will continue once the couple returns from their trip. However, if the intimacy continues beyond a few weeks, it will engender a round of questions and doubts and, ultimately, generate into intense jealousy among the cowives.

Mormon polygynous wives who are not the central focus of their husband's attention and love deeply resent the "favorite" wife. If the favoritism persists, a wife will assume that her husband has grown emotionally distant and is no longer interested in her. When this happens, a wife will respond in one of three ways: she will seek to rekindle her husband's waning interest; she will resign herself to the loss of affection and seek emotional fulfillment exclusively in her children; or she will divorce and seek fulfillment in another marriage. Clearly, it is imperative for all concerned that the husband and his wives avoid favoritism and work together to sustain a harmonious family ambience. However, it is the rare plural family where the harmonious family ideal is sustained more than a few days.

If polygynist women are emotionally vulnerable, particularly to psychological abandonment, so are the men. If a polygynist husband becomes too attached, he knows that he will disrupt family bonds and damage his reputation within the community for being unable to manage his family. However, if he becomes too detached, he will live a life devoid of emotional intimacy.

A man is dependent on his wife's (or wives') assistance in attracting another spouse for, even if the priesthood council recommends a marriage partner, the woman must still decide. Her decision is often based on three factors: the quality of family harmony (actual and potential) represented in the cooperation between cowives; the intensity of affection held for the husband; and the number of wives, especially young wives, in the family. It is cultural given that it is often in a young woman's short-term interest to marry a middle-aged man with mature wives.

Mature wives are not powerless. They are respected, valued, and loved not because of seniority, but rather for

either the quality of marriage or their access to valuable resources (e.g., a deceased husband's retirement funds, social security benefits, or some other forms of inheritance or income). This wealth, while not considerable, is often sufficient to attract another wife. With this supplementary source of income, a man can buy a used car or build a home for his new wife. If a wife withholds her income, it can undermine her husband's ability to attract another wife. A polygynist husband depends on his cowife's (or cowives') assistance to sustain a friendly household environment and to provide economic aid in helping him build his heavenly kingdom.

Men and women embrace the polygynous principle and its call for plurality, while simultaneously seeking to hold onto, or rekindle, the romantic passion once felt toward a particular spouse. The tensions that erupt around this dilemma are the source of the drama found in daily life living in a fundamentalist community. The reality is that the majority of polygynous families seldom achieve genuine long-lasting harmony but remain, at best, a cauldron of competing interests that periodically rupture the fragile balance that unites a man, his wives, and children in their religiously inspired and unified cultural system.

Cross-Sex Relationships

The polygynous family is often a contentious zone of competing interests that contribute to the fostering of full sibling solidarity. Thus the typical sibling rivalry found in monogamous families is often muted in the polygynous family owing to the presence of intrafamilial strife.

This hierarchy of feeling and affection is ubiquitous in the American polygynous family. There is a gradation of emotional affiliation and intensity in affection and loyalty between full and half-siblings. However, this does not mean that half-siblings never form close bonds with other half-siblings. Nonetheless, there is an overwhelming preference for full siblings to form more intimate patterns of solidarity. Generally, it is the later born siblings (i.e., a mother's last two offsprings) who are more likely to establish a close friendship with the comother's children. Thus, half-siblings attend family functions out of friendship bonds previously established, whereas full siblings attend for a variety of reasons ranging from obligation to deep affection.

Outside the family, teenage girls and boys often seek out an adult male who lives in the community but is not

directly related to them to serve as a mentor in advising them about life and its goals. This relationship is usually formed in the mid-teenage years with the mentor being significantly older (20 years or more). The mentor serves as a moral guide and buffer between the individual and his birth family. The emotional bonds formed during this time will extend through the individual's lifetimes.

Change in Attitudes, Beliefs, and Practices Regarding Gender

There is greater recognition of the value of female choice in Centennial Park community, but not in Colorado City. Centennial Park women have greater opportunities to select a mate from within their own age cohort. In the Le Baron community in Mexico, many mature women are finding that they cannot support themselves and therefore have decided to leave the community and the fundamentalist religion to find employment and security in the United States. In other communities (e.g., Montana and Colorado City), the change in U.S. welfare laws that has restricted the period of time that people can remain on welfare will have a demonstrable impact on most fundamentalist families. Many middle-income and poor men are only able to support large plural families because of the government's subsistence policies. The ending of the federal entitlement will result in more women working outside the community. It will also mean that only the wealthiest members will be able to form a plural family. In a relatively short time, the percentage of men who live in polygynous families will revert to around 20%, similar to that found among the 19th century polygynous Mormons.

Mountain Arapesh

Paul Roscoe

ALTERNATIVE NAMES

Ethnonyms are Arapesh and Bukiyip. At contact, the Mountain Arapesh had no name for themselves: Arapesh is simply their word for "friends" or "humans."

LOCATION

The Mountain Arapesh live in the East Sepik Province of Papua New Guinea, between 3°27′ and 3°34′S and 143°09′ and 143°19′E. At contact, they inhabited the central peaklands of the coastal Prince Alexander and Torricelli mountains. The following description refers to their life in 1931–32, and derives from the writings of Margaret Mead, who spent 8 months in Alitoa locality, and Reo Fortune, who spent 11 months in Alitoa and Liwo localities. Arapesh life was severely disrupted by World War II and postwar colonial developments, and by 1960 most of the mountain dwellers had deserted the peaklands. Unfortunately, almost nothing is known of how these changes affected their gender conceptions and behavior.

CULTURAL OVERVIEW

The staples of Mountain Arapesh subsistence were yam and taro, cultivated separately by slash-and-burn horticulture, and sago. These were supplemented with bananas, greens, sugarcane, bamboo sprouts, breadfruit, coconuts, and a variety of game, including pigs, cassowaries, other smaller mammals, birds, grubs, and fish. Pigs and dogs were the main domestic animals.

At contact, the Mountain Arapesh were distributed across the mountains at a density of around 15–25 per square kilometer and loosely organized into localities of 200 or so people. Intralocality relations were rather tenuous and joint action relatively infrequent, but under the coordination of its senior men a locality occasionally prosecuted war against other localities, mounted rituals such as initiations, feasted other districts, and participated in interlocality meetings (possibly a postcontact innovation). Localities were also linked to others by an intensive trade conducted through long-established trade links that spanned the mountains from the southern foothills to the sea. Through these links passed tools, weapons, shells and other valuables, musical instruments, magic, songs, and dance complexes.

Internally, localities were divided into moieties, with clans of one moiety generally living within easy distance of one another but almost out of shouting range, across deep valleys or high ridges, from clans of the other moiety. Some tension existed between the moieties of a locality. Occasionally, they battled and even killed one another, but more usually they "fought with food," with the senior men of one moiety competitively exchanging root crops and game with hereditary exchange partners in the other.

The clans of a moiety were divided into one or more ceremonial communities; the exact composition of these communities depend on circumstances of geography, history, and kinship. Each ceremonial community took its name from a large central ridge-top settlement that served as the locus of its social and ceremonial life and, in times of heightened conflict, as a nucleated defensive position. These centers also provided some community members with their primary home and many others with secondary homes. For most people, though, the main residence was a *sho'ubeli wabul*, a "little place," that ranged in size from a gardening, hunting, or pig-herding camp of one or two houses to a hamlet of perhaps half a dozen buildings. Reflecting the mobility of mountain life, few of these "little places" were permanent; the larger ones shifted site from one generation to another, and the smaller camps were even more mobile.

CULTURAL CONSTRUCTION OF GENDER

The recognized gender categories appear to have been limited to male and female. Gender markers included

physical dimorphism, names, and gender-specific enculturated skills. In the case of females, the netbag was a prime symbol of feminity; the spear was possibly the equivalent symbol of masculinity. Children of both sexes went naked. About the age of 4 or 5, girls began to wear skirts of shredded sago frond, though they would wear these irregularly until they were 7 or 8. Around the age of 8 or 9, boys began to wear a loincloth made of softened breadfruit bark.

In both males and females, a "clear" skin—one unblemished by disease—was considered attractive. In women, a buxom figure and breasts that fell in "luxuriant heaviness" were esteemed. In men, height, sturdiness, and strength were highly valued. So far as marriage preferences were concerned, however, non-visual cues—a partner's aptitude and ability to fulfill his or her gender role—were especially important. Girls and young women were judged first by their sweet-temperedness and by their commitment and capability in caring for their families and providing hospitality to guests. If they lived locally, their appeal was enhanced if they brought with them many male kindred who were good hunters, successful gardeners, slow to anger, and wise in making choices. Youths with many relatives were also looked on with favor as spouses.

GENDER OVER THE LIFE CYCLE

It is not clear whether there were cultural names for the different stages of the life-cycle. Several life-cycle stages were occasions for ritual, though some practices were private rather than public; only a few were directly related to changes in rights, responsibilities, or power, and occasionally it is unclear whether the parent's or the child's life stage was being marked. When the child's fontanelle was deemed to have closed, the father ceremonially bled his own penis. Once the child possessed two teeth, its septum and ears were supposed to be pierced, though the actual timing of the rite varied considerably. Once the child could walk and talk, its parents privately finished their post-partum taboo on sexual relations with a day's fast and, sometimes, taboos associated with the moon. At the first signs of sexual maturity, both sexes observed a year of food taboos that were connected to the yam cycle and named for their newly emergent body hair. From this point on, they had to avoid the foods associated with childhood and old age and observe a range of taboos to protect their parents from their developing sexuality. A few years later, both males and females began to observe a second set of food taboos to ensure growth, a clear skin, and—for girls—menstruation and full breasts. Around this time, both sexes were initiated in separate ritual sequences, girls being scarified on the shoulders and buttocks to mark their newly nubile status. At the birth of his first child, a father was subjected to a ritual seclusion marking his new parenthood. When his eldest child was initiated, the father then formally "retired" from public life. Finally, in their old age, men and women entered a stage when in Arapesh feeling they were placed together with children.

Socialization of Boys and Girls

Mead emphasized how important child socialization was to understanding the warm maternal Arapesh temperament. A baby was never far from its mother's arms and never denied the breast until it had to be weaned, and there was considerable tactile play between mother and child. A crying child was given whatever it craved. Older children of both sexes also played an important role in holding and playing with the youngster.

The Arapesh greatly valued both daughters and sons, and parents afforded them virtually identical levels of affection. However, there was a preference for boys in so far as sons, unlike daughters, would not leave their parents at marriage but stay and care for them in old age. Infanticide was practiced, and daughters seem to have been killed somewhat more often than boys.

From childhood on, girls started to associate more with their mothers, boys more with their fathers. At quite an early age, girls were supposed to start helping with their mother's work, accompanying them to the gardens, caring for younger children, fetching water, and the like. Therefore most of their leisure time was passed in the company of their mothers and other female relatives. Young boys tended to follow their fathers about, sleeping in their arms at night. As they grew older, they would also start accompanying their fathers on hunting and gathering expeditions, but much of the rest of their time would be spent playing with other boys.

There appear to have been no gender-specific rites or rituals in infancy and childhood.

Up to the age of 4 or 5, boys and girls were subject to much the same socialization. Caregivers would immediately intercede to stop quarrels. Tantrums were appeased

rather than curbed or disciplined. An angered child would be allowed to kick and scream and roll in the mud, though not to hit another child. Boys often continued with such fits up to the age of 14 or 15. Girls learned to control their tantrums much earlier, not as a result of discipline so much as from the results—for example, they would discover that rolling in the mud would dirty their new sago-leaf skirts and their little netbags. Partly as a result of the society's ritual structure, in particular gender-specific attitudes to the Tamberan (*wareh*) spirit, little girls learned to be passive and not to express curiosity. Boys, by contrast, were encouraged in curiosity and speculation.

Children played very few games, none of them aggressive or competitive sports requiring "sides." Most games involved singing and pantomime, playing at being animals, for example, or at processing sago. Boys also played at various forms of target practice.

The main caretakers were parents, followed by older siblings. After they reached 5, however, it was common for children to be taken off by an aunt for a week's stay in another hamlet or locality, there to be handed on to another relative and eventually returned to the natal home. In this way, and through parental encouragement, children learned that they had many "mothers" and other relatives around their homes.

The Arapesh conceptualized the relationship between caregivers and care receivers as one of "growing" the young by contributing food to build their bodies. This ideology provided seniors with a measure of control over their juniors. If a young man spoke rudely to an elder, for instance, the latter might answer reproachfully, "And think how many pigs I have fattened from which you took your growth."

Puberty and Adolescence

Adolescence was not apparently recognized as a named stage of the life-cycle. The socialization processes of childhood continued to adolescence, though as they approached this stage boys and girls clustered together more in their daily lives in gender-specific groups.

The socialization of girls was complicated by the Arapesh preference for child betrothal. This practice has attracted considerable interest from incest theorists, but because the details are vague, they have caused considerable confusion in the literature. Girls were betrothed to a future husband at a relatively young age, sometimes at 5 or possibly even younger. At some later date—the exact sequence is unclear—she was adopted into her young husband's home and went to live at his settlement, though in the beginning this might only be for a few days or weeks at a time. An analysis of Mead's census data indicate that these shifts occurred between the ages of about 8 and 15.

In Mead's view, these moves made little gender-specific difference to the socialization process, the young girl in essence moving from the familial amity of her natal home to a similar ambience in her marital home. To all of her in-laws, the young girl "becomes warmly attached. Her feeling for her husband and his father and brothers is practically identical with her feeling for her own father and brothers." However, the responsibility for "growing" the young girl passed from her parents to her young husband, allowing him to exercise a modicum of control over her: because as an adolescent he had helped feed her, he could in later life rebuke her for being sulky or dilatory.

Attainment of Adulthood

In both sexes, initiation marked and produced the transition to adulthood, when both sexes were expected to assume the gender-specific roles associated with maturity. For males, this involved induction into the Tamberan cult, which made boys into men by promoting their physical growth and personal development. Male initiation took two forms: a stripped-down, family affair staged for a single youth, or a communal interlocality affair that occurred every 6 or 7 years. In either case, the initiate was secluded, bathed, beaten, fed a meal containing the blood of older men of the community, and shown a variety of sacra associated with the Tamberan, including masks, carved figures, flutes, and bullroarers. As part of the sequence, the boy's father also took him along his trade road to introduce him to his future trade friends. He was also "incised," though exactly what this involved is unclear.

The initiation rites for females were individually staged at first menstruation and shared structural similarities to male initiation. The young woman—usually now resident at her husband's home—was secluded in a small hut and tabooed water, food, and other comestibles for as long as she could endure, usually 4–7 days. During this period, older women rubbed her with stinging nettles and taught her the "women's tamberan," the practice of thrusting a rolled-up stinging nettle in and out of her

vagina. She was also scarified on the shoulders and buttocks. At the end of her seclusion, she was painted and decorated, and her husband fed her ritual foods to ensure she would be strong, fertile, and a hard worker. The sequence ended with presentations of gifts, rituals, and taboo observances.

Middle Age and Old Age

In some ways, the very old and the very young were conceptually assimilated in Arapesh society. Foods were divided into two categories: *shaloh*, foods eaten by those of reproductive age, and *bonah*, foods eaten by old people and little children. As this formulation implies, there was also an opposition between the elderly—those passed their reproductive years—and those approaching or in their reproductive years. Youth was a danger to old age. At adolescence, and even more scrupulously following consummation of their marriage, the young had to be careful to protect their elders from the polluting effects of their sexuality. Parents could not eat sago processed by their children, they could not eat food cooked over a fire by which their children had enjoyed sexual relations, and a son had to take care not to consume lime from his father's lime-gourd and not to step over any of his father's possessions. The consequences of infractions are unclear, but among a neighboring group, the Yangoru Boiken, similar age-related pollution is believed to cause arthritis, blindness, and ultimately death.

For all that, elders were respected, and their juniors felt a special responsibility to care for them.

Personality Differences by Gender

The Arapesh are famous in the literature for Mead's assertion that both males and females were socialized to be, and were, gentle, nurturant, passive, dependent, cooperative, and maternal. Although they might lack these qualities as children, by the time they were fully socialized, they had become so noncompetitive and unaggressive that even warfare was "practically unknown." In provisioning, defending, and serving their kin and communities, men sometimes had to be more aggressive, assertive, creative, and productive than women. As a result, masculinity was regarded as having a dangerous as well as a nurturant aspect: men were associated with

hunting, destruction, and death as well as with nurturance and life. In Mead's rendering, this created a dissonance that suited very few men. The rest viewed leadership, the assumption of arrogance, and the occasional deployment of violence as necessary evils, "onerous duties" to be undertaken in service of the community and gladly surrendered in old age. In many Melanesian communities, women are debarred from male cults and ceremonies as a means of bolstering male dominance and prestige; among the Mountain Arapesh, however, women were excluded solely to protect them from sickness and from bearing deformed children.

It is highly likely that the Mountain Arapesh did view gentleness and nurturance as ideals for both men and women. There is also little doubt that, in comparison to many other Melanesian societies, they *were* relatively gentle and peaceful. In making her point, however, Mead probably overstated it significantly. It is simply not the case, for example, that warfare was "practically unknown": in Fortune's view, warfare was "good Arapesh custom," and he provided detailed information on Arapesh fighting to support his contention.

Gender-Related Social Groups

Although gender relations were comparatively equitable, Arapesh society was structured around males rather than females. Clans and lineages were organized by patrilineal descent; there were no matrilineal kin groups. Moreover, women became strongly assimilated to their husbands' rather than to their natal, kin. Postmarital residence was patrilocal: at an early age, the young wife was taken into her husband's home, there to be "grown" and absorbed into his family, and, as the years passed, she became more thoroughly a part of this household than were her husband's sisters. She was addressed and treated as a sibling by her in-laws, when she died she was buried on her husband's land by her husband's people, and her spirit remained with him, on his land, at the abode of his clan's *walinab* spirit.

Nonkin associations were also structured around males rather than females. On becoming an adult, every man inherited in the male line a *buanyin* exchange partner with whom he competitively exchanged meat and crop foods for the rest of his life. Some men, in addition, formed *ano'in* relationships—relationships of competitive animosity that usually emerged from violent incidents

such as a fight over a woman, in which the loser thereafter tried to outdo his rival in raising pigs, sponsoring feasts, and the like. Women participated in no such institutionalized exchange relationships. Occasionally, a girl and boy born on the same day would be declared *ano'in* and were expected to marry, but these were not "real *ano'in*" relationships.

Then there was the men's Tamberan cult. Although Mead emphasized that it possessed none of the antagonism toward women and children found in other New Guinea communities, it nonetheless united the adult men of the locality in an exclusive association, and she felt that it was an important means of socializing women into intellectual passivity. Women did have their own *tamberans*—childbirth, girl's puberty rites, and the ritual dyeing of skirts, but these appear to have united no greater community than the wives of a clan.

GENDER ROLES IN ECONOMICS

There was a marked division of labor. Men did the fighting, hunting, clearing and fencing of gardens, planting and harvesting of yams and sago, and housebuilding. They manufactured their weaponry and, in the ritual realm, they cooked ceremonial food and produced the ritual artwork. Women reared pigs, did the daily cooking, and bore most of the portering. They planted and harvested the taro, bananas, and greens, fetched water, and gathered firewood, bush foods, insects, and grubs. Both sexes participated in fishing and manufactured smaller items of material culture such as ornaments, clothing, and twine. Both men and women were supposed to take care of children, though women appear to have shouldered more of this responsibility than men.

The Arapesh imported much of their visual art. Of the remainder, both sexes were likely to decorate their own personal items, tools, and weaponry, though one gets the impression that men did more than women. Men also produced the formal ritual art—most notably, the bark paintings associated with men's houses. Women dyed their sago-frond skirts, though, and this was considered an important ritual act. Men were the main musicians of the community, but both sexes sang and danced, often in complementary concert.

Men dominated the trade links across the mountains, and trade journeys were the main reason for them to be absent from the locality. Although warriors mounting a distant campaign might spend a night or two on the road, trade journeys sometimes lasted for a week or two.

In Arapesh feeling, a clan's land and trees belonged to its ancestors; living members merely occupied or used these resources. Allowing, then, that ownership was, strictly speaking, usage, only males could own land, sago, and coconut palms, and this property was inherited patrilineally. Very occasionally, a woman might inherit, but the property passed via her to her husband or sons. There was a different attitude to property that people had made themselves. Individuals owned anything they had made through their own "hard work," had obtained in trade with the fruits of their own labor, or had inherited from such an owner. Thus, a woman owned all the pots, tools, utensils, and so on given to her by her natal kin on her marriage. Since people were conceptualized as "growing" young wives, children, and pigs—as making them through hard work—there was therefore a "possessive tinge" to relationships with these agents.

PARENTAL AND OTHER CARETAKER ROLES

Parents were those believed to have created a child through repeated acts of intercourse, but caring for a child—in particular, "growing" through feeding—defined the quintessential parental role. Therefore, since nonnuclear kin routinely took the Arapesh child off to care for and feed it for a week at a time, the child grew up regarding many of its kin as "parents." As noted, both sexes played a role in childrearing, though mothers appear to have borne more of the work than fathers. As their children grew up, fathers began to spend more time with their sons and mothers more time with their daughters, but there is little to suggest that parents differed greatly in the ways that they educated and disciplined their children or in the amount of time and affection they invested in them.

LEADERSHIP IN PUBLIC ARENAS

Males dominated social and political affairs. They were the warriors, they exercised control over the affairs of their kin groups, and they were the political leaders—the "big men" (though Arapesh big men had nothing like the

power and influence found in some New Guinea communities). There is no evidence that women exercised any leadership or had influence, at least in the formal affairs of the community.

GENDER AND RELIGION

Men commanded most of the formal ritual and ceremonial of a community, much of which was staged in the name of the men's Tamberan cult. Women had their own *tamberans*—childbirth, girl's puberty rites, and the ritual dyeing of skirts, but men still played prominent roles in the first two of these.

The Arapesh had no conception of an original human, male or female. The principle spiritual agencies were ancestral spirits, *walinab* spirits, and the *wareh* (or Tamberan) spirit. Ancestral spirits were male or female according to their gender in life. *Walinab* spirits, which featured as characters in myth and as spirits of the stream and bush, were associated in a vague unspecified way with ancestral spirits and were also either male or female. Embodied in a noise-making device such as a flute or bullroarer, however, the Tamberan spirit, the patron of the men's cult, was genderless—or, more accurately, both male and female. There appears to have been no formal ranking of these agencies, but the Tamberan was considered especially important as the agent responsible for people's growth and welfare. Although women were said to have their own *tamberans*, the reference was not to spirits per se but rather to important ritual acts.

LEISURE, RECREATION, AND THE ARTS

It is difficult to quantify the amount of leisure time. It does appear, though, that females spent rather more time in physical labor than men. Boys spent much of their time playing with others of their age, while their sisters were under greater obligations to perform domestic chores. As they grew older, males would spend a significant amount of time in politicking, while their wives were out working in the gardens and forest. Much of what leisure time they had, women passed in visiting and chatting with other female relatives and in playing with children. Men, too, socialized with kin and friends. Both sexes passed time in storytelling, singing, and dancing, though it is difficult to gauge whether one sex did more

than the other. Beyond a top-spinning game that men played at harvest time, there were no adult games or sports.

RELATIVE STATUS OF MEN AND WOMEN

According to Mead, "The whole organisation of society is based upon the analogy between children and wives as representing a group who are younger, less responsible, than the men, and therefore to be guided." Thus, men controlled the formal political decision-making processes, the important subsistence resources (land, sago, and coconut palms), and most of the formal ritual and ceremonial. Fathers, rather than mothers or the partners themselves, appear to have decided marital matches, at least in the case of child betrothals.

Women were not entirely without influence or status; as noted, they did maintain rights over the fruits of their own labor, they controlled important elements of childbirth, girl's puberty rites, and the ritual dyeing of skirts, and one assumes that they could exert some informal "backstage" influence over political affairs. To judge by Arapesh sayings about wives taken in childhood and those taken later in their life, the former were more dutiful towards their husbands than the latter.

SEXUALITY

In conformity with their mild passive temperaments, according to Mead, the Arapesh viewed sex as a gentle and peaceful act. Rape was all but unknown. At the expense of active enjoyment of his own sexuality, a man was taught to approach his wife gently to ensure that she was well prepared to receive his advances. As a result of this enculturation, sex was not viewed as arising from a spontaneous internal desire but rather as a response to external stimuli, arising in situations culturally defined as sexual. There was no emphasis on satisfaction; the emphasis was "on preparedness, the completeness of the expectancy." Sex with a spouse was simply a more final and complete expression of the same affection one felt for one's child or sibling. That said, Fortune provided evidence that both sexes thought sexual desire was like a hunger.

Because sexual feelings emerged only in culturally sanctioned contexts, the Arapesh were unconcerned

about young people experimenting with sex. This was thought likely to occur only between a betrothed couple, who were therefore lectured about the dangers of premature intercourse in stunting their growth and development. Once the pair were fully grown, this danger passed, but sex was still associated with significant danger. On first consummating their marriage, husband and wife had to purify themselves of the act's "heat" on pain of destroying their future ability to perform their adult roles. Once their child was born, a post-partum sex taboo was observed until it could walk and talk in order to avoid endangering its health. Subsequently, sex was also avoided as dangerous during various rituals. Adultery was considered dangerous to men because their semen could be used for sorcery against them; it is not known whether women entertained similar fears.

According to Mead, there was no recognition of men as the natural initiators of sex; females were just as likely to initiate intercourse. Indeed, the verb, "to copulate," could be used with both male and female subjects. Apparently, there was no recognition of female sexual climax; women talked of preferred sexual partners not in terms of their ability to satisfy a desire but in terms of ease and lack of difficulty in sex. Male climax was phrased simply as a loss of tumescence.

Information is sparse, but there appears to have been no excessive modesty about the body. Men, for example, would move their loincloths to one side, even in public, to scratch their testicles.

Boys were given to expressions of ease, warmth, and "much giggling puppyishness," but homosexuality was not institutionally cultivated. Nor, to judge from the fact that Alitoa locality was apparently undisturbed by the homosexual behavior of two of its young men, does it seem to have been actively opposed or condemned.

Men who had abandoned any attempt to maintain their economic and ceremonial standing were called *alomato'in* or "male women." These men exhibited no female manner or dress, nor were they homosexual; indeed, one of their characteristics was heterosexual irresponsibility. They failed to observe taboos, they were regarded as greedy and exhibitionist, they ate game which they themselves had killed—an act tantamount to incest— and they were regarded with contempt. It is doubtful, however, that *alomato'in* represented a transgendered category. Rather, the designation "male woman" likely referred to their failure to live up to the expectations of manhood. In this regard, they were like women, and

it is probably significant that Fortune also translated *alomato'in* as "male wastrel."

COURTSHIP AND MARRIAGE

Most first marriages, it will be recalled, were by child betrothal, which sometimes occurred when the girl was as young as 5. As might be expected, therefore, young women appear to have exerted little influence over the choice of their husband. It is not clear, though, whether a young man had much greater freedom. As Mead describes matters, the boy's father selected a likely mate for him, largely on the basis of past relationships and other social and political considerations. The father then approached the girl's father, who decided for or against the match on much the same grounds. There is little evidence that love was a major element in the choice; the expectation was that, as the young husband "grew" his "little wife" with food, the pair would grow to love one another with much the same affection as siblings raised together.

Child betrothal involved the young girl leaving for her husband's home—typically, for a few days at a time, and then for longer periods. At some point, there was a betrothal ceremony, but little is known of its form. The young wife's menarche ceremony was held at her husband's hamlet, and he played an important role in its ritual. Some time later, the major part of her bridewealth was paid, usually some dozen rings and other shell valuables. Later still, at a time of their own choosing, the pair consummated the marriage.

Virtually all females married, though a few men— usually those with *tinea* skin disease or mental impairment—did not. In Arapesh ideology—and, according to Mead, also in practice—unfortunates who remained bachelors because of skin disease likely would revenge their bitterness by taking up sorcery or trafficking in exuviae.

An analysis of Mead's data suggests that between a half and two thirds of first betrothals failed. Major reasons, according to Mead, included the premature death of one partner, an age mismatch such that a young wife matured faster than her husband, a young husband taking an outsider for a second wife, and, very occasionally, physical or mental defect. Although some young girls were made miserable by an unhappy pairing, there is no mention of them openly provoking a break-up. In fact,

divorce as such was virtually unknown; rather, a marital split was camouflaged as a military abduction of the wife by a new lover, the kidnapped woman being as complicit in her seizure as the kidnapper and his kin. Women were more likely to be widowed than men, and about three quarters of widows remarried within their dead husbands' clans, the sentiment being that they should remain with their children, among his kinfolk.

Husband–Wife Relationship

In the ideal, husband and wife grew up to love one another as brother and sister, a familial amity that diffused among all members of the husband's home. Mead described the young wife's attitude towards her young husband as,

one of complete trust and acceptance. No constraining taboo marks the ease of their relationship. He is just another older male to whom she looks up and upon whom she depends. She is to him another small girl, his special small girl, whose hand must be taken in rough places on the paths.

In practice, as noted, there were many shoals on which betrothal founded, but there was no formal hostility, antagonism, or aloofness between spouses. The family usually ate and slept in the same hamlet and spent considerable time together there before and after the day's labor.

Polygyny was practiced and commonly was the consequence of widowhood; a man would take his dead brother's wife in marriage, principally to care for her and his brother's children. As a result, cowives were often well known to one another, they had long-standing affection for one another, and got on very well together. Cowives called one another *megan*, "a term of affection and confidence." Not all polygynous relationships fared so well; in particular, if a husband took a second wife from afar, the relationship between cowives could be rancorous.

Other Cross-Sex Relationships

The only significant other cross-sex relationships were between males via a cross-sex linkage—in particular,

between mother's brother and sister's son—rather than between males and females.

Change in Attitudes, Beliefs, and Practices Regarding Gender

The principal ethnographic studies of the Mountain Arapesh were conducted in the 1930s, a couple of decades after contact and a decade or so following pacification. Subsequently, Arapesh life was severely disrupted by World War II, and by 1960 most of the mountain dwellers had migrated down to the coast or to villages in the southern foothills of the ranges—partly to escape the wartime devastation of their homes, and partly for greater accessibility to developments associated with globalization. Unfortunately, we know almost nothing of how these changes affected their conceptions and practices regarding gender.

Mundugumor

Nancy McDowell

ALTERNATIVE NAMES

The Mundugumor are also known as the Biwat(s).

LOCATION

The Mundugumor are located on the Yuat River, a tributary of the Sepik River, Sepik River Province, Papua New Guinea, southwest Pacific. Since this area is only a few degrees south of the equator and not high above sea level, the climate is tropical, and the Mundugumor lived in an area of rainforest and lowland sago swamps.

CULTURAL OVERVIEW

The Mundugumor were a horticultural people with a population of about 1,000 who lived along the rich and fertile banks of the Yuat River (the time period referred to here is the early 1930s unless stated otherwise). Their main staple was sago, but it was supplemented by significant garden products (taro, bananas, yams, coconuts), fish, domestic pigs, game (pigs, cassowaries, marsupials), and gathered items such as eggs and greens. Tobacco and betel nuts, consumed as well as traded, were important crops.

Although there were six villages, or more accurately "hamlet-clusters" (Mead, 1935/1963, p. 169), the two away from the river had begun to differentiate from the four along the river proper. Villages were not clearly demarcated settlements, but conceptually grouped hamlets, and it was the hamlet that was the main settlement. Each, ideally distant from all others, was inhabited by one or more households, which were the basic residential units. Although actual composition was variable, each household comprised the male head, his wife or wives, their children, and attached others such as unimportant unmarried men and elderly relatives.

Political organization was the type anthropologists label "big man." Individual men achieved powerful positions due to their personal initiative, the manipulation of exchange transactions, the accumulation of wives, control over substantial garden produce and trade items as well as domestic pigs, demonstrated leadership in warfare, magical knowledge and ritual sponsorship, and oratorical abilities. Conflict within hamlets and villages as well as between villages was common, and warfare, including raiding and cannibalism, involved shifting alliances with a variety of neighboring groups. They were known by their neighbors to be fierce, and there was an unoccupied strip of land 20 miles long down river from their settlements because others feared to encroach upon them. From their rich riverbank location they participated in trade networks to which they contributed coconuts, tobacco, and betel nut; they served a mediating role in several networks as well. From these associations they obtained pottery, shells, stone, and a variety of manufactured goods as well as art styles, songs, and dances.

Most interpersonal relationships were based on kinship; individuals were related to others in one way or another. A person's kin were divided into three types, based on the nature of the tie and the behavior appropriate: (1) people with whom one demonstrated some intimacy (e.g., a man's mother), (2) people who elicited shame and should be avoided (e.g., affines), and (3) people with whom joking was obligatory (e.g., distant cross cousins).

CULTURAL CONSTRUCTION OF GENDER

The Mundugumor appear to have designated only two genders, male and female, and did not recognize homosexuality. Each gender was associated with specific tasks within the division of labor (see "Gender Roles in Economics"), and each dressed in a gender-appropriate way. Men wore a woven belt with leaves attached to the front and back, or a flying-fox skin decorated with shells, while women wore grass skirts. Both women and men wore woven armbands (sometimes with shells) as decoration, and women wore strings of shells attached to their earlobes. Little girls were decorated with special

ornaments, shells, and fancy grass skirts, and, as they grew older, were occasionally paraded about by their fathers while mothers too took some interest in bedecking their daughters. Little boys remained devoid of decoration and remained naked until age 6 or 7. Later, girls' ears were pierced while boys were scarified, primarily on their backs.

Women were thought to be weaker than men physically, and the ideal woman was "tall, lithe, and slender" (Mead, 1935/1963, p. 230). Women per se seem not to have been polluting, that is, they did not inherently pose a danger to men by their very nature as is often the case in Melanesia, but some entities, such as long yams and certain spirits, disliked the odors associated with menstruation, sexual activity (either partner), and soap.

GENDER OVER THE LIFE CYCLE

There is no indication that the Mundugumor conceptualized the possibility of gender shifts over a lifetime, as do some Melanesians. Expectations of proper behavior did change over the course of a life cycle, but these changes were gradual shifts, not marked by ceremony or event.

Socialization of Boys and Girls

The birth of a first child was rarely the cause for celebration for a married couple (see "Courtship and Marriage"). Children in general were not especially valued or prized, and infanticide was not uncommon. Mead (1935/1963, p. 191) noted that more girls survived birth because men, including the mother's father and brothers as well as her husband, preferred girls more than boys because females could later be used in exchange for wives for themselves. Women wanted sons, and thus ensured the survival of some male infants. Child hostages, sent to enemy groups as tokens of good faith, were almost always boys because girls were more highly valued by men, but it is important to note that children were always used as hostages because they were less valued than adults if harm should come to them.

Although there is some evidence that women, the main caretakers of very young children, might have cared for sons more carefully than daughters, infants or toddlers were not considered precious beings and were never coddled. Mead (1935/1963, pp. 198–199) wrote that,

"although there is some difference between a woman's treatment of a boy and a girl, this difference is against such a general background of maternal rejection that to an observer the treatment of both seems hostile and harsh." Infants were fed perfunctorily only when hungry and convenient, never for comfort. They were carried in scratchy baskets or awkwardly and roughly by their mothers. Weaning occurred when mothers pushed their children away from the breast and simply refused access; only an unusually kind woman might smear an unpleasant substance on her nipples to encourage avoidance rather than continually and brusquely rejecting the toddler physically. Children learned quickly that they could not expect solace or succor from anyone and that they would find safety only in the solitude of their own mosquito baskets, not with human beings.

Boys formed playgroups that wandered at will through the hamlet cluster and sometimes beyond. Their games were impromptu, competitive, and often violent. Occasionally a group of boys would band together and stay in the bush, stealing food from gardens during the night and greatly enjoying themselves and their daring deeds. Girls, on the other hand, did not form play groups and demonstrated a somewhat greater ease with one another than perpetually quarreling young boys.

Men wanted daughters and women preferred sons. As the child matured, he or she spent more time with and was instructed by the opposite-sex parent. Girls helped their fathers in their bush tasks, and boys sometimes assisted their mothers. A boy was expected to come to his mother's defense if she were being beaten by her husband. One of the most important activities that the parent engaged in with this favored child was instruction in the proper use of kin terms: the father taught the daughter while the mother taught the son. In this small community, people were related to one another in more than one way, and to choose one kin term rather than another could stress an inappropriate marriage and thus insult one's spouse. For example, marriages were supposed to take place only between people of the same generation, and yet many men used their daughters to exchange for wives from that younger generation. The young wife would teach her son kin terms that called attention to this infraction and thus embarrass and shame her husband. Children were used in this way to "score points" against spouses.

A child (more often the less valuable boy) might be sent as a hostage to an enemy village where he or she remained for weeks or months at a time among strangers

and enemies. Mead (1935/1963, p. 211) emphasized the strength and independence of the children by saying that "although all children do not have this experience, and some have it more than once, it is nevertheless significant of the sturdiness of the children's personality that any one of them is felt capable of undergoing such an order." Enemy children were also sent to Mundugumor villages, so local children always had before them the possibility of being teased and bullied as these children were among strangers.

Some boys also had the additional experience of killing a captive. Raids yielded captives who were brought back to the hamlet, dispatched, and eaten. Adult men did not do the killing because they feared others would mock them for only killing captives and not enemy warriors during a raid. The young boy who did the killing was not given any special honor, nor did this count as a head he had taken; he was still expected to kill later in raids in order to be a respected warrior.

Ideally, some time in later childhood an individual would begin to demonstrate the ability to fulfill his or her appropriate subsistence role, and these were important occasions in developing intergenerational exchange networks among kin. A girl presented her first catch of fish or her first processed sago to her a classificatory father's sister; this was reciprocated at the time by a small feast. A boy presented his first hunting trophy (pig, cassowary, marsupial) to his classificatory mother's brother. The exchanges begun here, especially that between the males, evolved into more elaborate and substantial ones that were critically important throughout their lives and continued into later generations (see McDowell, 1991). The father's sister also sometimes pierced the ears of her brother's children, but these occasions were not always ceremonial accompanied by ritual and feasting.

Mead (1935/1963, p. 212) described the nature of late childhood this way: "as a result of this Spartan training, preadolescent Mundugumor children have an appearance of harsh maturity and, aside from sex-experience, are virtually assimilated to the individualistic patterns of their society by the time they are twelve or thirteen."

Puberty and Adolescence

Unlike many places in the world, initiation was not designed to turn men into boys or girls into women, nor did there appear to be any overarching ritual cycle that encompassed the variety of ceremonies that took place.

First menstruation was not marked. Individuals were "initiated" by viewing specific ritual objects for the first time, and although it was better that youngsters view the objects early on, it was not uncommon for adults not to have seen a particular object and need to submit to the initiation and its associated cult if they wanted to avoid ridicule and exclusion. Thus initiation was not a coming-of-age ceremony but rather a ritual that allowed an individual to see and participate in the cult activities surrounding a particular sacred object, usually a flute, owned by an individual. Men who wanted to demonstrate their largesse and power sponsored these occasions when one of their kin (e.g., a son) was an adolescent; it was the big man who arranged and paid for the construction of a special cult house, who oversaw the preparations and execution of the ritual, and who ensured that the initiates observed the appropriate taboos.

In 1932, the Mundugumor claimed that there were to be no further initiations, but anthropologists Mead and Fortune sponsored, paid for, the performance of the initiation associated with the *ashin* or crocodile flute. Thus they were able to observe the ritual only a few years after it had been abandoned. One of the most unusual aspects observed was the inclusion of girls in the initiate group. Although they were not subject to the hazing received by the boys (the rationale for not scarifying female initiates was that scarification prepared boys for warfare, and women did not go to war), they participated, *if they chose to do so*, and were allowed to view the sacred objects if they observed the appropriate taboos (especially food taboos) and other ritual behaviors of the cult. In this instance, about two thirds of the girls chose to view the ritual object. The inclusion of girls in any such initiation is highly unusual, but there can be no doubt that Mead and Fortune did witness girls being initiated only 3 years after pacification. Unfortunately, we cannot be sure of the extent to which this may have been a historical anomaly (see McDowell, 1991).

As puberty and adolescence came along, responsibilities, especially for girls, increased. Boys worked with their mothers or senior male relative (not father or brother), but their participation was casual and uncertain. Girls might already be married and living with their in-laws, or under the careful and watchful eye of their jealous and possessive fathers. A great deal of time and energy, especially for girls, was consumed by the numerous love affairs they conducted, despite the ideal of female virginity (see "Sexuality").

Attainment of Adulthood

There is no marked occasion after which the Mundugumor individual was recognized as an adult—no specific ritual or achievement. Marriage probably indicated adult status more than anything else, although the birth of first child might also have been important.

Middle and Old Age

All adults were expected to be married and to participate in household activities, and men spent considerable time conducting warfare and defense. Older people contributed what they could, but few people lived to be significantly old. There is some evidence that older women possessed powers not available to males or younger women. Only an old woman, for example, could perform the ritual for the capture of a soul stolen by water spirits, and during a funeral food set out for the ghost was sometimes eaten by an old woman of the household (everyone else was afraid).

PERSONALITY DIFFERENCES BY GENDER

Socialization produced individuals who were independent and aggressive. Mead (1935/1963) described them as "gay, hard, and arrogant" (p. 167), "proud, harsh, and violent" (p. 233), and as a people who possessed an "aggressive individuality" (p. 183) and a "ruthless individualism" (p. 190). Mead's description of the Mundugumor stressed that male and female ethos were essentially the same, and that both women and men resembled the American cultural model for the "masculine" of the 1930s. Both genders were "actively masculine, virile, and without any of the softening and mellowing characteristics that we are accustomed to believe are inalienably womanly" (p. 165). Women and men alike behaved "in a fierce, initiating fashion" (Mead, 1935/1963; preface to the 1950 edition). Despite the fact that parents treated male and female children somewhat differently, "… behind this difference… lies no theory that women differ temperamentally from men. They are believed to be just as violent, just as aggressive, just as jealous. They simply are not quite as strong physically, although often a woman can put up a very good fight…" (Mead, 1935/1963, p. 210). "Women did not engage in the same activities as men,

but both sexes were gay, hard, arrogant, aggressive, charming, individualistic, positively sexed …" (McDowell, 1991, p. 298). Neither gender possessed the characteristics, such as a desire to nurture, that Mead's generation expected of women. Different "temperaments" were the result of individual biological endowments combined with idiosyncratic events in socialization. Women and men did different things (see "Gender Roles in Economics"), but the Mundugumor did not expect there to be personality differences and they did not find them.

GENDER-RELATED SOCIAL GROUPS

In this society comprised of relatively autonomous individuals, there were no active gender-related social groups. The Mundugumor assumed the existence of conflict and hostility among almost all people of the same sex. Land was inherited patrilineally, but because it was so plentiful, access to it never became an issue and patrilineal groups were almost invisible. Men, especially fathers, sons and brothers, were highly suspicious of one another. Sons suspected fathers of claiming their sisters to use in exchange for wives for themselves, and brothers competed with one another for the rights to use sisters in their own marriages. Among men, only the mother's brother–sister's son relationship was relaxed; often, the mother's brother sided with his sister's son in order to oppose his brother-in-law, the boy's father. Men did not regularly come together for any purpose. There was no men's house. There were no patrilineal descent group affairs to conduct. Men only came together for raids and the occasional feast, and even these were fraught with interpersonal tensions.

Women were more apt to gather unceremoniously or to work casually together even though they had no structured or enduring groups that lasted over time. Daughters might assist one another and their mother until their own marriage obligations pulled them away, but it was only informally. Two women who participated in the same marriage exchange (i.e., were "exchanged" for one another) maintained somewhat relaxed and close ties. Despite the fact that cowives characteristically did not get along and were constantly competing with one another for their husband's attention for themselves or their children,

… nevertheless they form one of the most permanent semi-co-operative organizations in Mundugumor. They live in the same compound, they see each other constantly, and no formalized avoidance or jesting

behaviour separates them or regulates their conduct. They call each other "sister" and reproduce the constellation of daughters around the father of the polygynous household. (Mead, 1935/1963, p. 208)

Groups of females—daughters, mothers, and cowives—could be seen in a compound, working together and quietly chatting about the events of the day. These relations contrasted sharply with men's.

In ordinary times [not feast times], only women gather in chattering groups to comment cattily upon each other's brightly coloured grass skirts, or laugh at the older women who stubbornly insist upon dressing in the modes of an earlier period. (Mead, 1935/1963, p. 175)

GENDER ROLES IN ECONOMICS

Although women and men shared the same ethos, they did not share the same economic obligations, and there was a significant sexual division of labor here. The unusually rich resources of the area allowed women to do most of the subsistence labor while men, responsible for warfare and defense, engaged in planning or executing raids and battles. Men also cleared the land for gardens, cut down sago palms for processing, grew the ceremonially important long yam, built houses, and hunted. Women planted, tended, and harvested the gardens, including the all-important tobacco gardens that yielded the important trade item. Women did most of the fishing, which provided the regular intake of protein. Women were also in charge of childcare, cooking, and household chores (including the relatively onerous task of firewood acquisition). Both men and women made items of material culture, but men were in charge of the construction of ceremonial and ritual items, and both gathered wild products such as greens and eggs (bush fowl and crocodile). Just after pacification, men's energies in warfare were being replaced by indentured labor on coastal plantations.

PARENTAL AND OTHER CARETAKER ROLES

The Mundugumor were not a noticeably nurturing people, and the caretaking of young children was an annoying task assigned to the mother. Although the baby's father's classificatory sister assisted in the birth and helped the mother (she was repaid by a feast from the father/brother if he wanted to increase his renown), she was not designated as a supplementary caretaker.

Mothers were the major caretakers of infants and very young children; rarely did a father ever hold such a child. Sometimes youngsters were carried under the mother's arm, but as they grew they were placed with a leg on each side of mother's head and expected to hold on for themselves. As children grew older, their independence took them away from parental control; this was especially true for boys because girls remained under the jealous, infuriating surveillance of their fathers.

As noted above, men preferred daughters (whom they could use in exchange for more wives for themselves), and women preferred sons (who would support them and cause trouble for their husbands). Despite the lack of overall nurturing behavior, it is certain that parents and children did develop deep emotional attachments to their cross-sex relative.

LEADERSHIP IN PUBLIC ARENAS

There were no ascribed leadership statuses in this small society; men (and only men) became leaders as a result of their own actions (see above). These men were strong, aggressive, and feared. Polygyny played a critical role in the achievement of leadership status: multiple wives meant more gardens, especially tobacco gardens for inter-group trade, and multiple wives meant multiple affines with whom exchanges could occur. There were two such leaders in the village of Kinakatem in the early 1930s, one of whom had eight living wives, the other nine.

Although women did not occupy the status of "big man," they were not necessarily quiet and unobtrusive. When matters pertained to them, such as their own marriage arrangements (see "Courtship and Marriage") or an extended period of warfare that went on too long, they were heard and often achieved their desired ends.

GENDER AND RELIGION

The focus of Mundugumor religion was very practical: people used nontechnical or supernatural means to achieve desired ends or avoid undesired ones. In addition to a large variety of magical spells and taboos, supernatural beings of various sorts were critical in this process. Bush and water spirits occupied the forest; these were

associated with particular territories and kin groups, members of which had special relationships with them. They occasionally appeared in the form of an animal (bush spirits usually as cassowaries, water spirits as crocodiles) or human being. These spirits lived in groups similar to human groups, composed of husbands, wives, and children, and it is possible that the ghosts of the dead resided with them as well. These spirits could be helpful or harmful to human beings, and sometimes individuals could influence their behavior for good or ill. They also enforced a variety of taboos associated with their territories. For example, some disliked the smell of sexual activity, and a man or woman who had recently engaged in sex avoided areas inhabited by these beings.

Ghosts of the dead were another category of spirit being. Skulls of dead relatives were kept, and the bones of powerful warriors were scraped and the scrapings eaten by distant male kin as a type of war magic. Ghosts, too, could be influenced by the living; it was possible to invoke the name of particular ghosts as a curse. Funerals for the dead were elaborate for important people, especially big men, and less so for the unimportant.

There was a series of magical techniques that produced a desired end without the clear participation of a supernatural being. Many of these were acquired from other people by men as they conducted trade and warfare, so they tended to be the property of men rather than women. Sometimes they were gender specific because the interest was; men had hunting charms while some women knew curses that could affect the fishing territories of other women.

Apart from death in warfare or from obvious accident or old age, all deaths were the result of sorcery. Although a few Mundugumor people knew sorcery techniques, they rarely used them on their fellows because the required secrecy was too difficult to maintain. So sorcerers from up-river villages were hired if the target were a local person, and anyone, male or female, could hire one to harm an enemy or competitor. The sorcerer needed only payment and some "dirt" (hair, nail clippings, etc.) from the victim. Women did have a specific power not available to men; they could and apparently did put menstrual blood in men's food to cause illness.

We know of two myths that were important. One told of the exploits of Bilishoi, a male who traveled the countryside causing harm to people wherever he went; after his death, he, in the form of his bones, received food from people who continued to fear him. Informants in 1981 likened

him to Satan. The second myth was of a woman, Gorinjime, who was driven out of her village after her husband accused her of being a ghost (she had been killed by enemies but her blood coagulated again and she came back to life); in 1981, informants continued to describe her exploits and suggested that she went off America where her descendants and their kin continue to live (McDowell, 1991).

LEISURE, RECREATION, AND THE ARTS

There are very few data on leisure and recreation beyond what we know of children's games (above). Both men and women were active in the manufacture of necessary material culture, but they preferred to exchange tobacco for goods (e.g., pots) if possible. Men made all ritual and military objects such as war shields, sacred flutes, and slitgong drums. These were often elaborately decorated, and Mead (1935/1963, p. 172) described their manufacture as "… the fine tight tradition of Mundugumor art, the high-relief carving on the tall wooden shields, the low-relief styled animal representations on the spears, the intricate painted designs on the great triangles of bark that are raised at yam-feasts." Women's manufacture of material objects was far more mundane and practical; their creations were usually unadorned yet important. They made small fishing baskets and the fiber that they wove into fishing nets, string bags, and a variety of other useful items.

RELATIVE STATUS OF MEN AND WOMEN

In general, women and men here seemed to inhabit separate but articulated worlds within each household. Women had considerable autonomy in their tasks, such as gardening and fishing, while men operated independently from others as well. Although the public culture stipulated that men exchanged women in marriage, the reality was that few women married men not of their choosing (see "Courtship and Marriage"). Both men and women were admired for their forcefulness and independence. Although it is difficult to measure in any realistic way, it must be said that Mundugumor women had a relatively high status, relative, that is, to women in other Melanesian groups. Their influence on the public arena was significant, but from the sidelines. Girls may have been more valued than boys, but they were valuable to men for the purpose of marriage exchange.

SEXUALITY

One of the reasons that young married couples were frequently not pleased at pregnancy was that it meant the end of sexual activity for several months both before and after the birth. Sexual activity was important to both men and women, and sexual taboos were felt to be an onerous deprivation for both.

Female virginity was valued and expected, and if a girl were known not to be a virgin, she could only be exchanged for another nonvirgin. However, if she had kept her affairs relatively secret, no one could be sure of her status, and her husband, on discovering it, remained quiet. Despite the watchful eye of fathers, adolescent girls were very successful in conducting love affairs. Adultery by either wife or husband was frequently a cause of conflict.

"The love affairs of the young unmarried people are sudden and highly charged, characterized by passion rather than by tenderness or romance" (Mead, 1935/1963, pp. 215–216). Sexual foreplay, between married and unmarried alike, was aggressive and violent, and often involved biting. Mead described the usual position for sexual intercourse as "the missionary position" (McDowell, 1991, p. 204). Females were active sexual beings, and young boys were taught that being too fast would displease their partners. A woman's clitoris was the site for her sexual feelings, and women generally preferred a long penis to a short one, length being more important to them than duration of erections.

COURTSHIP AND MARRIAGE

Despite the ideal that marriages were arranged, individualistic young men and women had considerable choice of partner.

From childhood on they [girls] were taught to make their own sentimental choices and to take the initiative in their relations with boys and later with men. Although boys were warned about the potential sorcery involved in playing with many women, they also used love magic to seduce desirable women. (McDowell, 1991, p. 203)

In the face of all Mundugumor conflicts about arranged marriages there exists a violent preference for individual selection of one's mate. Children who have been accustomed to fight even for their first drops of milk do not docilely accept prescribed marriages arranged for other people's convenience. (Mead, 1935/1963, p. 215)

Girls dressed to attract young men, and boys were on the lookout for interested young women. Girls did not restrict their activities to bachelors and often had affairs with married men.

From these sexual relationships developed the desire for marriage, and an insistent young woman almost always won her choice. However, the road to that marriage was not an easy one because of the serious rule of brother–sister exchange marriage. The ideal was that two men marry one another's sisters, that is, two men exchanged sisters. However, the girls' desires often caused considerable difficulty in these essentially public male arrangements. Trouble resulted when a young woman arranged to elope with her lover in order to marry the man of her choice. Three possible scenarios were common. First, perhaps the girl had already been promised in marriage to another man and that her elder brother (or even father) had already stipulated her marriage road in acquiring a wife for himself. That is, half of the exchange had already taken place and the second half awaited only her maturation. Her refusal to marry her brother's wife's brother (or father's wife's brother) was the source of considerable conflict. Second, even if she were not already promised, perhaps her lover did not have a sister to return to her brother (or other male kin). Fights were then inevitable as the sisterless man tried to defend himself against accusations of woman-stealing. He needed to find a distant classificatory sister or other female relative to use as a return. Only occasionally, if the young woman's family had more daughters than sons (i.e., extra women), they would accept a sacred flute in lieu of a human return, but such marriages were never as respectable as those executed by sister exchange. Finally, if the girl's lover had an appropriate sister, and if the families approved of the match, then a marriage could be arranged but only after considerable conflict and discussion.

Sometimes families took action to avoid the troubles that young women caused by arranging exchange marriages among very young adolescents and sending the young wives to the homes of their future spouses. (Such a marriage might also be the result of one of the above scenarios; a young woman gets her man, but then his much younger sister is sent to her brother as a wife.) These youngsters were not ready for marriage, and they did not have the maturity to fight for their own later choices. The young boy found himself with a wife not of his choosing, but he was free to add wives more attractive to him as he matured. Despite the enormous complications, marriage exchanges were the norm within the four river villages.

Marriages were even more complex because of an additional rule: ideally, marriages took place between third cross cousins (distant classificatory siblings). This rule was honored far more in the breach than in the observance. However, the rule that one should not marry within one's own patrilineal group was usually observed. A widow was supposed to marry a distant kinsman of her deceased husband, but she usually exercised some choice in the matter. Big men also frequently married foreign women, and these women helped to strengthen their households both economically and politically.

Husband–Wife Relationship

To some extent the nature of the relationship between a husband and wife depended on the way in which the marriage was executed. If it was the outgrowth of a premarital affair, there was less conflict and discomfort than if it was an arranged marriage between youths. However, there existed a built-in assurance that marriages would be conflict-ridden. When the young married couple discovered a pregnancy, both husband and wife were displeased by the prospect of sexual abstinence and the variety of taboos associated with impending childbirth. The husband blamed his wife for getting pregnant too soon and wondered why his antipregnancy magic was not effective. She resented his anger and worried that he would seek out a second wife during their enforced abstinence. They both rebelled against the restrictions on their freedom. The husband feared that a boy would be born, a son who would compete with him and cause conflicts, while the wife feared that she would bear a daughter for her husband to dote on and prefer. Discussion ensued as to whether the child should be kept at all. Thus, at the very inception of a new marriage, conflict arose between wife and husband that was unlikely to lessen much over time.

Marriages, then, tended to be rather stormy affairs. Couples argued about a variety of things, including the fate of a newborn child or a wife's too frequent absences; marital arrangements for their children were often cause for serious conflict, especially if the husband wanted to use one of their daughters in an exchange for an additional wife for himself, thus depriving a son of a wife. Established wives resented a husband's attempts to acquire an additional wife and sometimes made it so difficult that the husband gave up the attempt. Divorce, especially before the birth of children, was not uncommon.

Few men achieved the ideal of eight or ten wives simultaneously, but many men did have multiple wives (11 out of 31 in Kinakatem in 1932). Cowives rarely cooperated with one another; usually their relationship was one of conflict and competition for their husband's time and resources, both for themselves and their children (especially sons). Men had favored wives, with whom they spent more time; sometimes these were the younger and more attractive women, but some men favored older and more productive wives. Cowives frequently fought verbally and insulted one another; occasionally the quarrels resulted in physical violence.

Other Cross-Sex Relationships

Cross-sex relationships were critical in the social structure. The brother–sister tie, although marked by formality and respect, was crucial in marital arrangements. Emotional bonds between father and daughter, mother and son, were predominant. The mother's brother–sister's son and father's sister–brother's daughter ties were also critical in the system of exchange among kin that ideally carried down three generations and resulted in a new marital exchange identical with the original one. Cross-sex ties were so important that they led Mead (1935/1963) to argue that the Mundugumor possessed a kind of descent group called a "rope" of alternating ties: a woman belonged to her father's "rope," while a man belonged to his mother's, and so on. Although Mead was probably wrong in seeing these ties as forming descent groups, she was correct in stressing the importance of these cross-sex relationships (see McDowell [1991] for another interpretation of "rope"). She wrote (Mead, 1935/1963, p. 176): "… social organization is based upon a theory of a natural hostility that exists between all members of the same sex, and the assumption that the only possible ties between members of the same sex are through members of the opposite sex." It is interesting to note that the only tie between men that was characterized by relaxed affection, between a mother's brother and sister's son, was one mediated by a female relative.

Change in Attitudes, Beliefs, and Practices Regarding Gender

There are no specific data about changing gender practices or beliefs among the Mundugumor. All available evidence

points to the conclusion that, despite the dramatic changes that have taken place during the past 100 years, gender roles and practices have been characterized by an essential continuity. Men and women are both assertive and engaged in advancing their own interests, and both take active roles in new public institutions such as church, school, and sports clubs. Although attenuated, polygyny is still practiced, and the *ideal* of brother–sister exchange marriage remains, although the extent to which it is currently achieved is not known. There is some evidence that the role of affines has increased in importance while that of the brother–sister tie has decreased, but that is speculation (McDowell, 1991).

ALTERNATIVE NAMES

Na are also known as Mosuo, Moso, Yongning Naxi, and Naze.

LOCATION

Na live in southwest China, in an area straddling the border of Yunnan and Sichuan Provinces. Despite the government's official designation of the Na in Yunnan as a subgroup of the Naxi, and in Sichuan as Mongolian, Na are generally referred to as "Mosuo" in China, and this name has been used by the foreign press as well. The Yongning area in Ninglang County, northern Yunnan, is the cultural center of Na territory. This entry describes the Yongning Na.

Yongning Township consists of a high-altitude basin area (over 2,600 m), and includes mountainous areas that surround the basin (with altitudes reaching over 4,000 m). Half of the large alpine lake, Lugu Lake (whose shores are at 2,700 m), lies in Yongning.

CULTURAL OVERVIEW

Living in the foothills of Tibet, the Na have a population of approximately 40,000. Na speak a Tibeto-Burman language related to other languages found in this region. Many Na consider their closest ethnic cousins to be Tibetans, and point to shared religion and similar lifestyles. Na practice Lamaism (predominantly Gelugpa) as well as their own shamanism, "dabaism." Until the 20th century, the Yongning basin area was predominantly Na. Trade between Tibet, the Liang Mountains, and the LiJiang area flowed through this region. In the 1920s and 1930s, trade in opium (Shih & Jenike, 2002) and other goods carried by horse teams flourished. Starting from this time period, other ethnic groups became more numerous and populous in the Yongning region. However, the Na are still the dominant group in this area with approximately 37% of the population.

In 1956, the People's Liberation Army entered Yongning to establish the area firmly as part of the People's Republic of China (P.R.C.) and end the long-standing feudal system. Prior to this time, social strata consisted of the aristocracy (5%), commoners (48%), and slaves (47%) (Yan & Song, 1983). The county is officially listed as "impoverished" and receives development aid. However, this aid, as well as other economic projects, is usually controlled by the county government, which is dominated by Yi, the majority ethnic group in the county. The historically strained relationship with the Yi affects the relationship of the Na with their current county government.

The wetland basin is the agricultural and economic heart of the Yongning region. Into the 1990s, over 90% of the population engaged in agricultural production. The area experiences a rainy season in the summer. The dry season, the winter, is marked by intense sun, strong winds, and very little precipitation. Primary crops in the basin include rice and corn (used predominantly for feed), while secondary crops include wheat, buckwheat, oats, and potatoes. Nearly all households own several pigs.

The cultural traits for which the Na are best known in China are their large matrilineal households and *sese*, consensual visiting sexual unions. If a couple agree to relations, the woman receives her lover at her residence in the evening and he leaves to return to his in the morning. Both remain socially and economically attached to their natal households, and either can end the relationship. Children normally remain with the mother, take her family name, and are considered part of her household. Since the 1960s the government has used both persuasion and coercion to try to end *sese* and alter traditional family structures. *Sese* relations continue today in Na communities, alongside legal marriages.

CULTURAL CONSTRUCTION OF GENDER

Ideal roles in Na society, household, and labor are divided into those considered appropriate to men and women. In practice, however, Na accept fluidity between roles.

Na women are also symbolically valued as the core of Na household and religion; the primary Na deity is a goddess, Gemu. An ideal household will have consanguineally related male and female members of older and younger generations to ensure harmony, a labor force, and the continuity to care for the elderly and "feed" (give offerings to) the ancestors. The acknowledged head of the household may be a man or woman, and the de facto head is often a woman.

Na believe that women provide the core and continuation of the household. A household without women of a reproductive age would need to adopt in a girl or female mate to "continue the hearth," and ensure that the household continues as an economic unit, and as a unit to continue to give offerings to ancestors. Households may adopt girls or boys if lacking in descendants, or may incorporate fully grown members of other households.

As adults, Na men and women, both traditional and modern, dress and adorn themselves in gender-specific ways. In Yongning, women over 50 generally wear traditional clothing, as do some older men and younger people for special occasions. Traditionally, children of both sexes wore simple tunics until the age 13 (12 by Westerner reckoning) when they gained status as an adult member of the community through a coming-of-age ceremony. Now, children's clothing is usually factory made, and one can generally recognize a child's sex by clothing. In addition, young girls often have their ears pierced.

The traditional Na women's costume consists of a very full floor-length skirt, a side-buttoning shirt, a wide waist sash, and a headdress of a long thick artificial braid. The headdresses are made of black yarn, animal, or human hair, and women wrap these around their crowns and adorn them with beads or, recently, plastic flowers and artificial pearls. Women wearing traditional dress for daily wear will usually wear a simpler headdress of a scarf wrapped into a turban. Women not wearing traditional dress generally wear gendered factory-made clothes common in much of rural China, but may combine this with the simpler headdress made of a scarf. Most women wear jewelry; earrings, rings, and thick bangles of silver are most common. Some women still wear the long chain for keys attached to their clothing. In some remoter Na territory in Sichuan, men still wear, for special occasions, trousers covered by ankle-length tunics of hand-spun cloth, drawn in at the waist by wide sashes. In Yongning, the tunic has given way to what Na describe as a more "Tibetan-style" shirt of side closure similar to that of

Na women, also worn with a waist sash. Some older men still wear full three-quarter-length pants, while younger men generally wear trousers. Wide-brimmed wool felt hats are common. Some Na men adopt Tibetan-style decorative hats, and also wear decorative (but functional) knives. Men not wearing traditional dress generally wear gendered factory-made clothes common in rural China, and will often combine this with a brimmed hat. Many men wear rings; silver are most common.

The features thought attractive in men and women are basically the same (see "Courtship and Marriage").

GENDER OVER THE LIFE CYCLE

The most important life passages for Na are coming of age as adult members of the community and passage to the land of ancestors (their funeral ceremony). These life passages are equally celebrated for Na men and women, and in a similar fashion. Since Na generally did not marry in the past, marriage was not and still is not an important life transition. Traditionally, a *daba*, a practitioner of Na religion, named a baby within a day of the child's birth. A month later, the household invited elders, especially women of the village, to celebrate the addition of the child to the household. The rituals of naming, and celebration a month after birth are the same for boys and girls. More recently, the child, when a toddler, is brought to the Living Buddha of Yongning to be named.

Socialization of Boys and Girls

Na households welcome both boys and girls. However, since girls are seen as necessary for the continuation of the household, a household may begin to experience rising tension if no girls are born into the younger generation.

Na boys and girls are raised similarly, and many household chores and responsibilities are assigned to children based on their age and ability to take them on. However, children's labor power is often not immediately essential to the household, and children are granted a large degree of freedom and playtime. Girls and boys engage in somewhat different activities. Even small girls may join their mothers and aunts for a day of working in the fields. Boys will often join older men in taking livestock to pasture or attempt to join other men's activities such as carpentry. Girls seem to assume more responsibility for household chores than boys. Both girls and boys

are taught to be responsible and respectful. Children are not ashamed of helping with household chores of any kind. Children of either sex will be tolerated to a certain degree when acting out (especially if younger than 3 or 4), but they may be admonished verbally or slapped if they create a disturbance. In general, however, there is little or no physical abuse of children.

Because of government campaigns to increase formal education of rural children across China, many Na children now receive at least an elementary education. Officials are trying to enforce children's attendance through ninth grade. Generally, Na girls and boys have almost equal access to education, and girls are thought to perform somewhat better than boys in school because they are less rowdy and more diligent. Most agricultural households believe that it is essential to groom one member of the younger generation to take over the responsibilities of farming. A girl is usually preferred for this task (as she will be more responsible, and can continue the family line).

Attainment of Adulthood

Na go directly from being children to adults. Na follow the same 12-year animal cosmology as the Chinese. Once a child has survived a full cycle, and the child's animal year is being celebrated for the second time, the child is considered tested and ready to be accepted by the household. The household has a formal ceremony to initiate the girl or boy as an adult member of the household and community. This ceremony is called the "wearing skirt" or "wearing pants" ceremony for girls or boys, respectively.

The ceremony is similar for both boys and girls, with several small differences (see Cai, 1997/2000, pp. 179–183; Shih 1993, pp. 189–193). For both, a *daba* presides over the ceremony, an elder of the same sex leads the initiate through the ritual, and both stand on the staples of Na farms—grain and salted pork. Girls stand next to the one of the two main pillars of the house that symbolizes all the female members of the household; boys stand next to the pillar symbolizing the male members. The attending elder will give a girl jewelry and a shuttle to hold, while a boy will be given silver (or cash) and a knife. During the initiation ceremony, harmony and diligence are stressed as key virtues. The initiate is expected to rise early, work hard, be respectable, and respect all the household members.

Once a Na has been initiated as an adult, he or she is expected to take on the duties and responsibilities of an adult, and in turn has gained the rights of an adult. Within the household, these new members can take part in household discussions and decision-making. Within the wider community, these new initiates are now allowed to participate in social activities and may now choose to become sexually active.

Middle Age and Old Age

For the Na, both age and capability bring respect from household members as well as the larger community. Many Na areas still rely on labor exchange between households, and so a competent sober worker with an even temper and sense of humor is highly valued by the community. All elders are accorded respect because of their seniority.

PERSONALITY DIFFERENCES BY GENDER

When asked to describe themselves, Na say that they are hospitable and honest. Men are valued for courage, cooperation, and, among younger members as well as some elders, admired for boldness. Women are valued for competence and skill in management. Na believe that household harmony stems from a combination of respecting others, a sense of one's place and responsibilities, and allowing others in the household to act independently. Both sexes should be able to get along well with other members of the household. Both Na men and women are sociable and expressive, and social ease and the abilities to joke and engage in verbal parry are admired in both. Kindness is valued in both men and women, as is a sense of propriety and respect for elders. Mischievousness is perhaps admired more in boys than in girls; however, girls are also expected to be independent and bold. To the observer, girls do not seem less mischievous, but rather more responsible.

Members of other ethnic groups (such as Han, Naxi, or Yi) living in or traveling through Na areas often describe Na women as very capable. Outsiders may also comment on how free and independent Na women appear to be. Na women are relatively comfortable traveling alone or in small groups, staying out of doors, and interacting with strangers.

GENDER-RELATED SOCIAL GROUPS

Na social groups are primarily organized around household and village life. Household size tends to be from 6 to 12 members. However, in some communities there are still large households of 20–30 members; while in towns Na tend to live in nuclear families. Households that are related through female consanguinity consider themselves part of a larger grouping, and will assist each other with projects, planting, harvesting, and the expenses of a funeral.

A household may reach out to include new members (who are not kin related) if they believe that they are too small or lacking in women or men. A household without children will usually seek female children. In most of these cases the adopted woman later becomes the head of the household. While some scholars have represented Na households as female centered, both men and women are considered full members of the household.

Because of government policies during the 1960s through the early 1980s, which pressured Na to marry (see "Sexuality"), many Na villages now show a variety of household structures and different compositions of households. Most households have three generations; however, some have only two and a few households consist only of an elderly couple. Typical household compositions include one or two elderly siblings living with one to three adult children of one of the siblings and two or three small children of the grown children.

One variety of the household that is not generally found among the Na is a young couple living together or married, but without children. In general, Na who do marry will marry when they are preparing to have children. In the village, there does not seem to be the idea of coupledom without children, or even of intimate relations without the desire to have children. Most elderly villagers did not believe that young women without children would engage in intimate relations and use birth control, and considered this a rather strange idea.

Na generally cluster in single-sex groups. Often groups of only women or men, but not mixed, will gather to walk to market or to a movie, make the trip to a neighboring village to celebrate the opening of a new house or a coming of age celebration, walk together to festivals, or work in fields. These groups may sometimes include members of different age cohorts, or at other times be almost all one age (as in the case of walking to a movie or social event). Single-sex grouping allows for easier group relations as there is no need to respect taboos on speech (see "Sexuality") and these groupings develop from gendered labor activities.

GENDER ROLES IN ECONOMICS

Within Na household and village economies, both genders are active and important. While gender-specific labor is readily described, practice shows fluidity, and men often engage in work outside the recognized domain of men's labor. Na men are responsible for building and plowing; women are responsible for everything else. Women are generally considered responsible for all field-work, digging, tilling, planting, transplanting, weeding, harvesting, and food processing. They are likewise considered responsible for feeding animals and livestock, although men are generally responsible for herding. Although butchering and funerary work are considered men's duties, most informants neglected to mention these unless specifically asked. Similarly, virtually no respondents replied that men's work includes protection or soldiering. Trade within Na areas is conducted by men and women. When speaking of the past, Na also mention long-distance trade as men's work. This sometimes kept men out of the village for months on end. However, the majority of men remained within the village. Currently, both young men and women are migrating out of rural Na areas to work in county or district cities. Women are perceived as having an advantage in finding service work in the tourism industry. However, women are generally paid less.

One of the interesting things is how *un*gendered much labor is. Men and women will both contribute to accomplishing many of the daily tasks of farm work and food processing (although perhaps not equally). This is especially true as household sizes shrink. Even in domestic chores, such as bringing in water, firewood, and meal preparation, men often contribute. Women's work seemed more difficult for respondents to define because it was so all-encompassing. Respondents sometimes laughed and said women did everything. Women still have much longer workdays than men, and still shoulder more than 50% of the farm labor and much of the household work (which includes long-term food storage and preparation, preparing and storing grain supplies, animal husbandry, and other tasks).

While Na discuss the jobs of plowing, construction, and butchering as men's work, usually women offer

important assistance in accomplishing these tasks, often engaging in some of the most heavy labor involved. Plowing seems to be the single village activity that solely men engage in. Before farm work was collectivized, women and men plowed together using large plows drawn by two oxen. Women would walk behind and guide the plow, while a man would lead the plow and guide and control the oxen. It appears that during the era of collectivized farming, plowing shifted to being a task exclusively for men and at the same time the type of plow changed. In the past, hunting was almost exclusively a male task, but there is very little hunting now due to lack of game.

In general, men will engage in "women's work" without shame if there do not seem to be enough women to complete certain tasks. Women almost always serve meals and wash clothes. One of the few activities I was told that a man should not do is wash a woman's garments that have been soiled from menstruation or childbirth. Assistance in delivering a child comes from one's female relatives.

Shared labor will be organized for large projects, such as construction or planting seedlings. The woman of the house who has senior status and is still actively working will organize the appropriate amount of neighbors required for the activities. She keeps a mental tally of which households contributed which labor. This tally will be referred to on future occasions when reciprocity is called for. The same woman will generally decide how and when to give gifts or support to other households.

Traditionally, personal property included jewelry, knives, occasionally tools or musical instruments, and clothes. Clothing and other personal goods are often burnt with a corpse, but jewelry, knives, tools, and musical instruments are inherited by the remaining members of a household.

The position of household head will pass to a member of the household who is perceived as competent and stable. In practice, this often occurs while the elder household head is still alive. She or he may retain the title of household head, while the junior member has in effect taken on much of the management of the household.

PARENTAL AND OTHER CARETAKER ROLES

Households, not individual mothers, raise children. Since women of child-bearing age are also important to the household's labor force, these women, once they have rested after childbirth (generally 1–3 months), return to labor. Elders in the household will watch over babies and children. An elderly aunt or grandmother may be a primary caregiver, but sometimes an elderly uncle is an important caregiver. Once children become toddlers, older siblings and cousins of either sex often assume their care. Emotional bonds develop between children and caregivers, and at times the bonds of affection are stronger with aunts or uncles than mothers. Children generally refer to all women in the household in the mother's age cohort as *emi*, and all men as *ewu*.

Households did not traditionally include fathers, except in unusual circumstances (e.g., in the aristocracy), so uncles were important and took part in providing for, and overseeing the children of the household. Some Na families now have fathers or grandfathers as part of the household and these men take part in providing for and caring for the children of the household (as do uncles in other households). As Na households become smaller in size there may not be as many aunts or elders to watch over children, and, for the few nuclear families in the area, childcare may limit women's productive power.

LEADERSHIP IN PUBLIC ARENAS

Prior to inclusion in the People's Republic of China, local chieftains and aristocracy ruled Na territory. A chieftain paid tribute to the imperial court, and his rule was officially recognized by the central government on the condition that he could show a clear patrilineal claim to his title. Na describe the roles of leadership (chieftain, administrator, soldier, and village security) as being held by men. Religious leadership, also important within the political arena, was also restricted to males.

Currently, within the township, virtually all officials are men, both the elected and appointed, although some villages have elected women as "people's representatives." During the years of collectivization, village- and township-level leaders were appointed or recommended by the Communist Party. Since the reform era (beginning in 1982), villages have gained back some autonomy. Now each village chooses a village head, generally a man from a large respected household. Villagers say that they choose village heads for their farming ability as well as their leadership abilities. The village head is responsible for officially representing the village to the township.

Plans for township events or agricultural innovations may be relayed to the village through the village head, or the village head will call a meeting at which outside representatives can talk to the village. Village heads also announce the beginning of agricultural stages, mobilize workers to help maintain public works, and may mediate village conflict.

Another form of official organization is the village women's representative. The women's representative has primarily dealt with villagers on issues of marriage, birth planning, and child-rearing. There is currently no women's representative in many villages. The women who held the position in the past could not recall actually bringing issues from the village to a higher level, but were active in bringing outside policies to the village. During the Cultural Revolution, the "one husband one wife" policy was introduced to the village through the women's representative. In Yongning, as in much of China, the activities of the women's representatives in the past decade and a half have centered more on the birth planning policy than any other issue. The policy of birth control came to the village through the mediation of these women.

GENDER AND RELIGION

The Na are very religious and nearly all Na practice their own religion, Dabaism, as well as Tibetan Buddhism. Na *daba* religion is an oral tradition which centers around life cycles, ancestors, healing, and divination. The *daba* are Na religious specialists, who traditionally led important annual events and well as major life ceremonies (such as naming a child, new house ceremonies, and funerals), and acted as the Na historians and cultural interpreters. *Dabas* also drove away evil spirits, and would be called on to assist with cases of illness as well as bad fortune. *Dabas* were and are male, and an aging *daba* generally chooses a nephew to train in his role. There are few living *dabas*. According to Na cosmology, the sun and other celestial bodies, the wind and the rain, mountains, and caves are all divine, and most deities are genderless. However, several important deities are gendered. The sun is female, while the moon is male. The primary Na deity is a goddess, Gemu. The large Gemu Mountain dominates the Yongning Plain and the most important Na festival involves visiting mountain and wish her well. She is believed to protect and help the Na, but she can also withhold her benevolence. The lesser surrounding mountains are male gods believed to be her lovers.

Tibetan Buddhism probably reached Yongning as early as the 14th century with the Mongol invasion. Na were converted to Gelugpa en masse after the chieftain's conversion, circa 1700, which brought Na more tightly under the aegis of Tibet (Mathieu, forthcoming 2003). Government policy forced a hiatus during the collective era, but Na are again sending their sons to train as lamas. Na women rarely become nuns, unlike in other Tibetan Buddhist areas.

LEISURE, RECREATION, AND THE ARTS

Na report, and observation confirms, that Na women work more than men. The management of the household and farm, and care of children, while shared in by all members of a Na household, are more women's responsibility than men's, and women contribute more labor than men to the household. As a result, men have more leisure time than women, and young men are more likely to pursue leisure activities outside the household, and to spend money on them.

Na report that in the past during holidays they most enjoyed games and visiting during the day, and singing and dancing in large groups during the evening. However, card-playing and gambling have become prominent activities as well. Celebrations at a household will involve food and drink, and evening activities of community circle dancing and solo singing performance in the courtyard. For those communities with electricity (and even some without borrow generators), karaoke and Chinese videos have been added to party activities as well as showing Chinese videos.

For those with electricity and access to television, watching television is the most common evening leisure activity. Men and women of a household watch television together, and often neighbors visit and join in. Videos, shown in cinemas, are also a source of entertainment. Some young people enjoy travel and groups will form for local walking trips to visit friends and relatives in other Na villages. Young Na are sometimes now traveling to other areas of the province as tourists, and some take work outside the area in part for the adventure of seeing new places.

The sexes often segregate in single-sex groups that form for labor or leisure activities. However, during the leisure activities, the groups often come together. So, for example, a group of young women may go to the cinema

where there are other groups of young women as well as groups of young men. Na involvement in these types of activities diminishes during their twenties.

RELATIVE STATUS OF MEN AND WOMEN

Na generally reply to questions about status that women and men are equally important and that both have equal control over their lives and input in household decision-making. A man or a woman may head a Na household. The term *dabu* is used to refer both to the head of the household and to leaders in general (Shih, 1993, p. 157). The head of the household is not necessarily in charge of making major decisions for the household. Most Na report that if a major decision needs to be made, the entire household, or the adults in it, will discuss the decision, reach an agreement, and then proceed with the action agreed upon. In these discussions, informants say that decisions are reached by universal agreement. One woman, in her forties, laughed when I asked her if she liked being the head of the household. She said she would rather have more freedom and fewer worries, but someone needed to do it. However, within some households, decisions related more closely to the work of one gender or the other may fall to a leading member of that gender.

General inability to agree is often the reason that a Na household may divide. In the case of household division, a senior male member will often decide how household property will be divided and what resources should be given to the new household branching off. Na say that this is preferred because it is believed that a mother may be partial to her siblings and so will be less fair, while an uncle will not be influenced by such partiality.

The majority of Na have customarily been subsistence farmers. However, those men who engaged in long-distance trade in earlier times controlled the money which they earned. While they may have contributed substantial amounts to the household budget, which then came under the control of the household head, they decided how much to retain for private use. This model still continues in many instances. In the case of young Na working at the primary tourist village, several households reported that young men would generally keep more of the earnings for themselves, while young women would generally contribute almost all of the earnings to the household.

Na men and women are both in control of their sexuality. Either can initiate sexual relations (although women may do so less directly), either can take other lovers, and either can end a relationship at any time.

SEXUALITY

Na men and women both appear to believe that sexuality is natural, healthy, and private. Once a Na comes of age, by custom she or he is free to choose or abandon lovers. This has been mitigated by Chinese policies, which in the late 1960s and early 1970s increasingly demanded that Na marry and cohabit. Na saw this as a destruction of their households, and an undesirable control of their sexuality. Reform in the 1980s allowed Na to return to the practice of visiting relations, *sese*, again. Currently, Na may marry or pursue visiting relations. However, birth-planning policy requires women to register a father for each child born. Class did not and does not constrain Na *sese* relations. Na culture has a strong restriction against *sese* relations with people closely related matrilineally. Children of the same father but different mothers are not prohibited from having relations, nor are children of two brothers or a sister and a brother.

Because marriage was atypical in Na society, the ideas of premarital or extramarital sex are not directly applicable. Na men and women in the past were admired for the number of lovers they may have had. Many Na would engage in short secretive relations when young. Na may choose to make public more stable relationships, which often occur in their twenties. While Na women and men in established public relationships may take secret lovers, they risk anger, jealousy, and abandonment by their established partner, but they are not generally censured for such actions by the community at large. In fact, the betrayed lover generally makes no public display of anger or jealousy. Na do not believe that romantic love is necessarily enduring; rather, passion is fleeting. It may last one evening, or it may combine with friendship to bond a couple together much longer. Much of a Na's emotional life is lived through the household, and so Na are not dependent on romantic relationships for emotional fulfillment. While Na women as well as men enjoy sexual relations, the community at large seems to believe that children are a natural and desired result of sexual relations. Many older women in Na communities are much more interested in whether or not a younger female relative has a child than in who her lovers are.

Neither women nor men (including monks) are expected to remain celibate, although a substantial number of Na appear to have few or no sexual relations (by their own choice). In addition, lovers are not expected to spend every night together, even if they live a convenient distance from each other. One story about visiting relations is that obstacles were set by a god to test who would be more determined reach a lover—the man or the woman. Because the woman showed so much more determination than the man, it was divinely decided that men would visit women. The implication is that woman are more determinedly passionate than men, and too much time might be spent in pursuing lovers if women were the pursuers.

Na generally keep their bodies covered from the intense sun and wind of the winter and the rain and dampness of the summer. Modesty about the body is not expected in front of members of the same sex, but seems to be uniformly practiced in front of members of the opposite sex. Expressions of sexuality such as joking are enjoyed in single-sex groups, and in mixed groups the most traditional display of sexuality is through song. Individual public displays of affection between members of the opposite sex almost never occur. When engaged in sexual relations, lovers are generally quiet and discreet. Taboos prohibit Na from verbally or otherwise referring to sexual relations in front of relatives of the opposite sex.

COURTSHIP AND MARRIAGE

Before the 1960s, Na did not generally marry. Chinese policy attempted to force the Na to marry during the Cultural Revolution, but beginning in the 1980s allowed more flexibility. Currently, some Na marry, usually those holding government jobs, those working out of the area, or those whose households need members of the opposite sex. Others choose to engage in *sese* relations in various forms. Na generally describe *sese* today as more stable than in the past. Most Na will engage in sexual relations as adults, although some choose not to.

Men and women come together in a variety of ways, and may take advantage of any of these opportunities to develop new relationships. Through labor exchange, village activities and celebrations, funerals, or festivals, Na interact with people from outside their households. In addition, through school and daily activities, such as marketing, Na routinely come into contact with the

opposite sex. Young people go to video showings in the evenings, and some of these include dancing (in public, most Na are more comfortable dancing with the same sex). Karaoke has been incorporated into many village celebrations. Younger Na men report that one way to get to know someone is to offer a ticket to the movie, or a ride home on your bicycle.

Most Na believe that men approach women to request relations. While Na customs do not prohibit a woman from making the first verbal advances, Na reported that this is simply not done and is perceived as risky. A woman might develop a bad reputation or be laughed at. Women are expected to make their interest clear in other ways than direct verbal invitation.

When involved in *sese* relations, Na may exchange gifts, but these are not prescribed. In the past, common gifts from women to men included handwoven articles of clothing, which women sometimes embroidered. In basin villages, where few women weave or embroider, these gifts are becoming uncommon. Common gifts from men to women were and still are items of purchase—jewelry, hair decorations, and textiles. A man who wishes to engage in stable *sese* with a woman may choose to bring gifts to the woman's mother and elders in her household. An elder man of his household may accompany him if he is young. A woman is never forced to accept a suitor. The suitor is petitioning to have his relationship to the woman recognized and to have some access to the household, since the woman resides there.

Both sexes describe physical attractiveness (tallness, large eyes, high nose) as an important quality in a lover. Na believe that personality traits are also of importance in a lover, including a sense of humor, a quick wit and lively tongue, a vivacious personality, kindness, and ability. Excellence in some skill (weaving, hunting, dancing, and singing) will also contribute to one's desirability as a lover. Women sometimes describe lovers of longer duration as desirable because they are responsible and sober, and exhibit appropriate and respectful behavior.

Na sometimes describe *sese* relationships as superior to marriage because only feelings are involved, and people do not choose partners for mercenary reasons, nor does the stress of economics come between couples. *Sese*, they say, creates less conflict than marriage, as partners do not live together or depend on each other. Furthermore, any conflict that develops is easily diffused simply by separation for a few days (which occurs in most *sese*). Some Na describe marriage as difficult

because, if a new household is formed, the new household is too small, and the couple may not have enough hands and generations for all of the tasks of farm work, livestock, household, and childcare. Na believe that it is also difficult if one spouse moves into the other's household. In the case of a man, there is thought to be high potential for conflict between him and his wife's male relatives; in the case of a woman it is thought that she will miss her own household.

Other respondents discussed the advantages of marriage as bringing more stability to a relationship in which the man takes more responsibility. In their opinion, a man would take more responsibility for his own children than his nieces and nephews, and for contributing to farm work and household labor when he was doing this for his own children. These respondents felt that women did more work than men in a system of walking marriages, and that the way to make men responsible was through marriage. Another advantage that some married respondents mentioned was that they could control their resources. There were not so many mouths to feed. However, most Na will say that both systems are good and that the most important thing in deciding is to look at "conditions." In general, Na will marry when they are preparing to have children. Those Na in the village who did not have children were believed to have been unable to produce children or abstained from sexual relations because they did not desire children.

HUSBAND–WIFE RELATIONSHIP

Husbands and wives in villages often married because of earlier government policies that required it. The couples who married several decades ago seem to have settled into a living pattern that publicly resembles the relationship between brothers and sisters. They may be platonically affectionate, but may have separate sleeping areas and will not publicly display romantic or sexual interest. They generally consult on some household decisions and not on others. Women and men work in single-sex groups, and help each other as needed.

Among younger couples, some are marrying because they live out of the area, hold government jobs, their households need members, or they wish to begin a branch household. For those living out of the area, often the husband has much better employment. If a household needs members, the member marrying in often has a

status equal to other household members because the new member is needed. In the case of marrying to begin a new branch household, the husband or wife whose family has financed the venture generally has higher status in household decision-making.

Na enter into some relations with no expectations for duration, while others include intense feelings and hopes for continuity. In all relations, however, the man is expected to treat the woman well while with her, and Na have no understanding of or tolerance for physical abuse between lovers. In addition, whether engaged in shorter and more secretive *sese* or in longer and more public relations, Na believe they are individually in control of their sexuality and free to take other lovers. This strong sense of sexual freedom may be weakening somewhat as relationships become more stable.

OTHER CROSS-SEX RELATIONSHIPS

Because of the nature of Na households, there can be many other significant male–female relationships between Na. Brothers and sisters (as well as cousins in larger households) grow up together. Grown siblings who reside together spend much time together, eat meals together, consult each other on projects, and work together. Uncles and great-uncles are involved in the care of the younger generations, as are aunts and great-aunts. Because of this, strong affective relationships may develop between uncles and nieces (or nephews) and aunts and nephews (or nieces). It is not uncommon that when households divided because they were becoming too large, generally a woman starts a new household with several children. She may bring nieces and nephews, and might leave some of her children behind. As described above, adults (and children) in a household share in childcare, and some Na report feeling more affection for an aunt or uncle than for their mothers.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Incorporation into the Chinese state in 1956 ended the hundreds of years during which Na territory was locally ruled by Na chieftains and administrators. This also marked the beginning of waves of policy which were

intended to produce radical changes in Na household and economic structures. From 1958 until 1982, land was collectivized and households no longer controlled production or labor resources. Government policies tried to encourage, and then to force, Na to marry and start nuclear families with men as heads of households. Government discourse and rhetoric told the Na that their household structures were primitive and backward, as well as immoral, and that they needed to change them and end sexual freedom to become modern and civilized.

Currently, several factors are contributing to or acting as pressures for social change. These include education, the media, migration, and tourism. Outside sources of information and interaction pressure the Na to change—to modernize in both standard of living as well as lifestyle. Educational materials in government schools reflect the lifestyle and expectations of greater Chinese society through the mediation of government text writers, while teachers and school administrators marry and live in "modern" nuclear households. Economic reforms and greater mobility throughout China have affected growing numbers of youth, who are trying to leave the area for educational or economic opportunities. Television is rapidly reaching more and more Na communities, and Na compare their situations with the comfortable lives and different lifestyles represented on television. In general, these outside models involve nuclear families headed by fathers, and a wider society and economy controlled by men in which women have a declining status.

Since the mid-1980s, increasing numbers of tourists have been visiting Na areas. In some Na communities the economy is almost completely driven by tourist income. These tourists are drawn by curiosity about descriptions of the Na as "matriarchal," and these descriptions have been taken up and enhanced by travel writers, novelists, and travel agencies to lure tourists. To maintain this source of income, residents of tourist communities must to some degree satisfy tourists' curiosity and the images they bring with them. Sexuality and gender figure prominently in representations of the Na as "matriarchal" and sexual without marriage.

In the primary tourist area, the labor defined as household work/women's work seems to have increased. Men are less likely to assist, using tales of traditional long-distance trading and hard-working matriarchs to claim that, for the sake of cultural preservation, they should not do household work. Women generally have responsibility for all household work in households which have now grown to include large guest-houses, and in the most successful tourist households men manage the profits of the guest-houses. Public positions of authority are now almost exclusively occupied by men. Women in the tourist area seem trapped in a myth of matriarchy that holds them responsible for almost all labor, a labor imbalance that they are told should continue for the sake of cultural preservation. Women work more than men for the sake of preserving "traditional" culture for the tourism on which their new wealth depends, but the wealth produced is often controlled by men.

Nahua

James M. Taggart

ALTERNATIVE NAMES

Contemporary speakers of Nahua refer to their language as "Mexicano," and some scholars prefer "Mexica" for the ethnic category of Nahua speakers on the central Mexican plateau (Berdan, 1982; Hill & Hill, 1986). The name Aztec is commonly used when referring to the 16th-century Nahua, a tradition attributed to the naturalist Alexander von Humbolt (López Austin, 2001, p. 68). Some linguists use the name General Aztec for speakers of contemporary as well as ancient Nahua. Pipil is the name for Nahuas living in Central America.

LOCATION

Nahua speakers live mainly in the Mexican states of Durango, Guerrero, Jalisco, Morelos, Puebla, Tlaxcala, Toluca, and Veracruz, and in the Distrito Federal (Carrasco, 1969; Nutini & Isaac, 1974; Wolf, 1959). The Pipil settled in El Salvador (Fowler, 1989).

CULTURAL OVERVIEW

Dialects of Nahua or General Aztec belong to the Uto-Aztecan family of languages (Miller, 1983) and include Nahuatl spoken in Tetelcingo, Morelos (Brewer & Brewer, 1971), and Nahuat in the Zacapoaxtla region of the sierra norte de Puebla (Key & Key, 1953). The Tetelcingo dialect is close to classical Nahuatl spoken in the 16th century in the valleys of Mexico, Toluca and Puebla-Tlaxcala. Zacapoaxtla Nahuat lacks "the characteristic lateral release of TL" but is otherwise similar to classical Nahuatl (Karttunen, 1983, p. xxi). This article is based on fieldwork among speakers of Zacapoaxtla Nahuat, and most Nahua words marking important gender and sexuality concepts are in the T rather than the TL dialect.

Contemporary Nahuas are sedentary farmers; they support themselves by growing corn, beans, squash, and chiles, and they live in towns and hamlets. They have preserved their language to different degrees depending on their historical relationship with Spanish-speaking Mexicans, many of whom are mestizos descended from Spaniards and speakers of Native Mexican languages. Geographically isolated groups of Nahuas, like some Nahuat in the sierra norte de Puebla, have remained monolingual. The Nahuas are the subordinate group in rigid systems of ethnic stratification, at the top of which are mestizos who refer to themselves as "people of reason" (*gente de razón*). Many Nahuas must support themselves by working for very low wages for mestizos whom they call *coyomeh*, a derogatory term implying people with a lack of culture.

Nahuas have shown remarkable ability to preserve their culture by telling narratives that teach cosmovision and moral discourse that support the social order (Taggart, 1983, 1997). Nevertheless, the political and administrative hierarchy of the Mexican state has replaced the indigenous corporate social structure. The local political unit (*āltēpetl*) and kin group (*calpulli*) changed into the *municipio* and the *barrio* (Chance, 1996; Lockhart, 1992). The most enduring indigenous social structural unit is the domestic group which frequently goes through a patrilocal and patrilineally extended family phase during its developmental cycle (Arizpe, 1973; Sandstrom, 1991; Taggart, 1972). The cosmovision and moral discourse contained in the oral narratives are aimed at regulating conduct within the domestic group.

CULTURAL CONSTRUCTION OF GENDER

Ancient as well as contemporary mythology depicts a sharp distinction between male and female cosmic forces (Graulich, 1997; López Austin, 1997). The Nahua address their parents with kin terms that carry deep cultural meanings and convey their contrasting expectations for males and females. The Nahuat of the sierra norte de Puebla use the term *tahueh* for father and *nāhueh* for mother. Tahueh means brave and connotes someone who acts

with strong emotions or considerable assertiveness. *Nāhueh* means "she who is in the center of all things" and refers to the mother's central position in the domestic group. The strong emotions of tahueh mean that he is inclined to act with *īlihuiz*, an adverb that connotes excessive strength or power and a lack of consideration for others (Karttunen, 1983, p. 104). Many oral narratives caution men against acting with *īlihuiz* and encourage them to respect *nāhueh*, on whom the unity of the Nahua family heavily depends. A man who gets drunk, beats his wife, or abuses her sexually acts with *īlihuiz*, and his behavior can tear the family, the community, and even the cosmos apart.

Nāhueh wears a red loincloth (*tahcoilpilōni* or *tahcocuetax*) because she sheds blood during menstruation and childbirth, and tahueh wears a white loincloth symbolic of semen. Nahuat men in the sierra norte de Puebla also wear loose-fitting white cotton trousers and white shirts. Women wear white cotton skirts (*iztachueh* or *enaguas blancas*), beautiful woven sashes, and blouses with intricate embroidery (*pehpenalō*) around the sleeve and collar. Ideas of beauty and sexual attractiveness are related to dress and grooming. Men apply the term for beauty (*cualtzin*) to young women who have long, shiny, combed and braided black hair. A maiden who wants to look *cualtzin* braids her hair with colorful ribbons. Men rarely talk about woman's breasts (*chīchīhualmeh*) as erotic symbols in the same way as North American men. Until recently, Nahuat women covered the upper body only with a shawl (*huīpīl*) that gave their nursing infants easier access to the breast. Women consider a man attractive if he grooms himself well by keeping his hair short and dressing neatly. Young men of courting age wear spotless white cotton trousers and shirts, and display their masculine power by wearing long razor-sharp machetes in handsome leather sheaths.

Gender over the Life Cycle

Gender begins at conception, when semen (*oquichyo*) mixes with female sexual secretions (*cihuayo*) to form an embryo (Lopez Austin, [1980], 1988, p. 297). The gender of the child is determined by the balance between the two secretions. At birth, an infant is either a baby boy (*oquichconēt*) or a baby girl (*cihuāconēt*). In some communities, the mother's placenta is buried in the hearth in accord with her close connection to the domestic group

(Redfield, 1928, pp. 135–136), as women generally work in or near the domicile. The ancient Nahuas had a naming ritual that merged with Catholic baptism in a rite that purifies the infant. The Nahuat of the sierra norte de Puebla begin their rites by washing their hands in bowls containing water and flower petals.

The *oquichconēt* or *cihuāconēt* usually becomes a boy (*oquichpil*) or girl (*cihuāpil*) when weaned and walking. To wean her infant, the mother puts a bitter herb called *chichicxihut* on her nipples, usually in the sixth month of her next pregnancy. Nahua women usually conceive their next child a year after their last birth because they breast-feed their infants on demand, they observe 6 months of post-partum abstinence but appear to have 11 months of post-partum amenorrhea, and they do not practice other methods of birth control. Thus weaning frequently takes place when the infant is about 18 months old. The weaned infant passes from the sleeping mat of the mother to that of the father, where he or she remains until puberty. A boy remains an *oquichpil* and a girl remains a *cihuāpil* until they reach puberty, the most dramatic transition following weaning. The stages beyond childhood are marked with terms for maiden (*ichpōch*) and bachelor or youth (*telpōch*), man (*tācat*) and woman (*cihuāt*), and old man (*huēhuēntin*) and old woman (*lamatzin*).

Socialization of Boys and Girls

Some Nahua express a preference for boys and encourage their sons to live patrilocally either in the same house or in a neighboring house so that they can continue to work with the father on the family corn and bean plot (milpa). Parents socialize all their children to work hard and to avoid behaving with *īlihuiz*. Boys are prone to certain forms of *īlihuiz* because they are inclined to have strong emotions, but their *tahuel* nature also suits working outside of the domestic group. By the time a boy can walk well, he accompanies his father to the milpa, if the family is fortunate enough to have one, and he continues to work with his father long after marriage. Boys are taught to avoid becoming a *calayo*, a man who only wants to stay in the house and have sex.

Parents instill in their daughter a strong sense of sexual shame and discourage her from becoming *ilāpāc*, a woman who excessively desires sexual pleasure, another form of *īlihuiz*. Oral narratives express a great deal of fear that women who are *ilāpāc* will fall into the

hands of the devil and mestizo men. Girls are taught to work hard and be brave in childbirth. Boys have more freedom to play in village streets, and girls are expected to remain near the home and help their mothers with food processing and infant care. Boys become skilled at playing marbles with other boys, including mestizos.

Puberty and Adolescence

A *cihuāpil* becomes an *ichpōch* or maiden when she has her first menstruation, but maidenhood is short because an *ichpōch* marries immediately after puberty and goes to live with her husband's family. The boy usually experiences less dislocation as he passes from an *oquichpil* to a *tēlpōch* (bachelor or youth). Being a *tēlpōch* lasts 5–7 years because a youth must make a substantial contribution to his family's economy and earn the money to help pay for his betrothal ceremony. Youths sleep apart from other members of the family, particularly the mother and sisters. The ancient Nahua apparently had youth houses, and contemporary Nahuas sometimes build a separate sleeping house for their adolescent sons.

Attainment of Adulthood

A *telpōch* becomes a *tācat* (man) and an *ichpōch* becomes a *cihuāt* (woman) after marriage and with the birth of their first child. The betrothal (*cihuātaliz*) ceremony and the ritual for the godparents of marriage mark the transition (see "Courtship and Marriage").

Middle Age and Old Age

When a man reaches old age he becomes a *huēhuēntzin* and, if he has done good works for his family and his community, he may become a respected elder. A woman in old age is a *lamatzin* and she may also enjoy considerable respect and be chosen as a *cihuātanque*, the intermediary who arranges betrothals. The line between *tācat* and *huēhuēntzin* and between *cihuēt* and *lamatzin* generally accords with the birth of grandchildren.

Personality Differences by Gender

The Nahua expect women to nurture and feed the members of their family. While both men and women husk corn, women do most of the other food-processing tasks that include fetching water, boiling the *nixtamal*, a mixture of corn and lime, grinding the *nixtamal* on the *metate*, and making tortillas and bean soup. Women are very skilled in making many different kinds of chile sauces to give their meals variety. Nurturing women appear in many oral narratives that provide models for gender behavior.

Men are supposed to represent the family to the world outside the domicile, acting as the official host on ritual occasions; they greet visitors and instruct the women to feed the guests. Men distribute shot glasses of *refino* (sugar cane alcohol) and cigarettes, and they occupy the main room of the house that usually contains the family altar. Women occupy the kitchen, a smaller room containing the hearth and attached to the main dwelling. However, it would be a mistake to conclude that men are the dominant personality in gender relations. Some women order their husbands around, speaking in harsh-sounding tones. Occasionally men lose control and hit their wives, but men are criticized when they act violently toward women and they are expected to control their *īlihuiz*.

The comparison of cognate Spanish and Nahuat folktales reveals that Nahuat men express a relational social consciousness more than do their counterparts from Spain (Taggart, 1997). A relational consciousness ordinarily develops in women when the mother primarily cares for small infant children (Chodorow, 1978). Nahuat men define themselves as closely connected to other men, particularly their brothers and fathers. In this respect, the contemporary Nahuat resemble the ancient Nahuas who told of Topiltzin Quetzalcoatl avenging the death of his father and searching for his father's bones (Bierhorst, 1992, pp. 153–155). Men's relational social consciousness is apparent in masculine narratives that depict a highly connected universe that *īlihuiz* behavior can unravel.

Gender-Related Social Groups

Men have some advantages in gender relations because of patrilocal residence, patrilineal land inheritance, and the age difference between husband and wife. The domestic group is frequently a patrilocal and patrilineally extended family household consisting of blood-related men—the father and his sons—and affinally related women—the

mother and mother-in-law. Approximately 80% of the married couples live patrilocally for a while in the same house or in adjacent houses on the same plot. Nahua parents exert considerable pressure on their sons to remain in or near the parental family after marriage so that fathers, sons, and brothers may continue to work for the same thing (*cē cosa tequitih*). Consequently, a bride begins her marital years working under the authority of her mother-in-law, and their relationship is often troubled.

It is difficult to know for sure if mother and daughter-in-law tensions develop entirely from the afinally related women or if women express the conflicts among blood-related men. Tensions among father, son, and brothers can be quite high, particularly if the father shows favoritism and one brother believes he is carrying the workload of the other men and women in the extended family. There is some evidence of favoritism to the youngest son or daughter who inherits the house in Tlaxcala and elsewhere (Robichaux, 1997). The Nahua refer to the youngest child as "the spoiled one" (*xocoyote* or *taxocoyot*). Nevertheless, conflict between mother and daughter-in-law does occur, and the Nahua handle it by dividing the kitchen so that the two women can work independently. Dividing the kitchen may occur before the men decide to fill separate granaries and purses.

GENDER ROLES IN ECONOMICS

Men primarily work on the milpa, a corn and bean plot that may be next to the domicile or several hours walk from the house. They clean their milpa, plant corn, beans, chiles, and squash, and, with the help of women, harvest the crops. In coffee-growing communities, women, children, and men cut the crop. Women spin, weave on the backstrap loom, mend, and embroider cloth. Men as well as women weave on standing looms. Women wash clothes, feed the domestic animals, and care for small children. Men usually collect and cut the firewood, hunt, and migrate to work on lowland plantations. Women join migrant labor groups as cooks. Men cut trees in the forests and work in carpentry. Men and women sell produce and crafts in local and regional markets. Adult men and women become shamans and have the ability to communicate with spirits affecting the fertility of crops and the health of humans (Huber, 1990; Sandstrom & Sandstrom, 1986, pp. 72–73). Adult women become midwives who assist in childbirth and perform rituals to

clean newborn infants (Huber & Sandstrom, 2001; Sandstrom & Sandstrom, 1986, pp. 72–73). The Nahua do not consider the work of one gender more important than the work of the other.

PARENTAL AND OTHER CARETAKER ROLES

Mothering and fathering are important expectations for women and for men. Women are close to their children because they exclusively care for nursing infants and they nurture their children with food. Women spend more time physically caring for all young children and they carry infants in their shawls, while men rarely carry their infants outside of the domicile. The concept of *nāhueh* is one indication of the woman's central place in the family. A woman's relationship with her daughter can be very close and affectionate, and mothers express anger during the betrothal ceremony (*cihuātāliz*) because the groom and his family will take her daughter away. However, most women marry within their village, and so many mothers can pay regular visits to their married daughters.

Men lavish a great deal of affection on their infant children, kissing them and calling them *tahueh* or *nāhueh*. They express a strong desire for children whom they see as an unambiguous benefit. Nahuat in the sierra norte de Puebla are expected to provide care and particularly comfort to their recently weaned child who, at about 18 months, passes from the sleeping mat of the mother to that of the father. Many Nahuat men speak with pride about the closeness they develop with their young children from weaning until puberty. The man's role in parenting his son may rival that of the woman's role in parenting her daughter. Some boys, particularly in isolated villages in the sierra norte de Puebla, skip school and go with their fathers to the milpa where they spend the entire day working together. Some men get drunk, lose control, act with *īlihuiz*, and occasionally punish their wives and children harshly. However, some women also punish their children harshly, and they too are criticized for acting with *īlihuiz*.

LEADERSHIP IN PUBLIC ARENAS

Men hold most of the public positions of leadership in their communities. They generally serve in the *municipio*

government as police, judges, secretaries, *aguaciles* running errands, councilmen, and *municipio* president. Some women took an active role in Social Party politics during the 1970s in the sierra norte de Puebla and they incurred criticism from some men.

GENDER AND RELIGION

The contemporary Nahua do not have an organization of nuns or priests that is independent of the Catholic Church. They do occupy a number of religious offices that are part of a civil and religious hierarchy or *cargo* system (Dehouve, 1976). The most important *cargo* holder is the *mayordomo* who sponsors a saint's day celebration. Men are usually the *mayordomos* but women also serve as *mayordomas* without enduring any criticism from men who assert that anyone, regardless of gender, may show religious devotion by sponsoring a saint's day celebration. Men in the sierra norte de Puebla usually lead the prayers that are part of family rituals. Prayer leaders receive training under a priest and can read the prayer books in Spanish.

The Nahua view the cosmos as governed by the interaction of powerful feminine and masculine forces associated with the earth and the sky. The ancient Nahuas had male and female creator deities, *Tonacateuctli* (Lord of the Sun) and *Tōnacacihuātl* (Lady of the Sun), and the contemporary Nahuas continue to depict their main creator gods in pairs (Sandstrom, 1991). Contemporary cosmology, particularly in isolated and monolingual Nahua-speaking communities, resembles that of the ancient Nahuas (Taggart, 1983, 1997). While many of the original creation myths have been lost, Nahuas of today continue to express their belief in hierogamy (Eliade, 1987, p. 89) or the notion that divine creation is a process on the same order as human and plant reproduction. The Nahuat of the sierra norte de Puebla depict the gods creating the universe as masculine lightning bolts emanating from the sun and fertilizing the feminine earth. They also tell stories of men finding lightning-bolt women in the forest who are goddesses that can produce vast quantities of food from a single bean or kernel of corn. In other tales, men transform the forest into milpas and chile plots. The Nahua place some primacy on the masculine forces in their universe, but the feminine ones are more accessible to humans who appeal to them in important rituals (Sandstrom, 1991, pp. 279–300).

LEISURE, RECREATION, AND THE ARTS

Nahuat men and women in the sierra norte de Puebla spend most of what little "free time" they have in their homes with their families. On ritual occasions—baptism, *cihuātāliz*, marriage, *mayordomía* celebrations—men and women tend to segregate, with women gathering in large groups preparing the ceremonial meal and men butchering pigs, preparing adornments, and setting up the giant cauldron to cook tamales. Some men drink *refino* in *cantinas*, much to the chagrin of their wives. A few men devote a great deal of time to performing and practicing in dance groups to express their religious devotion. The dance groups include the flying-pole dancers or *voladores* (*cuauhpatānini*) who represent birds descending from the sun to fertilize the earth (Graulich, 1999, pp. 417–418). Men and women become oral narrators of myths, legends, and folktales, although they tend to tell their stories in groups segregated by gender.

RELATIVE STATUS OF MEN AND WOMEN

The status of Nahua women probably declined as women became jural minors in the eyes of the Spanish court and as private property replaced corporate land ownership by kin groups (Kellog, 1995). Nevertheless, the status of women in contemporary Nahua communities varies, depending on their position in the domestic group. As mentioned earlier, patrilocality clusters blood-related men and places affinally related women in the same kitchen, and a young married woman can have a very vulnerable position in her husband's family. However, 20% of the married couples in the sierra norte de Puebla spend some time living with the wife's family where a bride is united with her mother rather than her mother-in-law. Patrilineal inheritance of land is a second practice tilting the balance in gender relations in favor of men; Nahua who own land as private property bequeath most of their land to their sons. However, a substantial number also pass some land to their daughters unless they are under severe land pressure. Women who inherit land have a greater influence in making important decisions, and their ownership of land may help stabilize their marriage. Married women who own the house have a particularly strong position in their families. The age difference between spouses also shifts the balance toward men who are generally older than their wives by an average of 3–5 years.

SEXUALITY

Sexuality is a very powerful force that can create and destroy the human body, the family, the community, and even the cosmos itself. The Nahua belief in hierogamy is based on the assumption of heterosexuality between the masculine and feminine forces in the universe. Cross-dressing occurs in rituals, particularly when men put on the attire of Spanish colonial women. Homoerotic play occurs among boys, but the Nahuat of the sierra norte de Puebla rarely manifest homophobia despite the tendency of some mestizos to label as "homosexual" those Nahua men whom they consider sexually passive with women. No lesbians came to my attention, although lesbian sex probably does occur.

The Nahua believe that they must manage sexuality with a number of respect rules governing the relationship between men and women. They convey these rules by telling stories that describe men and women loving each other excessively (*cimi motazohtah*), resulting in the death and destruction of the family. Sometimes the man and woman are brother and sister, and their excessive love drives them to commit incest. Avoidance rules for managing sexuality include the separation of adolescent brother and sister, strict rules of dress according to which a woman conceals her pubic area from a man, and little open expression of emotional excess. Brothers will admonish their younger sister for showing excitement in public (Taggart, 1992).

Any form of sexual transgression, particularly sex outside marriage, is called *tahtacol* (*tlahtlacolli*), a word that originally meant "to be in a state or disorder or broken" (Burkhart, 1989). With the influence of Christianity, *tahtacol* (*tlahtlacolli*) became a synonym for sin (*pecado*) and the two words occur together in Nahua versions of Adam and Eve. The Nahua do not place much importance on preserving a woman's physical virginity, although they do fear that mestizo men will sexually take advantage of their maiden daughters. Maidenhood is extremely short, as girls marry soon after puberty.

COURTSHIP AND MARRIAGE

The Nahua do not permit marriage with anyone whom they refer to or address with *icnīuh* (sibling and cousin) or any other term for blood or spiritual relative. Courtship begins when a boy tells his parents he wants to marry a particular girl, and his parents look for a *cihuātanque*, an old and respected woman to ask the maiden's parents for her hand in marriage. Love (*tazohtaliz*) is very important in marriage for the girl as well as the boy, although the Nahua believe that excessive love is dangerous. Soon after making the transition from a *cihuāpil* to an *ichpōch*, a maiden will become betrothed, and her family will celebrate a *cihuātāliz* ritual in which the boy and his family will deliver the bride-gift consisting of two turkeys, spices for the ceremonial *mole*, and a small quantity of money. The maiden's godparents provide a complete set of clothes including the loincloth, the billowy skirt, an embroidered sash, a blouse with beautiful *pehpenalō*, ribbons for braids, and earrings.

The climactic moment of the *cihuātāliz* takes place when the *cihuātanque* hands the bride a *xōchicuahuit* and asks her to dance in front of her family's altar. The *xōchicuahuit* is a hand-held wooden adornment with three prongs decorated with flowers and tortillas or bread. The adornment represents the tree in the ancient myth of Taomanchan (Quiñones Keber, 1995, pp. 29, 183), vestiges of which are woven into stories of Adam and Eve as told by the contemporary Nahuat in the sierra norte de Puebla. According to the ancient myth, the gods in the celestial paradise of Tamoanchan picked flowers from a tree, a symbol for sex. The gods were expelled to earth, and one of them, Xochiquetzal, gave birth to the corn plant. The trees in the myth and *cihuātāliz* ritual are symbols of fertility (Graulich, 1997; López Austin, 1997). During the *cihuātāliz* in the sierra norte de Puebla, the bride's mother sometimes interferes with the *cihuātanque* when she offers the *xōchicuahuit* and displays anger toward the groom and his family for taking her daughter from her. However, the daughter usually accepts the adornment, the intermediary asks the couple to embrace, and she surrounds them in a web of incense to seal their union.

A few years after the *cihuātāliz*, the couple celebrate another ritual in honor of the godparents of marriage who will become the godparents for their children. The ritual for the godparents of marriage closely resembles the *cihuātāliz* except that it takes place in the home of the groom's parents where the couple usually begin married life. The *cihuātanque* again hands out the *xōchicuahuit* first to the women and then to the men, and she conducts a ceremony called the *nānāhuin* (the dance of departure) in front of the family altar during which she weaves a web of incense around the groom and their

ritual sponsors. Those who are widowed and divorced are free to remarry as long as they observe the incest rules. The Nahua do not practice the sororate or the levirate, and the *cihuātāliz* is held only for first marriages.

HUSBAND–WIFE RELATIONSHIP

The Nahuat of the sierra norte de Puebla mention gender interdependence as a major reason for marriage. When widows and widowers grieve over the loss of a spouse, they frequently anguish over how they will cope by living alone in the future. The Nahuat place a high value on monogamy and sexual fidelity for the man as well as for the woman. Adultery is considered a serious form of *tahtacol* (sin), and sex with a ritual coparent of marriage and baptism is particularly heinous. Married couples sleep on separate mats in the domicile, and they rarely show affection in public. Married couples never hold hands, kiss, or embrace each other in front of others. However, some men and women reveal their deep love with a kind gesture and by looking deeply into each other's eyes. Some show their affection by addressing each other as *nocihuāpil* (my daughter) and *nooquichpil* (my son). To be sure, some marriages are filled with frustration, betrayal, anger, and violence. However, the Nahuat tell many stories warning men against behaving with *īlihuiz* with women. First marriages are unstable, and separating couples do not always file divorce papers in the sierra norte de Puebla before remarrying two or three times before settling down in a permanent relationship. The woman or the man may initiate a divorce, and the children usually go with the mother.

OTHER CROSS-SEX RELATIONSHIPS

Both ancient and contemporary Nahua narratives describe the brother–sister relationship with a great deal of erotic imagery. Seventeenth century hunting chants sung by Nahua men depict the older sister (*hueltiuh*) as the object of erotic desire (Coe & Whittaker, 1982). Contemporary Nahua men tell Orpheus tales in which the sister is the brother's love object (Taggart, 1997, pp. 223–241). Mother–son relationships are also very close, but there is no hint that the mother is the object of the son's erotic desire. Rather, the mother is the model for *nāhueh*, the woman who is at the center of all things or a goddess.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The Nahua are fighting an uphill battle to hold on to their culture because mestizos are forcing them off their land, and there is little governmental interest in preserving the indigenous language and culture (Sandstrom, 1991). It is possible to see what happens to Nahua gender relations by comparing communities where the language flourishes with those where Spanish has taken over. Language change often occurs with landlessness and extreme economic, social, and political dislocation. Ethnographers report a great deal of tension, sometimes breaking out in ugly examples of incest and spouse abuse, in the more Hispanized and former Nahua-speaking communities of Tepoztlán (Lewis, 1964), Hueyapan (Friedlander, 1976), Tlayacapan (Ingham, 1986), and Mixquitic (Behar, 1993; Frye, 1996). Here the forces of change have led to a breakdown in the rules of respect by which the Nahuas have managed male *īlihuiz*. Ingham (1986) reports that men in Tlayacapan no longer care for their recently weaned infants and they express a great deal of hostility toward their wives because they cannot reconcile their ideas of woman as mother and lover. Tlayacapan men are a dramatic contrast to the Nahuat of the sierra norte de Puebla who still believe in hierogamy.

Nandi

Regina Smith Oboler

ALTERNATIVE NAMES

The Nandi are also known as Chemwal (Old), Kalenjin (includes societies with other ethnic designations, e.g., Kipsigis, Keiyo, Tugen, Marakwet, Endo, Kony, Terik, Pokot).

LOCATION

The Nandi are located in the highlands of Western Kenya, East Africa.

CULTURAL OVERVIEW

The Nandi are a section of the several million Kalenjin-speaking people in Kenya. Greenberg classifies the Kalenjin languages as part of the Nilotic sub-branch of the Eastern Sudanic branch of the Chari-Nile subfamily of the Nilo-Saharan language family. The Nandi were formerly semipastoralists, who kept cattle, sheep, and goats, and planted eleusine (finger millet) as the staple crop. In the 20th century they have become settled cash-crop farmers, who produce maize, milk, and tea for national and international markets.

During the 19th century cattle were central to the economy, and at times the cattle-to-people ratio was as high as 4 : 1 or 5 : 1. Cattle were also central to social life, a focus of cultural interest celebrated in song. The language included an impressive cattle-related lexicon, and men were tied together in cattle-exchange partnerships. As with other East African pastoralists, raiding for cattle by young men of the warrior age grade was also important to Nandi cultural identity.

Prior to colonial rule, the Nandi were tribally organized, with the beginnings of political centralization in the role of the Orkoiyot, the most powerful prophet of the Talai, the clan known for producing powerful prophets. The Orkoiyot was believed to be able to foresee the future. All cattle raids were cleared through him.

The settlement pattern was and is scattered, with each minimally extended family living in a compound of several houses on its own land. Each married woman has a separate house. A minimally extended family might be an elder with wives, married sons, unmarried daughters, sons' wives, and grandchildren; or it could be a married man with his wife or wives and children and widowed mother. Descent is patrilineal, and communities are made up of households from several patrilineal clans. The other important feature of social organization is seven rotating age sets for men.

CULTURAL CONSTRUCTION OF GENDER

The Nandi acknowledge two gender categories, male and female, and male is considered to be superior. Men are said to be both physically stronger than women, and stronger willed and more decisive. Men have a very strong sense of pride in their manhood. It is manly to be courageous, and also to be very decisive, particularly in the area of herd management. The cultural ethos is definitely one of male dominance. Women are held to be subordinate to men. A submissive demeanor is considered appropriate for younger women. These expectations of submissiveness, and some other gender expectations, are suspended for older women who are widows. In fact, when questioned, Nandi may say that the traits associated with men, such as initiative and decisiveness, are in fact also good in women, but not natural to them. There is a term, *chemurenyo*, that denotes a woman who has these qualities.

In the 19th and early 20th centuries, women wore beaded leather skirts and capes tied together on one shoulder and passed under the opposite arm. Earlobes were pierced and stretched to accommodate long leather beaded ornaments. Married women also wore flat spirals of brass wire above their breasts, suspended by a leather strap worn around the neck. Young men (warriors) wore nothing but the over-one-shoulder cape and some ornaments, and black-and-white colobus monkey skin decorations for

fancy dress. Elders might wear a more encompassing cloak made of leather or monkey pelts. Men's earrings were metal, each a horseshoe-shaped loop with a ball at either end, so that two balls hung together just beneath the earlobe. Men now wear trousers or shorts and shirts, and women wear cotton dresses.

Attractiveness in men is related to decisiveness and strength of will as well as physical fitness. It is often said that in the past a glamorous mystique surrounded the warriors. Physical beauty in women is important to sexual attraction. A young Nandi man told me, "We like the same things European men like: girls who aren't too fat or too thin, and have nice breasts that stand up …" Smoothly pigmented skin is positive, and a slight space between the top front teeth is a mark of beauty.

GENDER OVER THE LIFE CYCLE

Rotating age sets for men are a key aspect of Nandi social structure. A group of men initiated to manhood at the same time form a solidary group that moves together through life's stages: warrior, married man, junior elder, senior elder, retiree. Though some other Kalenjin peoples also traditionally had age sets for women, the Nandi did not. The important status distinguisher for women is marital status: unmarried, married, or widowed. Initiation to adult status at puberty is a crucial life cycle event for both sexes.

Socialization of Boys and Girls

There is a clear preference among the Nandi for the first child to be a boy. A male heir is necessary to continue the family line. However, an ideal family has children of both sexes. The marriage of daughters brings to the family bridewealth cattle that enable its sons to marry. Babies of both sexes are welcomed, loved, and carefully nurtured. Nandi mothers deny that there are significant sex differences in the behavior of infants and young children, although fieldwork did not include close enough observation to determine if this reflects actual behavior. Both child caregivers and adults are very indulgent toward infants and young children. A baby or toddler is picked up and placated whenever he or she cries, but as soon as children reach the age where they can be reasoned with they are expected to be obedient and may receive corporal punishment for disobedience. A time-allocation study

using broad categories found very few differences in activities of boys and girls up to about the age of 7.

From this point, boys and girls begin to learn the work appropriate to their adult gender roles. Girls do household chores and childcare and help with weeding in the fields; boys' major chore is watching domestic animals (cattle, sheep, and goats) to prevent them from wandering into the crops and periodically driving them to water.

There are gendered terms for these tasks, *cheplakwet* (child nurse) and *mestowot* (herdboy). Still, girls do herd animals and boys do sometimes care for smaller children. Children of both sexes (no gender differences are obvious) are most likely to be disciplined either for impertinence or for failure to carry out assigned tasks. Girls and boys both go to school, have similar amounts of leisure, and play in mixed-sex groups. In the 1970s there was still a bias in school attendance favoring boys, but as more years of school are provided free by the government, this difference is diminishing.

Puberty and Adolescence

After the age of about 10, boys, but not girls, spend nights in a "hut" (*sigiroinet*) away from their parents' house. By early adolescence, adults expect boys to take more initiative than girls. Boys of this age often take on extra work or independent projects as a way of proving their fitness for initiation. After the age of initiation, young men spend many fewer hours doing domestic chores than young women do, and have a great deal of free time. Girls change their behavior during adolescence, but there is no particular term for this stage. They go from being unmarried girls to married women. After initiation, young men are "warriors." They are considered adults, but traditionally they did not marry and begin families until attaining the next age grade.

Attainment of Adulthood

Initiation (*tumdo*) is a central Nandi institution, the most important event in the life of the individual up to that point. The main feature of initiation for both sexes is genital modification—circumcision for men and clitoridectomy for women. Both sexes are expected to display courage under the knife—men to prove their fitness for the hardships of the warrior role, and women to prove that they are able to face child-bearing without fear. Both

men's and women's initiation are public events, but men's initiation directly involves more of the community because all the boys of the appropriate age, but only one or a few girls at a time, are initiated in the same ceremony.

In the precolonial period, men's initiation was coordinated throughout the entire Nandi area. At about 15-year intervals (alternate flowerings of the *setiot* plant) a male initiation period was "opened." Initiation remained open for several years, with some boys between the ages of about 12 and 20 being initiated in each year. These men formed an age set. Seven standard names for the sets were used in rotation. At any point in time there would be four sets of elders (one of which might have no living members, and another considered "retired"), the set of the senior warriors, the set of the new initiates, and the set of uninitiated boys. At a ceremony marked by the sacrifice by strangling of a white ox, each age set moved up one age grade, taking over the duties of the set before it. The coordination of the system broke down during the colonial period when the British cancelled three successive *saget ab eito* ceremonies as events likely to arouse rebellious militaristic emotions. In the 1970s some boys were initiated every year in different Nandi communities, and understandings about which age set new initiates belonged to were reached informally. The modal age of initiation for boys is 15 or 16. It is about 15 for girls.

There are some Kalenjin-speaking societies (e.g., the Sebei) where girls and boys are initiated at the same time, but for the Nandi these ceremonies are segregated by gender, with some public parts of the ritual attended by the whole community, and some private parts attended only by people themselves initiated in the same ceremony. Occasionally people are allowed to attend the opposite-sex initiation in its entirety to cure infertility.

Boys' initiation, under the "senior warriors," begins in the morning. The boys sing and dance publicly all day. They are made to behave submissively and to perform tasks usually associated with women, and subjected to aggressive lectures and tongue-lashings. Periodically, the senior warriors take them into a grove for private instruction. At sunset, the boys hear last words of encouragement from their female relatives, who tie headscarves around the boys' necks as tokens of being with them in spirit. Then they are taken for the final time into the grove, where they undergo physical hazing and instruction during the night, culminating in the actual circumcision just before dawn. At dawn, the instructors appear to return tokens and assure the waiting women that the

initiates behaved honorably. The initiates remain in seclusion, receiving further instruction in manhood, until their circumcision wounds heal. Today, initiation ceremonies for boys are not always communitywide, and in some cases Roman Catholics have incorporated Christian religious symbolism into the ceremony.

By the 1970s, about 20% of women, mainly those who were highly educated, were no longer initiated. The figure has probably increased in the intervening decades. Beginning in the 1980s, clitoridectomy became illegal by presidential decree in Kenya. In the 1970s, girls were dressed for their initiation in a standard costume that was reminiscent of male and military styles—for example, a white dress-shirt and tie, men's shoes and knee socks, crossed bandoliers, and colobus monkey skin ornaments (warriors' decorations of precolonial times). A red skirt was also invariably part of the outfit. It is said that traditionally the warriors dressed the girls for initiation, lending them their own ornaments and other items. In the 1970s, there were men who specialized in dressing girls and providing costumes, though women controlled the rest of the girls' initiation ceremony. Both male and female initiation seem to dramatize aspects of the adult opposite-gender role, which the initiates are repudiating.

Beginning in the late afternoon of the day before the actual clitoridectomy, the beautifully costumed initiates dance with a group of uninitiated girls referred to as their "childhood friends." The initiates are supposed to stay up all night, and by morning they should be exhausted and numbed to the pain to come. Friends and neighbors visit throughout the night, and gather after dawn for the culmination of the ritual. After distributing food, drinks, and cigarettes to the crowd, the girls move into a circle formed by initiated women separate from the men and uninitiated women. This is where the actual surgery takes place. The girl is not supposed to move or cry during the operation, and if she proves worthy, there is much rejoicing among the women. The observer cannot help being impressed by their emotional release as they break from the circle and run ululating toward the guests to deliver the news that all went well and congratulate the girl's male relatives.

Following initiation, a young woman is secluded in the home of a neighbor for a period of time while she is "fattened" and instructed in womanly lore. While she is secluded, families of marriageable young men may negotiate for her as a bride. Technically, her seclusion should end with her marriage. Young men emerge from seclusion

in a group ceremony. These newly initiated warriors then begin a period of great social freedom. In the past, they would have engaged in cattle raids. Today they may be students or otherwise free from many adult responsibilities. Before initiation, a boy may not engage in sexual intercourse. After initiation, he is free to do so.

Middle Age and Old Age

As men age and move into the status of elderhood, they become more important as political actors within the community. The important decisions are made by councils of men beyond the warrior age grades. Women, too, gain power with age, but a woman is jurally under the authority of her husband as long as he is alive. As a widow, however, she inherits property and may become completely economically independent.

Personality Differences by Gender

When asked about ideal personality traits, Nandi tend to describe a similar ideal for both sexes. A good person is hardworking and "polite" or "humble" (*tala*). Getting along well with others, courage, and honesty are important for both women and men. Nandi tend to be reserved in the expression of emotions, and to avoid direct confrontation. Some points also differ by gender. Women are believed to have a greater capacity than men for compassion (*rirgei*), and men are supposed to be a bit more "sharp," "bitter," or "fierce" (*korom*).

Men pride themselves on physical fitness and feats of endurance, for example, ability to withstand cold and rain, and to travel for long periods and distances without food, water, or rest. Men should be able to confront and vanquish human enemies or wild animals; in the past, "Barng'etuny" was an honorary name reserved for those men who had killed lions, usually in defense of their herds. Women also should be brave and stoic in the face of hardship, but they are generally thought to display these virtues to a lesser degree than men. They are also believed to have less capacity for planning and forethought than men, and to be more apt to hold grudges. Only a few desirable qualities are said to be more characteristic of women. Compassion, empathy, and cleanliness are some such traits.

Women's personality typically changes over the life cycle. Young women are supposed to be shy and retiring,

and usually are, especially in the presence of men. Older women, especially widows, are much more assertive and less retiring in mixed-gender social situations.

Gender-Related Social Groups

Residence in Nandi is patrilocal, though communities are not patrilineally structured. Three-generation patrilineal extended family households are fairly common, but larger residential kin groups are not present. People recall specific patrilineal connections only for a few generations, and patrilineal clans are important only for the regulation of marriage. Local communities are made up of households representing many clans.

The age-set system for men (previously described) is the most important gender-oriented social institution.

Gender Roles in Economics

The Nandi live in an area of Kenya that has been characterized as having "high agricultural potential," with average land holdings in the 1970s that were large compared with most of rural Africa. The economy is based on the production of maize, milk, and vegetables for home consumption, as well as maize, milk, and tea for the market.

In the process of agricultural production, men clear land for planting and do the plowing with oxen. All members of the household are involved in planting. Women and men participate in routine weeding of the staple crop, though women spend slightly more time doing this, and women also plant and tend vegetable gardens. All members of the household are involved in harvesting. Women and men sometimes work in the fields together, but more frequently work separately except for planting and harvesting. Women and men spend approximately equal amounts of time in agricultural production as a whole, and on maize and tea, the major cash crops (Oboler, 1985, p. 212). Women milk cows morning and evening. The common idea that, among agropastoralists, women are the cultivators and men are the herders does not hold for the Nandi. Women actually spend more time than men caring for livestock, though neither does as much as children (Oboler, 1985, p. 215).

When both cultivating and caring for livestock are included, married women have an average agricultural work week of about 18 hr, and men about 13 hr. Married

women in the Nandi time-allocation study also spent about 30 hr a week doing "housework" (cleaning and maintaining the house, carrying water and firewood, cooking, doing laundry, etc.) and married men spent an average of 18.5 hr on income-generating activities. Income-generating activities include such things as cattle trading, buying and selling farm produce, making and selling charcoal, dredging and cleaning sand to sell for making concrete, contract farm labor for larger land holders, and other similar activities. Most men are involved in some form of entrepreneurial activity that earns income. Even traditionally there were some skilled craft specialties, for example, blacksmithing and thatching for men, potting for women, and herbalism and traditional medicine for both sexes.

Most farm households sell some milk, tea, or maize, or all three, to government-controlled marketing agencies. The maize and tea crops are said to belong to male heads of households, even though their wives also work on them. It is also said that the milk from the morning milking belongs to the husband and that from the afternoon milking to the wife. The morning milk is normally sold, while the afternoon (wife's) milk is used to feed the family. Thus married men have much greater access to and control of cash income than married women. Women may own vegetable gardens and chickens outright, and can sell vegetables and eggs. There is not much general market for such produce; women would normally sell them on contract to institutions such as schools. In the 1970s, brewing traditional beer was another way for women to make money, but the sale of traditional beer has become illegal in Kenya. Men in general have control over cash incomes far in excess of those of women (Oboler, 1985, p. 235).

The major property besides money is land and livestock. Traditionally, the Nandi had no land shortage, and whoever cleared and prepared a piece of land for cultivation had use rights until it returned to fallow. Cattle were the major form of property with which traditional norms of ownership were concerned.

The norms governing the ownership and inheritance of livestock among the Nandi and some other African peoples have been called the "house-property complex." Each married woman is the starting point of a house, or line of inheritance, which holds property separately from all comparable units. If a man has several wives, each is the founder of a separate house. There are basically four categories of Nandi cattle, with different norms governing their ownership: (1) those a man inherits; (2) those a

man takes in cattle raids (or in modern times, buys with his cash earnings); (3) those that come to a woman's house as gifts at her wedding, or that she acquires through her own economic efforts; and (4) those that come to a woman's house as bridewealth when one of her daughters is married. Only a woman's sons, not her daughters, inherit her house-property. Women acquire their major rights in property through their husbands when they are married. There are very strong norms that each wife's house is entitled to an equal share of cattle that the husband inherits, regardless of how many sons she has, and also that bridewealth cattle stay within the house. Men (husbands) are in charge of herd-management decisions, including the sale of cattle, but they are not supposed to violate these principles. Cattle that women receive as wedding gifts or acquire through their own efforts are supposed to be theirs, and husbands may not alienate them without the wives' permission. In practice, there are some cases in which husbands have not followed this rule, and there are also some in which wives have succeeded in having rule-violating husbands sanctioned by the elders' court. Men have relative freedom to allocate cattle they earn through their own efforts.

In the 1970s there was beginning to be a sense that inheritance of land should follow the same principles as inheritance of cattle. It remains to be seen how circumvention of these principles by a will, for example, would play out in the national legal system.

PARENTAL AND OTHER CARETAKER ROLES

Adoption is a possibility under special circumstances, but most children are reared by their biological mother. A child's *pater* is its mother's husband. There are institutionalized circumstances in which the *genitor* may be someone else, but the Nandi are clear that the *pater* fills the father role, for example, in the case of a female husband (see below).

Relations between mothers and infants are warm and nurturing. Relations between fathers and infants in the past were distant. The Nandi belief in feminine-child pollution (*kerek*), a mystical substance emanating from babies and breast-milk that destroys masculine character traits, prevented fathers from having close contact with infants. By the 1970s, most young men had given up belief in *kerek*, and fathers could be seen holding and

playing with infants and toddlers. Still, men's involvement in child care is minimal. Most of the work of caring for young children is done by older preadolescent girls. The time-allocation study showed that they spent more time even than mothers (15–20%) in direct interaction with young children. Mothers spend about 10% of their time in childcare, and fathers much less (1–2%).

Fathers spend more time with older boys teaching them the male side of the division of labor, for example, how to drive oxen while plowing. Parental conversations with children are not usually intimate. Children are obedient and treat parents with respect. More intimate relationships often exist with grandparents. Grandmothers are the tellers of children's tales.

LEADERSHIP IN PUBLIC ARENAS

Public leadership roles are all held by men. Nandi District is divided into locations, and the locations into sublocations. The sublocation is the local community, or "village." The sublocation that was the main site of my ethnography had 286 households or about 2,300 people in 1975. The government-appointed (based on popular preference) chief of the sublocation is a paid position, and the most obvious leadership role. Each neighborhood (*kokwet*) within the sublocation also has an "elder," whose main duty is to settle neighborhood disputes. All these offices are held only by men. Decisions involving the whole community are taken in a council of all adult men of the community, led by the Chief. Any married man has the theoretical right to participate in these meetings; in practice, discussions are dominated by a group of influential elders. Discussion proceeds to consensus. Consensus has been reached when, after a considerable period of talk, an apparent conclusion is stated by a leading elder, and nobody disagrees thereafter. Women may observe at these meetings, but not participate. Disputes and minor criminal cases are sometimes heard and judged by a council of (male) elders. In such proceedings, women may speak as parties to the dispute or as witnesses.

There are no positions of leadership for the whole community that women may hold. A local branch of the national women's organization Maendeleo ya Wanawake was just beginning to become active after a hiatus as I was leaving the field. Positions in such an organization would be women's only arena for leadership. However,

a Nandi woman from another area was a popular national member of parliament in the 1970s.

GENDER AND RELIGION

In traditional Nandi religion, there was no pantheon of gods and spirits, but rather a single deity called Asis or Cheptalel, and personified by the sun. There does not seem to be a strong sense of gender attached to this traditional concept of God, although the feminine name Cheptalel, which could be translated "White Girl," suggests that at least the deity was not unequivocally male. Today, the majority of Nandi are Christians (Roman Catholic, Africa Inland Church, Anglican, and Seventh Day Adventist), and accept that the Christian God and their traditional God are the same. In several Protestant denominations, the name "Jehovah" is used for God. It seems that God is conceptualized as masculine in most Christian presentations.

In traditional religion, prayers to Asis were offered at family shrines by both women and men. There was a belief that spirits of deceased ancestors were reincarnated in their descendents, and such reincarnation was not dependent on sex. Ritual elders in charge of community-wide rituals were men, except for women's initiation. All Nandi Christian clergy that I encountered were men.

LEISURE, RECREATION, AND THE ARTS

Men spend more time at leisure than women, but the difference is not spectacular. In the time-allocation data all adult men were engaged in clear-cut leisure for 42% of observations (37% for married men) and adult women for 30% (married women, 26%). For children under the age of 18, there is no marked gender difference in leisure time (35% for girls and 33% for boys).

Most adult leisure time is spent in relaxation and conversation with other persons of the same sex. Gender segregation is voluntary and not absolute. In the 1970s, the "beer hall" at the sublocation center, where traditional beer was brewed and sold, was a popular gathering place for older men and women (widows), and one of the few places where women and men were commonly seen socializing together. Beer parties in family compounds usually involved women brewing and tasting the beer in one area and men drinking it in another.

There are also "traditional" singing and dancing groups, separated by gender, that gather to rehearse and perform their acts at community fund-raising events. Churches may sponsor mixed-sex choirs. There is a popular game of strategy played by distributing stones among rows of holes in certain patterns. Men gathered in the sublocation center can be seen playing it, but never women. Checkers or draughts, imported by the British, is another game played by men. Children of both sexes play both these games. Children make their own toys. For example, a worn-out plastic sheet (used for protecting tea seedlings) bound up with string served as a soccer ball for neighborhood games. Children play mostly in mixed-sex groups. Schools sponsor track and field contests, with separate events for male and female students. The Nandi enjoy an international reputation as distance runners. Spectator interest is high for both male and female events.

RELATIVE STATUS OF MEN AND WOMEN

The status differential between men and women, and especially between husbands and wives, is considerable. Women's formal authority in community, kin group, and religion is virtually nonexistent, though they may exercise some informal influence. Nandi wives give great public deference to their husbands. The section on the economy (above) explained husbands' and wives' rights in property and produce. Husbands have the right to control the family herds. However, if a husband has a pattern of violating his wife's interests and wishes for those animals in which her rights predominate, she can secure from the elders' court a judgment for him to desist. Though wives have total control over certain economic assets of their own (vegetables, chickens, and milk from the evening milking), the incomes they gain as a result are tiny compared with those derived from male-controlled assets.

Women are active in arranging marriages. Indeed, it is usually said that the initial contacts that lead to most marriages are made between women, and both sexes are members of the parties that negotiate marriages.

Young people of both sexes are at the mercy of their elders in many life decisions. For example, their parents will decide whether to provide money for their school fees so that they can continue in school. There are instances in which a mother will find a way to get money

for this purpose that a father has refused. Marital decisions are usually partly, but not completely, a matter of choice (see below).

Widows have much more freedom and independence than do wives, including the right to inherit and manage their house property, and to come and go at their will.

SEXUALITY

Despite the practice of clitoridectomy, both women and men are supposed to enjoy sex. Young men of the warrior age grade are allowed to bring uninitiated girls to spend the night with them in their own personal "hut" or a communal neighborhood warriors' house (*sigiroino*). Sexual play, which ideally does not reach the point of penetration, is an expected part of such encounters. There is no high value on virginity at marriage per se (though honor is accorded to a girl judged to be a virgin at her initiation), but premarital pregnancy is not approved. Traditionally, people said, if a girl became pregnant out of wedlock the problem would be solved either by infanticide or adoption by a barren woman, the girl would have difficulty being married, and the young man who impregnated her was supposed to be beaten by his age mates. In modern times, unmarried girls sometimes have and keep their babies, and this is viewed as a social problem. The degree to which sexual play is present in young children and attitudes toward it are unknown.

Modern norms of modesty are a legacy of Christian missions. Women normally cover their thighs and breasts, though public nursing of babies is common. Married women cover their shoulders. In precolonial times, adult women covered their genitals at all times, but adult men did not. Adult women might work in the fields bare-breasted. The most embarrassing body part, after a married woman's genitals, is a married woman's thighs.

Nandi have a generally negative view of homosexuality and are reluctant to discuss it. People sometimes denied the existence of homosexuality among them, but I learned that there is a word for sodomy and there were a pair of men in the neighborhood reputed to be sexual partners. It was viewed as shameful, but not an outrage. I did not hear of any lesbian relationships. There was a person in a neighboring community said to be a woman who dressed as a man. This was thought to be exceedingly strange, but I was unable to learn more about her.

COURTSHIP AND MARRIAGE

Virtually every Nandi gets married. Exceptions are extraordinarily rare and explained by very unusual circumstances. The average age at marriage in 1975 was 18 for women and in the twenties for men. In marriage arrangements, men have somewhat more choice than women. They can urge their parents to try to arrange a match with a particular girl in seclusion following initiation, or discourage them from doing so. If a young man and a girl have a prior relationship, their preferences will probably be taken into account in arranging the marriage. The girl is supposed to observe her prospective bridegroom from behind a screen and give her consent before a marriage agreement is considered final. Almost half of couples report that they had "love marriages," involving an agreement to marry prior to the wife's initiation. In only three of 120 cases was the marriage totally arranged by parents without input from either spouse.

When a woman is in seclusion following her initiation, parties of relatives and friends of young men arrange to come to negotiate for her hand in marriage. Sometimes more than one offer will be made to a girl's family. A party from the bride's side negotiates with them. The parties consist of both men and women, and women are active in the proceedings. One item that is discussed is bridewealth, but it is more a matter of descriptions and pedigrees of the cattle that are being offered than of numbers, because bridewealth is a relatively standard number of cattle. During the wedding ceremony, the specific animals are ritually pointed out to the bride's brothers, who come later to drive them home. Modern weddings often take place in a church in the morning (or traditional weddings under the auspices of elders in a nighttime ceremony), followed by a feast the next day at the groom's family compound. The journey of the bride to the groom's compound is ritualized, with the bride refusing to go forward at certain points until promises (e.g., gifts of cattle from the groom's kin) are made. At the gate of the groom's compound there may be a mock battle between women from the bride's home trying to keep her from going farther, and women from the groom's home trying to pull her forward. Both sides sing ritualized songs.

Men can marry any number of wives, as long as they can pay bridewealth. In the 1970s the incidence of polygyny was about 25%. A woman is married once and may never remarry. Widows do not remarry, although they have leviratic relationships with close kinsmen of their deceased husbands.

A special feature of marriage among the Nandi is the possibility of woman–woman marriage. If a post-menopausal woman has no sons to inherit her house-property, she may use house-property cattle to pay bridewealth for a newly initiated woman who becomes her wife (the older woman is the husband). The wife has sexual relations with men of her own choosing, or the female husband arranges a sexual partner for her. Children born to the wife regard the female husband as their father, and the sons become heirs of the house-property. The relationship between the female husband and her wife is not sexual. The female husband is said to become a man, and she is required to give up sexual intercourse with men. An alternative solution to the same problem involves a daughter going through a marriage ceremony with the center pole of her mother's house. She then lives at home with her mother, has sex with self-chosen partners, and her sons count as heirs of the house.

HUSBAND–WIFE RELATIONSHIP

Husbands have jural authority over wives, including the right of corporal punishment. It is an offense for a woman to contradict her husband publicly, and it is wrong for a woman to "try to be bigger than" her husband. Wives must ask their husbands' permission for many activities, such as traveling. However, women's informal influence is far greater than this public image might imply. Many, possibly most, husbands confer with their wives about economic decisions and decisions concerning issues such as children's education and marriages. Relations between spouses are normally harmonious. If a woman is very dissatisfied with her marriage, she may leave her husband and live elsewhere, but divorce and remarriage are not possible. Children belong to the husband's lineage and their inheritance rights lie there. Older children stay with the father if the mother leaves. Younger children go with her, but are supposed to be sent back when they are old enough. The separated wife's rights in her husband's homestead and property are secure, and there are examples of older sons bringing their mothers home to live in the family compound following the father's death.

Some tasks in the division of labor are interchangeable, but some wives' tasks (e.g., cooking) are never done by husbands. Men often eat with age mates, served by the

wife of one of the men. Women and children eat separately. Wives often sleep with children, and separately from husbands. Husbands and wives spend some, but limited amounts of, leisure time together.

The relation between cowives is expected to be somewhat hostile, since they are in competition for resources. It is said to be best if husbands arrange for their wives to live on separate farms and travel between them. Yet examples of close relationships between cowives and widows of the same husband also exist.

OTHER CROSS-SEX RELATIONSHIPS

The relationship between women and their fathers and grandfathers may be affectionate, but is also distant and respectful. Men usually have a more easy-going relationship with their sisters, including lifelong concern for their welfare. A woman who leaves her husband is always supposed to be able to make a home in her brother's compound. Mothers often have a lot of influence over adult sons, and a widow usually lives in the compound of a son and his family.

CHANGES IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Participation in the cash economy and modern legal title to resources has in some ways undermined women's traditional rights in property. At the same time, some women have been able to acquire personal title to land they have purchased. Traditional license to engage in sex play, without traditional safeguards, means that illegitimacy is a growing problem. Some people suggested (though I think not seriously) that a solution could be allowing daughters a share of inheritance. In the late 20th century the incidence of woman–woman marriage appeared to be increasing because it presented a way for women to safeguard rights in land. People often spontaneously mentioned loss in the belief in *kerek* (child pollution) as a positive feature of modernity that enabled fathers to have closer relationships with children. However, this has also meant reduction in the long postpartum sex taboo, and larger families, leading to land shortage.

ALTERNATIVE NAMES

Navajo are also known as Diné and Navaho (antiquated).

LOCATION

The Navajo Nation occupies a 25,000 square mile reservation in what is now known as the southwestern United States. Reservation lands extend across northeastern Arizona and adjacent portions of New Mexico and Utah. Situated in the south central portion of the Colorado Plateau, the geographic terrain, which varies between high desert and pine-forested areas with numerous natural lakes, is marked by deep canyons, steep escarpments, and prominent buttes of colorful rock layers.

CULTURAL OVERVIEW

With a total population of nearing 300,000, the Navajo are the largest native nation in the contiguous United States. At the time of European contact, the Navajo subsisted by means of hunting and gathering supplemented by some agriculture (Brugge, 1983, pp. 489–501). Extended family units, centered on matrilocal residence, lived in widely dispersed settlements. After livestock were first introduced into the region by Spanish settlers, a herding economy based on sheep and goats developed. The Navajo population and their area of settlement gradually expanded as new crops, animals, and technological innovations continued to be added to their subsistence base during the Spanish and American periods.

Like Native people throughout the Americas, Navajo endured many hardships at the hands of European and European American conquerors. For example, in the 19th century an extended period of war resulted in nearly 9,000 Navajo being rounded up and forced to walk 300 miles to Hwéeldi (Fort Sumner, New Mexico), where they were incarcerated by the U.S. Military from 1863 to 1868. On June 1, 1868, a treaty was signed which established a reservation on a portion of the Navajo homeland to which the captives were allowed to return. After their return, the Navajo economy and population gradually recovered (see Bailey & Bailey [1986] on the reservation years). Trading posts began to flourish on the reservation in the late 1800s and a barter economy developed wherein male lambs and items of Navajo manufacture were traded for coffee, flour, lard, canned goods, and other food staples. During the closing decades of the 19th century, the first biomedical physicians began servicing portions of the Navajo reservation. Tracts of land were annexed to the original reservation at numerous times between 1878 and 1934, and separate tracts of land were subsequently secured for outlying Navajo groups—the Alamo (1946), Canoncito (1949), and Ramah (1956).

The early years of the 20th century were riddled with cultural and economic hardships resulting from drought and overgrazing. Coupled with fluctuations in livestock and wool prices, these factors resulted in a shift toward increased dependence on wage labor and the production of woven goods and silverwork for the off-reservation market. To accommodate developing resource extraction-based industries, including coal and uranium, a federally designed centralized government—the Navajo Nation Council—was installed on the Navajo reservation in the 1920s (see Iverson [1981] on the development of the Navajo Nation). Federally mandated stock reductions diminished family herds in the 1930s, which resulted in increased dependence on wage labor on and off the reservation, as well as greater acceptance of non-Navajo religious beliefs and practices such as Catholicism, Protestantism, Mormonism, and the Native American Church. Increased exposure to the non-Navajo world through military service and employment in war-related industries during World War II led to greater usage of government-run health care and educational facilities. The so-called "Navajo–Hopi Land Dispute" over an area of Arizona that both tribes consider to be ancestral homeland has monopolized enormous amounts of time and energy since the turn of the century.

In the face of these various changes and concerns, the Navajo Nation has experienced relatively high language retention, and Navajo tenets of philosophy are currently taught at all grade levels, including courses at Diné College. Navajo who are employed off the reservation or in towns on the reservation return to matrilineal family homes in remote areas as frequently as is possible in order to participate in family activities. Those in need of medical attention freely combine biomedical care and treatments administered in state-of-the-art facilities across the reservation with traditional care and treatments administered at home. Most Navajo who have adopted non-Navajo religious doctrines and practices still participate in traditional healing rituals held for themselves or for members of their extended families.

According to Navajo oral tradition, which relates their origin as successive emergence upward through a series of subterranean worlds, the Navajo universe preceded human existence. Thus, to understand philosophical beliefs underlying contemporary Navajo notions of gender and sexuality, it is necessary to consider first the view of the universe and the place of Navajo people within it documented in these accounts.

The Navajo origin and creation stories describe the preparation of the physical world and the creation of its inhabitants. Collectively they establish an ethnic identity for all Navajo, defining meaningful relationships between individual members of the community and between the community and the cosmos. Navajo consider themselves to be the Nihookáá Dine'é, having been created on the earth's surface by Asdzáá Nádleehé, "Changing Woman," the most highly revered of all Navajo Holy People and the inner form of the earth. Her continual maturation, death, and rebirth are mirrored in the changing seasons of the earth (birth is mirrored by spring, youth by summer, maturity by fall, and old age and death by winter). As its inner being, Changing Woman is considered the mother of all who dwell on the earth's surface. She directed the Nihookáá Dine'é to live within the geographical area demarcated by their four sacred mountains (O'Bryan, 1956, p. 112).

The space within which Navajo life is lived is organized on the paradigms established in the origin stories. Interconnection among all aspects of the world on the basis of these is a fundamental aspect of the "natural order" established by the Diyin Dine'é, "Navajo Holy People." Relationships between and among all entities are based on culturally sanctioned rules governing rights, prerogatives, and agency.

CULTURAL CONSTRUCTION OF GENDER

Manipulations of the bodies of infants shortly after birth and of pubescent children indicate that desirable features for both Navajo men and women are a long straight nose, a flat forehead, a straight back and good posture, an overall physically strong and fit body, and long, healthy, and well-groomed hair. The Navajo Holy People directed men and women to wear their hair in a bun at the back of the neck. Women traditionally wore two-piece woolen dresses, with sash belts, and moccasins with leg wrappings. Men wore woven breechcloths with moccasins. In the mid-1800s women adopted multi-tier gathered skirts of satin and pleated velveteen blouses, and men adopted pants and shirts constructed of commercially manufactured cloth. While they may don such attire for special occasions, contemporary men and women under the age of 50 cut their hair and wear clothes reflecting current European American styles on a day-to-day basis. Elderly men, who frequently wear their hair in traditional buns, prefer wrangler jeans, Western-style boots, hats, and shirts. Elderly women, who almost always wear their hair in the traditional bun, wear cotton gathered skirts and simple blouses, with support or tennis shoes. Both genders cherish turquoise and silver jewelry and wear an abundance of it with pride.

Prior to European American colonization, the Navajo recognized four main gender categories: women, men, *nádleehé*, and *dilbaa*. *Nádleehé*, "a person who is in a constant state of change," is a feminine person born with both genitalia who dressed and functioned as a woman. A person born with both genitalia who in adult life dressed and functioned as a man was classified as a *dilbaa*. *Dilbaa* was the first of these gender categories to disappear completely from the Navajo tribe during the second half of the 19th century (Thomas, 1997). Some *nádleehé* are known to live on the reservation today.

GENDER OVER THE LIFE CYCLE

The sex of the child is said to be determined at the time of conception by the type of fluid with which the father's sperm merges in the mother's womb. If the man's sperm

combines with *tó aľtahnáschíín*, "all different kinds of waters come together," a biologically male child is formed; if it combines with *tó biyáázh*, "child of water," a biologically female child results. (No information is available distinguishing the conception of *nádleehé* and *dilbaa*.) This sexuality is not immutable. Navajo can and do influence the sex of their unborn children. Parents who have a sexual preference pursue all avenues to influence the outcome of the sex of the child. Navajo women have knowledge of a variety of specific means that can be used to influence the sex of a child before conception or during pregnancy, including the application of pollens or white shell directly to the mother's body, the wearing of white shell or turquoise, the ingestion of aragonite, white shell, or particular parts of sheep, and the power of prayer.

The prenatal period is a time of intense susceptibility. As a result, both parents take precautions throughout the gestation of a child. After birth, children are carefully bathed and molded to take advantage of the body's malleability at this time. Children must be assisted in the process of attaining full Navajo personhood. The teachings of the Diyin Dine'é dictate that particular parts of the body—afterbirth, blood, umbilical cords—are more susceptible to effect than others, and that the human body is more open to effect at critical times in the life cycle—in utero, at birth, and at puberty. Although the male puberty ceremony is not performed as frequently as it once was, specific rites are performed shortly after birth, at the time of a child's first laugh, at puberty, at marriage, and at death for both women and men.

Consideration of the various methods used to influence children—in the womb and throughout childhood—reveals that Navajo individuals can be affected by contact with other persons (human and nonhuman alike), with various substances, or with dramatic events. Influence can be transferred through a variety of means, including person-to-person contact, contact with bodily substances such as blood, exposure to the sensitive portions of a ceremony, or exposure to another person's death.

Babies of either sex are referred to as '*awéé*" throughout the first year of life. Girls are referred to as '*at'ééd yázhí* from roughly age 1 until age 3; boys are referred to as '*askii yázhí* during the same period. From 3 until puberty the reference is shortened to '*atééd* for girls and '*askii* for boys. After puberty until about age 30, a young woman is referred to as *ch'ĳééh* and a young man is referred to as *dinééh*. An adult woman between the ages of 30 and 70 is referred to as '*asdzáni*, while a man in this

age group would be referred to as *hastiin*. A woman over 70 years of age is referred to as '*asdą́ą́' sání*, and a man of this age is referred to as *hastiin sání*.

When infants are near the age of 4 months, relatives begin to joke about the need to be cautious in their presence because the person who makes the baby laugh for the first time is obligated to sponsor a ceremony in honor of the event. The child's first laugh marks its preliminary step toward emotional development and expression of empathy. Relatives use the occasion as their opportunity to anchor the child's emotional life firmly within his or her social landscape by initiating the child into the complex network of communication and reciprocity that operates within extended families.

Throughout this rite, the sponsor holds and acts for the baby. With the assistance of this adult, the child will first apply a protective layer of natural rock salt to the outside of its own body and then give a token amount of the salt to each of its relatives, as well as to close friends of its family who are in attendance. This giving is designed to encourage generosity and to guarantee that the child will not grow up to be "stingy." As relatives walk up individually to accept their portions of rock salt from the baby, they ingest a small amount. A small token of natural rock salt may be given alone or, when finances allow, other items are also given as gifts from the baby. In such cases, the salt and gifts are placed in a ceremonial basket, and with the help of his or her sponsor, the child hands these to each relative who files past. Distribution of the rock salt and small gifts is followed by a large meal for all relatives and friends in attendance.

All Navajo are believed to possess both male and female aspects or qualities. This pairing is demonstrated in the actual composition of the human body. Navajo believe that their bodies are divided in half from the top of the head down to the feet. The left-hand side of every Navajo is considered *naayéé' k'ehjigo*, "on the side of protection," that is, the warrior side of the person; the right-hand side is *hózhǫ́ǫ́jigo*, "on the side of tranquility, harmony, and order," that is, the female or "peaceful" side of the person (Schwarz, 1997, pp. 94–101). Despite this shared constitution, Navajo men and women are considered to have some different attributes and very different roles.

The primary culturally sanctioned role for women is that of nurturer. This means that Navajo women are to be mothers whose most important responsibilities are to foster and sustain the development of children (Schwarz, 1997, pp. 26–27, 238–239). The culturally

sanctioned role for men is that of protector (Schwarz, 1997, pp. 159–160, 162, 163). This role distinction is symbolized by the traditional weapons for each gender—*ádístsiin* (stirring sticks) for women and *nádleehé*, and the bow and arrows for men and *dilbaa*.

Socialization of Boys and Girls

After birth, children are carefully bathed and molded to take advantage of the body's malleability at this time. Formerly when children were born at home, once the baby was born the woman supervising the birth ascertained that the child was breathing and stimulated it to cry with a gentle circular sternal massage. She then cut and tied off the umbilical cord, wrapped the child in an expendable blanket or sheep pelt, and placed it with its head toward the fire to rest, while all present waited for the afterbirth to be delivered.

Following safe delivery of the placenta, the child was bathed in warm water, wrapped in a blanket or sheep pelt, and handed to its mother, who would greet the child while shaking his or her right hand. Care was taken in selecting the woman who would bathe the child, because her personal attributes—industriousness or laziness—were transferred to the infant (Bailey, 1950, p. 75).

The midwife or attending female relative dipped her right forefinger into a mixture of pollen and water and administered a pollen blessing. Next, the woman who bathed the child shaped it by means of gentle molding. She pulled on the child's nose to lengthen and straighten it, she pressed on its forehead to flatten it, and she pressed and shaped the arms and legs to "make them stiff" and facilitate future walking (Bailey, 1950, p. 75). The bathed, blessed, and shaped child was then placed at the left side of its mother, with its head facing east toward the fire (Bailey, 1950, p. 77; Leighton & Kluckhohn, 1947, p. 17). Infants were placed in this position to allow the heat of the fire to penetrate the child's skull and thus aid the closure of the fontanel, and to promote the development of a round head.

In addition, Navajo parents and grandparents carefully manipulate parts of the child's body, such as the blood associated with childbirth or the umbilical cord, and this manipulation has lifelong effects on the child. The teachings of the Holy People governing the cultural construction of personhood dictate that the umbilical cord be placed in a location considered by the parents and grandparents to be most beneficial to the child's future.

When the family wants a boy to be good with livestock, parents or grandparents bury his cord in a sheep, cattle, or horse corral, tie it to the tail or mane of a horse, or tie it to a sheep. A boy's cord is buried in the family fields when it is desired that he be concerned with farming (Bailey, 1950, p. 74). A girl's cord is buried underneath the place where the loom is erected if the family wants her to become an expert weaver (Bailey, 1950, p. 74; Leighton & Kluckhohn, 1947, p. 17) or in the sheep corral to ensure that her thoughts are with the livestock (Bailey, 1950, p. 74). A girl's cord is buried near the home when they want the girl to become a good homemaker.

Many contemporary parents and grandparents continue to bury the umbilical cords of new family members under looms or in corrals to actuate the development of good weaving and herding skills. While recognizing the importance of traditional skills, other Navajo, concerned over the ways in which Navajo life is changing, believe that to succeed in today's world their children and grandchildren will need additional skills. To foster new skills such as those required in the Western educational system, elders place dried cords in dictionaries or schoolbooks.

From an early age until puberty, both boys and girls are expected to assist with routine domestic chores such as sheep herding and hauling of water or firewood. In addition, boys are expected to help their fathers and other male relatives with masculine tasks such as farming, wood collection, making jewelry, or livestock care, while girls are expected to help their mothers and female relatives with feminine tasks such as cooking, basket-making, weaving, and childcare.

Once chores and schoolwork are complete, prepubescent children entertain themselves with television programs, toys, music, and other products of mass popular culture. In general, girls spend leisure time under the watchful eye of relatives, while boys have more freedom to wander and spend time with peers away from the domestic sphere.

Puberty and Adolescence

Pubescent girls are directed to notify their mothers or grandmothers at the onset of menstruation. In anticipation of this important event, family members gather necessary clothing, jewelry, and other materials so that a Kinaaldá, the Navajo female puberty ceremony, can be begun as soon as notice is given. This is a 4-day event involving ritualized dressing of the initiand with traditional attire in

the image of Changing Woman, shampooing the initiand's hair, multiple moldings of the initiand's body, and running on the part of the initiand toward the east at dawn, noon, and sunset on each day, as well as the communal production of a corn-based cake cooked overnight in the ground as an all-night sing is performed over the young woman. Approximately a quarter to half of all Navajo girls take part in this important ceremony today. Ideally, it should be repeated at the time of her second menstrual cycle; however, school and work schedules combined with limited family resources or inclement weather frequently result in young women forgoing the second ceremony.

Several Navajo people with whom I consulted mentioned male puberty ceremonies that were performed for themselves or their male relatives. According to most consultants, it is change in voice that marks a boy's entrance into puberty. Alternately, in some families the male puberty ceremony is triggered by a young man's first ejaculation, which is likened to a young woman's first menstrual period. Individual accounts of male puberty ceremonies closely parallel the episodes documented in oral history regarding the pubescence of Changing Woman's twin sons, Monster Slayer and Born For Water. Despite profound changes in the Navajo world, many of the old methods for transforming boys into men endure. Today, boys are ushered into manhood by means of ceremonies in which they may run to the east while singing or yelling, sweat, fast, be whitened with cornmeal, be molded, have a giveaway, learn songs, and be educated in matters of sexuality and the proper behavior for Navajo men (Schwarz, 1997, pp. 156–173). This ceremony ensures that men will have physical strength, knowledge of songs, and educated understandings of male sexuality and responsibilities.

Attainment of Adulthood

At the close of the puberty ceremony, young women and men were traditionally considered eligible for marriage. Although early wedlock is not practiced in the contemporary world, after Kinaaldá, young men and women are expected to assume adult roles.

Personality Differences by Gender

The primary culturally sanctioned role for women is that of nurturer. This means that Navajo women are to be mothers whose most important responsibilities are to foster and sustain the development of children. Women are expected to act in a more nurturing and emotionally demonstrative manner than men. The culturally sanctioned role for men is that of protector. Men are expected to be more aggressive by way of defense but not by way of dominance over women, for women wield vast power over day-to-day life decisions—what food will be eaten, when a sheep will be butchered, how funds are to be spent.

Gender-Related Social Groups

The first Nihookáá Dine'é were not made to live as individuals; rather, they immediately were matched and paired to found the Navajo social order. It is generally agreed that Changing Woman simultaneously created four pairs of women and men by rubbing cuticle from various parts of her body and mixing this with ground precious stones, ground corn, and her breath. She selected individuals from these first Nihookáá Dine'é to live as husband and wife and thus established the four original clans of the Navajo and the practice of clan exogamy (Aronilth, 1985, p. 83; O'Bryan, 1956, p. 167; Yazzie, 1971, p. 74). There is no consensus in the various accounts of this episode about exactly which clans originated from Changing Woman's flesh, or which clans originated from which parts of her body, but members of the clans believed to have come from her flesh take special pride in their sense of being members of an original clan. Once paired, these men and women were directed to go forth to where Changing Woman's sacred cornfields were in the east, within the sacred mountains of Diné Bikéyah, and increase their numbers through heterosexual reproduction (Aronilth, 1985, p. 83).

Navajo reckon kinship through four matrilineal clans—the mother's to which they are born, the father's for which they are born, the maternal grandfather's, and the paternal grandfather's. In addition, married Navajo have affine relations with a spouse's clans. Greatest emphasis is placed on the clan to which one is born. Coupled with matrilocal residence, this generally results in closer ties and commitments to one's mother's relatives than to one's father's relatives. In addition, clans are believed to be related to each other and clan exogamy rules extend to these related clans.

Gender Roles in Economics

The necessity of sexual desire for the continuance of society brought with it jealousy, worry, and adultery, which caused numerous social problems. Oral history documents that in the last underworld men and women disagreed about important aspects of their joint lives. The powers of sexual attraction, in one form or another, played a fundamental role in the initial dispute that took place between First Man and First Woman (O'Bryan, 1956, pp. 6–7; Yazzie, 1971, p. 28).

The men and women lived apart for 4 years. Since the women remained on the side of the river where the agricultural fields were already prepared, they initially fared better at procuring food from crops than the men did. But year by year, as the men continued to hunt and, under the guidance of Nádleehé, became increasingly adept at farming, their subsistence base exceeded that of the women (Fishler, 1953, p. 26; O'Bryan, 1956, pp. 7–8). The women, who grew weak with hunger, were soon dying for want of everything, including the companionship of their spouses.

After consultation, they agreed to rejoin and live as one group. The hardships and failures of life during the separation ultimately proved that neither sex can exist without the other, and this reunion symbolizes the complementary roles of men and women. The "rules" established by First Man at the time of the reunion form the base paradigm for the complementary nature of gender relations.

Women were given control of the domestic realm (household, livestock, and agricultural fields); men were given control of hunting as well as the political and ceremonial realms. Thus men hunt, dress skins, make moccasins, gather firewood, perform agricultural labor, and care for horses and associated equipment, whereas women cook, clean the home, tend to the needs of children, butcher livestock, and gather agricultural products from fields for immediate consumption. While enshrined in oral tradition, these roles and duties are flexible depending on family circumstances. Men care for children and cook when the need arises, and women assist with livestock care during lambing and sheep dipping or when needed at other times. Women have traditionally been the potters, basket-makers, and weavers, while men did silversmithing and other metal work, but men and women do each of these crafts today.

Men were traditionally removed from home for substantial periods of time because of involvement in long-distance trade and warfare. Presently, owing to unemployment rates far exceeding national norms on the reservation, young men who do not hold grazing or farming permits are frequently away from home for extended periods of time working on construction crews or completing military service. Additionally, thousands of Navajo are employed in the fields of health care, education, government service, and commercial farming or in resource-based industries such as timber and mining. Women are generally more successful in securing such employment close to home; therefore, with the aid of matrilineal relatives, they tend to bear more child rearing responsibilities than their husbands.

Leadership in Public Arenas

Since after the "separation" the decision was made to delegate political and ceremonial power to men, the voices of male ceremonial practitioners and orators came to embody the power needed to restore health and to maintain social order. In accordance with this dictate and European preferences, men assumed leadership roles in all negotiations with European powers after contact. Furthermore, since its inception, Navajo men have dominated the federally designed centralized government, which they have adapted and molded to become an effective means by which to control and dispense much needed goods and services. Although no woman has yet served as President of the Navajo Nation, women are making significant inroads in the political realm.

Gender and Religion

Despite the fact that there has been a long-standing assumption that women are not ceremonial practitioners, Navajo women can and do successfully fill this role. While most women are diviners or herbalists, women practitioners of Blessing Way and curing ceremonials are practicing in communities throughout the Navajo reservation. Navajo women who choose to pursue careers as ceremonial practitioners face complex challenges—oral accounts dictating that men are to be the leaders of ceremonial and political matters, rules surrounding menstruation, and strict sexual continence rules. Nevertheless, motivated to fulfill the culturally sanctioned role of nurturer, they navigate the social and personal issues

raised by these multiple challenges to aid fellow Navajo in times of need and carry forward time-honored traditions.

LEISURE, RECREATION, AND THE ARTS

Women relatives and friends commonly spend idle hours quietly chatting while doing craftwork, cleaning vegetables, roasting corn, or performing other household tasks in each other's company. Sweat bathing is a favorite leisure time activity, and is strictly sexually segregated. While sweat bathing, men and women entertain themselves or each other by practicing songs, discussing politics, and telling stories, including origin stories, the oration of which, while normally limited to the winter months, can occur in a sweathouse during any season.

Male Enemy Way singing groups traverse the reservation throughout the summer season to entertain during the social dancing portions of this important ceremony. During the winter season, male teams of shoe-game partners travel to various communities for competitions. To supplement food resources and for pleasure, men hunt with other men in groups of two or three. Men also drink on or off reservation with male drinking partners. Importantly, each of these leisure-time activities is delimited by traditional Navajo values such as cooperation with and responsibility toward relatives.

RELATIVE STATUS OF MEN AND WOMEN

While arranged marriages were previously the norm, men and women currently have personal control over their sexuality, marriage choice, and divorce, but family members offer input and advice to help guide personal choices on all such matters.

Grazing and farming rights are passed through the matrilineal line. When a parent dies, however, both sons and daughters can and do inherit ceremonial paraphernalia, jewelry, or grazing and farming rights to a mother's customary use area. Matrilocal residence results in men commonly living in situations wherein the house, household furnishings, fields, and most of the livestock belong to the wife and her family. In-marrying men bring only personal clothing, tools, vehicles, and weapons, when first married. Over time, they bring their livestock to the new residence. Only these possessions are taken back to the man's mother's or sister's house if divorce occurs.

All adults living in a collective unit have input into decisions regarding family matters—what type of help will be sought for an ill family member, who will take a child to college, what will be taken to a relative's ceremony, or what household repairs will be completed—but the matriarch (the eldest woman in the parental generation of the extended family) makes the final decision on all such matters. In some cases, even today, she determines how each adult member's earnings from silverwork, weaving, or paid employment will be used for the collective good.

SEXUALITY

While sexuality is accepted as a natural healthy aspect of life, Navajo people maintain that it must be carefully controlled due to the danger of individuals allowing sexual desire to go awry. The libidinous acts and excesses practiced in the last underworld rendered certain forms of menstrual blood and game animal blood polluting and dangerous in the contemporary world, resulting in strict rules for containment and control of these substances.

Both men and women are believed to have sexual drive, and either gender can initiate a sexual encounter. Sexual interests are associated with visual cues. Navajo people normally avoid direct eye contact in day-to-day associations. To look a member of the opposite sex directly in the eyes is a sexual overture. In addition to cautions against holding hands with, kissing, or fondling a sexual partner in public, Navajo people are taught that it is inappropriate to dance with a clan relative in ceremonial or social contexts (Kluckhohn & Leighton, 1946/1974, p. 201). Sexual avoidance dictates relations amongst cross-sex siblings, sons-in-law and mothers-in-law, mothers and sons, as well as fathers and daughters. In addition to using formal means of address, individuals in these relationships must not make direct eye contact, pass things directly to each other, or be found alone together. Extreme personal modesty is the ideal, with emphasis on concealment of body parts, especially the genitalia. Even among sexual partners, exposure of the sexual organs is considered shameful and embarrassing. Sexual relations are to take place during the hours of darkness, to guarantee privacy, and protect personal modesty (Kluckhohn & Leighton, 1946/1974, p. 91). Furthermore, it is deemed improper for Navajo people to engage in oral sex or to use certain positions during sexual intercourse.

COURTSHIP AND MARRIAGE

Formerly, Navajo marriages were arranged between families on the basis of clan exogamy and efforts to maximize familial-pooled talents and resources as well as to affiliate clans and build social and economic relationships (Reichard, 1928, pp. 58–73). The mother's brother had the final say on a niece's partner, as did a father or paternal grandfather on a young man's bride (Reichard, 1928, p. 139). Bridewealth—livestock and other gifts from the groom's family to the parents of the bride—was and is an integral part of solidifying reciprocal relations between extended families. The wedding ceremony involves washing of the groom's hands by the bride, the bride's hands by the groom, consumption of cornmeal mush from the east, south, west, and north quadrants of a ceremonial basket by first the groom and then the bride, and the giving of advice by elders to the couple, followed by a feast for all in attendance. Polygamy was common through the 1940s, with a preference for a man to marry sisters simultaneously or a wife's daughter from a previous marriage upon her maturity. Cowives live in separate homes in close proximity to each other. To maintain affine ties between families and clans, a widower was expected to marry one of his deceased wife's sisters. Today, marriages result from courtship and personal affection. Elders continually caution members of the younger generation against having relations with clan relatives.

Spousal relationships are generally characterized by deep affection and close companionship. Spouses eat and sleep together and spend time in each other's company on a regular basis. Formerly, Navajo practiced polyandry; the fact that cowives were frequently sisters aided maintenance of harmony within the family. No stigma is associated with divorce. Either spouse can and does initiate separation. Children stay with the mother or her female relatives.

OTHER CROSS-SEX RELATIONSHIPS

The mother's brother plays a disciplinary role and mentors his nieces and nephews. Joking relationships exist between specific types of relatives. Prurient joking is conducted between maternal grandmothers and grandsons, unmarried siblings of wife or husband with her or his unmarried siblings, and cross cousins who are not potential mates. In contrast, prurient joking is acceptable between father-in-law and son-in-law, while less explicit jokes about members of the opposite sex are regularly conducted between maternal or paternal uncles and aunts with nephews and nieces, respectively.

Mother-in-law avoidance on the part of sons-in-law, which was strictly adhered to for generations, is practiced on a limited basis today. Many sons-in-law simply make themselves scarce and useful while their mother-in-law is present, while others agree to drop the restriction entirely.

Nepali

Mary M. Cameron

ALTERNATIVE NAMES

"Nepali" refers to the people of Nepal, who are a diverse group both ethnically and historically. Nepalis are sometimes referred to as Gorkhalis, though that is an increasingly archaic term. Since approximately 80% of Nepal's population are subsistence farmers who live in the Himalayan foothills called *pahard*, they are sometimes referred to as Parhardis. People of the far western region are referred to as Khasiya, after some of the earliest inhabitants, the Khas. The author's original data on sex and gender come from a western region called Bajhang, and the people there are called Bajhangi. Other ethnic minorities of Nepal, mentioned briefly in this chapter and some of whom are Hindu and others Buddhist, include the Sherpa, Gurung, Tamang, Magar, Thakali, Tharu, Rai, and Limbu. The Newari are the largest ethnic minority and are considered the original inhabitants and rulers of the Kathmandu valley, who practice a distinctive form of Buddhism and have unique gender practices. This chapter will primarily discuss the majority Hindus, who are socially organized by caste, with each caste varying somewhat in its gender culture. Significantly varying or unique cultural practices of other ethnic minority groups (Hindu and Buddhist) will be mentioned.

LOCATION

The country of Nepal is located north of India and south of the Tibetan Autonomous Region in China, in the geographical area of South Asia. It is a small landlocked country famous for the Himalaya Mountains which comprise its northern border, and for its ethnic diversity. Nepal has never been colonized, unlike its surrounding neighbors, and its most important regional relations are with China and India. The country's geography encompasses the highest peaks in the world, the Himalayas to its north, which gradually descend southward to the foothills and into the flat, hot Tarai that borders India in the south. The majority of people live in the Himalayan foothills, and the south holds the largest cities, the most industrial production, and the greatest infrastructural development. The capital city is Kathmandu, one of three medieval cities in the largest valley that served as an important trade route between India and China over the centuries.

CULTURAL OVERVIEW

Earliest records describe a land of separate ruling principalities that were united under large kingdoms west of Gorkha, and smaller kingdoms east of Gorkha. King Prithvi Narayan Shah of Gorkha unified the country east of Gorkha in the 18th century, and what is known today as Nepal cites its origins to that time, even though incorporation of the western kingdoms occurred later. The national language of Nepal is Nepali, from the Indo-Aryan branch of the Indo-European language family, and numerous variations of standardized Nepali are spoken. Nepali uses Devanagiri script, derived from Sanskrit. Numerous languages from the Tibeto-Burman branch of the Sino-Tibetan languages are spoken by ethnic minorities throughout the country.

Nepal has a primarily agricultural economy, and the majority of people are subsistence farmers. It is considered one of the 10 poorest countries in the world, with an average annual income of approximately $250 (U.S. dollars). People meet their basic subsistence needs through farming and forms of exchange labor described below. Tourism is one of Nepal's most important industries. International development has been underway in Nepal for the past half century, and development dollars comprise a large percentage of the national budget. The majority of Nepali people claim Hinduism as their main religion, followed by Buddhism. Hinduism is also a way of life that organizes society and people into ranked groups called castes, which have religious and economic features. Nepal is famous for its religious syncretism and non-violent sectarianism.

Most Nepalis live in small farming villages, and those with land plant main crops of rice and wheat, supplemented by corn, millet, vegetables, legumes, fruit trees, and tobacco. Nepali villages generally do not have running water or electricity inside the homes. Water taps and wells are shared by the community for drinking water, for bathing, and for washing clothes. The number of families with outdoor latrines is increasing in Nepali villages, though the majority of people use river and creek beds as their toilets.

Nepali houses are built from local raw materials and are generally of stone and mud–dung construction, with supporting wooden beams. Roofs are thatch or slate. The number of stories depends on the family's wealth, but most do not exceed three, and the poor usually have only one storey. Animals live in barns attached to the house on the ground floor. Rooms are multifunctional, serving as sleeping and storage spaces. The hearth and dining areas are on the top floor.

Integrated into the agricultural economy is a traditional patronage system called the *jajmani* system, which binds low-caste families to high-caste families through economic need and Hindu religious ideology. In exchange for low-caste artisan products, such as agricultural tools, pottery, baskets, clothing, and house construction, high-caste landowner patrons regularly provide harvest shares called *khalo* to artisan families, and are expected to meet many other subsistence needs of these untouchable landless dependents (Cameron, 1998). Now, lower castes seek independence from the patron–client system by becoming small landowners in an increasingly closed market.

CULTURAL CONSTRUCTION OF GENDER

A pervasive ideology of social hierarchy—ranking based in religious principles—is found in the caste and the gender systems. In behavioral, material, and symbolic ways, one's position in the world is relational and emergent, yet is also bound by one's birth status of caste and gender. Nepal is fundamentally a patriarchal society, and it recognizes only two genders, female and male (although ancient medical texts describe ambiguously sexed individuals). The same word for caste, *jaat*, is used to refer to one's sex, and referents share the ideas of a common "natural state," and common biological and social features with others in the group, from the time of birth. Just as an individual can never change her caste, so she can never change her biological and social sex. Similar values operating in caste reproduction are found in gender hierarchy, such as ritual purity.

The Nepali family structure may be extended, stem, or nuclear; the ideal family is one in which brothers live with parents, wives, and children in one household. Alternatively, brothers will live near each other, for their economic livelihood depends on sharing patrilineal resources such as land, animals, tools, and clients. Sex-role dichotomy is found in the household domain in many forms. For example, men plough fields and women carry fertilizer and weed the crops. Women cook and clean, while men attend to political affairs. Studies show that women work more hours than men throughout the agricultural cycle, a finding true for lower castes as well. The people with the greatest amount of leisure time are high-caste men, and those with the least are high-caste women. Within the lower-caste groups, who are primarily artisans, a gender division of labor in the household is similar to that in high castes, though economic activities are more varied and complementary (Cameron, 1998).

Rural Nepalis dress in fairly traditional and similar ways, and people's age, life stage, and caste can be partially discerned from their clothing. In warm weather, infants are often naked to allow for easy cleaning, or they are wrapped in a light cotton cloth; in cold weather, layers of cloths are used. A cap is almost always worn throughout the year, to protect the child from the ill effects of wind. When carried, infants are bound to a relative's back with a long shawl tied around the caretaker's chest. Everyone cares for children, even youngsters, and the latter learn early how to sling a sibling or cousin-sibling on their back. At night, babies are swaddled and sleep near the mother in the warmth of the upstairs hearth. Toddlers graduate to their own tailored garments or wear outfits purchased at local stores. Most clothes are made of cotton or polyester, and sewn locally by tailors and seamstresses. Shoes are optional, depending on the season. Young girls wear jumpers or long tunics with loose-fitting pants, and boys wear long tunics with fitted drawstring pants. Depending on caste, married women wear saris, long full skirts or long tightly wrapped *lungi*, and locally stitched blouses. Women prefer brightly colored clothing, especially red, and their skirts always cover the knees and calves. Local stores sell manufactured garments for boys and men, polyester and silk saris for women, and wool and cotton shawls, all imported

from India or southern Nepal. Before the introduction of cotton cloth, garments were made from locally manufactured hemp and wool. Boys and men wear small hats called *topi*, which are made from Nepali hand-woven cotton. Women and men wear sex-specific clothes. Only recently has it become acceptable for girls to wear pants, though married women are still reluctant to do so.

Men keep their hair short, and women wear theirs long and in braids. Shorter hair fashions for girls are found in urban areas, and sometimes among unmarried girls. An attractive female is one who has shiny long black hair, dark eyes, light skin, and plump rosy cheeks; an attractive boy has the same features (except with short hair) and is strong. Wealth, education, and storytelling and musical talents are also deemed attractive. Desirable and ideal behaviors in girls and women are subservience, obedience and respect for elders and males, being soft-spoken and composed, and showing restrained laughter. The same is generally true for boys, though greater latitude is granted in their behavior.

Throughout life, the sexes are separated in many ways, and people's closest friends are those of the same sex. Gender is a complexly articulated social signifier, and finds many behavioral, familial, and social expectations. The symbols that organize gender relations include purity, impurity, and honor—symbols that also organize caste and kinship relations.

GENDER OVER THE LIFE CYCLE

Women tend to conceal their pregnancies to family outsiders, and although the immediate family soon learns of a daughter-in-law's pregnancy, her work responsibilities do not diminish. Women fear childbirth because of the pain, lack of emergency healthcare facilities, and high maternal mortality. Postpartum women are considered ritually impure and remain isolated from the family for 10 days. Then the family priest performs a purifying naming ceremony called *nuaran*, during which the mother comes out of seclusion, the baby is blessed, held by its father for the first time, and given a name by the priest. The new family member's astrological chart is completed, and the family sponsors a feast. A few months after *nuaran*, the family sponsors the infant's rice-feeding ceremony, *pasnay*, during which it is given its first solid food. In some groups, a son's future professional life is predicted based on which among a few items the child is attracted to.

Nepali children are breast-fed for an average of 2 years. Infant mortality rates are high in Nepal, as is maternal death, due to lack of emergency health facilities in the mountainous country. Infant mortality rates are higher for girls than for boys, reflected in the country's unnatural gender ratio and shortened life expectancy for females.

Socialization of Boys and Girls

The birth of boys is celebrated, while the birth of girls is ambivalent—sometimes welcomed, other times tolerated or mourned. A girl is considered a financial burden, and must be protected from men as she grows older and matures. Contradicting this ambivalent view of daughters is the belief that she is sacred to her family as the embodied form of the virgin goddess, and she confers religious merit on her parents at the time of her marriage (Bennett, 1983). Nonetheless, daughters learn to work hard in the fields before their brothers, and are often denied an education while brothers attend school. Nepal has one of the world's largest gender literacy gaps (Poudel & Shrestha, 1999).

Puberty and Adolescence

An unmarried girl is called *taruni* (youthful) and *kumari* (virgin), and a boy is called *taruna* and *kumar*. Menarche is a period of ritual seclusion in some ethnic and Hindu groups, and soon afterwards, matchmakers will be asked to begin locating a suitable husband for the girl. When a boy reaches maturity, as seen in voice changes and facial hair, his marriage preparations will begin. In high-caste groups who are called "twice-born" (referring to their induction into karmic activity), boys undergo a thread investiture ceremony in which they are given a long sacred thread worn across the right shoulder and under the left arm. There is no equivalent ceremony for girls. Some high castes encourage premenarchal marriages of daughters so as to protect the natal home from her menarchal pollution. Newaris ritually enact marriage with a god, represented as a fruit, for their unmarried daughters so that they may never suffer the stigma of widowhood or divorce (Allen, 1982).

Attainment of Adulthood

Nepalis are considered adults when they have completed the cycle of life with marriage and the birth of a child.

Individuals are expected to have attained the skills of farming or artisan production to provide for their family economically, and will be given increasingly more responsibility for family economic decisions. While men may occupy positions of public authority and are the heirs of family wealth, women are expected to be equally knowledgeable and able to make informed decisions. Women focus more of their time and energy on the prosperity of their marital family, subsequently decreasing the time they spend visiting their parents and brothers at the natal home. Adults are expected to be able to control their emotions as they are called on to navigate the challenges of family and community, and to foster the ties of reciprocity and cooperation essential to the Nepali rural farming life. Adults become more interested in their spiritual lives as well, though the greatest increase in attention to religious matters occurs in middle and old age.

Middle Age and Old Age

With the presumed diminished sexual interest and activity of older people, the body is believed to become cooler and lighter. Increased concern for their spiritual well-being leads the elderly on pilgrimages to religious holy sites. Older adults welcome the relinquishing of their power and authority to their increasingly competent children, as they move from center stage to the periphery, caring for the grandchildren as the parents work in the fields, and tending to the animals around the farm. Their comfort and security depends on the reliability and goodness of their sons- and daughters-in-law, and older adults who lack such kin ties find themselves in physically difficult positions of having to continue farming or working for others, and the economic insecurity that comes with it.

PERSONALITY DIFFERENCES BY GENDER

Nepalis frame sex-role differences in terms of social roles more than personality differences. Still, ideal behaviors for females and males are well known, with some overlap across the sexes that stems from general desirable characteristics of persons. Girls and boys are taught to be self-reliant, strong, and competent, but also respectful of older adults, particularly their parents. Girls learn of their lower social status fairly early, as they experience the preference and privileges given to their male relatives.

They are encouraged to be soft-spoken and reticent, and to trust other women more than men. Boys are encouraged to be proud, almost boastful of their achievements, and to seek help from others in fulfilling their goals. Nepalis are generally friendly and helpful to strangers, and they regard the guest to be an honorable person. Public displays of aggression and other expressions of anger and hostility are discouraged, yet husbands' verbal and physical abuse of wives is not considered irregular until it becomes repeatedly violent. Other emotions that are publicly acceptable for both men and women include sadness and despair, pain and discomfort, and happiness and joy. Coveting others' good fortune is thought a form of flattery, though the fortunate also conceal some forms of prosperity, such as land and beautiful children, as they fear the curses of the less fortunate. Individual personalities may well override cultural stereotypes of gender-based personalities.

GENDER-RELATED SOCIAL GROUPS

Most social groups are gender specific, for the separation of the sexes is a common practice, and people feel most comfortable with others of the same sex. This organizing principle extends to children's playgroups, school sports, and social activities, the division of agricultural, artisan, and domestic labor, reciprocal labor groups, religious groups, community and development activists, and political organizations. Kin groups are formed through patrilines. Married couples live with or near the husband's family, and also near the wife's if they are from the same village; some variability is found among ethnic minority groups. Some ethnic minorities such as the Newars have strong matrilineal ties, even though inheritance is through males.

GENDER ROLES IN ECONOMICS

As an agrarian society, Nepal's Hindu majority is organized in quite specific gender-based economic roles. The farmers are primarily women, and perform a greater variety and frequency of farming functions than do men. With the exception of ploughing and maintaining irrigation canals, women perform all other agricultural work, such as preparing organic fertilizer throughout the year and carrying it to the fields, removing rocks from fields,

sowing seeds, transplanting rice, thinning and weeding fields, and harvesting and storing the crop. Men may help in these jobs, but it is women who spend far greater time in them.

Among lower-caste artisans there is also a gender division of labor that is apparent in a variety of production functions. Women's work here includes negotiation and delivery of tools and other artisan products, obtaining raw materials like clay for pottery or bamboo for baskets, weaving baskets, sewing clothes, making wooden handles for tools, and product repairs. Artisans who do nonagricultural work for high-caste patrons will follow gendered economic roles specific to farming.

When additional farm hands are needed to supplement the family's labor, subsequent differences in pay between women and men is attributed locally to men's work being more difficult and requiring greater physical strength than women's work. Women are more likely to be members of reciprocal labor groups, a very effective way to ensure that seedlings are transplanted and that the crop is harvested in a timely and cost-free manner. In salt- and rice-trading communities near the Tibetan border, males will be gone for several months at a time (Fisher, 1986; Levine, 1988).

PARENTAL AND OTHER CARETAKER ROLES

There are few articulated gender-based parental roles in Nepali families. Women breast-feed their babies on average for 2 years, and will usually clean the child's toilet and clothing. Otherwise, fathers, grandfathers, brothers, and uncles spend equal time caring for and playing with children, as do mothers, grandmothers, sisters, and aunts. Since many women farm away from home during the day, it is expedient for men to play significant parental roles.

LEADERSHIP IN PUBLIC ARENAS

Local governance has typically been in the hands of high-caste men. To create greater gender representation, the 1990 Constitution of Nepal stipulates that at least three women be appointed to the National Assembly, considered the less powerful of the two houses of parliament. Local and regional governing bodies must have women on their councils. This has encouraged the emergence

of local women leaders. Accounts of real power and authority by women are common, in particular locally organized mothers' organizations advocating and enforcing alcohol temperance.

GENDER AND RELIGION

The majority of Nepalis are Hindus, and Hindu religion frames ideal behavior in the concept of religious duty, *dharma*, and the fruits of one's actions, *karma*. Whether it is respectful obedience to parents or a wife's obedience to her husband or mother-in-law, people understand that the religious valence of honor bears fruit in the form of wealth, health, fertility, prosperity, and exceptional rebirth. Gender-based behavioral differences found in religious doctrine and beliefs include premarital female virginity. High-caste women consider their husbands to be the equivalent of deities, though this is understood to mean that they should not remarry if widowed. Daughters are considered living goddesses and are worshipped at various points in the Hindu calendar. Sons carry on the Hindu patriline.

Monks and nuns exist in Buddhist communities. Buddhist ethnic minorities have been influenced over the centuries by Hinduism, but tend to have more gender equality in their religious ideology and social roles.

LEISURE, RECREATION, AND THE ARTS

Owing to the gendered division of labor that assigns more different and more frequent kinds of work to women than to men, adult Nepali men have more leisure time than women during the day, and variation among groups is based on age, class, and caste (Cameron, 1998). Socializing with same-sex friends and relatives is typical for both sexes, and illegal and surreptitious card playing is common among male friends, who discuss local and national politics amongst themselves. Boys and girls socialize in a great variety of ways, and often together; they play games, swim in local streams and ponds, and go fruit and honey gathering in the hills. The Nepalis relax and celebrate life in a variety of ways that relate to religious and agricultural seasons, themselves tied to astrological phenomena. The Hindu and Buddhist

calendars have numerous holidays when the births of important deities are honored, significant new and full moons are venerated, harvest is celebrated, and ancestors are worshipped. Fasting and other purificatory rites precede some festivals; one example is the annual women's festival of Tij in which the longevity of husbands is prayed for. The most important celebration in Nepal, Dasai, takes place over 2 weeks after the rice harvest in the autumn, and honors the warrior goddess Durga, the Hindu national goddess.

The most popular art form is music. Nepalis learn to sing at home and at school, and are encouraged to create their own lyrics and melodies. Young and old are generally not shy of singing in public, and singing is one of the few public forms of expression that women can participate in. Other art forms that both women and men enjoy are dancing and creating artisan products such as decorated pottery and finely made baskets.

RELATIVE STATUS OF MEN AND WOMEN

Women's status relative to men is low in most areas of social, political, religious, and economic life, and has been the subject of much research and development activism. An ideology and organization of male privilege are found within kinship, economic, religious, political, and gender institutions, such that men are considered superior to women in their rights and privileges. Women do not have inheritance rights, though this is soon to change legally with the finalizing of women's inheritance rights legislation. Consequently, women do not generally have rights over children in the unusual case of divorce. In landholding families, women do not have the right to inherit land, as it passes from father to sons. In lower-caste families, women have rights to the artisan tools they will need to be productive after marriage, such as sewing machines. Within religious practice, only men may be priests, but both men and women are healers such as shamans and herbalists, and women of low caste are midwives. Women are considered impure during menstruation and childbirth, and banned from religious activities during those times. Women's lower status is attributed to menstrual and childbirth impurity and lack of economic power, themselves associated with lack of girls' education. Examples of lower female status are discussed in the relevant sections throughout this chapter.

SEXUALITY

Women and men have ambivalent attitudes toward sexuality. Following Hindu beliefs about the impurity of bodily substances, sex is considered impure. Owing to the strong value placed on female virginity at marriage, women grow up regarding sex as dangerous; men, too, consider sex dangerous, but for a different reason— the fear of semen loss. Countering these views is the strong desire for children, particularly sons, which necessarily places importance on an ongoing sexual relationship between wife and husband. Women express distrust of men in matters of extramarital affairs. People regard sex as being for both reproduction and pleasure, and men are expected to be the initiators of sex in a marriage. Women are expected to be modest about sexual matters, and rarely talk with others about sex; many first learn of sex in marriage. Expression of sexuality is reserved for the marital relationship, where men are expected to be the informed experts. Contradicting all of the above is one low-caste group of potters and entertainers found in western Nepal, whose women are dancers and prostitutes. The women from this group speak openly about sex.

Male cross-dressing as a form of entertainment is not uncommon; cross-dressing by a groom's female relatives occurs in an openly secretive place and time, after the groom's party has departed to the bride's home. Female and male homosexuality is not discussed openly, and it is hard to gauge people's acceptance of it. Still, affectionate relations between same-sex friends include holding hands and sleeping together.

COURTSHIP AND MARRIAGE

Marriage is considered the most significant event in a person's life. Most people in Nepal marry, and matchmakers and other family members within the caste and outside the clan identify potential spouses. Frequently, people marry strangers. Love marriage is infrequent, and may be disguised as a religious marriage if it is the couple's first. Marriage is often the largest expense that a family incurs, not infrequently going into debt for years after a daughter's marriage as these include expensive dowry gifts of gold and silver jewelry and livestock. Weddings are large and expensive feasts that may continue over 3–4 days at the bride's and groom's houses.

In poorer low-caste families, brideprice may be paid by the groom's family to cover marriage costs.

When a girl reaches maturity with menarche, her public behavior is expected to conform to standards that reduce her sexual appeal and is absent of flirtatious gestures toward unrelated young men. However, there are opportunities for young people to meet and fall in love. Regular night songfests and festivals that last overnight are widely attended. During these times there is little supervision of unmarried girls and boys, as they perform competitive line singing and line dances, and share alcohol and cigarettes. It is not uncommon to hear about flirtations and liaisons that occur during the dark night hours. These special friends may meet in the forests, away from others' sight. They rarely result in marriage.

HUSBAND–WIFE RELATIONSHIP

Wives and husbands have relationships that may be very close and loving, or may be distant and antagonistic. Because parents and other close relatives arrange most marriages, newlyweds may be virtual strangers, or they may be village acquaintances (Bennett, 1983; Cameron, 1998; Levine, 1988). Over time, many factors shape the relationship, including family support, personalities of the individuals, children, and economic security. The wife has less power than the husband in controlling relationship dynamics and outcomes. Her role includes obedience to her husband and her in-laws, she owns only property she received as dowry, her natal family may be far away, and she is generally less educated than her husband. She expresses subservience to her husband in numerous ways, including eating after him, walking behind him, carrying the heaviest load, and bowing and touching her head to his feet. She is expected to keep silent when the couple is around nonrelatives, and she never uses her husband's name to address him. It is rare in Nepal to see wife and husband showing affection in public, though most would claim that they are free to do so in private. Still, the high incidence of physical abuse against wives and its acceptance reflect the difficult conditions for women in Nepal and the lack of social and relational support; even today, there is no law against domestic violence. Support for abused women can be expected only from the natal home, and a woman whose marriage is unhappy or abusive will spend long periods there.

Married couples may gradually come to love each other and develop satisfying intimacy. The birth of children contributes to a family identity and satisfies strong social expectations that can strengthen the relationship. Couples do not generally share their problems and concerns with spouses, but with same-sex friends and trustworthy affines. Intimacy with one's mate is somewhat discouraged in extended families, as it is believed to weaken fraternal and lineage bonds; still, couples share life's experiences and daily problems with each other in private, and can be potential friends in times of need. Since divorce is rare, couples work and maintain the household together over the decades, and develop strong bonds that such close association engenders.

OTHER CROSS-SEX RELATIONSHIPS

The closest and deepest cross-sex relationship is that between sisters and brothers. Sisters are considered sacred by their consanguinal relatives, and their brothers ardently express this. Sisters are worshipped as goddesses during the fall harvest festival, and at other religious times in devout families. In return for sacred tributes such as clothing and money, sisters confer longevity and prosperity on their brothers. Brothers are expected to take care of their sisters until their marriage, and even after, if necessary.

A unique cross-sex relationship widely accepted is that between an older married woman and her husband's younger brother. The latter sometimes considers her to be like another mother, as she may show him love and kindness, and fulfill his needs for afternoon tea or a sweet snack. People comment that this friendship is often more affectionate than between wife and husband, and may hint at more than just friendship. Young men are happy when their older brothers marry, for they can expect to find a female companion in the new sister-in-law. The Nepalis do not discourage this friendship for they trust that a younger brother would not damage his relationship with his older brother, who has more power than him. The Nepalis also recognize a woman's need for an ally in the family (Cameron, 1998).

Opposite to this affectionate relationship is one of complete avoidance between an affinal woman and her older brother-in-law and all other older male relatives. They should not speak with each other unless necessary, and should tenaciously avoid any contact physically or

emotionally. Affinal women demonstrate their avoidance respect for elder males by covering their heads and faces while in their presence, and leaving their presence altogether if possible.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Nepal is an increasingly modernizing society, and recognizes that its discrimination against women in the form of education, economics, politics, and religion stymies its development. While girls' education increases slightly each year, Nepal still has one of the lowest female literacy rates in the world. Women's employment in urban areas is relatively high, though their wages are lower than that of men; the same is true in rural areas where cash or in-kind payments are made for agricultural work. Perhaps Nepal's greatest source of international shame is girl trafficking, involving the sale by poor families of young girls to brothels in India (Poudel & Shrestha, 1999).

Recently, a woman's right to an abortion was signed into law.

Northeast India

Orissa and West Bengal

Susan C. Seymour

ALTERNATIVE NAMES

Alternative names are Oriya (Uriya) and Bengali (Bangali) language and culture.

LOCATION

The states of Orissa and West Bengal constitute part of northeast India. Both have coastlines on the Bay of Bengal, with Orissa lying directly south and west of Bengal.

CULTURAL OVERVIEW

Orissa and West Bengal are two of India's post-independence states. Although they have distinct languages—Oriya and Bengali, respectively—they are closely related Indo-European languages. The histories of these two states have been closely intertwined, especially in modern times when the British ruled this region from Calcutta, the contemporary capital of West Bengal. Together, West Bengal and Orissa constitute North India's rice bowl, made possible by the rich alluvial Gangetic plain that extends east to Bengal and south along the Orissan seaboard. Both states share a similar climate: summer monsoons (June–August) that cool the region from its hot dry period, with temperatures reaching 120°F (March–May) and replenish the land, a cooling and drying period in the fall, with temperatures dropping into the fifties (Fahrenheit) during winter months (December–February). Temperatures can be lower in the hills of both states.

Both states are predominantly Hindu, and they share similar family, kinship, and caste systems. This article will address sex and gender among the Hindu populations of this region, examining possible variations due to rural versus urban residence and caste/class status.

While West Bengal is one of India's most densely populated states and Orissa one of its more thinly populated states, they both have extensive rural populations. West Bengal is about 78% rural and Orissa about 86% rural. Rural settlements in this region vary between a dispersed layout to nucleated villages. West Bengal has one of India's largest and most cosmopolitan cities, Calcutta, whereas Orissa's cities are much smaller. Bhubaneswar, its capital, was only established in 1948 and has grown from a population of about 10,000 to half a million.

The ideal family system in this region is the joint family where two or more patrilineally related kinsmen reside together—a father and his sons or a set of brothers, their wives, and children. Household size and structure are cyclic. When a father dies, his sons may partition the family holdings, breaking into nuclear units until sons marry and have children, once again producing a multi-generational household. From an Indian perspective, however, families are always extended. They include all close patrilineal kinsmen regardless of residence. The Bengali term used for family is *samsar*, literally meaning "that which flows together" or the ties of bodily and emotional attachments that bind people together through the flux of births and deaths (Lamb, 2000).

This family system belongs to a general model of social institutions and associated beliefs that Mukhopadhyay and Seymour (1994) call "patrifocal family structure and ideology." This system is characterized by the importance of family generally, and of the extended family specifically, regardless of household composition; the subordination of individual goals and interests to the welfare of the larger group; a complex of structural features (patrilocal residence, patrilineal descent, patrilineal inheritance, and succession) that emphasize the importance of males, particularly sons,

to the continuity and long-term well-being of the family and kin group; gender-differentiated family roles and responsibilities that associate males with the "outside world" and females with the "inside world"; a gender-differentiated family authority structure that ideologically gives same-generational males authority over socially equivalent females; an emphasis on family control and regulation of female sexuality and reproduction with an accompanying ideology of appropriate female behavior that emphasizes chastity, obedience, self-sacrifice, and modesty; and a marriage system characterized by family control of all marriage arrangements, including the selection of their children's spouses.

Families are parts of larger patrilineal kinship structures locally known as *jatis* (castes and subcastes). These are endogamous descent groups that are locally and regionally ranked by both ritual and socioeconomic criteria. Ritual ranking is based upon beliefs about the relative degree of purity that one *jati* has in relation to another. The Hindu principles of reincarnation, *dharma* (righteousness, moral actions), and *karma* (fate based upon one's past actions) underlie this system. *Jatis* also have an occupational identity and are often economically interdependent. In urban areas the caste system is gradually being transformed into a class system where status is measured more by educational and occupational achievement than by birth into a particular *jati* (Seymour, 1999).

CULTURAL CONSTRUCTION OF GENDER

The patrifocal family system underlies the cultural construction of gender in this region. There are two recognized gender categories: males, who are central to the patrifocal kinship and family system, and females, who are somewhat peripheral to it. At the time of marriage daughters leave their natal families to join their husbands' families where, as wives and mothers, they are critical to the continuation of their husbands' patrilines. At marriage a woman changes her kinship affiliation from that of her father to that of her husband but retains her own blood and paternal bloodline. As a wife, she passes her husband's blood to her children and thus preserves his patriline. She is a vehicle for the passage of seed and blood from male to male or, to use the Oriya and Bengali metaphor: "A woman is the field or nourisher of the seed that a man

provides and cultivates. They complement one another in the creation of a child, but the child is born *of* the father" (Fruzetti, Ostor, & Barnett, 1992).

Gender, however, is not conceptualized as a fixed binary system. Bodies are considered open and composite, not self-contained entities. For example, bodily differences between the two sexes are subject to relative differences in the amount of heat/coolness, fluidity/dryness, and openness/boundedness that they contain at any moment in time (Lamb, 2000). Thus they can shift and change, although in asymmetric ways. This fluidity of gender is reflected in Hindu mythology where there are bisexual and transsexual deities and where males are transformed into females and vice versa. Underlying this fluidity, however, is a significant gender asymmetry. While the transformed deity, whether male or female, usually forgets his or her former gender and identity, there is usually another *male* present who does remember and who thereby acquires power over the transformed person (Doniger, 1999).

GENDER OVER THE LIFE CYCLE

The birth of a boy, who continues a father's patriline, is more celebrated than that of a girl, who is given away in marriage. Otherwise, there is little overt difference by gender in the treatment of young children (Rohner & Chaki-Sircar, 1988; Seymour, 1999). For upper-caste males, however, there is an idealized four-stage life cycle (the *dharmasastras*) outlined in Hindu ethical–legal texts: (1) celibate student, (2) married householder, (3) disengaged forest dweller, and (4) wandering mendicant (sannyasi) preparing for death and potential release (*moksha*) from the cycle of rebirth. Women and lower-caste males have less well-defined life stages. For upper-status females the onset of menarche marks the beginning of restrictions on behavior and change of dress. Marriage overtly defines the transition from childhood to adulthood, and old age is marked by a reduction in work and the receipt of care from others. Throughout life, regardless of gender, one is either a caregiver or a recipient of care.

Socialization of Boys and Girls

Children in general are greatly desired, although having more daughters than sons is considered a burden because of the costs associated with marriage. Nonetheless,

parents express special concerns for daughters who at marriage will leave home. While a child's gender is marked at birth, during infancy and early childhood gender is of less consequence than learning to be a member of a corporate group where the group's well-being is valued more than individual needs and desires. Gender is not marked by such special symbols as pink and blue blankets or by special dress or hair styles. Rural girls and boys, if dressed at all, wear short pants and shirts. Urban girls sometimes wear dresses.

The value of interdependence is transmitted in a variety of ways. In extended households children learn that they have many caretakers—mothers, aunts, grandmothers, older siblings, as well as fathers and other male kinsmen. Someone will always be there to hold, carry, and sleep with them. While they are nursed only by their mothers, infants soon learn that they are not in control of feeding. Mothers tend not to respond immediately to a crying child and not to nurse it to satisfaction (Seymour, 1999). Delayed and intermittent responses keep mothers in control and infants in a state of supplication and dependence. Other forms of caretaking, such as highly ritualized daily baths, are forced upon infants and young children, reinforcing their position as subordinates.

Infants and young children are usually addressed as "baby," or by a variety of nicknames or birth-order terms—for example, "first," "second," or "third son" or "daughter." Their personal name is given at their first birthday but not used until adulthood. Any special identity associated with a personal name is thereby de-emphasized. By contrast, toddlers are carefully inducted into the world of kinship by being taught appropriate terms of address for all family members.

Young children are cared for and disciplined by whoever is present with no apparent gender differences. Toilet training is handled casually, and weaning does not usually occur until a mother is expecting another child. Children play in mixed-age and mixed-sex groups. With few toys available, they entertain themselves by chasing one another, making up games, or following older children or adults around. Some higher-status urban children do have manufactured toys and games, and children are introduced to group sports at school.

Although gender differences are not emphasized at this stage, children are continually exposed to gender-differentiated roles. They observe mostly women caring for children, preparing food, and doing other domestic chores, while men come and go from the outside world.

Women also perform daily household rituals. Depending upon their caste or class status, children are exposed to greater or lesser degrees of sexual segregation in the house and to female seclusion (purdah). In multigenerational households they are also exposed to male and female hierarchies with grandmothers in charge of mothers and aunts and grandfathers directing fathers and uncles.

Children of low-caste families, where both adult men and women work outside the home, have an abbreviated period of dependence. They are cared for during the day by elderly grandmothers and older siblings but are encouraged to become self-sufficient as quickly as possible. By 3–4 years they are helping older siblings with domestic chores and by 6–7 years may be in charge of younger siblings. Boys, more so than girls, are sent on errands away from home and given charge of livestock. At an early age low-status children become responsible members of the household.

High-status children, by contrast, are rarely assigned chores. In both rural and urban settings, where schools are available, they are expected to attend school and do homework. They may be tutored at home as well. While educational achievement may be more emphasized for boys than for girls, except among the very poor, in early childhood both sexes usually attend school. Most schools require uniform dress—short pants and white shirts for boys, short dresses for girls.

In early childhood boys and girls experience uniform rites: for example, the first feeding of rice; the first hair cutting; etc. Between 8 and 10 years, however, high-status boys go through the Twice Born ceremony which inducts them into full status as Hindu males and where they acquire the sacred thread (*upanayana*), worn as the insignia of high-caste status. No comparable rite exists for girls or lower-status boys.

Puberty and Adolescence

An old Oriya proverb states: "When a boy is 7 years old, he will be given a sacred thread; when a girl is 9 years old, she will be given in marriage." There was no provision for "adolescence" and no indigenous name for this stage of childhood. High-status boys, following their sacred thread ceremony, moved into the student stage of life where ideally they would live with a guru and study Hindu texts and rituals. Now they live at home and attend secular schools. Low-status boys work for the family or

are apprenticed to adult men to learn caste-appropriate trades.

For girls, who are no longer married so young, puberty is marked by the onset of menstruation. In some parts of rural Orissa and West Bengal a girl's first menstruation is highly ritualized by a period of seclusion followed by a public celebration (Apffel-Marglin, 1994; Dube, 1988). The ritual marks a girl's readiness for marriage and the onset of restrictions to be observed throughout her child-bearing years: for example, seclusion during her menstrual periods, taboos on touching of people or food, cessation of bathing, hair combing, and other acts of personal hygiene, prohibitions on entering temples or family rooms of worship, and avoidance of certain foods. During menstruation a woman is considered untouchable—literally, she is in a semiwild state, symbolized by unbound hair and uncleanness. At the end of her menses she returns to a normal state by ritually bathing, preparing her hair, and putting on fresh clothing. Menstrual restrictions set a woman apart and remind the family of her reproductive powers, which must be controlled until she is properly married and, once married, she is sexually reunited with her husband following her menstrual seclusion.

Menstrual taboos are the prerogative of middle- and upper-status women who do not work outside the home. Schoolgirls and employed women cannot observe them, and consequently they are disappearing or being transformed. Nonetheless, once a girl reaches sexual maturity, she is considered highly vulnerable and learns that her behavior can have adverse effects upon the family. Rules of female seclusion and sexual segregation may be enforced at home. She is no longer free to wander about the neighborhood where she can be seen by strange men. She should wear mature clothes—a sari or loose pants and long tunic (*salwa-kameez*) that cover her legs—and behave modestly and respectfully in the presence of elders. She is escorted by male kinsmen to school and, while there, should avoid contact with boys. (Many families consider all-girl schools safer for their daughters.) A virgin daughter is considered a man's greatest gift, and for that gift to become sullied brings great dishonor on the family.

Traditionally, menstruation marked a girl's readiness for marriage and adulthood. If her marriage had been arranged during childhood, it would not be consummated until menarche. Today, with the age of marriage delayed to the late teens or twenties for both rural and urban residents, menstruation marks the time a girl should begin to practice the decorum of adult females. There is no comparable marker for boys.

In Orissa and West Bengal there is now a transitional period of "adolescence" between childhood and marriage for most girls and boys. For the elite who attend college, it has become a very protracted period, whereas for most low-status youths it is just another period of work (Seymour, 1999).

Attainment of Adulthood

Adulthood is symbolized by marriage—the time when one family arranges to give their daughter in marriage to another family with a son of suitable caste, age, education, and employment. Marriage marks a more dramatic transition for the bride, who must shift residence to that of her parents-in-law, than for the bridegroom. The bride's status changes from that of an older and cherished daughter to a new daughter-in-law who is under the authority of her mother-in-law and older sisters-in-law and who may be expected to do the heaviest domestic chores. By contrast, the bridegroom's life may change little. He resides at home, still under the authority of his parents, but has entered the householder stage of life and is expected to assume more responsibilities and to produce children.

Middle Age and Old Age

Ideally, middle age marks the successful bearing and rearing of children—especially sons who continue a man's patriline. For men, and low-status women, it means many economic responsibilities. For women, successfully bearing children transforms their low status as new daughters-in-law to highly respected mothers and even mothers-in-law. They may also have become household managers—the nurturers of family ties and overseers of domestic work. Middle age is a stage in which both men and women take pride.

Old age involves letting go. As one's children reach adulthood, there is a gradual reversal of responsibilities. The younger generation begins to care for elders. Older men can withdraw from work and family ties, perhaps becoming wandering mendicants preparing for death. Women, too, are less constrained. Their bodies, once considered more open (vulnerable to impurities) and hotter (sexual) than men's, have begun to close and cool

with the onset of menopause, making them more like men (Lamb, 2000). Freed from the constraints placed upon them at menarche, they can leave the house, visit friends and temples, and dress more casually. By contrast, most men as they age remain closer to home and resemble women in their increasing domesticity.

For women, old age and widowhood are symbolized by changes in dress and adornment. Bengali and Oriya brides are adorned in gold jewelry and red saris that symbolize their heat, sexuality, fertility, and menstrual blood, and their hands and feet are elaborately decorated with red henna. As wives, they place red vermilion in the parts of their hair and on their foreheads and continue to wear colorful saris and much jewelry. In old age women shift to mostly white saris, a cool color, and wear little or no jewelry. If widowed, they cease to use the vermilion markers of married status.

PERSONALITY DIFFERENCES BY GENDER

Most characteristic behaviors for each gender are role specific and can change through the life cycle. A playful and highly sociable young girl, for example, may become shy and modest as she approaches puberty, subservient and respectful in the early years of marriage, and increasingly dominant and managerial as she moves up the household's female hierarchy. Such behavioral changes are more characteristic of high-status women than low-status women who work outside the home and reside in more egalitarian households.

High-status boys are expected to be less playful and more mature following their Twice Born ceremony. However, because their bodies are considered invulnerable to impurities, their behavior is subject to fewer constraints. Oriyas and Bengalis compare men's bodies to impenetrable brass jugs and women's to unglazed earthen water jugs. Men, as the dominant sex, are also allowed to express more overt dominance and aggression than women. However, the expectations for each gender are always affected by age.

GENDER-RELATED SOCIAL GROUPS

See "Cultural Construction of Gender" for a discussion of the patrifocal orientation of family, kinship, and caste structures in Orissa and West Bengal. Traditionally, nonkin associations for males or females were rare with the exception of village councils (see "Leadership in Public Arenas"). With education and urbanization this has changed. Elite men, and some women, belong to social clubs and business and international organizations. Many autonomous women's groups emerged during the independence movement and again during the 1970s to address women's rights and economic opportunities. Most of these are urban based but with outreach to rural sectors.

GENDER ROLES IN ECONOMICS

In the traditional caste-based system, in both rural and urban settings, a gender-based division of labor existed for middle- and upper-status households. Women were in charge of domestic work while most men worked outside the home. By contrast, most low-status women and men worked (and continue to work) outside the home as agricultural laborers, construction workers, sweepers, etc. Women were not involved in marketing, local or long-distance trade, or military service. Today, however, educated urban women have entered most businesses and professions.

The economic aspects of marriage negotiations (e.g., dowry) are a major arena of nonmarket exchange. Men are formally in charge of these but women also participate.

In practice, all property is inherited by males except for what is transferred as dowry to a daughter's husband and in-laws at marriage. Since independence, property rights have been contested: for example, the 1965 Hindu Succession Act gives daughters equal rights to their parents' "self-acquired" property, which does not include ancestral lands. However, this law has rarely been implemented in this and other regions of India (Agarwal, 1994; Basu, 1999).

PARENTAL AND OTHER CARETAKER ROLES

Indian family relationships are based upon expectations of interdependence and reciprocity. The older generation cares for the younger one until offspring are sufficiently mature to assume responsibility for elders. Men and their

wives are responsible for aging parents and other patrilineal kin. It is wives and other women who are in fact the primary caretakers of children and elders. Multiple caretaking predominates; a woman is rarely alone to do all the caretaking and other domestic chores. In higher status households she may be assisted by servants as well as by other kin. Seymour (1999), for example, found that Orissan mothers, regardless of caste/class status or of rural or urban residence, performed from 50% to 58% of their children's caretaking. Fathers participated some by holding and carrying children, but rarely fed, bathed, or dressed them. Fathers helped with discipline and took an active interest in their children's—especially sons'—schooling. Other gender-based differences in parental attention are not noteworthy, although Roy (1972) mentions the intensification of the father–daughter relationship in middle-class Calcutta families preceding a girl's marriage.

LEADERSHIP IN PUBLIC ARENAS

In pre-independence Orissa and West Bengal, only men participated in the public arena as representatives on village councils (*pancayats*) or heads of lineages and *jatis*. Today, both men and women elect representatives at the local, state, and federal level, and women vote in about the same proportion as men. While only small numbers of women are elected to public positions, since independence many urban women have been involved in the political process. Furthermore, legislation has been passed at the national level to enhance women's political participation by reserving for them 30% of elected seats on village councils.

GENDER AND RELIGION

Hinduism has no single historical founder, no single revealed text, and no centralized system of authority. One is born into a family with a set of beliefs and practices that are loosely known as "Hindu." The more canonical form of Hinduism, however, recognizes Brahmins as the priestly caste, with a ranked set of subcastes whose male members attend to the deities housed in temples and perform numerous sacred rites. There are no comparable public roles for female Brahmins, although women of different *jatis* perform many rituals within the home. It is also possible for women to acquire sacred powers by becoming possessed by a deity.

Many Hindus believe in one transcendent God, beyond the universe, who resides within all living things, can take a variety of forms, and can be worshipped in diverse ways. In this abstract sense God has no gender. However, in Hinduism's more canonical form there is a set of predominant male deities: Brahma the creator, Vishnu the preserver, and Shiva the destroyer. There is also Devi, the Feminine Aspect or Divine Energy (*Shakti*) that all male gods have, but who can act independently, take different forms, and is worshipped directly. In Orissa and West Bengal there are major temple complexes devoted to different incarnations of Devi, as well as to male gods, and annual rites that celebrate female as well as male deities.

Daily worship (*puja*) takes place in the home in a sacred space where icons of male and female deities reside. Whereas male priests attend to temple deities, women attend to these.

LEISURE, RECREATION, AND THE ARTS

Most rural residents of Orissa and West Bengal spend their limited leisure time socializing in sex-segregated groups. In both rural and urban areas religious rituals provide numerous occasions for extended kin to gather, visit temples, and share feasts.

The arts include numerous classical forms of music and dance, much of it originating in temple rituals, with roles for both men and women. Orissa is the home of a highly regarded dance form known as Odisi. Folk music, dance, painting, and other regional arts are rich and numerous in both Orissa and West Bengal and are often associated with specific *jatis*.

For recreation, urban settings have restaurants, cafes, theaters, and movie houses that provide family outings and hang-outs for young unmarried men. Women rarely frequent them unescorted by male relatives.

RELATIVE STATUS OF MEN AND WOMEN

This region of India is characterized by a variety of patriarchal beliefs and practices that are gradually changing with increased education, urbanization, and commercialization of the economy. Men, as the heads of households and kin groups, are the formal decision-makers. Most property is transferred from father to son.

Women own little or no property and rarely control the fruits of their labor. Nonetheless, within the context of the home women can be very influential. Many view themselves as household managers and the persons who uphold family honor by observing the *dharma* appropriate to their age and gender, family, and *jati* (Menon & Shweder, 1994; Seymour, 1999). Daughters continue to receive less education than their brothers and to have their marriages arranged at an earlier age in order to protect their sexuality.

This imbalance in the overall status of men and women is partially compensated for by beliefs in women's reproductive powers, the honor they receive as mothers, and the recognition they are given as household managers. At the metaphysical level, beliefs in powerful female deities, who have control over life and death, provide significant metaphors for the feminine.

SEXUALITY

Sex is primarily associated with marriage and reproduction and should not be an end in itself. Outside of sacred conjugal love, sex is viewed as antisocial and dangerous because it challenges the principles of caste and kinship hierarchies—hence, the negativity with which "love marriages" are viewed. Conjugal love should be *prem bhakti* (love and devotion), not just *prem* (sexual love) (Fruzetti, 1982). Given that women's bodies are considered more permeable and hot (sexual) than those of men, and that for them sex outside of marriage endangers family honor, it is understandable that once upper-status girls reach menarche they are subjected to numerous restrictions. Fewer restrictions are imposed upon lower-status girls whose caste status and work outside the home make them already impure.

There are caste and gender-based double standards with respect to premarital and extramarital sex. Sex outside marriage is prohibited to upper-status women but not to upper-status men, who may construe marital sex for reproductive purposes and seek sexual pleasure elsewhere—often with economically vulnerable low-status women and widows. Because men's bodies are considered less easily defiled than women's, extramarital sex for men has less impact on their purity and family honor.

Little open expression of sexuality is allowed children, although their curiosity may be piqued by sleeping in close proximity with elders, hearing about the sexual escapades of gods and goddesses, reading erotic devotional poetry, or seeing contemporary films. Sexual joking occurs among segregated groups of male and female adolescents and adults, especially as a wedding approaches. A new bride may be subjected to sexual teasing by female in-laws but is allowed to joke sexually with her youngest brother-in-law.

With aging, men's and women's bodies are believed to cool and close, and sexual desire to decline or cease.

Male and female homosexuality are just beginning to be recognized in contemporary India, but there is literary evidence in both Oriya and Bengali that homophobia was once less prevalent in this region (Vanita & Kidwai, 2000). Meanwhile, the sexual segregation of many activities may enable same-sex love to coexist with marriage. Overt cross-sex identification and cross-dressing are limited to *hijras*—groups of castrated, transgendered, and transvestite men who are entertainers and prostitutes.

COURTSHIP AND MARRIAGE

"Courtship" is inapplicable to a region where premarital sexuality is controlled and marriages arranged. With the exception of a small educated urban elite, young men and women do not date. They learn to distrust romantic love but to trust the parental selection of a spouse. With a slight change, arranged marriages are still predominant. Instead of meeting for the first time on their wedding day, today many young people are allowed to meet, chaperoned, to approve or disapprove a prospective spouse before marriage negotiations are finalized (Seymour, 1999).

Negotiations begin when a daughter is considered eligible for marriage, having reached the right age and/or completed enough schooling. Her male and female kin begin seeking a good match through word of mouth, letters, newspaper matrimonial advertisements, and/or a professional go-between. A family of the same caste and socioeconomic status is sought with a suitable son—someone older and more educated than the bride, with good employment prospects. Once someone is identified, horoscopes are checked, negotiations over dowry begun, and the prospective bride inspected by the boy's family for looks, manners, and expressions of modesty. Both families investigate one another's social reputation and that of the prospective bride or groom. If all goes well, an auspicious date is set for the wedding.

A traditional Hindu wedding requires a priest and a Vedic ceremony in front of the god fire, the witness to the

wedding. It takes place in or near the bride's home, with all her extended kin in attendance. Preceding the ceremony the bride is ritually bathed, dressed, and tended to by her female kin. On the day of the wedding, she, her father, and the groom fast. The groom attends with only some close friends and cousins. His kinsmen await the bride and groom at their house following the wedding ceremony, feasting, and the bride's formal departure from her father's house. The consummation of the marriage takes place at the groom's house.

Various phases of the wedding may occur over the period of a week or be concentrated into one day. There are also variations by caste and class. Many educated urban dwellers, for example, no longer maintain the separation of the two families for the wedding ceremony, and following the wedding the bride and groom may take a honeymoon trip before going to the groom's residence or establishing their own.

Among high castes, widows are considered inauspicious and do not remarry. Widowers remarry in order to produce children and/or acquire mothers for already existing children. Lower castes, and members of the educated elite, do not observe the prohibition on widow remarriage.

HUSBAND–WIFE RELATIONSHIP

In the context of arranged marriages and joint households, the husband–wife relationship is not initially one of love, affection, and companionship. A wife should be devoted to her husband and the husband respectful of the woman who will bear his children. Love (*prem bhakti*), it is assumed, will grow over time, but husband–wife bonds should be contained and not threaten the well-being of the joint family.

In more traditional households, husbands and wives spend little time together. At mealtime a wife first serves her husband and then her children, and she eats last. Once there are children, a wife sleeps with them separate from her husband, or they may share children in separate sleeping spaces. A general orientation to sexually segregated activities limits the time that husbands and wives spend together. However, more educated urban husbands and wives are beginning to seek a more conjugal relationship, symbolized by dining together, sharing a bed, and socializing together inside and outside the home.

Post-independence law allows divorce on the grounds of mutual incompatibility, but high-caste marriages are still considered indissoluble. Separations may occur but rarely divorce. Although children belong to the father's patriline, specific circumstances will dictate with whom they reside (Seymour, 1999). There is less stigma attached to separations and "divorce" among low-caste groups, where husbands and wives are freer to leave one another and to remarry without the benefit of legal procedures.

OTHER CROSS-SEX RELATIONSHIPS

The most significant cross-sex relationships in this region are those that maintain alliances between women and their natal kin. Annually, sisters ceremonially honor their brothers, who in turn offer their sisters gifts. Following marriage, it is through her brother that a woman and her children maintain ties with her natal kin. He is expected to visit and protect her, bring gifts, and periodically escort her home. To her children, he is an affectionate uncle and a participant in all life-cycle rites.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The gender system, characteristic of Orissa and West Bengal during the past century, is being transformed as more women receive an education, marry at a later age, and work outside the home. While significant variations by caste/class status and rural or urban residence exist, the patrifocal family is having to adjust to changed circumstances and beliefs regarding women and husband–wife relationships. An older, educated, and employed daughter makes for a more independent and less subservient daughter-in-law. Such women, and many of the educated men they marry, want more egalitarian and companionate marriages and less supervision by elders. Nonetheless, the extended family continues to be a highly valued and useful institution, especially for childcare and the care of elders.

Orang Suku Laut

Lioba Lenhart

ALTERNATIVE NAMES

The Orang Suku Laut (Sea Tribe People) are also referred to as Orang Laut (Sea People). Subgroups are Orang (Suku) Mantang, Orang (Suku) Mapor, Orang (Suku) Barok, and Orang (Suku) Galang.

LOCATION

The Orang Suku Laut are located in the Riau Archipelago, located at the northwestern frontier of the Republic of Indonesia (Southeast Asia).

CULTURAL OVERVIEW

The Orang Suku Laut of the Indonesian Riau Archipelago (Chou, 1997; Lenhart, 1997, 2001, 2002a, 2002b; Sather, 1998, 1999; Sudarman Sembiring, 1993; Wee, 1985) belong to the boat-dwelling, fishing, and foraging communities of sea nomads found in the territories of five Southeast Asian states, namely Myanmar (Burma), Thailand, Malaysia, Indonesia, and the Philippines (Sather, 1995; Sopher, 1965/1977; Tauchmann, 1992). These groups have several features in common, including relatively egalitarian gender relations.

In the middle of the 1990s, the Orang Suku Laut were estimated to number about 5,000 people, or about 1% of the total population of the Riau Islands. Since the close of the 19th century and in fairly large proportions during the 1990s, most of the Orang Suku Laut gradually shifted from living entirely as sea nomads to becoming seminomadic. Today, the majority have settled in pile-dwellings built over the water on the seafront, while others have moved to recently built villages on land given to them by the government. But they still leave their settlements for seasonal fishing trips that may last for only a short while or for many months.

The Orang Suku Laut make their living in small groups of kinsmen by exploiting the natural resources of the sea, mangrove swamps, and adjacent coastal areas. Their environmental knowledge is immense, and comprises ocean currents and tides, winds, fishing grounds, and the position of the sun, moon, and stars by which they find their way during their journeys through the archipelago. They are also familiar with freshwater sources at the shore and numerous species of flora and fauna of sea and coast, including edible species and species for medical use. Also, their beliefs and convictions refer to their natural environment which they experience as animated nature, and are adhered to even by those who have become converts to Islam or Christianity.

Orang Suku Laut modes of earning a livelihood are spear fishing, collecting marine and forest products, and hunting sea mammals and coastal animals for both subsistence and small-scale trading with Chinese middlemen. Their social organization is based on ties of kinship and the ideal of endogamy. Nuclear families are the basic social units. A few nuclear families of close kinsmen join together into mobile groups that travel on their own, each led by an elder, or live in corresponding groupings in settlements ashore. Every family and every group of kinsmen is socially and economically similar and independent.

Most Orang Suku Laut are not yet formally educated, and in many respects follow a way of life apart from the mainstream society. Until recently, interethnic contacts have mostly been avoided, because the regional Muslim Malay majority are prejudiced against the Orang Suku Laut who are regarded as a primitive people without religion or culture—an assessment made by referring to their mobile way of life in small boats, under allegedly poor hygienic conditions, their habit of hunting wild pigs for meat, drinking alcohol, and keeping dogs, as well as their extraordinary magical powers. However, since the 1990s, interethnic contact has intensified as a consequence of ambitious government programs for the region's economic development and special projects of directed change which aim at assimilation.

Modernization projects have included the excessive exploitation of the natural resources of the islands and the

sea, and the establishment of industrial estates and tourist resorts run by big Jakarta-based and Singapore-based business groups. Since then, the local people, mostly fishermen and horticulturalists, whose livelihood depends on the natural resources, have had to cope with the pollution of the environment which has already led to a loss of biodiversity, and have difficulties in finding alternative jobs because of the enormous influx of migrant workers from other parts of Indonesia. In the last few years, with economic recession and political instability, their situation has deteriorated even further (Chou & Wee, 2002; Lenhart, 1997, 2001; Wee & Chou, 1997). The projects for the Orang Suku Laut were conducted during the late 1980s and the 1990s under the auspices of the Department of Social Welfare and associated government institutions that classified the Orang Suku Laut as *masyarakat suku terasing* ("isolated tribal community"), or a marginal and backward minority whose culture and way of life prove a hindrance to regional modernization and nation-building and have thus to be developed. The main efforts to bring about cultural change were sedentarization at special resettlement sites, efforts to change their modes of livelihood, introduction of medical care, and formal education in schools (including the teaching of civics and religious instruction). At the beginning of the 1990s, about 20% of the Orang Suku Laut could be motivated to move to resettlement sites on land. However, after the fall of Soeharto in 1998 and owing to a lack of financial resources in times of recession, the development of resettlement sites and other measures of directed change were stopped (Lenhart, 1994, 1997, 2002a).

CULTURAL CONSTRUCTION OF GENDER

The Orang Suku Laut differentiate clearly between two biological sexes, and this distinction is connected with the two gender categories of "male" and "female." The differentiation is argued with reference to primary and secondary sexual characteristics, genitalia, breasts, body size, muscular build, etc. Females with a fuller figure are regarded as attractive and healthy, whereas maleness is associated with a strong physique and therefore with stamina. Beauty, health, and stamina can be enhanced by using spells (*jampi*). This differentiation thus implies conceptualizations of male and female, and also certain gender-specific behavioral characteristics, and yet it also

reflects gender equality as one basic characteristic of Orang Suku Laut society. Thus, on the one hand, sex difference is clearly outlined, but in social reality, on the other hand, there is great scope for individual performance of those characteristics and behavior patterns that are ideally regarded as either "male" or "female." This can be observed, for instance, with regard to the outward appearance of Orang Suku Laut.

When Orang Suku Laut males and females are asked how they typically dress, they answer that they all prefer brightly colored clothes: females prefer flowered sarongs and blouses, and men prefer check sarongs or trousers and shirts. However, in fact, everybody wears whatever is at hand, partly because of the lack of material wealth, but also because gender considerations in this respect are actually only of minor importance. Make-up is also used by both sexes, albeit more frequently by young and middle-aged women and female children who like flashy red lipsticks and white powder, but sometimes also by young men, usually boat dwellers who, for instance, use a piece of charcoal as eyebrow pencil and also powder themselves. Both females and males who can afford jewellery wear golden necklaces, bracelets, and earrings.

A "third sex" is not explicitly recognized. Although the phenomena of transsexuality or transvestism are not unknown, and can sometimes be observed in the surrounding majority society with its clear-cut conceptions of male and female role performances, the Orang Suku Laut comment on this with amusement and irony. For them, there may be no "need" for it, because the daily performance of Orang Suku Laut males and females always implies certain proportions of the opposite gender role as defined by their neighbors—something that is in turn commented upon by the latter with amusement and irony—who, for instance, regard the appearance of Orang Suku Laut males carrying and cuddling their children in public as "womanish."

GENDER OVER THE LIFE CYCLE

The Orang Suku Laut recognize four major distinctions in the life cycle: childhood, adolescence, adulthood, and old age. However, the genesis of human life starts with pregnancy.

The Orang Suku Laut are aware that pregnancy starts with conception but, in their view, one becomes a

human person only during the fifth month of the mother's pregnancy. At that time, the sex of the child can be ascertained by touching the embryo's position which, if it is preponderantly on the left-hand side in the mother's abdomen, will become a boy, and otherwise a girl. However, there is no sexual preference for children.

Determination of the unborn child's sex is the task of the midwife (always a female)—an expert in naturopathy as well as in magical knowledge—who has "to open" the female for birth and then "to lock" her again. Between the fifth and seventh months of pregnancy, the expectant mother and her husband will "court" the midwife like a bride (cf. "Courtship and Marriage"), and then she is obliged to care for mother and child until the sixth week after birth.

From the seventh month onwards, numerous behavioral taboos must be observed by the woman and her husband in order not to harm their unborn child; for instance, during those hours of the day "when the spirits are walking around" (late afternoon and sunset), they are not allowed to tie the boat or anything else, as otherwise the umbilical cord could strangle the child inside the uterus. Additionally, the future mother has to adhere to several food taboos.

The genesis of human life culminates in the act of giving birth, which becomes a social event, because it is attended by the woman's closest relatives as well as by many other members of the social group to which the woman belongs, and does not end until the 44th day after delivery. Persons who accompany the entire process, or parts of it, are the pregnant female and her husband, the midwife, the mother of the pregnant female and her mother-in-law (if both live in the same residential group), middle-aged and elderly women with experience in the medical and spiritual care of pregnant and childbearing women, and other female and male relatives and neighbors. All these people are urged to attend the event of birth, and often the healer and shaman is consulted as well. Some of these people provide practical assistance; others are simply present and support the expectant mother and her assistants psychologically. The husband holds his wife's head during contractions, a process that is assisted by massage, conducted by the midwife or other experienced women, or in case of complications and need of greater physical strength, even by males.

Delivery is regarded as dangerous because of the possibility of physical complications, but also because blood-sucking and other bad spirits and witches, and also the spirits of the ancestors, threaten both mother and child. Furthermore, a woman who dies in childbirth can herself transform and become a bad spirit threatening males.

During the first 3 days after birth, the parturient is cared for by her husband and her mother. On the third day, a purification ritual, called "the cleaning of planks," is held, which includes washing the newborn, cleaning the place of birth which had been exposed to blood and amniotic fluid, and purification of the midwife. Until the 44th day after delivery, the mother has to observe certain dietary prescriptions and abstain from sexual intercourse because she is still in a weak condition and further endangered by the bad spirits.

Socialization of Boys and Girls

In Orang Suku Laut society there are only few obvious differences in gender-specific socialization.

Boys and girls are valued equally. They are reared and educated by their parents, and also by older siblings, grandparents, and other members of the jointly travelling or settling group of close kinsmen to which they belong. These socializing agents expect them to become good fishermen and fisherwomen, to have their own families, to bear numerous descendants, and to look after their parents in their old age and provide them with economic security. Formal education in public schools has only recently become part of the way of life of those Orang Suku Laut who live in resettlement sites.

Orang Suku Laut education can be characterized as nonauthoritarian (see "Parental and Other Caretaker Roles"). Children learn by listening, observation, and experience. They imitate the activities of the adults in play—for instance by making miniature fish spears to hunt the little fish—and are meanwhile instructed by the grown-ups who do not put pressure on them. Irrespective of their sex, they learn how to handle boats and fish, and also start to do some housework, for instance, fetching drinking water, collecting firewood, or cooking. As they become older, a slight shift can be observed in girls' tasks as they are gradually obliged to care for their younger siblings, while their mothers do fisherwomen's work. By about age 5 or even earlier, Orang Suku Laut children are able to obtain as much fish or other kinds of marine products as necessary for their own nourishment, and consequently already take some load off their parents.

Transitions between infancy and childhood are not the object of any particular attention. Nonetheless, there are some customs and rituals, most of them for both sexes—naming, keeping and "drinking" the umbilical cord, circumcision, piercing earlobes, and shaving children's heads.

Naming a male or a female child is done shortly after birth and often spontaneously by reference to natural phenomena occuring at the time of birth (e.g., Kilat, "lightning," or Rih, "storm"). Naming is not an outstanding event, because often one does not carry the same name throughout life. Names are changed in case of serious illnesses, because a name itself might be "too heavy" and therefore causes illness, or because the change is regarded as an act of anonymization of sick persons who are consequently difficult to identify by the bad spirits or by those humans who caused the evil.

Among some subgroups of the Orang Suku Laut it is a common practice to dry the umbilical cord of a newborn and keep it for years. When there are younger siblings, small pieces of all siblings' umbilical cords are watered for some hours. Then, the siblings have to drink the water; this is said to safeguard them against ever quarreling with one another.

The circumcision of girls and boys—a common practice among Malay Muslims—is also practiced by some subtribal divisions of the Orang Suku Laut, irrespective of whether their members have converted to Islam or are keeping to Orang Suku Laut traditions. If girls are circumcized—this involves a small cut in the vulva and seems to be a symbolic act, rather than genital mutilation—this is done by the midwife 1 or 2 months after birth, and is accompanied by a minor ceremony attended by close relatives only. Circumcision of boys is conducted at the beginning of adolescence (see "Puberty and Adolescence").

Piercing of earlobes is a common practice. During babyhood and for reasons of beauty, the girls' earlobes are pricked and, if there is money, adorned with golden earrings. Sometimes, during childhood, one of the earlobes of a boy may be pierced for the following reasons: to fight illness and also to increase the similarity between the fathers' and sons' faces and voices which guarantees a good relationship. Older boys also like to wear earrings.

The shaving of male or female children's heads is sometimes practiced in order to protect them against illness, prevent relapses, and to improve their physique.

Puberty and Adolescence

Adolescent boys and girls are fully integrated in domestic and economic activities, and now a change takes place in gender relationships. The members of the nuclear family and the kin group try to ensure that unmarried adolescents of opposite sex cannot meet on their own. On the other hand, there are no reservations against young males and females meeting, if older persons are present, and even developing flirtatious relationships. These may sometimes result in premarital sexual contacts. Although these contacts are not appreciated, there are no grave sanctions, but the couple are often urged to marry soon, especially if the girl has become pregnant.

Boys are circumcised shortly before the beginning of puberty, at the age of about 10–12, by an expert, often a Malay Muslim. Circumcision is accompanied by a ceremonial feast attended by relatives. This marks the beginning of adolescence for a boy.

The transition from girlhood to womanhood is indicated by a girl's first menstruation, but it is unmarked by any ritual. A woman's menstruation is not only called "the coming of the month" (*datang bulan*), but also "becoming dirty" (*dapat kotor*). However, this term is the only indication of potential impurity associated with females. Furthermore, a woman's menstruation is known among her immediate neighbors, because females talk about it. The materials which absorb women's menstrual discharges are strictly taboo and are hidden.

Attainment of Adulthood

The stages of adolescence and adulthood are not clear cut, especially for a boy, but the transition from one to the other takes place gradually. This applies even to one of the most important aims of life for the Orang Suku Laut, namely setting up a separate family as a precondition for having many children. In former times, close relatives (preferably cousins—see "Gender-Related Social Groups") were married during infancy, and today engagement and marriage take place at approximately the time of sexual maturation, that is, at the age of about 13–17 (see also "Courtship and Marriage").

Middle Age and Old Age

Middle and old age in no way imply retirement. Owing to their accumulated experience and wisdom, elderly

males and females are treated with respect, and their status and authority in the context of their family and the jointly traveling or residing group increases continuously. They are the custodians of historical and religious knowledge, are important advisors in decision-making processes, and enjoy the position of experts (e.g., as healers or midwives). The eldest male represents his community vis-à-vis other Orang Suku Laut groups and the surrounding non-Orang Suku Laut society (cf. "Gender-Related Social Groups" and "Leadership in Public Arenas"). Furthermore, as long as they are physically and mentally strong, they continue to work and stay economically independent of their children and grandchildren. Even widows and widowers try to maintain their own household for as long as possible.

GENDER-RELATED SOCIAL GROUPS

Social structures of Orang Suku Laut society are neither male-oriented nor female-oriented.

Descent and kinship are the most important organizing principles of Orang Suku Laut society, and are traced equally through both parents, females and males. Furthermore, the groups that share everyday life and activities are established on the basis of very close kinship ties. The ideal forms of marriage are between cross or parallel cousins. In the Orang Suku Laut view, this preference prevents jointly traveling or settling groups of close kinsmen from splitting up. At times, married couples live with the wife's family and then join the husband's family for a while, if they do not live together in the same group. Particularly during the period after wedding, they are obliged to stay alternately with one or the other group.

GENDER ROLES IN ECONOMICS

Males and females participate equally in the process of production, and carry out more or less the same activities. Both go to sea and fish, and both collect strand products and sell the surplus to Chinese traders. The sexual division of labor at sea is complementary—one of the two spears fish, while the other rows. In contrast, hunting is largely a male task, whereas collecting crustaceans, shellfish, and the like is usually done by women and children. Housework and domestic work is done jointly—repairing

boats or pile-dwellings, gathering firewood, and cooking, as well as raising and educating children. Hence there is almost no sex-specific division of labor, except when biologically necessary (for instance, taking care of babies by nursing mothers), and men's and women's labor is equally important for family subsistence.

Women's contribution to daily subsistence equals that of men. Because women produce a sizeable proportion of food, they are able to provide for the family on their own in case of divorce, or in case of their husbands' illness or death. With regard to financial matters, the women have the main responsibility. They save all the money and do the shopping. Since property is only minimal, inheritance is not an issue.

PARENTAL AND OTHER CARETAKER ROLES

The parental role is not defined as much by biological parenthood as by a married couple living together with one or more children. Adoption is the Orang Suku Laut's common way of solving the problem of childlessness. The adopted child knows who his or her biological parents are, but the bonds between the child and his or her social parents are much stronger. Even if the latter have birth children later, they treat these and their adopted child with the same affection.

Father and mother are equally responsible for bringing up their male and female children, supported by other caretakers, like grandparents, siblings, and members of the jointly traveling or settling kin group. These socializing agents do not differ very much in education and disciplining, in physical care and affection, and in time spent with children (see also "Socialization of Boys and Girls").

In Orang Suku Laut society, there is much scope to develop freely because education is nonauthoritarian. In quarrels among children or between children and adults, those involved are not stopped, even if they indulge in minor physical attacks. Also, little children are not prevented from climbing dangerously high landing stages or playing with extremely sharp knives. If they are defiant and weep, they are simply left standing, while their behavior is countered with scathing remarks, which reinforces their fits of anger. Beating children is not regarded as an adequate means of influencing their behavior.

LEADERSHIP IN PUBLIC ARENAS

Orang Suku Laut society is characterized by a high degree of gender equality, only weak hierarchies (elders), and hardly any domination or subordination. Hence leadership is, to a large extent, informal.

There is no superordinate leader of society as a whole, nor of each subdivision, but political leadership positions today exist only at the level of those kin groups which actually share everyday life, and only in this realm is there an obvious gender asymmetry. The eldest of a jointly traveling/residing group who becomes the group's leader and advisor is always a male. His main task is to represent his community's interests vis-à-vis other groups and non-Orang Suku Laut, but he does not possess the authority to impose sanctions in case of deviant behavior (primus inter pares type). In former times, there existed the superordinate position of the *batin/penghulu laut*, who represented several such groups in a specific area. This position was also held by a male.

Although a group's leader is always a male, this does not mean that women have no influence in community matters. They give a frank opinion on boat- or house-dwellers' community affairs, and intervene actively in disputes and quarrels. In this respect, older women possess much authority.

Some other extraordinary positions of individual members of residential groups, for instance, healers with shamanistic experience or boat builders, seem to be dominated by men as well. In contrast, the midwife is always female. There are also female healers and experts in naturopathy. However, even in cases of exclusive male or female positions of power or authority, members of the opposite sex have a significant influence on the respective role performance—examples of this are the wife of the eldest or the wife of the healer who advise their husbands during community meetings, or in the course of healing ceremonies; the midwife is sometimes also assisted by males.

GENDER AND RELIGION

In principle, members of both sexes can acquire basic magical knowledge, establish bonds with the supernatural, and carry out ritual functions. Everybody learns simple techniques for daily use: for instance, the casting of spells (*jampi*) to enhance the effects of herbal medicine; or honorific words and specific behavior taboos to propitiate the spirits of the first humans while sailing, and thereby crossing and disturbing their sacred sites and areas at sea; or the right way of providing offerings to the spirits of the sea in order to obtain a good catch; or to call the spirits of the ancestors during the annual commemoration ceremony, and "feed" them with incense, rice, cigarettes, and the like. Besides this, there are elaborate procedures, like divination, which are mastered by religious experts, who are usually male.

Among the gods and spirits of the sea and the littoral who have a special relationship with the Orang Suku Laut, and among those of the land who are dangerous for the people of the sea, there are some of human appearance or a mixture of human and animals, and of either male or female sex; these may feel attracted by humans of the opposite sex whom they sometimes try to kidnap. However, in the case of other spirits, for instance those associated with natural phenomena like the rainbow or thunder and lightning, gender affiliation is not an issue. Also, in the world of gods and spirits there is no hierarchy, with the exception of the supreme deity of the sea who is a kind of Neptune, and, like the representatives of the Orang Suku Laut jointly traveling or settled groups, is male.

Certain mythical beliefs substantiate the far-reaching gender equality in Orang Suku Laut society, for instance, the origin myth; or the narrative that explains how people once learnt the way of giving birth which is still common today.

According to the Orang Suku Laut origin myth (in the version of the Orang Mantang), there is no male or female creator who made mankind and nature, but humans are the origin of everything. In the beginning, there were already the sea, two islands, and an Orang Suku Laut couple, a male and a female, who had a child (whose sex is not mentioned). Because of an offense this child was cut into pieces which were thrown into the sea, and out of these pieces islands, mountains, trees, and everything else came into being, and this is why today there is still wood that will bleed like a human if it is chopped. At that time, mountains also had human characteristics; for instance, those on the islands of Bintan and Lingga are brothers who once fought each other and had a feud. Also, the first animals, which in former times spoke the human language, are descended from the first humans; others came into being later as a consequence of sexual intercourse with humans, males as well as females.

Other phenomena of the natural environment are still like humans, the most striking example being the sun with its male characteristics, who in the course of solar eclipses tries to capture and make love with the female-like moon, which must be freed by humans by beating metal objects to protect the world from everlasting darkness.

One of the reasons why birth is not an exclusively female responsibility, but sometimes also involves the presence and active assistance of men (see section on pregnancy and birth), is illuminated in the following narrative. In ancient times, males rather than females became pregnant and gave birth to children. To be able to do this, a man's abdomen had to be ripped, and consequently every man had to die while giving birth for the first time. Later on, females were asked to bear the children because, it was argued, women have vaginas. However, the females, who did not know any other way but the male way, also had to die in childbirth, up to the time when they observed the monkeys on the shore giving birth to their young. From them they learnt how to give birth in the way that is common these days.

LEISURE, RECREATION, AND THE ARTS

In Orang Suku Laut life, work and leisure time are not strictly separated or terminologically distinguished. However, because men and women normally work together and carry out more or less the same activities, they also have the same amount of free time, and this increases during stormy seasons. Leisure time is always spent together, and there is absolutely no segregation of the sexes.

During leisure time, males and females meet relatives and friends, sit together, report news and gossip, tell stories, or play cards. A special enjoyment is the competitive performance of impromptu rhymes, called *pantun*, created alternately by males and females. In recent times, groups of people like to assemble in front of a black-and-white television set run from an automobile battery. Since on the Riau Islands one receives Singaporean or Malaysian broadcasting services, the spectators often understand neither the films' languages (e.g., English and various Chinese and Indian languages) nor the subtitles, since they are illiterate. Therefore somebody in the audience acts as a storyteller and shares his or her perception and interpretation of the pictures and actions with the others.

RELATIVE STATUS OF MEN AND WOMEN

Orang Suku Laut gender relations are highly (though not absolutely) egalitarian.

Daily social intercourse between males and females is permissive, and no spheres are reserved exclusively for either males or females.

In the nuclear family, neither the man nor the woman have a dominant position. In the intraethnic public sphere—during daily gatherings or while dealing with conflicts—both represent their family equally. This contrasts with interethnic contact, when the male appears in the role of the head of the family. However, widows who do not remarry can also take on this role.

When paying visits, men and women sit, eat, drink, smoke, and chat together. Generally, there are no substantial differences in decision-making with regard to family and kin-group matters, or ritual affairs. The males' and females' scopes for deciding when and whom to marry, as well as divorce choices, have expanded considerably, although the parents of both spouses—who formerly had a major say in these matters—are still influential. As already stated, both sexes contribute equally to subsistence; Orang Suku Laut couples work together, and in the course of this they access the same resources and finally share the fruits of labor. The only striking difference concerns leadership in the public arena. The position of the leader is always held by a male, but this should not hide the fact that women have considerable control in public decision-making (see "Gender-Related Social Groups" and "Leadership in the Public Arena").

SEXUALITY

Orang Suku Laut attitudes towards the body, nakedness, and physical characteristics are uncomplicated.

Sexual intimacy, genital area, sex-specific physical characteristics and pecularities (e.g., penis length, breast size, or abnormal number of testicles) are popular topics, which are discussed uninhibitedly either jointly among men and women in the presence of children, or in exclusively male or female circles, in a purely factual manner or through suggestive jokes. Also, infants are not treated like asexual beings. Grown-ups tend to pat the babies' bottoms and to sniff and kiss them everywhere.

Further, in a way, nakedness is no taboo. Children of both sexes normally walk around naked up to the age

of about 6. Males often wear short trousers only, and females are from time to time seen wearing nothing but brassieres and sarongs, or stripped to the waist. Sometimes, owing to the crampedness of houseboats and pile-dwellings and the absence of toilets, one can observe people while relieving themselves. However, normally people try to do so in a discreet way, and if not, this is commented on with disapproval.

In the Orang Laut view, sexual intercourse is natural. It is healthy and, of course, it is for reproduction. It legitimately takes place within the bounds of marriage and in the intimate space of the houseboat or pile-dwelling. Extramarital relations for both males and of females are regarded as inacceptable, and in fact hardly occur.

Premarital sexual intercourse is the exception. In former times, children were engaged before sexual maturity and were married with the beginning of puberty at the latest, so that the "problem" of premarital intercourse did not arise. Even today, many males and females are already married at the time of sexual maturation and therefore can satisfy their sexual desire within the accepted bounds of marriage.

As already mentioned (see "Cultural Construction of Gender"), cross-sex identification and cross-dressing are almost irrelevant in Orang Suku Laut society. If male or female homosexuality does occur, the couple behave extremely discreetly.

COURTSHIP AND MARRIAGE

Marriage is regarded as a desirable aim in life and hence, there are relatively few unmarried people. Ideally, the Orang Suku Laut are monogamous, and marriage should last for a lifetime.

In former times, boys and girls were often married during childhood. Today, child marriage has become rare, but the marrying age is still low. For girls, it is approximately 13 years and boys marry from the age of about 15 upwards. This difference in the age between girls and boys is connected with marriage ideals, according to which cousins, either cross or parallel, are preferred spouses; also, the male partner should be older than the female. These preferences are explained by the ideal of groups of close kinsmen living together and not breaking up as a result of marriage (see "Gender-Related Social Groups"). However, the scope for choosing one's own spouse as well as when to marry has become much greater today.

Emotional bonds and love between prospective spouses have become an argument for marriage choice. Nonetheless, as in the past, skills and the capacity for hard work, and deference vis-à-vis the parents of the bride and groom are still important considerations.

However the choice of partner takes place, it is always expected that the parents of the boy and the girl agree, after a discussion with close relatives. If the parents do not accept their children's choice, the marriage either will not happen or the couple decide to flee and not to return before the girl has become pregnant, because then marriage is normally accepted. If one of the spouses dies, the widow or widower normally remarries quite soon, with the exception of very young women who return to their parents. Widowed persons prefer to marry siblings of their deceased husband or wife respectively.

Marriage is preceded by engagement, which can last for a month or a year. During this period, the husband-to-be is already responsible for his future wife's needs regarding food and clothing, but she has no reciprocal duties to fulfil. Courtship is officially asserted by the groom's mother who pays a visit to the bride's mother after her son's request has been discussed and consented to. A box containing a golden ring, bracelets, a sarong, an umbrella, a mirror, powder, lipstick, and the like is handed over to the bride. By accepting the box and inspecting the presents, the bride expresses her readiness for marriage. Sometimes the husband-to-be is expected to give bridewealth in cash and also has to bear some of the costs of the wedding ceremony. Ideally, the amount to be paid for a young girl is twice as much as that for a widow. However, in fact, bridewealth is often paid only partly, or not at all, because the groom is not able to raise the money.

The time of the wedding calls for careful consideration. Every Wednesday in the course of the waxing moon and the eighth month of the year are favourable. Also, the place where the wedding will be held has to be inspected carefully to protect the participants from the noxious influence of evil spirits. All relatives are invited to attend the ceremony. Bride and groom are decorated with floral wreathes and golden necklaces. The husband-to-be also wears a hat and a belt with a *keris* (Malay knife). First, he has to ask the bride's parents if there is a rival, which is of course negated. Then he expresses his intention. This is followed by a ceremony in which the spouses feed each other with chicken eggs and eggs made from rice (*pulut*).

With this act, the marriage is formalized. Then the guests are entertained with food and songs and dances (*pantun*; see section on leisure), and sometimes also with *silat* performances (a kind of Malay martial arts).

Those Orang Suku Laut who have been settled for a long time have adapted their wedding ceremony to Malay traditions. This includes engaging a female expert who leads the bride through the various stages of the ceremony (*nikah*), which lasts much longer, is more complex, and is sometimes conducted in the presence of an Islamic authority.

HUSBAND–WIFE RELATIONSHIP

The aim of marriage is the spouses' mental, physical, and economic partnership, and the bearing of numerous descendants. Only if there is a child, is the "rightness" of marriage deemed to be confirmed. The husband–wife relationship is characterized by affection and companionship, especially in the case of nomads who rarely separate. Husband and wife do nearly everything together—eating, sleeping, working, making decisions, and spending their leisure time.

In cases of childlessness, the adoption of a child of relatives is the alternative to the dissolution of marriage (see "Parental and Other Caretaker Roles"). Childlessness as a consequence of infertility or miscarriage is put down to magical malpractice or imperfect dealings with the spirits of the ancestors, or it is associated with the incompatibility of the spouses' personal spirits who shape every human being's character (*mare*). Only if these causes can be excluded is childlessness traced back to biological infertility, which is then supposed to affect only the woman.

Divorce is infrequent, it is impossible during a woman's pregnancy and it is mostly granted only if there are no offspring. However, divorces occur, and do not reduce the prospects of remarriage. Both partners can ask for divorce, and their request has to be discussed with the spouses' parents. Also, if one side is not willing to separate, he or she can protest. The spouses' parents normally try to identify the problems and find a solution. If this proves impossible, they agree to the divorce and the partners return to the residential group of their respective parents. If there are offspring, the younger children normally stay with the mother, while the older ones can decide by themselves whom to follow.

Another form of divorce is simply to escape. This occurs, for instance, when one of the partners abandons his/her spouse and children after a severe dispute, leaving all material belongings behind and perhaps never returning.

OTHER CROSS-SEX RELATIONSHIPS

Brother–sister and grandparent–grandchild relationships often last for a lifetime, because adult siblings and their parents' parents often live together with their families in one and the same group of boat-dwellers or house-dwellers. This is often also the case with cousins, because they are preferred marriage partners (see "Gender-Related Social Groups").

Other significant male–female relationships are subject to marriage taboos. Marriages between maternal/paternal uncles or aunts and their nieces/nephews, as well as between adoptive parents and their adopted children, are met with disapproval.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Up to now, Orang Suku Laut gender relationships have not been influenced much by the norms and values of mainstream Indonesian society, or by the moral boundaries of the surrounding Malay Muslim population. However, in recent years, things have started to change among those sections of Orang Suku Laut who have become sedentary, because of more intense interethnic contact and the pressures of directed change by the Indonesian government.

There is increasing male dominance in resettlement sites. One indicator is that during visits by officials women either do not attend the gatherings, or sit apart from the men and no longer give their opinion. This change in behavior is reinforced by the officials who normally treat only Orang Suku Laut males as competent persons to approach, and who, if they summon a meeting, insist on fixed gender-segregated seating arrangements.

Also, women in resettlement sites tend to lose the considerable control in economic affairs that they had earlier. In the course of ongoing sedentarization, a sexual division of labor gradually develops, and women's labor is pulled out of fishery and instead allocated to domestic

work. Those Orang Suku Laut women who have settled some time ago now tend to accompany their husbands during daily fishing only sporadically; more often they stay with the children in the settlement. More and more, the men take on the role of family breadwinners and also sell the fish, whereas the women look after the money and take care of the home and the children.

With ongoing sedentarization and the simultaneous development of the sexual division of labor, role expectations with regard to children are also changing. Now, sons more often take part in their fathers' activities, while daughters help their mothers at home.

The promotion of gender segregation is linked to other aspects of the moral order of the Malay Muslim majority and has affected, for instance, the dress habits of women who now cover the upper parts of their bodies. The nakedness of children has also become an issue, as has the demand for "more disciplined" sexual intercourse and the aim of having fewer children. Officials have tried to introduce birth-control methods, but these have received little response.

Finally, the expansion of broadcasting media in Indonesia, including private stations using the national language, and the increasing access to radio and television among the Orang Suku Laut have a great influence on the definitions and redefinitions of male and female roles. However, the most lasting effect results from formal education in state-run schools—something which is often emphasized by officials, who state that "for the elder generation, development is a lost affair, it is the younger generation that counts."

Till now, regional modernization and state-directed change have had rather disruptive effects on the mobile lifestyle and economy of the Orang Suku Laut, as well as on their social and cultural orientations, including gender issues. In this context, only the ideals of the nation-state and the cultural and moral aspirations of the regional Malay majority have become the promoted standards, challenging what the Orang Suku Laut consider to be appropriate. Rethinking such matters is long overdue in Indonesia, however. In accordance with democratic principles and the Indonesian state motto of "National unity in cultural diversity," the participatory rights of the Orang Suku Laut must be acknowledged as a matter of course in all decision-making processes that impact their way of life.

Puerto Ricans

Marysol Asencio

ALTERNATIVE NAMES

Puerto Ricans are also known as Puertorriqueños Boricua or Borinquén.

LOCATION

Puerto Rico is located east of Central America between North and South America at the entrance of the Caribbean Sea. It is part of a chain of islands that range from the southeast coast of North America to the northeast coast of South America. This chain of islands is divided into the Greater and Lesser Antilles. Puerto Rico is part of the Greater Antilles that also includes Cuba, Hispaniola (Dominican Republic and Haiti), and Jamaica. Puerto Rico is a relatively small island (100 miles long by 35 miles wide) with a great deal of geographical diversity. It has flat coastal plains, high mountain regions, lush fertile areas (e.g., El Yunque rainforest) and deserts. There are many rural and urban communities throughout the island as well as the cosmopolitan capital of San Juan.

CULTURAL OVERVIEW

Each historical group in Puerto Rico has had some influence on the current culture of Puerto Rico—first the indigenous populations, the Taínos, then the Spanish colonizers, then the African slaves, and finally the United States, which took possession of Puerto Rico as a war bounty from Spain at the end of the Spanish–American War in 1898. While the basis of contemporary Puerto Rican culture is Spanish, there has been significant fusion with other cultural traditions. Puerto Ricans take pride in viewing their national identity as the product of the melding of primarily three cultural groups—Taínos, African, and Spanish. Puerto Ricans, although part of the United States, maintain a strong national ethnic identification. However, the United States has exerted a great deal of control of and influence on Puerto Rican society in the last 100 years, in particular pushing the large and rapid movement of Puerto Rico from an agrarian to an industrial society. Puerto Rico is currently a class-structured complex society, which has been described as more "traditional" than U.S. mainland society.

Puerto Rico is currently a Commonwealth of the United States. As such, there are no travel restrictions, no custom duties, or shipment quotas between Puerto Rico and the U.S. mainland. The U.S. Congress granted Puerto Ricans U.S. citizenship in 1917. However, the people residing in Puerto Rico cannot vote in U.S. national elections. A Resident Commissioner, who has a voice in the House of Representatives but no vote, represents the Puerto Rican people. The Puerto Rican government is a democracy within the U.S. constitutional system. The currency is the U.S. dollar. Spanish and English are the official languages. English is a compulsory second language in school and is widely used in business, industry, research, and education. Current political debates on the island revolve around whether Puerto Rico should stay in its current political status as a Commonwealth or become the 51st state of the United States of America. Since the 1940s, a large percentage of Puerto Ricans engage in extensive and circulatory migration between the island and the U.S. mainland (in particular the northeast region of the United States).

CULTURAL CONSTRUCTION OF GENDER

One of the major problems with discussing gender among Puerto Ricans on the island is the limited research on gender as the central point of analysis across many subject areas. Some gender research areas such as women's and men's experiences and contributions to the labor force have amassed more attention and empirical research than other areas of gender scholarship, such as gender roles within marriage, the family, across the life-span, leisure, arts, sports, and sexuality. Moreover, there is a long history of scholarship that has created pathological models on Puerto Rican families. Although this scholarship is currently being challenged, it provides the basis

for much of the readily available information on Puerto Ricans. Another problem associated with gender studies among Puerto Ricans is that the limited empirical research available spans several decades. There is no critical mass of gender research available on the current situation for most subjects discussed in this chapter. Thus this chapter will produce an overview of what has been described as the "traditional" sex–gender system for Puerto Ricans in the social science literature with the caveat that many of the descriptions are not adequately empirically researched and are out of date.

The Puerto Rican sex–gender system is characterized by dichotomous descriptions and expectations of male and female behavior. Machismo and marianismo represent the two major constructs that have been used by scholars to define male and female behavior in Puerto Rican society, with males and females usually being given opposite expectations and characteristics. Machismo and marianismo in the social science literature are often poorly defined and empirically tested concepts that diminish the range of masculinit(ies) and femininit(ies) ascribed to by Puerto Rican men and women. The concept of machismo involves male domination and female subordination. A male may exert power and control through physical abuse. Machismo in the extreme is connected with fighting, bragging, and drinking. In addition, males may refuse to do anything that they perceive to be feminine. It also involves a sense of invulnerability, courage, honor, and veneration for the mother as well an obligation to protect and provide for the family. It may be linked with concepts of respect and dignity. Marianismo, on the contrary, involves the expectation for females to be virgins, asexual, submissive, humble, tolerant, faithful, and devoted to the male and the backbone of the family. Motherhood is exalted. It is important to point out that the patriarchal sex–gender system for contemporary Puerto Rican society follows the same pattern of gender behavior and dress codes as those of modern industrialized Western nations. Although the pattern of gender behaviors are described as more conservative or traditional than those of the U.S. mainland, some researchers have described Puerto Rican women as somewhat less traditional than other Latin American women (Cuadrado & Lieberman, 2002). Although machismo and marianismo are commonly presented as unique phenomena of Puerto Rican and Latino/Hispanic culture, researchers also have used these terms to describe gender roles in a variety of non-Latino/Hispanic cultures. While the literature available consistently describe or refer to machismo and marianismo as framing most gender issues for Puerto Ricans, some studies also show that in any given population of Puerto Rican males or females, the elements described above as *machista* or *marianista* may vary in magnitude or be absent. Age, social economic class, geographical location (rural versus urban environment), and extent of circulatory migration with the U.S. mainland, to name but a few variables, influence the construction of gender among Puerto Ricans.

Gender over the Life Cycle

Socialization of Boys and Girls

According to the social science literature available, within the Puerto Rican family, girls and boys are taught different gender and sexual behavior. The family teaches boys to be strong, independent, and aggressive, while teaching their daughters to be dependent, obedient, responsible, and submissive. Puerto Rican girls are taught that chastity is of utmost importance. Family members protect females more than males. Females are perceived to be more vulnerable and weaker than males. Males are seen as being able and needing to take care of themselves. A girl, regardless of social class, is expected not to be unclothed in public while boys are allowed to appear naked or half-naked. Boys are trained to be respectful and submissive to adults during childhood years, but are expected to be active, restless, daring, and to commit more acts of disobedience as they grow older. They are then expected to become independent and aggressive as they emerge into adulthood. Girls are made more responsible but have less social freedom than boys. Although child rearing patterns differ by socioeconomic class and region of the country, there are some patterns that seem to hold constant for most Puerto Ricans on the island (Vázques-Nuttall & Romero García, 1989). The sexes are strictly separated, with the female role more narrowly defined than the male. From early childhood, girls are restricted in dress, conduct, freedom, language usage, and social associations.

Scholars have also noted sexism in the socialization of boys and girls within the Puerto Rican school system. Research conducted in classrooms in the 1970s and 1980s showed that sexism was supported by teachers and reinforced in textbooks and instructional materials

(Acosta-Belén, 1986). While boys are shown as aggressive and strong, with mechanical ability and engaged in a variety of activities, girls are portrayed as passive, dependent, physically and emotionally fragile, and engaged in activities usually limited to their future role as mothers and homemakers. In the 1980s, female characters were significantly underrepresented in the textbooks (Vázquez-Nuttall & Romero-García, 1989). When shown, they are in traditional roles and occupations. Girls are presented as mainly involved in passive activities like playing with dolls, observing the boys at play, or just waiting for them. Socially valued characteristics among Puerto Ricans, such as courage, creativity, perseverance, and adventurousness, were more likely to be attributed to males than females, while negative social values, such as weakness, passivity, dependence, and fear, were more likely to be attributed to girls and women.

Cultural notions on sexual differences also have a bearing on the disciplining of children (Vázquez-Nuttall & Romero-García, 1989). Although there are more expectations and acceptance of male's violating parental rules, when they are punished it tends to be harsher, in particular with the use of physical punishment. This practice is also related to sex stereotypes. Boys are considered to be stronger and thus capable of withstanding, as well as in need of, stronger disciplinary measures (Borrás, 1989, p. 203). The belief that boys are stronger also leads to the belief that they are more difficult to discipline than girls. Therefore the father or a male substitute is more likely to be called upon to exact punishment on a young male. The mother is more likely to discipline the female, who is seen as weaker.

Puberty and Adolescence

Many adolescent girls are not provided with information about their bodies and issues involving sexuality. Adolescent males are expected to begin sexual relations during this period of time whereas females are expected to wait until marriage. Males must find females with whom to have sex. If a girlfriend agrees to have premarital sex, she is seen as a failure and her boyfriend will probably not ask her to marry him (Burgos & Díaz-Pérez, 1986). Scholars have suggested that traditionally in Puerto Rico and throughout Latin America males came into their manhood by engaging in sexual intercourse (sometimes visiting prostitutes who are paid by male relatives), while females at age 15 are given parties (*quinceañeras*) to emphasize their virginal qualities. This latter event is still

a part of traditional entry into womanhood in Puerto Rico as well as in other Latin American countries. While many young Puerto Rican women celebrate becoming 15 years old, others, more assimilated to U.S. mainland traditions, also celebrate their "Sweet 16."

Attainment of Adulthood

Adulthood in Puerto Rico is defined legally with certain adult rights and responsibilities beginning in the late teens. As women enter their adulthood, they are expected to dress beautifully and to be feminine and attractive to men while being modest. Sloppiness and being disheveled is tolerated more among men. Once married and with children, men and women take on the expectations and responsibilities of adulthood. When men become widowers they are encouraged to remarry (Burgos & Díaz Pérez, 1986). Widowers are more likely to be perceived as needing women to take care of their homes and sexual needs. Once past child-bearing, a widow is less likely to be seen as needing to remarry.

PERSONALITY DIFFERENCES BY GENDER

Traditionally, dignity and respect are qualities expected and admired by both male and female Puerto Ricans. However, there is a greater expectation of Puerto Rican men to have some sense of personal dignity (*dignidad*) and make sure that proper respect (*respeto*) is shown to them. Therefore, a man is called to protect his personal honor as well as the honor of all other members of his family. The behavior of family members also reflects on the honor of the man, in particular the chastity and fidelity of his daughters and wife. According to some scholars, Puerto Rican personality constellations are framed by machismo and marianismo. As noted previously, machismo and marianismo are concepts that are poorly defined and not sufficiently empirically tested.

Machismo is described as involving personal bearing by which one faces challenge, danger, and threat with calmness and self-possession. It is also a quality of personal magnetism that impresses and prompts others to follow one as a leader. Aggressiveness, violence, and assertiveness are also associated with machismo. Marianismo is described as involving self-sacrifice, nurturance, passivity, and modesty. Within this framework,

femininity is strongly bound to the ideology of sacrifice. A good woman is defined by her self-abnegation and by placing family and community needs before her own. A good woman is one who is selfless and willing to sacrifice in order to ensure the well-being of her family, including the well-being of her parents as they age. Puerto Rican women are expected to accept misfortune with stoicism and silence. The oppressive nature of the limited gender role, which does not allow women to demonstrate aggressiveness, has been thought by some scholars to cause *mal de nervios or ataques de nervios* (bad nerves or attacks of nerves) (Cuadrado & Lieberman, 2002). Researchers have also attributed *nervios* as a response to acute stress. The Puerto Rican culture is said to allow for psychosomatic displays as self-mediating stress relievers. These attacks are a culturally acceptable way of expressing uncontrollable emotions. While these attacks do occur in both genders, they have been found to be more common among Puerto Rican women, as has depression. Alcohol use, which is allowed for male stress reduction as well as celebration, is usually discouraged in women.

GENDER ROLES IN ECONOMICS

Puerto Rican women have a high level of participation in the labor force. This high level of female labor participation has been linked to the economic development of Puerto Rico as a U.S. colony, in particular the growth and subsequent stagnation of the post-World War II industrialization program in Puerto Rico. The deliberate development of export-oriented industrialization increased the demand for female labor in the formal economy, contributing to a new division of labor and a feminization of the labor force. Employers in export-oriented industries selectively recruit women for their low wages and relative docility, and the belief that women have the patience and skills to do repetitive and detail-oriented tasks (Zsembik & Peek, 1994). Men were displaced from the extracted industries as Puerto Rico industrialized. Unemployment rates for men in Puerto Rico have risen more rapidly than for women. The high rate of the unemployment led to male out-migration leaving many families without a male income earner. Growing unemployment has led to increasing reliance on federal financial assistance to sustain the Puerto Rican economy. Females sought government subsidies to make ends meet.

Female employment is an important element to Puerto Rican working-class family survival. Studies have found that, within this population, women work as a way of contributing to the family income rather than as a way of establishing their own independence. Safa (1986) found that married women contributed 40–60% of the total family income. Women's participation in the labor force may support the current trends of Puerto Rican women of marrying at later ages, bearing their first child at later ages, and more likely to be employed before child-bearing begins. Some scholars contend that Puerto Rican women's increased contribution to the household economy has increased egalitarian relationships between husbands and wives as well as support for the feminist movement in Puerto Rico.

PARENTAL AND OTHER CARETAKER ROLES

Four main family structures are found among Puerto Ricans. One is the extended family system, where there are strong bonds and frequent interactions among a wide range of natural or ritual kin. Another family structure associated with Puerto Ricans is the nuclear family, which is composed of the father, the mother, and children. A third family structure, female-headed households, involves the mother as the only parent in the household with children. Finally, there are individuals who live in the same residence in various arrangements. In rural and urban lower socioeconomic class families, it is more common to see an extended family system. In upper- and middle-class families, nuclear family arrangements are more common. A significant percentage of Puerto Rican families are headed by females. These arrangements, among other variables, influence issues related to parental roles and caretaking.

Puerto Rican women still continue to be the center of the home and family. Within this sphere, they have the responsibility of caring for the children, the aged, and the ill. While women's and men's roles within the family and as caretakers vary, scholars tend to describe parental and caretaking roles with more gender-role rigidity than may actually be the case. Women's roles as mothers are highlighted, calling for self-sacrifice in favor of their children. Males are responsible for providing for and protecting the family. Males are portrayed as making the major decisions regarding family economics, behavior, and

education of the children, and the duties of each family member. Men's responsibilities include chores such as house and car repairs, but they are not expected to do any housework (Confresí, 1999).

The father is characterized as having authority in all family matters, including the discipline of children (Vázquez-Nuttall & Romero García, 1989). The mother may also establish rules for the day-to-day regulation of child behavior, but these rules do not go against the father's wishes. The mother's role as the provider of love and affection in the family is seen as more significant than her role as a disciplinarian. The mother is portrayed as responsible for the raising of the children and management of the home. She is also responsible for the religious education of the children and for their attendance at religious services. The parents provide economic support for their children as long as they live in the home. If the father dies or is away from home, the oldest son is expected to assume his responsibilities and duties. The oldest daughter is expected to do the same for the mother. It is not uncommon for children to leave school to assist the family in these moments of crisis. While these are common descriptions, some scholars question the uniformity of this model, noting economic and other influences on patterns observed. A single mother has to take on dual roles assigned for the mother and the father. The availability of providing care in the family is also constrained by women's changing roles in social life.

Research has shown that it is primarily women who are the caretakers for the elderly. It is only when an elderly couple become unable to take care of themselves or when one of the partners dies, that children become involved in daily caregiving (Sánchez-Ayéndez, 1998). The daughter is usually the one to take responsibility for primary caretaking of the parents. In a study of older Puerto Ricans (Zsembik & Bonilla, 2000) there was no consensus on who is the ideal caregiver for older adults. The common attitude that daughters are more natural caregivers than sons is supported by the gender construction in Puerto Rican society. Men thought of daughters as more emotionally attached to parents. However, older women saw both daughters and sons as needing to provide care.

LEADERSHIP IN PUBLIC ARENAS

Since 1962, women in Puerto Rico have graduated from college in higher numbers than men and at the same time have increased their participation in the traditionally male dominated disciplines (Confresí, 1999). In the last three decades women have played an important role in Puerto Rican public and academic life. Women have been steadily gaining acceptance in leadership roles and have taken on political power. Through the 20th century, women have held prominent places in the Commonwealth's Supreme Court, as well as being elected as leaders. Felisa Rincón de Gautier was mayor of San Juan from 1946 to 1968 and Sila Calderón is San Juan's current mayor. By the 1980s 17 women had served as elected members of the Senate and 13 in the House of Representatives in Puerto Rico (Votaw, 1995).

There have been women in prominent leadership positions throughout the island in medicine, law, and education, as well as in politics. Ana Roqué de Duprey was an early feminist who with other Puerto Rican women suffragettes pressed for women's right to vote, which Puerto Rican women exercised for the first time in 1936. Women also excelled throughout the century in the education field with notable women such as Carmen Gomez Tejera and Antonia Pantoja. Moreover, the high rates of education among Puerto Rican women also produced outstanding literary figures, such as Julia de Burgos who in her writings challenged other women to question the social constraints on women. She also was a strong political supporter of independence from the United States. Although Puerto Rican women are found in leadership positions across Puerto Rican society, female representation is not proportional to their numbers in the society. The number of women in leadership positions is significantly less than that of men. Despite the increased educational, professional, and political participation, there is a paucity of research documenting current gender-role expectations for professional Puerto Rican women.

GENDER AND RELIGION

As part of the Spanish colonization of Puerto Rico, the Catholic faith was brought to the island and enjoyed a privileged relationship with the dominant powers. Catholicism is a patriarchal, hierarchical, and gender-segregated religion in terms of its religious organization and orders. The higher levels of the Church are completely male dominated. Only males can become priests, and therefore only men can hold the positions of Pope, archbishops, bishops, and cardinals who make up the

hierarchy and power structure of the Church and who are responsible for the interpretation and administration of Church teachings. While females can serve as nuns, they do not hold the same status and power as priests.

The Catholic Church position on issues related to gender favors traditional gender and marital arrangements. All followers are expected to maintain themselves within the teachings of no premarital sex (to observe the sacrament of marriage), no masturbation, no condom use (or other contraceptives), no abortion, no infidelity, and no homosexuality (McCarthy & Bayer, 1984). Although non-coital sexual expressions are no longer prohibited, they are only acceptable under certain conditions (in marriage, as foreplay). Noncoital sex cannot substitute for coital activity between husband and wife. The Church's exultation of motherhood and encouragement of large families create constraints in the present society for women's economic contributions and independence outside the home.

The cultural values of sexuality discussed in terms of Puerto Rican machismo directly oppose almost all religiously based expectations. The cultural expectations of marianismo clearly resemble those of official religious dogma. In fact, the term marianismo (or mariolatry) discussed throughout this chapter is also associated with devotion to the Virgin Mary. This symbol within Roman Catholicism represents virginity, motherhood, and devotion to males (whether father, husband, or first son). The "cult the Virgin Mary" has influenced the female ideal for many cultures where Catholicism has been dominant.

Protestantism significantly increased on the island after the United States took over in 1898. Pentecostal sects have been the most vigorous in converting Puerto Ricans. It is among the urban poor where conversion seems to be most prominent. While there are Pentecostal female ministers, males are more likely to be church leaders. Overall, as a fundamentalist religion, Pentecostal teachings support traditional family arrangements, sexual behaviors, and gender roles.

For some Puerto Ricans, alternative religions or belief systems such as Santería and Espiritísmo are practiced alone or in combination with a mainstream religion. For some Puerto Ricans there has been a blending of traditions from Santería and Espiritísmo. Santería is a merging of Catholic and African spiritual traditions (in particular the Yoruba religion). It has its own priests and rituals. Espiritísmo was brought to Puerto Rico from Europe in the mid-19th century. It is basically a belief in a spirit world where good and bad spirits interact with humans and the spirits of the dead are in communication with the living. In Puerto Rico, there seems to be a combination of many different rituals and practices—Catholic, Santería, and Espiritísmo—where the people themselves are not certain of the origin of a particular custom. Santería and Espiritísmo are not centralized religions as is the case with the Catholic Church. Therefore sects and particular followers of these traditions may differ in their acceptance of females in certain roles. In some sects and among some followers, females play important roles as priests, mediums, and leaders (Paulino, 1995).

LEISURE, RECREATION, AND THE ARTS

The mixture of cultural traditions has influenced the cultural arts of Puerto Rico, like many of the other aspects of Puerto Rican society. The musical traditions of Puerto Ricans are rich and varied. Bomba y plena, salsa, danza, Latin jazz, Latin rock, and hip-hop are just a few examples of the music styles found throughout the Island. Male composers and male musicians and performers dominate these traditions, but there are notable female entertainers. Many traditional music types are composed by males and possess references to females that may be seen as sexist (Aparicio, 1998). There is more equal representation of females as actors; however, there needs to be further research in terms of their representation and career trajectory compared with males. Television, radio, cinema, newspapers, and *novelas* (soap operas) have also reinforced the attitudes and prejudice as well as stereotypes of women (Acosta-Belén, 1986). There are many types of artistic tradition in Puerto Rico, including traditional Puerto Rican crafts such as making Santos (carved wooden saints). As with other areas of the arts, males have had a more predominant role.

Female participation in sports has increased in Puerto Rico as it has in other countries. However, males have a strong predominance in sports, both professionally and for leisure. Participation in sports by Puerto Rican women is not as socially supported or as popular as it is in the United States and other countries. Of course, in most cases professional sports are segregated, and men earn more and obtain greater social popularity and support than women in sports.

Relative Status of Men and Women

According to the Puerto Rican Constitution, men and women are created equal. Yet, sexism still exists in Puerto Rico today. The increased demand for women's labor has not necessarily improved women's status, as persistent patriarchal pressures at the social level continue to favor policies that promote men as the primary breadwinners. Some Puerto Rico officials have voiced concerns about social problems associated with the economic conditions that prevent men from assuming the principal role as a provider; accordingly, in an attempt to reduce men's unemployment, they have developed policies that are geared to attracting employment opportunities for males (Zsembik & Peek, 1994). As a consequence of these policies, Puerto Rican women may be driven out of the labor force and potentially lose their emerging autonomy.

Browne's (2001) comparative study of female entrepreneurs in Puerto Rico, Martinique, and Barbados found that Puerto Rican ideologies of gender are the strictest and occupational segregation is most strongly pronounced. Entrepreneurial women appear more likely to be social outliers than their counterparts in less gender-stratified societies like Barbados. While two-thirds of working women in Puerto Rico are married and lived in nuclear households, the majority of female entrepreneurs are unmarried, living alone, or in nontraditional households. In Puerto Rico it is suggested that economically ambitious women may choose to avoid the constraints of family structures dominated by male authority. Other indicators suggest that entrepreneurial women go against normative patterns. While 85% of the Puerto Rican population is Catholic, nearly half of the entrepreneurial women in the study are not. The large proportion of non-Catholic unmarried women living in nontraditional households who own nontraditional businesses suggests the possibility of a certain social marginality among female entrepreneurs in Puerto Rico.

Sexuality

Traditional descriptions of Puerto Rican women's sexuality include virginity until marriage, passivity when having sex, and the lack of expectation of pleasure from their sexual activities. In their study of sexual expression among Puerto Rican women, Burgos and Díaz-Pérez (1986) found that adherence to this dominant cultural ideology was related to class. Working-class Puerto Rican women were found to adhere more to this ideology than middle-class women. Working-class females also believed that males are the sexual experts. Females are expected to be simultaneously attractive, seductive, and virginal. Puerto Rican society has been described as valuing a female for maintaining her physical appearance. Attractiveness is based on modern Western perspectives. Female attractiveness is emphasized more than male. Moreover, female cleanliness was believed to reflect genital cleanliness (free of diseases). Males are given more latitude in terms of looks, with virility and strong masculine qualities idealized. Given the socialization of females not to want sex, engaging in sex may produce feelings of guilt.

In Puerto Rican society, there is a tendency to judge women according to their sexual behavior. The double standard is still prevalent in expressions such a "*la mujer buena o de su casa*" (a good women/of the home) and "*la mujer mala o de la calle*" (a bad women/of the street). The former deserves respect and protection, the latter scorn and harassment. Moreover, the latter group of females is seen as a source of sexual release for males.

Puerto Rican women are supposedly solely responsible for fertility control. Males are portrayed as uninvolved or hostile to contraception. In a dated study, Murrillo (1976) found that their husbands forbade most Puerto Rican women to use contraceptives, and most Puerto Rican men refused to use contraceptives. Social class has been shown to influence contraceptive use. Borrás (1984) found that working-class Puerto Rican woman were less knowledgeable about birth control than middle-class Puerto Rican women. Puerto Rico has one of the highest sterilization rates in the world, in particular female sterilization.

In Puerto Rico, as in other societies, the masculine ideology stresses sexuality. A man should revel in his sexuality. Women are objects of pleasure, so long as men abide by the taboo of incest and give the respect expected toward those women who are considered part of the family. Men are expected to engage in the conquest of women. The males' conquest of females is framed by differences in class and racial phenotypes. Women of a higher class are usually reserved for men from the same class (Ramírez, 1999). The culture is phallocentric with a great deal of attention and power given to the male genitals. The Puerto Rican language of sexuality reflects the importance of the penis and its connection to power (Ramírez, 1999). The aim of male sexuality is sexual

intercourse. Sexual acts other than penetration are seen as of lesser value. Gender expectations for males involving virility and sexual prowess create concerns in males around sexual dysfunction. The sexual relationships between men and women involve maintaining the proper gender and sexual roles.

Homosexuality is considered as unacceptable on the island, for both women and men. Homosexuals and lesbians are ridiculed. Their sexual preferences and behaviors are viewed as "*poco verguenza*" (lack of shame). Homosexuality in Puerto Rico is seen variously as a sinful act, a crime, a sickness, or sexual orientation depending upon the ideological stance that the individual, social group, or institution assumes in dealing with it (Ramírez, 1999). There may be family rejection for those Puerto Rican men and women who are open about their sexual preference. Frequently, homosexual males are not are seen as being "real" men. In Puerto Rico, same-sex sexual practices cover a wide range of practices that are articulated and categorized differently, as are those who participate in these practices.

It has been suggested that same-sex sexuality among Latin American males is more common than among Anglos in the United States (Murray, 1995). The sex–gender system described for Puerto Rican males who have sex with men only considers the male receivers (*pasivos*) in anal intercourse as homosexuals. A male who penetrates another male (*activos*) in anal intercourse is not necessarily perceived as being a homosexual. *Activos* and *pasivos* are located in a sex–gender system where appropriate gender-sexual behavior rather than the object of sexual interest is used to determine who is a homosexual. Research on same-sex behaviors by Puerto Rican females is sparse, both theoretically and empirically.

Courtship and Marriage

Traditional descriptions of Puerto Rican courtship note that a young man interested in a girl had to request a permission of the girl's parents to ask her out socially and was never permitted to be alone with her. They had to be chaperoned at dances and social events. In order to marry, the approval of both sets of parents, in particular the father's, was necessary. These customs have almost disappeared from current Puerto Rican courtships. While curfews and a greater attention to female protection are present, many Puerto Ricans can go out and date without

significant supervision. However, females are more closely guarded and supervised than males. Males and females can both choose their partners, but usually families like to be consulted and maintain some form of approval. Many Puerto Ricans continuously migrate to and from the U.S. mainland. This has also pushed for Puerto Rican courtship patterns to resemble many of those found on the U.S. mainland.

There is a great deal of social expectation for both men and women to marry or have a committed relationship with the other sex. If they do not, it is assumed that there is something wrong with them. Marriage and motherhood are seen as essential elements in a Puerto Rican woman's life. Marriage is conceptualized as being of great consequence for Puerto Ricans because of its connections to both a Catholic religious sacrament and family formation. However, it is important to point out that Puerto Ricans have had a long history of informal unions which are considered a form of marriage and can be likened to common-law marriages (Landale & Ogena, 1995). This is in particular true of people in the lower socioeconomic classes.

Sayings such as men "*son de la calle*" (are of the streets) basically express the sentiment that men should come and go as they please. Men are and should be allowed to socialize outside family settings, and the time they spend out of the home is not monitored. The male spends much time outside the home working, in recreational activities, or in political or extramarital affairs. Men have the privilege and freedom to have an affair while women are expected to tolerate it (Acosta-Belén, 1986). Infidelity on the wife's part is seen as an affront to a man's dignity and honor. Women are considered to be morally or spiritually superior to men, which gives them the capacity to endure all the suffering and abuse inflicted by men. Moreover, a female's love for a male is demonstrated through complete trust and martyrdom. Divorce is seen negatively with the failure of the marriage seen as failures in the marital pair, in particular the wife (Muňoz-Vázquez, 1980). She is faulted for the personal failing of being unable to maintain a marriage. Marriage and divorce among Puerto Ricans have not been adequately studied.

Husband–Wife Relationship

Traditional descriptions of the husband–wife or heterosexual partnered relationship viewed the female

partner as the property of the male. Women's primary task was to raise children, manage the household, and serve their male partners. Warwick and Williamson (1977) found that marital communication about sexual behavior and family planning among Puerto Ricans was limited. They attributed the findings to cultural views on femininity, male fear of loss of dominance, and fear of wife's infidelity. The spousal/partner system of the low-income Puerto Rican family has frequently been described as strained because of the different expectations imposed by the culture on men and women. In patriarchal authoritarian families, few activities are shared between spouses.

The limited research available shows that Puerto Rican women are not passive chattel. Instead, while males clearly hold a more powerful social position in families and in relationships, many couples engage in more egalitarian roles and decision-making. Women's educational levels have risen, further prompting employment outside the home and migration away from childhood homes. Rising divorce rates and nonmarital fertility quickly vault mothers into the breadwinner role (Zsembik & Bonilla, 2000). As women have obtained education and economic independence, they have also obtained greater authority in the home. Conversely, males are also changing their attitudes about gender as Puerto Rican society becomes more open to issues of egalitarianism and equality between the sexes. Women have been found to have a range of expectations about their roles as wife (Muñoz-Vázquez, 1980). In addition, some scholars have found that a husband's authority varies by socioeconomic class and region of the country. In certain rural regions, husbands' authority may be very great while in the large urban capital of San Juan their authority may be greatly diminished (Vázquez-Nuttall & Romero-García, 1989).

OTHER CROSS-SEX RELATIONSHIPS

Descriptions of traditional Puerto Rican gender roles expect females to have limited relationships with members of the other sex who are not part of their kinship network. Since the cultural expectation is on protecting females from men, there is a strong segregation of males from females from childhood on. Relationships between men and women who are not related may be considered problematic within Puerto Rican society, particularly if the female is married or cohabiting. However, cross-sex relationships in Puerto Rican society have not been an area of much theorizing and research. Yet, contemporary Puerto Rican society has males and females, who are not kin, interacting in many ways with each other, both socially and professionally.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The last three decades have brought considerable social and economic changes that have touched on fundamental structures and processes, altering traditions, norms, and values within Puerto Rican society. Puerto Rican women's movement into the work force, lower fertility rates, and increased awareness of their social political and economic inequality have redefined women's roles, men's roles, and the relationship between them. Changing gender roles have raised women's educational achievements, spurred employment and migration, transformed family life, and in these ways played a critical role in women's availability to provide care to family members. The emergence of a large middle class in Puerto Rico and the circulatory migration pattern of a significant percentage of Puerto Rican men and women between the island and the U.S. mainland has also exerted influences that have assisted in redefining gender roles. Women, especially young unmarried women from rural areas, have historically constituted a significant share of internal and international migration streams (Zsembik & Bonilla, 2000). However, there is still evidence that women still adhere to traditional Puerto Rican roles to varying degrees. Sexism and homophobia are still maintained within Puerto Rican society. Traditional and modern constructions of gender are found to coexist among Puerto Rican women. While Puerto Rican women have accepted and, in some cases, welcomed roles outside the home, these women are still balancing two sets of expectations. Little is known about the role that the cultural orientation towards familism plays within Puerto Rican society in perpetuating women's continued subordination to the needs of others at the expense of the development of their own separate goals (Vázquez-Nuttall & Romero-García, 1989). More empirical research on Puerto Ricans' construction of gender is needed to develop a more expansive and nuanced understanding of the expectations and roles of gender in different arenas of Puerto Rican society.

Rungus Dusun

George N. Appell and Laura W. R. Appell

ALTERNATIVE NAMES

Rungus are also known as Rungus Momogun.

LOCATION

The Rungus are found on the island of Borneo just north of the equator. They inhabit the Kudat Division of the State of Sabah, Malaysia. They are found on two peninsulas, the Kudat Peninsula and the Melobong Peninsula. The data in this article refer to the Rungus of the Kudat Peninsula. A range of hills stretch down the length of the peninsula, and small, short, and unnavigable streams run down the hillsides into the ocean on either side of the peninsula. The primary forest on the peninsula is a monsoon tropical forest, but it has been largely replaced through cultivation by secondary forest.

CULTURAL OVERVIEW

The ethnographic present of 1959–63 is used in this description. At that time the Rungus still carried on their traditional cultural ecology under the political control of the British colonial administration. The Rungus village is the major political unit. It has residual rights over its land in which only resident members may cultivate swiddens. The village area encompasses the drainage pattern of one of the small streams that drain from the spine of the peninsula of their territory. A village may consist of one or more longhouse hamlets. It is not a kinship unit. Membership can be granted to families with no kin resident in the village. The major social unit in terms of economy and religion is the domestic family inhabiting a longhouse apartment which it constructs and owns. The domestic family ideally, and most frequently, consists of a husband, his wife, and their children. Parents of the married couple may join when they are no longer able to carry on their swidden activities. Marriage requires a brideprice of brassware, gongs, and jars. After marriage a husband lives in the apartment of his wife's family until the following agricultural year when he builds their own apartment onto the longhouse. The domestic family cuts a swidden each year in secondary forest, planting rice, maize, cassava, and a variety of vegetables and other economically useful plants. On removing the last of the produce from the swidden the area reverts to the village reserve for any other family to use. Animal protein and fat is provided through the sacrifices of pigs and chickens to various spirits that cause illness and by hunting and fishing. The family also plants and owns a number of fruit trees. Agricultural surplus is invested in gongs, jars, and various types of brassware. These are inherited individually by children of the family.

There are three social classes based solely on economics: wealthy, middle class, and poor. Prior to British colonization, there was a slave class that was primarily based on debt slavery.

Along the coast of the peninsula are a number of coastal Muslim villages, with whom the Rungus trade agricultural surpluses for fish, brassware, gongs, headcloths, and other items of native weaving. Intervillage disputes that cannot be resolved are taken to the leaders of these villages for mediation.

CULTURAL CONSTRUCTION OF GENDER

Gender categories include only male and female. Women wear skirts and sarongs. Men wear loose-fitting trousers, a shirt, and a headcloth. Women working in the fields will put on shirts over their sarongs. Women wear their hair knotted on the back of their head and cut out a small fringe of forehead hair so that it frames it. Boys and married men without children wear their hair knotted at the base of the head. Women wear earrings, brasswire coil from ankle to knee, coiled arm brass, and a girdle of fine brasswire interspersed with beads under their sarongs; some wear coiled brass around the neck. Girls start wearing earrings at an early age, and wearing of coiled brass represents the girl becoming of marriageable age.

Rungus institutions that lead up to marriage and guide behavior after marriage are informed by the major value premise: all sexual relations, unless occurring in marriage, are deleterious for those involved, the rest of the society, and its cultural ecology. The resulting heat from illicit intercourse causes illness and death that spreads out from the offenders to the entire community, infertility of marriages, desiccation of the countryside, failure of swiddens, and reproductive failure of domestic animals. Gender in the kinship system is not systematically marked. Husband and wife are referred to by the same term. Terms for siblings and children are not gender differentiated, although a descriptive term indicating gender can be added. Gender is marked in terms for mother, father, grandmother, grandfather, uncle, and aunt.

Gender is not identified in pronouns, verbs, or verbal clauses either for the actor or the recipient of action, with one exception. Verbs indicating the initiation of sexual activity are used only for males. This mirrors the cultural imperatives that females publicly do not put themselves forward in matters of sexual relations, although there are rare instances when females do in fact initiate sexual behavior.

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

The major caregivers and agents of socialization are the parents. Grandparents and aunts and uncles in the longhouse can also be involved. Socialization for boys and girls is different, as their roles are different, but the processes are the same. Girls and boys are thought to be equally valuable. Girls will bring in a brideprice, which adds to family property. Boys require a brideprice which comes from family property, but they also make major contributions to the accumulation of property by their work in the swiddens before marriage.

Boys and girls go naked as they are "not yet aware enough to be ashamed" until about 3 or 4. Then girls start wearing a skirt; boys a little older start wearing trousers. At this time, girls begin to participate in the household economy. Well before puberty a girl takes responsibility for household tasks and caring for younger siblings while her mother accompanies her husband to the fields. Boys begin to participate in the work of the domestic family, such as helping in the swiddens and gathering firewood,

several years later than girls. At the age of only 11 or 12 years a girl is an accomplished housekeeper and can be considered a suitable wife. A boy at this age is just beginning to learn how to help in the swiddens. However, by his mid-teens he will be fully competent in the swiddens and other male tasks such as house-building, etc., and is equal to a girl in his ability to manage a household economy.

There are water games and much play in the river involving both sexes while they are still young. Well before pubescence the sexes segregate in bathing and water play. In general play tends to be gender oriented, with boys imitating the work of adult males and girls that of females. Girls play at being priestesses and spirit mediums at sacrifices; boys build the platforms on which a pig is to be sacrificed.

Puberty and Adolescence

No rites or genital modifications occur. The Rungus distinguish children from marriageable girls and boys by the term for "child." By about the age of 10, before her breasts begin to enlarge, a girl starts wearing a sarong over her skirt. When breast development is apparent, a girl is referred to as a "maiden," which indicates that she is of marriageable age. Menarche does not constitute a labeled stage in a girl's development. Marriageable young men are referred to as "past childhood." Male and female children under the age of 9 or 10 years sleep with their parents in the enclosed family sleeping area of the longhouse apartment. However, boys beyond this age must sleep in the gallery, the open area of the longhouse, while unmarried girls continue to sleep with their parents. Female visitors also sleep inside the enclosed area of the apartment.

In an effort to make themselves attractive to the opposite sex, both males and females will have their teeth filed and blackened at the age of approximately 12–15 years.

Work groups for weeding swiddens are formed of boys and girls. These also serve as a means to get acquainted with each other and engage in flirting. During this period young men and women will also join together in the preparations for various ceremonies to cure illness and promote fecundity in their own and nearby longhouses. Young women prepare the food and bring water; young men catch the pigs and chickens for sacrifice, and kill and prepare them for cooking.

Attainment of Adulthood

The major social and psychological discontinuity that occurs is for women at marriage. Previously they were expected to exhibit uninterest in sexual matters. Following marriage children are expected and wanted. Marriage and building a separate longhouse apartment is the beginning of adulthood, but becoming a parent for the first time is a major social transition. It is marked for both males and females. With his first child, a man shaves his head. A new mother no longer covers her breasts while working in the longhouse, but keeps her sarong around her waist to facilitate nursing children and work.

Middle Age and Old Age

During middle years, while the children are in their adolescence and still working in the household, the domestic family's economy improves as a result of larger agricultural surpluses. Wives who are skilled spirit mediums and priestesses are in demand. The payment for their services adds significantly to the domestic economy. Women skilled in weaving the elaborate ritual clothing also bring in considerable income. Husbands' counsel in the community moots is taken more seriously.

After the children have married and left, an older couple will continue with their own economy. When they can no longer work in the swiddens, they will join the household of the youngest child.

Personality Differences by Gender

The male initiates relations that lead to marriage or sexual activities. The female is to exhibit no knowledge of sexual matters before marriage, no matter what her private knowledge may be. After marriage she must continue to be uninterested in sexual matters publicly. Men are leaders in political affairs, trading, and village moots. A husband is "heavier" than his wife with regard to legal matters and the trading of agricultural surpluses. While a wife will bow to the leadership of her husband in these matters, during village moots she may sit alongside him and advise and consent on matters concerning their family. Women control the knowledge of rituals for health and fertility. A husband will follow his wife's advice on these matters.

Men are considered to be physically stronger and braver than women. Women are more easily frightened and not able to run as fast. They are more afraid than men over rumors of headhunters, which no longer occur, and of the potentially evil spirits. They will not go to the swiddens alone and are afraid to come back after dark when there are malignant spirits about. As women grow older their shyness over sexual matters becomes less evident.

Gender-Related Social Groups

Young girls, maidens, and women tend to move about outside the longhouse in groups of several females or with husbands. They are afraid of being propositioned by men and of the malevolent spirits in the forest. They are also concerned that if they go by themselves they will be gossiped about as encouraging sexual attentions or engaging in illicit sexual relations.

The only formal gender-related social group is the village moot. Any married man may participate in the discussion if he wishes. Women in the longhouse work together on household tasks. Other social institutions are not structured around gender. The organization of Rungus society is bilateral with no kin descent groups. A woman depends on her father, or if he is not alive, on an uncle or a brother to represent her interests in any jural dispute that might arise, including disputes with her spouse. That, plus their dependency on their mothers for support in child rearing and advice, results in uxorilocal residence, that is, residence in the hamlet of the wife's family, particularly during the early years of marriage. ("Uxorilocal" is appropriate rather than "matrilocal" as there are no matrilineal kin groupings.) If brothers marry within the village, the constitution of apartments in a longhouse would include a married brother or two along with the apartments of their married sisters. There are no nonkin associations for males or females.

Gender Roles in Economics

While the gender roles are not identical, they are equivalent. Both behaviorally and ideologically they are of equal importance for societal functioning. Male and female roles are thus interlinked, forming a whole. It is difficult for an adult man or woman to operate a household without a spouse. Husband and wife should "balance

each other." The symmetry of roles and their balance is also symbolized in there being only one kin term to indicate either a husband or a wife.

Men clear and burn the swiddens, and women help clear debris before planting. Both men and women plant, weed, and harvest the swiddens. Threshing is done by men. Men plant fruit trees, weed them, and tend them to maturity. Such trees are owned by the family of the person who initially planted them and are devolved on their offspring. Many of these trees survive for several generations. Men care for and raise dogs for hunting and water buffalo. Women care for pigs and chickens. In hunting and gathering, men hunt large game with spears, catch fish with traps and nets, and gather honey and orchard fruits. Women gather snails and shellfish, fish with scoops for small fish and prawns, fish with fish poles for larger fish, and collect wild roots, nuts, berries, and vegetables.

The domestic activities of men include collecting firewood and making knives, rope, fish traps, and carrying baskets. Women husk the family's rice supplies, prepare and cook food, and carry water. They raise cotton, dye it, and weave it into clothing. They embroider elaborate strips of decoration on sarongs. Women also make rice winnowing trays and a variety of baskets for general household use. Men market agricultural surpluses and bargain for brassware and gongs. Women sell the valuable ceremonial clothes that they weave. A woman as a spirit medium receives payment for curing illness and righting ritual imbalance.

Women are in charge of the ritual aspects of birth, while certain men are skilled as birth facilitators. This facilitator pushes with his foot against the womb of a woman in labor each time a contraction occurs.

Inheritance tends to be homoparental; that is, female ornaments such as beads, brasswire neck adornments, armlets, leg brass, and female clothing usually go to daughters, while gongs, jars, and brassware tend to go to sons. But there are no sanctions requiring this form of inheritance. If the family has sufficient property in gongs and jars, they may devolve some on female children.

Parental and Other Caretaker Roles

Both parents perform the role of caregivers. The mother is the primary caregiver. However, if the father is not needed in the swiddens, he will help when he wants to be with the child or the mother is otherwise occupied. The father takes over much of the caregiving of an older child when he is abruptly weaned at the birth of a subsequent child. Both male and female older children, up to the age of 10 or 12, will help with tending a young child when the mother is busy or working in the fields.

Leadership in Public Arenas

Men are the sole leaders in any public arena. Married males constitute the village moot that meets to resolve disputes, levy fines, or deal with divorce. A moot is called by the village headman, always a male, and attendance at such is determined individually on the grounds of whether the individual's interests are involved and whether or not one wants to enter into the dispute.

Gender and Religion

The health, fecundity, and ritual welfare of family and village lie in the hands of women, particularly those who have become spirit mediums and priestesses. All females are potential priestesses and spirit mediums. However, only about a quarter become proficient at trance behavior and memorizing the extensive ritual texts that accompany sacrifices to cure illness and enhance the ritual status of the family and village. Illness is explained by the capture of human souls by members of the spirit world who have become angered. The spirit medium in trance identifies those spirits causing illness and lack of fecundity, and she determines the nature of the sacrifice for them. These ceremonies involve the offering of pigs and chickens to these spirits to recapture the wandering souls and reestablish relationships of goodwill with such spirits. The priestess/spirit medium also calls the spirit world to offerings when the village is not prospering. She performs the rituals and sacrifices that accompany a marriage to make sure that the couple are not closely related and that the marriage will not produce ritual heat.

At the age of about 8–9 years, girls begin going to the swidden houses with their mothers, grandmothers, or aunts to learn the elaborate ritual hymns and chants that are recited at ceremonies for illness and the complex behavioral restrictions involved. It takes years to become adept at all the critical ceremonies. This process of

learning these ritual texts requires a significant ritual payment to the teaching priestess.

Men perform the major ceremonies and sacrifices in the swiddens for the rice spirits and for any of the various spirits causing a poor harvest or an inundation of agricultural pests. However, a few women are also skilled in these ceremonies. Men also call the spirits associated with accumulating wealth and give them offerings by putting blood on the family property.

LEISURE, RECREATION, AND THE ARTS

What leisure time there is, is spent in playing the nose flute (primarily women), the native guitar (boys and men), and gongs (men), and in extensive linguistic games that include riddling, turning phrases backwards, competitive poetry, etc. There is very little leisure time during daylight hours, and even in the evening many household tasks such as husking rice, etc. are carried on with only the light of a very small oil lamp.

During the harvest there are drinking parties for those involved. After the harvest there are marriages, death ceremonies, and other sacrifices to which friends and relatives are invited and where there is drinking, as well as dancing and gong playing. During this period young men go visiting to other villages to look for potential wives and to socialize. The major art forms are linguistic play, including the telling of myths and legends, dancing and gonging, and the women's weaving.

RELATIVE STATUS OF MEN AND WOMEN

Statuses of men and women are primarily equivalent. This is illustrated by the Rungus concept of balance between male and female roles. These roles are balanced in all spheres of life, with the one exception that men are expected to initiate sexual and marital relationships. The high status of the female role is indicated by uxorilocal residence, brideprice, and the prohibition against premarital sexual relations. More details are given in other sections.

SEXUALITY

Traditionally, the Rungus are very reserved about talking on sexual matters. Discussion of sexual relations is considered to be morally sanctioned against. If men talk about sex or make sexual innuendos in the presence of females, the women ignore the men and talk among themselves about something else. Women are considered to be particularly reluctant in sexual matters. Consequently, information on aspects of coitus is almost impossible to elicit. Children are not instructed in sexual matters.

Menstruation among the Rungus is an unmarked category, both socially and culturally. There is no term specifically to refer to menstruation. A menstruating woman is neither polluting nor purifying, neither propitious nor dangerous. Thus there are no taboos, restraints, or other forms of social separation. Prior to menarche, girls are not informed about menstruation or how to handle it. At menarche a girl turns to her mother for an explanation. A female does not observe any special method of hygiene, except perhaps to bathe more frequently, and she employs no napkins or tampons. During the time of heaviest flow a woman chooses less strenuous tasks which can be performed while sitting on the longhouse gallery.

There is little evidence of sexual antagonism, aggression, tension, or conflict between the sexes and their roles behaviorally, linguistically, or in the projective systems such as are reported in male-dominated societies. Similarly, there is no evidence of aggression or antagonism between the sexes in mockery, jokes, overt statements, or the play of children. Boys do not tease girls or belittle female roles, and girls in their play do not tease boys or ridicule any of the male roles.

Critical to the understanding of gender relations is determination of the degree to which the drives of sex and aggression are intertwined or individuated. Among the Rungus these drives are highly individuated by the sociocultural system so that they do not overlap. The result is that the expression of sexual behavior has no aggressive component and aggression in turn has no sexual content. Instead, these drives are so individuated that sex and violence seldom, if ever, are part of the same behavioral environment. Violence and assault are lacking in instances of induced intercourse. A Rungus woman either accedes to or refuses the man's pressures. Women recognize the superior physical power of men. But if she refuses advances, it is stated, then the man proceeds no further. Women do not perceive that their volition in matters of sexual intercourse is ever taken away from them by force. If a man touches a woman's breast or if he

throws his legs across her legs as they sit beside each other, these are fineable offenses.

The Rungus men do understand that forced intercourse may occur, although we were unable to collect any clear-cut jural case material on this. But women deny that it could ever happen, as they always maintain the right to refuse any attempts at intercourse. Nor is there any association of aggression in coitus in terms of bodily injury in cases of fornication, adultery, or marital intercourse. There is no evidence or discussion of marks rendered on a partner's body during passionate intercourse. Aggression in coitus was never a matter of discussion among the Rungus, and we have no observational data to suggest that it occurs. Finally, there is no term for rape in the Rungus language.

If there are no witnesses to illicit sexual intercourse but the couple are found out, it is expected that the woman will claim that she was induced to have coitus, that she was not actively inviting sexual relations, and this claim will be accepted.

While females present a reserve and reluctance to engage in discourse or action involving sexual matters, females are subject to the startle syndrome (*latah*) during which time all sorts of sexual exclamations are uttered. A young girl tripped and exclaimed, "The testicles of my grandfather are golden!" When a toad jumped on her forehead, another married woman shouted her son's name, saying "[his] testicles are stuck to my forehead." Her son was humiliated, as he was sitting beside her. While these actions can violate rules against referring to a person's genitals, these outbursts are not subject to a dispute case. If uttered in anger, such language would involve a fine.

Homosexuality is unknown linguistically or behaviorally.

COURTSHIP AND MARRIAGE

Young men go visiting longhouses to become acquainted with marriageable girls. If they find one they are attracted to, they will bring small gifts of betel chewing supplies. The choice of a girl is largely in the hands of the man's parents as they will have to make up the brideprice. The parents of a girl also choose what suitor to accept. If they do not approve of the suitor or his family, they will put up objections through demands in increased size of brideprice.

Brideprice is an expression of the cultural value of the female role. Its size is dependent on the wealth of the girl's family, the wealth of the suitor's family, and the attributes of the girl. These include her virtue, beauty, comeliness, and skills in household tasks as well as her diligence in swidden work. A hard-working wife is especially desirable, and a significantly higher brideprice will be asked for a maiden who is learning weaving and the ritual chants to become a spirit medium. The size of brideprice also depends on the ability of the young man's family to pay it and the qualities of the suitor, for if he is a hard worker with qualities of character, the brideprice may be adjusted to fit his family's wealth.

Brideprice also protects the wife from mistreatment as none, or only a small part, of it will be returned if a wife leaves her husband before the birth of children. Nothing is returned if there are children.

On the day of the wedding, a bride is told for the first time of the forthcoming wedding, which she is not supposed to have known about. At that point, young married women grab her and put her in a special sarong where she cries over and over again that she does not want to get married. There is concern that the bride-to-be might run away into the forest. It is expected that she will object. If she did not it would indicate a desire to have sexual relations. At the start of the wedding ceremony the bride is supposed to cry. This passive resistance is sustained through every phase of the wedding. If a bride is not comfortable with her groom, she will refuse sexual advances. She may refuse to feed him, sleep near him, or go to the fields with him. If the husband makes advances, she may hit at him with her arm brass. This can last from a few days up until several weeks. If it persists, it can result in divorce. The parents of the bride attempt to give them space, and encourage them to go to the field house together alone. The explanations given for this behavior are that the spouse selected by the bride's parents is not acceptable, or that the bride is "ashamed" or "embarrassed" at publicly performing the role of wife, which implies coitus. She may be afraid of engaging in coitus, particularly if she is very young. Not all women have begun to menstruate before marriage. Finally, if she does not show a certain amount of reticence, it would indicate that she lacked character and wanted to engage in intercourse. This reluctant bride behavioral pattern only occurs with a first marriage, not when a woman marries again after being widowed or divorced. And it may occur publicly while privately engaging in coitus.

There are two levels of wedding ceremonies depending on the wealth and standing of the parents of the bride. The most elaborate is called a "dry wedding" at which the bride and groom are dressed in special ceremonial dress, both having up to five or six attendants. The groom wears neck brass like a female and a girdle of coiled brass similar to that worn by a woman. The simpler form is called a "soft wedding." There are only one or two attendants and the couple are dressed in the usual clothes worn at ceremonies. The most significant aspect of the actual ceremony is when the couple feed each other cooked rice. This is symbolic of their contract to care for each other.

The concept of the man taking the initiative in marrying has its expression in arguments between spouses in which a wife will say to make her point, "You chose me for your wife, I did not choose you!"

Children are highly valued and sought after. One reason for divorce is the failure to produce children. Abortifacients from the forest are rumored to be known, but there is no evidence of abortion ever having taken place.

A widowed person may remarry after all the required ceremonies have been held to assure that the souls of the deceased spouse have arrived in the afterworld. It is expected that a widowed person will marry the sibling or a first cousin of his or her deceased spouse. If they marry a nonrelative, a gift of a small piece of brassware or jar is given to the parents of the deceased.

Love magic is claimed to exist, causing a person to desire another. It can also be used by a third person against two other people whom he or she wants to get involved in an affair. It can result in "love sickness." The term for this and the behavior are referred to as "grieving." This emotional state is equivalent to that felt by someone who has lost a parent, spouse, or child. The behavior includes refusing to eat or drink and sometimes running away into the forest. It can lead to suicide attempts. Both men and women can experience this. This state can occur over an unmarried love object, or over a love object who is marrying someone else. There are no statements that the love object could be a spouse of someone else.

HUSBAND–WIFE RELATIONSHIP

The husband–wife relationship is the most important relationship emotionally and economically. This is symbolized in ritual actions required even for the young. If an unmarried person engages in an act that a widowed person has to perform, such as facing downstream while bathing, he or she is cautioned not to do that as it will cause the person destined to be his or her future partner, his or her "balance," to die.

Husbands and wives closely depend on each other for the household economy and for support and affection. Sexual jealousy is very prevalent and is a major feature of the relations between men and women. Both sexes frequently display emotions of jealousy, and accusations of infidelity arising from ungrounded suspicions or even just from the fear of infidelity are common. Brides are known to exhibit these emotions even during the period when they are publicly rejecting their husbands and refusing the role of wife.

A husband and a wife are expected to "care for," "to be fond" of one another. They are supposed to take care of each other, particularly when one is ill or indisposed. A source of arguments between spouses can be whether one or the other has fulfilled this aspect of the spousal role satisfactorily. Fulfilling it is a sign of affection. If they do not argue, sleep together, have no arguments over raising children, like to be alone in gardens together, are excited when they see each other, and laugh and talk together a lot, they are said to have the same feelings for each other. As the married couple settle down into a productive marriage, both economically and in terms of children, and if the wife is close to her husband, uxorilocal residence of intervillage marriages may change, and the family may move to the village of the husband, or they may move back and forth every few years.

There appear to be few ambiguities or conflicts over definitions of roles. Tensions can arise in intervillage marriages when the husband wishes to spend more time visiting his relatives, and he may wish to move to his natal village. Another conflict between men and women is over the use of the family's domestic animals. Men want to use these to exchange for property to build up the assets of the family. Women may want to retain them for sacrifice if there is threat of illness in the family. Again, this conflict is not frequent and is only episodic. It does not constitute a major source of tension in defining male–female roles. Males may perform female tasks, except the ritual ones, and females may perform male tasks except the cutting of swiddens, hunting, and those involving the village moot or political activities.

While the vast majority of marriages are monogamous, a wealthy man may take a second or very occasionally a third wife. Attempts at this frequently results in the first wife divorcing her husband. Any such polygamous marriages require that a separate household be kept for each wife. Very poor men may also engage in marrying a second wife, but this is extremely rare.

Physical abuse of a wife is rare. If it occurs, or if a man wants to have intercourse when a wife does not want to and persists, the wife will return to her father's household or to the household of an uncle or brother. To retrieve his wife, the husband has to pay a fine of a jar or a piece of brassware to the wife's relative. If a wife or a husband becomes angry with his or her spouse and cuts up the other's clothing, or cuts in anger at a house post, this is a ritual delict as it implies that the angry person wants to frighten away the other's soul, causing sickness and death. This delict requires a fine and a sacrifice of a chicken to alleviate this threat. It is expected that women will want to refrain from intercourse during their menstrual period, if they are sick, or after giving birth. However, a husband will become angry if he is frequently refused by his wife, and this will be the cause of disputes and divorce. One informant stated that if a man's wife no longer wants intercourse, the man just gets up and leaves.

Divorce is relatively easy. Males and females have equal access to divorce. If there is no fault, the assets accumulated by the family are divided between husband and wife. If there is fault, the division of assets includes compensation for the injured spouse.

OTHER CROSS-SEX RELATIONSHIPS

Females rely on male relatives for support and jural protection.

If the behavior of a spouse suggests interest in a person of the opposite sex, or if insufficient attention is given to one's spouse by not carrying on one's obligations to the domestic economy or caring for one's spouse, this results in disputes and accusations of sexual infidelity.

Adultery does occur, but it is infrequent. This brings down the same ritual dangers as any illicit intercourse. It does not always result in divorce. However, pigs are required from both offenders for a sacrifice to remove the "ritual heat." Large payments of gongs and brassware are made to the offended spouses by those caught in adultery.

CHANGES IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

When schooling started in the early 1960s and Christianization followed shortly thereafter, relationships between the sexes began to change. Boys and girls thrown together in residential schools without the supervision of parents developed crushes on each other, and if not reciprocated there have been cases of suicide. As individuals have moved into positions with the government or gone to the cities to seek wage work, they are exposed to members of the opposite sex from other ethnic groups, which have resulted in interethnic marriages. Young men with jobs will now make up the whole brideprice for a fiancée, rather than expecting their family to do so as in the past, or they will make major contributions to it. Girls and women are more confident and unrestrained in their relations with men. A great deal of intercourse now occurs prior to or outside marriage. This has also resulted in a growing number of illegitimate pregnancies. Children of such relationships are frequently raised by the mother of the woman, and her daughter then goes back to the towns and cities to work. Rape has now occurred within the Rungus community, and women have been subjected to rape by members of other ethnic groups as they go to work outside their villages.

Men have taken a larger role in the political arena, leaving their wives to undertake more work in the swiddens and in the development of plantations of coconut and rubber. Some women have also taken to traveling around to other villages and ethnic groups on trading expeditions which traditionally was only done by men. Women are now wearing trousers, particularly when working in the plantations and clearing fields. Little of the original dress is left, with the exception of beads. Only the older men now wear headcloths.

Sakha

Susan A. Crate

ALTERNATIVE NAMES

The Sakha are also known as the Yakut.

LOCATION

The majority of Sakha inhabit the Sakha Republic of northeastern Siberia, Russia. The climate is sharply continental, with temperature variations exceeding 100°C, from +40°C (+104°F) during the summer to −60°C (−76°F) in winter. The annual change in day length is also extreme, with the shortest winter day at 4 hr and 14 min and the longest day in summer at 19 hr and 45 min.

CULTURAL OVERVIEW

Sakha are a non-Russian indigenous people of Siberia, at present numbering approximately 350,000. Sakha are relatively unknown in the academic and popular literature, yet they have a fascinating cultural heritage and presently inhabit one of the most progressive areas of the Russian Federation (Tichotsky, 2000). However, not unlike other areas of post-Soviet Russia, the Sakha Republic is fraught with issues ranging from environmental degradation to local political subterfuge (mafia), survival adaptation, and the local challenges of economic transformation and globalization.

Historically, the Turkic ancestors of the Sakha migrated east from Central Asia to the Lake Baykal regions of southern Siberia in the 8th century and then northward to the present day Sakha Republic in the 13th century. Being keepers of horses and cattle, they were drawn to the lush hay fields of the northern river regions of the Lena, Viliui, and Aldan, and lived in extended family units throughout those pasturelands. The climate was harsher than their previous southern residence, but they had ample hay lands in the northern regions and an abundance of hunting and fishing resources at their disposal. They kept the indigenous breeds of cattle and horses, which were hardy to the climate and could live outdoors year round, finding their own fodder under the snow. The Sakha practice of horse and cattle husbandry was their main subsistence strategy in the former southern residency and in the new subarctic home.

During the pre-Soviet time period, the dominant social structures, which Sakha depended on for their subsistence, were the single-family household and extended family–clan. Sakha had a highly stratified class system with wealthy *toions* (clan heads) owning most of the local herds and "employing" the local population in the husbandry of those herds in exchange for their keep. Russian efforts to colonize the area began in the mid-17th century and resulted in a demand for fur tribute, a form of taxation required of all native inhabitants. This made Sakha subsistence survival all the more challenging due to the time required to trap and hunt animals.

The policies of the Soviet era (1917–1991) were, in many ways, a conscious effort to undermine the Sakhas' extended family–clan kin systems by consolidating single family units first into collective enterprises and later into agro-industrial state farms. Soviet jurisdiction replaced the authority of kin systems as the guiding social influence in daily life. Soviet policies also worked to alter the Sakha practice of animal husbandry, in four main ways.

1. The indigenous breeds were replaced by "improved" high-producing European ones, which required foddering cows in barns for 9 months of the year and the cutting and storing of hay for that period.
2. The native populations were resettled into compact villages which resulted in the continual need to move from village to outlying areas and back again to maintain subsistence.
3. The native populations were alienated from and grew increasingly uninterested in their historically based subsistence practice owing to the influx of Soviet agricultural practices, exposure to mass media, centralized living, and higher education.
4. The health of the native floral, fauna, and human populations was (and continues to be) threatened by the contamination of local drinking water, air, forage resources, and soils resulting from Soviet-period industrialization.

In the post-Soviet context, rural Sakha have adapted to the dissolution of centralized state farm operations by

developing household-level food production centering on raising cows, a lifestyle considered as the key to survival by the majority of rural agropastoralist Sakha inhabitants. Concomitantly, the dominant social structures have shifted back to an emphasis on household and family–clan networks. This move is most clearly documented by the contemporary cows-and-kin adaptive strategy wherein 55% of all households keep cows but a total of 90% of all households are supplied with cow products via cow-kin interhousehold networks (Crate, 2001). A smooth "return" to household-level food production is greatly impeded by several major factors including (1) a higher population pressure than in pre-Soviet times, placing a higher demand on limited hay and pasture land and wild food resources, (2) a different settlement pattern with concentrated village centers as opposed to scattered households, (3) the effects of globalization, which has acted to cut off local inhabitants from access to consumer goods, and (4) the Soviet-period shift in public values from subsistence to a consumer life, resulting in a greater desire for amenities and comforts.

The existing literature on post-Soviet indigenous peoples of Siberia shows that most are making claims to their rights for land, subsistence, and, in some cases, mineral wealth (Anderson, 1995; Balzer & Vinokurova, 1996; Fondahl, 1998; Grant, 1995; Humphrey, 1998; Kaiser, 1995; Osherenko, 1995; Wiget & Balalaeva, 1997). Today, Sakha are also making such claims and experimenting with cooperative and collective alternatives to maintain subsistence survival (Crate, 2001). In common with other native peoples throughout post-socialist Russia, their novel strategies are often jeopardized by issues of inequality and corruption. Additionally, Sakhas' ancestral landscape is rich in resource and mineral wealth—diamonds, gold, gas, and oil. In sum, Sakha, like other post-Soviet Siberian peoples, daily face unique challenges which are based in their particular historical, environmental, and adaptive context.

CULTURAL CONSTRUCTION OF GENDER

Historically, gender roles were defined by the Sakhas' agropastoralist subsistence, raising horses and cattle in the harsh Siberian climate with average winter temperatures of $-50°F$. Women were confined to work in the inside environment and were dominant in the care and socialization of children. Their work was varied and consisted of maintaining the living area, preparing and preserving food, making and repairing the family clothing, making containers and utensils of hides, hair, birch bark, and clay, and tending the herds in the barns throughout the long 9-month winter. Men were responsible for outside tasks. The list was equally long, and included the daily gathering of firewood, the procuring of drinking water, the building and repair of all homestead structures, hunting and fishing, the harvesting of sufficient hay to overwinter the herds, the tending to all the daily outside work for the herds, managing the fences for the hay fields, and the slaughtering of the herds. In the brief months of summer, both sexes worked and toiled in the warmth of the long subarctic days. Men cut the hay while women raked it into small piles or *buguls*. Only men hunted and fished while the women foraged for berries, roots, and herbs.

As mentioned earlier, Soviet-period changes from household-level subsistence to state-run agriculture altered the Sakhas' historically based gender roles to the extent that women were employed outside the home as much as men on the collective and state farms. However, the women continued to be the major worker in the home, resulting in a double burden of external work and domestic chores during this period (Buckley, 1989). In post-Soviet times women, who are now more likely to be employed than their male counterparts, continue to carry this double burden.

GENDER OVER THE LIFE CYCLE

Table 1 lists the Sakhas' cultural names for life stages. These terms do not differ with gender except for the first stage of *Orto Saas* (age 21–45) when both sexes are considered to be in their most productive years. For men this is *Wolan Saas*, signifying when a man has the most physical energy in the life cycle and is most productive in his work and creative pursuits. For women this is *Kere Saas*, when a woman is most beautiful and creatively productive. There are no publicly marked passages from one stage to the next. It is interesting to note that in the Sakha language the word for "spring" and "age" are one and the same—"*Saas*." This is because Sakha count the years based on their New Year, which falls toward the end of May at the very time when nature begins anew.

Table 1. Sakhas' Cultural Names for Life Stages

Age	Name	English equivalent	Literal translation
0–15 years	*Ogho Saas*	Childhood	Child age
0–2 months	*Uu kihil ogho*	Newborn	"Water-red" child
3–5 months	*Kihil ogho*	Infant	"Red" child
6 months to 1 yr	*Nirei ogho*	Infant	"Calf" child
1–3 yr	*Kyra ogho*	Toddler	Small child
3–9 yr	*Kuochugui ogho*	Juvenile child	Large child
9–12 yr	*Oburgu ogho*	Juvenile	Sizable child
12–15 yr	*Beder ogho*	Teenager	Rambunctious Child
16–20 yr	*Eder Saas*	Youth	Youth
16–18	*Sitii Saas*	Youth	Ready to marry
18–20 yr	*Tusnetier Saas*	Youth	Gaining wisdom
21–55 yr	*Orto Saas*	Middle age	Middle age
21–45 yr	*Wolan Saas*	Middle years	Strongest years (male)
21–45 yr	*Kere Saas*	Middle years	Beauty years (female)
46–55 yr	*Duolan Saas*	Prime years	Solid years
56–60 yr	*Agham Saas*	Aging adult	Settling down years
61–65 yr	*Kyrjar Saas*	Aging adult	Aging years
66–70 yr	*Kyrjaghas Saas*	Elder adult	More aging years
71–100+ yr	*Kyrjaghas Saas*	Old age	Old age
71–80 yr	*Mungur Saas*	Elder	Older years
81–90 yr	*Aap Saas*	Elder	Respected years
91–100 yr	*Ytyk Saas*	Elder	Sacred years
101+ yr	*Uhun Uller Saas*	Elder	Long-living years

Ogho Saas (0–15 years) is considered the best time of life, when a person is more or less free from a daily work schedule (although they are given a gradually increasing number of chores in preparation for the responsibilities of youth and adulthood) and expected mostly to play and learn from the world around them. *Eder Saas* (16–20 years) is the beginning of becoming a mature man or woman and, historically, when marriages were consecrated. In contemporary times, this is the time when dating and courtship begins. *Orto Saas* (21–55) is considered the time when a person is most fully alive and establishes and builds their own household, has offspring, and pursues and accomplishes significant life work. From 56 to 70 a person progressively slows and settles down physically but this is considered the wisest of life periods. Old age is divided into four progressively older segments, *Mungur Saas, Aap Saas, Ytyk Saas*, and *Uhun Uller Saas*.

Socialization of Boys and Girls

Historically, Sakha women were always busy preparing the household meals and stores, working leather, and making family clothes and utensils. They never rested or took time for personal care. Sakha elder women (grandmothers, great aunts, etc.), who were physically less able to perform the above duties, were responsible for rearing the children. Sakha girls were raised to mirror their mothers and other adult female kin by gradually learning all the inside domestic chores including the care of the herds in the barns. Girls were expected to learn and share these household duties. Sakha boys were raised to mirror their fathers and adult male kin who, historically, held the role of household head and were responsible for all outside activities including hunting, fishing, and hay harvesting. Until they were old enough to accompany their elder male role models and learn these skill outdoors, they too were taught by residing elder female kin.

In contemporary context little girls and boys are still taught to take on their respective gender roles described above. However, today, with less strict gender roles, more flexibility in lifestyle, and an expectation that children will gain a higher education outside the home and village, the socialization of boys and girls also emphasizes acquiring literacy, mathematical, and science skills from an early age to gain a competitive edge for careers outside the home village.

Puberty and Adolescence

Historically, it was not uncommon for Sakha to be betrothed and/or married when they went through puberty and adolescence, with some marriages as early as 13 years old. Today, as in the West, Sakha are in formal schooling during these life stages. In the past and today Sakha have no special designations or rites of passage associated with reaching puberty.

Attainment of Adulthood

Similarly, Sakha have no special rites of passage indicating a transition into adulthood. Sakha are considered adults at age 21. The main behavioral change when a person moves into adulthood is sufficient maturity to run their own household (fulfilling all duties according to gender) and raise a family.

Middle Age and Old Age

Sakha hold high respect for elders. This is because the older a person is, the greater their life experience and the more they know about how to work, how to perform subsistence tasks most efficiently, how to use tools, and how to maintain a prosperous household. In general, elders are listened to and their opinions are highly regarded and respected.

PERSONALITY DIFFERENCES BY GENDER

Sakha men and women are both socialized to control their emotions and keep their feelings to themselves even about their most intimate relations. There are also differences between men and women's *Sang* or character, which are based in the differing domestic gender roles. Men come and go from the household, fulfilling tasks related to procuring necessary subsistence resources, and maintain a business-like working character. Men tend to be hardened to the extent that they must slaughter domestic stock and wild game. Women run the inside household and maintain a softer, calmer, mediating character in order to keep the household running smoothly.

Sakha are also taught to value certain character traits in the opposite sex, summed up in the Sakha saying, "*Er kihi kharakhynan subuluur, jakhtar tylynan oiunan*

subuluur," literally meaning, "Men like women for their eyes [according to how attractive they are and how competent they are in domestic duties] and women like men for their words and intelligence."

GENDER-RELATED SOCIAL GROUPS

Historically, Sakha lived according to patrilineal clan groups with inheritance (land rights and herds) passed to male progeny only. Because of this brides had to move to their husbands' clan household to have the resources to maintain a separate household. In her husband's land, a new bride was expected to participate in the female work as much as, and sometimes more than, residing adult females (see later discussion on "Courtship and Marriage").

Policies of the Soviet period worked to break down this system by appropriating clan holdings, dispersing clan members to different collective and state farms, and providing ample housing for developing households based on the nuclear family. In contemporary times, couples are mostly free to decide their own fate, moving to either the bride's or the groom's region and household or establishing their own household there. The tendency is still to live with either the husband's or wife's aging parent(s) to act as partial caretakers in exchange for their tending of family herds and caring of young children.

Historically, the central gender-related social group was the patrilineal clan system. Additionally, in both Soviet and post-Soviet times there were and are established women's groups (the local branches of the *Zhenski Komitet*, or Women's Committee, and the *Iye Ogho Kiine*, or Mother and Child Center, respectively). Both these institutions work(ed) to bring local issues of women and children to the attention of politicians and to provide opportunities for women to gather and share various projects.

GENDER ROLES IN ECONOMICS

As explained in detail above, Sakha gender roles were historically defined by the prevalent household subsistence economic system, in this case focusing on horse and cattle husbandry in a subarctic climate. During the Soviet period, household subsistence was replaced first by collective-farm and later by state-farm production.

Table 2. Time-Allocation Observations of Food Production and Resource Management Activities

	Date range[a]	No. of observations	Age range (yr)	Female (%)	Male (%)	No. of house holds
Food production						
Berry picking	7/22–9/25	36	4–68	72	28	21
Hunting (duck and game)	9/6–11/6, 5/12–5/24	27	17–65	0	100	23
Fishing						
Lake and *sylyhar*[b]	Year round	14	7–76	0	100	13
River fish	5/31–7/24	3	12–35	67	33	2
Sayylyk[c]	4/10–10/12	131	0.1–84	49	51	21
Haying						
Main haying	7/19–9/6	151	3–73	22	78	73
Preparation and hauling	6/11–1/7	11	25–71	0	100	7
Horse tending	11/6–4/10	6	24–72	0	100	3
Cow tending						
Overall	7/19–6/11	287	4–84	47	53	96
General	7/19–6/11	208	4–84	46	54	83
To pasture/milking	9/30–6/11	26	6–78	58	42	22
Feeding	9/6–5/31	30	4–75	47	53	20
Watering	10/6–4/29	4	37–77	0	100	4
Khoton[d] and hay preparation	9/18–5/18	24	35–78	51	49	19
Manure management	9/30–5/18	13	35–78	53	47	10
Pig and chicken tending	7/28–3/4	7	11–68	55	45	6
Gardening: overall	5/24–9/25	45	2–78	55	45	18
Greenhouse: overall	4/29–8/18	26	10–73	54	46	13
Food storage: overall	7/22–6/11	46	14–88	70	30	33
Food preparation:						
Duck cleaning	8/12–10/19	8	14–65	100	0	6
Fish cleaning	8/12–6/5	11	28–70	82	18	10
Resource management activity						
Firewood						
Harvesting	7/24–5/31	42	9–68	0	100	25
In home use	8/6–6/11	64	3–78	40	60	49
House building	7/19–11/12	8	28–69	38	62	6
Own						
Other's	6/5–12/1	16	22–65	0	100	11
Water						
Overall	8/1–6/11	49	8–85	41	59	39
Away harvesting[e]	10/30–4/16	13	14–72	0	100	10

[a] This "date range" reflects the period of the time-allocation observations, which started July 19, 1999 and ended June 11, 2000.
[b] *Sylyhar* or burbot (*Lota lota*) is a bottom-feeding river fish.
[c] *Sayylyk* is the Sakhas' summer home.
[d] *Khoton* is a barn for cows.
[e] The Sakha use ice for water from November through spring.

This resulted in women working on equal footing with men in a working-class society while retaining their former duties in the household. In the contemporary context, women continue to be the main keepers of the household herds and to perform the majority of household duties historically carried out by Sakha females, in addition to being as, and sometimes more, important as the household bread winner, working outside the home for salary. Table 2 is an activity calendar charting contemporary food production and resource management activities, defining their seasonal range, and the age and gender of those participating in specific tasks.

It is clear from this general table that certain acts continue to be gender specific. In general, women tend to perform the activities that are either inside or close to the household, and men, the acts that require travel into outlying areas. This food production and resource management data can be further analyzed to understand what, if any, age ranges the activities are specific to. Children are involved in many of the same activities as women, and their contributions start from an early age. Around the home it is not uncommon to see children helping with cow care, such as general tending, leading the herd to water or pasture, and feeding; helping with gardening and greenhouses; and learning from an early age splitting, stacking, and carrying firewood. Children are also taken along to participate in berry foraging, haying, and some forms of fishing.

I further analyzed the time-allocation data to measure the proportion of male and female adult participation in given activities. Out of the 587 observations of people at work at a regular job, half were male adults and half were female adults. This coincides with the reality that women hold slightly more than half of the available regular jobs in the village. I next recoded all reported activities into two groups, either working in a regular job or not. Of the observations in which inhabitants were not working a regular job but were away from the household, males were gone twice as much as females. This supports the traditional role of men as being responsible for the duties away from the household—haying, firewood harvest, hunting, fishing, and horse care. Next I looked at the frequency of male versus female involvement in housework and found that women are doing 70% of the housework with men performing the rest. This is a break from the traditional gender roles in which women did all the housework. Similarly, in contemporary times males and females equally share all activities involved in keeping the household's herds, which traditionally were done only by women. Another sign of the blurring of traditional gender roles is the proportion of males and females doing outside work, including raking, shoveling, firewood management, and water hauling; formerly all male activities in the contemporary context, women perform 28% of these acts.

Sakha are known for their craftmanship. Sakha artistry revolves around utilitarian ends and includes male-dominated blacksmithing, woodworking, and jewelry-making, and female-dominated leather-working, clothing manufacturing, embroidery, and making birchbark utensils.

PARENTAL AND OTHER CARETAKER ROLES

Sakha, historically and today, maintain a broader understanding of family obligations than in the West to include near and distant kin networks. Children are considered central to a meaningful and productive life, and most marriages are initiated with the objective of producing offspring. This social value remains true today, although the number of children a couple has is much less in the present economic climate. As in the West, children are expensive in the post-Soviet context now that the social subsidies and institutions that supported large families in Soviet times are no larger available. Additionally, a new emphasis on educating and urbanizing children makes it difficult to raise more than two or three.

Despite the decline in numbers, the roles of caretaking and being taken care of carry on. Parents provide for their children, all the while training them to assume household tasks so that the children can provide for their parents in their old age. Historically, the eldest child maintains the central responsibility for parental care and also plays a role similar to a parent to his or her gender of siblings, by helping them with their education, employment and even marrying them off to form their own household. Eldest males watch, tend, and teach their younger male siblings, and likewise for eldest females.

The upbringing of children is sometimes shared between kin, most commonly to balance household numbers when a couple cannot conceive themselves and their kin have too many children. By sharing children, the childless couple gain immediate household help from children and long-term care when those children reach

adulthood, and the kin household is relieved of several mouths to feed.

LEADERSHIP IN PUBLIC ARENAS

Historically and today, Sakha leadership in public arenas is dominated by men. This began to change in the Soviet period when women were valued for working side by side with men. This held true across all sectors of the political economy, with incentives given, regardless of gender, for the highest production by state farm workers to the most diligent observance of Communist Party protocols. In the contemporary context, women continue to have a presence in the political arena, but only in the areas associated with family economics, women's issues, healthcare, and improving the social infrastructure. In rural areas, women are the mainstay of the household, because they are employed more outside the home than their male counterparts and continue to maintain the household.

GENDER AND RELIGION

Historically, the Sakhas religion is shamanism, carried over from their Turkic ancestral lineage in Scythian–Siberian cultures who commonly held a worldview ideology including an ancestor cult, a cult of animals and birds, with prominence given to horses, deification of the sun, a fertility cult, a dualistic representation of the eternal fight between good and evil, and the "tree of life" as symbolic of the continuation of all living things. They shared a world view that included beliefs that all beings of the earth and all powers of the sky were possessed by spirit-protectors and they were to pray and pay homage to these spirits regularly.

Russian Orthodoxy was introduced by Russian colonizers starting in the mid-17th century, and many Sakha "converted." However, most Sakha registered as converted to Orthodoxy in order to relieve their household of fur tribute and not because they truly went through a religious conversion. Their shamanistic belief system and world view persisted during this time. Shamanism was outlawed during the Soviet period and most Sakha turned away from these ancient beliefs. Many shamans were persecuted and murdered during Stalin's purges in the late 1930s. In the post-Soviet context many Sakha are relearning and reinstating this ancestral world view.

According to the contemporary interpretation of the traditional Sakha belief system, the world has an upper, a middle, and a lower realm. The upper world, Khallaan, is home to the *aiyy* (gods), the pantheon of sky deities. Khallaan is nine-tiered, with each level a home to one or more deity protectors. The highest place is held by Urung Aiyy Toion, the "Great Lord Master," a male deity considered to be the creator of all the universe. The deities below him are various manifestations of his essential power. Of the entire pantheon of deities, those most highly regarded and recognized in ritual are Urung Aiyy Toion (the highest and creator of all), the male Juhugey (the horse deity), and the female Aan Alakhchyn (the deity of spring and fertility).

The middle world, Orto Doidu, is inhabited by earthly beings and *ichchi*, the spirit keepers of nature. Sakha believe that trees, rocks, words, and all things animate and inanimate have *ichchi*. Although there is no clear hierarchy of *ichchi* (as in the *aiyy* pantheon), the fire, the forest, and the earth *ichchi* are most highly regarded and commonly recognized in ritual. They are both male and female.

The most highly respected middle world spirit is *wot ichchite*, the spirit protector of the fire and home hearth. *Wot ichchite* is personified as a gray-haired male elder. Traditionally, Sakha "fed" *wot ichchite* daily with gifts of food from the table for his continued protection of the home. *Wot ichchite* also serves as the conduit through which sacrifices in the form of libations, gifts of food, and trinkets find a passage to the upper world *aiyy*. The earth *ichchi*, Jaajay Baraan Khotun, is personified as an old woman, an image carried over "from the times when women held a central role in society" (Ergis, 1974, p. 117). The spirits of plants in the form of tiny children assist her by cleaning and dusting the leaves and grasses. Sakha traditionally made offerings to Jaajay Baraan Khotun when foraging, haying, and moving to their summer home. During hunting, Sakha pay tribute to Baianai, the spirit keeper of the taiga forest and all wild animals. Sakha personify him as a jolly red- or black-haired male elder wearing a coat of reindeer skin and riding a reindeer or running through the forest.

The lower world, Allaraa Doidu, is an impassable swamp where steel trees and plants grow. The inhabitants of the lower world comprise the tribe of *abaahy* (evil spirits or devils), representing the source of all existing and potential evil. These spirits are both male and female. Their primary task is to battle with secular inhabitants of

the middle world. The enactment of Sakha ritual and sacrifice to the *ichi* and *aiee* serve to maintain protection from the *abaahy*. Central to this defense are the daily rituals of feeding the home hearth and the annual seasonal ceremonies.

The middle-world human inhabitants responsible for negotiating between the spirit worlds are the *oiuun* (male shaman) and the *udaghan* (female shaman), both either born with or indoctrinated into possessing supernatural powers. *Oiuuns* were either white or black. *Udaghan* carry no black or white designation, but instead are known as healers.

The white shaman's main role was as a benevolent priest with powers limited to the realms of goodness and fertility during the *yhyakh* (Sakha summer fertility festival). The *khara*, or black, *oiuun*, could utilize both the powers of good and evil and enter the lower and upper worlds and serve as mediator for humans between these spirit worlds. Sakha summoned the *khara oiuun* to combat illness and bad fate. The *oiuun's* travel involved riding the *oiuun's* "spirit horse," whose rhythmic canter was personified by the *oiuun's* beating of the ritual *dungur* (shaman drum) along with the *oiuun's* spoken and sung prayers (Alekseev, 1974, p. 162). In the upper world, the *khara oiuun* appealed to the benevolent deities. Reaching the lower world, the *oiuun* chases the particular *abaahy* away, and thereby heals the ailing person. According to the historical record, the *khara oiuun* traditionally conducted the annual fall blood sacrifice of horse or cattle to the *abaahy*, a ritual event no longer practiced (Troshanski, 1902, p. 130).

Leisure, Recreation, and the Arts

Sakha have always maintained a diverse ability in recreation and the arts. Historically, they competed amongst their clan groups in a wide variety of ethnic games, include *khapsagai* (Sakha wrestling), *mas tardihii* (stick-pulling), *kyllyy, ystanga*, and *kuobakh* (three forms of hopping), and myriad games, including *khaamiska*, a game of dexterity with small wooden blocks played something like jax, and *oybonton yylahin*, a game of individual balance. These games and competitions were a means of maintaining individual strength and endurance during the non-labor-intensive time of year so that they could perform well during the seasonal labor bottlenecks. Most of these activities were dominated by men, although

women began participating in these sports during the Soviet period.

Sakha are well known as fine artisans (see the section as economic activities for more on this). Leisure was essentially unknown to Sakha (except the elite who did not have to work daily to make their living) until the Soviet period, when all who were part of the working class could obtain vouchers to vacation on the Black Sea or other Soviet resorts. It should be noted that most inhabitants did not enjoy these leisure activities because vouchers were only dispersed to high-ranking members of the Communist Party. In the contemporary context, the cost of travel to such places has skyrocketed and vouchers are a thing of the past. It still holds true that only the elite sector can afford the cost and the time away from a daily subsistence regime to enjoy leisure activities.

Relative Status of Men and Women

Historically, men held higher status than women in both the public and the private spheres. Men had the final word in the home regarding major decisions. Women took charge and made decisions on matters related to maintenance of the internal household and care of the herds. In both urban and rural contemporary contexts women dominate on the home front due to their central role in maintaining the household. In the political arena, men hold leading roles from the village administration level all the way up to the parliament.

Sexuality

Sakha consider sexuality an integral part of the natural plan to procreate, which is essential to carrying on the family lineage, maintaining a household, and raising children who will be major caretakers when parents reach old age. Sexuality is not considered something to flaunt but to share with an intimate partner in a private space. Modesty is expected in the public sphere.

Courtship and Marriage

Pre-Russian Sakha society (prior to the middle of the 17th century) was organized on the basis of patrilineal kinship structures with the nuclear family and extended

kin as the base unit. In marriage Sakha observed the principles of lineal exogamy, not unlike many other Siberian agropastoralist peoples (Humphrey, 1998). As the late 19th century explorer Seroshevski noted, "Sakha always take wives originating from foreign clans and from as far away as possible" (Seroshevski, 1993). Traditionally, Sakha consider nine generations as their blood kin with whom they are forbidden to marry. These blood ties are considered one's brothers and sisters, hence the use of the general terms "brother" and "sister" across the wide range of these relations. Any relations beyond the ninth generation are considered non-blood relations and marriage is allowed. Some archival documents show early Sakha society strictly holding to counting 14 levels out of their blood kin before they could consider marriage (Sleptsov, 1989, p. 11). However, this seems impossible considering the low population density of the society at that time.

Polygamy was commonly accepted in pre-Soviet times. It was most common among the wealthy. Approximately a third of all Sakha men had more than one wife up to the late 19th century. Ides and Brandt, explorers in the late 17th century, concluded that "Sakha take as many wives as they can feed" (Ides & Brandt, 1967, p. 288). Notes from the expedition of F. I. Langas listed the following reasons for taking many wives (Sleptsov, 1989, p. 12).

1. Sakha marry off their children at an early age, so that when they grow up they fall out of love with each other and take a second wife.
2. If they live together for many years and do not have children, then they take a second and a third wife, for the main goal is to have children.
3. They can scatter their herds in various homesteads and have each wife as the caretaker of one homestead.
4. If one wife turns out to be a poor herd keeper, they can replace her with another wife.
5. Having many wives will improve the chances of having many children who can work and carry on the herd with their respective mothers.

The main reason for having many wives was the women's central role in caring for the herds. Thus the wealthier the Sakha, the greater his herds and hay land areas, and the more wives he needed. The 20th century historian, Basharin, strongly criticized this early form of female exploitation among Sakha *toions* (1956, pp. 130–131). According to folklore materials, the wealthiest *toions* had between seven and nine wives. The materials do not

detail how such "wife–hoarding" balanced out for the rest of the male population, that is, if this meant that six to eight men had no wives. The first wife was the head female in the household, if they all lived together. She and her children had the first rights over all other wives and their children. The number of polygamous households declined sharply in the late 18th and early 19th centuries due to massive conversion to Christianity (see the discussion of gender and religion for more on this).

Sakha had several ways to marry. The most common was betrothal or promising children from a young age by the partial paying of a brideprice by the groom's parents, commonly in the form of a *surekh*, a ritual heart-shaped necklace made of silver or gold. Upon marriage the remaining brideprice was paid, and the bride's parents reciprocated with a more or less equivalent dowry consisting of herds. The wealth of a household determined its ability to pay brideprice and dowry and thus maintained the class order. It also served to redistribute wealth.

Marriage was a series of rituals involving betrothal, matchmaking, courting, and the marriage act. Parents betrothed their children at an early age. An interested parent would come and solicit approval to have their child married to another parent's child once they reached age 14 or 15. This was called *uos khongnoruta*, literally "lips opening," meaning that the solicited parent finally give approval of the match. This was verified as the future plan by the two parents symbolically with *ilii tutuhuu*, the shaking of the hands. Once these early decisions were made, the bride's parents began preparing the clothes and adornments. Often the father of the groom-to-be gave the bride's family a *surekh*, an ornately engraved heart-shaped necklace to be worn by the bride on the future wedding day. If no such match is made in early life, a *khodoghoi* or matchmaker often performed this work, going to another region or village and telling potential spouses about this or that young man or woman who was available for marriage. Social gatherings were also a central place for men and women to meet and decide to wed, most notably during the various large and small *yhyakh*, or festivals, which were the main place that Sakha interacted socially in those times.

Once the *uruu* or wedding was set, both sides prepared for the ceremony. The groom's side prepared the *suluu* or brideprice which ranged anywhere from one to nine head of cattle, depending on the family's wealth. The bride's side prepared *kyys ennyete* or a dowry to be sent

with the girl to her husband's home. On the wedding day the two families (including extended kin relations and any matchmakers who were involved in the match) met by fulfilling *kuon korsuhuu*, various competitions of strength and dexterity between the two clans including an initial horse race by the two fathers. All next took part in *buhurem*, the wedding feast. After this, all proceeded to the male's home. The bride was not to look back or it was believed that she would never be happy in her new home with her new husband and clan group.

Another common tradition which facilitated the strict rules of lineal exogamy was *Agasin Ungyogun Tunnerii*, literally "Return to the Sister's Bones." This involved a husband giving his sister to marry the brother of his wife. A younger brother would also marry his older brother's widow in the event of the latter's death. Similarly, a man would marry the younger sister(s) of his wife if she was infertile (Sleptsov, 1989, p. 15).

Policies of the Soviet period worked against kin groupings by forming work brigades and collectives based on the nuclear family. This disrupted these matchmaking, courtship, and marriage rituals, which were essentially replaced with more conventional ones. Youth courted by attending dances, movies, and other social events. The decision of when to marry and to whom was no longer made by parents in children's early lives but taken later by the parents and the young people themselves.

In contemporary times the institution of marriage is still considered a stronghold of the Sakha family and cultural life. For example, Sakha continue to refer to an age-old word pairing *yal-kuus*, literally "family strength," meaning that a person does not realize their full strength until they marry. A man is only a half and a woman is only a half. A whole is realized through the marriage of a man and a woman. However, the past 10 years have been a period of rapid change for rural Sakha households, resulting in a 5% drop in village populations due to migration to urban areas for employment and both a decline in marriages and a rise in divorces, all correlated with the increasingly downward-spiraling economy and the overall rise in alcoholism, unemployment, and crime. As a result, it is not uncommon to find that 15% of households in rural Sakha villages are headed by a single mother with one or more children. Most of these households rely on extended kin in their village to help with the more male-dominated household chores including harvesting and hauling firewood, ice, and hay, building

and renovating household structures, and supplying hunting and fishing resources.

In response to these trends, the Sakha government began a program called "The Development of Family Economics in the Villages." This policy effort is mainly a way of finding ways to fill the void left after the dissolution of Soviet era social service programs. The central idea is to reinforce the institution of the family and reorient inhabitants away from dependence on government assistance and towards household-level self-sufficiency in all arenas. The programs have had varying levels of success on the local level, depending on local leadership and the initiative of individual households. One of the tangential projects is the revival of a former Sakha matchmaking ritual where available spouses visit adjacent villages for a social gathering of single adults and play various games to encourage pairing and eventual wedlock.

HUSBAND–WIFE RELATIONSHIP

Sakha marriages, despite the strong emphasis on their utilitarian and functional value, are based first and foremost on love between a man and woman. Even in the time of betrothal both the bride and groom were given the option to decline the prearranged match if they so desired. If a husband and wife love each other, they treat each other well. In the past and today, Sakha husbands and wives eat, sleep, and consult about important issues together, although the male has the final word. Similarly, in the past and today, both parties can decide that they want to divorce. In the past when Sakha men had many wives, this was less common. A wife who was unhappy had no place to go and so usually remained with her husband so that she and her children would be supported. Today children tend to stay with their mother and fathers are expected to pay alimony.

Some Sakha have extramarital affairs and can decide between themselves whether to separate or forgive. In contemporary times many (mostly males) argue for procreation with multiple women because the Sakha population has been decreasing the last decade and their efforts would help offset this decline. Historically, children out of wedlock were referred to as *oruk oghoto*, referring to the thick branches of the evergreen trees under which the child was conceived. There are also many Sakha women today who desire children but not a husband, owing to the high levels of alcoholism and

unemployment among the male sector of the population. This is attractive because single mothers can receive subsidies sufficient to support their children.

Samburu

Bilinda Straight and Jon Holtzman

ALTERNATIVE NAMES

The Samburu are also known as the Loikop and the Loiborkineji.

LOCATION

The Samburu are located in northern Kenya (East Africa).

CULTURAL OVERVIEW

The Samburu are pastoralists living in semi-arid lands in north central Kenya. They subsist mainly on their herds of cattle, goats, sheep, and occasionally camels. For the Samburu, livestock are more than a form of wealth and a source of subsistence. Livestock constitute the cement of social relations, and a focal point of ritual acts and meanings. In recent decades a variety of factors have greatly reduced the vitality of the livestock economy, forcing most Samburu to supplement their subsistence with wage labor, commercial livestock trading, brewing, and, in higher-rainfall areas, farming. Nevertheless, almost all Samburu continue to have livestock, and life remains oriented around the herds.

Currently there are approximately 150,000 Samburu. Most live in Samburu District in north central Kenya, with smaller numbers in neighboring Laikipia, Isiolo, and Marsabit Districts. Their lands remain somewhat remote from the more developed agricultural highlands of central Kenya, which lie to the south. To reach the boundaries of the district it is several miles on rough, dirty roads once one has left the pavement, and many parts of the district are not accessible to vehicles at all. Samburu are Maa speakers, and their dialect is mutually intelligible with that of the closely related Maasai. However, only small groups of Maasai still neighbor them, since the Maasai were pushed south by the British colonial government in the early 20th century. The Samburu lands are mostly quite dry, but with considerable variation due primarily to altitude. The lowlands are predominantly semidesert and acacia scrub, while the highland areas of the Leroghi Plateau are open grasslands, going into forest at the highest elevations.

Samburu political organization is fundamentally based on their age-set system. Young men are initiated around the age of 15–18, and stay as unmarried bachelor warriors (*lmurran*) for approximately 14 years. Men move as age sets through the various life stages, and age and gender together form the central basis for individual and group identity. Samburu are divided into eight patrilineal, usually exogomous, sections, each of which is divided into clans and subclans. These sections are loosely territorial, and much of ritual life is organized on a sectional basis. Samburu settlements (*nkang*) usually contain between 1 and 4 (often polygynous) families, and are enclosed by thorn fences, with each family having their own separate gate. While men are the "owners" of the settlement, women own the houses (*nkajijik*) that constitute it. Each woman has her own house, which includes the physical structure, her children, and livestock.

Samburu are bordered to the west by the pastoral Turkana and Pokot, and to the north and east by the Rendille, Boran, and Somali. The areas to the south are ranch areas, leased to white settlers in the early 20th century. Some of these ranches remain, but other groups—Kikuyu from central Kenya, Tugen, and Pokot, as well as Samburu—have started to occupy these areas in recent years. Cattle raiding continues today, and puts Samburu into violent conflict with many of their neighbors. However, intermarriage is common even with their bitterest rivals, the pastoral Turkana. In drier areas, Samburu sometimes cooperate closely with Rendille camel pastoralists.

CULTURAL CONSTRUCTION OF GENDER

The Samburu recognize two distinct genders, male and female. The treatment of infants differs little by gender, but by the age of 4 or 5 girls' genital areas are usually

covered, while in boys this may come considerably later. Similarly, older girls and women are very careful not to expose themselves—men cover their genitals, but can be lax in the care that they take to do so. With the spread of Christianity, breasts are also increasingly hidden.

Girls begin to wear an increasing number of beads (mostly red) around their necks as they approach the age when they will dance with *lmurran*. Older girls and young married women wear an enormous number of beads strung on wire like a round collar. *Lmurran* also wear a lot of beaded ornaments, which differ stylistically from those of girls and women. *Lmurran* are the only age-gender category to wear long hair, braiding it into small pigtails that they cover in red ochre. All others shave their hair short.

Upon marriage, young men shave their heads and exchange their ostentatious ornaments for a few strands of beads and a couple of bracelets. Their appearance, like their behavior, should become temperate. Young married women on the other hand, continue to wear enormous quantities of beads, only gradually reducing the number as their children grow. Women whose sons and daughters are initiated should wear far fewer beads so as not to compete with young people or imply that they are sexually accessible to young men of their son's age set.

GENDER OVER THE LIFE CYCLE

Because Samburu gender is strongly differentiated by age, it is more accurate to speak of age–gender categories, rather than gender or age categories. A boy of any age is *layieni*—a girl is an *ntito*, but as she gets older can be referred to as the more respectful *koliontoy*. Once she is initiated and married, a young woman is *ntomononi* until she passes menopause, at which time she becomes an *ntasat*. A boy is a *layieni* until initiated as an *lmurrani*. At marriage he becomes an *lpayiani*, a status he will keep throughout his life. As they move from one status to the next, both men and women acquire increasing rights as well as responsibilities. The greatest change in this regard is marriage. Women's responsibilities increase tremendously at marriage, but their status increases significantly once their children become initiated.

Socialization of Boys and Girls

There are few differences in the ways boys and girls are treated as infants. As they grow, however, boys are encouraged to become tough and aggressive, while nurturance is encouraged in girls. As Samburu children are the main herders, much of their early socialization centers on learning this task. Very young children are taught to wield a herding stick, and even toddlers can help put baby goats into their pens. By the age of 6 they can assist with herding small stock. Boys and girls both engage in similar herding tasks until puberty. Herding affords considerable leisure time, and children often play while the animals in their care graze nearby. The play of boys and girls becomes sharply differentiated by the time they are old enough to herd, though some mixed play continues. Boys enjoy chasing and killing small animals, while girls often make play houses with nearby stones.

Today, more and more children attend school. While in the past children who were educated were often those considered too stupid to be good herders, this is less the case today. Boys are more likely to be educated, since the benefits of education will remain with the birth family, rather than going to a girl's husband at marriage.

Puberty and Adolescence

The lives of girls and boys diverge dramatically when they reach puberty, largely because the age-set system delays male marriage. A new age set is initiated approximately every 14 years, at which time a new cohort of *lmurran* emerges, and the previous cohorts become married elders. "Boys" sometimes may have to wait until well into their twenties to become *lmurran*. Subsequently, because *lmurran*-hood is a lengthy period, men are typically in their thirties when they marry, while girls typically marry in their mid-teens.

Unmarried girls are girlfriends to *lmurran*, sometimes by the age of 10. It is a carefree time for them, and they are able to combine herding with time spent with boyfriends and other girls (Spencer, 1965). While *lmurran* are responsible for long-distance herding and martial activities, they also have a lot of leisure time to spend eating meat together in the "bush" or singing and dancing with their girlfriends.

Attainment of Adulthood

Samburu initiate both boys and girls through genital surgery. These literal cuts are also conceptualized metaphorically by Samburu within an idiom of cutting to divide and create categories. Clitoridectomy, usually performed at marriage, separates females from girlhood.

This surgery gives a girl full adult status, and it is expected that she should now be both nurturing and industrious, caring for her house and family. Initiation provides a young woman the license to bear children, as it is considered extremely unpropitious for uninitiated girls to have children. For a male, circumcision is a cut that separates him from boys while uniting him with his fellows. Yet it is not a cut that accords him full adult status. *Lmurran* are not allowed to marry, and they are subjected to harangues from their elders, enumerating their misdeeds and pushing them to attain the proper forms of respect (Spencer, 1965). However, it is expected that only upon marriage will a man abandon the hotheaded impulsiveness of an *lmurran* and exhibit the cool, temperate behavior of a true elder.

Middle Age and Old Age

Samburu men enter middle age at marriage. Through marriage men become elders (*lpayian*) and gain increasing control of their own livestock. Men attain additional respect when their cohort becomes responsible for initiating a new age set and, later, when their own sons are initiated. Similarly, women's status increases when sons are initiated, and their daughters married. Typically, life also becomes easier by this time, since there are enough children to assist with herding and household tasks.

Both men and women are increasingly venerated as they grow old. Nonetheless, old people increasingly withdraw from the management of the community and their families. Often men disperse their herds to their sons long before death, leaving their children fully responsible for their care. The quality of care varies from family to family. Should the care become too lax however, grandmothers and grandfathers might remind their family of their power to curse them.

PERSONALITY DIFFERENCES BY GENDER

Already in boyhood, males cultivate hot-bloodedness and exhibit their prowess for killing. By the time they become *lmurran*, their hot tempers are fully developed. Girls, in contrast, are charged with cherishing life. By the time they are married, they will have fully developed their capacity for creating and sustaining life. However, during menstruation or early pregnancy, women can sometimes have "hot blood."

Married men are not hot-tempered. They cultivate the calm cool respect (*nkanyit*) which is the most fundamental Samburu value, and should put the needs of others (their families in particular) above their own. Women can also develop *nkanyit*, but more readily display anger and are considered less likely to behave altruistically outside of their family. Women attempt to show attentiveness to the livestock and children in their care and generosity toward those who request food from them. Young women tend to be more demure, becoming more assertive as they get older. These are of course ideals, and there is a broad range of personalities and temperaments between ideal and unacceptable extremes.

GENDER-RELATED SOCIAL GROUPS

Samburu social groups are highly segregated by gender. Although small children play together in mixed groups, gender segregation increases as they move toward puberty. Samburu coalesce in predominantly single-sex groups and are reluctant to mix with members of other age–gender categories. In some cases there are formal patterns of avoidance. Older girls should not mix with elders, and may literally shake with fear in their company. *Lmurran* have formal prescriptions (*lminong*) against eating food that has been seen by women—they should eat in the bush, and avoid domestic life. However, uncircumcized girls may mix with *lmurran*, though they remain separate much of the time.

The age-set system is structured around males, and organized through patrilineal sections. There are no corresponding social institutions for women. Samburu society is largely patrilineal and patrilocal. Brides move to their husband's home at marriage, and belong to their husband's patrilineal descent group. However, women do not completely relinquish their ties to their natal homes at marriage. A woman's children may seek support from their mother's natal kin, and a woman herself will visit her natal family as often as she can. If her husband mistreats her severely, her natal family (particularly brothers) will often come to her rescue.

Patrilineality and patrilocality are not absolute. In a polygynous household sons sometimes derive their family name from the name of their mother, rather than their father. Similarly, with regard to locality, widows

often reside with their brothers rather than their husband's kin, and poor married men sometimes live with their wife's family.

Gender Roles in Economics

Samburu men and women have distinct and interdependent economic roles. Women's roles are centered on the home, while men's work centers on the herds. Some overlap is possible however. Men and women may both do some herding—a task which optimally falls upon children. Men may also perform female tasks—such as cooking or gathering firewood—should circumstances dictate on rare occasions.

Women are responsible for building their houses, collecting water and firewood, milking, and cooking (Spencer, 1965; Straight, 1997; Talle, 1988). Women's tasks are mostly performed around the settlement; they usually travel for an hour at most to collect water or firewood. Men are responsible for managing the livestock. They usually make decisions about selling or slaughtering livestock, although ideally in consultation with their wives and older sons. Men should manage the herds fairly, and in the interests of all family members. Of course, this ideal is not always fully adhered to, though a man risks public condemnation if he misuses family resources. Men are also responsible for long-distance herding. Although older boys and *lmurran* do most long-distance herding, married men also check on the well-being of the animals. Men perform the strenuous task of digging wells for watering animals and are also responsible for fencing the settlement with thorn branches.

Today, both men and women have begun to engage in new economic activities. Where farming has been adopted, men and women both participate. Migratory wage labor has become common among younger men, usually as watchmen in Nairobi. Money is controlled more by men, since the largest sources of cash—wage labor and livestock marketing—are predominantly under their purview. However, woman also have important sources of cash, such as brewing alcoholic beverages that they sell predominantly to men—including their own husbands (Holtzman, 1996, 2001). Most money from brewing is used to buy food, though women may also buy items like beads or cloths. Money—whether held by the man or the woman—is their property to spend as they see fit, though ideally in consultation with one another.

However, since women are responsible for food provisioning, it is expected that they will direct it to their children's needs, while men may be more likely to spend some of it on themselves (Straight, 1997).

Parental and Other Caretaker Roles

Mothers, grandmothers, and older children do most of the childcare. Men, though, are often affectionate to small children and seek to convey wisdom, especially to their sons. Grandfathers may also play a role, though delayed marriage means that men typically die while their grandchildren are still being born. As children grow, the division of child rearing labor becomes more distinct. Since fathers strictly avoid their daughters as they approach puberty, any advice they give them is from a respectful distance. Thus mothers take primary charge of disciplining and inculcating the necessary skills in their daughters while, in contrast, men and women may both maintain close relationships with their sons.

Sons care for their aging parents. The first-born son is responsible for his father's care, while a mother's last-born son is responsible for her. These roles extend to the deathbed. The first-born son must hear his father's last words, while the last-born son hears his mother's. Since daughters often move far away to their husband's homes, they cannot provide much care for their elderly parents, though they are often called to visit them as they near death.

Leadership in Public Arenas

Traditional public leadership is the purview of men. Elders (usually from the same locality or patrilineal descent group) hold meetings under a large shade tree, adjudicating disputes, discussing community matters, and hearing appeals from community members. There are few positions of formal leadership in Samburu society, and meetings are ideally egalitarian, with all elders having an equal say. However, Samburu recognize that wealthy elders and good speakers have a more equal say than others. Within the age set there are positions of formal leadership. Most notably, a ritual leader (*launoni*) is appointed in each patrilineal section. He is given

substantial wealth, and has considerable influence over his fellow *lmurran*. His role diminishes significantly, however, as they move into elderhood. Indeed, Samburu believe that their ritual roles diminish the soundness of *launoni's* minds, and that most end up in poverty.

Elders continue to meet to decide local matters, though national laws and institutions have limited their power. However, these developments have also opened up greater opportunities for women's leadership. While traditionally women exercised political influence only indirectly (e.g., through their husbands), some women—particularly Christian converts—have begun to assume leadership roles in churches and development organizations.

Gender and Religion

The Samburu "God" (Nkai) is associated with all of the forces of the world, especially the procreative. The word is itself feminine, as are many (though not all) of Nkai's metaphorical associations. A few people claim to have been taken to Nkai's home, and in these cases Nkai is described as a family with men, women, and children. Men and women both participate significantly in religious life. Men and women have interdependent roles in major ceremonies, with women singing prayers and praises, while men perform most blessings. Both men and women pray to Nkai daily, asking for protection, human and animal fertility, and the rain and grass necessary for survival.

In the event of misfortune Samburu may contact religious specialists (*loibonok*) who regularly divine Nkai's intentions and desires, or wise men and women (*laen'geni*) who can make suggestions based on their deep historical knowledge. *Loibonok* are men, but Nkai may choose to communicate with members of any age–gender category. Some women in particular have gained a widespread reputation for communicating with Nkai (Straight, 1997).

Leisure, Recreation, and the Arts

Typically, members of all age–gender categories have a fair amount of leisure. The more a family is able to subsist on their livestock, the more gender-balanced leisure tends to be. Children have the least pure leisure time; herding and play are often completely intermingled.

Men and women often engage in leisure activities in same-gender social groups. Women like to engage in handicrafts together, while men enjoy games of *ntotoi* (a variety of the *mbao* game common in Eastern Africa), talking, or (since their recent introduction) drinking locally brewed alcoholic beverages. The gender segregation found in leisure activities is largely voluntary but also has ritual implications in some areas. For example, women are barred from playing *ntotoi* because it is said that men cursed the game for women. Samburu leisure activities are often art forms and recreation simultaneously. Singing and dancing by male and females of all ages accompanies many rituals, but can also be purely recreational. Women may also sing while milking their cows, praising and encouraging the cow as it is being milked.

Relative Status of Men and Women

On the surface, the Samburu are highly patriarchal. Central cultural institutions such as marriage are regulated by men. Men are socially sanctioned to beat their wives if there is "just" cause, and as long as the beatings are not too severe. Men also have the last word on the disposition of the family herds, sometimes overstepping ideal restrictions on their use.

On the other hand, men are highly dependent on women for their domestic well-being (Holtzman, 2002). Women feed men and provide men with children through their sexuality, which they control to a great extent. It is not uncommon to encounter very thin men whose wives have been withholding food partially or utterly from them. A husband's recourses are limited, since men who complain risk being perceived as putting their own stomachs above the needs of their family. Similarly, women frequently engage in surreptitious extramarital affairs, giving birth to children not sired by their husbands. These children will be raised in the settlement, except in rare cases, directly affecting men's happiness, prestige, and well-being.

There are a number of ways in which women oppose wrongdoing, or undermine their husband's authority. When a couple live with the wife's family, her brothers will typically prevent all beatings, and even restrict the husband from talking to her harshly. Women also frequently run away from their husbands when they feel they are treated unjustly. Usually a man must travel to his wife's parents' home and negotiate for her return, which

can be embarrassing, particularly since the parents or other relatives will usually support their daughter and may repeatedly refuse to return her. The wife will fully air her grievances, the husband must agree to curb his behavior and sometimes pay a fine. Since a man's reputation depends largely on his ability to successfully manage his family, his power can be significantly limited by the consequences he will feel among his peers.

As they age, the deference accorded to men and women increases, and their relative statuses become more equal. All old people have considerable power to curse those younger than themselves. Women's curses are particularly feared because they bear such stark contrast to their nurturing role. Neither old men nor old women do much work, but are cared for by their children. The fact that women control food distribution can sometimes mean that old men are in more danger of malnutrition than old women.

SEXUALITY

The Samburu are sexually permissive toward young people. It is expected that girls and *lmurran* will be sexually active, and a mother will sometimes formally sanction a relationship between her daughter and an *lmurran*, who will give the girl a large gift of beads (Spencer, 1965; Straight, 2002). *Lmurran* and their beaded girlfriends are from the same exogomous clan, and thus cannot later marry. *Lmurran* and girls avoid pregnancy through the withdrawal method, as it is considered an abomination for an uninitiated girl to give birth. However, should a girl become pregnant, the women in her family will usually assist her in aborting, or else initiate her quickly. These days it is a common precaution to initiate girls early if they are attending boarding school.

Samburu view sex after marriage as oriented predominantly toward procreation. Sex is considered pleasurable for both partners, but it is considered a strenuous job for men (who are "bulls") but little work for women. These attitudes begin in the relationships between *lmurran* and their girlfriends—girls sing mocking songs about other's boyfriends, saying they are too unhealthy and weak to perform long enough or with enough strength. Married women also complain to one another about sexually inadequate husbands, and this is a common rationale for engaging in extramarital affairs. While Samburu elders individually abhor their own

wives' affairs, collectively they accept female infidelity as a fact of life (and they themselves engage in affairs). To a great extent Samburu elders encourage turning a blind eye in order to mitigate the violence and conflict that can result from discovered affairs (Holtzman, 1996).

Samburu overwhelmingly deny that homosexuality exists. Cross-gender behavior—including cross-sex dressing—occurs rarely, and is reluctantly tolerated. Usually these individuals assume their culturally appropriate role before reaching adulthood, though even when they do not, they are to some extent accepted in the gender of their choice.

COURTSHIP AND MARRIAGE

Samburu practice arranged marriage. Men identify a suitable partner, and make many trips to the girl's family to get permission, to negotiate the bridewealth payment (approximately eight cattle) and other gifts he will offer the family. If it is their first marriage, men must get permission from their fathers, but unlike girls—who must simply accept their family's choice—they choose their own wives. Physical attractiveness plays a role in men's choices, but Samburu emphasize selecting a girl from a respected family whose mother has shown herself to be a good wife. Girls whose mothers are reputed to be lazy or unpleasant often have difficulty marrying.

Marriage is the beginning of a relationship between two families, as well as between two individuals. Many family members share in bridewealth, at least indirectly. The dual-family relationship forged through the marriage is also indicated by the fact that a group of elders from both families bless the couple before they proceed to the husband's home. Likewise, any children born to the couple will belong to and inherit from the husband's lineage, not just from their father.

Following the bride's initiation, the marriage ox (*rikoret*) is slaughtered, officially enacting the marriage. A day of celebration and blessing ensues, and neighbors come from miles around to partake in the singing and dancing, and to drink tea. Men and women eat the meat that is specifically designated for their age and gender, and men receive tobacco as part of the blessings. At night elders keep the bride and groom up late, admonishing them and giving advice. The following morning, the couple receives more blessings as they proceed by foot to the husband's home.

Some time after a man's first marriage he is promoted to full elderhood, while wives are promoted to the status of fully married women. In the case of the woman a new totally clean house (*nkaji naibor*) is built in the middle of the cattle pen. In the evening men kindle her first fire using a wooden base with a depression (*ntoome*—a feminine noun) and a kindling stick (*lpiroi*—a masculine noun). The wife then is responsible for nurturing and maintaining this fire. The fire is seen as a joining of male and female in an act like procreation. Conversely, if it is his first marriage the man must make the transition from being an *lmurran*, who should eat in the bush, to an elder who can be fed by his wife. This ceremony, in which he is fed milk and meat by his wife, is often held together with the *nkaji naibor* ceremony.

There are occasional exceptions to this pattern of arranged marriage. In the past men occasionally practiced marriage by force (*kunon*) in which they would secretly bring their own marriage ox and slaughter it before the rightful groom could do so. Men are still known to abduct girls, and girls may occasionally acquiesce or act as accomplices. The groom will usually pay bridewealth later. If a girl becomes pregnant more than once, women in the girl's natal family may conspire to marry her off. These are also spoken of in the idiom of abduction, since the father must be (or pretend to be) oblivious to such arrangements.

It is expected that all Samburu will marry, though exceptions occur. Girls whose mothers are poorly regarded, or girls from unpropitious families may have difficulty marrying. If they remain too long without marrying, they may be initiated anyway, and even allowed to have children. Very poor men, or men with physical or mental handicaps, may have difficulty getting married, but usually will eventually. Since Samburu men may marry many wives, widowers typically remarry. Widows may not remarry, and they have no incentive to do so. Widows enjoy greater sovereignty, taking lovers of their choosing while continuing to bear children in their husband's name.

HUSBAND–WIFE RELATIONSHIP

Besides being a union of two families, marriage is also a union of a husband and a wife. Their shaved hair is mixed during the marriage ceremony, and once married they share the fortunes of their children and livestock, working together to safeguard the interests of each other and the family. However, this does not mean that marriage is characterized by love and affection. Men are usually anywhere from 10 to 50 years older than their wives, and a level of respect is expected to exist between them. Genuine affection may exist, but husbands in particular are forbidden to display it, lest men take it as a sign of weakness. When a man comes home from a journey he is not even supposed to greet his wife. Men who seem to have excessive love for their wives may explain it away as a result of bewitchment.

In practice there is a lot of variation from the ideal of peaceable wedded interdependence. While some wives dutifully care for their husbands, there are some who withhold food, who are lax in other responsibilities, or who generally behave disagreeably. Likewise, there are husbands who sell animals without regard for the needs of wives and children, who beat their wives often, and start needless quarrels. Sometimes in polygynous households a husband may show preferential treatment, selling or slaughtering one wife's animals more frequently, disproportionately allocating resources, or failing to sleep regularly with all his wives. Women have a right to their husband's sexuality, so a man who is neglectful may subject himself to external criticism. For their part, cowives often get along well, but (real or perceived) favoritism leads to jealousy and quarrels.

Separation is common, though divorce is rare. Before children are born, a woman's family may return the bridewealth and negotiate another marriage for her. However, a woman's position becomes difficult once she has children, since they will remain with her husband. Likewise, it is difficult for a man to divorce. He may chase his wife away to her natal family, but when the community perceives that he has acted unjustly, they may force him either to accept his wife back or to release all of her livestock and children. Commonly, women who believe their husbands treat them badly may run away (*kitala*). This is a powerful tool for woman, as it will be incumbent on her husband to locate and negotiate with her relatives to return her.

OTHER CROSS-SEX RELATIONSHIPS

The brother–sister bond tends to be close, though its character varies according to the age gap between siblings. Brothers and sisters who are close in age interact freely,

but when there is a larger age gap, the relationship is characterized by greater respect. For a Samburu man to swear on his eldest sister is one of the strongest oaths he can make. In adulthood brothers and sisters will continue to visit one another when possible. It is expected that the brother will offer his sisters assistance, while a sister must always feed her brother whenever he visits.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Christian missionaries discouraged many Samburu practices such as female genital surgery, polygyny, and arranged marriage. This has had a major impact on gender roles of devoted Christians and educated Samburu, though these remain a fairly small minority. Development projects have also been directed disproportionately toward Samburu women, which has encouraged westernized notions about how Samburu women should behave today. Gender roles have undergone important transformations as a result of economic changes brought by the declines in their herds. For men, migratory wage labor has increasingly become a part of their normal gender role, while the cash for daily sustenance is often generated through women's brewing or other small-scale business activities.

ALTERNATIVE NAMES

Formerly, the westerly islands were called Western Samoa and the easterly islands American Samoa. The westerly islands are now called Samoa.

LOCATION

Samoa is a group of islands in the southern central Pacific, located at latitude approximately 14°S. American Samoa became an unorganized U.S. territory in 1900 and is the most southerly territory of the United States. The westerly islands became an independent country in 1962. The Samoan islands form the heart of the Polynesian triangle, extending to Hawai'i in the north, Tahiti in the southeast, and New Zealand in the southwest.

CULTURAL OVERVIEW

Samoa's kinship system is generational (the Hawaiian kinship system). All aunts and uncles, no matter how distant, are called by the terms for mother and father. All cousins are called by the terms for brother and sister. Younger relatives are often simply called *tei*. Samoans trace ancestry back as far as oral traditions and, today, written records make possible. This genealogical penchant means that the circle of one's fathers, mothers, brothers, sisters, and younger relatives is potentially very large.

Politically, Samoa is organized in a chiefly system. Chiefs are of two varieties: talking chiefs and high chiefs. Talking chiefs have oratorical responsibilities and are of lower rank than high chiefs; however, some talking-chief titles are more exalted in status than some high-chief titles. *Matai* is a general term for chief and the chiefly system is called the *matai* system. Every extended family has a *matai*. In the village, the various *matai* meet regularly to decide village affairs. Both Samoas have universal suffrage. The easterly islands have an elected legislature and governor. The westerly islands have an elected head of state and legislature, as well as a prime minister and cabinet appointed by the head of state with approval by the legislature.

Traditionally, Samoa had a horticultural subsistence economy. People cultivated taro, as well as breadfruit, coconuts, papaya, bananas, pineapples, yams, mangos, and a number of other tropical fruits and vegetables. They deep-sea fished for bonito and reef fished for shoreline species, as well as octopus, sea cucumber, jelly fish, and other reef inhabitants. They ate a number of wild seaweeds. Males did the deep-sea fishing; females participated in reef fishing. Samoans also raised chickens and pigs.

Today, many people maintain their roles in the subsistence economy and may supplement these roles with income from a job in an urban area (Apia in the westerly islands and the Pago Pago harbor area in the easterly islands), income from a village store, surplus agricultural production, or remittances from overseas relatives. Men are better represented in high-paying jobs in government and business, but women constitute a significance presence in both.

Since colonialization in the 19th century, exported production of coconuts and other agricultural commodities has become an important source of income. In the westerly islands, agriculture continues to employ two thirds of the labor force and is the source of 90% of the exports. Along with other forms of manufacturing, the westerly islands produce a good beer, Vailima. The easterly islands have tuna factories supplied by U.S., Taiwanese, and South Korean vessels. In the 19th century, Apia and Pago Pago were ports for whalers, traders, and adventurers. Around the turn of the century, Apia and Pago Pago became depots for cruise liners. Apia and Pago Pago were trans-Pacific refueling stations between California and Australia prior to the use of jumbo jets, ensuring a supply of tourists. The westerly islands have again become a popular tourist destination, particularly for visitors from New Zealand and Australia. Today, development aid and family remittances are important sources of income.

CULTURAL CONSTRUCTION OF GENDER

In Western cultures, identity is believed to reside within the person in personal experiences such as thinking and feeling. Similarly, Westerners tend to locate gender identity within the person in temperamental differences. In Samoa, identity is located in the persona. The term persona refers to the social roles one plays. Samoans conceive of gender identity as a role and have various gender roles: boy (*tama*), man (*tane* or *tamaloa*), girl (*teine*), women (*fafine*), and male transvestite (*fa'afafine*).

Fa'afafine represent a liminal gender, situated between a number of other gender roles (Mageo, 1992, pp. 452–453, 1996a, 1998, pp. 202–217). The distinction between *teine* and *fafine* (unlike that between *tama* and *tane*) pertains to sexuality. In Christian Samoa, *teine* are putatively virginal; *fafine* are sexually active. *Fa'afafine* are referred to as "*teine*," but, at least in more urban areas, are blatantly active sexually. *Fa'afafine* also retain aspects of maleness and may switch to their "male side" if antagonized. There is no comparable sex role for females. Some little girls are said to be *fa'atama* (literally, "the way of boys"), but this means only that they play with boys and has no implications for their future gender identity or sexuality. A little boy who prefers to play with girls is thought to be a transvestite in the making. Women do not dress as men in Samoa. It may be said that a women is *fa'afatama*, "acting in a manly way." When used as a noun, however, *fa'afatama* does indicate sexual identity.

In pre-Christian Samoa, there was little visual difference between girls and boys. They both wore a sarong (lavalava) of mat, tapa, or leaves tied at the waist. Names did not typically differentiate children by gender. Many tasks, such as baby-sitting, could be performed by girls or boys. At puberty, girls and boys transferred their sleeping quarters from their extended family's compound to the great houses of village-wide gender-based organizations—the *aualuma* for girls and the *'aumaga* for boys. Visual distinctions between the sexes then became more pronounced. Although both sexes continued to wear only a lavalava, girls' hair was likely to be cut in a *tutagita* style, consisting of a shaved head with a tuft hanging down over the temple from which a tail dangled down the cheek. Tufts and tails were commonly bleached with lime to a light reddish-brown. Boys' hair was worn long.

With Christianization, women gradually began covering the upper body and the *pulatasi* evolved. The *pulatasi* consists of a short fitted dress worn over a lavalava. Although some people today wear Western clothing, on Samoan culture days women consistently wear *pulatasi* and men shirts and lavalava. Women also commonly wear Hawaiian mumu. In less formal situations, women often wear a lavalava tied under the arms and men wear a lavalava tied at the waist. With young children, dress gendering is not strict, at least in more rural areas. If relatives living overseas have sent a number of fancy dresses, some boys may be dressed in these for Sunday services, the display of wealth being more important than gender.

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

Childhood is a time of learning to serve elders. Samoa has an age-grade status system within the family; children are at everyone's beck and call. Throughout the village, people keep an eye on children and will protect, nurture, and punish them when necessary. With Christianization, a desire to ensure the virginity of girls increased the need to keep them around the family compound. This meant that girls could be found more easily than their brothers; caring for babies tended to fall on them. Girls learn household tasks and some crafts. Boys are encouraged to cultivate an agricultural plot, learn associated craft skills such as making baskets to transport produce, and learn how to make the traditional earth oven. Today, girls may undertake most boys' tasks if they have no brothers. Boys may perform domestic tasks for elders that were considered male in pre-Christian times (such as cooking), but if boys perform domestic tasks that missionaries imported and assigned to females (like washing dishes or clothes), people wonder if they are becoming transvestites. In old Samoa, children were trained in dance performance from their earliest years. Both sexes attend primary schools, and often Bible schools during the summer holidays.

Puberty and Adolescence

In adolescence, along with refining their horticultural and craft abilities, boys strove to acquire genealogical knowledge and to learn chiefly language and rhetoric. Girls practiced a number of crafts, most importantly weaving fine mats. Both sexes also perfected their dancing and comedic skills. They learned how to decorate

themselves and others so as to be attractive to the opposite sex.

In pre-Christian times, high-status girls remained virginal and had formal weddings. After missionization, lower-status girls were also supposed to be virginal prior to a church wedding. This Christian stricture implied that all girls were high status in the eyes of God, and girls came to affect the dance style and other mannerisms associated with the *taupou* or village virgins. In Samoa, those with status are served by those without status, so it is likely that adolescent girls' workload decreased. Service requirements for adolescent boys in rural areas probably increased. Their elders came to rely more extensively on foreign goods. O'Meara (1990) argues that in order to secure cash, horticultural production (particularly in the western islands) has become more intensive and has depleted soils.

Adolescent girls exercise considerable administrative authority within the household, and boys exercise authority in the village as members of the *'aumaga*. The *'aumaga* is an organization of the village's untitled males (those who are not chiefs) and was the counterpart of the *aualuma*, an association of village-born females. Members of the *'aumaga* function as a village police force and admonish people who disturb the village during the evening prayer period. Adolescents of both sexes now attend high school and many go on to college.

Attainment of Adulthood

To a degree, Samoans marked adulthood by the begetting and raising of children. The couple usually resided with the extended family of either the boy or the girl, depending on their land and title prospects in the respective locales. The tendency was patrilocal. Adulthood was fully marked by the awarding of a title. Titles rewarded competent and willing service as a youth. Although titled men and their wives partook in joking and entertainments, they were expected to comport themselves with a degree of dignity, warranted by their titles. Titled men and their wives are members of village governmental organizations and have responsibilities for maintaining order and allocating labor within the family and village.

Middle Age and Old Age

In Samoa, older people of both sexes have ultimate authority in family and village governance, but they have a decreased role in maintaining order and in dispensing punishments to children and adolescents. Parents are not supposed to show affection for children; this rule is not as strict in relation to grandparents. The bonds between children and grandparents tend to be close. Young people are generally committed to serving and caring for them. These commitments can raise conflict in modern life, where young people of both genders have responsibilities to succeed in school and may wish to travel abroad to pursue an education.

PERSONALITY DIFFERENCES BY GENDER

As noted, some cultures construct gender as temperamental—that is, as based in personality differences, for example, a tendency towards emotionality, detachment, aggression, compassion, and so forth. Other cultures, like Samoa, construct gender as a role. Where role-based gender identity is emphasized, personality differences between the sexes tend to be downplayed; this is so in Samoa. People of both sexes are expected to be strong, dignified, and respectful, and to offer love and generosity to all. People are thought to have tendencies toward overwhelming outbursts of emotion, pride in the form of belligerent self-assertion, and envy. To a limited degree, in contemporary Samoa outbursts of emotions at funerals and departures, as well as envy expressed through gossip, are more readily ascribed to women and belligerent self-assertion to men. Polite young people of both sexes are expected to be shy, except with same-age and same-sex groups and in public performances. Since Christianization, young women are expected to be especially shy.

GENDER-RELATED SOCIAL GROUPS

Village social structure was gender dimorphic. Traditionally, the *'aumaga* served the village council of chiefs (*fono*), cultivating plantations for them, carrying out their ordinances, and acting as their army. The *aualuma* sponsored two major activities: hosting parties visiting the village and marriages of ceremonial village virgins (*taupou*). Hosting guests entailed housing, feeding, and entertaining them. In many villages today, the *aualuma* is assembled to perform only on special

occasions, such as a funeral. In the westerly islands, the *aualuma* has largely been replaced by the women's *komiti*. The *komiti* grew out of church auxiliary groups in the westerly islands during the 1920s and 1930s. The *komiti* is not confined to village-born women, but includes all village women and has had a vital role in village health and sanitation.

GENDER ROLES IN ECONOMICS

In old Samoa, wealth derived from land, proprietorship of which was based in titles. These entitlements were pursued in two primary ways: through ceremonies (largely a male province) and through hypergamous begetting; that is, bearing offspring with better genealogies than that of one's own family, who might make claims to status and titles. Genealogical recitations at ceremonies were, in essence, claims to titled lineages, or bolstered such claims by representing a family as so distinguished in ancestry as to have natural claims to the dignity that titles bestowed. Titled men as orators were responsible for gathering genealogical knowledge and making ceremonial speeches that asserted their extended family's distinguished genealogy. Ceremonies created alliances between villages; in wartime, allies supported one another's putative rights to titles. So clearly was war a male task that women from rival camps might picnic together on the outskirts of the battle.

Women had a significant indirect role in ceremonies. Women produced fine mats, which were the currency of ceremonial exchange. Certain mats were linked to certain titles, so that it was possible to capture a mat and the title with it. Wealth in fine mats in the maternal line was a criterion used to select a person for a high title. Females forwarded family and village entitlements more directly through hypergamous begetting, which is explained below.

A village's major resident titles determined its status. A *taupou* drew high titles into her communities' compass by wedding a high title. After becoming pregnant, she returned to her natal village. High-title holders were selected on the strength of paternal and maternal lines. *Taupou* were chosen for their ancestry. Upon that chief's death, therefore, the *taupou's* son had a weighty claim and might bring the title back to his village. Like *taupou*, all high-status girls were to remain virginal; their elders furthered family entitlements through arranged marriages with title-holding males or their sons.

Undistinguished families encouraged their girls to lure scions of ranking families in informal marriages (*avaga*) because the children who descended from these unions had rights in the father's family estate. A girl who became pregnant from an elopement qualified for a piece of land from the boy's family that she shared with her group. If she bore a son who was serviceable, bright, and talented, his father's family might give him a minor title. If his sons married well, they had better title prospects.

With missionization, women's economic role became increasingly defined as domestic. Mission schools taught sewing and housekeeping to women. Girls and women were expected to perform many domestic tasks, although cooking in the traditional earth oven remained a male task. Many of women's subsistence fishing and horticultural responsibilities were unchanged. Samoans also participate in a modern economy in which jobs are to a degree gender typed. Secretarial jobs and jobs in beauty salons, for example, are performed either by women or by male transvestites. Nonetheless, status trumps gender in Samoan society: as long as a woman is perceived to be high status, she can hold posts such as college president or head of a government agency.

PARENTAL AND OTHER CARETAKER ROLES

Traditionally, when a woman gave birth she stayed with her relatives. The maternal grandmother played a major role in directing early care, although the infant was also tended, played with, and carried by a large circle of relatives. At the age of 2, care was transferred to a somewhat older child. Usually the caretaker was a girl, but not necessarily; boys too might become primary caretakers for one of their extended family's children. Care of children by older children freed adult women for participation in economic and political life.

LEADERSHIP IN PUBLIC ARENAS

The distinction between public and private is based upon the model of the person as an individual. Public is that arena in which individuals have professional relations with others; private is that arena where they have personal relations. Samoans see people as role players in groups rather than individuals; prior to missionization, they did

not make a strong public–private distinction. Village life was public, but was divided into a formal ceremonial sphere and an informal entertainment sphere. For the most part, men were leaders in the ceremonial sphere and women in the entertainment sphere. The missionaries who Christianized Samoa came from 19th century British society, where there was a public–private split corresponding to male and female roles. Men dominated public life; upper- and middle-class women were confined to private life. After Christianization, Samoan women abdicated some entertainment roles, but not their role in village governance. There is a *fono* of male chiefs but also a council of chief's wives (*faletua ma tausi*). Today most politicians and other civic leaders are men, but women are increasingly prominent as heads of government agencies and as school principles and presidents.

GENDER AND RELIGION

While traditionally men were most likely to be title holders, women as sisters had spiritual power—*mana*. Some of the fine mats women wove were considered the resting place of spirits. When missionaries demanded that Samoans destroy their idols, Samoans took their most sacred fine mats to the sea and "drowned" them.

Even today, if a man goes against his sister's wishes or offends her, she may curse him. Ill luck, injury, sterility, even death, may then befall him or his descendants. In old Samoa, if a man fell seriously ill, his sister came to his bedside and sprayed his body with coconut juice from her mouth; this was a ritual forgiving offenses against her and lifted whatever spiritual cause the illness might have.

A change to more sexually restrictive norms for girls was gradually introduced and differentially enforced prior to World War II. After that time enforcement seems to have been more consistent. This change was psychologically problematic, as indicated by the increasingly prominent role female spirits began to play in spirit lore. Girls who were believed to have been *taupou* prior to having been "taken" by spirits became major figures in spirit-induced illnesses and possessions. While the *taupou*'s virginity was closely guarded prior to a brief marriage with a highly titled partner, these spirit girls were notorious for following attractive young men home at night and seducing them. Remember that in old Samoa, lower-status girls often married by elopement, which involved following a boy back to his family compound.

Spirit girls united the figure of the high-status virgin with the sexual agency that common girls exercised in pre-Christian times.

LEISURE, RECREATION, AND THE ARTS

The most salient entertainment in pre-Christian Samoa was the *Poula* (Joking Night) and was led by women, although males also played significant roles. Joking Nights followed major ceremonies (which were occasions of travel to other villages) such as welcoming ceremonies, investitures, marriages of rank, births of ranking children, first birthdays of ranking children, deaths of ranking persons, pigeon-hunting expeditions, and spirits' feast days. Joking Nights had two parts: a dignified first segment, concluded by a chiefly dance, and a ruckus second segment, characterized by ribald joking. Joking skits were part of the second segment. After missionization, the dignified dancing of the first half became the model of all dancing. A chiefly dance (the *taualuga*) came to be considered the *taupou*'s special dance, and later to be the prototype of girls' dancing generally. By the mid-20th century, males had taken over young women's roles as leading comedians, most importantly in Ghost House, a comedy theater named after the house in which Joking Nights had taken place. Older women remained skilled comics and performed in many contexts.

Women specialized in tapa making and weaving fine mats. Men might specialize in house building or tattooing. Samoans have long been the tattooing experts of the region. When missionaries and cultural erosion had extinguished tattooing in much of the Pacific, other Polynesians would journey to get tattooed or to learn this art from Samoan experts. The male tattoo extends from midriff down to and covering the knees; early explorers compared it to silk trousers. Although a matter of choice, getting a tattoo was an initiation ritual for young men and was a prerequisite for males to serve chiefs in ceremony. The tattoo for women was purely decorative and included lacy designs on the thighs only. Both men and women still get tattoos today for decorative reasons and to show their loyalty to traditional Samoan culture.

In old Samoa, the chiefly sport was pigeon catching, carried out with decoy birds. Pigeons would be caught, leashed around the leg, and trained. Trained birds, secured by a long string, were released. They flew around a pigeon-catching mound as if circling food or water,

attracting wild birds to the area, which were captured by chiefs hidden in blinds below. Today Samoans put on dances, beauty contests, entertainment competitions, and culture days in which they perform crafts and dances. Samoans also participate in a number of sports—from longboat racing to canoeing to cricket to football. Longboat racing and football are male sports, although formerly women rowed a half-longboat called a *tulula*. Women as well as men canoe and play cricket. When women score, they often perform choreographic jokes led by a male transvestite.

RELATIVE STATUS OF MEN AND WOMEN

In Samoa, status is associated with titles and genealogies. In more stratified Polynesian chiefdoms, genealogy determines status; in Samoa, titles determine status, but genealogy legitimates title claims. Males are more likely to hold titles, but a chief's sister, in theory, has more *mana* and thus status than the chief himself. His wife holds a status similar to but less than his. Missionaries believed raising the status of women as wives to be an instrumental part of instituting a Christian form of marriage. Inadvertently, missionaries also helped to raise the status of the sister. By stressing the importance of virginity and formal weddings for all girls, missionaries implied that all girls were high status. This rise in female status in Christian times was accompanied by a decline in women's ability to negotiate/improve their status through hypergamous begetting; missionaries also imported the idea that parentage counted only when sanctioned by church and state. Today, education is an important factor for improving and negotiating status for both sexes.

SEXUALITY

When missionaries arrived in Samoa, people had no need to hide their bodies and women appeared to be less modest than men (Williams, 1830–32/1984, pp. 167, 232). The missionary Williams (p. 82) describes commoners of both sexes as wearing a "small tea leaf apron," and high-status people as wearing fine mats. People had little reluctance to shed this clothing; it was more decorative than moral in nature. As mentioned above, with Christianization came upper-body clothing for girls and women.

It is difficult to address the question of whether or not attitudes toward, and practices of, premarital and extramarital sex differed for males and females in old Samoa because sex was not highly differentiated from marriage; to the degree sex is marriage, there is no premarital or extramarital sex. Marriage customs differed greatly for men and women of high status and to a lesser degree for men and women of commoner status (discussed in the next section). Since Christianization, there has come to be a double standard for young unmarried women and young men. Young men show their manliness by having premarital sex; young women disgrace themselves and their families through premarital sex.

In old Samoa, sexuality, like other bodily functions, was an area of laughing and jest. We saw that people often entered into sexual relationships in the context of Joking Nights. Women did, and married women still do, take the lead in sexual joking. Sexual joking is facilitated by the fact that in Samoan the word *mea* means "thing," but also refers to male and female genitals. *Fiamea*, literally "want to make the thing," means "want to make sex." Therefore any thing is, potentially, a sexual thing and informal talk is rich in double meanings. This attitude toward sexuality, while still present, has been complicated by missionization. The idea of girls as leading sexual joking was incompatible with the Christian model of the premarital virginal girl. In the 1920s, Margaret Mead says that when the village virgin assumed her office, she ceased joking in the presence of boys (Mead, 1928/1961). In contemporary Samoa, any girl who jokes too much around boys is said to be "looking for a husband." Yet sexuality remains a subject of teasing and jest among young people in informal contexts.

Drozdow-St. Christian (2002, p. 146) reports that contemporary Samoans distinguish between two kinds of sexuality. Sexuality in marital relations is looked upon as sacred and is for the purpose of making large families. Premarital sexuality is looked upon as "what the boys are looking for on the roads at night"; it is associated with play, being young, and obviously with boys rather than girls. This lack of sexual symmetry creates practical problems, and *fa'afafine*, who are as unregulated in their sexuality as other boys, represent one solution. Boys who are looking for sex and cannot find a girl often turn to a *fa'afafine*. This may be one reason, among a number of others (see Mageo, 1992, 1996a), why male transvestism has become a more salient institution in Christian Samoa.

COURTSHIP AND MARRIAGE

In pre-Christian Samoa there was no hard and fast distinction between intercourse and marriage. As late as the 1970s, a boy who had deflowered a girl might appear at her wedding to another man insisting that she was already his wife.

Go-betweens (*soa*) handled courtships between persons of rank and then contracted their marriages in light of political considerations. The ordinary boy, like his ranking counterpart, sometimes employed a companion to speak for him in matters of the heart. For the commoner, however, sending a *soa* to a girl's family was problematic. Commoner boys could not expect a welcome reception because Samoan parents generally wanted their daughters to wed a high-status husband. Therefore their *soa* often approached the girl herself rather than her family. While the chief's *soa* was elaborately courteous to all parties, the common *soa* praised his principal, but joked with the girl he wooed. Samoan boys and girls may still get a friend to speak for them to someone in whom they feel a romantic interest.

In old Samoa, ranking marriages consisted in the girl's ritual defloration and an elaborate display of her hymeneal blood, as well as an exchange of speeches and prestations. The talking chief of the groom or the groom himself performed the defloration. Old ladies from both sides might examine the girl prior to the ritual to insure she would not embarrass both families. A *taupou* who did not shed blood at a defloration might be stoned. Joking Nights were a common venue for the elopements of lesser folk because they occurred when people visited from other villages. Given that Samoans calculated kinship so broadly, people within a village were often related. Samoans consider marriage with a relative, no matter how distant, incestuous.

High-status males practiced serial polygamy (technically "polygyny") and, sometimes, simultaneous polygyny. Lower-status men could also have more than one wife. With lower-status girls, marriage was a matter of the amount of time spent residing with a partner and was formerly acknowledged by their families when the couple began having children. The event that was ritualized for lower status people was not the act of intercourse but the act of childbirth. Females were forbidden to marry again if their male spouse was of high status, even if the spouse was residing with another wife or wives. An exception was made if the wife's status was equal to or surpassed that of her husband; then she could take a new husband after she had ended a marriage.

As noted, World War II was an important turning point. Many Samoan girls formed relationships with American servicemen, who appeared to be of high status. These young men usually deserted their Samoan girlfriends; the resulting children were an embarrassment to girls and their families. Christian mores made new sense in terms of this historical experience. Today there is an ideal of virginity for unmarried girls, but many young unmarried people engage in sexual relationships. Marriages are by elopement, as well as by state- and church-sanctioned unions.

HUSBAND–WIFE RELATIONSHIP

Christian missionaries valued and fostered the husband–wife relationship. In Samoa, one's primary bond is to one's extended family. Blood, Samoans believe, is forever; sexual relationships may not be so. While the sister, in theory, outranks the brother, the husband outranks the wife and has authority over her. The couple will reside with either the husband's or the wife's kin, depending on where their opportunities for land and titles are greatest. Given how broadly kinship is calculated, this is typically a large number of people, often residing in different villages. The husband's authority over the wife is stronger if the couple resides with the husband's family. Even then, however, should he mistreat her, she can return to her kin. In pre-Christian times, divorce was simply a matter of the person who was living with the kin of his/her spouse returning to his/her own family. Today couples often have their own house on family land, thereby affecting a pattern closer to the nuclear family model.

OTHER CROSS-SEX RELATIONSHIPS

The brother–sister relation is the most important cross-sex relationship in Samoan culture. Remember that in the Samoan kinship system, all cousins, no matter how distant, are brothers and sisters. A sister is her brothers' honor; a brother is his sisters' mainstay and protector. While there was no word for marriage in pre-Christian Samoan, there was a word for the brother–sister relation, *feagaiga*. The term refers not only to the brother–sister

bond, but also to a bond that may be established between their descendants. (It is also applied to the bond between talking chiefs and high chiefs.) Parties to a *feagaiga* are regarded as two complementary sides of a larger whole. Samoans not only abhor actual incest between categorical brothers and sisters, but any hint of sexuality when both are present. Crossing this line impugns the name of a family and is likely to ignite conflict. In old Samoa, incest between a brother and sister was believed to result in miscarriage. Miscarriages were called "blood clots"; many spirits were believed to be born as blood clots.

Change in Attitudes, Beliefs, and Practices Regarding Gender

For several decades following World War II, there was a spirit possession epidemic, predominantly among Samoan girls. During roughly the same period there was a suicide epidemic among Samoan boys. In both cases these epidemics were related to the impact of colonialization and modernization on gender roles. These factors probably also account for the high population of male transvestites in contemporary Samoa. Although undoubtedly present in small numbers in old Samoa, the historical record suggests that these numbers have significantly increased in recent decades.

Shipibo

Warren M. Hern

ALTERNATIVE NAMES

Shipibo are also known as Conibo or Chama (considered derogatory).

LOCATION AND LINGUISTIC AFFILIATIONS

The Shipibo are located in the upper Peruvian Amazon. Their communities are found principally along the banks of the Ucayali river and its tributaries from Atalaya to Requena or on lakes off the main course of the river. The coordinates of the area are approximately 6°S–9°S and 75°W. Upstream on the Ucayali from the town of Pucallpa, the Shipibo are known locally as the Conibo, although the language spoken and the culture shared by the Shipibo/Conibo are essentially the same. The entire group will be referred to here as "Shipibo."

Shipibo is one of the Panoan languages of the Amazon. Panoan speakers tend to be concentrated around the upper Ucayali drainage basin in eastern Peru and western Brazil.

The word "Shipibo" is not generally used by the Shipibo to describe themselves. They tend to use the word *jonibo*, "person (pl.)," in reference to themselves and the word *nahuabo*, "foreigner/stranger/not-person (pl.)," in reference to others who are not Shipibo. The term "Shipibo" has been used by members of other tribes to refer to the group under discussion because of their custom of capturing and maintaining as pets specimens of the pygmy marmoset (*Cebuella pygmaea*), the smallest known primate, which is indigenous to the eastern Peruvian Amazon. In Panoan languages, this animal is called a *shipi*. The suffix *bo* indicates plural.

OVERVIEW OF THE CULTURE

The Shipibo are thought to have occupied the upper Peruvian Amazon area for about 1,000 years. They have principally and traditionally inhabited small settlements on the banks of oxbow lakes (*cochas*) and small tributaries of the Ucayali.

The Shipibo have long had a highly developed ceramic tradition, and their contemporary pottery is internationally known for its beauty and craftsmanship. Pottery is used for cooking, eating, and ceremonial purposes, and sometimes for decoration. The Shipibo women are also accomplished weavers, using a native cultivated cotton for making yarn and thread. They use a backstrap loom for large bolts of cloth that may be 10–15 m long and require the weaver to secure the distal end of the longitudinal threads on a tree. The geometric and repeating patterns used by the Shipibo are distinctive and are painted or engraved on pottery, cloth, faces, oars and clubs, and anything that might retain the figures.

Until the last few decades, the Shipibo economy has largely been one of subsistence supported by fishing, hunting, gathering, cultivation of high-carbohydrate plants such as yucca (at least two varieties of manioc, *Manihot esculenta* sp.), plantain, and a large purple sweet potato (Bergman, 1980). More recently, rice and corn have been sown and cultivated for market as well as consumption. *Chiclayo* (black-eye pea) is sown and cultivated on the exposed river beaches in the dry season.

Traditional Shipibo family patterns tend to be matrilocal and matrilineal, although this appears to alternate from generation to generation (Abelove, 1978; Eakin, Lauriault, & Boonstra, 1980; Hern, 1992b). Sororal polygyny was widely practiced in the past but is now much less common. The levirate and sororate are practiced; the brother of a man who has died accepts his deceased brother's wife as a second wife. She is often the sister of her new husband's first wife. Cross-cousin marriages were the preferred marital arrangements in the past, particularly in polygynous families.

A typical Shipibo village consists of a single matrilocal extended family containing five or six nuclear families and representing as many as four generations. Larger Shipibo communities appear to be the result principally of missionary activity in the 19th and early

20th centuries (Myers, 1990). Catholic and then Protestant missionaries induced aggregation of various family groups into small communities that were more susceptible to proselytization for religious purposes.

Missionaries describe some encounters with the Shipibo as extremely dangerous (Samanez y Ocampo, 1980). This was particularly true for more isolated groups such as the Pisquibo, Shipibo who lived along the banks of the Pisqui river, a tributary of the Ucayali. Shipibo are depicted in various accounts as ruthless in the treatment of their enemies, especially the Cacataibo, or Cashibo as they are called by the Shipibo.

The traditional leader (*curaca*) of a Shipibo community is the male head of a large extended family, with an informal but permanent status until death, old age, or disability requires him to accede to a younger man. Currently, the Shipibo choose a village chief on a rotating basis and elect officials to conform with the national governmental structure. These leaders generally consist of an chief, *jefe de la comunidad*, or *curaca* (traditional), a *teniente gobernador*, official representative to the district government, and an *agente municipal*. These are not traditional Shipibo designations, but the community process by which leaders are currently chosen resonates with traditional Shipibo methods of dealing with issues that affect the community. Community assemblies are attended by both men and women, and while male leadership predominates, women express their opinions vigorously and often prevail.

Traditional Shipibo religious views and cosmology are animistic. Spirits reside in various living things, specifically certain trees and certain animals, and in the stars. Freshwater dolphins are of particular interest and are not killed because of their intelligence and capacity to inflict harm on humans. The Shipibo have survived culturally and demographically through hundreds of years of European colonization and missionary activity at the same time that other tribes such as the Cocama have lost their identities and languages. The Shipibo have apparently absorbed other groups such as the Setebo. The population numbers of the Shipibo during precolonial times is not known, but there is evidence that they, like all indigenous Amazonians, experienced catastrophic population losses following European contact owing to the introduction of exogenous diseases, armed conflict with European settlers, slavery, and intertribal warfare.

In the mid-1960s, there were approximately 100 Shipibo settlements from Atalaya to Requena, including those found on Ucayali tributaries and interior lakes, comprising a total population of approximately 15,000. In the mid-1980s, there were 125 identifiable Shipibo settlements. The present Shipibo population is estimated to be about 40,000–45,000 in 150 or more settlements, and many Shipibo have moved permanently to larger mestizo towns such as Pucallpa, which was originally a central Shipibo settlement.

In a baseline health study of the Shipibo village of Paococha in 1969, Hern (1971, 1977) found a rate of population growth of 4.9% per year in a carefully defined population of 538. This extremely high rate of population growth means that the population doubles approximately every 14.3 years. The average woman had an average of 10 live births during her reproductive years. The Shipibo have the highest fertility ever recorded in a human group.

This means that, following a massive population crash during the 16th–19th and early 20th century time span, the Shipibo experienced a rapid recovery with population growth rates that exceeded precontact rates. The most rapid population growth of the Shipibo population occurred in the years immediately following World War II.

There has been aggressive immigration of other Peruvians into the upper Peruvian Amazon. The town of Pucallpa, which was principally a Shipibo settlement in the middle to late 19th century, contained a Peruvian mestizo–criollo population of about 3,500 in 1944. The Trans-Andean "highway" reached Pucallpa at about that time, and immigration from the Andes and the Peruvian coastal cities began, as did increased commercial activities in logging, petroleum exploration, fishing, cattle ranching, and agriculture. The Shipibo were increasingly exposed to sources of rapid cultural change, and they also found themselves competing increasingly with other groups and immigrant populations for the same resources.

Rapid cultural change in the region was enhanced by the establishment in the late 1940s of the Summer Institute of Linguistics, an evangelical Christian group dedicated to translating the Bible into native languages. Their base was built on the shore of Lake Yarinacocha and included a landing strip for the use of the missionary planes as well as establishing a fleet of floatplanes capable of landing on the waterways and lakes. The missionaries also provided excellent medical care to all indigenous groups with whom they had contact.

Another important influence on both cultural change and the health of the Shipibo was the establishment in 1960 of the Hospital Amazonico "Albert Schweitzer" by

Dr. Theodor Binder, a German physician who was dedicated to helping the indigenous people of the Peruvian Amazon. The hospital was several kilometers upstream from the Summer Institute of Linguistics.

Extensive and intensive contact between the Shipibo and the hospital has been a major source of cultural change for the Shipibo as well as a major contribution to their improved health. Shipibo families came from outlying villages to reside at or near the hospital while family members received prolonged treatment for diseases such as tuberculosis and leishmaniasis. This contact resulted in exposure not only to health education but also to European customs and a Spanish language environment. These families have then taken some of their adopted customs, material culture, and language influences back to the home villages. Yet another source of cultural change at the village level was the introduction of Western-style schools. These were primarily elementary schools sponsored by missionary groups such as the Seventh-Day Adventists or bilingual schools established by the Summer Institute of Linguistics. Some educational materials included reading and arithmetic, but the curriculum had a heavy emphasis on religious indoctrination and marching around the village plaza or soccer field in a goose-step military fashion. Later, these schools were replaced in all villages by government-sponsored bilingual schools with education levels through high school in some villages. The goose step, which seems antithetical to the languid cultural ethos of the Shipibo, continues to be the prescribed mode of marching.

Prior to large recent population increases throughout the upper Peruvian Amazon, the Shipibo lived in the presence of spectacularly abundant food sources (Bergman, 1980). A few hours fishing resulted in more than enough for a large family. Hunting wild game on high ground during the seasonally flooded dry season often resulted in kills of deer, wild boar, tapir, monkeys, large birds, large rodents, and land turtles that provided excellent sources of protein. Gathered and cultivated fruit and vegetables resulted in a highly varied diet rich in vitamins and fiber. General levels of nutrition were excellent.

CULTURAL CONSTRUCTION OF GENDER

The Shipibo recognize two genders: males (*jonibo*) and females (*ainbo*). When a child is born, it is either a boy (*benbo*) or a girl (*ainbo*). Female homosexuality seems to be unknown, but male homosexuals, while rare, are simply regarded as males who are a little strange. Males classically wore a hand-woven and hand-painted *cushma* or *tari* (Shipibo) in the cool evening hours or during ceremonial occasions, and still do, but they now usually wear Western trousers and shirts underneath. Most daily wear among men nowadays consists of plain cotton trousers and shirts.

The classical dress of a Shipibo woman prior to missionary contact was a hand-woven and hand-painted cotton tube skirt that was pulled together and rolled at the top to keep it from falling down. The tube skirt is not only universally adaptable to the woman's size, which may change with pregnancy and delivery, but provides a handy private cover for the woman who is squatting to urinate or defecate.

Contemporary Shipibo women continue use of the extremely practical tube skirt, but they now wear short blouses that have a design at least inspired by missionaries. The typical Shipibo woman's blouse is rather tight-fitting with long sleeves and open around the bottom, just long enough to touch the top of the tube skirt at the back. The front is conveniently short enough to permit easy nursing of an infant carried at the waist, and sometimes the front of the blouse is not quite long enough to cover pendulous breasts. This was not the effect sought by the missionaries, since breasts are supposed to be covered at all times, but Shipibo women find it to be practical.

The missionaries' blouse design was conferred on the Shipibo because, before missionary contact, Shipibo women customarily wore nothing from the waist up except a shoulder shawl loop used for carrying a baby at the hip. In the evenings, after dark, and when going to the river to do laundry and bathe the children, this custom prevails. Having learned that the savage custom of female upper-body nudity offends outsiders such as Christian missionaries, women cover themselves when they know that unfamiliar visitors are present. Women wear their hair long, usually cut at a little more than shoulder-length, with bangs just above the eyebrows, giving a classical Shipibo "look." Men have worn their hair short with a Western haircut since they were introduced to this style in military service beginning with World War II, although young boys may have long hair.

Both men and women may have face-painting at times, particularly during feasts, but face-painting, done with a small roller carved with Shipibo designs to hold the dye, is usually seen almost exclusively in women. Women, while dying their already dark hair with *huito* (*Genipa* sp.), also carry the dye down the forehead a little to frame the face from above. Women also use facial adornments

such as pieces of thin shaped metal (*cori*) placed in pierced lips and a cone-shaped metal disk (*ruesho*) suspended from the nasal septum. Men use such adornments but less often than women and usually during ceremonial occasions only. Men do not wear earrings (*paroniti*).

Shipibo women are attracted to men who are physically strong and muscular, but who are also proven providers of food such as fish and game. Having an outgoing personality with a smile and sense of humor helps. Shipibo men are attracted to women who are very young, who are sexually mature and available, and who bring them gifts. Young women with pleasant personalities, who are physically active and laugh a lot, are considered desirable. In addition to underlying Shipibo tradition, stated normative mate preferences for women now include such descriptives of men as "clean," "hardworking," "well-dressed," "tall," and "thin."

In the past, it was considered attractive for either men or women to have the flattened forehead caused by skull binding with a headboard at birth. This custom has been abandoned because the Shipibo feel that it identifies them as "savages" in the city and brings ridicule.

The idea that a person could be something other than a heterosexual male or female is puzzling for most Shipibo, but they accept this as, however uncommon, within the range of known behavior. Male homosexuality is known to occur among the Shipibo, and while most regard homosexuality as an aberration, it is not regarded as pathological. Some people are just born that way, say the Shipibo, and some become homosexuals from one moment to the next. A man who is an aggressive partner in a homosexual relationship is not regarded as homosexual, merely as engaging in sex with a passive male who got into his mosquito tent. Female homosexuality seems to be unknown.

The term for a male homosexual is *sinia*, and the term for the activity of homosexuality is *poinquinique*, which could be loosely translated as "fucks the asshole" (*poinqui* is the common term for anus). Male homosexuals who are Shipibo are accepted in the community and are not mistreated. Mestizo homosexuals are regarded with apprehension and hostility.

GENDER OVER THE LIFE CYCLE

Boys and girls are differentiated at birth by, among other things, their names. A boy is a *benbo* and a girl is an *ainbo*.

Socialization of Boys and Girls

Boys and girls are both valued as children, but girls slightly more so because they not only can and will work to perform household chores, but their presence will attract suitors, who will become husbands for the girls and will then contribute as hunters and fishermen to the household economy. Boys may help with hunting and fishing chores, but they are expected to leave the household to marry.

Caretakers for the children include all members of the household and immediate kin group, usually living in adjacent or nearby houses. Older men in the family will often teach the young boys how to make hunting and fishing weapons such as spears, arrows, and bows. The boys watch the tedious process of weapon manufacture and then go off to try to make a primitive copy. Girls are taught by the grandmother how to make pottery and how to weave and paint. Certain kinds of clay have to be collected for making the pot with a coiled-rope method and for painting before firing, a specific resin must be obtained for glazing the pots, and certain barks and plants must be collected for dying the hand-woven cloth. Before the introduction of Western schools, all children learned these skills and arts from older members of the family, usually a grandmother, grandfather, aunt, or uncle.

Young children up to the age of 10–12 are given great freedom to play with their peers and to explore the area around the house and village. They frequently accompany their parents or other adults on excursions, such as girls going to the garden to cultivate or gather food, or boys hunting and fishing with their fathers.

Shipibo children begin learning the complex family relationships including kinship terms and avoidance patterns at a very early age (Abelove, 1978). A Shipibo child's social success is highly correlated with its mother's pattern of interactions with others.

Child abandonment is almost unknown. It is inconceivable to the Shipibo: "Only mestizos abandon their children." Discipline is gentle and consists principally of quiet talking and persuasion. Once in a while, a parent will spank a young child. A parent may gently scold or, rarely, have an angry exchange with an ill-behaved older child, but it does not appear that the physical abuse of children occurs among the Shipibo.

Puberty and Adolescence

At the beginning of adolescence and the onset of menstruation, girls are referred to as *shontaco* or *shontashaco*

and called by that term instead of by given name (the suffix -*shaco* or -*shico* is an affectionate diminutive attached to various terms, mainly family members). A young girl walking down the path will be called or addressed by an older person as "*ShontA*!" instead of by her given (Shipibo or Spanish) name, even though the girl's name is known to the caller.

Young boys are called *yosito, baqueron, ranon*, or *ranonshico*. The onset of adolescence, as marked by menstruation and breast development in girls, has been marked by ritual genital mutilation in the past, but this practice has been abandoned for the past 50 years. The genital operations consisted principally of labiectomy, perforation or excision of the hymen, and clitoridectomy. In 1984, I had the occasion to perform a gynecologic examination on a woman who was about 50 at that time and who had experienced this procedure at puberty.

For boys, the ritual of the haircut occurs at about age 12 or 13, and this is accompanied by an all-night party sponsored by the boy's parents and kinsmen. No other physical acts such as scarification occur at this time.

Although traditional patterns are changing rapidly with the introduction of formal schools through the high-school level, Shipibo adolescents still assume many adult responsibilities that include subsistence activities and mating. Informal trial marriages occur, with an adolescent couple cohabiting in the girl's parent's house, and these are generally regarded as temporary arrangements. However, if the girl becomes pregnant a more stable relationship is likely to emerge.

Attainment of Adulthood

A young girl is considered a woman once she bears a child, although childless women are accepted as adult women in late adolescence. For a young man, either induction into military service or becoming a father are irrevocable signs of adulthood. A young man who is a father has a special status as *padre de familia*, a term recognized by Spanish-speaking government authorities. Attempts to obtain census figures are usually met by the observation that a community has X *padres de familia*, with the clear implication that those men are the only members of the community that really count. This becomes even more awkward when the head of a particular household is a woman.

In the absence of formal Western schools, Shipibo girls entered permanent sexual relationships at the age of 13 or 14 and immediately began having children. They were considered adults from that point on. Currently, girls are encouraged to attend school at least through grade school and beyond if possible. Sexual encounters occur, but adolescent cohabitation in the traditional patterns occurs much less than it did before the introduction of schools.

Once a nuclear family is established, the young husband builds a house for his own family, typically in the family compound or immediately adjacent to the home of the woman's parents. A separate structure containing the hearth and eating area is usually a few meters from the house. In the case of polygynous marriages, each woman may have her own house and hearth.

Middle Age and Old Age

As age advances, both men and women stay closer to home and become involved with more sedentary tasks. A man becomes a *yosi* or *yosishico* (old man) at about the age of 40 or 45, with the affectionate diminutive being applied as the man approaches the quite elderly status of 60 years. A woman who is menopausal and no longer bearing or nursing children is a *yosan* or *yosanshico* ("old lady," "little old lady"). People at this age are usually addressed by one of these descriptive titles rather than by given name. They are usually treated by others with a combination of gentle humor and veneration. Both sexes continue to dye their hair black as age advances, although some men will stop and let the distinguished grey show through. Older women who no longer dye their hair often have naturally red hair.

When an adult man dies, his house is burned down with all his possessions. His widow crops her hair and dresses in black for a year. The possessions of a woman who dies are burned, but not the house in which she lived.

At the end of a year, a funeral wake is held and marks the end of the mourning period.

PERSONALITY DIFFERENCES BY GENDER

Men are expected to be calm, strong, quiet, cheerful, and courteous under most circumstances, but they are expected to be much more boisterous during special events such as a large intervillage feast (*ani shreati*) or "big drink." On such an occasion, a real man drinks far

too much *masato, chicha, huatapo*, or mestizo-supplied *aguardiente* (raw overproof rum), depending on what is available. Men may become belligerent and break priceless museum-quality Shipibo pottery for the sheer hell of it, make speeches, or challenge sexual competitors. The latter events are potentially deadly. The man who has been cuckolded sneaks up behind the offender and cuts the back of his neck with a small concealed curved knife called a *huisate*, which is concealed in the hand and secured by a cord wound around the thumb. The cuckolder then must accept the challenge. The two square off in a large open space, each carrying a carved flat club 1 m long called a *macana* which is double-edged and notched at the end. Made of the black wood at the heart of the hardest palm, *chonta*, the *macana* is a deadly weapon. It weighs about 6 or 7 kg, is covered with Shipibo designs, and is meant to be swung in an oblique falling arc like an axe. The two men stand a short distance apart, each wielding his weapon, and take turns hitting each other glancing blows on the side of the head with the sharp edge of the *macana*. The idea is not to kill one's opponent but to get him to lose so much blood from head cuts that he passes out. The effect of this ritual on subsequent intellectual capacity is unknown.

Men who have many scars on the back of the neck have serious prestige advantages in getting new women to become sexual partners and in retaining the previous or current ones as long as they wish.

Women have a more peaceful existence and are not expected to be physically aggressive. They are expected to be independent and competent, but also, for the most part, to be quiet and non-demanding. At the same time, it is expected that women will screech at each other or at their husbands from time to time to express displeasure. A falsetto voice conveys the height of the anger. The response to male loutishness, as in the case of egregious breakage of tediously, proudly, and conscientiously made ceramics, is to withdraw uncomplainingly in horror. However, the maker of the broken pottery reserves the right to berate the potbreaker at full screech volume at a later time, say during the acutely worst phase of the offender's hangover, when death beckons as a compellingly attractive alternative.

A young woman who is *cutipado* (bewitched) may experience a dissociative hysterical episode during which she is obviously out of control, accompanied by writhing, mild seizures, screaming, shaking, clenching her teeth, sweating, moaning, and beyond any social interaction.

When this happens, all activity in the surrounding neighborhood stops as spectators gather. The woman is reportedly possessed by some spirit, probably wished on her by a sexual or status competitor. All attention is drawn to the afflicted, and she is comforted by everyone after the event is over, usually in about an hour. These episodes, which are uncommon, do not in any way resemble what is known in Western medicine as an epileptic seizure. Young men apparently do not experience this phenomenon.

GENDER-RELATED SOCIAL GROUPS

Shipibo residence is matrilocal and descent is matrilineal. The only other gender-related social groups apparent among the Shipibo at the present time are soccer teams.

GENDER ROLES IN ECONOMICS

There are sharp distinctions in male and female economic roles, although some individuals do not follow the usual prescription. Women gather and carry firewood, maintain the family hearth, cook the food, make pottery, weave and paint cloth, gather food from the family gardens, provide care for the children they have borne as well as, at times, the children of other women, wash the clothes, bathe the children, carry water from the river or lake to the family kitchen, make clothes on the sewing machine if there is one, sweep the floor of the house and the path in front of it, and cook cane juice squeezed by the men for making *huatapo*. When *masato* (*atsashreati*) is being prepared from manioc, the women cut the tuber, cook it, then masticate the detoxified paste in order to give it the bacteria for fermentation to occur. Similarly, they prepare and cook the ground corn for *chicha de maize* (corn liquor). Women are masters of the Shipibo brewery.

The responsibilities of men were classically to hunt and fish, to make their own canoes and weapons, and to defend the village from military enemies. The men still do many of these things, and they also have the responsibility for bringing building materials from the forest and building the houses. Men clear the forest for making a garden plot and manage the burning of the slash. Men provide the formal political leadership, but they know better than to ignore their wives and the community of female opinion. Men negotiate with outside forces such as the local, regional, and national governments.

Men negotiate with river traders in trades concerning hardware, but women negotiate in the purchase of food and some manufactured materials (such as cloth). Both men and women make trade items for sale to tourists, but women specialize in jewelry while men make such items as decorated weapons and oars.

PARENTAL AND OTHER CARETAKER ROLES

Both men and women take responsibility for child rearing, but these tasks mostly fall to women. Shipibo children are engulfed in love from their first moments and are highly indulged by both parents. Children are breast-fed for at least 6 months, and complete weaning may not occur for several years. Infants are carried on the hip in a shawl tied around the mother's neck as she goes about her various chores. Very young infants sleep during the day in a covered hammock that is watched by a grandparent, sibling, or other relative who may be sitting nearby performing such tasks as weaving and potting.

All children receive close supervision and attention from a variety of adults, but particularly the child's mother and the mother's immediate relatives. This is true for both healthy and sick infants. The child of a woman who has deficient or no breast milk is nursed by a female relative who is lactating.

GENDER AND RELIGION

Whereas the indigenous Shipibo religion appears to have been thoroughly animistic, and many Shipibo retain beliefs in this tradition, Christianity in various forms, especially evangelical Protestantism, has become the predominant nominal religion. Christian missionaries have inculcated a highly patriarchal religious practice among the Shipibo, who follow the new precepts even if it means not eating most kinds of fish from the river. The evangelical Shipibo pastors are all men.

LEISURE, RECREATION, AND THE ARTS

Both men and women enjoy playing and watching soccer games which range from a neighborhood pick-up with a few people to formal championship games with uniforms,

official soccer balls, and referees. However, all teams are either one sex or another. Soccer is the main form of recreation and leisure outside of church-related activities.

While men make certain items for tourist sale and may carve a canoe paddle that is in itself a work of art, women are the primary authors of artistic expression in pottery, weaving, and the painting of designs on any possible object that can be carved or will hold a vegetable dye.

RELATIVE STATUS OF MEN AND WOMEN

Aside from and before missionary influence, Shipibo society appears to be highly egalitarian for men and women. This is changing under the impact of evangelical Protestant Christianity, which defines the role of women to be subservient in a way that does not reflect Shipibo tradition. Although it has not been customary for women to hold positions of political leadership, some women form independent households and conduct many of the economic roles of men such as fishing and gardening. Their status has not traditionally been diminished in any way. On the contrary, such women are admired and seen as self-reliant and commanding the respect of the community.

SEXUALITY

Sexuality and Reproduction

It is not particularly difficult for Shipibo children to obtain knowledge of sex and reproduction. Although adolescent children may have their own mosquito nets, the whole nuclear family sleeps together in one mosquito net and older but subadolescent children inevitably become aware of adult sexual activity.

Watching animals of various kinds mate in the forest or around the village is a favorite form of entertainment. A most hilarious episode of this occurred when two mating dogs could not get unstuck. The yowling dogs were surrounded by gleeful children.

The Shipibo have a certain working knowledge of what Europeans would call comparative anatomy and physiology since they dissect animals of all kinds in the process of food preparation. They know, for example, that there are embryos and fetuses in the uteri of various

female animals that they kill, such as tapirs, wild boars, and monkeys, and that these features are not found in male animals.

The Shipibo like sex and are sometimes quite open about it, particularly in joking relationships. At the very least, they seem to like to think about sex. They love obscene and intimate sexual humor, especially when there is a cover of darkness to obscure the speaker (even though everyone knows from the voice who is speaking). Whether it is under the influence of Christian missionaries or reflects traditional Shipibo custom, sexuality is not flaunted or openly recognized during the day and in the midst of communal activities. Young people court and disappear into the bush. Although there is no formal marriage ceremony, young couples who are recognized as "newlyweds" are indulged as they spend long hours under the mosquito net together, even during the day. The young man is then likely to be ribbed mercilessly by his age mates about his consequent alleged weakness and incapacity for any useful work.

However, most sexual activity seems to occur in a much more furtive fashion as husbands and wives bathe together in the river at dusk and meet secretively in a remote section of the *chacra*, or garden, distant from the village. It is customary for whole families to sleep under one mosquito net. Sexual activity between spouses occurs during the night under the family mosquito net when the children are supposedly asleep.

Whether the sexual banter that occurs in darkness as people speak from their porches is correlated with a significant level of real interpersonal communication about intimate matters is doubtful. Some Shipibo women have told me that they did not enjoy sex very much and found it an onerous duty, whereas other women convey an attitude of affectionate intimacy with their partners. The former are likely to have been given in marriage at a very young age, whereas the latter are more likely to have had a voice in the choice of a partner. Yet most arranged marriages appear to last a lifetime.

Despite a certain openness about sexuality, both men and women exhibit modesty about genital exposure. It is perhaps impossible to know how much of this is due to exposure to Christian doctrine. Younger women, especially, are careful to keep their breasts covered in the presence of adult men, and all sexually mature women are extremely shy about genital exposure except during childbirth. A man who is bathing in the nude in the river will emerge from the water onto the river bank and cover his genitals with a hand while walking to his house, although most bathing takes place with some kind of shorts or trunks in place. Given the omnipresence of voracious carnivorous fish in the Amazon waters, this precaution may reflect prudence more than modesty.

Shipibo women have a wide variety of herbal remedies that are thought to control reproduction. The general category of these remedies is *to-otirao* (from *tooti*, "pregnancy" and *rao* or *rau*, "medicine"). A kind of *tootirao* is taken in order to become pregnant. Remedies to prevent pregnancy are more common. The most commonly known *tootimarao* (*ma*, negative) is *tootimahuaste*. *Tootimahuaste* is a grass-like plant (probably a sedge) that grows on the shores of a lake (*huaste*, "herb"). It is pounded and the juice is squeezed into a cup of hot water. This tea is taken on the first 3 days of two successive menstrual periods. This is alleged to result in permanent sterility. *Tootirao* works by making the *baquenanuti* (uterus) moist, lush, and receptive to the seed of the man. *Tootimarao* works in the opposite way by making the inside of the *baquenanuti* hard, dry, and unreceptive to the male's seed.

Pregnancy and Birth

Young Shipibo women learn about pregnancy and birth from close observation of their mothers, sisters, aunts, and cousins. Traditionally, the young woman has her first menarche at the age of 12 or 13. She has her first sexual experience and perhaps a permanent partner at 13 or 14, and has her first baby by age 15.

One type of herbal contraceptive, called *navashuaste*, is taken by young women in order to postpone pregnancy instead of causing permanent sterility, the effect sought by taking *tootimahuaste*. There is no evidence that the use of *navashuaste* for this purpose is successful.

When a woman is pregnant, she must observe certain dietary laws and taboos that restrict activity and foods. She must not be subjected to a frightening experience such as encountering a snake or other wild animal.

Birth occurs in the woman's home, and she is usually attended by her mother and/or close female relatives in the same age range as the woman's mother. A young woman may be surrounded by all the women neighbors in the case of a difficult delivery. Freely offered folk advice from this gathering of interested spectators is accompanied during labor contractions by a frantic chorus of *Canihue*

("Push! … Push! … Push!"). After delivery, the placenta is usually buried under the woman's house.

In a traditional family, sororal polygyny (in which all cowives are sisters) is the preferred and prevailing family structure. In this setting, women are able to observe postpartum sexual abstinence for longer periods of time than women who are in monogamous unions. Births are fewer, with more time between them. This has a positive effect on the health of both mothers and children.

Although the Shipibo treat children with a great deal of gentle affection, they do not express any desire for more than two or three children. The rare woman who is infertile or subfecund is regarded as unfortunate, but not tragically so. Such women and their partners readily adopt children from other households, and the children have two homes and families, almost always harmonious.

COURTSHIP AND MARRIAGE

Notwithstanding Christian disapproval, Shipibo women make themselves attractive to men by a variety of means such as the hip-hugging skirt, bead wedding belts (*shakira*) that accentuate the hips, woven anklets, and a seductive athletic walk. Early travelers describe young Shipibo women as exuberant, openly affectionate, and comfortable with nudity in the presence of strangers. Shipibo men sometimes openly cultivate the skills of seduction, in which personal charm and good humor is reinforced by the availability of *nuihuaste*, "love herb," a highly aromatic and pleasant-smelling *nuirao*, "love medicine." This is a root also known among flower children in the United States as *patchouli*.

Traditionally, a young woman at about 14 is *entegrado* (given) to a young man by her mother. The bride has no say in the arrangement, which may or may not succeed emotionally. Loyalty and commitment to the partnership is the expected norm, but neither sexual pleasure nor emotional satisfaction is expected. By most accounts, sexual pleasure has not been something often experienced by very many young Shipibo women. As the model of the marriage relationship has drifted toward the companionate marriage in which the partners choose each other, this has been changing, and sexual pleasure does occur for women as well as for men.

In a traditional family, sororal polygyny (in which all cowives are sisters) is the preferred and prevailing family structure. In this setting, women are able to observe postpartum sexual abstinence for longer periods of time than women who are in monogamous unions. Births are fewer with more time between them. This has a positive effect on the health of both mothers and children.

The change from polygyny to monogamy began with the first contact with Christian missionaries. Polygyny is still severely criticized by Christian missionaries, and in one well-known instance a disapproving official Peruvian census taker would not count members of polygynous families. The extremely high fertility and high rates of population growth that have been found in Shipibo communities are at least partly due to cultural change with a disruption of patterns that dampened fertility.

HUSBAND–WIFE RELATIONSHIP

Classically, the husband–wife relationship is marked by loyalty and a common economic purpose, but it is not necessarily loving or tender. For women, sex is often regarded as a duty and economic necessity rather or more than a source of pleasure and satisfaction. "Divorce" is not uncommon. The marriage can be ended by either partner at any time. The husband just walks away or goes to live with another woman. Women can, and sometimes do, kick their husbands out of the house. A Shipibo woman feels free to advise another woman that she should "throw out" her husband if she thinks the woman being advised has married beneath her status and can do better.

OTHER CROSS-SEX RELATIONSHIPS

As noted elsewhere (Abelove, 1978), a woman's most important relationship with a male is with her brother. A man may not look at or talk directly to his mother-in-law, but may have a joking relationship with his sister-in-law.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The increasingly intensive and prolonged contact with people outside the community, the introduction of Western schools and national government agencies, and

various economic activities are related to profound changes in Shipibo society. This is particularly true for women, who now begin school at the age of 6 and often continue through high school. A girl's traditional role was to learn all the domestic skills including pottery and weaving and begin having babies at the age of 13 or 14. That is now more the exception than the rule. Some young Shipibo women now have enough literacy and clerical skills to seek employment in the city of Pucallpa.

The lives of boys have also changed because education through high school is now followed by military service, technical education in the city, or work as a bilingual teacher. The boys no longer spend their time learning the survival and hunting lore of the tropical forest from their fathers or the trick of harpooning a 100 kg, 4 m *paiche* (*Aripaima gigas*, the largest freshwater fish in the southern hemisphere and possibly in the world) from a 2 m dugout canoe in the middle of a lake swarming with flesh-eating fish such as piranha. The boys now learn reading and writing, the military history of Peru, and how to march. Whereas there was no unemployment in the subsistence economy, the boys must now seek jobs in the city because they cannot live by farming or fishing and there are no jobs in the village.

The necessary activities that defined the gender and identities of both men and women in the old Shipibo society are slowly disappearing or ceasing to exist altogether.

Shoshone

Richley H. Crapo

ALTERNATIVE NAMES

While "Shoshone" is the spelling preferred by the Shoshone people themselves, many linguists use "Shoshoni," since this spelling makes it clear that the final vowel is not silent. Anthropologists often distinguish among three major groups of Shoshone who occupied somewhat different natural environments: (1) the Western Shoshone, who occupied areas of central and northeastern Nevada and northern Utah, (2) the Northern Shoshone who occupied much of southern Idaho in the Snake and Salmon River region that is a transitional zone between the Great Basin and the northwestern Plains, and (3) the Eastern Shoshone of western Wyoming that abuts the northwestern Plains. The Shoshone had numerous subgroups that bear individual names. The geographically largest of these include the Goshiute, a Western Shoshone group who occupied the region south of Wendover in both Nevada and Utah, and the Panamint Shoshone, another Western Shoshone subgroup who occupied territory surrounding Death Valley in southern Nevada and contiguous southern California. There were also a host of smaller groups.

LOCATION

The Shoshone occupied the central Great Basin of the United States. Their territory included the arid lands of central Nevada, southern Idaho, part of southwestern Montana, and northern Utah, the high-altitude arid lands of western Wyoming, and a strip along the western half of northern Colorado. Today, there are five main reservations with Shoshone populations: Wind River in Wyoming, Fort Hall in Idaho, Duck Valley on the Idaho–Nevada border, Gosiute on the Nevada–Utah border, and Duckwater in Nevada. There are also more than a dozen federally sponsored Shoshone "colonies" in or adjacent to towns in Nevada and two similar Shoshone settlements in Utah.

CULTURAL OVERVIEW

In the second half of the 19th century, the basic subsistence economy of the Shoshone was foraging. Foraging in the arid lands of the Great Basin involved a division of roles by gender that was not strictly enforced. Men's primary subsistence activity was hunting small game, including water fowl, jack rabbits, antelope, mountain sheep, and mountain goats. Women specialized in gathering a diversity of wild plant foods, including edible roots, fruits, and seed-bearing grasses.

On occasion, when conditions made it worthwhile, the Shoshone engaged in communal hunts that were participated in by men, women, and children. These collective hunts were organized when several families were in the same vicinity, when there was a sufficient number of animals, such as rabbits, antelope, deer, and mud hens, and when one or more of the families had the necessary equipment for such a hunt. According to Steward (1955, p. 109), "the principal collective hunt was the rabbit drive." Rabbit drives required the use of several nets that were about 3 feet high and several hundred feet long. The nets had a mesh about the same as that of tennis nets. They were strung out in a large semicircle, and the women, children, and some men beat the brush over a large area, driving the rabbits towards the nets. Rabbits were clubbed or shot during the drive or when they became entangled in the nets.

The political organization of the Shoshone was what Steward referred to as a family level of sociopolitical organization, in which nuclear families were the autonomous political units. Leadership positions among the Shoshone were based on personal charisma rather than the authority of office. Those positions included (1) rabbit and antelope drive "boss," who coordinated communal hunts, (2) winter encampment "talker" (*tekwani*), who acted as a town crier by passing on information about social events and game sightings, and (3) shamans, who specialized in religious healing. After about 1690, when the horse entered the Great Basin, the Northern Shoshone

of southern Idaho and the Eastern Shoshone of western Wyoming adopted the horse for use in bison hunting. This shift in subsistence base resulted in their developing larger local groups, warfare, and policing associations with authority to enforce order within local groups.

Throughout most of the year, each nuclear family wandered independently over a large territory in search of food. Toward the end of summer, families moved towards whichever pinyon pine forest was currently beginning to bear nuts. Groups of up to 300 people might gather in the same forest, and families would gather enough pine nuts to feed themselves during the winter. During these periods in which large groups were congregated, charismatic leaders known as *tekwani*, "talkers," served as conduits of information for the entire group, letting individuals know such things as when communal dances were being organized or where game had been sighted. However, such leaders had no political authority, although they might rely on their personal charisma to mediate disputes. The winter gatherings were important times for socializing, gambling, and courtship. It was also at this time of year that such groups normally held a communal Round Dance, a sacred dance which was believed to promote the health and welfare of those who participated in it.

The basic Shoshone family was a nuclear family, a group of two to five or six persons consisting of parents and their children. Children typically left their parents when they married and began to forage for themselves, although surviving parents might continue to travel with one of their later sons when he married. Similarly, a family might include not just a married man and his wife and children, but also a younger sibling of the husband or wife who was not yet capable of caring for him- or herself.

Shoshone kinship was bilateral, and an individual's kindred consisted of any known relative of either parent. The kinship term for mother was *pi'i*. In some groups, this term was extended to mother's sister. The term for father, *appɔ*, was also applied to the father's brother in some groups. Shoshones typically applied the same kin term for siblings and (both parallel and cross) cousins. In this term, they distinguished older from younger siblings. Thus, an older brother was a *papi*, while a younger brother was a *tami*. Similarly, an older sister was a *pazi*, and a younger sister was a *nammi*. These sibling terms were both terms of reference and address. Cousins were referred to using sibling terms. The Shoshone used reciprocal kinship terms for grandparents and grandchildren, but made a distinction based on whether the relationship was paternal or maternal. Thus, *kaku* meant both "mother's mother" and "a woman's daughter's child," while *kynu* meant "father's father" and "a male's son's child." A third grandparental term, *toko*, meant "mother's father" or "a man's daughter's child." Any great-grandparent or great-grandchild could be addressed or referred to as a *tsoo*.

All the surrounding Great Basin Indian societies practiced foraging lifestyles similar to that of the Shoshone. The tribes which surrounded the Shoshone were the Utes, who occupied the highlands of western Colorado and southern Utah; the Southern Paiutes of southwestern Utah and southern Nevada; the Mono, who occupied territory in western Nevada surrounding Mono Lake; the Northern Paiute (or Paviotso), whose territory was north of the Mono in western Nevada; the Bannock, a branch of the Northern Paiute who settled Idaho lands north of the Shoshone and shared land in southern Idaho that the Shoshone also used; the Crow of southern Montana and northern Wyoming and Colorado; and the Arapaho of eastern Wyoming and northeastern Colorado. All of these, except for the Crow and Arapaho, shared many cultural characteristics due to their foraging adaptation to the arid Great Basin environment and, with the exception of the Mono, Crow, and Arapaho belonged to a common language family. The Ute adaptation diverged the most from the others because of the higher elevations they occupied, but otherwise had much in common with the Shoshone. Because of their similarities in lifestyles, these groups had relatively amicable relations that were reinforced by nonmarket economic exchanges between neighboring groups, although occasional feuding between neighboring groups was not unknown.

The Crow and Arapaho belonged to the Great Plains culture area, where bison hunting and intertribal raiding were important traits that distinguished them from the Great Basin Indians. The Eastern Shoshone traded with the Crow and Arapaho, and the occasions for conflict were minimized by the small size of the Shoshone groups (who lacked the population base to support military associations) and by the fact that the arid Great Basin environment offered little in the way of resources of interest to the Crow and Arapaho. When the horse entered the Great Basin, the Eastern Shoshone adopted it for use in bison hunting and warfare between them and the Crow and Arapaho became common. The Northern Shoshone had a similarly hostile relationship with the Blackfeet and Crows of Montana.

CULTURAL CONSTRUCTION OF GENDER

The Shoshone recognized four gender categories—ordinary males and females and male and female *berdache* categories. The egalitarian nature of Shoshone social organization carried over into gender relations, and there was no gender stratification. Men were thought of as more interested in hunting and women as more skilled in domestic activities, but their relative economic contributions to family survival were equally ranked, and the typical differences in the gender roles of men and women were not strictly enforced. Thus, individual personality traits that led to a violation of the usual gender-role patterns was tolerated without censure.

The flexibility in Shoshone gender roles is one of the factors that made for an easy acceptance of the gender mixing of both male and female *berdaches. Berdaches* (called "Two-Spirit People" in contemporary English by many writers today) were individuals who did not adopt the usual gender roles of their sex, but who adopted many of the roles usually practiced by the other sex. Their distinct gender status was sometimes symbolized by their adopting of (nonmandatory) gender-mixed dress. The *berdache* gender status was adopted either because of individual inclination or because a visionary experience called the person to this role. Hultkrantz (1983) reported that among the Wind River Shoshone, *berdaches* were always males and they never married. However, elsewhere among the Shoshone, *berdache* individuals could enter either heterosexual or same-sex marriages or remain single, according to individual inclination. In same-sex marriages, the *berdache* partner adopted the spousal roles that were usually carried out by the person of the other sex. Thus, a *berdache* male might become a wife to a biological male husband, and a *berdache* female could adopt the husband's roles in a marriage to another female. Unlike many North American Indian groups, Shoshone *berdache* roles had no special religious significance and no necessary connection to shamanistic healing roles. Both men and women could become *berdaches.*

Dress was least elaborate among the Western Shoshone where the sparse environment made it difficult to acquire materials for making clothing. The most common article of clothing for both men and women was a cape made of woven strips of rabbit skin. These capes were also used as blankets when sleeping. Among many families, not every adult had such a cape, and so nudity was not rare for either sex, particularly in the summer. Powell (1875, p. 104) reported meeting a couple late in August in which the man was "dressed in a hat; the woman in a string of beads only." Among the Northern and Eastern Shoshone, clothing was differentiated by sex. For instance, Lowie (1986a, p. 217) reported that among the Wind River Shoshone, a Northern Shoshone group in Wyoming, women wore buckskin dresses decorated with elk teeth, while men wore shirts, breechclouts, and leggings.

GENDER OVER THE LIFE CYCLE

Infants were referred to as *ohmaa*, a gender-neutral term. Children were distinguished by sex, either as *tua*, "boy/son," or *naipin*, "girl/daughter." In the (reduplicative) plural, *tutua*, the term for boy was also used generically for children of either sex. An adult man was called a *tenkwan*, and this term was sometimes modified to distinguish adult men by age. Thus, *tenkwappɔ* referred to a male who was slightly older than a *tenkwan* and *tenkwacci* an old man. A very old man might be called a *tenkwaccicci* (by reduplication of the suffix), although the generic term *cukku* (or *cukkuppy*) was more often applied to very old males. Similarly, terms for women varied by age: *wa'ippy* referred to a young adult women, *hypi* to a slightly older woman, and *hypicoo* to an old woman. The term *kuhma* indicated a married male, and a married woman was called a *kwyhy*.

The verb for marrying differed by sex. Women were said to *kuhattu*, while men were said to *kwyyttuh*. The suffixes in these verb forms are archaic frozen forms of the same origin that have the sense of "take a—."

Socialization of Boys and Girls

Among the Western Shoshone, children of both sexes were valued. Trenholm and Carley (1964, p. 11) asserted that "a girl baby was considered a blessing because the parents knew that some day she would attract a mate who would help the family in its never-ending quest for food." Child rearing was lenient for both sexes, and neither sex seems to have been preferred over the other. In contrast, Meriwether Lewis, in his log for August 19, 1805, noted that among the Northern Shoshone girls might be beaten for some offense, but boys were never spanked because it

was feared that this would cow them and undermine their ability to perform as warriors.

Among the Western Shoshone, modesty was not a major cultural concern. For instance, nudity was common among children, although girls were somewhat more likely than boys to be clothed. Nudity was less common among the Northern and Eastern Shoshone, where larger game, such as elk, made it easier to clothe all members of a family.

Among the Shoshone, younger children of both sexes were either cared for by their older siblings at the camp site or accompanied their mothers as they foraged for food plants around the camp. Differences in socialization were minimal until boys were old enough to accompany their fathers on hunts, at which time boys learned hunting skills.

Attainment of Adulthood

According to Trenholm and Carley (1964, p. 12), "a coming of age ceremony was observed throughout the Basin for the girl as well as the boy." For girls,

the emphasis seemed to have been an isolation during the "dangerous period" of the girl's life and upon giving her tasks to strengthen her for the hardships she must face. The boy, too, was prepared for his life's work of helping to provide for a family. He was not allowed to eat the first wild game he killed, as a lesson in abstinence.

Among the Western Shoshone, girl's puberty rituals were practiced for females but not for males. At first menstruation, a girl observed several days of relative isolation. During this period, her mother admonished her "to arise early, work hard, and be restrained in talking and laughing" (Steward, 1941, p. 316).

Gender-Related Social Groups

Although gender role differences existed among the Western Shoshone in the common activities of males and females, such as hunting by men and gathering by women, these differences were not rigidly enforced, and there were no unisex organizations or institutions. Both men and women could become shamans, although this was a more common role among men. Among the Northern and Eastern Shoshone, where elements of the Plains culture were adopted after the arrival of horses, local community size was somewhat larger than among the Western Shoshone, and policing associations developed that were exclusively male.

Gender Roles in Economics

Gender and age were the two determinants of the Shoshone division of labor. Women were the primary contributors of the daily staple foods. They regularly gathered various edible plants, including roots and bulbs, edible leafy plants, berries, and grass seeds that could be made into a kind of porridge. Women also wove baskets for domestic use and made capes by weaving strips of rabbit hides together.

Men's primary subsistence activity was hunting. Since game was sparse, hunting was a time-consuming but important activity, since it provided both meat and resources, such as hides, that were used for manufacturing various items such as clothing.

Both men and women were free to participate in non-market exchanges with persons outside their own families. Until the arrival of European immigrants and the establishment of markets in their settlements, the primary form of exchange among the Shoshone was reciprocal gift giving. Among the Shoshone, natural resources were not owned. Rather, use was allocated on a "first come, first served" basis. Personal property consisted of only such things as clothing and the tools one carried from camp to camp. For the most part, personal property consisted of those things one had made oneself or received as a gift. Since individual families wandered alone for most of each year, there were no regular rules of inheritance rights. Most personal property was buried with a deceased person, although individuals of either sex who were present at the death of a relative might keep individual mementos for either emotional or utilitarian reasons.

Parental and Other Caretaker Roles

Since hunting was a time-consuming activity in the arid lands of the Great Basin, women spent more time than men in child rearing activities, but the division of labor in child rearing was a matter of circumstance rather than of strict rule, and men also participated in the care of children when they were not hunting.

LEADERSHIP IN PUBLIC ARENAS

Leadership in public arenas was not restricted to one sex. For instance, dance organizers might be either women or men, and antelope shamans might be women as well as men. It was, perhaps, more common for men to take the role of *tekwani* during winter encampments, but this does not appear to have been a hard and fast rule. However, among the Northern and Eastern Shoshone, policing authority in communities was a male-dominated role.

GENDER AND RELIGION

Shoshone religion was shamanistic, and both women and men could become shamans based on their personal incli-nation. The Shoshone pantheon consisted of numerous male and female zoomorphic deities. Prayers were addressed to *nia appɔ*, "our father," although whether this practice preceded contact with Europeans is uncertain. The two primary aboriginal deities were the brothers Wolf and Coyote. Wolf, who was sometimes viewed as the creator as well as a "master of animals" figure, embodied the qualities of mature thoughtfulness, while his brother Coyote was a trickster deity who symbolized the uncon-strained sexuality and lack of impulse control of the unsocialized youth.

Other Shoshone deities included beings with both male and female characteristics. For instance, *tsaippichih*, or Blue Jay, was a grandmother figure in Shoshone mythology, while *taputtsi*, or Cottontail, was masculine. Bear, or *wyyta*, in the story of the origin of the Bear Dance was a female supernatural, as were Dove (*haaiwi*) and Deerbrush Echo Woman (*hynasusukki wa'ippy*), while Bat (*honopittsyh*) and Rattlesnake (*tokoa*) were masculine supernaturals.

In Shoshone mythology, the earliest era of human existence included a nearly invulnerable monster *tympin tzo'appiccih* (Rock Monster), who periodically stole Shoshone children and carried them home in her burden basket to feed her children. Since her body was stone, she was impervious to arrows, and every attempt to kill her failed until an elderly woman conceived of a plan to build a bonfire to make hot embers and throw them into *tympin tzo'appiccih*'s pitch-covered burden basket. The fire that this created was so hot that, reaching *typin tzo'appich*'s heart, it killed her.

Shoshone mythology includes the vagina dentate motif in which Coyote removes the teeth from (pre-human) women's vaginas using a bone, stone, or other hard material. Variants of this story are typically part of the myth in which the first humans, usually daughters, are created as offspring of Coyote and one of the women with whom he cohabits after the removal of her vaginal teeth.

LEISURE, RECREATION, AND THE ARTS

Games, socializing with friends, storytelling, singing, and dancing were all prominent activities during the winter months when large groups of families congregated in the same pine-nutting areas.

Children were not segregated by sex at any age. Boys and girls were each more likely to play with toys that were associated with the work of their own gender— toy bows and arrows for boys and baskets and dolls for girls. As boys neared puberty, they might spend time hunting with their fathers away from camp. Lowie (1986b, p. 198) reported that Northern Shoshone boys and girls both played cat's cradle (p. 199). Girls played with buckskin dolls (p. 199), and boys particularly enjoyed four games: a kind of football, arrow shooting, the hoop game (p. 198), and racing (p. 199).

Some forms of recreation among adults involved varying degrees of sexual segregation. Madsen (1980) described the Bear Dance—originally, a hunting dance— among the Northern Shoshone as a dance in which men and women arranged themselves in separate parallel lines that alternately approached and moved away from one another. According to Lowie (1986b, p. 195), the handgame, a gambling game that involved guessing which of two markers an individual was holding, was played by both sexes among the Northern Shoshone, but apparently only in groups of the same sex.

RELATIVE STATUS OF MEN AND WOMEN

There were no formal rules regarding the relative value attached to men and women by Shoshone society. Since the social organization of the Shoshone included no positions of official authority, what status differences

existed by gender were largely a function of individual personality. Since game was sparse in the Shoshone environment, no special status advantage was gained by men from their hunting. The organizers of communal rabbit hunts were usually, but not necessarily, men, and the shaman who played the most prominent role (of magically attracting the antelope into the antelope corral) during antelope drives might as readily be a woman as a man.

SEXUALITY

The Shoshone viewed sexuality as a natural part of the human condition. There were no customary taboos concerning the discussion of sexuality. For instance, the Shoshone language contained no obscene or vulgar words for body parts or processes, although sexual terms were sometimes used in nicknames with friendly humor.

Thin or absent eyebrows, particularly on males, were apparently considered attractive among the Wind River Shoshone. Lowie (1986b, p. 217) reported that, "formerly, young Shoshoni men who were courting girls used to pluck out their eyebrows."

Shoshone rules regarding premarital sex were lenient. Extramarital sex might be reacted to with jealousy by a spouse, but there were no fixed or customary punishments for adultery by either men or women. Wife-stealing, in which a man and several compatriots might abduct another man's wife, occasionally occurred. The outcomes of the practice were variable. The husband might attempt to recover his wife, she might later return of her own accord, or she might remain with the captor, accepting him as her new husband.

Male and female homosexuality was not tabooed in aboriginal times, although the Western stigmatization of homosexuality was adopted during the 20th century. In precontact times, *berdache* marriages were sometimes same-sex marriages.

COURTSHIP AND MARRIAGE

Marriages among the Western Shoshone were arranged informally, either by parental agreement or elopement. There was no formal ritual of marriage. Instead, the existence of a marital relationship was recognizable simply by the fact of a couple's residing together and referring to one another publicly as "my man" or "my husband" and "my woman" or "my wife." For instance, according to Trenholm and Carley (1964, pp. 12–13),

among the Shoshonis, if a man stayed one night with a girl, in her lodge or his, the marriage was considered consummated. The couple would usually live with the girl's parents for about a year or until the first child was born. Then they would provide a dwelling of their own.

There was a mild cultural preference for marriages between a man's sister and his wife's brother, since such marriages could facilitate cooperative hunting between the two men. Marriages with kindred were generally disapproved, although cases of second-cousin and even first-cousin marriage were not unknown. Polygyny, especially sororal polygyny, was occasionally practiced. Shoshones also occasionally practiced a form of polyandry in which a wife might take her husband's younger brother as a second husband until he was mature enough to establish his own family. The Shoshone also practiced the levirate—if a husband died, his family had an obligation to provide his widow with another husband. Like marriage, divorce was a simple process that involved nothing more than leaving the relationship, and serial monogamy was common. Divorce could be initiated by women as readily as by men.

Perry (2000, p. 31) reports that among Utah's Northwestern Shoshone (a subdivision of the Western Shoshone whose primary territory was north of the Great Salt Lake), marriages were typically arranged and that,

Sometimes an older man would go to the home of parents of a newborn girl and ask permission to marry their newborn daughter at some future date. If the parents liked the man and knew him to be a good provider, they were sometimes agreeable.

Alternatively,

a man would send a gift to the desired girl's parents. It might be a horse or several horses; it could be skins of all kinds, deer meat, or other food supplies showing him to be a good provider. If the parents agreed, the marriage was arranged.

Perry also reports that marriage ceremonies among the Northwestern Shoshone were conducted under the auspices of a spiritual leader as well as occasional ritualized mock capture of the bride by the bridegroom and that there were customs that made divorce relatively difficult. This greater emphasis on arranged marriage, the role of a "brideprice" (which was nonexistent or rare among the Western Shoshone), and the presence of a formal

religious ceremony of marriage (that was absent among the Western Shoshone) may have developed as they began to form larger permanent communities based on a sedentary farming lifestyle and on religious influences from the Mormon settlers in Utah Territory who introduced them to farming.

Janetski (1987, p. 43) describes marriage among the eastern Northern Shoshone of the Yellowstone Park region in terms similar to those that might be applied to the Western Shoshone when he says that "Marriage was usually an informal economic union which bound a man and woman together to insure survival." Among those Northern and Eastern Shoshone, where the economic base included larger game such as elk, moose, and bison and where the influences of Plains culture were most notable, marriage arrangements tended to be somewhat more formally organized and marriages less brittle. For these groups, some tendency towards cross-cousin marriage existed.

HUSBAND–WIFE RELATIONSHIP

The husband–wife relationship among the Western Shoshone was characterized by affection and companionship, and marriages that were not mutually acceptable were readily ended by either partner. There was no fixed rule concerning the disposition of children upon divorce. Husbands and wives ate together, slept together, and made decisions together. The relative dominance of one spouse or the other was determined by their individual personalities rather than by cultural rule. Among the Northern and Eastern Shoshone, the husband–wife relationship was also characterized by affection and companionship, but horse-based hunting resulted in larger local communities and competition among males for social rank based on their prowess as hunters and warriors. This, in turn, led husband–wife relationships to be somewhat less egalitarian than among the Western Shoshone.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

After the Western Shoshone adopted a sedentary lifestyle, economically based on paid employment in cities and towns or on cattle ranching in rural areas, women's prominence in the political life of their communities notably declined. This has recently led to the organization of women's groups which have been attempting to reverse this change by emphasizing the importance of women in traditional Western Shoshone culture.

Spanish

Susan Tax Freeman

ALTERNATIVE NAMES

The Spanish are also known as España/los españoles.

LOCATION

Spain is located in Europe. Together with Portugal, on its west, it occupies the Iberian Peninsula, at Europe's southwestern extreme, with coastlines on both the Atlantic and the Mediterranean. Also on the Iberian Peninsula are Gibraltar, under British sovereignty, which stands at the entry to the Mediterranean from the open Atlantic, and the Principality of Andorra, on Spain's far northeast, in the Pyrenees mountains. The Pyrenees range separates Iberia from France and the rest of Europe.

CULTURAL OVERVIEW

Spain is a geographically diverse country. A mountainous perimeter separates fairly narrow coastal plains from high central tablelands, or mesetas, which themselves are dissected by hills and mountains into climatically diverse zones. The most humid coasts are on Spain's Atlantic north, and these support most of Spain's cattle and dairy production, and some of the nation's significant garden and orchard crops, but little grain. The meseta lands support sheep and goat herding, dry cereal agriculture, and in favorable zones irrigated orchards and gardens yielding diverse crops. Olives, oranges, and almonds are the most important tree crops of the Mediterranean area, roughly the southern half of the Peninsula and its east coast. The humid north where cattle are raised is marked by more generally dispersed settlements than are found inland. Meseta populations are usually more nucleated, or clustered, but extensive agricultural estates in the south, in particular, also see some isolated settlement in the fields outside of towns.

Historically, Spain's population has been heavily rural and agricultural, with commerce important in the exchange of specialties between diverse localities and regions. Local economies and traditions of production have produced different traditional divisions of labor between the sexes and different status groups. Today Spain's agriculture is heavily mechanized, its transport systems modern, and its industrial, commercial and service sectors enlarged, while the population of rural food producers has declined. Spain is a member of the European Economic Community and, with the rest of Europe, enjoys global markets, but traditions of gendered activities are often rooted in older modes of local production and community life.

Spain's diverse geography has not stood in the way of her national formation. Spain is one of the West's oldest nations. Today Spain's 50 provinces are organized into 17 Autonomous Regions, each with a complex regional government, united under a constitutional monarchy. The current king, Juan Carlos I, has reigned since 1975. Spain's center has long been tested by a few movements for regional independence (especially from the Basque and Catalan regions), but the nation and its current form of monarchy have remained strong under a constitution which has yielded much to regional powers.

The Spanish family is a strong entity with significant command over its members' sentiments. Even though family size has shrunk drastically in recent decades—and thus also household size, as most of Spain's households are nuclear family units—kinship ties that bind family members in different households are generally strong. Kinship is everywhere reckoned bilaterally on the familiar European model. Household formation is more variable, however: the stem family household, in which a single heir and his or her spouse and children coreside with the heir's parents, is the most familiar form in the Pyreneean (Basque, Catalan, and Aragonese) regions.

Spain's religious culture is Roman Catholic. Catholicism has been not only the majority religion but the state religion through most of Spain's history as a nation. Although the Spanish state is now secular and other religions have an increasing presence, the vast majority of Spaniards still practice or profess Catholicism,

and Catholic traditions, history, social institutions, and symbology are part of Spain's general culture. Catholicism's concrete monuments—churches, shrines—are everywhere stamped on the landscape and more intangible referents form part of Spaniards' daily experience, regardless of individuals' kind or degree of religious commitment. The Holy Family is the common model for family virtues, Fathers' Day and Mothers' Day are defined by the Catholic calendar (Fathers' Day is March 19, St Joseph's Day; Mothers' Day is December 8, the Immaculate Conception), and much of general social life is dominated by collective feast days and such personal and family observances as personal saints' days or sacramental events (baptisms, first communions). Family virtues include procreation; nurturant motherhood; supportive fatherhood; and devotion of spouses to one another, to the family enterprise, and to God. Nurturant motherhood implies a sexual division of labor which takes a husband into the public sphere in pursuit of his family's livelihood and political interests and places a mother in the home with their children.

Spain's Catholicism, energized by a struggle against the presence of Islam from 711 until 1492, and her resistance to the Protestant Reformation, have given her a conservative image in much of the rest of Europe. However, Spain's economic development and state secularization in the latter half of the 20th century, culminating in her integration into the European Community, have eroded the stereotype. Spain has long been a tourist destination for Europe and the Americas—tourism is modern Spain's largest and most pervasive industry—and Spain today is thoroughly connected, both economically and in social contacts, with the rest of Europe and the world.

Issues of sex and gender in Spanish culture must be understood in relation not only to regional cultures and economies but also to the social class structure, to Spaniards' sensitivity to behavioral models from beyond their daily experience, and to the importance given to collective action.

Spain's social class structure is generally European in nature. The population of peasants and petty tradesmen in countryside and towns was historically large, overlain by a small bourgeoisie or middle class of townspeople, and this in turn surmounted by aristocrats, nobles, and royalty. The clergy, drawn from all levels, had a significant presence.

In contemporary Spain, the countryside is worked by fewer and now modernized farmers connected to global markets and the society is dominated by blue- and white-collar employees and middle-class and professional urbanites. Nobles, aristocrats, and the royal family live, with the rest of the populace, under the constitution, and the nation's affairs are determined by the actions of democratically elected officials and government appointees. The Roman Catholic church, while the largest religious presence, is separate from the state and no longer enjoys the enormous economic power, particularly as a landlord, that it had in the past.

The elite or leisure class presents models to the general populace that working people might envy and try to emulate but not fully achieve. Likewise, the elite sometimes look to the popular folk culture of the peasantry for traditions to make fashionable. These exchanges emerge from the steady contacts between social strata brought about by travel, other forms of communications, and the juxtaposition of people of different levels through the employer–employee relationship—these are ancient as well as modern. Modes of gender behavior may differ for the different social classes as well as in different regions and traditional economies, but they are not inflexible and are open to creative manipulation. Spaniards have a deep and often playful sensitivity to variation in styles of behavior.

Creative emulation is part of Spanish cultural dynamics, but so is a deep concern for collective judgments. Collective life is very strong in Spanish communities, both rural and urban. In cities, neighborhoods (*barrios*) are important in social consciousness and social life and are part of people's local identities, just as villages and towns are in more rural settings. Thus, while behavioral styles, including gendered behavior, are subject to dynamic change, this is less a product of individual action than of group consensus. Changes promoted by individuals are subject to endorsement or censure by their fellows, so changes may be very tentative until they receive group approval; a would-be innovator can be ridiculed or ostracized if, for whatever reason, his or her fellows do not find a particular kind of changed behavior attractive. The adoption of changes can be quite rapid, but its collective aspect can make changed styles appear much more traditional than in fact they are. Thus gendered behavior is guided by deeply rooted traditions and cultural categories, but is also open to considerable stylistic play as Spaniards pursue new self-images derived from a variety of sources in a time-honored dynamic of change.

The changes which have most affected all Spaniards in the 20th century are those associated with the decline

of peasant farming and the growth of a capitalist global economy. Heirs to farms find alternative occupations; men and women alike enter the labor market and family farms are taken over by entrepreneurial farmers, supplying national and global markets rather than household and local needs. The gender roles associated with traditional farming, fishing, and herding economies and the family organization that underlay production are altered as both men and women are freed from obligation principally to their parents' households and become wage-earners on their own, able to forge independent futures in new kinds of occupations and, increasingly, to live and raise their families in towns and cities. These shifts are not unique to Spain—they are common in Western nations—but their relative recency in Spain illuminates changes in the lives of men and women that show their past and future to be sharply different even while their environment remains distinctively Spanish.

Cultural Construction of Gender

Spanish gender categories "male" (*varón*) and female (*hembra*) rest on the biological distinctions of the two sexes and are familiar to Americans and Europeans. Spanish usage also distinguishes males and females at different stages of the life cycle, and these differences correspond generally to behavior common to or expected of people at a given stage.

Standards of male and female dress at various ages are generally Western and familiar to Americans and Europeans. In past times, as in the rest of Europe, gendered dress styles in Spain varied more systematically with age than they do today. Styles of dress and grooming have always been subject to the play of fashion and thus have always been prone to various degrees of change. Concern for dress and grooming in the styles of the moment have always been at their height among young men and women at the age of courtship and among married adults of the middle and elite classes, for whom the display of fashion awareness and material wealth are deeply important.

Gender over the Life Cycle

The first life stage is infancy (*infancia*) and babies are *críos* and *crías* or *criaturas*. As children begin to walk they are children (*niños*)—boys (*niños*) and girls (*niñas*). At the age of courtship, traditionally at 17, they are *mozos* (bachelors) and *mozas* (maidens). Adults, whether married or single, are men (*hombres*) and women (*mujeres*); if they marry they become *casados* and *casadas*, adult married householders. Old age (*vejez*) might correspond to widowhood (*viudo, viuda*) for either sex and often signals retirement, especially when married children have already assumed householder status.

Infancy is the least gendered stage of life. Even though the sexes of girl and boy babies may be made evident through the color and/or style of clothing and the piercing of girls' ears for earrings, their gender does not create great differences in their social environments. Babies and toddlers—*críos*—play together, may sleep together, and are cared for together.

The age at which children start school, about 5 or 6, sees *niños* and *niñas* clearly separated by dress and sometimes also in school (though coeducation is increasingly common at all grade levels). Children at this stage are increasingly shown different adult role models for behavior and appearance, and are treated as having gender-specific futures (though adult roles in modern Spain are increasingly less gender specific).

Traditionally in Spain, as in much of Europe, age 17 marks entry into bachelor- and maidenhood and is the age at which courtship may begin. Marriageable males (*mozos*) and females (*mozas*) have sharply separate social lives from the groups of *niños* and *niñas* of which they were formerly members. This social life binds each sex in separate activities, while defining various social contexts in which they should meet (festivals, dances, weekly or evening strolls) as marriageable young adults. Even after marriage, men and women who were *mozos* and *mozas* together usually retain close ties which become part of their social life as adults.

At marriage, the new couple departs the *mozo/moza* groups and joins the groups of *casado/casada* adults. *Casado* means "married" as well as "housed," reflecting the fact that in much of Spain a new couple establishes a new household. *Casados* become the masters of their own domestic economy as well as representatives of a household in the local political-economic sphere, responsible for whatever commitments and duties householders are assigned in a particular community.

The passage from babyhood to childhood is not marked by particular ceremony, but the passage of *niños* and *niñas* into *mozo* status can be marked by special

observance of the individual's 17th birthday along with (in some local traditions) collective festivities by a group of *mozos* (or *mozas*, but the tradition is more common for males) receiving their new member. Similarly, at the time of a marriage, *mozo* and *moza* groups may bid formal good-byes to groom and bride, who are in turn formally received by the groups of householders (*casados*) to which they now belong. These events are more closely associated with village than with urban social life, but same-age and same-status associations of males and females are nonetheless universally important in Spanish social life.

Active householders do not necessarily retire and their entry into elder status is subtle and not always clearly defined, but as children marry, parents may begin to step aside both publicly and domestically. This depends, among other variables, upon the degree to which parents and their married children live in the same place and depend for their living upon the same resources or whether their economic lives are independent of each other, as is common in the middle or upper classes and outside the agrarian sphere. When parents control the property on which their children depend, a couple together or a widow or widower singly might retain control until they die, or they might hand control to the next generation as part of their own retirement.

A Spanish woman does not change her name at marriage. She passes her father's surname on to her children, for whom it becomes the second official *apellido* after that of their own father, the woman's husband. Women inherit property just as men do and carry it into marriage. At marriage, a woman historically—but no longer—relinquished control of her property to her husband. If she were widowed, she regained control over her own property and at least some of her husband's and did not necessarily relinquish this to their heirs until her own death. Traditionally, then, a woman's independence was most compromised by marriage. As property holders, both spinsters (*solteras*) and widows can wield considerable economic and political power in their families and communities. While married women once ceded certain formal powers to their husbands, their informal power could be great, and today their formal power is the same as men's. The household is the essential unit in the social structure and men and women manage their households jointly. Even in the past, to fulfill their household's obligations within a community, men or women might cross the traditional lines of the sexual division of labor in the domestic or public spheres when necessary. Such necessity—for example, for a woman to pull the plow when her husband is absent or disabled—burdens the poor more often than the well-to-do, who can hire helpers of either sex.

Socialization of Boys and Girls

Boys and girls are doted upon in early childhood and surrounded by adults and other children. Men and women are affectionate, playful, and permissive with them but generally do not conceal the pressures on them as adults and do not create a separate world for children. This occurs more among some of the bourgeoisie and elite who adopt models of intergenerational distance and hire such intermediaries as wet-nurses (in the past) or other servants, nannies, or tutors to serve their children's needs.

Boys and girls are dressed differently—in pants or dresses, respectively—as toddlers. There are complex class and contextual variations in when or whether small girls wear shorts or slacks, and in general these choices are fairly recent.

Small children are usually tended by female family members or kinswomen from outside the household, if not by servants. Fathers and other male adult household members have an affectionate presence but traditionally spend more time than women at work outside the home. As more women enter work places away from home, relatives may lend a hand, and day-care centers become options in some places. Spanish employers tend to be sensitive to employees' childcare problems and provide them some flexibility of schedule.

Children's experience of adults is extended by their parents' respective groups of friends (perhaps those who were *mozos* and *mozas* at the same time) as well as by kinsmen. Elderly uncles or grandfathers may be more present than fathers, and priests (as family members, friends, or purely in their line of duty) are important presences and counsellors to parents.

Preschool children are taught standards of proper behavior, dress, and grooming by all the people surrounding them. These also communicate, both directly and by example, the different male and female qualities. For example, little boys may be praised as "strong" and girls as "pretty," but many praiseworthy qualities are not gendered: intelligence, quickness to comprehend, humor, interactive skills, individuality. The cultural stress upon the individuality of any person's character paves the way

for the changes in sex roles that separate modern Spain from Spain of times past, particularly where peasant economies governed the sexual division of labor more rigidly than is the case in most Spanish economies today, when more people are salaried and both married and single women are an important part of the work force.

Children enter school by age 6 if not earlier. Teachers then enter the ranks of adults socializing children. Coeducation is increasingly common today and socialization in school focuses on general social behavior. Same-sex groups are nonetheless important at any grade level, both in and out of school, and teachers of each sex become guides for gendered socialization. Of course, this is much intensified in same-sex schools. Probably the most central stress in general socialization is that on family values, which include the importance of reproduction, nurturance, productivity in support of family maintenance, and social position. Of course, these have gendered dimensions and are taught to children of both sexes along with general social comportment.

Puberty and Adolescence

Boys or girls approaching age 17 are often referred to as "almost *mozos/mozas*." At 17, the traditional age for beginning courtship, the associations of males' and females' same-sex groups with each other become explicitly focused on sexual attractiveness and potential reproductive sexuality. In addition, *mozos* and adult men, and *mozas* and adult women, in their families and communities become newly linked in what for the adults are friendly "tutorial" relationships as confidantes to their marriageable children, kinsmen, or friends. This involves close kinsmen of the same sex in particular, and older siblings who might already be married can be important. Sexuality may or may not be taught and discussed directly, but it is a subject of general attention. In addition, at this stage of life, same-sex peers are crucially important confidantes, critics, and sharers of information.

Attainment of Adulthood

Marriage normally creates an independent economic unit. A wedding is an obvious marker of adult status, but adult status is more generally defined by the beginning of economic independence and responsibility as well as sexual maturity and post-teen age. When an unmarried young adult, probably in his or her late teens or early twenties, finished with whichever level of schooling or professional training was sought, enters the economy as a worker—whether an artisan, secretary, teacher, farmer, lawyer, manual laborer, academic, or entertainer—he or she also usually becomes an independent economic unit. Such people, with their own domestic economies, are socially adults regardless of marital status and whether they coreside with kinsmen. These people's principal associations are with other adults. They become adult examples of life's variety for the children in their social circles.

Social and legal adulthood are not necessarily coincident. The age of legal majority—of civil and penal responsibility—has varied in the 20th century from age 21 for males and 25 for females to age 21 for both sexes to the current age of 18 for both sexes, which also now marks voting age for men and women. Men alone were traditionally subject to the military draft and entered the draft lottery at age 20 in a local group of same-age youths called *la quinta*, whose members might form a social subgroup of the *mozos*. Currently, young men are still subject to the draft but military service is entirely voluntary and is open to women as well.

Middle Age and Old Age

Men and women enter middle age and retirement in generally the same way and at the same period. Middle age can see people at the height of career development, community activity, and family management. As their children enter adulthood and they themselves become grandparents, and as they reach an age where retirement is financially possible, they may reduce their activity in many spheres. Within the family, grandparents and other older adults of both sexes are respected sources of guidance, love, and wisdom. If the elderly become infirm, their families are their first source of support and care, but social institutions also exist to shelter rich or poor old people.

PERSONALITY DIFFERENCES BY GENDER

Gender differences in social behavior are those familiar to Europeans and Americans and are dominated by familiar notions of masculine or feminine qualities—strength and certain kinds of dominance for males, and

"prettiness," decorum, and nurturance for females. However, both strength and affectionate kindness are valued in both sexes, though styles of expression can vary.

In the Mediterranean generally, males have been seen as aggressive protectors of family honor and reputation, and females as requiring protection from the kinds of sexual aggression (including their own seductiveness) which would ultimately sully their families' honor and destroy reputation. The male's virtue is actively to protect the family's honor and the female's is to display, through modesty and decorous social comportment, the virtue of "shame" (*vergüenza*, which is a virtue for males also and is opposed to shamelessness, *sin vergüenza*). Regions in which these notions are extreme, and in which crimes of honor are recognized and condoned in customary law (e.g., when a man kills his sister and her lover for besmirching the family's honor) are very few and have never characterized universal or even majority behavior in a country like Spain, where the values governing permissible female sexual behavior and definitions of family honor itself are truly diverse. However, the values of "honor and shame" enter heavily into stereotypy in the Mediterranean, become powerful in literary and mythic reference, and offer models of behavior which Spaniards (among others) recognize and can bring into play. Behavioral styles of aggressive manhood and decorous modest sheltered womanhood can in fact be displayed even when or where their underpinnings in customary law are absent. Gendered behavior focused on honor and women's virginity can be a complex many-layered mixture of performances with varied realities. There has been a sexual revolution in Spain which makes these behaviors for the most part curiosities of a partly mythical past.

GENDER-RELATED SOCIAL GROUPS

Groups of same-sex women or men of similar age (*niño, mozo, casado*, etc.) are important in social life all over Spain. These associations unite people of different households, different families in leisure and sometimes as well in specific tasks outside their households. Post-marital residence in most of Spain is neolocal, though kinsmen of one or both spouses may live nearby, but households are generally small and their members' social lives are vastly extended by same-sex groups in their own localities or beyond. The domestic group is crucially important but highly private; groups of *mozos, mozas*, or married men or women lead active social lives together in public non-domestic space. Extrafamilial same-sex social groups exist for both sexes, but the spaces with which they are associated and their activities can differ. In traditional social life, men and women pursue leisure separately in same-sex groups, both outside and in the home, with which women are particularly associated. Public festivals and traditional rituals also can see groups of like sex organized in parallel activities. However, particularly in urban areas and among the middle classes today, families are ever more emerging to pursue leisure (including travel) as units.

GENDER ROLES IN ECONOMICS

In most traditional economies, women are more closely associated than men with household management, domestic tasks, gardening, and details of childcare, while men are more closely associated than women with manual and heavy labor, including plowing, and with the professions. However, married people of both sexes perform tasks essential to the domestic economy when necessary. Women pull the plow if necessary and men cook and sew if necessary (but they almost never launder!). Both sexes engage in trade and marketing as partners, co-owners, and co-producers in their households. The herding of sheep and goats is generally male, but women may also do it, as well as own herds. In regions with cattle-based economies, tending, milking, and herding cattle fall to both sexes. In these same regions, where hoe culture and haying are predominant over plow agriculture, men and women equally garden, cut hay, and engage in processing and peddling of garden or orchard crops and dairy products (milk, butter, cheese). Although much of food production in Spain is currently being modernized and is subject to commercial intermediaries (such as wholesale fodder producers, industrial dairy processors, etc.), the enduring legacy of cattle-raising regions is a sexual division of labor which is perhaps the weakest in Spain. In coastal regions where fishing is important, men tend to man the boats while women manage the land-based economy, which can involve gardening, small-scale animal husbandry, and local trade.

The most visible division of labor by sex is seen among plow farmers and the bourgeoisie and upper classes, where salaried labor outside the home separates

men and women in space. The bourgeoisie and upper classes also provide traditional models for the separate pursuit of leisure by the two sexes. Rural food producers and the urban poor are more compelled to break the norms of the sexual division of labor whenever necessary and at the same time to enjoy fewer and less ostentatious forms of leisure.

Throughout Spain, the sexual division of labor or leisure does not divide the sexes on the basis of their ability to own or manage property. Local traditions may dictate the disposition of different kinds of property, especially in stem family farm areas, but women in most cases can be heirs to estates just as Spanish women hold noble titles and can inherit the crown.

Many of Spain's traditional crafts are associated with one or the other sex. Such handwork as embroidery, lacemaking, and spinning (all now in decline), as well as most sewing and dressmaking, are done by women. Men are the principal tailors of men's wear, and men dominated the historically important profession of weaving. Craft pottery is also produced principally by men, as is most decorated metalwork. The fine arts of painting, sculpture, and musical composition are historically dominated by men but are open to anyone, particularly today. The performing arts—drama, song, dance, film—depend heavily on artists of both sexes. Female writers have long been an important minority in the literary arts.

Women's embroidery was traditionally associated with the establishment of new households at marriage and, coincidentally in many places, with courtship. Mothers and daughters, often in groups from different households, spent their afternoon hours socializing while they embroidered the linens that would form part of the daughters' trousseaux. If they were in public space in good weather, the *mozos* might visit the *mozas* who worked under their mothers' chaperonage. These traditions die when women enter the salaried work force, and traditional handwork is becoming scarce (and has been replaced by machine embroidery), but it is highly valued family property and the art of embroidery is still taught by many older women to younger ones.

PARENTAL AND OTHER CARETAKER ROLES

While mothers and other adult women in a family circle spend more time than men do in the physical care of children, both sexes lavish attention and affection on their children and spend time in their training and their play. Probably the most attenuated relations between small children and their fathers are to be found in bourgeois families whose men work outside the home and affect greater distance and formality than is common in other classes. Generally, however, parents are partners in their children's discipline and the implantation of proper models of behavior (which themselves focus on adult roles of the two sexes). In adolescence, growing men and women seek most specific guidance from their parents and other kinsmen of the same sex. Spanish families do not normally express preference for children of one or the other sex and recognize the importance of both sexes in a domestic economy and the world at large.

LEADERSHIP IN PUBLIC ARENAS

Historically, Spanish men have had a more significant presence than women in public arenas, but there have always been exceptions, and such of Spain's noblewomen and royalty as Queen Isabel I (1451–1504, r. 1474–1504), sovereign over her own domains, are obvious examples. Women's ownership of property has always given them influence even though it has not always been wielded in the most public ways. Married women, however great their informal power, might relegate themselves to the background for the sake of a desired propriety of appearance. Until the 20th century, public office has generally been reserved for men. Currently, however, women work at all levels in all secular professions, exercise authority, and hold high government and administrative posts throughout the nation.

GENDER AND RELIGION

The religion of the majority, Roman Catholicism, offers careers to men in the clergy and monastic orders and to women as nuns. There are also lay groups for one or both sexes (some celibate, some not) which function widely in society, for example, in the field of education. However, only men can rise to the highest offices in the ecclesiastical hierarchy.

In traditional Catholic practice in some parts of Spain, women might visit the local church, chapel, or shrine more frequently than the men of their families.

Although this pattern varies, some observers have regarded it as part of a "division of labor" in which families are represented by their women in daily observance and by their men in the local political sphere. Since the Church has a significant political presence in Spain, there are and have long been contexts in which people—often men especially—feel their own political interests compromised by those of the Church or its local personnel. However, the sacraments and most solemn holidays remain important to all believers.

Gendered positions in religions other than the Roman Catholic are governed by the laws and traditions of those other churches, but, as minority religions, their practice does not produce dominant social patterns.

Leisure, Recreation, and the Arts

Leisure is traditionally pursued mostly outside the home and by groups of like sex and age or marital status. In this sphere, people from different households interact and socialize. Local festivals often involve these groups in separate parallel activities. *Mozos* and *mozas*, as groups, interact explicitly in public (at dances, etc.), as their age dictates the activity of socializing with potential mates. Married women and married men, as groups, may play separate roles in the organization and execution of public festivities. These same groups socialize together at more ordinary times as well—early evenings, Sunday afternoons—in public space (in plazas or cafés) or at selected homes, where they might snack or drink wine or coffee together, play cards, or simply chat. Working men and women might take breaks in like-sex groups during their work day. Traditionally, families reunite in their homes by 10 p.m. for their evening meal, but families may also eat together at restaurants at midday or in the evening; this is an emerging form of nongendered public leisure.

Relative Status of Men and Women

Family interests weigh heavily in the lives of all adults, and men and women are both influential in arriving at decisions regarding their domestic economy, their household's role in their community and in relation to specific other households, and their public face in religious and civic activities, as well as in training their children in the

nuances of all these matters. A married man may be the official head of household, but his wife (who holds property in her own right) has enormous power within the family and the two are partners in family management. This includes influence over the formal and informal education of their children and the passage of judgment on their prospective spouses. Adults of both sexes are generally respected by their children; duty to the family and respect for its interests are values heavily impressed upon the young. Outside the household, age and social status engender deference for men and women alike. Family reputation and illustrious achievements heighten deference where these are known, and men's achievements are often more publicly known than women's.

Sexuality

Sexuality is normally regarded as natural and healthy but, for women especially, is seen to serve the end of reproduction only, in marriage. Men and women cultivate sexual attractiveness, within the norms of modesty and appropriate behavior, at the age of courtship—when they are *mozos* and *mozas*. Spaniards of both sexes are deeply concerned with personal appearance. Married people are supposed to appear presentable and attractive without being sexually provocative.

Males are traditionally granted more sexual freedom than women, both before and after marriage. A married woman's extramarital sex is generally seen as the greatest blow to family values. Women's sexuality is stereotypically seen as dangerously powerful, particularly because it is supposed to be confined to the marriage bed and can thus be more frustrated than men's. In reality, premarital sex is common in many parts of Spain (more in the north than the south) and is becoming more widespread. However, sexual affection between partners is not publicly flaunted—that of husband and wife is no exception. The sexual aspect of human relationships is regarded as best kept private, and so public behavior may conceal actual realities in many cases. In the late 20th century, sexual morés in Spain began to conform with Anglo-American and other European models in which sexual enjoyment can be separated from both marriage and reproduction. There has been a spate of heretofore censored explicit or pornographic publication and a general defiance of traditionally taught values, though the sexual revolution is most evident among urban

professionals and the more cosmopolitan classes for whom fashionableness dictates ultramodernity.

Because the public advertisement of one's sexuality is frowned upon, male and female homosexuals are most successful in social life if they, too, keep expressions of their affection private and their public appearances in accord with the mainstream norms for their respective sexes. Most do this, and cross-dressing is generally not approved. The Spanish mainstream is generally demanding of "proper" appearances but also humanely tolerant of differences of character, and homosexual households where they exist, especially of women, are treated with neighborly respect. Male homosexuality seems less well tolerated. Not surprisingly, homosexuals find better niches in the many-layered society of urban centers than in the smaller populations of the countryside.

COURTSHIP AND MARRIAGE

Men and women are expected to marry unless they choose careers as priests or nuns. Lifelong bachelors and spinsters generally remain important within their family circles, regardless of where they live, especially as aunts and uncles to their siblings' children. Concerns for the preservation of property and social status always affect families' attitudes toward their children's marriage choices, and in the past many marriages were arranged, but love is a principal concern today and, in the modern economy, a couple's future is usually more closely tied to their own achievements than it is dependent upon their respective families' fortunes.

Spanish courtship is stereotypically long and marked by distinct formal stages, beginning as two people of courting age choose to be seen together in public (at dances, in the public *paseo* or stroll), and successively the man is received into the woman's house, their two families agree on the match, the man formally requests the woman's hand, an engagement is announced by both families, banns are eventually posted in church, and a wedding takes place, following which a new household is formed (except in stem family areas) and the couple joins the ranks of married adults. The length of a courtship and the ostentation of its associated household and public rituals can vary greatly. At the simplest end of the spectrum, couples elope. Elopement is not uncommon, nor in many areas is a couple's lifelong cohabitation without engagement or wedding. These solutions occur most in poor social strata and aid couples in escaping the expenses of the traditional public engagement and wedding, but they are occasionally chosen by others who would flout convention. The convention remains the measure by which alternative decisions are taken.

Marriage was traditionally seen as having its chief purpose in establishing a reproductive family; hence the marriage of anyone beyond the normal age of reproduction—either widowed people or older unmarried individuals—was often greeted with derision in their communities. The association of marriage exclusively with reproductive sexuality is becoming a thing of the past, and mature adults' needs for marital companionship apart from family building are well recognized.

HUSBAND–WIFE RELATIONSHIP

For most of Spain's history, divorce has been impossible, and Spaniards are socialized to work at making their marriages successful; the long courtship which follows the tentative first approaches of boy and girl to one another surrounds them with a web of sentimental and material support for their future as spouses. Divorce is now permitted and has in some circles become fashionable, but Spanish marriages are generally stable. Spouses retain friendships and social life outside the household to a greater degree than is true in American marriages; a Spanish marital partnership exists in a much less isolating context than most Americans experience, and in many cases spouses spend fewer hours each day alone or alone together in their home. Family life, when children are of school age, engages members principally at mealtimes. Women who do not hold jobs outside the home might spend most hours there, but the period following the midday main meal, from 5 or 6 p.m. until the family gathers for supper at 10 p.m., is often spent socializing, even if young children are in tow. But women have increasingly entered the work force and their side of the marital partnership has come to resemble more closely that of their husbands; there is less leisure at home, but greater equality of income.

Husbands and wives together manage their household economy and rear their children; although there can be a division of the associated tasks, major decisions are made in partnership. The division of tasks itself is often manipulated as children grow, as the family enlarges or shrinks over time, and as demands of parents' work

place(s) dictate. These things are openly discussed in most families—husbands and wives debate, chide one another, argue, work out agreements, and often joke their way through rough spots in their mutual management of household and family. Husband and wife share a bed, jointly preside over family meals (daily) and festivals, and set the rules and tone of life in the household. They are seen together at public social occasions and in the traditionally patterned leisure activities (the evening stroll) that are considered part of the social life of a couple (rather than same-sex groups). As noted earlier, Spanish families increasingly enjoy leisure away from home as a unit; restaurants are favored places for their enjoyment.

OTHER CROSS-SEX RELATIONSHIPS

The Spanish family circle is generally large, gregarious, and affectionate, and ideally its members gather frequently. Grandparents or aunts and uncles serve their grandchildren or nephews and nieces as models and guides to the adult world, supplementing the parents' roles in this respect and often providing special counsel to youngsters of like or opposite sex, depending on the matter at hand. Brothers, sisters, and their cousins form play groups if they are of similar age, and they separate into groups of like sex as they pass into school age and *mozo* status. Though siblings and cousins of opposite sex are companions within the family circle, they usually emerge socially in public in groups of like sex.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Despite the changes which have occurred in Spain's modernization, men and women share a deep appreciation of gender differences and the collaboration needed between them to accomplish the traditional goals of creating households, nurturing family ties, and raising children to be Spaniards. Extended kin groups are as important as ever, or possibly more so, and social ties to groups of like sex are significant in all lives and in the social structure. The concerns for personal appearance and the stylistic differences that make women feminine and men masculine persist, as do concerns for collective judgments, consciousness of local and regional roots of individuals, families, and traditions, a generally Catholic cultural heritage, and the insistence on the importance of maintaining marital partnerships in the face of changing circumstances.

Swat Pathan

Charles Lindholm

ALTERNATIVE NAMES

People of Swat are sometimes known to outsiders as Swatis. The dominant majority call themselves Pukhtun (Pathan is the British term for them). Most belong to the Yusufzai segment of the larger Pukhtun/Pashtun tribe who inhabit southern Afghanistan and northern Pakistan.

LOCATION

Swat District consists of a beautiful river valley located in the mountainous Northwest Frontier Province (N.W.F.P.) of Pakistan, close to the Afghan border.

CULTURAL OVERVIEW

Swat is a predominantly rural area where local subsistence farmers raise their own wheat, rice, maize, and some fruit and seasonal vegetables. Cattle and water buffalo provide milk, labor, and meat. Chickens and fish in season are the other sources of protein. Despite the relative fertility of the valley, overpopulation means that hunger is common. The money economy of Swat is primarily reliant on remittances from immigrants to Karachi and the Gulf States.

Despite considerable differences of wealth and power among the Pathans, they are remarkably egalitarian, reflecting the structure of their segmentary lineage organization which provides them with the framework for concerted political action without the necessity for any central authority. It does so by obliging those closer genealogically to combine against those more distant, and to join those distant enemies in battles against foes who are more distant still. As a result, Pathans may battle violently amongst themselves, but are capable of uniting against external enemies, a capacity that has long enabled them to repel invaders from their territory. (For more on Pathan descent and kinship organization, see "Gender-Related Social Groups"; see also Barth [1959a, 1959b] and Charles Lindholm [1982].)

Only landed members of a village are considered to be Pathans. Also resident in the valley are caste-like groups of landless individuals who serve the dominant Pathan farmer–warriors as carpenters, millers, barbers, leatherworkers, and the like. Traditionally, these subaltern occupational groups were linked to Pathan patrons by close ties of mutual obligation, but these ties have recently been eroded by the encroachment of capitalism.

The people of Swat prize their independence, and rely as little as possible on the Pakistani state for order. Anarchy is avoided by the operation of the segmentary lineage system and by the tribal code (*pukhtunwali*), which demands refuge to supplicants, hospitality to guests, and the absolute obligation to revenge any slights. A person who cannot live up to tribal standards is held in contempt—a fate worse than death in a culture where one's very existence depends on the respect of peers, relatives, and allies. (See Ahmad [1962], Ahmed [1980], Barth [1959a], and Charles Lindholm [1982, 1996] for standard ethnographies of Swat, Bellew [1864/1977] for an early study, and Caroe [1958] and Spain [1962] for comprehensive overviews of the Pathans.)

The people of Swat consider themselves to be devout Sunni Muslims, and they explain local practices of strict female seclusion, veiling, polygamy, denial of inheritance to women, prohibition on divorce, and so on, as enjoined by Islam. However, many of these so-called Islamic practices are actually expressions of a patriarchal social system (Kandiyoti, 1991).

CULTURAL CONSTRUCTION OF GENDER

In Swat there are only two categories of gender: male and female. They are complementary and are ranked hierarchically, with males considered superior while females are believed to be naturally inferior. Men command public life; women are relegated to the lesser world of the compound and children.

Gender is clearly marked in clothing, hairstyle, and demeanor. While both sexes wear the standard long shirt

and baggy trousers, only women wear bright colors, contrasting shirt and top, and floral patterns; in contrast, men wear plain outfits of matching drab colors (though some bright blues are considered to be masculine). For special occasions, women wear necklaces, earrings, nose-rings, and bracelets, while acceptable male jewelry consists of an austere wristwatch. Men always have short hair and most wear typical Pathan wool hats, which some young blades decorate with a flower. Both young men and young women may wear kohl to accentuate their eyes. Women also decorate their palms with henna. Men drape woolen blankets across their shoulders and over their hats in cool and rainy weather, while women always wear white shawls, which they use to cover their shoulders and long hair. In the village, poorer women wear their shawls when they walk about the street or are in the fields, but women of any social standing never leave their compounds without donning a *burqa*—a voluminous all-over covering of black cloth which renders them completely anonymous. Even in the compound women only let their shawls down to reveal their hair when in the presence of very close relatives, such as their own children or siblings.

Women who must go out in public scrupulously avoid encountering men. If a man and woman do happen to meet on the pathway, she will step aside and look down. Men and women do not look at each other or speak to each other in public, and amongst themselves men never refer to another man's female relatives, except euphemistically to ask about "the house." When in the presence of men of one's own family, women should exhibit *sharm* (shame), and remain quiet and deferent.

Stereotypical male images of female beauty are inspired by local love poetry, which follows the familiar Persian pattern, apostrophizing long black hair, eyes like stars, milky white skin, and so on. Corpulence (which is rare) is also much desired in a woman. Female images of the ideal man are not so well articulated, since there is no female love poetry, and little possibility for women to have any choice in marriage partners. But it is clear that women favor men who are strong, honorable, and commanding.

GENDER OVER THE LIFE CYCLE

Up to the age of 6 or so, girls are known as *wara* and boys as *warukai*. Afterwards, girls are called *jinai* and boys are

halak. An adult man is *saray*, and an adult woman is *khaza* (wife). Elderly men are respectfully called *spin giray* (grey beards); elderly women may be called *budai*—though this is an insult in direct address. The major marker in a boy's life-cycle is circumcision, which is the occasion for a large public celebration. It usually occurs when the boy is between 2 and 5, but can take place later, and in any case implies no change in rights or responsibilities. A girl's only important life cycle ceremony is marriage, which marks her transition into womanhood and her departure from her own family.

Socialization of Boys and Girls

Pathans greet the birth of a boy with celebration, and the birth of a girl with condolences and silence. Nonetheless, both male and female infants are treated more or less alike. They sleep with their mothers and are swaddled until they are around 12–18 months old. Whenever they cry, they are pacified with the mother's breast. Weaning is sudden and usually occurs when a new baby arrives—generally when the child is around 2, but sometimes much later.

Gender distinctions become very marked after the child is taken out of swaddling. Until he becomes a *halak*, a little boy is considered to be quite incompetent; he does no chores and is not held responsible for mistakes that would earn punishment for girls of the same age. He is the prince of the household and is treated with deference by all. If he dirties himself, his sister will wash his clothes; if he breaks something, his sister will pick up after him. If he hits his sister, he will be applauded. As a result of constant pampering and low expectations, little boys are not as advanced developmentally as girls, who are expected to help out with household chores from an early age. In particular, as soon as they are able, they serve as caretakers for their younger siblings, carrying them continually on their hips, and taking responsibility for their well-being.

As they become *jinai*, girls spontaneously begin exhibiting typical female behavior, such as donning head scarves and avoiding boys. Younger girls report the latest scandals in the village, learning conventional morality as well as the highly valued skills of gossiping. As they get older, girls stay more and more within their family compounds, practicing the purdah (seclusion) they will follow for the rest of their lives. Formal education for girls is rare, though some do now go to a few all-female

primary schools where they learn rudimentary skills of reading and writing. But for most girls, life will be perpetually circumscribed within the domestic sphere.

The primary virtues for girls, as for women, are obedience and deference, a capacity for hard work, an ability to bear punishment, and a sense of shame and propriety, all of which are deeply inculcated into them by peer pressure and parental training. At the same time, Pathan girls are also taught a strong sense of pride in their lineage, their family, and themselves.

Boys' socialization is very different, and has different aims. After their extended period of irresponsibility and indulgence, at around the age of 5 or 6 boys begin to be trained by their fathers in the maintenance of honor. They are instructed in the names of their clans and in genealogy, and are taught the proper rituals of greeting and politeness, most especially deference to elder men. A boy learns how walk in a dignified manner rather than running, how to control his emotions in public, and how to maintain an impassive face and a manly demeanor. Any babyish behavior earns quick and harsh punishment from the father. Crying and whining, which were indulged before, become taboo, and lead to shaming and slaps. Gossip, so much a part of the lives of girls, is discouraged. For boys learning the virtues of courage, respect, and proper comportment, the private lives of others should be of no interest.

While girls become more housebound as they get older, boys are increasingly out in the world. In the village streets and fields they join their age mates in gangs from the same ward where they learn about the competitive rough and tumble of masculine life. In these gangs the strongest and most daring rule. Fathers expect their sons to stand up for themselves among their peers, and a boy who flees a fight is punished. Aside from the serious play of gang life, a *halak* must also help with work in the fields and participate in public rituals of hospitality. Some boys also go to school, and a few may continue on to college, and to professional or semiprofessional jobs.

As noted, girls, even if educated, live in the private sphere of the household, and their only realistic hope is to become like their mothers. In contrast, boys have a more conflicted existence. Though expected to be meek and obedient to their elders, they are also expected to assert themselves in the rough-and-tumble universe of their peers, where the joker and the fighter succeed. These contradictory expectations can have a problematic effect in later life. (For Pathan socialization practices see Charles Lindholm, [1982], Cherry Lindholm [1982], and Newman [1965].)

Puberty and Adolescence

There is no special marking out of puberty among the Swat Pathans. For girls, adolescence often does not even exist, since many are already married by the time they reach puberty and so have effectively entered adulthood. For boys, in contrast, adolescence is a continuation of childhood, and can last for many years, since men marry late and do not carry adult responsibilities until then. Typically, adolescent boys run with their gangs, wrestling, playing pranks on villagers, and testing each other's courage. Older boys may manage to keep a prostitute in their clubhouse, or rape a girl caught out alone. Male adolescents are notoriously easily to offend. A rejected friendship, a careless insult, or a minor humiliation can lead to violence and to a blood feud.

Attainment of Adulthood

As noted, girls become women when they marry. They continue to keep strict purdah and must show deference to their husbands and mothers-in-law. Their status is slowly enhanced if they have sons. Women without sons are held in contempt, and can expect their husband to take a second wife if he can afford the expense. Unmarried woman are not considered adults; usually they are hidden in their own homes and rarely spoken of, as their status is both ambiguous and disgraceful.

A man also requires a wife to be reckoned as an adult, but sons are not as crucial for his status as they are for a woman. What is most important for him is that peers recognize his power and autonomy. This means that manhood is fully achieved only when a man inherits his land from his father and becomes an independent householder.

Middle Age and Old Age

Both men and women continue along the pathways set for them during their early years. For a woman, child-raising, arranging marriages for her children, dominating incoming daughters-in-law, and maintaining her status as first wife are the most important priorities. After menarche, women no longer need to remain in seclusion. If they have had sons and controlled a large household, their lives are reckoned to have been successful.

The aging process for men is more ambiguous. Although respect is automatically awarded to an old man, he is likely to resent the fact that his sons demand to be given the land and authority that he fought all his life to gain. As a result, elder men are often marginalized and embittered.

PERSONALITY DIFFERENCES BY GENDER

In general, the Pathans believe that women are naturally emotional and irrational while men are stoic and pragmatic. This division of labor is evident at funerals, where men meet at the men's house to drink tea and exchange subdued greetings and stereotyped remembrances, while women crowd together in the household of the deceased to weep and moan, pull out their hair, lament, and faint.

Pathan women gain status among other women for the depth of their grief and capacity to bear suffering. Their dominant narrative form is "the tale of the hardships that have befallen me" (Grima, 1992). Men, in contrast, pride themselves on their emotional stoicism. Even anger, which is very much a male prerogative, is properly expressed coldly, with forethought. Revenge, a major element of Pukhtunwali, is a dish that men savor cold, plotting carefully for many years to enact vengeance.

Pathan men say that women are far less intelligent than men. Women do not necessarily agree, but they do recognize their own lacks in education and experience. The negative stereotype is belied by the fact that girls who do go to school tend to do much better than their male counterparts. Men also reckon that women are untrustworthy and unable to keep a secret. They are thought to be vindictive and petty, continually seeking advantage over their husbands. Men, in contrast, are supposed to be above any concern with women's affairs. Ideally, they are more focused on public matters of politics and religion.

Despite these stereotypes, to an outsider, the men and women in Swat are remarkably alike in character: proud, conservative, competitive, aggressive, and articulate; strong friends and formidable enemies.

GENDER-RELATED SOCIAL GROUPS

Virtually the entire sociopolitical order of Swat is structured by the segmentary lineage system which is based on patrilineal descent. As mentioned in the "Cultural Overview," this system connects all Pathans in Swat to one another through reference to a genealogical pyramid that reaches back to a common patrilineal ancestor. This pyramid provides the framework for the political order, as men who are close patrilineal relatives are expected to ally against those who are more distant. Maternal links are officially completely excluded from this system, but Pathans do assume that they will have friendly relations with their mother's kinsmen, though those maternal kin cannot be obliged to participate in battles.

Patrilineal descent is also completely determinant of inheritance and residence. Land and rights are shared equally among sons or brothers, while the women of the lineage do not inherit. Villages consist of a core of men descended from a common paternal forebear and their dependents. Each village is further divided into wards (*tuls*) according to patrilineal kinship ties. Every *tul* has its own men's house where Pathan men and their clients gather to talk and show solidarity.

Households ideally are made up of a patriarch, his wife or wives, his unmarried daughters, and his sons and their wives and children. It is only within the household that a woman has any official authority. However, even there her orders can be overriden by her husband, though this rarely occurs.

GENDER ROLES IN ECONOMICS

Men do all the work that requires appearing in public. They do the plowing, sowing, harvesting, and other farm work, as well as any herding of animals; men build houses and walls, mill grain, set bones, slaughter animals, and cut hair; local carpenters make elaborate carved chairs, now much coveted by Western collectors. Men also do the buying and selling in the market, and only men should hold paying jobs. Men are responsible for blood debt and revenge, undertake warfare, and migrate in search of work.

Ideally, women are responsible for all domestic chores: childcare, cooking, and so on. This division of labor is so strict that a single man is ashamed to make rice for himself, and asks his sister or mother to prepare it for him. Women are also responsible for building ovens to bake their bread; another valued female skill is the intricate embroidery of pillowcases, dresses, and quilt covers that are often given as marriage gifts.

As mentioned, men inherit all land and property. When a man dies without sons, his brothers—not his wife or daughters—inherit from him. In principle, a woman does have absolute rights to the jewelry and the monetary value of the land given to her at marriage by her husband's family (*mahar*), but this is only claimed in case of divorce, which is rare.

PARENTAL AND OTHER CARETAKER ROLES

Mothers and older sisters or young female servants are the primary caretakers in the Pathan household, and take the major role in all socialization. Men serve as disciplinarians and later as instructors to their sons on matters of propriety and etiquette.

Although mother and daughter are emotionally close, the mother's relationship to her daughter is ambivalent. This is said to be because the girl will abandon the household at marriage, but there also may be an element of jealousy, since girls are often treated with much affection by their fathers.

Boys are very much tied to their mothers, who indulge them far more than they indulge their daughters. The father–son relationship is much more formal and fraught with tension, since the two are eventual rivals over land and authority. The father demands and gains respect and deference from his son, but it is the mother whom the son loves.

LEADERSHIP IN PUBLIC ARENAS

With the advent of the modern state, official bureaucracy and political appointments now overlay the traditional system, but in earlier times leadership in Pathan society was held by forceful men with powerful lineages and supportive allies who could establish dominance in a village. But since no Pathan accepted the superiority of any other, and since allegiance was wholly voluntary, the authority of these informal leaders was always in danger of being subverted by betrayal (Barth, 1959b).

The other major authorities in traditional society were holy men. Sanctified by their patrilineal connection to a saintly ancestor and by their own asceticism and pious demeanor, such men served as mediators in disputes and as rallying points in times of war. Prior to the annexation of the valley by Pakistan in the 1970s, Swat was ruled by a family of saints who used their religious aura and political acumen to establish their regime.

GENDER AND RELIGION

Pathans are Sunni Muslims. All official and mystical religious authorities in the region are male. Women are forbidden to pray in the local mosques, though they often follow Islamic practices more strictly than their husbands do. Islam is less limiting of women's rights than is local custom, and this is slowly transforming property rights, inheritance, marriage exchange, and the like. (For more on women's rights in Islam, see Coulson [1964].)

LEISURE, RECREATION, AND THE ARTS

Boys and girls have very different leisure-time activities. Girls spend their free time playing jacks and other girlish games, imitating cooking by making mud pies, dressing their faceless dolls in finery and placing them in a tiny wedding palanquin, singing and talking about marriage and wedding gifts, and pretending to be the wives and mothers they will soon become.

In contrast, boys' gangs roam the village playing pranks, wrestling, joking, and hunting birds with slingshots. They do not sing nor do they play with dolls. Adolescent gangs sometimes commit rape, destroy property, and have slingshot fights with boys from other wards and neighboring villages. Until recently, these intervillage battles were ritual occasions that could end in death.

Adult men do not have a great deal of leisure time during the farming season, but winter is usually quiet, and then they rest on cots in the men's house of their ward drinking tea, talking politics, and taking *nusfar* (chewing tobacco) with their allies and clients. Some men play cards, smoke hashish, and sing popular songs, but these activities are considered reprehensible and occur only among very close comrades. Women have even less leisure, since children and husbands always need to be cared for. When women do relax they exchange gossip, complain about their husbands, and tell tales of hardship. These occasions take place during women's periodic visits to other households where they join in mourning or celebrating rites of passage.

Entertainment is rare, and is provided by travelling troops of male musicians and female dancer–prostitutes who perform at weddings and other special celebrations. Women are not permitted to watch these events, but look on from behind screens or from afar.

While the primary female art form is lamentation and narratives of distress, some women also make complex abstract decorations on their house walls, supposedly to ward off the evil eye. Men do not practice any visual art, but they do recite and sometimes compose poetry, usually in rhymed couplets.

RELATIVE STATUS OF MEN AND WOMEN

In principle, men are the authorities over every aspect of life. Even in their own compounds, women are supposed to defer to men and offer them unquestioning obedience. The husband controls all the family resources, and ideally his wife should donate her *mahar* to him as well. Nonetheless, women can have considerable influence over men as behind-the-scenes advisors and instigators, and a wise man confers with his wife about household expenditures and other matters of mutual interest. Eventually, successful postmenopausal women can even gain some of the public deference due to men.

SEXUALITY

Men regard sexuality as a positive good, while women profess to have little interest in sex, which they say is a distasteful but necessary duty. Sex itself is said to be mainly a matter of penetration, without foreplay. Men regard themselves as the predators in sexual liaisons, but simultaneously believe that a woman's passion, once awakened, is insatiable. The double standard is blatant in Swat, as men are expected to pursue extramarital affairs and to brag about their conquests, while women who have affairs are permanently disgraced and liable to be killed by their husbands or male relatives. An exception are the professional dancers who are despised as whores, but also covertly admired for their freedom and power.

These female dancers have replaced the transvestite boys and young men who provided sexual services in the previous generation. Still, homosexual encounters between boys and with men remain fairly common among the Pathan, and many youths have their first sexual experiences in this manner. A boy who has been a passive partner in anal intercourse is not regarded with great opprobrium, so long as he changes his habits, marries, and fathers children. However, an adult man who is passive is despised. It is said that a man becomes a passive homosexual if he loves his wife too much, or if he is enchanted by a male lover. Impotence is also a result of enchantment, and is reputed to be quite common.

Both men and women are extremely modest in dress and behavior in public, and boys and girls are expected to follow suit at an early age. As mentioned, women cover themselves completely outside the house, and wear a headscarf at all times. Despite this, sexuality forms the basis for the terms of abuse that are in common use among the Pathans and their clients. Nor is chastity widespread. Women of the poorer classes are sometimes the equivalent of prostitutes, and the wives of barbers are especially notorious for their promiscuity. Rape is said to occur commonly when a man encounters a woman alone and defenseless. She dare not report the offense, for fear of being punished and even killed by her husband or father.

COURTSHIP AND MARRIAGE

First marriages are arranged entirely by the families of the bride and groom, and serve to cement alliances between families or to add a large brideprice to the family coffers. The groom is usually much older than the bride, who is quite often prepubescent. Love has no part in marriage arrangements, though young people can object if the chosen partner is known to be ugly, old, or otherwise unattractive. Men who marry a second wife or widowers may take a more active role in negotiations, and look for a woman who is compliant and beautiful. A man is obliged by levirate to marry the widow of his brother.

Pathan marriages are drawn-out and complex processes of exchange between the two families. They are arranged by go-betweens, often by the barber's wife who has access to many households. Mothers take the major part in informal organizing and negotiating of the engagement and marriage, but fathers must oversee the final bargaining. The marriage service itself is conducted by a mullah and consists of a statement of the contractual arrangement between the new bride and groom. The bride is carried in triumph in a palanquin by the groom's party

from her household to his, where she is met by joyous shouts, drumming, gunfire, and an enormous feast. The female relatives of the groom dance and sing in happiness as the bride is brought into the compound—the only time dancing is permitted for them. Fights sometimes erupt between the two households during this procession, since marriage is seen as akin to the theft of a girl, and has connotations of domination and rape.

The new bride is expected to stay silent and still for the day, covered in her wedding shawl. Her new in-laws coax her with sweets to reveal herself, but shame keeps her hidden. Her husband is not permitted to take part in the celebration. He should stay secluded in his men's house for 3 days before appearing at night to deflower her—an occasion fraught with anxiety for both parties. She fears she will be proven not to be a virgin; he fears he will be unable to perform. Afterwards, if all goes well, the bride gingerly enters into her new household.

HUSBAND–WIFE RELATIONSHIP

Although they sleep together and live under the same roof, husband and wife are rarely close in Swat. Instead, marriage is viewed as akin to warfare (Lindholm & Lindholm, 1979). The hierarchical sexual division of labor keeps the couple apart, though complementarity means that each requires the other for survival. The distinction between husband and wife is evident at meal times. Wives and daughters only eat after husbands and sons have finished. Males get the meat, fat, and other tender morsels; females get the bones and watery soup.

Yet the image of the self-abnegating Swati wife is not really accurate. Although trained to submit to men, women also are taught to assert themselves. As a result, the ideal of absolute wifely subservience is rarely found in reality. Some assertive women manage to drive their henpecked spouses into the men's house. A few even acquire lovers, knowing their weak husbands will not dare to take revenge. More commonly a wary truce is arrived at, as the wife has sons and comes to identify herself more and more with her husband's lineage.

Men who are unhappy at home may pursue affairs with their neighbors wives' and daughters, though the risks are high if the relationship is discovered. Homosexual liaisons with boys also occur. If very unhappy, a man may marry another wife. However, divorce is forbidden by Pathan custom. This means that women repudiated by their husbands can never marry again. Even male impotence is not grounds for a Pathan woman to divorce her husband. Obviously, relations between cowives are rarely friendly, and men who can afford to do so will put them under separate roofs, or else maneuver to have the disliked wife return to her family home and then not invite her to return. Since it is assumed that children of a repudiated wife are in danger of poisoning at worst, neglect at best, they accompany their mother, but the boys will return to their father's house when they become young men in order to claim their inheritance rights.

OTHER CROSS-SEX RELATIONSHIPS

Brother and sister are close allies and have strong ties of affection. For a woman, the greatest tragedy, after the loss of a son, is the death of a beloved and supportive brother. Men rely on the advice and succor of their sisters, especially if they are married to men in the same village, as is often the case.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The strict division of labor by gender has recently been challenged by the labor migration of men to Karachi or the Gulf States. Left without men, women have been obliged to do work that was previously prohibited to them, and this has led in turn to shifts in attitude about the proper place of women. Returning immigrants also occasionally find the old Swati ways too extreme.

Change is also brought by the Muslim religious practitioners who have increasingly entered the valley. Oftentimes, these preachers recognize that Islamic law does give women more rights than Swati custom provides—especially in terms of inheritance and divorce.

Swazi

Betty J. Harris

ALTERNATIVE NAMES

Isiswazi, Siswati, Tekela, and Tekeza are names used by the Swazi themselves.

LOCATION

The Swazi, an amalgamation of some Nguni and Sotho clans, live in the southern African country of Swaziland, in the Mpumalanga province in South Africa, and in neighboring areas of Mozambique. Swaziland, one of the smallest countries in Africa, shares its eastern border with Mozambique, and its northern, southern, and western borders with the Republic of South Africa.

CULTURAL OVERVIEW

At the top of the Swazi social hierarchy are the King and Queen Mother. The King (iNgwenyama) is leader of the Swazi nation who rules with the assistance of the Queen Mother (iNdlovukati). According to tradition, the King presides over the highest court and is the only person who can assign the death penalty in a crime (Kuper, 1961, p. 55). He commands the army, allocates land, and has access to the royal cattle herds.

The Queen Mother presides over the second-highest court, but her councillors may serve on the highest court and her hut can be a sanctuary for those sentenced to death. Despite the King's control of the army, the official commander-in-chief may reside in the Queen Mother's village and she may have her own regiments under the control of local princes. Furthermore, she serves as a check against his misuse of national wealth. The sacred objects of the Swazi nation are always in her possession.

It was after the sudden death of his father, King Bunu, that the child Sobhuza was selected as his successor in 1899 (Kuper, 1978, p. 18). However, he could not assume that role until he reached majority. Queen Mother Gwamile, his grandmother, served as queen regent until

Sobhuza was installed as King in 1921. Until her death in 1925 at almost 100 years old, she was consulted on various matters. During her regency, Queen Mother Gwamile set up a fund, derived from taxes of employed Swazi men, to repurchase land alienated during Boer and British incursions during the 19th century. She had a tremendous impact on the Swazi people as Queen Mother.

When Sobhuza was installed as King, his mother Lomawa became iNdlovukati. During his long reign of 61 years, which encompassed three fourths of the colonial period, he survived three Queen Mothers including his mother, his mother's sister, and a wife, after his mother's sister's death. When he died, his wife's sister and cowife served a Queen Mother. He was the longest reigning monarch in the world at the time of his death.

As a traditionalist, Sobhuza II was unrelenting in his resistance to Indirect Rule and dual political structures. As a consequence, alternative political structures did not emerge until the eve of independence, which occurred in 1968. However, the Swazi National Council, used as a vehicle to squelch the emergence of political organizations, was a traditional structure expanded to the national level and was more democratic. The political leaders who did emerge in the 1960s had strong ties to the royal family.

When Sobhuza saw that the British government was intractable in its demand for a Westminister-style constitution, he formed his own political party, the Imbokodvo National Movement (I.N.M.), which worked in tandem with the major white settlers' political organization, the United Swaziland Association, and won Swaziland's first national election in 1964. After sordid legal maneuvers, the King decided to suspend the Swazi constitution and institute a more traditional form of government in 1973, at which time all political parties were banned.

The Swazi homestead, which exhibits a scattered settlement pattern, is composed of the homestead head, his mother (if she is alive), his brothers and unmarried sisters, and his wives and nonadult children (Ngubane, 1983, pp. 98–99). All adult males have their own dwelling and have access to land and cattle allocated by

the chief. A wife, upon marrying into a homestead, forms her own household. The formation of new households internally led to the eventual fissure of the homestead as it increased in size.

Insofar as productive activities are concerned, a wife is allocated land and has access to cattle. Provided that she has children, they will assist her in cultivating maize or sorghum and vegetables for their sustenance. Usually wives do the weeding, husbands the plowing, and everyone is involved in the harvesting. The homestead provides social security against the vicissitudes of wage employment and small business enterprise (Ngubane, 1983, p. 113).

Like Botswana and Lesotho, Swaziland has functioned as a labor reserve to South Africa. However, of the BLS countries, as the three are called, Swaziland sends the smallest number of male migrants to the South Africa gold mines. With its arable land and mineral resources, the sizable white settler population sought to exploit Swazi labor domestically. The asbestos, iron, and coal mines, and the sugar, cotton, and pineapple industries emerged as major employers, particularly of males.

The Swazi are patrilineal, prefer patrilocal residence, and prescribe clan exogamy (Kuper, 1967, p. 86). They permit cross-cousin marriage (Kuper, 1967, p. 104), practice the levirate and sororate, and allow woman–woman marriage according to customary law. In civil marriage, under Roman–Dutch law, only one marriage is permitted and any previous customary marriages by an individual are invalidated.

CULTURAL CONSTRUCTION OF GENDER

The Lion (iNgwenyama) and the She-Elephant (iNdlovukati) are viewed as twins whose roles complement each other. They perform a number of rituals (including rainmaking) together, and each seeks advice from the other (Kuper, 1961, p. 99). Kuper notes that the Swazis gave a more elevated status to women than other Nguni groups. Bonner (1983) suggests that is was Sotho influence that resulted in the higher status of the Queen Mother. The relationship between the Ngwenyama and the Ndlovukati was supposed to be replicated on the chiefly and homestead levels.

To analyze the construction of gender, I will focus on two ceremonies. The iNcwala is a ritual of kingship while the Reed Dance is one of queenship. Gluckman

(1938, p. 34) examines first-fruit ceremonies throughout southern Africa and suggests as social functions the regulation of harvests, such as corn and sweet sorghum, and the reduction of social tensions. The ritual is practiced among Nguni groups (Gluckman, 1938, p. 30). It is a time when the King can declare that a particular regiment may marry (Gluckman, 1938, p. 29). During the iNcwala, the king may be criticized.

The iNcwala ceremony coincides with the movement of the sun northward after the December solstice and with the waxing of the moon (Beidelman, 1966, pp. 376–377). The small iNcwala, in which the King's ritual representatives are dispatched to procure river and seawater to reinvigorate him, lasts for 2 days. It is followed 2 weeks later by the Great iNcwala which lasts for 4 days followed by a 2 day period in which the King is reincorporated into the nation. Gluckman suggests that the first half of the Great iNcwala maximized the supernatural powers of the King to partake of and act upon supernatural forces that animate the world. The second half represents a gradual decrease of the "dangerous, but potent, concentration."

In the liminal state created by the ritual process, unequal relationships can be addressed, such as those between men and women, between royals and commoners, etc. Beidelman (1966, p. 371) states, "Women have to assert license and dominance as against their formal subordination to men …"

Kuper (1972) analyzes the iNcwala in relation to a changing political context in which Swaziland was slowly moving towards independence. However, as time progressed and more people began to attend the iNcwala, conflicts arose between kingship and the developing political economy of Swaziland. Workers had difficulty obtaining release from work to attend the iNcwala. Christians were strongly opposed earlier in King Sobhuza's reign. The British colonial administration was ambivalent about the ceremony. However, by the 1960s, teachers and other members of the new elite began to participate in the ceremony (Kuper, 1972, p. 608). Churches became less antitraditional, as did the colonial administration, as Swaziland's independence approached. Members of both constituencies attended the Incwala as participants and observers.

The Reed Dance or Umhlanga ceremony is a women's ritual attended by mothers, grandmothers, and aunts of the young girls who participate in honor of the Queen Mother (Twala, 1952, p. 97). This ceremony is

considered equivalent to the Lusekane or male circumcision (Twala, 1952, p. 103–104). In preparation for the ceremony, the young dancers go to an area near Manzini to collect reeds for the Queen Mother to use in the construction and maintenance of her house. Girls are spatially segregated while dancing and also exhibit status differences in their dress.

An added dimension of the Reed Dance is that the King observes the dancers and selects wives from among them. When King Sobhuza died, he was reputed to have had approximately 50 wives and 120 children. The Reed Dance, like the Incwala, is a national event attended by tourists, governmental officials, embassy personnel, and members of the dancers' matrilineage.

GENDER OVER THE LIFE CYCLE

There is age grading among males and females in Swazi child socialization. For further discussion, see "Gender-Related Social Groups."

Socialization of Boys and Girls

Swazi child socialization consists of eight periods from birth to "almost an ancestor"(Kuper, 1963, p. 50). A baby is not named and is described as a "thing" and cannot be handled by men until it is 3 months old. It remains a baby until it is 3 years old and has "teeth to chew" and "legs to run," at which time it is weaned. It is no longer carried on its mother's back and is encouraged to associate with its peers (Kuper, 1963, p. 51). The small child spends hours in the company of children slightly older than itself with whom it plays, sings, and learns accepted rules of behavior. A gender division of labor is seen in play that reflects the adult world. Small boys model clay oxen and automobiles, and girls pretend to grind grain and cook and style each other's hair. Also, emulating adults, children build miniature huts where they enact the roles of their kinspeople, and learn riddles and verbal memory games. Boys also create wire wagons and other toys to play with. These toys and other wire items, such as ashtrays and bowls, are now sold to tourists. The old women with whom weaned children reside tell them tales and fables that have a moral. Children are also prepared for ritual occasions with legends from clan and tribal history.

At age 6, a slit is made in the earlobes of both boys and girls (Kuper, 1963, p. 51). In terms of gender roles, boys are prepared to assume positions in the public sphere and prepared for physical endurance, while girls have less free rein and are encouraged to perform domestic duties such as drawing water, gathering wood, planting crops, cooking, and smearing dung on hut floors. In addition, at this age, boys and girls enter primary school.

Puberty and Adolescence

This is the period in which children start to sleep separately from their grandmothers, and boys and girls sleep separately from each other. Currently, no circumcision rites are practiced for either gender in Swaziland because during precolonial times there was a concern about the risk of mortality from circumcision. For pubescent females, certain menstrual taboos on public behavior have to be maintained (Kuper, 1961, p. 52). Pubescent girls were expected to marry a man several years their senior while boys had to delay marriage until the King gave their age regiment permission. For males, marriage confers on them "full tribal responsibilities and privileges." Married women achieve high status when they bear their first child. Later, when a son is married, his mother reaches her highest position in his home.

Attainment of Adulthood

While the attainment of adulthood for males and females was marked by initiation rites during the precolonial period, it is usually marked now by a student leaving school to enter the labor force. That could occur after one leaves junior high school, high school, or university. The level at which one enters the labor force determines one's earning potential, ability to acquire land and build a house, contract a marriage, and gain job security. Nevertheless, despite urban migration, the Swazi maintain close ties to their rural homesteads, which are dwindling in size.

Middle Age and Old Age

Middle-aged people, both men and women, hold some of the highest positions in the public and private sectors. However, in public sector jobs, the retirement age is 60. As the social welfare system is not highly developed in Swaziland, working people contribute to provident funds throughout their working lives in order to retire with a pension.

Traditionally, Swazis have placed great emphasis on status and role throughout the life cycle. Therefore elderly women and men are venerated and cared for by the young. The elderly, in turn, supervise the education of younger generations and lead ritual activities in the community level. However, the average life expectancy at birth is decreasing. It is 53 for men and 62 for women without AIDS, and 40 for men and 41 for women for persons with AIDS (U.S. Census, 2000, p. 1).

PERSONALITY DIFFERENCES BY GENDER

Men are socialized to be assertive and to play public roles, while women should speak in lowered voices and are not expected to challenge the patriarchy. However, Swazi men are adjusting to women being more visible in the public sphere and assuming leadership roles. It is sometimes observed that women are more serious about academic and work performance.

GENDER-RELATED SOCIAL GROUPS

Men and women form age sets in Swazi society (Kuper, 1963, p. 57). Men's age sets were traditionally regiments that could be called into battle during the precolonial period. During the period of Kuper's field research, they performed public service. Some of these young men lived in barracks near royal or chiefly homesteads. Women's age sets are less formal; they consist of work parties of unmarried and married women, and are not given a common name nationally.

In contemporary Swaziland, women and men are involved in a variety of social clubs locally, nationally, and internationally.

GENDER ROLES IN ECONOMICS

There is a pronounced spatial segregation between areas of male and female employment thereby perpetuating a tension between family life and livelihood. Matsapha Industrial Estate has become home to most of Swaziland's manufacturing industries. Whether males sought employment in the gold-mining industry or in Swaziland's domestic industries, they had to migrate from their homesteads to work. However, because Swaziland is a small country, all areas of the country can be reached within 2 hours. This enables men to travel home more frequently.

Swazi women, who could not be employed in South Africa, were employed as seasonal laborers and food processors in the agricultural sector. A 1963 law prohibited women from all the B.L.S. countries crossing to South Africa for employment. Other areas of employment for Swazi women in the postcolonial period include domestic service, clerical work, and sales. In the mid-1980s, when economic sanctions were imposed on South Africa, more textile and clothing jobs were generated in the manufacturing sector. In general, women receive lower wages than men, although they are relatively well educated.

Swaziland has invested heavily in the development of tourism. Major ceremonies, such as the iNcwala and the Reed Dance, not only have national ritual prominence as icons of traditionalism, but they also attract tourists. Swaziland has a number of nature reserves and some five-star hotels with casinos. The latter are legacies of the apartheid era when white South Africans flocked there at weekends.

Swaziland's economy has continued to experience growth in the post-apartheid period. However, the birth rate has surpassed the rate of economic growth. As the HIV/AIDS epidemic has become entrenched in southern Africa, Swaziland has not been spared. At the end of 1999, it was estimated that 25.3% of the adult population was living with HIV/AIDS (US Census, 2000, p. 1). By 1998, one third of pregnant women and a quarter of 15–19-year-olds were HIV-positive. This has to be factored into any projections on the future of Swaziland's economy.

PARENTAL AND OTHER CARETAKER ROLES

Childcare is the primary responsibility of mothers, whether single or married. Instead of contracting customary and civil marriages, many women and men have multiple partners and children with those partners over a period of years. Because *lobola* (bridewealth) has not been exchanged, children from these relationships belong to the mother's family. However, in subsequent relationships, the boyfriend might be willing to support

the woman and their children, but refuse to support children by a previous relationship. Those unsupported children might be sent to live with their maternal grandparents. The boyfriend might have a wife and/or other girlfriends. The displacement of these children, along with the AIDS epidemic, contributes to Swaziland's growing orphan population.

Secondary education is not free in Swaziland. Mothers often pay for their children's school fees, uniforms, and supplies. They are concerned about their children's education and view it as a key to their upward mobility.

LEADERSHIP IN PUBLIC ARENAS

Men are the prominent members of traditional institutions and serve as chiefs and headmen. They are also prominent in Western institutions. However, there are a few women ministers in the prime minister's cabinet and some ambassadors. The long-serving vice-chancellor of the University of Swaziland is a woman. There are and have been women heads of department and deans in the university.

GENDER AND RELIGION

Ritual permeated indigenous Swazi society. The iNcwala ceremony is viewed as a major ritual of kingship only performed during the reign of kings and not during periods of regency. Unlike other areas of Africa, where there has been some syncretism between indigenous and colonial religions, this has not been the case in Swaziland. Early missionaries represented the Wesleyan, Zionist, African Methodist Episcopal, Anglican, and Catholic churches. Most were established in the late 19th century. However, there are those who participate in both traditional and Western religious spheres. About two fifths of Swazis are traditionalists.

During the colonial period, many churches threatened to excommunicate their parishioners if they participated in the iNcwala (Kuper, 1972, p. 608). Elijah Nxumalo, the grandfather of King Sobhuza II, was the first Swazi Methodist minister. His eldest son, Benjamin, an adviser to King Sobhuza, was a member of the African Methodist Episcopal Church.

Women were among the early converts to Christianity. Queen Mother Gwamile did some networking for land reclamation through the Wesleyan Church (Booth, 2000, pp. 184–185) and her sister, Johanna Nxumalo, was a member of the Zionist Church (Kuper, 1972, p. 609). Queen Mother Nukase had been a member of the African Methodist Episcopal Church.

King Sobhuza only flirted with Christianity and viewed it as a threat to Swazi patriarchy as manifested in polygyny, witchcraft, and drinking of beer (Booth, 2000, p. 291). Christian doctrine was considered very attractive to women, in part because of their concerns about polygyny and extramarital affairs by their husbands. In an effort to control its development in Swaziland, in 1939 King Sobhuza proposed the formation of the National Swazi Church representing a number of independent churches. It was composed of independent churches and its name was changed to the United Church of Africa in 1944.

LEISURE, RECREATION, AND THE ARTS

Swazis attend traditional ceremonies such as the iNcwala and the Reed Dance as well as family gatherings and club functions. They attend movies, go to discos and casinos, and picnic at game parks.

In some of the more traditional settings, women and men are spatially segregated and are expected to wear traditional dress. At social gatherings, women might do most of the cooking and chat together.

RELATIVE STATUS OF MEN AND WOMEN

Swazi men are accorded considerably higher status than women. Patriarchal tendencies present in precolonial culture have been rigidified by the ideology of traditionalism. Swazi women do not have the same employment opportunities as men, who can work in the well-paid mining industry in Swaziland or South Africa. Women, often single heads of household, are confined to the manufacturing and service sectors, where they eke out a living to support their children.

SEXUALITY

Sexuality is probably the most difficult area to analyze. Prior to World War II, men exercised considerable control over women's sexuality under a polygynous system.

However, that has gradually broken down, with young men and women having multiple sexual partners. Marriage eludes some women altogether. Many men contract a civil marriage but have one or more long-term girlfriends. Some women have children by a variety of men, thereby contributing to an increase in the number of female-headed households.

In my 1989 survey of Swaziland's textile and clothing workers, I found that 66% of my respondents were single, 20% were married, 5% were separated or divorced, and 2% were widowed (Harris, 1993, pp. 153–157). Eighty-two percent of respondents had children regardless of marital status. Sixty-eight percent of single women and all the married women in the textile and clothing industry had children. Fifty-three percent indicated that they wanted more children, while the same percentage indicated that they used some form of birth control (Harris, 1993, p. 157).

COURTSHIP AND MARRIAGE

Derman (1977, p. 121) identifies three types of marriages: love marriages, marriages within defined kinship categories, and devised marriages initiated by the groom's or bride's family.

Cattle are provided by the groom's family to the bride's family (*lobola*) to establish a marital bond. The number of cattle are determined by the social status of the bride. It is only after all the *lobola* is paid that the groom has the right to all children born of the union. Otherwise, the children belong to their matrilineage. Traditionally, it was the prerogative of aristocratic and commoner males to have multiple wives under customary law, while the reverse was not permitted. Males can also negotiate a cowife, usually a sister, for a wife who is infertile or produces no male issue. Clan ranking is rather vague in the ethnographic literature. Although it is a consideration in contracting marriages, clan ranking becomes significant on the death of the King or homestead head and serves as the basis for choosing a successor (Kuper, 1967, pp. 94–95). In the case of royal succession, there is the dictum that the Queen Mother should have only one son (Kuper, 1967, p. 98).

Allen (1973) conducted a survey of Swazi households immediately after independence. Women who participated in the survey were very concerned about their legal status (p. 102). They could not pledge allegiance

(*khonta*) to a chief which would give them land rights. Inside marriage they were legal minors, while outside it they had no legal standing (p. 105). Furthermore, by Swazi custom women were prohibited from transacting business, having a bank account or inheriting their husband's estate by (p. 112). These problems troubled women in providing security for their families.

Although Swazi custom dictated that marriages be arranged by the parents, Allen found that parental choice was no longer exercised, with young people deciding for themselves and seeking their parents' consent afterwards (Allen, 1973, pp. 121–122). There is more pressure for unmarried women to engage in premarital sex which is contributing to a higher premarital pregnancy rate (pp. 132–133). However, some young urban women were opting to remain single because they could not be assured of marital fidelity (pp. 128–9).

Ngubane (1987, pp. 179–180) laments the fact that *lobola* or bridewealth is being paid in cash rather than cattle in contemporary marriage transactions. She views sisters and brothers as being linked in marriage exchanges, and says that cattle not only serve to legitimate children but are also insurance against prolonged spousal abuse.

In the early 1970s, very few Swazi women used any form of birth control. Swazi women viewed their fecundity as being reflective of God's will, with 98% of rural women and 91% of urban women responding affirmatively (Allen, 1973, p. 159). First births were earlier in rural areas (pp. 341–343). In rural areas, 50% of first children were born before their parents were married; in urban areas, 65% were born before marriage. Thirteen percent of urban children and 8% of rural children were born of casual relationships. Almost all urban women and 80% of rural women disliked polygyny (p. 133).

As the HIV/AIDS epidemic has escalated, Swaziland has legislated HIV marriage certificates. There has been some publicity about forged documents.

HUSBAND–WIFE RELATIONSHIP

When the husband is present in a household, he is usually considered the primary breadwinner and performs very few household duties. The wife is responsible for managing the household and supervising the children, regardless of her employment status. In middle-class households, wives often have servants. Husband and wife rarely display affection in public.

Working-class women often rely on female consanguines to assist them with childcare. In turn, older children are more likely than husbands to assist their mothers with housework according to my survey of Swaziland's textile and clothing industry (Harris, 1993, pp. 159–160). Most decision-making by these women included the participation of other family members.

OTHER CROSS-SEX RELATIONSHIPS

Traditionally, Swazis practiced mother-in-law and father-in-law avoidance. However, there are close ties between brothers and sisters, fathers and daughters, and mothers and sons. Relationships between students and teachers and between employees and employers of the opposite sex are rather distant but tend to be respectful.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The Swazi experienced a protracted and turbulent interregnum after the death of King Sobhuza II in 1982. His son, Mswati III, was finally installed as King in 1986. Like his father, he is opposed to total democratization in Swaziland. The mounting discontent against royal control of the Swazi political economy also provides a commentary on gender relations. The principal dissidents, for the past 15 years, are members of a group called the People's United Democratic Movement (P.U.D.E.M.O) which is closely aligned with the trade unions. Women are active members in P.U.D.E.M.O and some serve in leadership positions.

Taiwan

Chien-Juh Gu and Rita S. Gallin

LOCATION

Taiwan, an island sometimes referred to as Formosa, is located in the western Pacific, approximately 100 miles off the southeastern coast of China.

CULTURAL OVERVIEW

Incorporated into the Chinese empire during the Tang dynasty (618–907), the island has not always been an integral part of China, having been occupied by the Dutch (1624–61) and Japanese (1895–1945). With Japan's defeat in World War II, the Kuomintang (K.M.T.) government took control of Taiwan, retreating there in 1949 after losing the civil war to the Chinese Communists. Since then, Taiwan and Mainland China have been separate political entities. In 2000, Chen Shui-bien, leader of the opposition Democratic Progressive Party (D.P.P.), won the presidency, ending de facto K.M.T. rule.

The officials, soldiers, and supporters of the K.M.T. who came to Taiwan created a clear ethnic distinction between Mainlanders (post-1945 immigrants who are primarily Mandarin speakers) and Taiwanese (pre-1945 immigrants who speak Hokkien and Hakka). By 1991, Taiwan's population was made up of 75% Hokkien, 8% Hakka, 14% Mainlanders, and 2% aborigines. (Of Austronesian descent, aborigines were the original inhabitants of the island.) Under K.M.T. rule, Mainlanders were an advantaged ethnic group, enjoying greater access to political and social resources than Taiwanese. Many Taiwanese considered themselves oppressed, and ethnic differentiation is a source of tension on the island.

With massive infusions of aid from the United States, the K.M.T. government engineered the transformation of Taiwan from a "developing" island to a "newly industrialized country" (N.I.C). Initially strengthening agriculture to provide a base for industrialization, the K.M.T. adopted a policy of industrialization through export in the 1960s. By 1990, Taiwan was the world's 13th-largest trading economy, a producer and exporter of high-technology as well as consumer goods, and its populace had a per capita income of more than $8,000 and a level of education resembling that of people in developed rather than developing countries (S. Harrell & Huang, 1994). An economic "miracle" (Gold, 1986), Taiwan's industrial structure is based on and sustained by vertically integrated and geographically dispersed small-scale businesses.

Contemporary culture reflects this interlocking context of historical, political, and economic processes. Taiwan is both traditional and progressive; a continuity of the past and a discontinuity from that legacy; unique and related to the cultures with which it interacts (S. Harrell & Huang, 1994). Therefore contemporary Taiwanese culture is built on an ambivalent struggle between convention and modernity, native and foreign, and local and cosmopolitan. These contradictory tendencies are inevitably reflected in social attitudes and practices. While Western feminist thought has affected some middle-class women and men, traditional patriarchal norms continue to exert their constraints.

CULTURAL CONSTRUCTION OF GENDER

The cultural aphorism "men rule the outside, women the inside" (*nan zhu wai, nu zhu nei*) highlights the Taiwanese world view of gender. Although the constitution abrogates this expectation by guaranteeing women equality with men (Chiang & Ku, 1985), a woman is expected to be a virtuous wife and good mother (*xian qi liang mu*), even if she is highly educated (Tzou, 1999). Constructed as mutually exclusive categories in the education curricula, femininity and masculinity are defined as attributes of biology and central to the harmonious and efficient functioning of the family. Women are expected to embody the strengths of "obedience, … reticence, [and] adaptability" (Lang, 1946, quoting Confucius) and to accept an image of themselves as less important than men.

While the idea of gender is inscribed with Confucian morality, beauty standards are drawn from the West.

As the culture of consumer capitalism penetrates the island, white skin, round eyes, high-bridged noses, oval-shaped faces, large breasts, slender bodies, and long legs have become symbols of female beauty and attractiveness. However, standards for men are less exacting. While to be tall is the "basic" preferred bodily feature for men, power and status counterbalance any deprecated physical characteristics.

GENDER OVER THE LIFE CYCLE

Different stages in the life cycle are named, although who falls within a specific grouping is not rigidly defined. The period before formal schooling begins is labeled *you er qi*, but no term is attached to that of elementary school (ages 6–12); the notion of childhood (*tong nian*) includes *you er qi* and the period spent in elementary school. Adolescence is called *qing chun qi*, literally teenage years. Adulthood (*qing zhuang nian qi*), depending on definition, begins at age 16, 18, or 20 and continues until middle age. This latter period (roughly ages 40–60) is labeled *zhong nian qi*. Old age (which begins after 60 or 65) is called *lao nian qi*.

Socialization of Boys and Girls

Taiwan's patrilineal kinship structure recognizes only male children as descent-group members with rights to the family's property. In general, residence is patrilocal; when a woman marries, she leaves her natal home to live as a member of her husband's family, severing her formal ties with her father's household. Parents consider daughters a liability—household members who drain family resources as children and withdraw their assets (domestic labor and earning power) when they marry. Sons, in contrast, steadily contribute to the family's economic security during its growth and expansion and provide a source of support in old age. Not surprisingly, parents strongly prefer male children.

Parents are fonder of boys, pay more attention to them, and are more indulgent of them than girls. From an early age, girls are expected to help with the myriad tasks their mothers perform, while their brothers experience much greater freedom. This differential treatment is intentional. In preparation for a woman's move to another family at marriage, a mother socializes her to be an able worker, submissive daughter-in-law, and obedient wife.

Male socialization, in contrast, encourages the construction of bonds of sentiment between mothers and their sons who will stay in the family and provide for parents in their old age (Wolf, 1972).

Parents also tend to "invest" more financially in boys than in girls. Epithets such as "spilled water" and "goods on which one loses one's capital" are applied to girls but never to boys. Accordingly, prior to industrialization, boys were more likely to attend primary school than girls. Although a boy's education might be terminated because of a family's poverty, many families minimized expenses to assure a son's education. After 1969, when junior high school education was made free and "compulsory," almost all elementary school graduates continued their education. But fewer girls than boys attend senior high school, for which students must take highly competitive entrance examinations (Gold, 1996).

Puberty and Adolescence

The enforcement and reinforcement of gender difference primarily takes place in school during adolescence. Curricula are gender biased and students are tracked into sex-stereotyped fields. Girls are encouraged to study humanities and fine arts, while boys are advised to study natural sciences and computers (Farris, 2000). Separate schools for girls and boys, which are common, also encourage gender difference. Even schools that admit both genders, usually assign girls and boys to separate classrooms or seating areas within classrooms. Ironically, however, the notion of difference inculcated by such practices is blunted by the rigid dress codes enforced in elementary and secondary schools. Uniforms and, until 1987, prescribed short hair cuts, as in the military, produce analogous and well-disciplined bodies.

Well-disciplined bodies are necessary for adolescents who are expected to concentrate on their studies, as dictated by Confucian values. Gender segregation prevents students from developing cross-sex relations that might distract them from their studies, while dress codes discourage them from focusing on their appearance. As a result, young women and men have little contact with each other before entering college, tend to form same-sex peer groups, and embrace norms of beauty usually only after graduating from senior high school. In short, educational practices that impose difference and encourage spartan behavior create conscientious students who will become the type of citizens required by Taiwan's political economy.

Attainment of Adulthood

Legal definitions of adulthood vary. Under some codes, adolescents are considered adults at age 18 when they are eligible for a driver's license; under others, they are not adults until age 20 when they can exercise their civil rights. Social definitions of adulthood also vary. In rural areas, many girls are considered young adults at age 16, and are deployed to the labor market to earn money while boys are still thought to be adolescents who need to continue their schooling (L. Kung, 1994). Regionally, people in Tainan (southern Taiwan) celebrate both girls and boy's attainment of adulthood at age 16. In other urban areas, formal rites are conducted in temples, but usually only for boys. Despite these differences, most parents believe that children do not become adults until they marry, a rite that heralds their maturity and capacity to assume responsibility for a family.

Middle Age and Old Age

The roots anchoring the age hierarchy in the Taiwanese family are the Confucian principles of filial piety (*xiao*) and veneration of age. Filial piety demands obedience and devotion to parents, obligating children to repay parents for caring for them and ensuring the elderly support in their later years. Veneration of age demands a similar obedience. It requires children to honor the strategic knowledge and skills of their elders with deference, respect, and compliance. Despite these dictums, the degree of respect accorded to elders varies by class, and control of resources important in a capitalist economy shapes the treatment of and respect accorded to older people. Those with assets are able and those without resources are unable to achieve a secure old age (R. S. Gallin, 1986, 1994). Different criteria are applied in the case of gender, however. While men are more likely to be evaluated according to the resources they control, women's worth is assessed in terms of family. Those with established families receive respect while those who are single (*lao chu nu*, "old virgins," or *lao gu pao*, "old aunts") are considered failures and stigmatized.

PERSONALITY DIFFERENCES BY GENDER

Gendered forms of nurturing to a large extent shape children's personality. Boys are raised to be dominant, assertive, and goal oriented, while girls are taught to be passive, obedient, and adaptable. Accordingly, men are inclined to be independent, whereas women tend to be dependent. The sparse research available indicates that women across all marital statuses score higher than their male counterparts on measures of depressive symptoms (H. M. J. Kung & Farrell, 1992). Among the reasons offered for this phenomenon are the burden of multiple roles and social expectations (Y. H. Hu, 1990), unbearable marriages/households (Wolf, 1975), and social isolation (Selya, 1985).

GENDER-RELATED SOCIAL GROUPS

Patrilineality is the primary organizing principle of Taiwanese life (see Section on socialization), and social institutions are mainly structured around men. Kin relations beyond lineage, lacking institutionalization, receive little scholarly attention. Nevertheless, with industrialization, matrilateral and affinal relationships are becoming more important than heretofore (B. Gallin & Gallin, 1985). For example, although women are expected to devote themselves to their husbands' families, many use their "private money" (*sz fang chien*) to help their natal families financially (R. S. Gallin, 2000; Tsui, 1987). Further, the weakening utility of lineage groups that accompanied industrialization made associations such as fictive kinship groups assume new importance, particularly for men (B. Gallin & Gallin, 1977).

GENDER ROLES IN ECONOMICS

The Labor Standards Law guarantees pay equity (M. J. Cohen, 1988), but in the mid-1990s women earned only 66.9% of men's monthly earnings (Council of Labor Affairs, 1995). Equal employment opportunity legislation has not been enacted, and during 1984–94 women's participation in the labor market remained around 45.5% (Council of Labour Affairs, 1995). Also, the majority of women are located at the lower end of the production relationship and are not owners of the means of production (Chou, 1994). (While statutory law gives daughters the right to inherit a family's property, customary law demands that they "voluntarily" give up this right in favor of their brothers [H. X. Chen, 1996].)

Several factors contribute to women's disadvantaged economic position. First, the predominant form that businesses take in Taiwan is the family firm and, because this enterprise replicates the domestic unit's gendered division of labor, it fosters a stratified workforce (Greenhalgh, 1994; Lu 2001). Second, women's education is limited relative to men's, and education plays a key role in placing people in occupations (Yu, 2001a). Third, managers use ideas about gender to promote hierarchy in the workplace, relegating women to jobs that are low paid with little opportunity for promotion (R. S. Gallin, 1996). Fourth, ingrained understandings of women and men's roles means that women, to accommodate their reproductive responsibilities, accept part-time and/or temporary work that preclude their career development.

Despite these obstacles, women's productive activity has subsidized Taiwan's "economic miracle." A labor shortage in the 1970s prompted the government to implement the "Living Rooms as Factories" program (Hsiung, 1996). Designed to bring "surplus" labor into production, the program drew large numbers of married women into the labor force as factory workers and industrial outworkers. In fact, since the 1970s, the participation of married women in the work force has increased at a faster rate than that of single women (Hsiung, 1996). This increase reflects the fact that many married women must work to sustain the family's living standard (Yu, 2001b). Because most businesses are small scale and production tends to be labor intensive, earnings are relatively low and an average monthly pay check is insufficient to meet a family's consumption needs. Thus married women's income ensures the viability of the family. It also ensures the viability of family firms that depend on women's unpaid and underpaid labor to survive. Capitalism and patriarchy intersect on the island, supporting Taiwan's comparative advantage in the world system and reproducing traditional family hierarchies and gender relations (Cheng & Hsiung, 1992; Diamond, 1979; R. S. Gallin, 1984a, 1989; Gates, 1979; T. L. Hu, 1984).

Since the 1990s, however, Taiwan's competitive advantage has declined as wages and production costs have risen. As a result, increasing numbers of businesses, attracted by low-wage labor and minimal production costs in Southeast Asia and China, have transferred production offshore. This industrial transformation has left numerous women laborers unemployed and laid off without severance pay. It has also created a crisis in marriage; many Taiwanese businessmen support mistresses overseas.

PARENTAL AND OTHER CARETAKER ROLES

Although many married women participate in the labor force, traditional norms regarding gender roles persist (R. S. Gallin, 1995; Yu, 2001b). Men are considered "breadwinners", while women are deemed the primary caregiver in the household. Ethnicity and class, however, intervene to shape gendered divisions of labor. Mainlander and middle-class men tend to be more involved in domestic work and child rearing than their Taiwanese and lower-class counterparts. Patterns of cohabitation also create varied caretaking arrangements. Three-generation cohabitation is common, particularly in the rural area, but conjugal families are the dominant residential form; approximately 58% of families take the simple form (Brinton, 2001). The presence of a mother-in-law in the household decreases the demand for a woman to provide intensive childcare. Nevertheless, even a woman living in a conjugal family may depend upon her husband's mother for childcare. However, generational differences in raising children often create tension between mothers-in-law and daughters-in-law (Olsen, 1973, 1976).

As a result, in the 1990s foreign-born "nannies" became increasingly popular among dual-earner families in urban areas. In 2001, more than 110,000 foreign women were employed as domestic workers on the island. Ninety-three percent were from the Philippines and Indonesia, while the remainder were from Thailand and Vietnam (Council of Labor Affairs, 2002). In addition to childcare and housekeeping, such workers may also care for aging parents. Placing parents in nursing homes (an urban phenomenon) is stigmatized as irresponsible and immoral.

The presence of foreign domestic workers has reduced married women's workload and changed the dynamics between generations of women in the household. Some daughters-in-law hire housekeepers to resist three-generation cohabitation or to minimize the intervention of their mothers-in-law in domestic affairs (Lan, 2003). In such instances, daughters-in-law and domestic workers may become "comrades" in the face of an imperious older woman. In a similar vein, older women who do not live with their children may develop personal ties with their migrant caregivers, forming fictive kin relations with them (Lan, 2003).

LEADERSHIP IN PUBLIC ARENAS

Since the introduction of a quota system in 1954, women have increasingly won more than their minimum reserved seats at the local, provincial, and national levels (Clark & Clark, 2000). Nevertheless, men continue to hold major political power and resources (Chou, 1996; Peng, 2000). Although, in the mid-1990s, women held about 20% of the seats in the National and Provincial Assemblies and 15% of positions at the local level, only 5.7% of cabinet and deputy ministers were women (R. J. Lee, 2000). The first woman vice-president, Annette Lu, was elected in 2000. However, numerous male politicians defy her authority. The first female minister of the Ministry of Economic Affairs, Chai-Yi Chung, was frequently humiliated by legislators and forced to resign two months after she was appointed in 2002. Although the underdeveloped political skills of these women might be partly responsible for their mistreatment, gender was also a factor. Embedded in a male-dominated environment, women politicians encounter many more obstacles than their male counterparts.

Before martial law was lifted in 1987, most women politicians were from privileged or political families. In the 1980s, however, wives and widows of Taiwanese political prisoners, using electoral platforms as forums against the K.M.T., ran several successful campaigns; they also helped to establish the opposition party (Arrigo, 1994). Nevertheless, the field of women candidates only become heterogeneous in the 1990s (Peng, 2000).

Women's participation in politics, in general, remains disproportionately centralized in women's organizations concerned with issues such as child welfare, education, and community reform. (Men, in contrast, focus on issues such as labor, politics, and the environment.) Although the feminist movement began in 1972, it has struggled to win adherents to its cause (Ku, 1988, 1989), in part because most of its leaders are Mainlanders (Clark & Clark, 2000; Fan, 2003). Their predominance began to wane in 1994 as more Taiwanese joined feminist movements. However, high levels of education and wealth continue to characterize women leaders in feminist and other social movements.

GENDER AND RELIGION

Syncretism is the hallmark of religion. Blending Daoist, Confucianist, Buddhist, and animist beliefs, people worship a pantheon of supernatural figures. The scheme of gods and goddesses is a complex of many traditions that fuses both bureaucratic and nonbureaucratic orders (Shahar & Weller, 1996). Religion is not a simple reification of patriarchal hierarchy, and female deities, such as Mazu and Guanyin, occupy prominent positions in the pantheon of popular religion (Sangren, 1983; Shahar & Weller, 1996).

Women are not necessarily more religious than their male counterparts, but they are more likely to volunteer in religious activities and to choose religion as a lifetime career (W. A. Chang & Lin, 1997). Those who belong to groups restricted to nuns enjoy greater respect than those who are members of communities accepting nuns and monks (W. A. Chang & Lin, 1997). Reflecting the tradition which privileges male over female, the gendered hierarchy in Buddhism parallels the secular world. In the 1980s, when feminist thought gained popularity, women in Buddhist groups begin to receive more respect than earlier (W. A. Chang & Lin, 1997).

LEISURE, RECREATION, AND THE ARTS

In general, men have more leisure time than their female counterparts. However, region and age intersect with gender to shape patterns of recreation. Urban men of working age socialize with friends and play cards or mahjongg in their leisure time. Drinking is a unique aspect of their culture, and men often visit pubs where young women, dressed in a highly sexualized manner, serve food and drink. Women, when they have "spare time," shop, participate in community service organizations, and visit temples. Both men and women frequently join relatives and friends in restaurants and visit night markets, a ubiquitous feature of Taiwan's cities and towns, where a variety of traditional food and inexpensive commodities are available. While the elderly may be included in meals with relatives at restaurants, most primarily interact with their contemporaries. Both women and men commonly walk or exercise in parks. Older men also gather in parks or temples to play chess and/or to drink tea and chat. Older women may volunteer to help with chores at local temples, but many care for grandchildren in their homes or do industrial outwork to earn "pocket" money.

In the rural area, married women take care of domestic work and do industrial outwork in their "leisure" time. Men, in contrast, watch television, gather at a local venue

to chat, or occasionally visit local pubs with friends or business associates. Older women often chat with friends or play cards during the day, if they have no grandchildren for whom they care. Often, however, like their male counterparts, they farm because young people no longer wish to do this. Regardless of gender, the rural elderly tend to spend their evenings quietly at home.

Young people also spend their leisure time differently. Boys and girls in elementary school occupy different spaces when engaging in extracurricular activities (Yang, 1999). Boys tend to play sports or other physical games outdoors, while girls mainly stay indoors and engage in passive activities. This gender difference is carried into adolescence and early adulthood. Nevertheless, male and female youth share similarities that reflect adolescent culture; "internet cafés" are a favored place to spend leisure time. Given the highly competitive examinations that teenagers must pass to attend senior high school and college, however, the majority spend their "leisure" time at tutoring classes organized to prepare them to surmount these barriers.

RELATIVE STATUS OF MEN AND WOMEN

In a patrilineal society, men's status is higher than that of women; although women's status increases with age and the birth of sons, it remains lower than that of any man. Men are accorded a variety of privileges both legally and socially. They are more powerful in the public arena, more advantaged in the economic sphere, and more influential in the kin group and community than are women. They also have more control over the fruits of their labor and more access to important resources than do women (R. S. Gallin, 1992). Despite the fact that some middle-class men have become aware of gender inequality and are willing to concede opportunities to women in the productive and reproductive spheres, society continues to grant men more respect and privilege than women. Social and economic marginality mark women's experience.

SEXUALITY

Imbued with the traditional culture of modesty, people tend to avoid talking about sex-related issues. Some high-school teachers skip lessons about reproduction in health education because they are too embarrassed to talk about sex-related topics. Most parents also will not discuss sex with their children. Therefore, girls and boys, learn about sex primarily through the media. Women are particularly conservative because they are expected to guard their honor vigilantly. In some colleges, dormitories for women have curfews, reflecting the belief that women's bodies should be "protected" from potential physical danger and sexual activity. Such restrictions are not usually imposed in dormitories for men and, in fact, their residents frequently show pornographic movies publicly.

Within the culture of modesty, expression of sexuality is not allowed in childhood and adolescence, and it is discouraged in adulthood across class and ethnicity. Nevertheless, sexual activity is common among men. Pornographic magazines and videos are universally available, and abundant enterprises offering "special services for men" are located in urban and rural areas. In contrast to the license accorded men, women's sexuality is oppressed. Women's premarital and extramarital affairs are stigmatized, while those of men are considered "understandable" and "acceptable." Public discourse encourages unfaithful husbands to return to their marriages, but demands that "disloyal" wives divorce (J. S. Chang, 1999). Only women are considered responsible for the consequences of adultery, and women's sexual desire and pleasure are considered lascivious. Such conduct contradicts the image of women as virtuous wives and good mothers. Since the mid-1990s, however, some feminists (He, 1995) have advocated that women recognize and explore their sexual needs and desire. As might be expected, many men are threatened by this challenge, as are women who have conformed to norms of self-denial. Nevertheless, the idea of sexual emancipation is taking hold among the new generation.

Within this context of sexual liberation as well as feminist awakening a discourse on homosexuality emerged in the mid-1990s. Lesbian and gay men's groups burgeoned and collectives at universities pioneered the study of homosexuality (Castells, 2000). Despite the increasing number of young people who come out of the closet and devote themselves to promoting social acceptance, homosexuality remains stigmatized. Parents consider having a gay son or lesbian daughter a great shame. Hatred against homosexuals, especially gay men, is common. As a result, most homosexuals choose to stay in the closet, and lesbians and gays who join protests organized by the their communities often wear masks to disguise their identities.

COURTSHIP AND MARRIAGE

Traditionally, parents enjoyed a monopoly on marriage decisions. A family seeking a bride for a son engaged the services of a go-between or matchmaker to make inquiries on their behalf. Once a suitable young woman was found, the prospective bride's and groom's horoscopes were compared and, if they matched, their betrothal was secured by the transfer of gifts. The wedding was set and the bride moved to the home of her husband (B. Gallin, 1966). This tradition was modified in the late 1950s so that a young woman and man could see each and assess a tentatively chosen mate. However, because young people were unlikely to defy their parents, women married men—and men married women—with whom they had had no contact after the "initial meeting."

Marriage, then, was an arrangement between families not individuals. Its purpose was to join two people in order to produce children and to establish an alliance between affines. Accordingly, in seeking a daughter-in-law, the ideal was *men dang, hu duei* (to match gates), that is, to join families of similar socioeconomic and ethnic background. Marriages within the same class and ethnic group were typical, but occasionally brides would marry into higher-status families. Brides marrying downward were unlikely because a bride from a high-status family was unlikely to be able to adapt to humble surroundings.

With industrialization, this pattern changed. Young people are heavily involved in selection of a mate, pursuing romantic love and self-selecting their mate. Arranged marriages occur. However, after an initial meeting, dating, in the Western sense, follows to ensure the compatibility of the couple. Nevertheless, because the maintenance of family continuity requires that parents still be involved in negotiations (Thornton, Chang, & Lin, 1994), a prospective groom's family commonly ask a go-between to negotiate the process. She visits the prospective bride's family to propose the marriage, a practice known as *ti-qin*. Her goal is to negotiate between the two families so that the needs and interests of both are accommodated. Over a series of meetings, she mediates the terms of the "bride-price" (*pin jin*) and dowry (*jia zhuang*) (C. M. Chen, 1985; R. S. Gallin, 1991) and, if her efforts are successful, an engagement ceremony is held at the home of the young woman. The young couple exchange rings and the prospective groom and members of his family pay homage to his fiancée's ancestors and present gifts. While the custom of bride price had virtually been abandoned among middle-class urbanites by the 1990s, it continues to be practiced in the rural area and among many rural-to-urban migrants.

On the day of the wedding, the groom goes to the bride's house where he and she kowtow and bid farewell to her parents and the ancestors of her natal home. They then leave for a venue at which the wedding banquet, hosted by the groom's family, is held; in the rural area, this is usually the courtyard of the groom's home. A second banquet is often held the day after the wedding, hosted by the bride's family. But, many families, rural as well as urban, combine the two, inviting guests from the bride's as well as the groom's family.

Despite Taiwan's patrilineal system, women rarely change their surname after marriage. Although they are listed in official household records under their husband's surname, their maiden name remains affixed to their given name. Upon marriage, a woman's integration into her husband's family is far less traumatic than it was in traditional times. In contrast to her mother-in-law, a young bride has considerable resources available to deal with the older woman (R. S. Gallin, 1984b, 1991). In addition to the mutual affection that a couple develop during the betrothal process, a woman brings material and nonmaterial assets to her marriage that represent a serious challenge to the mother–son bond. A young woman's maturity may also play a role in her treatment upon marriage; in 1995, the mean age at marriage was 28.2 for women and about 30 for men (Brinton, 2001).

Fewer than five percent of people never marry (Brinton, 2001). As urban women's education and employment opportunities increase, some choose not to marry. Their male counterparts also refuse to marry highly educated career women who represent a challenge to their prerogatives. As a result, the number of foreign brides increased in the 1990s. Those who opt for this route find mates through transnational agencies operating in China, Vietnam, the Philippines, and Indonesia. Many men seeking wives overseas are the least privileged in society (e.g., the disabled, poor, and mentally retarded). Most foreign brides have few prospects in their countries of origin, and they hope to find a better life on the island. However, the intersection of class, gender, and ethnicity give rise to a complex of power dynamics, and the "dreams" of foreign brides are not always realized. Media reports of

problematic marital relations and domestic violence are common.

Husband–Wife Relationship

Few studies of husband–wife relationships have been conducted in Taiwan, although it is likely that these vary across class, ethnicity, region, and age. In general, however, young people seek romantic love and affection in marriage, while older people value deferential wives and responsible husbands able to ensure the viability of the family (R. S. Gallin, 2002). Within the household, the traditional gendered division of labor prevails, although exceptions have been found among some middle-class families. When both husband and wife hold egalitarian values and are highly educated, and when a wife contributes a high ratio of income to the household budget, a husband tends to share domestic work (M. L. Lee, Yang, & Yi, 2000). Nevertheless, given the obduracy of the *wai-nei* division, even women who contribute substantially to the domestic unit as workers in family businesses retain sole responsibility for housework and childcare (R. S. Gallin & Gardner, 1995; Lu, 2001).

In contrast to the older generation, most younger couples jointly participate in household decision making. However, Mainlander women usually have more power in decision-making than their Taiwanese counterparts (M. L. Lee et al., 2000). Nevertheless, regardless of ethnicity, many wives publicly defer to their husbands to give them "face," thereby demonstrating that their husbands hold absolute power in their relationship (Hsieh & Wang, 1995).

The divorce rate in Taiwan has been rising. Approximately one in four couples obtained a divorce in 1999 (Lei, 2000), although the rate is higher in urban than rural areas. According to civil law, both husbands and wives can initiate divorce. Until 1996, a divorced father had sole rights to children upon dissolution of a marriage. Currently, a couple seeking divorce jointly participate in making arrangements for child custody. If parents fail to reach an agreement, a judge makes the decision. This change has helped divorced women obtain custody of their children. Yet, because of women's disadvantaged position in the economy, divorced women suffer financial hardships, especially when they have child custody. Moreover, few divorced women request child support, further exacerbating their difficult financial situation (Lei, 2000).

Other Cross-Sex Relationships

Cross-sex friendships are common in urban areas. When a young woman and man go out together (e.g., to eat, shop, or see a movie), romantic love and courtship are not necessarily involved. Even when a woman invites a man friend to her home, no sexual intent is assumed. In other words, single women and men develop cross-sex friendships quite casually. However, married urbanites are cautious about such relationships, fearing that gossip might jeopardize their marriages.

Dyadic cross-sex relationships are less common in the rural area. Rather, young women and men tend to form friendship groups that cross gender. In general, however, when young men and women of marriageable age start dating, their relationship soon becomes a courtship rather than a friendship. Given the constraints associated with life in small bounded rural communities, cross-sex relations among married people are rare.

Changes in Attitudes, Beliefs, and Practices Regarding Gender

Taiwan has changed rapidly during the past decade. The lifting of martial law in 1987 moved the political system from a K.M.T. monocracy to a multiparty democracy, and rapid globalization exposed widening numbers of people to Western ideas and practices. These changes contributed to the weakening of traditional gender attitudes and behavior, particularly among the urban middle class and cohorts born after 1970. Nonorthodox gender practices are emerging. Increasing numbers of young people are challenging conventional gender codes by cross-dressing, exploring their sexuality, choosing not to marry, or remaining child free. The incorporation of women into the labor process has also chipped away at patriarchal principles. Money can be a mechanism that imposes and reproduces hierarchical structures or a mechanism that modifies gender relations within the family. Thus women's control of their earnings has the potential to erode traditional ideology and its norms of behavior (T. L. Hu, 1985). Nevertheless, the changes occurring have not completely displaced obdurate patrilineal hierarchies and traditions. The fiction of woman as homemaker and man as breadwinner is maintained (Hsieh & Wang, 1995).

Taiwanese Americans

Christine Avenarius

ALTERNATIVE NAMES

Alternative names that refer to the group of people recognized as Taiwanese Americans or a portion thereof are "Taiwanese Chinese Americans" and "Chinese Americans." This points to difficulties regarding the boundaries of both self-identification and identification by others (Fung, 2002; Ng, 1998). From a political point of view, all immigrants who arrived in the United States from Taiwan, the Republic of China, as opposed to the People's Republic of China, could be called Taiwanese Americans. However, until 1988 the Immigration and Naturalization Service (INS) recorded newcomers from Taiwan in the same category for origin, China, as immigrants from mainland China and Hong Kong, as well as ethnic Chinese from other places in Southeast Asia (U.S. Immigration and Naturalization Service, 1998). Although the U.S. Bureau of the Census created a separate category for Taiwanese in the 2000 Census, this designation does not appear in the general population statistics. In addition, not all immigrants from Taiwan insist on a separate identification from Chinese Americans or practice dual identification as both Chinese and Taiwanese.[1]

The name "Taiwanese" has several meanings that differ in their emphasis on linguistic, cultural, and political commonalities (Huang, 1997; Tu, 1998). The different connotations have political implications, since it is not officially resolved whether Taiwan is a part of or independent from mainland China.

Throughout its history, the island of Taiwan has been settled by four distinct groups of people: the Aborigines (*yuanzhumin*), who came from various islands of the South Pacific; the Hoklo (*fulao*) who started in the 16th century to migrate in large numbers from the coastal areas of southern Fujian province in mainland China (Ahern & Gates, 1981), together with the Hakka (*kejia*) from northeastern Guangdong province and the hilly areas of southern Fujian province (Constable, 1996; Leong, 1999); and finally a small group of political refugees from various places in mainland China, who arrived together in 1949 after the collapse of the Nationalist regime and are called the "Mainlanders" (*daluren*). In Taiwan, the latter group is literally labeled "people from outside the province" (*waishengren*), in contrast to the "people from this land" (*bendiren*), namely the Taiwanese. After separation from Communist China, the Nationalist party established a new government on Taiwan and declared Mandarin Chinese to be the official language.

The definition of what it means to be Taiwanese differs even among those immigrants from Taiwan to the United States who were considered local Taiwanese in Taiwan. Some recognize only speakers of the southern Min dialect (Minnan/Hoklo) as Taiwanese people. Others refer to the descendants of both early Hoklo and Hakka settlers as those who are culturally Taiwanese. Yet others consider themselves to be culturally Chinese since their distant ancestors had originated from China. In addition, some descendants of Mainlanders in Taiwan have begun to refer to themselves as Taiwanese because they were born on Taiwan or are the children of a mixed marriage. Obviously, the identity of Taiwanese Americans is complex, has fluid boundaries, and is continuously evolving. Here the focus will be on all immigrants from Taiwan to the United States.

LOCATION

Taiwanese Americans prefer to live in quiet secure neighborhoods of suburbs or urbanized counties surrounding large cities, rather than settle in urban centers or small cities in rural areas of the United States. As a group, their settlement patterns are dispersed rather than clustered (Avenarius, 2003). The highest concentration and largest number of Taiwanese Americans in the United States can be found in the large metropolitan areas surrounding San Francisco (B. Wong, 1998) and Los Angeles (Fong, 1994; Horton, 1995; Tseng, 1995) in California. Immigrants are attracted by the mild climate, the availability of houses in newly built subdivisions, the large number of other immigrants in the area, the multiethnic society in general, and easier travel to Taiwan. In the earlier phases

of immigration from Taiwan, areas of urban sprawl in the vicinity of New York City were the preferred place of residence and continue to be home to many Taiwanese Americans (Chen, 1992; Kwong, 1987). However, they have also settled in substantial numbers in the metropolitan areas surrounding Atlanta in Georgia (Zhao, 2002), Houston and Dallas in Texas, Washington, DC, and Seattle, Washington. In addition, immigrants from Taiwan have moved to Canada and many countries of South America.

CULTURAL OVERVIEW

Immigration from Taiwan began in the late 1950s and early 1960s and so far has unfolded in three distinct waves. The first wave of immigrants arrived as students in pursuit of a higher education unavailable in Taiwan. The implementation of the Hart-Celler Act of 1965, which opened up immigration quotas for immigrants from Asia, in combination with the change of international recognition of China from the Republic of China (Taiwan) to the People's Republic of China (communist-ruled mainland China), gave rise to the second wave of immigrants. In the 1970s and 1980s large numbers of immigrants arrived from Taiwan both as students and as relatives of former students who had opted to stay in the United States (S. L. Chang, 1992). Today, the majority of these immigrants are professionals and entrepreneurs who lead middle-class lifestyles.

The third wave of immigrants is characterized by a large proportion of female-headed households, that is divided families (Chen, 1992), a tendency which has become more and more common since the late 1980s. After arrival, many highly trained immigrants from Taiwan realized that they were unable to find adequate employment in the United States. Therefore the main breadwinner of a household, in most cases the husband, either returned to Taiwan upon graduation from an U.S. university or decided not to leave a well-paying job in East Asia in the first place. Instead, the preferred strategy of these families was for only the mother and the children to move to the United States to take advantage of the educational opportunities and a more secure lifestyle in less crowded spaces. Taiwanese Americans call husbands who engage in transnational commuting between their families in America and their jobs in Taiwan or China "astronauts" (*taikong ren*) (Ong & Nonini, 1997; B. Wong, 1998).

At present, Taiwanese American culture is mostly influenced by foreign-born first generation immigrants. However, the children of immigrants have begun to introduce a larger variety of cultural patterns (Fong, 1998). There are several distinct groups of immigrant children with different experiences and characteristics. American-born Taiwanese Americans, as well as children who were born in Taiwan but entered the United States in time to attend kindergarten and elementary school, represent the second generation of immigrants. Children who were older than 13 years of age at the time of their arrival in the United States are considered to be first-generation immigrants like their parents, since they received most of their enculturation prior to immigration (Rumbaut, 1994). The group of children who fit neither the description of first- nor second-generation immigrants because they came to the United States in the midst of their personal development, between the ages of 5 and 12, are called the "in-between generation" or "1.5 generation of immigrants" (Zhou, 1999, p. 7).

Most Taiwanese Americans work as professionals, or own small businesses, which generate middle-class or upper-middle-class incomes. However, there are also a number of immigrants who hold working-class occupations (Chen, 1992; Tseng, 1995).

The majority of Taiwanese Americans are not actively involved in a religious organization. Some occasionally practice a modification of Taiwanese folk religion at home, which combines remembrance of one's ancestors with Buddhist, Daoist, and Confucian teachings. A few Taiwanese Americans belong to Buddhist Organizations in the United States. The Yiguandao ("the way of pervasive unity") movement, which combines the wisdom of several religions with traditional Chinese philosophies, also runs organizations in North America. By far the most numerous religious organizations are various Christian denominations, which each have a small group of members (Yang, 1998).

Kinship is organized patrilineally, but bilateral relatives are recognized. Most Taiwanese Americans live in small nuclear families. However, there are a few extended families including either elderly parents or a nephew/niece (*zhizi/zhinü*), who attends school while his or her parents stay in Taiwan.

Relationships with members of other ethnic groups in the United States mainly occur among coworkers and parents of school-age children. Outside work-place and school environments, interethnic relationships

become fewer the higher the concentration of Taiwanese Americans are in any given geographic area, despite dispersed settlement, widespread ability to communicate in English, and comparable income levels (Avenarius, 2003; Fong, 1994; Li, 1999).

CULTURAL CONSTRUCTION OF GENDER

The construction of gender categories among Taiwanese Americans is influenced by several cultural concepts derived from the Confucian teachings of the five reciprocal relationships that maintain order within both family and society (subjects obey rulers, children obey their fathers, wives obey their husbands, younger brothers obey older brothers, and friends respect friends). Although these rules are mostly hierarchical in nature, they are not static divisions but rather reflect the fact that both polars in a dyad are compatible and inseparable (Barlow, 1994, p. 257). The main responsibility of men is to continue the patriarchic line and ensure the welfare of his family and the greater society. Women are required to support their husbands' quest in establishing a family. Having children is supposed to be their main purpose in life. In general, both men and women are obliged to marry, raise children, and care for their parents (Ahern & Gates, 1981).

The traditional ideal of division of labor between husband and wife is captured by the proverb "*nan zai wai*, *nu zai nei*" which means "the man works outside the house and the woman works inside the house." This points to one of the key virtues of a woman, to be the person who cares about the inner affairs of the household. Taiwanese Americans modify this expectation with their version of the saying to the situation of "astronaut" families, in which the wife stays with the children in the United States while the husband takes up more lucrative employment back in Taiwan: "*wai zai tai*, *nei zai mei*" which translates as "the outside person (the husband) is in Taiwan and the inside person (the wife) is in America" (Avenarius, 2003). Included in this adaptation is the fact that the Chinese character for America (*mei*) stands for the words "beautiful" and "virtuous." Since women are expected to dress beautifully and appear beautiful and are responsible for creating beautiful surroundings at home, it seems only fitting that they are the spouse which lives in the beautiful country, America (Chen, 1992).

Although there is no explicit celebration of masculinity among Taiwanese Americans in reference to body language or appearance, men's extramarital affairs are tolerated. Women, on the other hand, are expected to adhere to the cultural ideal of female chastity (J.-S. Chang, Tsang, Lin, & Lui, 1997). However, these ideals are viewed critically among members of the second generation. Over the years women have gained equal access to higher education, first in the United States and then in Taiwan. It is now common for Taiwanese American women to have well-paying occupations outside the home. Nevertheless, expectations regarding beautiful appearance and homemaking prevail.

GENDER OVER THE LIFE CYCLE

In general, Taiwanese Americans only distinguish between three life stages, that of children or young people (*hai zi*, *nianqing ren*), who are in the process of acquiring an education, that of adults (*da ren*), who are in the work force, are married, and have children of their own, and older people (*lao ren*), who are retired and have time to enjoy life's pleasures. There are no explicit rites of passage other than marriage and retirement. The stages do not differ for men or women.

Socialization of Boys and Girls

While first-generation immigrants from Taiwan experienced favoring of boys in terms of parental attention and educational investments during their own upbringing, most of them treat their sons and daughters equally. Differences between boys and girls are not overly stressed during the early phase of their socialization. The assignment of household chores to children depends on the financial situation of the family. In working-class households and families who run their own business, children are more likely to take over important tasks at home or help in the family business from an early age (Chen, 1992).

However, in the majority of middle-class households, children are assigned few responsibilities and enjoy a rather sheltered upbringing. Many affluent mothers refer to their children as the "crown princes and princesses" (*gongzhu*) of the family who expect constant service and attention (Avenarius, 2003). The main focus of all Taiwanese American families is to ensure the best possible education for their children (Ng, 1998). Both boys and girls are encouraged to study hard and attempt

to attend outstanding universities and graduate schools. In terms of extracurricular activities, parents support the development of musical skills over athletic skills. Engagement in social causes is supported as well. In addition, parents of second-generation immigrants enroll their children in Chinese language schools, which also offer other courses, such as Chinese culture and history, martial arts, and folk dance. The majority of these schools teach Mandarin Chinese (standard Chinese dialect) rather than Taiwanese (Min dialect, Hoklo).

Puberty and Adolescence

The emphasis of educational achievement continues to dominate the upbringing of adolescent Taiwanese Americans. Immigrant children who received their elementary school training in Taiwan often need to attend coaching schools in the United States to help them with initial problems of adjusting to a different language and curriculum. However, second-generation immigrants at the high-school level are also enrolled in coaching schools. Their additional schooling caters specifically to the preparation for SAT tests and the improvement of their overall grade level (Ng, 1998).

Achieving higher education is considered so important to Taiwanese parents in general that some send their children to the United States by themselves. Since obtaining the necessary grades to gain entrance to a university in Taiwan is very difficult and American universities are considered prestigious, attending high school in the United States is a welcome strategy for affluent parents. In case neither of the parents can accompany their child to the United States the child is sent to live under the guidance of a relative or a hired caretaker. Some older students live by themselves. Taiwanese Americans call them "parachute kids," because their parents drop them in the United States to ensure their well-being and educational achievements in the future (Zhou, 1998).

Extended socializing with other teenagers is not encouraged. Although the ideal of female virginity has lost its importance, unwanted pregnancies are mostly avoided (Chia, Moore, Lam, Chuang, & Cheng, 1993). With a few exceptions, even the "parachute kids" who have gained physical independence from their parents early, fulfill their parents demands to concentrate on education rather than exploring the dark side of teenage socializing, such as spending more time on the streets and in bars than in the classroom (Zhou, 1998). While elementary school children show no particular preferences for friends from a particular ethnic group, awareness of ethnic differences and one's own cultural heritage develop during middle school, and especially high-school years. The extent of interethnic dating during adolescence is a function of the number of other Asian Americans enrolled in a student's high school (Gudykunst, 2001, p. 189).

Attainment of Adulthood

From a traditional point of view, children only cease to be children when they have a family of their own and raise children themselves. In general, adulthood is attained gradually. The first step is the completion of education and the acquisition of a job. A prolonged education delays the onset of adult responsibilities. As long as the offspring are enrolled in school, they are considered to be children. Ideally, marriage is expected to follow only after graduation, preferably after completion of a graduate degree. On average, middle-class Taiwanese American children marry rather late, in their late twenties or early thirties, a trend which resembles developments in Taiwan (Ng, 1998, p. 27). The birth of one or two children should follow immediately.

Middle Age and Old Age

At present, few second-generation immigrants have reached middle age. Among first-generation immigrants middle age is characterized by involvement in occupations and the upbringing of children. Outside the work place, the composition of personal social networks depends on the age of children. Both parents are involved in the facilitation of activities for younger children, such as music lessons, dance classes, and Chinese language courses, which often leaves few opportunities to engage in other social organizations on a regular basis. Once children are in the last 2 years of high school and able to drive on their own, husband and wife, or the wife by herself, start to join recreational organizations, for example, taking up ballroom dancing, playing tennis, or joining a choir (Avenarius, 2003).

Though retirement means a definite change in the availability of time for those in the work force, the onset of old age is rather fluid. Most Taiwanese Americans continue to be involved in the social and recreational organizations that they joined earlier until they have to depend on outside assistance to lead their lives. Men who

are employed in American corporations often choose early retirement, especially when they see no chance for future promotions (Fong, 1998). They then change their occupational trajectories to run their own import–export business or work as a corporate consultant in Taiwan, while keeping a permanent home in the United States.

Only a few elderly Taiwanese Americans have immigrated after their adult children have established a livelihood in the United States as first-generation immigrants. As the standard of living in Taiwan has improved most (grand)parents do not want to forgo their lifestyle and social circles in Taiwan in exchange for a rather isolated life in the households of their children, who often live far away from other elderly Taiwanese (Kuo & Torres-Gil, 2001). In recent years, first-generation immigrants have increasingly been faced with decisions regarding the burial location of their deceased parents. Some opt to bring the ashes of a parent back to Taiwan and others make arrangements to transport ashes of parents who died in Taiwan to the United States. The decisive factor is usually the residential location of the majority of family members and the long-term cultural orientation toward either one of the two countries (Avenarius, 2003).

PERSONALITY DIFFERENCES BY GENDER

Although there are no sharp differences in temperament between men and women, women are thought to be more socially responsible and more involved in the maintenance of relationships with both kin group members and social acquaintances in general. Women are also expected to be more modest in their general appearance and interaction with others than men.

However, while women were traditionally seen as incompetent when it came to achievements outside the home, today both parents and society consider the potential for educational achievement of young women and men to be equal. This creates a conflict for the second generation and the 1.5 generation of Taiwanese American women who find themselves torn between their parents' high expectations for their occupational lives and the cultural expectation of women as self-effacing and understanding caregivers. As a result, they are often chided when they act too aggressively and independently

(Ng, 1998). In terms of individual academic talents, girls are considered to have more verbal skills and boys to have greater mathematical abilities.

GENDER-RELATED SOCIAL GROUPS

The very nature of immigration creates different types and structures of social groups compared with life in Taiwan. Owing to dispersed settlement there is not much overlap in the personal networks of Taiwanese Americans between kin-group members, coworkers, neighbors, fellow parents, and members of common-interest associations. Residence of immigrant families is almost always neolocal. Since both husband and wife, once they have become naturalized citizens, are entitled to sponsor a brother or sister to become a permanent resident of the United States, relatives of both sides of the family are treated equally. Patrilineal relatives are not necessarily favored over matrilineal kin-group members. However, in many instances relatives move to different and often distant neighborhoods after their initial phase of accommodation in their sponsor's home.

Middle-class and upper-middle-class Taiwanese Americans rarely rely on kin-group members alone in their adaptation to their new social and economic environment. Instead, former classmates are an important source of emotional support and information (Avenarius, 2003; see S.-L. Wong & Salaff [1998] on similar findings regarding Hong Kong Chinese immigrants). Actual former classmates (*tongban tongxue*) often establish fictive kinship relations once they locate each other in the United States (e.g., become each other's *ganmei*).

In general, relationships between fellow alumni (*tongxue*) of a high school or university back in Taiwan play an important role in the social and economic circles of Taiwanese Americans who arrived in the United States as graduate students. The relationship between individuals who share the experience of attending the same school is one of five prescribed relationships of similarity in traditional Chinese culture and comes with the expectation to be each other's resource in times of need. Chapters of alumni associations which represent prestigious high schools and universities in Taiwan exist all over the United States, predominantly in California. These associations have more male than female members, since fewer first-generation women had achieved higher education at the time of immigration. However, the alumni association

of Taiwan's most prestigious high school for women, Taipei First Girl's High School, is well known among Taiwanese Americans in the United States and its members are influential in both business and community activities.

Of the numerous other common-interest associations in first-generation Taiwanese American communities, such as cultural, political, professional, recreational, and religious organizations, only recreational organizations are decidedly gender oriented.

Second-generation Taiwanese Americans have founded fewer ethnic social organizations than their parents. Many join Asian American organizations at large which have no gender-specific membership structure (Ho, 2002).

GENDER ROLES IN ECONOMICS

As stated above, the traditional division of labor required men to work in occupations outside the home and women to carry out all work inside the home. In working-class families who migrated from Taiwan, women had to become wage laborers to make ends meet and save for the educational expenses of their children. In contrast, in many first-generation Taiwanese American middle-class families women do work mostly at home, take care of their children's upbringing, and are actively involved in community organizations. However, the few first-generation Taiwanese American women who were educated in the United States usually work in professional occupations comparable in pay and status to men after their children have entered middle school. Like men they work as doctors, dentists, engineers, computer analysts, and economic advisors. In addition, many initial home-makers, especially women whose husbands have returned to work in East Asia, work part-time jobs in the service sector of the ethnic economy, that is, as real estate agents or insurance brokers. Others run the American side of their husband's import–export business. If both husband and wife reside in the United States, the wife typically makes most decisions regarding the household's financial investments.

Members of the different groups of immigrant children, belonging to either the second generation or the "in-between-generation," usually experience equal employment opportunities for men and women based on their educational credentials and subsequent training.

Most women of these generations are employed or self-employed.

PARENTAL AND OTHER CARETAKER ROLES

Both parents consider it their main role to ensure that their children excel in life. For more recent immigrants this is often the sole reason for immigration. Mothers take over most responsibilities in their children's day-to-day socialization, especially the monitoring of academic progress, independent of their employment status. Fathers are more involved in recreational outings with younger children and in the guidance of the decision-making processes of older children.

In working-class families children do not spend much time with either parent and are expected to be self-disciplined and self-sufficient. In middle-class families in which the father is absent for long periods at a time, mothers take over all the disciplining tasks. In general, mothers are not expected to be very affectionate with children, but to be focused on the facilitation of their advancement. It is common for mothers who meet each other during social events to compare notes about their children's abilities and talk about various approaches to fulfilling their aspirations.

In contrast with second-generation Taiwanese Americans, most first-generation immigrants have had few other caretakers for their children, such as grand-parents or hired help.

LEADERSHIP IN PUBLIC ARENAS

There are no restrictions on women holding leadership positions. In the few municipalities in the United States with a very high concentration of Taiwanese and Chinese Americans both men and women run for local political office (Chen, 1992; Fong, 1994; Horton, 1995; Li, 1999).

The cultural expectation that women have more social orientation than men, in combination with the fact that women sometimes outnumber men in Taiwanese American communities, accounts for high numbers of female leaders in various cultural, political, professional, and recreational organizations. In addition, women who

work as homemakers often have a more flexible schedule than men and generally lead cultural, recreational, and child-related activities.

GENDER AND RELIGION

The extent of involvement of men and women in religious activities depends on the nature of the practiced religion. In Christian churches both genders attend in equal numbers, but men show a higher likelihood of serving as ministers and church council members. Women are usually responsible for the organization of community events, such as fundraisers and fellowship meetings. The same holds true for practitioners of the Yiguandao movement. Among Taiwanese Americans who are active practitioners of Buddhism, women are more likely to visit a temple and attend scripture reading groups. In addition, the charity organization Buddhist Compassion Relief Merit Foundation (*Tzu-Chi*/*Ciji*), which was founded by a nun in Taiwan and has since established branches all over the world, has a larger number of female than male members, especially among the ranks of active volunteers who visit hospitals and old people's homes and run fundraisers and bone marrow donation drives (Weller & Huang, 1998). In Taiwanese American homes that maintain a family altar to remember ancestors, it is mainly women who care for their upkeep. Women are also responsible for the construction and decoration of the home according to the rules of *feng shui* (wind and water alignment).

LEISURE, RECREATION, AND THE ARTS

Upper- and middle-class first-generation immigrant women are involved in more leisure time activities than men, which results in a voluntary gender segregation of recreational organizations. This is not simply a function of differences between homemakers and professionals, since many homemakers do not take up any recreational activities until their children enter high school. In addition, Taiwanese American women in the work force also have higher rates of participation than their male colleagues. Rather, it is a difference in interests. Most women benefit from the fact that they have fewer obligations to care for elderly relatives and assist neighbors compared with life in Taiwan. They welcome the opportunities to engage in self-improvement activities, such as taking singing, dancing, and painting lessons.

On the other hand, some Taiwanese American men consider the type and number of opportunities to engage in leisure time activities in the United States lacking in comparison with those available in Taiwan, especially if they live far away from any Chinatown. Although they join golf and tennis clubs in the United States, they miss more numerous occasions for after-work male bonding in bars and restaurants (Avenarius, 2003).

RELATIVE STATUS OF MEN AND WOMEN

Participation in the labor market, especially in professional occupations, has increased the decision-making power for women, both in the United States and Taiwan. However, immigration facilitated more influence for Taiwanese American women at an earlier time and often without their entrance in the work force. Prior to a more women-friendly adjustment of Taiwanese laws in 1985, immigration to the United States provided women with more rights to property ownership and inheritance, especially in the case of divorce (Ahern & Gates, 1981). Not surprisingly, women are generally the leading force in a family's decision to stay in the United States. Nevertheless, most first-generation Taiwanese American women still refrain from asking for a divorce, even if their estranged husbands have permanently returned to Taiwan.

The cultural expectation that a woman needs to stay with her husband in order to maintain a complete dyad keeps women from having equal status to men. Although men are also expected to stay married, divorce is considered less shameful for them and implies finding a new partner. Among second-generation immigrants, divorce is generally more acceptable for both men and women. However, despite their equal access to economic and educational resources, second-generation women are expected to comply more closely with the wishes of their parents, specifically their mothers, regarding both their financial and marriage-related decisions.

SEXUALITY

The traditional concept of sexuality expects women to be chaste before and faithful during marriage, while

allowing men to have several sexual partners before and after their wedding. Though men are not encouraged to engage in extramarital affairs, they may stay in their marriages or return to their families if they so choose (J.-S. Chang, 1999). While most Taiwanese American men who live and work in the United States rarely have the opportunity to do so, some financially successful "astronaut" husbands are known to practice de facto polygyny. Upon returning to work in Taiwan or mainland China, they often live with a mistress, their so-called "small wife" (*xiao taitai*) (J.-S. Chang, 1999). The wives of such estranged husband who stay in America are not able to express their sexuality, which often leaves them rather frustrated. In contrast with men, women who are unfaithful are expected to divorce their husbands (Avenarius, 2003).

Sexual conduct and sexual expression for second-generation immigrants are strongly influenced by mainstream American culture, and pop culture in particular. Both genders are educated in sexual matters. Although women are still required to practice modesty, their attitudes toward sexuality are often more liberal than those of men (Chia et al., 1993).

Homosexual expression among Taiwanese Americans is to some extent shaped by the gay movement in North America (Eng & Hom, 1998). It differs considerably from the experience of homosexuality in Taiwan which is less visible and continues to be influenced by the Confucian ideal of compatible polars which create a dyadic relationship.

COURTSHIP AND MARRIAGE

The experience of courtship has changed considerably over the years. Many first-generation immigrants had few opportunities to meet members of the opposite sex. Prior to immigration, potential marriage partners were found either through a matchmaker or the introduction of a friend. Since the majority of immigrants who entered the United States as graduate students were men, the unmarried among them often asked a fellow Taiwanese classmate to introduce them to a sister or cousin when he went back to Taiwan on vacation. After the exchange of letters, a future wife arrived on a fiancée visa and the couple got married in a small ceremony in the United States. The interethnic marriage rate is not very high among first-generation immigrants. However, Taiwanese American

women within this group tend to a have a higher likelihood than men to marry a member of a different ethnic group (Sung, 1990).

Second-generation Taiwanese Americans start their courtship experience in the form of dating in middle and high school, much like other American children. As stated earlier, parents expect their children to finish their education before entering marriage. Women usually wish to find more equal partners and try to avoid being cast into the traditional female role. They often date Taiwanese or Chinese men as well as European Americans, whereas Taiwanese American men usually look for Taiwanese, Chinese, or other Asian women. Although Taiwanese American families prefer their children to marry other Taiwanese Americans, marriage to a mainland Chinese is almost as acceptable. Marriage to a partner from a different Asian American group or to a European American is tolerated. Wedding ceremonies tend to be elaborate if the parents are included in the planning process. They often are a blend of both Western and Taiwanese customs.

HUSBAND–WIFE RELATIONSHIP

The relationship between husband and wife among first-generation Taiwanese Americans is often characterized by their efforts to keep the family together and the joint goal of providing their children with the best possible educational opportunities. Life in the United States has exposed many couples to a more egalitarian partnership. The combination of Taiwanese and American child rearing practices has introduced opportunities to make the tasks of mothers and father more interchangeable.

Marriage partners who stay and live together in the United States often spend a lot of time with each other, especially when the children are older and parents have more time for recreational activities and social engagement. Couples who have become estranged over long periods of time due to the husband's employment in East Asia are sometimes able to rekindle affection for one another in old age, when the husband returns more frequently to the United States.

In case of divorce, the wife usually continues to live in the United States and the children stay with her. This practice differs from regulations in Taiwan, where children of divorced parents tend to live with their father.

OTHER CROSS-SEX RELATIONSHIPS

There are few other important cross-sex relationships in Taiwanese American communities. Relationships between uncles or aunts and their nephews or nieces depend on the individual composition of kin groups who immigrated to the United States and their member's location of residence. Noteworthy are those cases in which the relationship between nephews/nieces, who stay with an aunt or uncle to attend high school in the United States (i.e., as "parachute kids"), is based on a fictive kinship relation between their parents who became close friends while growing up together in Taiwan.

NOTE

1. The 2000 Census recorded 2.3 million people who identified as Chinese and 118,000 who identified only as Taiwanese. In terms of the foreign-born population within this group, the INS reports 1 million foreign-born people from mainland China and Hong Kong, and 325,000 foreign-born from Taiwan living in the United States in the year 2000 (U.S. Bureau of the Census, 2002).

Tanna

Lamont Lindstrom

ALTERNATIVE NAMES

Tanna is also known as Tana.

LOCATION

Tanna lies at latitude 19°S and longitude 169°E in the TAFEA (Southern) district of Vanuatu, the country that is an archipelago of islands in the southwestern Pacific. Before independence on 30 July 1980, these were the New Hebrides—a condominium colony that France and Great Britain administered jointly. The island is high and volcanic and about 26 km wide by 40 km long, comprising a land area of 550 square kilometers.

CULTURAL OVERVIEW

Tanna's 27,000 inhabitants (estimated in 2000) speak six related Austronesian languages. Despite this linguistic diversity, Islanders share basic cultural understandings, including constructions of gender. Voyagers in sailing canoes settled Tanna some 3,000 years ago. Most Islanders today have dark skin and tightly curled hair and are related, physically and culturally, to neighboring Melanesian peoples of New Caledonia, the Solomon Islands, and New Guinea. Polynesian migrants from the east have also influenced the island's culture over the years. Although many men possess traditional chiefly titles, relations among adult men are generally egalitarian.

Islanders have been engaged with the global system for more than a century. Nonetheless, most people remain subsistence farmers and grow a variety of tropical staples including yam, taro, sweet potato, manioc, and banana. They earn cash on the side from coconut, coffee, and kava (*Piper methysticum*) plantations. Extended families live in scattered villages and hamlets, in houses made mostly of local materials—although those who can afford it will also build with cinderblock bricks and aluminum roofing. Men meet every evening on a clearing near their village

to prepare and drink kava. These kava-drinking grounds are important points within the island's cultural geography. People also convene here to settle disputes, to exchange goods, to feast, and to dance in celebration of important events.

CULTURAL CONSTRUCTION OF GENDER

Tannese recognize two genders, male (*erman*) and female (*pran*), which they apply to humans, animals, and some plant species (Guiart, 1956, p. 65). Males and females are ontologically different but complement one another within hierarchical relationships of masculine authority and female deference. Gender opposition organizes people's understandings of a range of cultural domains. For example, the island's two major staple crops stand opposed as male to female: the long (up to 2 m), dryer, and phallic tropical yam (*Diascorea* spp.) is masculine in counterpoint to rounder and moister taro (*Alocasia* spp.) corms, which are feminine. Likewise, men are hard, dry, hot, and "closed," and women are wet, soft, cold, and—since they menstruate—"open" (Bonnemaison, 1994, p. 171).

The Tannese share three widespread Melanesian concepts about men and women. The first is that, although women bear children, men must work to transform boys into men through ritual procedures that drain away female essence to replace this with male. Circumcision is the key ritual practice that makes boys into men, wet into dry, cold into hot, and soft into hard. Fathers arrange their sons' circumcisions between the ages of 5 and 12. Second, Islanders believe that female fluids—notably menstrual blood—can endanger men's health. Once, women moved into secluded menstrual huts when having a period. As soon as a boy was circumcised he left his mother's house and moved into a men's house located on the kava-drinking ground. European missionary influence led to the abandonment of menstrual huts and most men's houses in the early 20th century, but a wife and her husband

continue to sleep apart when she is menstruating and she will also not cook food that he will eat, nor visit their garden plots during her period. Third, people believe that men have a limited supply of semen. Those who enjoy too much sexual contact with women will age quickly, their recklessness marked by their body's low stamina, dry skin, and wrinkles.

Two male prerogatives sustain gender inequality on the island. First, only men have the right to speak in public at the regular dispute-settlement meetings (moots) and discussions that convene on local kava-drinking grounds. Women's place is on the periphery, sitting behind the circle of male participants. Men avow that women "should not speak in the faces of men." Women, however, do speak out or mutter loudly on the sidelines intending men to hear, if not appreciate, their often caustic commentary. Most, though, are too filled with "shame" to speak even if called upon to do so. Instead, a woman whispers to a husband or brother who then repeats publicly what she said.

Second, only men drink kava, and women may not be present on kava-drinking grounds when men prepare and drink infusions of the root (Brunton, 1989; Lebot, Merlin, & Lindstrom, 1992). If a woman passes by a kava-drinking ground when drinkers are present, she must cover her head and avert her eyes. Since kava intoxication remains an important avenue of spiritual inspiration, women are less able to claim ancestral authority for any ideas or opinions they might have.

Beyond public speaking and kava drinking, people mark gender difference in other ways. Men, traditionally, wore penis wrappers and belts, while women wore long bark skirts. Nowadays, men dress in imported, often second-hand, shirts and T-shirts and women dress in skirts, including the "big dress"—a Tannese version of the Mother Hubbards that many women wear to church. During ritual occasions, men wear lavalava, or waist-cloths, and women put on traditional bark skirts with a blouse. Both sexes paint their faces, although women's ceremonial face decoration is more colorful and elaborate than men's.

Apart from kava drinking, there are few gender-based food taboos, although most women do not smoke tobacco except for older women beyond menopause. Women are also less mobile than men, sticking closer to home villages, but increasing numbers nowadays migrate to Port Vila, Vanuatu's capital town located on Efate Island, about 230 km to the north.

GENDER OVER THE LIFE CYCLE

Age categories run from *iapou* ("speechless baby"), *iakunouihi* ("small boy"), *pranouihi* ("small girl"), *tamarua* ("circumcised youth"), *pran vi* ("adolescent virgin girl"), *ierman* ("man"), *pran* ("woman/wife"), *ieraghara* ("old man"), *pranemha* ("old woman"), to *ieremha* ("dead person, ancestor"). People teasingly may call uncircumcised boys *kapiesi*, which means something like "skin back," referring to their foreskins. Given local appreciation that masculinity depends crucially on circumcision, gender differences between girls and boys are muted up until this ritual operation. The term *iakun*, although mostly used for boys, may also include girls and therefore often translates as "child." The word for preverbal child, *iapou*, is also gender neutral. Just as gender is muted in the young, it is similarly muted in the old. Older women acquire a masculine character; the term for "ancestor" is also gender neutral.

Socialization of Boys and Girls

Parents are loving and indulgent with children, and value both sons and daughters. In 1884, missionary George Turner wrote, "The Tannese are fond of their children. No infanticide there. They allow them every indulgence, girls as well as boys" (Turner, 1884, p. 317). On the one hand, in a patrilineal society, men's sons will carry on the kinship group, succeeding their fathers and grandfathers. On the other hand, Tannese practice what anthropologists have called "sister-exchange marriage" and a son may not marry unless he has a sister to exchange in return. Therefore parents need daughters in order for their sons to marry.

New mothers and babies remain secluded for several weeks after birth. Traditionally, a father might not see his child for a month, and then only after the mother had ritually purified herself and the baby. Both women and men hold and feed children, and babies rarely touch the ground as people pass them from hand to hand. Older sisters (themselves perhaps only 7 or 8 years old) take on much of the work of minding younger siblings, freeing up their mother for garden work, cooking, and the like. Older siblings are indulgent of younger siblings. Young children, if angry, sometimes slap or hit older siblings, but it is rare for older physically to punish younger. Kin terms recognize relative age (terms for older brother/sister differ from terms for younger) and older siblings have lifelong

obligations to nurture younger, as do younger to respect older. Ambulatory children split into same-sex playgroups. This reflects island etiquette that demands important types of avoidance between brothers and sisters.

Men and women in large part live separately. Even though husbands and wives began sharing houses early in the 20th century, and couples spend time together working their plantations and gardens, the realms of male and female sociability still remain rather separate. Young boys soon join up with fathers and older brothers—toddling along to join men on kava-drinking grounds each evening. Girls, on the other hand, stay close to their mothers and sisters.

Generally, boys have more unsupervised leisure time than do their sisters who are drawn into helping their mothers with child-minding, pig feeding, gardening, food preparation, and production of woven baskets, mats, and bark skirts for upcoming ceremonial exchange. Boys help out in food gardens, but also spend considerable amounts of time wandering about hunting small birds and fruit bats. During the day, most children attend junior primary schools within walking distance of their villages. Many of those who go on to senior primary schools must board there during the week, and they see their families only on weekends and holidays. Most of these children return to home villages when they finish 6 years of schooling, since only about 20% have the opportunity to matriculate into secondary schools.

Puberty and Adolescence

There was no traditional notion of adolescence as a singular life stage located between childhood and adulthood. However, with increasing numbers of young migrants to Vanuatu's two towns, "youth" or "young people" is an increasingly well-defined social category reflecting high levels of youth unemployment and the emergence of urban gangs. Circumcision, for boys, and menstruation, for girls, mark the boundary between child and postchild. Parents may choose to celebrate a daughter's first menses and her new *pran vi* ("new woman") identity with a small feast and exchange of goods with her mother's brothers. Many do not, however, as this ritual is optional. In contrast, celebration of a boy's transition into manhood is obligatory; all boys must be circumcised.

Although it is a rite of passage signaling a boy's crossing into manhood, boys are circumcised quite young: some as young as 5 or 6 and most before the age of 12.

Each year, after yam harvest and during the cool season (April through August), parents organize circumcision feasts for sons. These rites are called *tamarua*, as are circumcised boys. Several families ordinarily circumcise their sons together. The ritual is structured like many similar rites of passage. First, boys are separated from mothers, sisters, and village life and brought to a special house constructed in the bush near an important kava-drinking ground. A specialist cuts away their foreskins with the traditional sliver of bamboo or a razor blade, or fathers may bring boys down to a government clinic or hospital. During a 6–8 week healing period, boys live separated in the circumcision hut. They may not feed themselves or scratch their heads. Like many sorts of male initiation ceremony, the *tamarua* incorporates symbols of rebirth and male nurture. Mother's brothers (or stand-ins) feed the boys who also bathe twice daily. Parading down to the sea or to a water source, they blow triton shell trumpets to warn all women to stay away since boys must not be seen by any woman until they reemerge from seclusion. When the boys' wounds heal and their fathers have gathered the treasury of exchange goods they will present to their wives' brothers (their sons' mothers' brothers), they parade back into society, circling the heaps of exchange goods that their fathers have piled in the center of the kava-drinking ground. Emerging from seclusion, a boy eats a special meal his mother has prepared that marks his reincorporation into ordinary life, albeit with his new *tamarua* identity.

Traditionally, a *tamarua* moved from his mother's house into the men's house at the kava-drinking ground. At some point, a young woman (also called *pran vi* in southeast Tanna, and *iowanhan* elsewhere on the island) sexually initiated these young men there.

With the exception of those under Christian influence no man may contract a marriage who has not been initiated into sexual matters by the *iowhanan* [sic], and a man may not be betrothed until he has been touched by her … The woman is painted in a special manner as a sign of her profession and wears turtle-shell earrings and other ornaments, while a shorter shirt distinguished her from other women. After a circumcision ceremony the *iowhanan* is sent to a village to initiate the young men who have reached man's estate into the mysteries of sexual intercourse. She lives in the bachelors' house with the unmarried men, and the payment for her services is made in pigs. After her services are no longer required she returns to her native village and later makes a good marriage, and there seems to be no feeling against her on account of her former life (Humphreys, 1926, pp. 45–46).

Although the Tannese have revived a number of traditions put aside following conversion to Christianity, the *pran vi* is not yet one of these.

Today, the rights and duties of adolescent boys and girls are not very different from those of their younger siblings. They may marry, although young adults tend not to marry until their early to middle twenties. Young women continue to live with their parents, while teenaged boys often sleep together in a sort of contemporary men's house in the village, maintaining brother–sister avoidance. As soon as boys are circumcised, their fathers demand that they start chewing kava each evening for older drinkers—the standard method of macerating the roots to prepare these for infusion. Virgin boys can also touch chewed kava and therefore assume the task of infusing this in water. However, as soon as a boy has his first sexual encounter with a woman, he can no longer touch masticated kava lest female essence on his hand drain away the power of the plant to intoxicate or even sicken a drinker. If no virgin youths are at hand, older drinkers mix their kava with a couple of kava branches.

Attainment of Adulthood

Marriage marks the beginning of true adulthood. Most young men rarely take the opportunity to speak publicly in dispute-settlement moots until they are married and have had children. At marriage, a man acquires the right to drink kava and one of his mother's brothers should offer him his first cup. (This is despite the fact that many youth have already drunk on the sly.) Although unmarried young men and women will have planted their own garden plots for several years, newly married couples begin farming seriously. They also move into their own house, typically located nearby those of the husband's parents and brothers. People presume that children will soon follow marriage, and they frequently adopt children whether they have their own or not.

Middle Age and Old Age

Age brings authority on the island for both men and women. Parents command children and eventually grandchildren, and increasing age demands respect from all. The very old will soon transform into ancestors who can be either powerfully helpful or hurtful. Therefore ambitious young men are often in a rush to become old, and may start calling themselves *ierghara* ("old man") when they are only in their late twenties. Women, as they age, also acquire authority over daughters-in-law and grandchildren. As is common in Melanesian societies, postmenopausal women become "masculinized" and may take up male prerogatives, such as smoking.

PERSONALITY DIFFERENCES BY GENDER

Only a few psychological researchers have addressed personality or mental illness in Vanuatu, and no work is available that documents gender psychology on Tanna. Widespread Melanesian cultural practices, including extended breast-feeding, ritualized initiation of boys, suspicions of sexuality, age hierarchy, and the like no doubt shape island personality.

GENDER-RELATED SOCIAL GROUPS

Families are patrilocal (virilocal, for married women) and patrilineal. Although children become members of whatever family provides them with their personal name, these namers are typically the baby's father or other patrilineal kin. A patrilineage (or "name set"; see Lindstrom, 1990, p. 35) typically shares the same kava-drinking ground with several others, but each possesses its own set of male and female personal names. Male names give title to individual garden plots, house sites, beaches, reefs, and other resources and holdings of their patrilineal estate. Thus men who share names from the same patrilineage typically live, work, and drink kava together. They reside near their fathers and brothers throughout life, while women move to husbands' villages when they marry.

Most island groups are gender segregated. Children form same-sex playgroups and boys, when older, organize all-male football (soccer) teams and village "string bands" (ensembles of guitars, ukuleles, and gut-bucket basses). During important exchange ceremonies, men and women separate into same-sex dance teams.

GENDER ROLES IN ECONOMICS

Tannese have a gendered although flexible division of labor. Men frame houses and women weave coconut frond thatching for roof and walls. Men hunt the occasional wild pig, fish with spear guns, and also go to sea in canoes to fish, while women fish from shore or gather

shellfish on the reefs. Women do laundry and much of the day-to-day household cooking, although men help prepare earth ovens and butcher pigs and cows cooked therein during feasts. Men carve bows and make arrows, while women spend much time weaving bark skirts, baskets, and mats for everyday use or ritual exchange. Islanders practice swidden horticulture, clearing away secondary forest growth each year for new plantations. Men are primarily responsible for "slashing and burning" the forest, although women help prepare cleared fields for burning. Both men and women plant, tend, and harvest crops, but women shoulder most of the weeding duties. Women also undertake much of the work of feeding the family's pigs, although men and children pitch in as well. Women do much of the petty marketing, selling produce, kava, crafts, and other goods at roadside stands or at the island's weekly marketplaces.

There is also a division of labor within the commercial economy. Slightly more boys than girls go on to higher education, but some educated women work on Tanna as teachers, nurses, shop and bank clerks. Men dominate public works jobs and monopolize opportunities to drive vehicles and equipment. Many Islanders have migrated to the capital and engage in a variety of wage labor. Men once practiced "circular migration," leaving the island temporarily in search of work. As more people are establishing permanent careers off-island, increasing numbers of women are also migrating up to Port Vila and beyond. Many male migrants work in agriculture, construction, and taxi driving. Women without education often find work in town as "house girls" (maids and nannies).

Gender inequalities characterize the island's inheritance system. Men acquire rights to land through their personal name; most male names give title to garden lands, forest, and village house sites. Female names, however, have no entailed land estate and women acquire access to land first through their fathers, and then through their husbands. Most families have little permanent inheritable property, although when they do (e.g., a vehicle), sons inherit more than daughters.

PARENTAL AND OTHER CARETAKER ROLES

Both fathers and mothers care for children, although mothers (and a child's older sisters) are the primary caregivers of younger children. As boys grow, they spend increasing amounts of time with their fathers and other men; conversely, girls remain close to their mothers.

LEADERSHIP IN PUBLIC ARENAS

Men dominate politics, both traditional and modern. Customary restraints on women speaking in public continue to limit their political roles and leadership opportunities. Men organize the regular meetings and moots at which they resolve dispute and make decisions for the community. Much informal politicking occurs each evening when men gather to drink kava, and women, who are forbidden to drink, are absent from these circles. Men also claim a series of chiefly titles that are associated with male personal names. Within national political arenas, no woman from Tanna has yet won a seat in either the island's local government councils, or in Vanuatu's national parliament.

Women may acquire a sort of authority reflective of that of their husband. The wives of men of chiefly rank may wear four feather headdresses, instead of two, at important ritual occasions. Wives of local leaders typically are also responsible for constituting and leading women's dance teams. And all women, as they age, accrue increasing amounts of authority over children and grandchildren.

GENDER AND RELIGION

Ancestors, both male and female, are the principle supernatural beings on the island. Gender among ancestors is muted; people respect the powers of all the dead. However, leading men are often buried along the circumference of important kava-drinking grounds, while women are more commonly buried in graveyards near villages. Kava-drinkers noisily spit out the last sip of their drink as a sort of ancestral libation to the dead, their male ancestors buried underfoot. Traditional gods and culture heroes are also mostly male, including the pan-Polynesian figures Mwatiktiki (Maui Tikitiki) and Tagarua (Tangaloa), although many myths and legends feature female spirits as well. A kava origin myth, for example, explains how two women were the first to find and use the plant before men stepped in to monopolize the drug (Lindstrom, 1987, p. 113).

The majority of Islanders nowadays are Christian (notably Presbyterian, Roman Catholic, or Seventh-Day Adventist) although traditional Pacific beliefs about the power and constant presence of ancestors remain strong. Several local syncretic religious movements have also emerged on the island. The best known of these is the John Frum Movement that combines traditional and Christian elements and also an appreciation of the U.S. military that dates back to men's work experiences on American bases during the Pacific War. Christian churches and local religious movements alike are important social organizations on the island, with both male and female membership (Jolly, 1991). Islanders quickly noted that the Christian god is masculine, and men dominate church governance. Moreover, worshippers sit on opposite sides of the aisle during service or mass rather than seating themselves as families. Most denominations have separate women's organizations (such as the Presbyterian Women's Missionary Union).

Many men and women alike have inherited local pharmacological recipes ("leaf medicine") that they use to treat various ailments. Some of the most respected curers also serve as diagnosticians and divine the cause of disease, which often is ancestral anger. Occasionally, women become well-known curers and diviners, and many people come to consult them. Although women may not drink kava, they can dream and thereby tap into ancestral wisdom when asleep (Lindstrom, 1990, p. 98). Women produced some of the founding visions that led to the institutionalization of the John Frum Movement in the 1950s, and women have since played important visionary roles within the organization.

LEISURE, RECREATION, AND THE ARTS

Just as boys have more leisure time than girls, men have more leisure time than women in that they are less engaged with daily domestic chores. Islanders are sociable and, in fact, either pity or are suspicious of individuals who prefer to be alone. People relax, as they work, in groups—and these groups tend to be sexually segregated. Young men often play a lot of football, and some are involved in local string bands. Older men spend considerable amounts of time walking to and participating in a constant round of dispute-settlement and decision-making meetings that they consider to be more duty than leisure.

RELATIVE STATUS OF MEN AND WOMEN

Although women may possess considerable influence within their families, men dominate religion, politics, and the economy. In practice, however, men need the support of wives if they hope to organize successful feasts, ritual exchanges, and dances. They will fail unless their wives are willing to help cultivate the extra food and kava gardens and feed the pigs that these ceremonies demand. Fathers expect that unmarried daughters with salaries will turn over at least some of their wages to the family, as husbands do of wives, although women may refuse to do so. Women who cultivate market gardens, or who otherwise make money selling crafts and food in the marketplace, control their earnings.

Parents customarily arrange their children's marriages, and people say that young men and women alike can veto a parental choice. However, since marriage arrangements are frequently complex and delicate, children often come under considerable pressure to acquiesce. Some young women pressured to marry attempt suicide, often by jumping out of tall trees. Only so perilous an act convinces parents that a girl is serious in her objections. Others may disappear for several days, claiming to have been kidnapped by an ancestor. Such signs of ancestral interference may also convince parents to back off reluctant daughters. Suicide rates in general are higher among women than among men, reflecting the island's unequal gender opportunities and pressures.

People expect that newcomers in a village will eventually support local religious and political affiliations. This applies to men and women alike, but women move more often than men given virilocal residence patterns. A girl raised a Presbyterian who marries into a John Frum family soon finds herself dressed in bark skirt dancing to John Frum hymns. There is little expectation that anyone has the right to his or her own individual religious or political beliefs, but women have to adjust theirs more than do men.

SEXUALITY

Like many Melanesians, Islanders worry about the dangers of sex. Intercourse is necessary to conceive children, but too many ejaculations can weaken and age men's bodies. Fathers warn unmarried sons about losing semen too early in life. In addition, female fluids and

essences—menstrual blood, in particular—can make men ill. People usually have sex in garden plots rather than in their houses. The island's thatched houses are small and open. They provide little privacy and, moreover, sexual fluids would pollute the living space. Customarily, couples abstained from sex during pregnancy and they also observed a postpartum sex taboo that endured as long as the baby nursed, or at least until it could walk. Children often nurse until age 2 or 3, and this period of abstinence could be lengthy. Nowadays, couples do not always abstain, as curers sometimes determine that a nursing child's illness has resulted from her parents having had sex. However, despite cultural worries about the medical and social dangers of uncontrolled sexuality, people are by no means prudish. Premarital sex, unmarried but pregnant daughters, and adultery are regular causes of dispute addressed at village moots.

Island modesty demands that women cover their thighs, a typical Pacific sensibility. Nowadays, they usually also cover their breasts, especially in front of strangers. A woman working without her blouse in her garden may grab a wrap if a truck comes along a nearby road. Young girls and uncircumcised boys often go naked. Before conversion to Christianity, men wore *ninhim*—leaf wrappers cinched to a belt that held their penises in upright position. Contemporary observers noted that men, although mostly naked, were nonetheless extremely modest about exposing their circumcised penis heads (Humphreys, 1926, p. 38). Several island political organizations, concerned to protect *kastom* (tradition), have revived use of men's penis wrappers and women's bark skirts with bared breasts, particularly during ritual occasions.

In men's perspective, men are active while women are passive. In cases of adultery, for example, people primarily blame the man involved. If a man "pulls" a woman, people expect that she is not able to refuse. Islanders are understandably mistrustful of situations when an unmarried man and woman somehow find themselves alone, suspecting the worst of them. Etiquette demands that women avert their eyes when they encounter unrelated men. Island men sometimes press woman tourists for sex, having misinterpreted their direct friendly gaze.

There is no "third-gender" category, nor a traditional concept of any sort of homosexual identity (as opposed to homosexual behaviors). Islanders do have a word for hermaphrodite (*kaprankerman*), a condition they recognize occasionally among animals, particularly hermaphroditic pigs (which are especially prized in the northern parts of Vanuatu). Occasionally, men put on women's bark skirts during dance festivals; people find this sort of clowning to be hilarious and hugely entertaining.

Tannese culture incorporates one carnivalesque period when sexual license may occur. This is the first night of *nakwiari* dance festivals. Women's dance teams perform throughout the night, singing as they vigorously beat hand-held basket drums. Raucous groups of chanting young men (*kauas*) with clubs—many carved into phalli—circle around the dancers, attempting to interrupt and break the teams' routines. Older men patrol the dancing grounds, standing between the women and young men to keep some semblance of order. During the pandemonium, men and women slip into the night for sexual encounters. Village leaders and church elders often exhort married people not to partake in the licentiousness, but many do so alongside the younger and unmarried.

COURTSHIP AND MARRIAGE

Parents arrange the marriage of their children. The most appropriate partner is a mother's brother's child (who may simultaneously also be a father's sister's child, if mother's brother married father's sister), and first-cousin marriage of this sort is common. Because of this, people typically have grown up with their future spouses, and may have known whom they must eventually marry since they were young children. Before the 20th century, powerful men often married more than one wife but monogamy has long since been the norm.

Almost everyone except the mentally ill or seriously disabled marries. In "sister-exchange" systems, one marriage depends on a second. A marrying boy owes a "sister" to the family of his new wife, who may marry one of his new brothers-in-law. If men lack marriageable sisters, they often promise to return one of their future daughters to their wife's family. Marriage negotiations typically are complicated. Several families may hinge marriages, so that family A promises a girl to family B which promises one to family C which gives one to family A. Divorce rates are very low (less than 5%) in that the dissolution of one marriage threatens the stability of a second. People come under much pressure to stay married, even if the relationship is not happy. Women, too, have few independent resources. Those who divorce must return to their father and brothers' estate. Widows often remain with their husband's people and may eventually marry one of his brothers, or another man from his family. During the 19th century, missionaries claimed that

some Tannese had borrowed the custom of strangling widows at the death of their husbands from the neighbor island of Aneityum (Turner, 1884, p. 324). However, this was likely Christian propaganda to encourage support of the mission.

Marriage ceremony is flexible. Depending on resources, families may mark a marriage with three sequential ceremonies: the "doorway," the "basket," and the "big feast." "Doorway" is a small exchange (perhaps including a pig from each side) that occurs when an agreement to exchange women between two families is made. "Basket" celebrates the physical exchange of a girl from one family to another. This may be a double exchange, with two girls moving in opposite directions. The "basket" refers to the baskets (and nowadays suitcases) in which a girl carries her belongings. Her family also gather together exchange goods (food, kava, mats, skirts) and usually at least one pig, and heap these in the center of the local kava-drinking ground. A man of the girl's side leads her by arm, often sobbing miserably and hiding her head under a piece of cloth, out onto the ground. He circles her around the heap of goods and there passes her to a representative of the future husband's family, seated on the opposite side of the clearing. The "big feast" marks marriage itself. If a woman marries immediately into the receiving family, men may organize this feast simultaneously with basket, although it often follows sometime later, especially if the girl is still young.

Western notions of love are increasingly popular among the young. Many string band songs celebrate romance. Although marrying couples eventually may come to love one another, romance disrupts systems of arranged marriage. Young lovers sometimes elope, running away to relatives or leaving the island for Port Vila. If caught, their parents may break off the affair or, if possible, conduct the negotiations to convert elopement into a sister-exchange. Young people occasionally fall in love with someone they call "brother" or "sister" in the island's classificatory kinship system. Such incest is particularly troubling but, if there is no other alternative, people will change the husband's kin category to legitimate the marriage.

HUSBAND–WIFE RELATIONSHIP

Although arranged, marriages are often happy. Even if newlyweds are at first not much inclined to like one another, they may come to do so in time. Couples live together (although they eat the evening meal apart since men are off at the kava-drinking ground) and nuclear families are the main productive unit; husbands and wives must cooperate in gardens, in other economic endeavors, and in child rearing. Even when spouses are at odds, the marriage remains viable as long as each performs his or her domestic duties. Men and women mainly socialize in same-sex groups, and unhappy husbands and wives can avoid one another much of the time.

Divorce is difficult, but if a husband or wife is determined to leave a marriage either may do so. Families must then convene and renegotiate sister-exchange. A brother may promise a daughter to replace a divorcing sister. Divorced women may keep younger children with them, but these children belong to the family that provided their personal names—most often that of their father.

OTHER CROSS-SEX RELATIONSHIPS

Brothers and sisters not infrequently come into conflict, as the marriage of one often depends on that of the other. Custom demands that they avoid overt recognition or discussion of one another's sexuality, but also that they respect and care for one another. A brother will leave the room, for example, if people start up a conversation about his sister's pregnancy.

Conversely, joking characterizes the relationship expected of brothers-in-law. Marriage establishes lifelong exchange links between a man, his sisters' husbands, and his wife's brothers. Island etiquette demands that brothers-in-law, who also often have good cause for conflict, maintain good relations through stylized joking, rather than avoidance. The same is true, to a lesser extent, of sisters-in-law. A woman also calls her brother's children by the kin term that means "younger sister." Since these children eventually may become her son-in-law and daughter-in-law, this practice may similarly smooth affinal relationships.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Increasing educational and employment opportunities for women are affecting gender relations, although this is truer of Vanuatu's towns than its rural areas. An effective

National Council of Women works for women's rights and has local representatives on the island. However, some men worry about new challenges to traditional gender inequality. For example, village leaders in one region have refused to let girls attend school, fearing that "they would learn the English language, and absorb new ideas, and perhaps become free to leave" (Gregory & Gregory, 2000, p. 198). Strategically eschewing Western feminism, many women leaders are attempting to ground women's rights and more equal opportunities in a new reading of island culture that recognizes women's traditional contributions to family, village, and society.

Tarahumara

Felice S. Wyndham

ALTERNATIVE NAMES

Tarahumara are also known as Rarámuri and Tarahumar.

LOCATION

The historical homelands of the Tarahumara are the mountain ranges of the Sierra Madres, western Chihuahua, northern Mexico, covering approximately 35,000 square kilometers on either side of the continental divide (Merrill, 1988, p. 17). Today, in addition to highland (sierra) and lowland (barranca) communities, a significant number of people live in urban settlements in Chihuahua City and Juárez, Chihuahua, and are found in every Mexican state.

CULTURAL OVERVIEW

The Tarahumara are of Uto-Aztecan descent, and are predominantly subsistence agriculturalists, though many now work as teachers, health workers, and laborers in agriculture and other industries. Rural Tarahumara's main field crops are corn, beans and squash; other foods include wheat, potatoes, cabbage, apples and peaches, and a variety of greens and wild foods. Goats, sheep, and cattle are kept primarily for the manure's value as fertilizer, though they are eaten on ritual occasions. Most Tarahumara live in *ranchos* or homesteads dispersed across mountainous landscapes but are affiliated with *ejidos*, political entities which include mestizos (Mexicans), usually centered around a church, school, and other missionary or government facilities. Local governance is by elected Tarahumara officials, who are responsible for organizing community feast days, advising on correct behavior, disciplining wrongdoers, and mediating with outsiders. Many families move seasonally between summer and winter residences, and also between multiple *ranchos* to tend their various fields. Thus the Tarahumara have been described as transhumant or residentially mobile agriculturalists (Graham, 1994, p. 18). The basic social unit among Tarahumara is the nuclear family, in which married partners play equally important and highly complementary roles in subsistence, social relations, and control of resources. Increasingly, Tarahumara rely on seasonal work outside of their communities for supplemental cash income, and thus travel to and from Mexican communities during the year. Logging enterprises throughout the Sierra Tarahumara are often operated jointly by Tarahumara and mestizo *ejido* members, and most Tarahumara communities have a long history of interaction with Mexicans through local trade, missions, land disputes, and schooling. The Tarahumara population is between 60,000 and 80,000 strong, in a territory that is geologically and biologically diverse, and until recently difficult to traverse. As a result, Tarahumara communities have diverse histories, dialects, religious practices, and lifestyles, making generalizations about their culture difficult. The information here pertains generally to high-sierra Tarahumara and specifically to the *pagótame* ("baptized" or Christian) communities in the Basihuare area, in the municipality of Guachochi.

CULTURAL CONSTRUCTION OF GENDER

The two prevalently recognized gender categories among Tarahumara are female (*bamirá*) and male (*owiira*). These terms also apply to nonhuman animals. Homosexual women and men (*nawiki, rineki*, or *kamu*) are also recognized, though relatively uncommon. Gender is biologically determined but not restricted; in other words, people are born as females or males but may undergo gender changes during their lifetimes. Often, "homosexuality" is more akin to "transexuality," conceived of as a monthly switching back and forth between female and male identity (Kennedy, 1996, p. 232). One way for this to happen is for a person to visit a certain mountain where an ancient rock shelter home still contains household tools. If the person approaches without the proper knowledge and propitiation (i.e., they are not *owirúames* or healers), and handles ancient household items associated with the

opposite sex, they will, in theory, from then on experience periodic shifting of their gender. Women are generally thought to have four souls and men three, and these are the symbolic numbers associated with each gender (for a thorough discussion of Tarahumara souls see Merrill [1988]). This is reflected in almost every ceremony and ritual by women performing in sets of four and men in sets of three (e.g., four death fiestas are required for deceased women and three for men; four *quemas* or ritual burning of babies' hairs for girls and three for boys, etc.). Women are thought of as having less "strength" than men, because their souls go out wandering more than men's do. One of a woman's souls is almost always out wandering, exploring, leaving the other three "at home" taking care of the body. Upon return, the wandering soul switches off caretaking duties so that another soul can go out. Men's souls wander less, which is why they have more "strength" to run long distances, for example. Women also use up extra strength while carrying babies and giving birth.

The two main gender categories, female and male, are marked culturally in dress, hairstyle, and accepted behavior. From a young age (6 months to 1 year old) girls and boys are dressed to resemble their elders: girls are usually dressed in hand-sewn tiered cotton skirts and blouses, often with a head kerchief and small *rebozo* or shawl; boys are dressed in premanufactured shirts and trousers or, more rarely now, in *sitagora*, the traditional men's muslin loincloth. Women now generally wear their hair long, tied at the back, with a head kerchief, though older women adhere to earlier styles worn by both genders of a short bob below the ear with a long cloth headband tied and hanging down the back. Similarly, most young men today have adopted hairstyles like those of mainstream north Mexico: short all around, topped with a cowboy hat. Older men and some young men wear longer hair, bobbed to mid-neck or shoulders, with a bandanna or headband. Though a cultural ideal of physical attractiveness is not rigidly defined for either sex, being well-dressed and well-kempt is valued in a mate, as is individual beauty, and for both men and women, ability and willingness to work hard, intelligence, and good humor.

GENDER OVER THE LIFE CYCLE

There are at least three generally identifiable life-stages for the Tarahumara. These correspond roughly to childhood (prepuberty), adulthood, and old age. Shortly after birth (ideally 3 days after for boys and 4 days after for girls), babies are given a ceremony called *rajirepema* (passing fire between pots, which is also performed for other curing purposes) or *na'yé ta muuchi* (burning babies). It is usually a quiet family affair conducted by an elder, often a healer or relative of the baby, who gives the baby a "burn" name and then becomes the "godparent of the burn." Prayers are said, protection from lightning invoked for the baby, and smoldering corncobs (again, three for boys and four for girls) are passed over the crown of the baby's head to sever invisible threads that connect them to the world from whence they came (see Levi [1993] for a discussion of non-Christian "baptism by fire"). Girls are called *tiwe, tewe*, or *tiweke* (plural *iwé*) from birth and boys are called *towi* (plural *kuruwi*). These names are used throughout childhood, both to refer to girls and boys in general and as terms of address. They are used to refer to married or elder people jokingly or affectionately. Children, regardless of gender, are called *kuuchi*. Some time after puberty a woman is called *muki* (plural, *muí*) and a man *rejoi* (plural, *rejoi* or *rarámuri*). Elder women are called *weráame* and elder men, *chérame*. Passage from one stage to another occurs gradually and is generally unmarked for both genders. Social responsibilities, governance and economic power are generally assumed by adults of child-raising age; religious and healing responsibilities fall mainly to elder men, though it has been reported that in earlier times it was more common for women to be healers as well.

Socialization of Boys and Girls

Girls and boys are equally valued in most Tarahumara families, though ideally a family has some of both. Gender socialization starts in early childhood, as girls and boys are expected and encouraged to start helping with gender-specific household tasks as soon as they are able to "think," talk, and walk. Thus, girls learn to prepare and cook food, care for younger siblings, wash clothes and dishes, sew, and weave baskets and textiles. Boys learn to fetch and chop firewood, plough fields, and fish. These tasks are only generally gender specific, and it is common to see either girls or boys performing "cross-gender" tasks. Both girls and boys herd goats and sheep from an early age, fetch water for family use, gather wild foods, and help plant, weed, and harvest corn and bean fields. Children learn their expected roles primarily from parents,

but also from grandparents, aunts, uncles, siblings, and peers. Young babies and lap children are doted upon, regardless of gender, by a wide circle of extended family. They are in bodily contact with their caregivers almost constantly, either in arms or carried on the back in a *rebozo* (shawl). By about age 5 or 6, children begin to assume responsibilities and help with household tasks.

Puberty and Adolescence

Adolescence is not named among Tarahumara, nor is it marked by specific rites or celebrations. The transition from childhood to adulthood is gradual, individually paced, and consists primarily of an increase in responsibilities. Menarche is not particularly celebrated, but is considered to be part of a natural and healthy transition to womanhood. Adolescents who go to school are exempted from many household responsibilities, and are often discouraged from drinking *tesgüino* or other alcohol.

Attainment of Adulthood

There are no special rites of passage indicating a transition from boyhood to manhood or girlhood to womanhood. This change in status is gradual, though generally considered to come with marriage and especially with attendance at *tesgüinadas* (corn-beer parties). A marriage may or may not be officiated publicly, depending on the wishes of the couple and their parents, but if so, it is usually after the couple has lived together for a while. Both girls and boys tend to marry between the ages of 14 and 20 and to assume adult responsibilities at this time, though they usually still live with and are guided by the wife's or husband's family. Married women and men are expected to work hard and help their relatives and neighbors in subsistence activities. Childbirth is considered a private affair, the responsibility of a woman, helped perhaps by her husband or mother and often performed in the woods or in a remote house. Midwives and formal birth assistants are rare or nonexistent in Tarahumara communities. Both young men and young women spend a great deal of time with their new babies, learning to parent and care for them with the help of extended family. Adult women ideally should avoid speaking with members of the opposite sex who are not their relatives and be modest in dress, behavior, and speech. These rules apply to young men as well, but to a lesser extent, as men are expected to interlocute with the non-Tarahumara world and thus permitted more leeway. Young adults begin to take on religious responsibilities, and may join a group of dancers, host their first *tesgüinadas* (corn-beer parties) on religious *fiestas*, and are expected to attend Sunday meetings in which community political and religious matters are dealt with.

Middle Age and Old Age

It is usually in middle age that Tarahumara men assume public leadership roles. Political leaders are ideally elected for their experience, ethical integrity and spiritual wisdom, all of which are thought to be undeveloped in the young. Healers, sorcerers, and spiritual leaders (almost all men nowadays) are self-identified or chosen by God through dreaming, usually during middle age, though some are chosen in youth. Middle-aged women may take on more vocal and influential leadership roles within women's social circles, and in general may behave more freely. Elder women and men who can no longer subsist on their own are considered the responsibility of their younger relatives, and ideally are fed and cared for by their families until their death (and after, in the form of death fiestas). Elders, especially elder men, are generally respected as sources of wisdom and tradition.

PERSONALITY DIFFERENCES BY GENDER

Stereotypic Tarahumara female behavior is quiet, soft-spoken, modest, and shy, particularly with strangers, while males can be more outgoing and vocal. In reality, diverse personalities are expressed by both sexes. Children up until the age of 5 or 6 are allowed relatively free expression of their emotions, but as they get older girls and young women are more firmly socialized to avoid unrelated members of the opposite sex, to be soft-spoken in the presence of others, to be nurturing, strong, cooperative, and responsible, and to avoid conflict. Boys are socialized similarly, but are allowed more freedom of movement and a wider circle of social interaction, which increases as they mature into men. Older women and men, especially past child-rearing age, enjoy relaxation of the social norms and often become more outspoken and interact more freely with both sexes. Many of these stereotyped personalities break down during *tesgüinadas* (drinking parties). It is culturally expected and accepted

that, while drinking, both men and women more freely express their aggressions, resentments, jealousies, attractions, and affections.

GENDER-RELATED SOCIAL GROUPS

Tarahumara social organization is neither predominantly male oriented nor female oriented. Though men's and women's roles in society are rather strictly separated, they are highly complementary and recognized as interdependent. The basic social unit in Tarahumara communities is the nuclear family, and the bond between husband and wife is important. However, in public, and in the social institutions of governance and religious practice, men and women perform separately. Men are elected as officials and undertake the duties of advising, caretaking, and punishing community members. It is predominantly men who vote for political positions, as well as female (sole) heads of households, who exercise this right more often than married women. Religious events are orchestrated primarily by men, though one or several women may be appointed as *tenanche* or ceremonial hostess for a particular event. She is responsible for overseeing the preparation of corn beer and meat stew for the fiesta. In daily life, the association of neighbors, relatives, and friends in *tesgüinadas* or corn-beer parties is an essential part of economic, religious and social practice. Men and women attend equally, but usually maintain gender-separated groups during the communal work and drinking (at least in the beginning of the festivities).

Newly married couples are neither strictly matrilocal nor patrilocal, but decide to live with the parents of the husband or wife depending on which benefits them most (more fertile land, available living space, food security) or which family needs them most (many young children to care for, an ailing relative, extensive land to work) or, simply, which family they prefer. Couples may move back and forth between households for several years or all their lives, often building houses and maintaining fields in several sites. Though kin terms distinguish mother's relatives from father's relatives (e.g., mother's mother is referred to differently from father's mother), there are no distinct matrilineal or patrilineal kin groups.

GENDER ROLES IN ECONOMICS

Both men and women inherit land and property bilaterally. Married couples work their lands together but maintain individual ownership; in the event of separation, each retains their own. At death, land ownership is divided among the deceased's children or, if there are no children, to a sibling—very rarely to a spouse. In general, men are responsible for maintaining corn and bean fields (clearing, plowing, fertilizing), gathering firewood, woodworking, hunting, building, and working for *ejido* (communal lands) lumber operations. Women are responsible for preparing food, childcare, sewing clothes, weaving wool and baskets, fetching water, preparing *tesgüino*, and, usually, caring for livestock (goats, sheep, horses, and cattle). Both genders participate in planting, weeding, harvesting, and storing crops, and gathering wild foods and medicines. Many men and some women work outside the community for cash on a seasonal basis, often as migrant agricultural laborers in the lowlands of Sinaloa, Sonora, and Chihuahua. Others work permanently in Mexican cities, coming to the sierra only to visit on holidays. Some women (and fewer men) sell traditional artisanry for cash and there is limited employment in the tourist trade of the Copper Canyon, mostly as guides and hotel employees. Some families participate in drug-growing businesses in the barrancas. Division of labor is defined but not immutable; depending on personal affinity men may participate in any or all of "women's work" and vice versa (though women tend not to travel and work far from home) without fear of ridicule or censure. Homosexuals or people of "reversed" gender will often be identified primarily by their affinity for the work and lifestyle of the other sex, rather than by sexual practices.

The most important form of trade in Tarahumara communities is labor trade, in which both men and women participate. Though fertile land and its produce is owned by individuals, the bulk of it is worked in cooperative work–*tesgüino* parties. Often, those who work together are kin or fictive kin (e.g., coparents) and the harvest will be shared later in the year if one family runs short. Other forms of trade include deals between individuals for the exchange of livestock, food, liquor, clothes, and land (and increasingly money). *Noráwa* are formal trading partners or clients, usually among the most wealthy men or women of the community, and will

preferentially trade or sell livestock to one another. Property is redistributed among community members through gambling on the outcome of footraces. Both men and women (and boys and girls) run, in separate events, and the two team's supporters, often geographically determined (e.g., "up-valley" vs. "down-valley"), stake large amounts of clothes, money, blankets, woven belts, cloth, soap, beads, and other personal belongings on the success of their team runners.

PARENTAL AND OTHER CARETAKER ROLES

Biological mothers and fathers are the primary caregivers for children, but from birth both girl and boy babies are cared for and socialized by an extensive network of family. Older siblings, especially sisters, spend a great deal of time carrying, feeding, and entertaining children. Grandparents, aunts, and cousins often play important caretaking and socializing roles too. Though women spend the most time with babies and children, and are thus the primary physical caregivers and discipliners, both men and women are openly affectionate and tender with youngsters, and both take responsibility for guiding and socializing their children. Babies are cherished as "gifts from *Onorúame* (God)" and are closely attended, breast-fed, and seldom out of bodily contact with their caregivers. Children stay near home or close to their mother or sisters as babies and toddlers, but by the age of 4 or 5 are considered to begin "thinking well" enough to venture out accompanied by siblings or other children, to play, explore, gather wild foods, and help herd goats. It is around this time that girls and boys will tend to form separate peer groups and begin to learn and play overtly gender-specific roles, such as grinding clay to make mud tortillas and driving wooden trucks around extensive miniature dirt highways. Fathers will increasingly take sons to help them in their tasks, and girls will accompany and help their mothers. As children grow, girls are usually closer to their mothers and boys to their fathers, in terms of confidences shared, friendship, and mutual cooperation. Children have especially close and affectionate relationships with their grandparents, who are respected and cherished for their role in imparting traditional values, stories, and technologies (Merrill, 1988, p. 59). Beyond family members, the elected authorities are considered responsible for the moral education of youngsters, and

may be called upon to chastise or advise a child who has seriously or repeatedly misbehaved. A large proportion of children with access to schooling do attend, starting at about age 6 and depending on whether they are needed at home to care for goats or younger siblings. Often, one daughter in a family is exempted from schooling to stay at home and help her mother with household tasks and in raising younger siblings. In general, boys are more encouraged than girls to study past the sixth year, as it is considered more appropriate for boys to learn Spanish, interact with Mexicans and foreigners (generally those in control of the schools), and work outside the community.

LEADERSHIP IN PUBLIC ARENAS

Public leadership is dominated by men. Elected authorities are male, and it is almost exclusively men who vote. This is probably due to Spanish/Mexican influence, as the positions of governance in Christianized communities are modeled after early colonial political organization (consisting of a hierarchy of governor, lieutenant, general, captain, mayor, soldiers, and *tenanches*). In some communities with more contact with mainstream Mexico, women are elected to leadership positions. Historically, Tarahumara women have limited their interaction with non-Tarahumara, probably because of threats of sexual violence, thus predominantly restricting their political influence to the private sphere, where their opinions and ideas are respected as equal to those of men. Widows and other single women do exercise their voting rights in order to receive the benefits due to *ejido* community members. Tarahumara men are increasingly involved in indigenous rights movements in Mexico as representatives from particular communities (there is as yet no pan-Tarahumara political representation structure in place).

GENDER AND RELIGION

Public religious practice is also dominated by men, especially when it is associated with political leadership. Political leaders are expected to give spiritual advice and deliver "sermons" on Sundays and religious holidays in addition to their governing and judicial roles. On Catholic feast days, the ritual offices are performed by the elected male authorities, with the exception of a female *tenanche*

or *moréami* (Kennedy & López, 1981) cargo responsibilities. Women play an essential, though less visible, role in the preparation and distribution of special feast foods and *tesgüino* (corn beer). Ritual costumed dance is dominated by men, though women do dance, especially the *yúmari, pascol*, and *nutuá* (offerings dance). In general, women play a more central role in indigenous religious events that take place on local ranches rather than the church, such as death fiestas and curing ceremonies. Often, a healer's wife will play an active supporting role in his healing practice, which is essentially religious in nature, and may specialize in particular illnesses or treatment of babies and women. *Onorúame*, or "he who is father," is a male creator deity now modeled after the Christian God, but also associated with the sun. The moon (*mechá*) is considered to be female, identified also as *Eyerúame*, or "she who is mother," an entity that loves and cares for her Tarahumara children at night (see also Levi, 1993, p. 290). In Christian Tarahumara worship, the moon has likely been assimilated into the identity of the Virgin Mary, and as such become part of a spiritual hierarchy, sometimes identified as "God's wife" and sometimes below God and Jesus in power. The sun and moon may have been considered the male and female aspects of one spiritual entity, rather than two beings dually opposed. The devil is male, and sometimes is conceived of as having a wife. Other minor spirit beings that inhabit (or inhabited) the landscape, such as little water people and giants, are conceptualized as consisting of both males and females. Most Tarahumara human origin myths identify the first humans as a pair, man and woman or boy and girl, who were created at the same time and became the parents of all Tarahumara.

Leisure, Recreation, and the Arts

Leisure time and recreation is not expressly demarcated in Tarahumara culture, but exists in a continuum of work, religious practice, sports, and play. In general men have more leisure time than women, mainly because agricultural responsibilities sometimes wane, while household tasks do not. Women and men spend their leisure time in similar ways, primarily socializing among family and peers at *tesgüinadas* (though work is often integrated here). At *tesgüinadas* men and women play music, dance, drink, tell stories, and joke with each other. Usually the genders start off drinking in separate areas of

a *rancho*, but become more and more mingled as festivities progress. Another form of recreation is the footrace. Both men and women (and boys and girls) run races of between 20 km and several hundred kilometers, in which the supporters (those who have bet on their team's winning) run portions of the race along with the runners to light the way in the night (men run while kicking a small ball ahead of them; women flipping a small hoop with sticks). Men often play throwing games in their free time, such as *cuatro*, in which they take turns throwing stones or coins into a square court. Pennington (1963, pp. 174–177) describes several other stick-throwing dice games, gender-specific team games, and archery games. Both men and women spend free time visiting friends and family, often in distant ranches, and most enjoy spending time "in the woods," hunting, fishing, or gathering wild foods.

Relative Status of Men and Women

Tarahumara men and women are valued equally in society, as different but intrinsically complementary to one another. Both men and women control their personal land and property throughout their lives but contribute their resources to the family as a whole, recognizing the mutual dependence of couples and family in subsistence farming. Women are considered to be intrinsically strong and possess an additional soul (total of four), which may help in the conception of babies. Men are considered faster and better at handling heavy work; they can travel farther from home and deal with external politics. The responsibilities and contributions of both men and women are considered essential to living well, and are equally valued. Most important decisions, such as the sale of livestock, when and where to move households, or children's schooling choices, must be discussed and agreed upon by both husband and wife. In cases in which the Tarahumara family is in more contact with mainstream Mexican culture and cash economy, gender equality may be compromised, as women have less access to the Spanish language, paid work opportunities, and control of resources outside of their home communities. Men who work seasonally outside of their communities not only bring back cash and manufactured goods, but may also bring hard liquor and associated domestic violence, new ideas about gender hierarchy, or awareness of gender-equality issues in public governance. In general,

women and men control their own sexual activity and marriage choices, though in the recent past it was more common for marriages to be arranged, even against the will of either party, often between young adults aged 12 or 13 years. However, sexual promiscuity is censured more in women than in men. Fertility choices (e.g., the use of contraceptives, or fertility curing ceremonies) are important to both partners and likely result from discussions between them.

SEXUALITY

Both men and women generally view sex among Tarahumaras as natural and healthy, but private, as is the physical expression of affection. Thus the flaunting of one's sexuality in dress, speech, or behavior, especially in women, is considered immodest and usually inappropriate except in overt joking. Sexual activity with non-Tarahumara is generally considered to be dangerous and polluting, with high risks of contracting venereal diseases, HIV, or other illnesses. Sexual urges are considered to be strong, and thus it is often assumed that men and women alone together will give in to them. For most Tarahumara, marriage consists of starting a sexual and domestic relationship with a partner, and it is expected that couples go through a "try-out" period of living together before any official ceremony is performed, though the official ceremony is not needed for them to be considered "married." If they find that they do not get along, they may separate and look for another mate. Thus teenage sex is expected for both genders, while they look for long-term partners, though sexual promiscuity is frowned upon for both men and women. Extramarital sex at any stage in life is considered to be bad behavior for both genders (though perhaps more condemned, and less common, among women) and is a considerable preoccupation and cause of jealousy and fighting (whether the infidelity is real or imagined) among insecure couples. Physical modesty is encouraged for both men and women, primarily in the avoidance of showing the pubic area and buttocks, and to a certain extent women's hair, which is properly covered with a kerchief. Women's breasts are not particularly sexual and are often exposed in breast-feeding. Physical affection is rarely shown in public, though flagrant transgressions of modesty occur during joking and play at *tesgüinadas*. Both men and women may lift skirts, loincloths, grab their own or other's genitals, make lewd and suggestive jokes, and simulate intercourse in public, generally breaking the rules that apply when sober. Usually this sexual play occurs between individuals linked in joking relationships, and is also used, in more subtle ways, in everyday life. *Ramoelma*—joking play—is expected between children and their classificatory grandparents (which includes great-aunts and great-uncles), and their aunts and uncles, and between in-laws, especially brothers-in-law and sisters-in-law. Sexual joking occurs equally between relatives of the same sex or opposite sex, and includes young children and babies. Aside from this sanctioned joking, children and adolescents, especially females, are not encouraged to express their sexuality in public, and adults primarily only do so while drinking. In general, Tarahumara extend the same respect for individual choice to men and women who "switch gender." It is considered natural, if unusual, for certain men or women to identify with the other gender in dress, behavior, and sexual desires. They may be somewhat marginalized, but their difference is respected if it does no harm to others in the community. Prejudices and homophobia may be increasing as more Tarahumara work outside their communities and interact with mainstream Mexican ideas about gender and sexuality.

COURTSHIP AND MARRIAGE

Tarahumara marriage is generally monogamous and almost ubiquitous. Few people never marry. It is not uncommon for people to have had several husbands or wives in a lifetime, owing to deaths or separations. Most people start looking for partners and marry between the ages of 15 and 20, and if separated or widowed, will usually start looking for a new spouse within a few years (there are no specific rules or preferences for remarriage). Love is considered important in successful marriages, though mutual respect and companionship can also lead to satisfactory unions. To be alone or single is considered intrinsically sad, and as sadness is dangerous and contagious, it is in some ways considered the responsibility of the whole community to make marriage matches. It is also difficult in practice for a man or woman to make a living alone owing to the many tasks involved; single adults often remain in or return to their parents' households. Nowadays most courtship is undertaken by unmarried men and women themselves, especially among those teenagers who attend school together, but in the recent

past (15–30 years ago) matches were often made by an elected official, the *mayoli* ("mayor") (Kennedy, 1996, p. 199). In the past most families lived in greater isolation from each other, and youngsters may have had very little chance to interact with unrelated peers. The *mayoli* is approached by the parents of youths of marriageable age and asked to find appropriate mates for them. Suitable matches must be unrelated (no traceable blood connection) and usually partners of similar ages, though this is flexible. It is not uncommon for young men to be married to women twice (or even three times) their age; it is less common for young women to marry much older men. Men or women identified as cross-gendered may cohabit with and marry members of either the opposite or same biological sex, depending on personal preference. Marriage with another Tarahumara is preferable to matches with other ethnic groups, though partners may be sought from distant communities to fulfill the unrelated rule. In the past marriages were often forced against the will of the youths, even to the point of sending *soldados* (soldiers) to capture dissenting girls or boys, who sometimes managed to escape by running away to live with other relatives. In the event that a ceremony is performed, it is integrated into another public celebration, commonly Easter or Epiphany. The couple kneel together before the *siríame* (governor), who gives a speech about correct married behavior. The couple may hold hands. The ceremony is short and simple, and the couple are expected to dance later on in the celebrations. Polygynous marriages are very rare, accepted but considered feasible only for wealthy men. In such cases the wives (usually not more than two) live in separate households.

HUSBAND–WIFE RELATIONSHIP

The husband–wife relationship is ideally characterized by love, privately expressed affection, companionship, mutual dependence, and respect. It is the central relationship upon which households are built and subsistence depends. Husbands and wives and their children eat together, sleep together, work together, and make important household decisions together. Many household tasks are quite clearly divided into women's work and men's work, but cross-over occurs frequently, as needed. Men may cook, or weave, or wash clothes if their wives are ill; women may search for firewood or plow fields if necessary. Married couples rely on each other for friendship, successful subsistence, problem solving, physical caretaking, emotional support, and intimacy. Both husbands and wives count on considerable freedom and autonomy, in that either may leave a union if they wish. This may contribute to sexual jealousies, a common source of conflict and resentment between couples. Domestic violence is not uncommon, usually associated with alcohol consumption, and is perpetrated by both women and men against spouses, though it seems that serious physical harm is more often caused by men. Illness and death by sorcery perpetrated by a spouse is a perceived threat for many Tarahumara. Unsatisfactory marriages may be dissolved by mutual consent, or by the fact of either partner leaving a union for whatever reasons they may have, simply separating their personal lands and belongings, though in cases of physical threat the leave-taking may be difficult and community officials may be asked to intercede. Children may go back and forth between mother and father, or pick one parent to live with (if very young they stay with their mother); in the event of remarriage some children choose to live with grandparents if they do not get along with their stepparents.

Tikopia

Judith Macdonald

LOCATION

Tikopia lies at the far eastern extreme of the Solomon Islands in the South Pacific. The Solomon Islands are a chain of islands about 1,000 miles long which stretches from Papua New Guinea in the west to Vanuatu in the east. The majority of the islands are Melanesian but, although the Solomons are outside the Polynesian triangle, there are a few culturally Polynesian islands in the group. Tikopia is one of them.

Tikopia is a small high island, the peak of an old volcano, with the original crater forming a small lake. The island is 3 miles long and 2 miles wide with sandy flat lands to the south and fertile volcanic soil around the mountain ridge. It is nearly 100 sea miles from the next island and 600 miles from the administrative capital, Honiara. Ideally, around 1,200 people live on the island, although more Tikopians are settled elsewhere in the Solomons. This number has fluctuated over the years as the discussion below will note.

CULTURAL OVERVIEW

Tikopia's isolation and small size meant that colonial intrusions like the 19th-century slave ships and European settlers did not impact on it at a time when other, more accessible, islands in the Pacific were being changed totally. Apart from a few anthropologists and one school teacher, virtually no Europeans have ever lived on the island and therefore the land remains under traditional control. The land is actually owned by the four chiefs (*ariki*), but patrilineally focused family groups belonging to each clan use garden plots which have nominally belonged to each family for generations. The four chiefs (Kafika, Tafua, Taumako, and Fangarere) control all aspects of life on the island with the Ariki Kafika considered to be the first among equals. Technically, the island comes under the jurisdiction of the now independent Solomon Islands government but the distance from the seat of government, Honiara, and the lack of sources of money on Tikopia means that the government shows little interest in the island. Equally, the Tikopians do not consider themselves part of a larger polity unless they leave the island for work elsewhere.

The people live in small villages of fewer than 100 people around the flatter parts of the coastline. The economy is a subsistence one: the island is fertile and produces a range of fruits and vegetables; the sea and the lake provide plenty of fish, and material for clothes, house-building, and canoes come from the land. Western clothes have been acquired by people who have been away from the home island to work but the more traditional barkcloth is usually worn.

Descent is strongly patrilineal, and households ideally consist of parents, their sons, the sons' wives, and their children. Unmarried women remain in their parents' house; girls go to live with their husband's family on marriage. The children of any union are seen as belonging to the patrilineage and in the almost unheard of cases of divorce, the children remain in their father's house. Young unmarried men may build a bachelor hut on family land to allow themselves more freedom than is possible in a one-roomed house occupied by several related families, but on marriage they will return to the main family house.

Christianity arrived late; total conversion by a Church of Melanesia (Anglican) missionary did not occur until the 1950s. There are now Tikopian Anglican priests who minister to the island, but some of the old rituals of the traditional "Work of the Gods" have been revived. However, the introduction of Christianity had one far-reaching consequence: traditional birth control practices were banned. On a small island where the people were well aware of the need to control population, sexual relationships among the young were allowed but only the eldest son could marry and have children. Abortion and infanticide were enjoined on the others to ensure a population which merely replaced itself. The early missionary observed what appeared to be promiscuous encounters among the unmarried young people and insisted on marriage for all. This led to a 50% increase in the population over about 30 years (from 1,200 in the 1920s to 1,800 in

the 1950s). Two severe cyclones in 2 years caused many deaths from starvation, and government-assisted migration to settlements in other parts of the Solomons was introduced to relieve population pressure.

This article will deal mainly with the home island of Tikopia because it retains practices long gone from other parts of Polynesia. There will be some discussion of the settlements and their relationships with other ethnic groups as well as a money economy, neither of which is an issue on Tikopia.

CULTURAL CONSTRUCTION OF GENDER

The construction of gender in Tikopia is unambiguous. The important categories are male and female and married and unmarried. The crossing of gender boundaries is permissible in other parts of Polynesia but *faka fafine* or *mahu*, "men who live as women," are entirely absent in Tikopia. Masculine and feminine are two discrete and mutually exclusive categories. There is little opportunity for females to take on a male role except in a few areas of work where young women replace their brothers who are away from the island.

The basic division of Tikopia humans is by sex. *Tangata* means male, and can also stand for humans collectively as distinct from animals or spirits (cf. English "mankind"). *Fafine* means female. When a child is born it is identified as *tangata* or *tangata fafine*, "a human" or "a female human." The very young are differentiated on the grounds of sex only, but once they approach puberty the differentiation is not only between the sexes but also, and especially for females, between the married and the single.

The terms for females that have an age referent are *memea fafine*, "baby female," *tamarikiriki fafine* or *tamaafine*, "little girl," and *maatua fafine*, "grown-up woman." The last term usually refers to married adult women. Once past puberty it is not age that is important for a female but marital status. The unmarried girl is *fafine taka*, a categorization which applies from the time she has grown pubic hair, and she remains in this category until the end of her life if she does not marry. The male equivalent is *tamaaroa*, "unmarried male." All single women are referred to by their given names or the appropriate kin term. An elderly bachelor can be given the married man's title *Pa* by courtesy, and most older single men were referred to in this way. Older unmarried women were rarely accorded the married woman's title *Nau*. The normal term of reference for the unmarried older woman is *fafine taka maatua* or *maatua taka*, "senior unmarried woman."

A married woman generally is *fafine avanga*, the adult married woman is *maatua fafine*, and the older married woman, at a stage when she could be the grandmother of adults, is *maatua valivali*. On marriage the married woman "forgets" her former name and takes the married name chosen by her husband. This is often the name of the house in which they will live, but if the father is still alive or an older brother has taken the house name, a name may be chosen that reflects some incident in the man's life. The titles and terminology of gender demonstrate very clearly that the most important terminology for males is a definition by age or seniority for males and by marital status for females. The equivalent English titles of "Mr" meaning adult male and "Mrs" meaning married female are parallel ideas.

In appearance, the Tikopia are tall strong people with mid- to dark-brown skin and wavy to frizzy hair. They are muscular from work in the garden and there is no idea of dieting for an esthetically appropriate body shape, but fatness is equated with laziness and a fat young woman would not be considered a desirable wife. There are standards of beauty which are more to do with temperament (e.g., a pleasant expression) than physiology. All Tikopia decorate themselves with turmeric, flowers, and leaves for their dances, and until recently both sexes were extensively tattooed. Little children of both sexes go naked until late childhood. The women wear a barkcloth skirt held up by a rope belt and the men a barkcloth loincloth, often with a fabric wrap over it.

Hair is an important marker of sex and status. Traditionally, men grew their hair long and often bleached it golden with lime. Chiefs still may not cut their hair after accession to the status as their body is symbolic of the welfare of the land, and to hurt themselves or cut their hair, diminishing their body, will diminish their land and people. For females, hair length is an index of growing sobriety—the shorter the hair, the greater the decorum. Little girls have their heads shaved, apart from a small fringe around the edge, but in adolescence they let it grow long. However, the day after her marriage, the bride emerges from her husband's house with a bristling blue scalp where her head has been virtually shaved. For the rest of her life her hair will be kept clipped close to her

scalp. The young women who do not marry keep their hair long for some years, but as time passes they may finally cut their hair short like a married woman which signals, first, that they have abandoned hope of marriage and, second, that their behavior will become more circumspect than that of the young unmarried girls. Everyone, except chiefs, must cut off some of their hair at the death of a relative, and the closer the relationship to the dead person, the more hair must be sacrificed.

In Tikopia gender relations are most clearly acted out in the way in which bodies of males and females relate to the house, the land, and the sea, and how each is controlled in these arenas. Houses are one-roomed structures, around 30 or 40 feet long and 20 feet wide, where the extended patrifamily lives. A line of poles supporting the ridge mark the central length of the house and define the division between the sacred and profane sides. On the sea-facing side of the house (*mataa paito*, lit. "eye of the house") family dead are buried inside the house, each grave a mound covered by a mat. The whole length of this side of most older houses is filled with graves, and only men may move on this side. The other side, *tuaumu*, lit. "back of the oven," is the domestic side where small cooking fires are lit, and eating, sleeping, and general domestic life goes on. The low entrance doors at the end of the house are for men's entry; the ones at the side of the house are for women. Men may lean against the house posts when sitting in the house; women may not. Married women must sit in one of two ways: with legs outstretched (but avoiding pointing the soles of feet at anyone), or *fai fetu*, "star-like," with legs folded to the side. The phrase *nofo fakalaui*, "sit properly," is the most commonly heard admonition on the island. Men and the unmarried women may sit cross-legged. While men may stand up in the house, women may not; they should crawl modestly past men and go backwards out of doors.

A small separate structure, the *fare umu*, "oven house," is built outside and to the inland side of the main house. This is where cooking is carried out every few days in big piles of hot stones. Here men and women work together; it is not the domestic female realm of Western ideology. Men decide when an "oven" will be made and direct all family members to go to the gardens or the sea to gather vegetables and wrapping leaves or catch fish. They oversee the preparation and cooking of the food and direct its distribution. Males must squeeze the coconut cream from grated coconut which is mixed with many of the vegetable puddings. Occasionally an unmarried girl may make the cream if no male is available, but a married woman may not on the grounds that their hands are dirty from cleaning up after babies. There is a direct association between coconut cream and semen.

The land is divided, conceptually and actually, into house and village sites, the paths that join them, the gardens and the "bush"—the uncultivated parts of the island. The place of the women is in the house and village of their father or husband. Unmarried young women may wander (see below) if they are not required to work in the family gardens, but married women must not. Even visiting their natal village is discouraged for a married woman. She may go to the sea or lake to wash, usually accompanied by women of the house—her mother-in-law or sisters-in-law—and she will go to the family gardens in a group from the house which usually includes at least one man. She may not go into the bush and she should never go alone anywhere because that is interpreted as going to an assignation. An illegitimate child is called a "child of the path."

Bodily postures and gestures underlie gender relations; a woman's head must be lower than that of a man and therefore on meeting a man on the path a woman should step aside. If men are sitting outside women will make a large detour around them, and if that is impossible they must crawl past.

Women may fish in the lake and on the reef but only men may go into the deep sea. It is believed that fish do not like the smell of women and therefore they would spoil the fishing. Women are not supposed to paddle canoes, but occasionally I have seen a woman take the small *tovi*, "lake canoes," across to gardens on the far side of the lake.

GENDER OVER THE LIFE CYCLE

From birth the gender assignation of Tikopians is marked. A child is a boy child or a girl child from the very beginning and any blurring of boundaries is discouraged. A small boy imitating women waving a fan in a dance quickly has the fan taken from him and he is given a stick which resembles the dance paddles used by men; cross-gender imitation is not found amusing or appropriate. The main changes in life trajectory occur for the male at his manhood ceremony and for the female with marriage, without which she remains, in effect, a minor all her life.

Socialization of Boys and Girls

With the coming of Christianity to the island, ceremonies surrounding the birth of a child are not particularly elaborate, but it is worth noting the traditional ceremony of the Fire ritual because that spells out most clearly expectations of Tikopian males and females. Shortly after the birth of a child, the mother's brother held the baby, a flaming torch of coconut frond was held in front of its face, and the Fire formula was recited. For a girl child the exhortation was

Light be your eyes from the fire which is set up
For the doings of women
To be adept in the weeding of taro
And the making of fine mats
And the plaiting of floor coverings
And the handling of the scoop net
That the fish wherever it goes
May be caught by you
And when you have brought in your hand net
Run hither and kindle the oven.
May you be adept in barkcloth beating, the preparation of the *masi*
The planting of the turmeric.
All the work of females to be grasped.
                    (translated by Sir Raymond Firth)

Boy children were told to be adept at gardening, deep-sea fishing, and making sinnet rope. The cord of a boy child was cut across the handle of a man's flying-fish net, and the girl's cord was cut across the handle of a woman's hand-net. The afterbirth and the cord of the child were buried in a gender-specific place: for a girl, behind the oven house; for the boy, in the gardens or on the reef.

From about the age of 7, boy children no longer stayed in the house with their mothers but followed their father on their round of talking to others, repairing artifacts or making sinnet, and gardening. Little girls remained with their mothers and, while they were regarded as their father's *manongi*, "scented flower decoration," it was recognized that on marriage a female was lost to her father's house. Ideally, any family wanted both boy and girl children but having a son was essential for inheritance, which could not pass through females. The children tended to play games that were gender specific and they did not play together from middle childhood. Boys played fishing and throwing darts; girls stayed around the house. Their education was overseen by the household although primary responsibility lay with the parents.

While primary schooling (age 6–11) was available on the island, mainly boy children attended school and it was thought unnecessary for girl children, although some

attended school. Secondary schooling cost money and was only available on other islands, so this was usually confined to males, although females who were already living off the home island did receive education and there are a few female nurses and teachers.

Puberty and Adolescence

There are several occasions that are marked in the life of the young people; these are often the first occurrences of events like walking round the island or, for boys, night fishing. There will be a small feast or exchange of gifts to mark the occasion. However, the most significant ritual for a male comes at puberty when a boy undergoes the *pungaumu*, "manhood ceremony." This ritual involves feasting and the exchange of mats as well as the physical operation of superincision of the penis. It has been seen as a symbolic cutting off from the mother's side, followed by full absorption into the patriline. It also marks sexual maturity.

Several boys may share a superincision ceremony or one boy may undergo it alone. The day begins with relatives preparing food for a feast. The initiate wanders around the village receiving gifts from people—a new barkcloth, cloth, beads—and then he is carried to the site of the operation by his mother's brother. A male from the mother's family performs the operation. This consists of pushing a piece of wood under the foreskin and slitting the skin from about two inches up the penis towards the tip. The skin is then bound back to heal. The mother's kin carry the boy to his father's house where the patrikin sit wailing for the damage being inflicted on the youth. The boy lies down, often with girls from his family by his side, and they are buried under a pile of mats given by relatives. Then the mats are removed and distributed among those who have helped and there is a feast. In tradition, girl children were also cut at adolescence, but the tale records that they died and that is the justification for the operation being performed on males only. However, the girls included in the ceremony are seen as being recognized as coming of age. First menstruation used to be marked for girls by the insertion of a nose shell, but this is no longer practiced.

Attainment of Adulthood

A young man is regarded as an adult in most respects following his *pungaumu*, while a young woman attains

adulthood on marriage only. Following marriage, sexual activity for both is restricted to the marital partner and, while a few married men may have affairs with single girls, the small size of the island and the fact that married women rarely move around the island alone makes illicit relationships very difficult. With adulthood for women comes a circumscription of her movements and activities which are now strictly controlled by her husband's family. The man is equally committed to the welfare of his family and he takes on more ritual and political roles. The couple will attend daytime dances and feasts, but they no longer go to the night dances which are for the unmarried of any age. A man should be protective of his wife; domestic violence is strongly criticized and rarely happens. A woman should be respectful to her husband and follow his wishes.

Middle Age and Old Age

When children are grown and married themselves, a married couple are supposed to stop sexual activity. They continue to work for the welfare of their household and have more say in the activities of house and village. In old age a widowed woman will no longer attend dances or public gatherings, and for the rest of her life she will avoid some favored food in memory of her late husband. She will also wear part of his clothing around her neck for the rest of her life and she may not remarry. A widowed man may remarry. The old continue to live in the family house, contributing as much as their physical condition will allow.

Personality Differences by Gender

Males and females are expected to behave differently all their lives, with the young being encouraged into the appropriate behavior from an early age. The difference in behavior is very clear to the outside observer. Women are quiet and respectful in the presence of men. Their body language is humble and self-effacing, they do not speak out in public, and they are obedient to male wishes, even those of young males. Men, on the other hand, are expected to be dignified, knowledgeable, good at oratory, and in control. Chiefs and men of chiefly families should be exemplars in these respects.

Obviously there are differences in behavior depending on context. There is joking familiarity between brothers and between a boy and his mother's brother, while a boy must show great respect to his father and even more so to his chief. When the men are away night fishing, groups of women may behave noisily, mocking male behavior and indulging in talk full of sexual innuendo, but the moment that the males return the women become quiet and respectful again.

Gender-Related Social Groups

The social groupings of the island are structured entirely around patrilineal kin relations. The villages are made up almost entirely of households belonging to the same clan, and it is these groupings that make up dance or work parties, which support their chiefs with labor and food, and who perform life ceremonies together. Men gather together to talk in public. There are no organizations or clubs that men join.

Women from related households may sit together outside their houses to weave mats or beat tapa cloth, but organizations such as Mothers' Union and other church groups for women have not succeeded in Tikopia. In part this is due to the kinship structure of the island: intimate talk is inappropriate between mothers and daughters, sisters and female cousins are competitors for husbands, and the household of a married woman is one of female in-laws whom she must address by kin term and not by personal name. That the children of sisters-in-law will be competitors for the land of the patriline also exacerbated a lack of solidarity among females.

Parental and Other Caretaker Roles

After the birth of a baby, the mother is excused from house duties for some months and, assisted by her sisters-in-law, she cares for her child who is never left unattended. Fathers take an interest in their children as they grow older and all members of the extended family are free to correct and educate the child. Ill-behaved or ignorant children provoke criticism of the parents. Increasing knowledge of the outside world has led to the Tikopians quite consciously inculcating values and behaviors that are seen as Tikopian as distinct from any other group.

Leadership in Public Arenas

Leadership is primarily through hereditary ranking. The four chiefs are descended from four deities and each leads a clan having absolute power over their people. This technically includes the power to banish people from the island. A malefactor can be told to go to his "land in the sea," meaning that he should go on a suicide voyage. Men descended from chiefly lines, *maru*, act as executive officers for the chiefs and transmit their chiefs' orders. Women do not have any leadership roles.

Gender and Religion

The introduction of the Anglican religion to the island technically gives women the right to read the lesson or take Sunday School classes. However, as most are illiterate, this is not possible. Furthermore, the Tikopia have introduced some indigenous practices to Christian religion, such as banning menstruating women from attending church. In the traditional religion women took no formal part in the rituals.

There are two main creation myths. In one, the island rises from the sea and on it are a man making rope and a woman beating barkcloth, the archetypal male and female occupations. In the other the origins of the hierarchy are described. Four brothers were born to the Female Goddess and the Chief God. They are the origin of the four clans. The Female Goddess also plays a role in molding the semen into a child inside the woman. However, many of the evil spirit entities are female. For instance, a man should not go alone into bush areas because he may encounter a desirable woman who will seduce him. She will be a spirit woman and if she conceives his child, she will then cause him to become sick and die so that he can complete her family in the spirit world.

Leisure, Recreation, and the Arts

Both men and women have considerable leisure on this fertile island. It is spent in talking or dancing. In the dances the women dance behind the men or sit watching the men dance as a group. Plastic arts are rudimentary, and the main creative activity lies in the composition of songs and dances. Women do compose songs but more men practice this art.

Relative Status of Men and Women

Men control all aspects of life on the island. While hierarchical status differences give some men more control than others, all have a say in household management and political affairs in adulthood. When the Solomons attained independence from Britain, universal suffrage was introduced, but the men of Tikopia refused to let the women vote on the grounds that matters to do with the outside world were purely male concerns. Equally, the women showed no interest in voting and conceded that it was a male affair. Women are to a degree infantilized by having no area in which they have sole control. This is evident in women's speech which is very concrete, dealing with the everyday, while men's speech is considerably more analytical, allusive, and metaphorical.

Men and women work equally in the gardens; women produce mats and men rope and wooden bowls which are used in gift exchanges. Women have little say in the exchanges. No surpluses as such are produced on the island and there is no access to money unless people leave the island for wage labor elsewhere.

Sexuality

In houses where several couples sleep near one another, sex has to be quick and quiet, and many married couples prefer to take the opportunity for love-making in the gardens during the day. The act is brief and without foreplay as a woman's genitals are considered polluting and men will not touch them with their hands. Males are not regarded as more eager for sex than females; after marriage, sex becomes rather perfunctory. Among the young there is more sexual activity (see below). While bodily modesty is practiced (the covering of male and female genitals but not female breasts), it is not particularly emphasized. Young children may be observed in sex play, which is discouraged but treated with mockery rather than horror. There is no homosexuality on the island; Tikopians know that other islands have such practices but they themselves evince neither interest nor shock at the idea.

COURTSHIP AND MARRIAGE

Adolescence is a time for courtship and this takes place during the night dances of the unmarried or in the picnic expeditions they arrange. The young men, *tamaaroa*, and young women, *fafine taka*, contribute to the work required by their households, but in their spare time they choose activities which take them away from the adult gaze. Interestingly, the name for the unmarried females means "wandering or mobile woman" and unmarried adolescent females have a surprising amount of freedom compared with their married sisters, of whom it is said *Nofo te avanga*, "the married woman sits/stays put." Because of migration from the island, often of men and their adolescent sons, there is a gender imbalance on the island. The boys who go away to other islands may marry women of those islands and they do not return to Tikopia. This has resulted in a shortage of potential husbands—only one in every three girls will find a husband, so the competition is fierce and girls marry in their early teens if possible.

The night dances reveal a degree of tension between the young people which has its foundation in the desire of girls to marry and the hope of boys that they will not have to, at least for some time. The girls dance in a group against the boys' group and they sing dance songs called *tauangutu*, "fighting mouth," songs. These are often insulting.

Beliefs about procreation impinge at this stage of life. It is believed that babies are made from the build up of sperm from one man. The sperm is molded into a child (there are metaphors of ovens and cooking used here) inside the woman, but the substance is male. Because it is believed that only the sperm from one man can make a baby, a contraceptive practice is to have sex with a different girl each night. There is a lot of sexual activity, with boys trying to avoid sleeping with the same girl too often and girls hoping that they will become pregnant which will precipitate marriage. While these practices are frowned on by the Church, most marriages begin with pregnancy and are not solemnized until after the child is born and the couple technically show repentance. Assignment of paternity is often done by the priest, and the discovery that some girl is pregnant often leads to young men who fear identification as the father disappearing to the other side of the island for a while.

Traditionally, marriage of higher-ranked young women was by capture. The potential husband's male kin would abduct the young woman, and her family would later be notified of her being taken through the gift of a basket of food. The new bride may have had no idea who the man was to whom she was being taken. Nowadays, this rarely happens, but highly ranked young people are more likely to have partners arranged for them. (See also the section on life stages for more on marriage.)

HUSBAND–WIFE RELATIONSHIP

Husbands and wives have a companionable relationship on the whole. They work in the gardens and oven house together, where there is some gender differentiation in tasks. Men climb trees for coconuts and express coconut cream, but each weeds and gathers food. However, the male makes the final decision on any matter, and if other men are visiting the house, females will eat after the men have finished their food. Divorce is possible but very unusual.

OTHER CROSS-SEX RELATIONSHIPS

The brother–sister relationship is close, with the brother looking after his sister to the extent of sleeping near her to prevent other males approaching her. They each must keep their sexual affairs secret from the other. Relationships with kin of either sex on the mother's side are characterized by joking, warmth, and generosity. Relationships with kin on the father's side are more difficult, with the father's sister having the ability to curse her brother's children. Grandparent–grandchild relations are warm and supportive, although in a society that practices patrilocal postmarital residence, the children see more of the paternal grandparents.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

While many Tikopia have left the island to settle elsewhere in the Solomons, they carry their ideas on gender with them. Women may enter the work force or obtain education but male control is still predominant. This is in part because away from the home island they will be living among Melanesians with whom they have an uneasy relationship. In the light of this tension, asserting ethnic identity as Tikopian is important, so traditional

gender relationships, which might otherwise change, have not done so.

Timpaus Banggai

Harald Beyer Broch

ALTERNATIVE NAMES

Timpaus Banggai are also known as Mian Banggai and Mian Sea-Sea (Lebar, 1972, p. 139). Timpaus Banggai is the name of reference and identification used at the island of Timpaus and in the Banggai Archipelago.

LOCATION

Timpaus is approximately 12 miles long and 2 miles wide. The island is located at latitude 2°S, in the eastern part of the Banggai Archipelago, Central Sulawesi, Indonesia.

CULTURAL OVERVIEW

The history of the Timpaus Banggai is short. According to the islanders, their ancestors moved from Peleng in the early 1920s. This exodus took place after several years of famine, but did not involve more than some 20 people. They settled at Timpaus because the men had previous experience with good catches of fish on and along the coral reefs that surround the island. Further, there was an abundance of shells and other mollusks and more food items rich in nutrition in the littoral zone. The island was "uninhabited"; only a few people from Taliabu, the neighboring island to the east, resided in the interior and these were driven off the island. Most promising to the pioneer immigrants was their opinion that the soils, with the exception of some swampy areas, were well suited for cultivation of fruits, coconut palms, various roots, and vegetables.

Timpaus culture is thus a local sprout from the cultural center located at Banggai Island, which has hardly been studied. The Banggai people and lands were formerly ruled by the I Toeoetoe of Javanese origin, who was appointed by the Sultan of Ternate. At the peak of its power (during the 19th century) Banggai territory included the eastern peninsula of Sulawesi in addition to the Banggai archipelago. At Banggai Island there were several sacred locations concentrated around the rulers and their palace. Traditionally the society was stratified, with the nobility including the ruling family at the top, then two classes of commoners, and slaves at the lowest level (Lebar, 1972). One of the most powerful cultural objects, an enormous kettledrum, was kept at Banggai Island, before, according to Timpaus islanders, it was stolen by Buginese rulers and transferred to the Sulawesi mainland. That theft ended the supernatural force of the Banggai. The Banggai people share a common Banggai language that is related to Loinan spoken on the eastern peninsula of Sulawesi (Geertz, 1963). All languages spoken in the area belong to the Malayo-Polynesian group of the Austronesian language family. At the schools all classes from first grade are taught in the Indonesian language (*bahasa Indonesia*).

Timpaus Banggai culture has developed away and relatively isolated from the cultural centre. At Timpaus, traditional Banggai social hierarchy, for instance, never played a significant role in daily interaction. There they were all commoners. In 1994, the total population of Timpaus Island was slightly less than 1,000 people, living in two villages: Kasuari (580 residents) on the east coast and Timpaus village (390 residents) on the west coast. The majority of the population are Timpaus Banggai, but there are also a substantial number of Bajau (often called Sea Nomads, see the entry on the Orang Suku Laut in this volume). In Kasuari Bajau the majority of the population are fishers. In the terminology of Geertz, the Timpaus Banggai represents a version of Indonesian *pasisir* or coastal culture. This lifestyle is distributed throughout most of Indonesia's coastal areas and has its origin in the international spice trade of the 14th to 18th centuries. From the outset it was closely associated with the spread of Islam. There is an orientation towards inter-island shipping and trade, coastal fishing, copra production, and the characteristic cultural adaptation patterns of swidden farming. Bilateral kinship systems are the cornerstone of local social organization (Geertz, 1963) and multiethnic village compositions are widespread.

On Timpaus there are people of Bugis, Chinese, Butonese, and Sangir origins. Many of these have married into Banggai families. The Timpaus Banggai say that their culture has developed on its own. Their dialect has many loan words from Bahasa Indonesia, Buginese, and Bajau. The residents say that their local agriculture, fishing methods, medicines, many rituals, and oral literature have absorbed components from various Indonesian ethnic groups.

Descent is bilateral. Residence is ideally initially matrilocal and then neolocal. Polygyny is accepted. Adoption or, rather, fosterage of children, especially among childless couples, is common. Children nursed at the same breast are regarded as siblings and are not allowed to marry.

Economy

The Timpaus Banggai are involved in three major economic activities: swidden agriculture, fishing, and trade. Most islanders earn what money they make by producing copra or from fishing activities (sale of shark fins and some dried fish, and collecting marine mollusks). Food for daily consumption is obtained from their swiddens, by gathering edible leaves in the bush, from some domestic fishing, and by collecting a variety of seafood from the littoral zone.

Timpaus agriculture depends on a simple slash-and-burn technique. Roots such as yam, cassava, and taro are planted; various vegetables like peppers, beans, sugar cane, and tomatoes are sown, and bananas, papaya, and pineapples are also grown. Breadfruit and mango trees also grow on Timpaus. Owing to deterioration of the soil, according to the islanders' estimation, their fields yield less than they did earlier. Recent repeated droughts and occasionally too much rain have also contributed to a reduction in cropping. However, when periods of mild starvation occur at Timpaus, this is not a novel situation. Many narratives and popular myths among the Timpaus Banggai are focused on food shortage and the threat of starvation. To supplement their own crops, the islanders import some rice and corn.

Some people keep goats. The animals are slaughtered on special occasions: on marriage, death, or when people gather to pay off debts to spirits after recovery from serious illness etc. Most households own four or five hens or ducks, primarily for their eggs. Hens are seldom eaten at Timpaus, but are the preferred foods of spirits.

Hens are commonly offered when contact with various spirits is sought. The fowls may be slaughtered, but are often let loose in the bush.

Fishing among the Timpaus Banggai is sporadic, and is carried out using many different techniques. Hand lines, fish-spears, rubber string harpoons, trolling, and various types of nets are used. Because local Bajau residents fish more consistently than the Banggai, fish can occasionally be bought from them.

Religion

The Timpaus Banggai regard themselves as an all-Muslim people, and there is a mosque in each village. A few wealthy women and men have made the pilgrimage to Mecca. The frequency with which the islanders attend prayers varies from individual to individual, but there is certainly some social pressure to attend more than just the Friday prayers. Qur'an readings are arranged in the homes of the more pious villagers.

As in so many other Indonesian communities, traditional rituals are staged but modified to be acceptable in terms of the local Islamic interpretation of what constitutes tolerable behavior. Most Timpaus Banggai publicly reject involvement with traditional bush spirits, black magic, and sorcery (Broch, 2000).

CULTURAL CONSTRUCTION OF GENDER

Two principles are central to Timpaus Banggai construction of gender. First, gendered behavior has to be learned and, second, the two genders are complementary and should not be ranked by dichotomous comparison.

Biological sex is recognized at birth and given predictive anticipation about future development and behavior. The youngest children (up to 2 years old) are thought to be ignorant of gender. Children are not corrected for mistakes and/or confused gender role play during their first years of life. People agree that it takes time to learn acceptable gendered behavior; thus people learn to become more or less good at being women and men. Most Timpaus Banggai believe that *banci* (see below) comportment results from unsolved gender confusion.

Like other people, the Timpaus Banggai elaborate and underline gender differences by dress. Both men and women wear sarongs. The men tie the sarong around their waists, whereas women secure it below their armpits. The

members of both genders like to wear rings and bracelets, but the objects are designed differently for men and women. Some pieces of jewelry are charms or amulets for general or specific protection. Many men, women, and children wear amulets of different shapes to protect them against drowning and black magic (particularly food poisoning).

Girls and women wear earrings, necklaces, several rings, and hair combs for beautification and to demonstrate their wealth.

It is strictly women's work to make the beautifying/cooling ointment *bada* for which there are three different recipes. One *bada* mixture has the power to charm men and may only be used by women. Another blend has a neutral effect and is used by both women and children. The third variety lacks the ingredients of sweet-smelling herbs and can be used by all household members, including men.

Fishing equipment is men's private property, and they also make and mend it. Blowpipes and spears are exclusively men's property. Lighting and pumping the pressure lanterns owned by all households is typically a man's task.

Until the 1970s, Timpaus women practiced a ritual demonstrating bravery and nurture towards their household members. Participation was voluntary. In the early morning the leader signaled that the ritual was going to take place. When she let the spirit-initiated conch sound all men in the village knew that they had to stay indoors. Nude women would gather at the swamps just north of the village. There they waded through mud and water, singing ritual songs. All the time they threw pieces of coral in front of them to scare away the crocodiles living in the swamp (the last animal was killed in the early 1970s). On their way through the swamps the women gathered clams with their toes. When the ritual party returned to shore, all the women dressed in sarongs. The leader sounded a new conch signal and the men knew that they were allowed outdoors. The women were on their way home to prepare clams for all to eat.

Men also have gender-exclusive rituals. Women were not prevented from watching competitive demonstrations of individual men's skills in fierce *balatindak* war-dances during which they used spirit-initiated outfits, spears, and machetes.

Two young men resident in Timpaus were labeled *banci*. A person is regarded as *banci* when he or she appears androgynous in dress and/or physical features or behaves androgynously (Oetomo, 1996, p. 260). The two local *banci* were well known, but treated with some curiosity, and remarks were often made about their female mode of dress, their jewelry, and their pretty made-up faces. The Timpaus *banci* were overtly feminine in their movements and made passes at nearby men. There is no indication that homosexual activities were inaugurated by the *banci*, and Timpaus villagers denied the possibility. However, the islanders did say that the two local *banci* rarely visited their home village, but spent most of their time in the larger cities on Sulawesi mainland and in Java. In those alien contexts few Timpaus islanders doubted that the *banci* engaged in sexual liaisons with other men.

Occasionally, a boy (4 years old) was seen in Timpaus village dressed up in his mother's outfit including lipstick and rouge. His father said that the boy preferred to dress in women's clothes: "He may become a *banci*; who knows perhaps he finds a man to marry?" Some villagers said that this father was only teasing his son; others expressed their distaste for the show. Parents should not allow their sons to dress like that (Broch, 2002, p. 83).

At Timpaus the term *banci* is not used to describe girls or women, although some were known to carry out men's work such as fishing. However, these women were of Bajau ethnic origin and culturally sanctioned to fish.

In general Indonesian terms *banci* see themselves as a separate third gender consisting of a particular blend of masculinity and femininity (Oetomo, 1996, p. 269).

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

Adults express no gender preference but welcome a male or a female equally. However, if a couple have more than one child they wish for a combination of girls and boys.

The first gender markers are in place shortly after birth. Within 3–5 months most girls have their ears pierced and are given small earrings, preferably of gold. Then the child's gender is underlined by the personal name chosen for him or her. As late as in the 1970s the tooth-filing ritual (*balibang*) was practiced on Timpaus. The ritual was a public and collective village event arranged for both girls and boys. The novices' gender was underlined by the traditional costumes that the children wore. The ritual lasted for 7 days and 7 nights. Food was

served to all villagers, music was played, and many ritual songs were sung. The teeth were filed with a small stone while the children, aged from 5 to 10 years old, were "sleeping." When they woke up they were all beautified.

The youngest boys and girls are treated in much the same way by their parents. The birth order among siblings influences the distribution of tasks. Thus the first-born child, regardless of gender, will always be delegated housework tasks and spend much time looking after younger siblings.

More gender specific training starts at the age of 9–10 years. Boys spend time with village men at the swiddens and in some fishing operations. Girls spend more time with their mothers helping out in the house, assisting with agricultural tasks, and gathering foods in the wood and on the reefs.

Boys and girls are often encouraged by adult villagers to copy gender-prescribed behavior. For instance, when young children play at dancing the *joget*, villagers enjoy their youngsters' experiments with exaggerated gender stereotypes. Boys are also encouraged to practice the basic movements of war dances and to go slingshot hunting for birds.

Boys are circumcised when they are between 10 and 11 years old. The prepuce is severed with a bamboo knife and the wound is treated with spiders' web to stop the bleeding. After circumcision, the boys have to emerge themselves in sea water for three consecutive days. This should lessen any pain, and according to some Timpaus Banggai men the tradition serves to acquaint the boys with the sea. Thus the boys were also presented to the sea spirits who in turn would protect them during subsequent fishing expeditions and voyages. A village ceremony is also arranged where the food eaten is blessed with words from the Qur'an and incense is burned in combination with spells to please spirits. Recently, some parents have had their sons circumcised at a hospital on Banggai Island or on Sulawesi mainland.

Puberty and Adolescence

Girls are not circumcised, but a village feast, similar to the one held when boys are circumcised, is arranged after the onset of their menses. Neither girls nor boys are regarded as adults at the conclusion of these rituals. However, girls are regarded as being eligible for marriage. The Indonesian civil authorities are trying to alter this conceptualization, and urge parents and village headmen to postpone the marriage of girls until they have reached the age of 17–18. Before boys can marry they are supposed to be able providers. This is proved by their participation in agricultural work, fishing, or other trades. Many boys in their late teens spend a year or two away from the island; some even travel to foreign countries to earn money for a brideprice.

Gender contrasts are most marked among the Timpaus Banggai in adolescence. Most girls move gradually into their adult roles, helping their mothers in the household, and usually marry at an early age. According to the villagers, boys, who marry later, are often difficult to handle. They become reluctant to help with domestic tasks and avoid heavy work on the swiddens or at sea. Thus adolescent boys often stick together in the village. They talk about their future, and dream about entering professions enabling them to become rich and to acquire money for a brideprice. Some of them leave the island for an extended period, but on their return it is often clear that their luck has been poor. They do not have the money to marry and some feel that Timpaus is backward and does not offer them a future. Other young men never leave the community, but gradually take on the adaptation patterns of their fathers. A few young men readjust after some time abroad, settle down, and eventually marry.

Attainment of Adulthood

The birth of one's first child is regarded as proof of adulthood. The event is marked by the practice of teknonymy where the parents are given new names of reference and address when their child is named. This happens regardless of the gender of the child. For instance, when a child is named Yeti, her mother will from that moment be called *ibu* Yeti (mother of Yeti) and her father's name is altered to *bapak* Yeti (father of Yeti).

Men and women who never have a child of their own may adopt. When they do, they are given the name of their adopted son or daughter.

Women or men who remain single, or couples who never take on the responsibility for a child, will be accepted as adults depending on their behavior. Recognition of adulthood is usually granted to women aged about 19–20 and to men aged about 25–30.

Middle Age and Old Age

Generally, growing older improves one's social position in the community. This means that the oldest men and

women are served first, have the best seats, and are well looked after during feasts and rituals. Younger people are always obliged to show respect towards those who are older. Although this is often mostly a prescribed form of courtesy, the tradition is based on some serious cosmological understanding. If old people are not given their legitimate respect or are otherwise maltreated, after they have died their spirits will have good reason to punish the offenders.

However, the deep respect toward both men and women only increases with age as long as they remain physically fit and able to work. Despite the prescribed respect shown to older people, the eldest community members are not asked for advice in important village or personal matters.

When one's own children marry, the parents are often given new names of reference that are sometimes, but not always, used in address. These names signify some attribute that the old person has achieved. Thus old villagers may be referred to as grandfather English (because he can speak a few English words), grandfather fish (because he was such a good fisherman), grandmother ill (because she is always ill), grandmother chicken (because she raised so many hens), etc.

Generally, the elderly are treated well and looked after by relatives for as long as they live.

PERSONALITY DIFFERENCES BY GENDER

Timpaus ethnopsychology provides an understanding that innate personality traits constitute a fundamental part of the character of all people. A knowledge of an individual's personality is regarded as important because personality and behavior are closely linked. Personality traits are linked to temperament, tastes for particular foods, kindness and willingness to share, body shape, and a division between sea- and land-oriented persons. According to the Timpaus Banggai such personality traits (or personal characteristics) are inborn, do not change in principle during the life-span, and cut across gender lines. Thus it becomes difficult to pinpoint fixed personality differences between men and women. Qualities like emotional control, not being aggressive in most contexts, being modest or showing others their due respect (*malu* behavior), and not being rude (*kasar*) are regarded as equally important for women

and men. However, there are some general ideal behavior patterns for women and men. For instance, men are supposed to be braver, more courageous, oriented towards the sea, more heavily or muscularly built, quicker in body movements, supposedly better warriors (legitimate expression of aggression), etc. than women. Women should be more modest, shy, sedentary, loyal, and tidy than men. Because the Timpaus Banggai feel that it is important to uphold these ideals they try to teach their children these values. According to them, in order to succeed it may be useful to know the personality of the child. When adults break these norms it is usually explained with reference to the personality of that particular individual.

Some personality traits are value neutral and impossible to change or hide by village education. Orientation toward sea or land is one such trait. It is regarded as impossible to make a land-oriented person into a fisherman or sailor. Likewise, a few women are regarded as extremely courageous, unafraid of most dangers, and even oriented toward the sea. One Timpaus Banggai woman took on the task of transporting copra to distant ports because she preferred life at sea. Her husband, who did not like ships or the sea, stayed at home and worked at their swiddens.

According to the Timpaus Banggai, expression of moods, basic interests, what is regarded funny, style of caretaking, and egoism have gendered as well as individual expression. They believe that some negative traits, such as egoism, greed, and a will to dominate, are overrepresented in males in general. Similarly, calculating and manipulative qualities are supposedly overrepresented in women. However, as far as is possible, it is attempted to eliminate or suppress such traits in young boys and girls by socialization processes.

GENDER-RELATED SOCIAL GROUPS

There are no gender-related social groups of significant duration among the Timpaus Banggai. Various task groups (*gotong royong*) are organized for mutual or specific purposes. Some task groups have a cross-gendered composition while others are single gendered. Task groups are recruited to assist in the preparation of major rituals, such as marriages, funerals, first haircut, thanksgiving feasts, and some offerings. Participants are always recruited bilaterally from kinsmen and friends. Usually

women will prepare food and men will haul, cut wood, and bring water for the cooking.

A variety of task groups of different sizes are recruited for various agricultural purposes such as preparing new land for swiddens, sowing and planting, harvesting, and production of copra. These groups are generally of mixed gender. However, harvesting coconuts is an exclusively male task. Some of these groups may have an extended duration. For instance, four men decided to work twice a week on each other's lands on a rotation basis. The group stayed intact for several months.

Male task groups are also recruited to assist in the building of a new house, to dig a well, etc. When task groups are recruited to assist an individual or a specific household, the group members are usually served an elaborate meal in compensation.

Crews recruited for fishing and other marine expeditions of varying duration are paid in shares of the catch. In the case of shark fishing, a successful crew is paid in cash. When the catch is poor, there is no payment.

Gender Roles in Economics

Timpaus economics is based on a broad understanding of the importance of gender complementary roles. How men and women share joint responsibility in household economics is nicely illustrated in a myth where the husband is condemned for providing inadequate economic support and held responsible for the suicide of his wife and mother of their first-born infant (Broch, 1996).

In the household women do most of the cooking, bring water from the wells, and wash clothes, but at times are assisted in these chores by their menfolk. In periods of drought, when water has to be carried over some distance, men and women share the labor. Both men and women sweep floors, sew and mend clothes. Gathering food in the littoral zone is a joint effort. Fishing is exclusively a male activity among the Timpaus Banggai. However, this is a common feature of many Indonesian *pasisir* cultures and is one criterion used to separate these societies from the Bajau where members of both genders are culturally allowed to fish. However, Banggai men and women share the tasks of cleaning, drying, and selling fish.

Women and men cooperate closely in making copra, the most important economic activity on Timpaus. Although only the men climb the palms, both genders split and cure the nuts. Also, when large work groups are organized for copra production, both women and men are called on to cooperate.

The wife is the family treasurer in many Timpaus households. She keeps the money earned by family members, takes care of bookkeeping, and redistributes the income toward particular goals. If expensive items of consumption or investment in fishing gear, for example, are necessary, the issue is usually discussed between wife and husband until an agreement is reached.

When a husband buys commodities for village trade outside Timpaus, his wife usually runs the retail business from their home.

Leadership in Public Arenas

Leadership among the Timpaus Banggai is not elaborated with much refinement. That is because this version of *pasisir* culture developed as a branch within the larger Banggai cultural domain. The most important cultural heirlooms and the legitimizing power that these symbols represented were in the possession of the ruler of Banggai. Local chiefs owed their positions to the goodwill of the ruler and paid tributes to him and his court. During the early years at Timpaus, the old people said, the male head of the strongest bilateral kin group represented them all. However, there was never any nobility among the Timpaus Banggai. During Dutch rule, villages were defined and village headmen appointed, but this development had little significance at Timpaus.

Administratively, Timpaus belongs to Labobo Bangkurung subdistrict (*kecamatan*) of Banggai regency (*kabupaten*) in the province of Middle Sulawesi. To represent the villages and people (not cultural or ethnic group members) of Timpaus, one headman (*kepala desa*) is elected locally for Kassuary and one for Timpaus village. The *camat*, the head of the *kecamatan* at Mansalean Island, formally appoints the headmen to their positions. The village headmen are chosen by criteria of social background (respected family), modern attitudes, educational level, and perceived rhetorical skills. They are supposed to discuss local issues and inform the *kepala lingkungan* or neighborhood leaders about relevant political decisions from above. In Timpaus village these officials are all recruited among the Timpaus Banggai; they are all men, but in principle women could be elected and appointed.

Temporary leadership is common and task directed. Thus there may be leaders for communal work, either men or women according to the task involved. These leaders have little authority, but are responsible for the organization of the work or task in hand. Temporary leaders are usually chosen because of seniority and/or skill.

GENDER AND RELIGION

The Timpaus Banggai regard themselves an all-Muslim people. Both men and women attend prayers at the mosque. When attending prayers, men and boys older than 13 or 14 dress in clean shirts and wear a black, white, or burgundy *songkok* (cap or fez) on their head. Women and girls usually dress in their white *pakaian Islam* (Islamic clothing). It consists of large white headcloths, leaving only a small slit for the eyes, and a loose garment that covers the body from head to toe. Some children, both boys and girls, attend Islamic schools in the private homes of villagers who can read the scripts. A group of girls were taught *sambra* Islamic songs that they accompanied themselves with tambourines and flat drums. The villagers said that the song and music was to please Allah and to delight men.

A substantial number of men and women do *bao koni*, that is, prepare offerings for local traditional spirits. Members of both genders also believe that they can communicate with various spirits. This communication is important, for instance, in order to make a proper diagnosis during many cases of illness.

LEISURE, RECREATION, AND THE ARTS

Typically, adult Timpaus Banggai of both genders say: "Here we are poor and work day and night, no leisure, no recreation, work only. When we do not work, we try to catch some sleep."

Such statements obviously carry some merit because the islanders' days are not divided into scheduled hours of work and leisure. On most days men and women work from dawn to late at night. Because the Timpaus Banggai in general practice a subsistence economy, it makes little sense (to them) to separate domestic work from paid work. However, the islanders do have a need to break the daily monotony of repeated work tasks and occasionally make preparations to celebrate. Although participation in

most rituals can hardly be labeled leisure activities, marriages, funerals, thanksgiving rituals, etc. certainly provide some recreational outlet. During ritual celebrations people find time to relax, talk, enjoy good food, and experience communality. Further, dances are arranged as part of some rituals. The most popular dances are *joget* (e.g., Martin-Schiller, 1984) and *modero* (Broch, 2002; Robinson, 1993). Neither of them are traditional Banggai celebrations, but most islanders now regard them as integral parts of their cultural traditions. In the old days Banggai dances were accompanied by flute and drum music; battery-powered electric guitars have now replaced traditional instruments. Although one woman was an expert drummer and another enjoyed playing the flute, musicians are men and only they play at public gatherings.

Everyday leisure and recreation are of the slow type. Married women and men stroll along the village path greeting passersby. When youths are walking they are usually in same-gender groups; mixed-gender pairs of unmarried persons, with the exception of siblings, are not seen. When it is dark, strollers are careful not to illuminate anybody with the beam of their flashlights because that is considered extremely rude. Some people bring their youngest children along and visit neighbors to sit down for a chat or to gossip for a while before going to bed. Most villagers end their day before 10 p.m. During the hottest seasons, some men and women, both young and old, walk down to the pier and spend the night there in the open air. They say that they lie down to rest, with many bodies close to each other, to escape from the humid heat indoors.

There is little artistic work among the Timpaus Banggai who do not decorate boats or homes to any noteworthy degree. The exception is ritual objects such as spears and shields dedicated to particular spirits. These objects are often beautifully decorated with pieces of cloth, and even with bits of silver and wood carvings.

A few skilled musicians know how to play bamboo flutes, and some of the older generation are good at writing songs and sing them in their homes. Expression of emotions of love and excessive sorrow is not regarded as proper behavior in public. Singing about one's emotions was part of traditional ritual and is still allowed, but is no longer common.

Two modern ways of relaxing from the daily toil should also be mentioned. Adult men occasionally meet and play soccer at the unleveled village green. Young

women usually gather by the field, apparently engaged in small talk, but watch the men from the corners of their eyes. Young boys also play some soccer, but are not allowed to join in the men's rather rough game.

Sometimes crews of commercial fishing boats, which occasionally anchor outside Timpaus village, invite the villagers to a game of volleyball. The islanders always accept the invitation and gather a mixed-gender team. Then the local young women and men, some of whom are quite competent volley players, play the fishermen. These games are popular because they provide a setting where unmarried youths may find a way of getting to know about each other in a culturally acceptable way.

Relative Status of Men and Women

Men and women enjoy similar social positions in Timpaus Banggai society. However, there is a tendency for men to be more authoritarian toward female household members when there are visitors in the house. The tasks carried out by men and women are equally ranked and generally deemed equally important.

Differences in status positions are less related to gender identity than to economic affluence. Despite an absence of Banggai traditional social hierarchy, some households are richer than the rest. Further, some islanders, such as the village headman and the members of his household, appear to copy the lifestyle appropriate for nobles on Banggai island. Thus women and men in such positions tend to do less physical work than the rest and also to order other villagers to do them favors.

Sexuality

According to the Timpaus Banggai neither men nor women are closer to nature, or more distant from culture, than members of the other gender. Nature is everywhere. Although girls, especially pubescent ones, are more closely watched than their brothers, members of both genders are allegedly sexually active. Both women and men may apply love magic to attract the sexual attention of a desperately desired potential spouse.

From approximately the age of 11, girls discuss and speculate on the subject of sex and male–female relations among themselves (Broch, 2002). Among adult men and women, sex and sexuality are private concerns and are rarely talked about in public. Demonstration of sexual lust in public is regarded most offensive. An exception to this rule is the *joget* dance, where the male dance partner actively displays a virile performance in front of a shy woman. However, the two dancers should never touch. *Joget* is generally not for married people. Older Timpaus Banggai villagers make a point of stopping dance couples from disappearing into the darkness.

Ideally, premarital sex is not allowed for either men or women. However, it is generally believed that most young men try out sexual intercourse when they are away from the island.

Some myths, legends, and other narratives that are told on the island imply that sexual desire may be directed at tabooed relations. A common theme that emerges through analysis of some of the narratives is that young boys occasionally possess (unconscious) sexual desire for their mothers (Broch, 1996, 2002). Some narratives can also be interpreted as focusing on sexual lust between siblings (Broch, 2002), close friends (Broch, 1996), and strangers (Broch, 2002).

Courtship and Marriage

Marriages arranged by the close relatives of brides and grooms are preferred, which is why courtship leading to marriage is not in accord with Timpaus Banggai ideology. The idea of romantic love is familiar but is regarded as unfortunate. According to the islanders, that is one reason why young people usually trust their parents' choice of candidates for marriage.

Elopement is relatively common. Women who have married after having eloped tend to explain it by claiming that the man must have used love potions and magic to make them oppose their parents' will. Both men and women know how to apply love magic and some people admit that they have indeed used it. The recipe regarded as most powerful for this purpose is dugong tears in combination with secret spells.

Marriage is an important social transition and public ritual on Timpaus. The ceremonies consist of a mix of Islamic and local traditional elements. Preparations for marriage begin with *harta* negotiations that settle the brideprice. Objects usually included in brideprice are money in cash, white cloth, rice, sugar, wheat flour, fresh fish, margarine, condensed milk, coffee, tea, cigarettes,

tobacco, paraffin oil, and one or two goats. The groom's party prepares a list of proposed items for the bride's party. Then discussions follow to reach an agreement.

The brideprice (except the money) is primarily used to entertain the guests at the wedding party. Some weeks after *harta*, the Islamic *nikah* is arranged. Words are read from the Qur'an and the groom repeats some of the phrases. After this short ritual bride and groom withdraw for a while, sometimes accompanied by one or two elders who narrate legends and myths dealing with existential problems of married life. A day or two after *nikah* a public village feast (*basa doa kawin*) with lots of food is served and public dances are arranged. During most of the feast the bride and groom sit motionless, in local costumes, at an elevated and brightly decorated stage.

HUSBAND–WIFE RELATIONSHIP

Every husband–wife relationship is based on the partners' common goal in life: to form a viable household, procreate children, and raise them in a manner that turns boys and girls into culturally accepted or sufficiently good men and women. This is also what people say give them the ultimate meaning in life.

The complementary roles and joint responsibility of young couples are stressed in myths that are narrated by elders during the wedding ceremonies (Broch, 1996). Cultural ideals about interpersonal respect, cooperation, household harmony, equality, and lifelong solidarity may not always be easy to fulfill in everyday life. Despite these principles, every husband–wife relationship at Timpaus develops its own character.

Husbands and wives live together, ideally in their own house, or temporarily as an extension of the wife's maternal household. Timpaus Banggai say it is best for married people to live by themselves and not too close to their parents. Husband and wife are not supposed to signal their love for each other in public, but are allowed to share such feelings in private. Although physical contact between spouses in public is frowned upon, mutual affection can often be observed by alertness to the partner's wishes and needs, appreciative words of respect, with the speech pitch suggesting tenderness, and mutually understood humor. In public they should, and often do, appear as good friends, help each other with various tasks, and support each other in conversations with other villagers.

In many homes wife, husband, and children eat their meals together, but in the most traditionally oriented households the man is served first and the wife and children start eating after the father/husband has received his portion. When there are visitors, and especially if they not are close relatives, men are served separately from women and children.

At night husbands tend to leave the house after supper has been served and tea has been drunk. If the couple have young children, the wife often stays home to look after them while the husband goes for a walk to visit friends or other men. It is also common for a messenger to ask a husband to come home because his wife wishes to go visiting somewhere alone. At times wife and husband go for a stroll or visit other villagers together.

However, the Timpaus Banggai live in the real world. Disputes between husbands and wives arise—some disagreements are long lived, and others are of short or temporary duration. It is not culturally acceptable to express hostile or aggressive feelings and so it is difficult to know what the exact relationship between husbands and wives is like.

Timpaus Banggai women have a noticeable influence on their husbands, who mildly resist some control and fuss about things to be done about the house and in the household. When other men are present, many husbands express some level of symbolic or fictive control of their wives.

OTHER CROSS-SEX RELATIONSHIPS

Adult brothers and sisters have a somewhat freer interaction than most other people in mixed-gender groups. Sibling relations are often characterized by teasing and laughter. Sisters and brothers usually give each other a share when fishing has been good or their swidden has provided fine fruits or other delicacies. In times of need siblings are the first to help each other. A mild form of joking relationship also often develops between the husband's brother and his wife or the wife's sister and her husband. Relationships between in-laws are generally restrained.

The Timpaus Banggai are convinced that spirits (*jin*) sometimes fall in love with people of opposite gender from themselves. The spirit will then usually posses the person he or she falls in love with. However, not all spirit possessions are caused by this.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The Timpaus Banggai are being influenced by pan-Indonesian cultural ideas at an accelerating speed. An elementary school is located in each of the villages on the island. The impact of the school is felt in many ways. All children learn the Indonesian language. Girls and boys who attend school are delegated less domestic work tasks than before. School attendance and homework are regarded as work that should be taken seriously, and education is regarded as equally important for girls and boys. Because education is regarded as a prerequisite for well-paid work, many children attend secondary schools away from Timpaus.

In the 1990s a few young men returned to Timpaus after living on the Sulawesi mainland. They brought with them more Islamic "fundamentalist" ideas than were readily acceptable among the Timpaus Banggai. It remains to be seen whether this influence will continue and gain acceptance. If such a shift in religious ideology takes place, it will surely have a major effect on local gender relations.

Tlingit

Laura F. Klein

ALTERNATIVE NAMES

The Tlingit are also known as Klinget, Kolosh, and Thlinket (historical).

LOCATION

The Tlingit are located throughout the panhandle of the state of Alaska from Ketchikan to Yakutat. The region is a fjord-like archipelago of islands with traditional and contemporary villages situated on the shores between the sea and the mountains.

CULTURAL OVERVIEW

This entry largely focuses on the culture of the precolonial Tlingit that are categorized as the northernmost of the Northwest Coast Indians. Groups in this category are known for their extensive wealth, complex art, and highly stratified societies. The economy of the region was based on the annual abundant runs of salmon and the resources of the largely evergreen forests. Although in the north of the region, the Tlingit enjoyed a relatively temperate climate with some winter snows, but with most months largely marked by clouds and rain.

The Tlingit characterized themselves as fishing people and people oriented to the sea. Salmon runs in local streams occurred from late spring to mid-fall. During this period people collected tons of fish that were dried and smoked for later use. Other seafoods, notably halibut, eulachon, shellfish, and seals, were also collected and preserved. On land, deer were hunted and plants, especially berries, collected as secondary foods. In a normal year a family was able to collect enough foods during the summer months to feed themselves throughout the year.

However, societal wealth was not based upon ownership of subsistence goods but on the distribution of luxury goods. Using a coastal trade route that extended from more northern Alaska to California and a land route across the Coast Mountains to the interior, Tlingit traders were able to obtain valuables including furs, metals, slaves, and objects of art that were locally unavailable. Astute traders could accumulate significant amounts of such valuables, but these objects, as such, did not confer high status. Items became important when they were given away in a potlatch.

The potlatch was a feast that was given by a clan, or subclan, for another group to witness the confirmation or improvement of social status. Most major Tlingit potlatches were arranged to honor a recently deceased relative or, perhaps, to confer honors on a young clansman or clanswoman. In a potlatch, which could last several days, the host group fed the guests, danced and sang family songs, told family stories, and presented costly gifts to the guests. Guests received gifts according to their rank, with higher-ranked guests receiving more valuable gifts than those of lower rank. During the event, members of the host family received higher-ranked names, and hence status, while the guests witnessed and accepted these new social positions. At the end of the event, the guests left burdened by their new goods, and praising the wealth of their hosts. Ironically, the houses of the hosts were now empty of valuable goods, but their prestige was raised in the act of publicly giving them away.

The major organizational principle of the Tlingit was matrilineal. All Tlingit were members of one of two moieties, Eagle (Wolf, in the south) or Raven. These categories were further divided into clans, subclans, house groups, and families. There were less than 20 traditional areas with winter villages. Each contained a number of multifamily wooden houses representing both moieties and multiple clans. Houses were organized according to an avunculocal principle and were arranged in a line along a beach. Aside from the moieties themselves, all units and individuals were ranked. The highest-ranked individuals had significant power over those of lesser rank, and titles of house and village heads went to them. Slaves were at the bottom of the status ladder and were not considered to be part of the "real" society.

CULTURAL CONSTRUCTION OF GENDER

There were two major gender categories: man and woman (*káh* and *shawát*). They were recognized as having different roles but similar characteristics. Definitions of proper behavior and rights depended at least as much on rank as on gender.

Early contact everyday dress was simple according to the drawings and reports of early explorers. Men went essentially naked, except for a fur cape draped around their shoulders. Women wore unshaped leather dresses with similar fur or skin wraps. Neither wore shoes except in winter. Socially significant dress, on the other hand, could be very elaborate and was based more on rank than gender. High-status individuals wore valuable robes and headgear that reflected their rank. The ceremonial dress was similar for men and women, although men might wear pants while woman generally wore skirt under their robes. Even those of lower status had ceremonial wear that differed considerably from their daily clothes.

High-ranked women marked their status by wearing labrets. These cylindrical objects fit into a slit in the lower lip. A large labret signified a very highly ranked senior woman. Both men and women pierced their noses and ears for ornaments and wore tattoos that reflected their clans. Beauty, when commented upon, seemed largely to reflect the person's high rank and the behavior that fitted the rank, rather than physical factors. Even the preference for light complexions for women may well indicate the higher-ranked woman's longer puberty seclusion as a young woman and her protection from extensive outdoor work when older.

GENDER OVER THE LIFE CYCLE

Tlingit traditional culture pictured human life as a continuum. When people died, they were soon reborn as babies in their clan groups. While the gender of the individual often remained constant from death to birth, sometimes an individual might, in fact, have changed gender in this transformation. A man might come back as a daughter of the clan, or a woman as a son.

While individuals changed their statuses throughout their lives with potlatch honors, aging, and marriages, the events of late childhood were often the most dramatic. Boys around age 10 commonly moved from the house of their fathers to those of their mother's brothers. This began

their training and life experience as men of their clan. Their sisters remained with their parents until they moved at marriage. With their first menstruation, however, they began a puberty seclusion that could last up to 1 or even 2 years. They emerged marriageable and as adults.

As adults aged they commanded increased respect. Among the Indian doctors and most highly ranked, their power also grew with age. The positions of house chief, clan chief, and village chief were based on age and rank. An adult high-status woman was owed the same deference as a man of her status. Older adults were categorized as grandparents by the young, regardless of kin ties, and treated with affection and regard.

Socialization of Boys and Girls

Boys and girls were both welcomed into Tlingit families, although de Laguna (1965) suggested that girls, as future mothers of the clan, were more valued. Children of both genders spent their first years in the almost constant presence of their mothers who nursed and nurtured them. Fathers and others in the clan house also played with babies and tended to their needs. With the birth of a new sibling the lives of the children changed. They were weaned and left to spend more time away from their mothers with others in the house.

As young children, boys and girls played together and were largely disciplined, when needed, by their mothers. Boys were encouraged to play games that enhanced hunting and fishing skills. They were also expected to show strength and bravery that would help them in raids. Girls were likewise encouraged to learn while they played. Skills in cooking, weaving, fish preservation, and the like were introduced early. However, high-ranked girls were kept away from menial tasks since their slaves were expected to do them (Oberg, 1973).

Ronald Olson (1956) listed the traits that were taught to children as "bravery, fortitude, industry, thrift, and pride in family and clan" and that they "should be smart and not extravagant." As they grew older, lessons became more difficult and clan centered. Boys made the break first at 8–10, and girls began their intensive training with their first menstruation.

Puberty and Adolescence

Boys went through a major change in their lives late in their childhood or early in their adolescence. At this time

most boys moved away from their parents and into the house of their mother's brother where they lived for the rest of their lives. In the avunculocal system, a boy joined his mother's brother, who was a senior man in his own clan. This allowed the men of the same clan, or subclan, to live and work together. The move was an important part of a young man's training. Since his father was a member of a different clan, he was not in a position to teach his son important, and sometimes, secret clan skills and knowledge. It was the mother's brother who had this knowledge and was charged with passing it on to junior clansmen. This was a time of intensive learning and social adjustment. It was also the time for toughening. By tradition, mother's brothers woke their nephews at dawn in winter and the boys were required to break the ice and wash themselves in the frigid streams. Afterwards they were slapped with evergreen boughs to harden them. Discipline and endurance were emphasized. With their first successful hunts their new skills were celebrated in a small personal event. The relationships with other men that were established at this time were the core of their adult lives.

Until their first menses girls saw little changes in their lives. They continued their education with their parents and played with their friends of both genders. Their change to adulthood was later, but also abrupt.

Attainment of Adulthood

While the transition to adulthood was not ritualized for boys, girls went through an extended and formal period of transformation. At the onset of a girl's first period, she was isolated in a compartment at the rear of the family house or in a small house built near it. The first 8 days were frightening and difficult. She was allowed to eat or drink only twice during those days. While restrictions remained throughout her seclusion, little of it was as onerous. She was kept inside and required to stay quiet. In this place she could visit only with young girls and older women. During this period, which could range up to a year depending upon her rank, a girl was educated in the skills needed to be a successful woman. These included everyday work skills, proper demeanor, negotiation, and pride in self and clan. During this seclusion she was considered spiritually powerful and she was warned to be careful of her actions. Since she had to remain inside during the entire period, when she emerged her light skin reflected her propriety and high rank. As a

contemporary elder, who fondly looked back on the tradition, put it: "This was our college, our finishing school." When a girl left her puberty retreat she was ready for marriage and considered a full adult woman. As such, she was governed by the rules of deportment and appearance that befitted her rank.

Middle Age and Old Age

Both men and women were expected to be married throughout their adult lives. As they aged they were required to act according to their rank, and they were judged according to this. The expectations of a high-ranked man or woman were more rigorous than those of lower rank. In exchange, lower-ranked people were expected to treat their betters with respect. Errors in either behavior became serious family issues since they could negatively affect the rank of all.

Older people were generally respected. Young people looked to the elders for affection and wisdom. The elders of high rank wielded considerable authority over their clansmen and women. Disregarding the wishes of those older and higher ranked was considered foolish and inappropriate.

PERSONALITY DIFFERENCES BY GENDER

Although the data are incomplete, the major cultural stereotype concerning gender personality differences was that women were credited with causing more trouble than men. Women were expected to be at the center of quarrels and gossip. Consequently, the training of high-status women emphasized that this was inappropriate behavior and that they would be honored, and honor their people, by cooperating and avoiding public criticism. Stories of feuds and wars caused by women's behavior are commonly told. De Laguna (1972) cited potlatches where women were called for honors due to their exemplary behavior.

A woman was not expected to be shy or docile, however. A high-ranked woman, like a man, needed to assert her rank in society. As a trader she was expected to strike a hard bargain and come away with the better deal. Early European explorers and missionaries wrote with disapproval of the toughness of the Tlingit women they met. The contemporary European feminine virtues of nurturance,

dependency, and deference were not evident to them. In fact, these "virtues" would have dishonored a high-ranked woman.

GENDER-RELATED SOCIAL GROUPS

As noted above, the Tlingit were organized according to a matrilineal principle with two moieties: Eagle and Raven. These were perhaps the only social groups that were conceptualized as equal. Each moiety was divided into several clans and each clan into local clans. Within a town, local clans were generally also divided into multi-family houses. An individual was born into his or her mother's house, local clan, clan, and moiety. Each unit included rights and responsibilities, although the rank of the person determined the details of each.

While a baby was born into a clan house, it was not the physical house in which that child would live. Children lived with their parents in the house of the father. It was only when a boy left to live with his mother's brother that he took his permanent place in his own clan house. While a girl was strongly identified with her clan house, she was unlikely ever to live in it. She remained with her parents until her marriage and then lived in her husband's house. As an adult, however, she had important roles in her clan house and her rank was tied to it.

GENDER ROLES IN ECONOMICS

At one level, the division of labor between men and women in subsistence work was clear. Men fished and women gathered. However, the reality was more complex. During the fishing season men gathered the salmon from the streams using a variety of methods and handed them over to the women. At that time, the women prepared the fish for processing and dried or smoked them for year-round use. The end product, processed fish, was a collaboration of men's work and women's work. During the fishing season, then, both genders were focused on this industry. Off-season subsistence pursuits were less critical. Men hunted the land mammals and women gathered the plants. In all cases, it is said that each gender could, and occasionally did, do the work normally assigned to the other gender.

The production of crafts and art was gendered. As a rule, men made objects from rigid materials, while women used soft materials. That meant that woodcarving, including masks, carved bowls, boxes, and spoons, house-posts, and freestanding poles were men's work. Women made the Chilkat and other blankets, leatherwork, and baskets. Artists had to be paid for their work, or the items were considered of no value, and the best artists, male and female, accumulated considerable wealth from their artistic endeavors.

Trade was often a partnership. More men than women went on the long-distance trading expeditions across the mountains or down the coast, but women did go along. As noted, women were trained to be the bargainers in a trade negotiation and so it was imperative that such a skilled trader be present to handle the negotiations. Early European traders in the area complained about having to deal with women and, then, how hard it was to take advantage of them in a deal (Klein, 1980).

Personal goods were owned by those who possessed them, male or female. Those that were gender linked were inherited in a matrilineal fashion from mother to daughter and from father to sister's son. Rank was an issue in ownership and no one was allowed to own an item of greater importance than the individual's status indicated. More highly-ranked individuals could order lesser people to hand their property over to them, and the lesser-ranked person had little alternative but to do so. The most significant property, such as houses, rights to resources, emblems and stories, and the like, were communally owned in matrigroups. Members of that group had the right to use those appropriate to their ranking. The *hitsaati*, "house chief," who was the highest ranked male in the house was custodian of the property.

Raiding was relatively short-term and men did the fighting. Bravery in such attacks brought honor to the clans of the combatants. Raids were instigated to redress perceived wrongs from specific towns or clans or for financial gain. Raiding was a primary way to obtain slaves. Reports from southern groups told of significant slave raids from the "northern Indians" which included the Tlingit. So-called "wars" between clans and villages among the Tlingit, although rare, were far more disruptive. Since these disputes were often among intermarrying groups, they split families. Women and children of the "enemy clan" left their husbands' or fathers' houses and moved to the houses of their own clans. Since a person's primary loyalty belonged to his or her own clan, a member of an enemy clan in the household was always suspected of spying.

PARENTAL AND OTHER CARETAKER ROLES

Tlingit mothers and fathers both demonstrated affection for their children. Since this was a matrilineal system, it was this affection that marked the key relationship between a man and his children. He had a limited role in the socialization and training of these children. As a member of another clan group he had neither the knowledge nor the right to teach clan-based skills and knowledge. He also had no right to discipline them. Tlingit mothers had both authority over, and affection for, their children. They and their clanswomen had the responsibility for rearing young children. They also had a responsibility to protect and increase the wealth and prestige of the kin group that they passed on to their children.

Mothers' brothers had an important male role to play with their sisters' children. They were the closest clansmen to these children and were key male authority figures. Since they lived in different clan houses, the immediacy of their interaction was different for nieces and nephews. When the boys moved to join their houses, the relationship became immediate. Girls also looked to their mothers' brothers as their closest senior clansmen and were expected to respect and obey them. Mothers' brothers were their male protectors who were expected to be concerned with their well-being throughout their lives.

LEADERSHIP IN PUBLIC ARENAS

Leadership was a matter of rank among the Tlingit. People of higher rank had power and authority over those of lesser rank. Within households, the highest-ranked person was called the *hitsaati*, or house chief. According to the avunculocal rule this person should be male, although cases of female *hitsaati* have been referred to (de Laguna, 1972; Emmons, 1991). *Hitsaati* was the most formal leadership position. The highest-ranking *hitsaati* in a village was called "village chief," and the highest-ranked *hitsaati* in a clan has been called "clan chief." In reality, however, these individual categories had little substance outside of the rank and force of personality of the person holding it.

Those of high rank, both male and female, had authority over all those lower in rank. In cases of dispute the rank of the disputants was the most important criterion.

Even in criminal disputes, rank was the issue that determined punishment. For example, if a person of lower rank killed one of high rank in another clan, the life of the killer was not sufficient compensation. A member of the killer's clan who was equal to the victim had to be voluntarily forfeited to avoid clan war (Oberg, 1973).

While women rarely held the "offices" of political power and authority, it would be a mistake to dismiss their public power and authority. They were able to speak at public meetings and to assert the force of their personal ranking.

GENDER AND RELIGION

Religion was based on the existence of individual spirits that established personal relationships with men and women. This spirit helped guide their lives. More powerful spirits were personified, often in animal symbols, and were said to exist without great interest in humans. The most significant exception was the trickster, Raven. Raven, who was said in various tales to have created humans (both men and women together), to have made the tide and sun available for human use, and to have had countless other adventures for humans, took on both male and female persona. However, Raven was not worshipped or active in individual lives.

Individuals took on both positive and negative roles in supernatural practice. The negative role was that of the witch. Either a man or women could become a witch. The witch used supernatural means to bring sickness and death to his or her enemies. Witches were universally condemned and subject to death when discovered. Acknowledgement that a clansman or clanswoman was a witch would undermine the ranking of the entire clan. The socially acceptable religious practitioners were called *ixt'* or, in English, Indian doctors. Indian doctors fit the anthropological designation of shaman. They were men and women who had accumulated a number of spirit guides and had trained with senior *ixt'* to learn the techniques of curing and ritual. They were called upon to cure serious illness. In the practice they went into trances and in the supernatural realm found the witch who was causing the disease and fought him or her for the health of the patient. A successful *ixt'* became wealthy and powerful. *Ixt'* were paid for their cures and the more highly ranked the patient, the more expensive was the fee. While the individuals were seen as essentially benevolent, their

spirits were powerful and not fully controlled. It was feared that an insult to such a person could invoke the wrath of the spirits. Both men and women became shamans, and both men and women were counted among the powerful practitioners.

LEISURE, RECREATION, AND THE ARTS

People on the Northwest Coast had far more leisure time than people in most cultures. Their highly scheduled economic quest left the winter free from most subsistence duties. This time was also one when villages were full. People visited their friends and relatives. It was a time of informal gatherings, often with people entertaining one another with singing and storytelling. Games were sometimes played, with a variant of the Native American stick game being popular. This was a gambling game that was apparently played in mixed-gender social groups. Sounds and dance steps often accompanied the play. Canoe and foot races were popular outdoor activities in more temperate weather.

The Northwest Coast cultures are probably best known for their artwork. As noted above, men worked on hard materials like wood, metal, and stone, and women worked with more flexible materials like bark, roots, and animal pelts. This meant that men carved the extraordinary "totem" carvings that fronted the important houses and welcomed potlatch guests. They also carved more everyday items like boxes, bowls, and tools, as well as ceremonial masks and rank insignias. Carving took place during the nonsubsistence period, and artists were well paid for their best work. Women wove fine spruce root baskets for everyday and ceremonial use. They also wove dance blankets, including the highly valued Chilkat and Raven's Tail blankets. Like their male counterparts, Tlingit female artists were highly compensated for their finest work.

RELATIVE STATUS OF MEN AND WOMEN

Status differences between individuals and kin groups were clear and well-known. Behavior appropriate to status was publicly monitored and the rights of high-ranking people were strictly enforced. However, rank was not tied to gender. In fact, as the marriage preference attests, women and men were expected to be equally represented at every rank. Consequently, the concepts of "women" or "men" in themselves did not fit as ranked status categories in this highly rank conscious society.

This does not mean that there were not gendered areas of specialization and interest. As noted, men fished while women preserved the resource. Ownership of the resources, and more importantly the streams, were located in the clans or clan houses. A communal ownership was the norm, and clan members, both men and women, had innate rights there.

Personal valuables were owned by individuals. A woman who produced a Chilkat blanket had the same ownership rights as a man who produced a dance mask. Either could trade it or give it in a potlatch. Both men and women were judged on similar characteristics, and both had the opportunity of raising their status and the danger of lowering it. In either case, this influenced the status of their clansmen and clanswomen as well.

Both men and women took part in ceremonies and discussions. All had the right to be heard. High-ranked orators had special influence, and this category included men and women. Deference belonged to rank rather than gender. Women, like men, worked hard, were taken as slaves, and were killed in raids. They could be heroes and villains. Deference belonged to individuals of high birth and accomplishment.

SEXUALITY

Very little has been written about sexuality in Tlingit life. In the past, and today, people consider this a private topic and are reticent to talk to outsiders about it. Much that is known is based upon lessons for "correct behavior" and European explorer and missionary reports.

A high-ranked girl was expected to remain a virgin until marriage. Adultery was considered a crime against the family of the innocent party, and compensation was demanded from both the man and the woman involved. While small children engaged in sex play, no serious experimentation was encouraged for older children. As an adult, overt sexuality was seen as a sign of low status. While modesty was important, it involved behavior rather than dress. Men's bodies were generally unclothed and women wore coverings that often left breasts exposed.

Women were described as selling sexual services to Europeans in many early European reports. Some were

clearly described as slaves who were being used by their owners to earn easy wealth. Others were also clearly lower-ranked women who traded their sexual services for personal financial gain. While this behavior would have immediately disgraced a high-ranked woman and her whole clan, in a low-ranked person the gain might have countered public disapproval.

Little appears in the literature about homosexuality or gender variants. De Laguna (1972) described individuals whom she defined as transvestites. These men who acted like women appeared humorously in stories and were described as cowards. Lesbians were not described at all in Tlingit literature.

COURTSHIP AND MARRIAGE

Courtship, as such, did not exist. Marriages were arranged by clan elders. Mothers, and fathers' sisters, were especially central to the decision. An individual was expected to follow the choices of their clan elders, but serious objections by a prospective bride or groom were apt to be accepted. A good marriage united people from opposite moieties who were of equal rank. In high-ranked situations, a history of marriages between clans dictated future choices. All people were expected to marry and if widowed or divorced, to remarry a person from the same clan as the original spouse. Traditionally, a young person married an elderly person as a first marriage. The younger spouse cared for the elder while the elder trained the younger. When the older spouse died, the widow or widower was expected to marry someone closer to his or her own age. Individuals who lived to an old age could expect to marry a young person. Of course, this system meant that most people would have multiple spouses during their lifetimes. The relationship between the clans of the spouses would be secured, and women could expect to remain in the same house throughout their married lives. Some high-ranking men and women had more than one spouse at the same time, although this was not a significant theme in Tlingit culture.

A marriage normally involved little ceremony, although a high-ranked marriage might have been accompanied by a potlatch-like reception. The relatives of the bride and groom met together at the house of the bride's father. The bride entered the room and sat near her husband. At this time the groom's family displayed items of wealth that were given to the bride's family. The bride's

family might provide a smaller offering of gifts. At this point, the couple were married and the bride moved into the clan house of the husband. If she married a clansman of her father, and this was called a "royal marriage," the house of her new husband was the one she was reared in and the one where her parents lived.

HUSBAND–WIFE RELATIONSHIP

A good marriage was a partnership which, over time, involved great loyalty and affection. Couples who remained married for many years became so identified with one another that clan differences faded. In such a marriage, a spouse did not accept potlatch gifts from the other's clan, since they were like one person. For other marriages, the pull of clan loyalty could, and was expected to, outweigh the marital bond. Also the differences in age between the spouses were critical in the definition of the relationship. In first and last marriages, where there were often extreme age differences, that factor was an important part of the relationship.

Husbands and wives lived together in their section of his clan house and, in season, they traveled together to summer fishing camps. Men and women had specific tasks, but women were said to have hunted when their husbands were gone and men gathered berries and cooked when wives were away.

Marriage was not the most enduring relationship in Tlingit life. In normal situations individuals were widowed and remarried more than once over a lifetime. Further, divorce, although thought unfortunate, was available for both men and women, with children remaining with their mothers. As long as remarriage continued ties with the same families, no structural problems emerged. Even while marriages endured, outside factors could break up couples temporarily or permanently. As noted, in times of enmity between clans the women and children of the contesting clans left the houses of their husbands and took refuge in their own clan houses for the duration of the conflict.

OTHER CROSS-SEX RELATIONSHIPS

The brother–sister relationship was an important, if complex, bond in Tlingit society. They were of similar ranks by birth and had common interests in clan welfare. They

became clan elders together. Cooperation in clan affairs was necessary for long-term success. However, personal relationships between brothers and sisters ended after childhood. A brother–sister avoidance rule meant that they were not permitted to be in the same room at the same time. Communication took place with the use of third parties.

Mothers' brothers were the closest senior clansmen to their sisters' daughters and commanded respect. They held a common interest in the success of the clan. Otherwise, mothers' brothers and sisters' daughters had a different relationship than that of these uncles and their nephews. Unlike her brother, a sister's daughter did not normally live with her uncle. A mother's brother's role included training and advising his sister's daughters, but this, by necessity, was less intensive than that of his nephews. His interest in the behavior and treatment of his niece was deep and long-term.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Up to this point this entry has focused on the Tlingit of the 19th century, but Tlingit life in the 21st century has globalized and adapted to its U.S. context. Degrees of acculturation vary widely, but many of the old traditions live on in Tlingit towns.

While Russian claims for Tlingit territory dated to 1741, and the Russian Church was prominent in Sitka for a century, it was not until the end of the 19th century that Europeans entered the land of the Tlingit in significant numbers. At this point, Presbyterian missions, commercial fisheries, U.S. government authorities, and casual tourism came to stay. Moreover, while the Russians tended to stay in a couple of major towns, the Presbyterians and the rest spread their interests to the smaller villages as well. At this point, it became impossible to avoid European cultures and Europeans completely. Myriad changes for the gender system of the Tlingit were broad and deep, but the essence of individual value persisted.

The missionaries were distressed by the behavior of Tlingit women. They saw them as immodest, domineering, and stubborn. The marriage system was a particular target of this church. In order to "save" Tlingit women senior missionary Amanda McFarland established a school for girls. Here she hoped to protect them from

unholy marriages to older men and to teach them the arts of cooking, embroidery, and Christian deportment. Other missionaries preached the same womanly ideals and asserted that, unless women learned their rightful places as nurturing mothers and subordinate wives, they could not be real Christians. Since several of these missionaries, including McFarland, were strong and assertive public women, the role models contradicted the messages (Klein, 1980, 1994).

The introduction of commercial fishing and canneries had significant gender implications. Commercial fishing was not the partnership that subsistence fishing was. Processing was separated from fishing. Men continued to fish for their families and for the canneries. The canneries employed local women, as well as Asian workers, in their plants. At first both men and women continued to work in the industry, but in a different way. Over the years, as outsiders took more of the canning work, local women were forced out of the industry. Many took new Western-style jobs that demanded year-round stability. Since fishing remained men's primary employment, they were not available for other work during the fishing months. In many of the villages this has lead to a division of labor that dictates a seasonal work schedule for men and a year-round schedule for women. Men still fish and hunt for their families, and women still gather and preserve foods, but this is generally added to their money-making duties.

The U.S. government, in a number of forms from district to state, imposed a new layer of authority and law in the territory. Traditional forms of leadership remained locally significant and ritually important, but were overshadowed legally by the European American laws and governmental structures. Land and resource rights were not settled until 1971 with the Alaska Native Claims Settlement Act. This complex agreement set up 13 regional corporations and numerous village corporations that represented the Native people of Alaska as stockholders. Tlingit residents made up the majority of the regional Sealaska Corporation. Men and women hold shares in both the regional and village corporations, are employed by them and serve on their boards. The skill to increase wealth and make astute deals still commands high esteem and, while men are also trained in economics today, women are taught that this is a traditional womanly skill.

Tlingit women today live far different social lives than those of their great-grandmothers and great-great-grandmothers. Echoes of the matrilineal system live with

local and ritual importance, but it has lost the political and economic structure of the past. Households tend to be based on the nuclear family. Marriages are based on courtship and individual choice. Husbands and wives work together as economic entities. Divorce is common and children normally stay with their mothers. As for their ancestors, however, kinship is still important and families are expected to support relatives whenever they are in need.

Trobriands

Wulf Schiefenhövel

ALTERNATIVE NAMES

The Trobriand are also known as the Trobriand Islanders. The name Kilivila is now exclusively used for the language of the Trobriand Islanders (cf. Kiriwina, the main island in the Trobriand group). The culturally and linguistically rather uniform region comprising the eastern tip of Papua New Guinea, the three major islands (Goodenough, Ferguson, and Normanby), and the smaller islands/island groups in the Solomon Sea is also called Massim.

LOCATION

Kiriwina, Kaileuna, Kitava, Vakuta, and a number of smaller islands are part of the Trobriand group and share culture and, with dialect differences, language. They are situated in the Solomon Sea, north of the eastern trip of Papua New Guinea and form part of Milne Bay Province with Alotau as capital. The government and police station are in Losuia (151°05′ E and 8°33′ S) on Kiriwina, where there is also a small wharf for coastal ships, the Kiriwina Subdistrict Hospital (headed by a health extension officer), the Kiriwina High School, the headquarters of the Protestant Church, a few main shops, and a local market. A large airstrip, built by the American army in the World War II, is located approximately 5 km north of Losuia, and there are several flights a week to and from Port Moresby and Alotau. A deteriorating unsealed road, another legacy of World War II, leads from the southern to the northern end of Kiriwina and other dirt roads connect many villages to this north–south axis. An estimated total of 40 cars are used to transport people and goods. Many more outboard-powered dinghies are owned by men in the coastal villages. Small ships offer passage to Alotau and other ports in Milne Bay Province.

CULTURAL OVERVIEW

The first Austronesian immigrants may have settled on the Trobriand Islands about 4,000–5,000 years ago. It is likely that at this time the region was inhabited by a Papuan-speaking population, as islands much farther away from mainland New Guinea (e.g., Buka in the Bougainville group) were settled as early as 23,000 BP by Papuan speakers and the Austronesian seafarers arrived much later. There are clear traces of Papuan genes on the Trobriand Islands and on islands in the wider vicinity (Kayser et al., 2000); one of them, Rossel, still has a Papuan speaking population. Only preliminary archeological surveys have been carried out so far, and the earliest dates determined range around 1,000 BP (Gotland University College, 1999). A legend telling of a man-eating giant and a young hero born from a woman who was left behind when the others fled the inhospitable place, may represent the clash of the early Papuan population and the Austronesian newcomers. Kilivila, the language of the Trobriand Islanders, is grouped into the Kilivila Language Family which comprises the islands east of the Trobriand Islands, including the big island of Muyuw (Woodlark Island). The Kilivila Family, in turn, is part of the Papuan-Tip-Cluster Group of Austronesian languages.

Malinowski conducted his ground-breaking fieldwork among the Trobriand Islanders, mainly in Omarakana, the village of the paramount chief, for a total of 23 months between 1915–16 and 1917–18. Much of what he described in his major works (Malinowski, 1922, 1926, 1927, 1929, 1935) is still basically true today (for his neglect of the important roles of women in Trobriand society see Weiner [1976] and for a criticism of some of his accounts on sexuality see below). This text is based on more recent anthropological fieldwork, especially that of Weiner (1976, 1988, 1991) on Kiriwina and Bell-Krannhals (1990) and our group on Kaileuna. As of 2000 there were approximately 35,000 Trobriand Islanders; as in other areas of Papua New Guinea, population growth is very dramatic.

The Trobriand Islanders are a very proud people who quite consciously and vigorously defend many aspects of their traditional way of life. Of course, major changes have been brought about by the missions (initially the

London Missionary Society, now Papua Ekalesia, for the Protestant majority of the inhabitants and the Catholic Mission), the government, schools, and tourists, whose numbers have dwindled considerably in recent decades, and the fact that quite a number of Trobriand Islanders work outside their home area, including in the national capital Port Moresby, sometimes in high positions—the Papua New Guinea ambassador to the European Union was, at one stage, a Trobriander.

Despite these changes most Trobriand Islanders are still subsistence farmers and, depending on the distance of their villages from the sea, collectors of marine food. The women usually gather shells and other small animals and plants on or near the reef, and the men employ various methods of fishing (line and hook, nets, spearing, *Derris elliptica* fish poison, and others). Fish (*yena*—I use the orthography laid down in Senft's [1986] dictionary of Kilivila) and shells (*wigoda)* are the most important sources of protein. Hunting feral pigs, birds, and a few species of marsupials does not play an important role.

The most valued crop is yam (mostly *Dioscorea alata, tetu*), especially as it is the "currency" for harvest gifts (*urigubu)* and other ritual exchanges. Yams are quite regularly grown in a competitive way; one of the leading men hosts a *kayasa*, that is, the most successful gardeners receive valuable prices provided by him. In good years, astounding amounts of yams will be harvested this way, displayed in large conical heaps and stored in the special storage houses (*liku)* of the high-ranking men, or placed under the roof of the verandahs (*bwema)* of the commoners. These yams from large specially chosen gardens (*kemata)* will not be consumed by the families who grew them, but will be given away to others as harvest gifts, a peculiar mark of Trobriand culture and a sign of the sophisticated network of reciprocity. A quantitative analysis (Schiefenhövel & Bell-Krannhals, 1986) of these *urigubu* showed that it is not ego's sister or her husband who receive the majority of these gifts (as claimed by Malinowski) but rather ego's father and elder brother, generally male persons who are close blood relations of the giver. Taro (*uli)*, sweet potato (*simsimwai)*, cassava (*tapioka)*, bananas (*usi)*, coconut (*nuya),* and several leafy vegetables are nutritionally (but not psychologically) as important as yams. Betel nuts (*Areca catechu, buva)*, which produce mild hallucinogenic and other physiological (parasympathicomimetic) effects are greatly sought after. Trobrianders are prepared to spend a large amount of available cash on betel nuts which are seen as the

equivalent of the white man's beer. The various stages of garden work, from clearing (usually) secondary vegetation using the slash-and-burn technique to harvesting, from the prime cooperative activity involving many ceremonies, including the *milamala* harvest dances (see below).

Another spectacular element of Trobriand culture, centering on exchange and reciprocity, is the ceremonial *kula* exchange of two types of valuables, *soulava* necklaces and *mwali* armshells, which are circulated clockwise and counterclockwise respectively, in a quasi-circle comprising various islands in the Solomon Sea (Leach & Leach, 1983; Malinowski, 1922). To become a successful participant in the *kula* is highly prestigious for a man and requires a well-developed sense of entrepreneurship and social competence. As in the *kayasa* harvests and the *lisaladabu* exchange carried out by women (see below), the highly competitive nature of Trobriand culture becomes obvious in the *kula*. Costly and well-prepared *kula* expeditions are still carried out today, but motorboats and small ships are increasingly used for the journey to the neighboring islands rather than the traditional large and lavishly decorated *masawa* outrigger canoes with pandanus sails.

Like other Austronesians, and unlike the Papuan peoples living on the nearby islands and the New Guinea coast, the Trobrianders were good sailors and navigators utilizing wind directions and the stars as their basic compass and calculating the course by a number of other parameters as well. However, the ordinary (i.e., non-*kula*) version of the historical seagoing *masawa* canoes can now only be seen in daily use in some remote villages of the Trobriand group.

Descent is matrilineal, as in many other Austronesian societies, that is a couple's children will inherit their clan (one of four, Malasi, Lukwasisiga, Lukuba, and Lukulabuta, each of which have various subclans or lineages) via the mother. This is of particular importance with regard to chieftainship. Village chiefs, regional chiefs, and the paramount chief (who traditionally resides in the village of Omarakana, still has considerable power, and is entitled to a large number of spouses) cannot pass their positions on to their sons, as their role is tied to a specific clan (for the leading positions to the *tabalu* lineage of the Malasi clan) and, owing to clan exogamy (a rule rarely broken, see below), their sons belong to their mother's clan hence are not eligible for chieftainship. Therefore succession of chiefs is usually via sister's sons. Land, on

the other hand, is primarily passed on in the patriline. Thus Trobriand society is matrilineal with respect to genealogical descent but patrilineal for land rights and some other aspects. Residence is virilocal, that is, a newly wed couple will usually live in the village of the husband. Compared with other Melanesian societies, women have a rather pronounced public role, but do not make political decisions for the whole community; that is the exclusive function of male chiefs. Therefore matrilineality has not led to matriarchy.

Each lineage is headed by a male spokesperson, some of whom, especially when they are renowned *kula* participants or otherwise famous, are equally influential as the village and regional *tabalu* chiefs. Their role, including that of the paramount chief who still presides over traditional court cases and other matters and is feared/venerated because of the magic powers ascribed to him, seems to be diminishing because a modern political system of local village councillors and other more or less formally elected positions is becoming increasingly important. The inhabitants of the Trobriand Islands and neighboring Goodenough Island elect a representative for the national parliament.

Ideally, the houses in a village form a circle with their entrances facing the center, a symbolic representation of unity. The backs of the houses *(bwala)*, usually built in the traditional way with local materials, are directed toward the bush or the sea, basically dangerous spheres, and thus shield the inhabitants from evil forces. Facing toward the center, in front of the houses, are the verandas *(bwema)*, thatched platforms without walls, where many activities take place in quasi-public. The insides of the houses are private. In the third circle (given the idealized village layout) towards the middle stand the *liku*, yam storage houses of influential high-ranking men, which are often impressive. Their axis points to the very center of the village which has no built structures. Despite this, it is socially and symbolically the most important part of the village, where gatherings, ceremonies, and dances are held. Until the Trobriand Islanders changed their burial customs under the influence of the early missionaries and administrators after the turn of the 20th century, the dead were interred in the center for a period of several months or more, after which, in a secondary mortuary ceremony, their skulls and other bones were placed in caves or rockshelters near the villages. Thus the center had a high religious significance. Only a few skulls and long bones are found. In some burial caves, such as those

near Labai and Mwatawa at the northern and historically significant part of Kiriwina (this is the location of the famous "hole" from where, according to the legend, the first people surfaced from their underground existence and the young hero killed the cannibal giant). These caves appear to have been reserved for the skeletons of high chiefs. Today the dead are interred near the family houses, and the practice of exhumation and secondary placement of the bones has been abandoned. In fact, this old custom is almost forgotten.

Other mortuary rites have survived acculturation almost unchanged. Mourning chants are often begun before death has occurred. Relatives, including those from distant villages on other islands, arrive, and in an atmosphere of deep grief and crying the grave is dug and the body is placed there. The subsequent *sagali* (a collective term for exchange ceremonies) involves specified role playing by the two kinds of relatives, consanguineous and affine, food is prepared, and a festive meal is eaten. A central part of these gatherings is the often spectacular *lisaladabu* ceremony carried out by women (some husbands may participate from the fringe, handing their spouses coins to make up for a shortage of *nunugwa* (in Kiriwina, *nununiga*) bundles). These are made from scraped banana leaves, in a long and time-consuming process, and constitute a currency. Influential high-ranking women will have hundreds of these bundles (each containing five actual *nunugwa*) plus skirts (*doba*, which is also the general term for women's wealth) made of *nunugwa* and decorated with other accessories. The women will proudly display their power, calculation and control of the very complicated exchange process, and their social and theatrical skills in the village square, which, on these days, is completely dominated by the women who are often in an elated euphoric stage during the transactions (for a full description see Weiner [1976]). Several mortuary ceremonies will follow until, after about a year, the taboos under which the widower, the widow, and others must live are lifted and they can rejoin full village life.

Much of the traditional animist religion has survived Christianization. For example, the spirits of the dead *(baloma)* are still believed to enter the underworld through a hole at the southern tip of the island of Tuma and to be reincarnated in newborns of their matriline. All serious diseases, and especially death, are attributed either to "poisoning" (there is no scientific proof for this) by sorcerers *(bwagau)*, the action of evil-minded spirits,

including "flying witches" *(mulukwausi)*, or the power of God who is basically angry with humans because they killed his son and will punish wrongdoers (e.g., people who have stolen betel nuts which were protected by taboo).

Because of the sharp growth in population there is increasing pressure on the ecology. Traditional fallow periods (in the past up to about 15 years) can no longer be kept and therefore the fertility of the gardens is decreasing. Thus people increasingly rely on rice and other food items from shops. Only small patches of rain forest are left on some of the smaller islands. Almost no ebony wood, which was used to produce many of the highly attractive Trobriand carvings (a good source of income in past decades), grows locally any more and it is now imported from Woodlark (Muyua) Island. The very precious *beku*, finely polished ceremonial stone adze blades, which constituted, and still do to some extent, a form of valuables *(vegua)* needed for certain important transactions (e.g., marriage) also come from Woodlark Island.

Modern times have brought peace; there are no more wars between villages, only occasional fights, in which men may be injured but which rarely result in deaths. The Trobriand Islanders probably appreciate peace more than the introduction of modern tools and techniques which make life easier for them. Of course, there are also negative impacts on their culture, and many of the islanders feel threatened by the modern way of life. There are also negative developments concerning the marine environment. Poaching by high-tech fishing boats from Taiwan and other nations, as well as more frequent and more efficient fishing (e.g., long lines with many hooks) and the use of dynamite by the local fishermen themselves, are a threat to marine resources. Sea cucumbers (family *Holothuridae*; French, *bêche de mer*), which have been a valuable item traded, as an aphrodisiac, to Chinese ports for centuries and the reason why Melanesian Pidgin developed as a lingua franca, are also extensively collected and need long periods to recover.

CULTURAL CONSTRUCTION OF GENDER

Both adult men (except a very few who say that they are not interested in women) and women expect to be married and to have children, and almost all women of reproductive age are married. Many marriages are childless,

probably because of the prevalence of gonorrhea and other sexually transmitted diseases, which can lead to female infertility. Adoption of children from relatives is very common. Women and men are expected to take on gender-specific roles typical of this traditional society based on the division of labor and the concept that both sexes are fundamentally and necessarily different but, at the same time, complementary in a psychosocial and cosmological sense. In Kilivila, the Trobriand language, each person and other living beings, and even inanimate objects, have a defined gender. This is indicated by a very complicated system of classificatory suffixes attached to the noun. Therefore it may be correct to say that Trobriand society places high importance on classification by gender. There is little tendency towards androgyny, except in the *milmala* harvest dances where women and men wear very similar (but not identical, as suggested by Malinowski [1929]) *doba* fiber skirts. The women's skirts are shorter and closed over one thigh (no underdress is worn), and the men's skirts are longer and closed in front. The men wear the traditional pubic cover *(mweki)*, made of the white upper bark of the betel nut palm, beneath their skirts. From a distance it is difficult to distinguish female and male *milamila* dancers, especially as their movements in the highly stylized circular dance are identical. This is an interesting feature of Trobriand culture which contrasts with the typical Papuan pattern of culturally enhanced gender dimorphism, leading to very different appearance and behaviors for women and men. However the Trobriand Islanders do have a special form of male dance which contains pronounced phallic elements.

GENDER OVER THE LIFE CYCLE

Adult women's and men's roles do not change very much during their life time. As in all societies, men become less vital and sexually potent with age, and there is some good-humored joking among women about this. Men themselves seem to accept these age-related transitions with the same apparent ease (i.e., without complaining about physical and/or psychological problems) as women with regard to aging and menopause. In fact, there is a striking difference with Western societies where a high percentage of women suffer from premenstrual syndrome and menopausal or other age-related complaints, and men increasingly take anti-aging and other medications supposed to increase

vitality. Postmenopausal women appear to have slightly more male characteristics than younger women, but there is no marked change in their behavior or lifestyle. Some elderly women are quite elegant and dignified. Men can exercise their roles as village leader *(tokarevaga)* or fully fledged chief *(guyau)* until they die, unlike the "big men" system of Papuan societies where these functions are related to vitality and performance.

Socialization of Boys and Girls

Girls and boys have gender-specific names (at least two different ones, representing the matriclan and the patriclan) and are socialized and expected to develop into "normal" women and men, that is, be able to fulfill the culturally prescribed roles. Small girls are given a genital cover (nowadays usually a little cotton skirt) much earlier than boys who are allowed to go naked for a number of years. Girls are told not to spread their legs in public and to adhere to other rules of decency. They also take part in typical female activities in the household and the garden somewhat earlier than boys, who have a longer period of work-free leisure. One of the first playful imitations of their mothers' activity can be seen when little girls try to scrape banana leaves, the first step to producing *doba*, the currency and pride of the women (see above). These gender-specific activities are encouraged by adults and seen as fitting and proper. In the case of the boys this refers, for instance, to fishing with line and hook. Children are frequently allomothers for their younger siblings; this is more often the case for girls, who carry around babies almost as big as they are themselves, but boys also take over this parental role with apparent pleasure and without being pressured to do so. This exposure to infants prepares them very well for their future roles of parents (see below).

Puberty and Adolescence

Puberty sets in with an approximate 2 year difference between girls and boys, which is characteristic for other populations as well; boys lag behind at this stage of development. Menarche is around 15; this seems surprising, as the Trobriand Islanders live in a kind of nutritional paradise with access to all essential foods, but is due to parasite load. Children and adolescents must first successfully fight malaria and other infectious diseases so that the immune system manages to overcome this burden. Then their bodies, which have been stunted during the childhood years so that children are small and underweight by Western standards but vital and mentally unimpaired, start to grow quickly and secondary sexual characteristics develop in a relatively short time. The earliest pregnancy we have seen in 20 years of fieldwork on Kaileuna was in a girl aged 16. Young men rarely become fathers before their early twenties, and usually considerably later. However, this is changing now, together with a shortened post-partum coitus taboo (see below). There are no rites of passage connected to puberty and early adulthood, especially not the kind of initiation of boys or adolescents into secret male societies typical of the Papuan cultures, nor is there any equivalent for girls.

Attainment of Adulthood

After puberty both girls and boys are expected to behave like adults and to take over more and more responsibilities. Again, there is no special ceremony to mark this transition; it is a gradual process and there is considerable variance between individuals.

Middle Age and Old Age

Women and men in the prime of their lives provide most of the resources, especially food from the gardens and the sea. They often exhibit extraordinary physical and mental stamina and most of them are proud to be seen as hard diligent workers. During seasons with competitive yam production (*kayasa*; see above) many hours of the day are spent in the coral gardens where clearing, planting, weeding, and harvesting are carried out with simple tools—nowadays a bush-knife, steel axe, and digging stick, which may but often does not have a metal tip. Both women and men share these responsibilities in working the gardens; men tend to take over more of the physically demanding tasks like clearing the land and building high strong fences as a protection against feral pigs who will destroy garden crops. Once a person has passed middle age she or he is called *numwaya*, "elderly woman," or *tomwaya*, "elderly man," respectively; these terms carry a high degree of respects and could best be translated as lady and gentleman. There is often a misconception about the possible ages that people in traditional societies can achieve. General life expectancy (e.g., for the cohort of newborn babies) is, at approximately 40 years among the Trobrianders, much lower than in industrialized societies owing to the toll that infectious diseases take, but this

does not mean that there are no old persons. It is not uncommon for women, although a little less likely for men, to reach 80 and beyond. These people are often surprisingly healthy and fit, well able to take care of themselves, and remain integrated in the village society for a long time. They do not appear to suffer from Alzheimer's disease, so typical for Western societies; however, there is a gradual slow decline in physical and mental abilities. Death in children and younger persons is usually due to infectious diseases (a typical pattern in developing countries); in old people death can also be due to a general decline of physiological functions. Long periods of infirmity are unusual. It is very striking to see Trobrianders die; usually they are calm and accept their inescapable fate. Very rarely does one detect uncontrolled anxiety or panic. Young and old are exposed to life-threatening disease and death as ever-present phenomena and this may prepare them well for their own dying.

Personality Differences by Gender

There is no doubt that male and female Trobriand Islanders differ not only with regard to their bodies but also to their personalities. Men engage in risk involving exosphere activities like long-distance sea travel and occasional fighting (among other weapons, pointed pieces of iron rod are thrown as rather dangerous projectiles) whereas women engage in activities directed to the endosphere of the house and the family. However, there is at least one ceremony where these roles are playfully reversed. This happens at the festive launching *(kabidoya)* of a new *masawa* boat built for a *kula* expedition. Girls and women from a village neighboring that where the *masawa* was made race towards the sea, where the boat is paddled along, and throw coconut husks and other objects at the crew, who eventually counterattack so that there is some physical but always playful fighting on the reef and the beach. This is followed by a meal in the village.

Gender-Related Social Groups

As discussed above, gender is an important category for the Trobriand Islanders. Groups of men will go fishing, perform heavy clearing or other garden work, often upon request by an influential man who will reward their contribution, or set out to play football (soccer) or the very interesting Trobriand form of cricket against other villages, or will engage in a *kula* expedition. Groups of women will carry yams from the gardens to the village or, as one of the various activities of "women's clubs" (suborganizations of the churches), travel to another village and conduct a ceremony of reciprocal gifts of food and other presents. Groups of unmarried female *(kubukwabuya vivila)* and male *(kukumatuva tauwau)* adolescents will receive food during ceremonies involving communal eating; married adults receive their food gifts in the village sectors *(katuposula)* where they live and eat in mixed-gender groups.

Gender Roles in Economics

There is traditionally a division of labor in many subsistence activities. However, much of the work necessary to grow food in the gardens can and will be carried out jointly by men and women; often wife and husband work side by side. Offshore fishing is a typical job for the men; reef fishing and collecting seafood at low tide is typical for women. In some larger villages and the "town" of Losuia local markets cater for the needs of the increasing number of inhabitants who do not have access to gardens and the sea. Fish are typically sold by men in these markets, whereas women sell garden products and, in recent years, homemade bread, pastry, and the like. Exclusively men are carvers of artifacts, many of them artistically very appealing, and try to sell them to the few tourists. Wage Labor in tourism or other industries is performed by both women and men. One often finds Trobriand Islanders, recognizable by their *bagi* necklaces made of the same kind of *Spondylus* shells as the priceless *soulava* circulating in the *kula* system, in banks and other institutions in the national capital Port Moresby. Trobriand business men and politicians are male, except one high-ranking Trobriand woman who has, together with her Australian-born husband, started to take initiatives toward new forms of tourism and the building of cultural awareness among her people.

Parental and Other Caretaker Roles

A quantitative study of infant caretaking (Schiefenhövel, 1991) demonstrated that, for the first year or so, the

biological mother is by far the most important person in the life of babies. There is a very high degree of physical body contact during the day (around 60%) and even more during the night, when babies sleep besides their mothers. Measuring body movements with actimeters revealed that mothers synchronize their nocturnal and, to a lesser degree, their diurnal activities very closely with those of their infants; that is, the baby's restlessness, crying, or other signals are answered almost immediately, with very competent intuitive parenting. The average duration of infant cries is about 30 s; taking the child into body contact or, most often, breast-feeding successfully soothes the infants. Infants spend about 20% of the day at the breast, not just feeding but also suckling for psychological comfort. The Trobriand Islanders distinguish those two activities linguistically as -nunu- and -susu-. As in other traditional societies, mothers, fathers (who become important caretakers and bonding persons after the early months), and other allomothers react to babies according to their belief that these little human beings need love and affection and expect their signals to be answered with the full range of parenting behaviors. Prolonged separation of infant and mother or caretaker is very rare; babies are where their family is, no matter what time of day or night. In this way they receive the optimal tactile, olfactory, auditory, and visual stimulation necessary for the brain to develop well. Their psychomotor development is very good, relative to Western standards, as long as they are breast-fed, which used to be for about 2 years or more (see below for changes in this practice). Difficulties arise at weaning, which often creates a psychological trauma and marks the begin of stunting, probably because of the lack of immune protection through breast-milk but also because there are no special weaning or infant foods. In contrast with what Malinowski wrote in some of his work (in other parts he states that fathers have a loving relationship with their babies), biological fathers have a very close and affectionate relationship with both infants and older children. There is playful behavior, mouth-to-mouth feeding, verbal interaction, instruction, etc. The maternal uncle *(kadala)* plays very little role in the everyday life of infants and children. Malinowski saw him as *the* important male figure in the families and based much of his vision of Trobriand culture on a combination of tension-free sex among unmarried people, *ignorantia paternitatis* (see below), and matrilineality, and consequently grossly underestimated the role of the biological father.

LEADERSHIP IN PUBLIC ARENAS

As has been said above, political leadership, that is, taking decisions which will affect the whole village or regional community, is still a male domain. Trobriand chiefs, despite the roles that women have in certain ceremonies (most notably the *lisaladabu*) and in the family, exercise marked undisputed patriarchal powers. This is probably an ancient trait of Trobriand culture. Men are also the organizers and leaders of a number of publicly performed competitive ceremonies (e.g., *kayasa* and *kula*). Women take a leading role in some of the stages of the mortuary rites, for example, as *tolisagali* (leader of the exchange ceremony). Village councillors and other representatives of new governmental forms of political leadership are usually also male.

GENDER AND RELIGION

Religiously meaningful activities like healing rites and garden, love, and other "magic" can be carried out by both women and men. However, it is more common for men to perform religious rites connected to seagoing canoes and hunting. Protestant pastors, catechists, and other church officials *(misinari)* are still exclusively male; however, women often act as leaders in prayers and similar church activities.

LEISURE, RECREATION, AND THE ARTS

Various activities in the sea close to the villages, such as swimming and playing in the water, are shared by girls and boys and by men and women. Women produce a special impressive drum-like sound by hitting the water in a special way, accompanied by lots of laughter. Generally the atmosphere during work, and particularly during leisure activities, is very relaxed, and joking and humor are part of Trobriand life. People enjoy each other's company, especially during the various feasts which take place on different occasions, some of them connected to the churches. A modern form of recreation takes place in the village square, preferably on clear moonlit nights. A group of young men will sing a particular type of modern song, accompanying themselves on guitars and ukuleles, which are sometimes homemade. The girls join in singing and may perform a newly invented type of dance which they

call "*disco*," which has a rather complex set of choreographic patterns. These songs, the texts of which usually tell of love sickness, nostalgia, and sadness, are composed by individuals, mostly young men, and some become popular, spread around the Trobriand Islands, and may even be broadcast on a local radio station. Handicrafts, like producing the banana fiber bundles in the case of the women or carving artifacts in the case of men, are also recreational activities, despite their economic importance. There is very little painting, although there are colorful symbolic decorations on the strikingly carved and painted splash boards *(lagim)* of *masawa* boats and on the *liku* yam houses of high-ranking chiefs. The human body is another object for artistic activity; much body decoration is quite striking and attractive. Generally, it can be said that Trobriand culture is characterized by a highly developed esthetic sense, in the visual and rhetoric arts, music, and dance.

RELATIVE STATUS OF MEN AND WOMEN

Men have most of the formal and almost all the political leadership roles and play the main roles in the *kula* exchanges. However, since the society has matrilineal descent, children take their clan membership from their mothers, and therefore chieftainship can only be inherited via the matriline. Women play important and often outstanding roles in mortuary ceremonies *(sagali)* and they can perform healing and "magic" and have control over their sexuality and whom they marry.

As mentioned earlier, there is a clear hierarchy of political and formal power: men, women, adolescents, children.

SEXUALITY

Malinowski's book *The Sexual Life of Savages* shocked and fascinated the post-Victorian world. However, some of the passages in this work are less well founded than Malinowski's usually careful and accurate accounts of Trobriand life. It seems that, like many other before and after him, he fell victim, to the "South Sea sexual paradise" paradigm which had been started by Cook and other early explorers, and which was partially based on fact. Sexuality in Trobriand culture was probably less governed by taboos than was true for Europe when Malinowski was writing—today, the opposite is the case because Western sexual rules have become much less strict. Malinowski claimed that "children have real sex." This is a gross misrepresentation, most likely due to the fact that he, like many others, underestimated the physical maturation process. Girls and boys who look as if they are 10 years old to European eyes may already be 14 or 16; it is necessary to have proper birth dates or to carry out dental checks, as dentition follows a biological clock and is much less affected by environmental factors than is somatic growth, the development of secondary sexual characteristics, etc. Malinowski also claimed that adolescent sex is free from jealousy. We had a number of male patients in our long-term project who were seriously wounded because they had had alleged or actual sexual contacts with the girlfriends of the aggressors. As Bell-Krannhals found, there is a lot of indirect courtship going on, a fact which Malinowski also acknowledges. The sex expeditions that he described have probably always been, like female gang rape *(katuyausi)* of individual men, rather rare events. However, it is true that during harvest time girls and women take liberties, like publicly touching men in their genital area, which are normally taboo.

The most inexplicable extreme position adopted by Malinowski was his strongly defended belief that Trobriand Islanders were ignorant of the biological connection between sexual intercourse and pregnancy. This issue has been dealt with extensively (see Delany, 1986; Schlesier, 1979). It is sufficient to note here that the Trobrianders, who are pig breeders (young boars are castrated) and very intelligent observers of nature, have probably always known that intercourse is a sine qua non for pregnancy—in fact it is hardly conceivable that any society, past or present, was ignorant of this fact. However, it is true that Trobriand Islanders believe that the soul *(baloma)* of a deceased member of the matriclan must enter the conceived embryo to allow it to develop into a real child.

Sexual contact between unmarried people requires careful and sensitive courtship, often through (female) go-betweens and the employment of love magic. Intercourse *(-ulatila-)* is usually in a sitting position; the woman moves onto the man's lap. Kissing and some other forms of sexual contact were not very common; however, this has changed recently. Lack of sexual arousal and orgasm in women do not seem to be a common problem. It can be

roughly estimated that the frequency of intercourse among the sexually active population is about twice weekly, similar to that in Western countries. Homosexuality was absent or extremely rare in traditional Trobriand culture; men who were not sexually interested in women stayed without partner. Lesbian intercourse was most likely equally rare. Today, homosexuality has been introduced by white men. The Trobriand Islanders know some basic facts about AIDS and are very worried that this deadly disease may be introduced—it is already responsible for most hospital death in the capital Port Moresby. Pedophilia was not an issue in the past; a person carrying out sexual acts with children would have been controlled by public disapproval. Taboos against incest *(sova, kwe-suvasova)* stipulate that sex between brother and sister is strictly avoided; sexual contacts between other members of the nuclear family are also forbidden, but may sometimes occur, as do sexual liaisons and even marriages between women and men of the same clan, which is violating a basic but somehow negotiable incest rule. Malinowski's account of incest taboos and their possible breaches is still basically valid today.

Courtship and Marriage

Some forms of courtship have already been mentioned above. An important principle is that the person (usually the man) actively seeking erotic–sexual contact with a possible partner should not lose face by straightforward rejection, hence the importance of indirect strategies, nowadays including the writing of love letters. Parents of two families belonging to different clans sometimes try to arrange the marriage of their children; cross-cousin marriages may be culturally preferred but actually occur only rarely. Most marriages are based on mutual love, usually after a sexual liaison; women have a strong position in this decision and will not be forced into a union they do not want, not even when they are courted by a powerful chief. The actual act of announcing one's new status as married couple *(vavegila)* is to be seen, early in the morning and presumably after a passionate night, sitting side by side on the platform of a house, often the hut *(bukumatula)* of the young bachelor where he will have received his girl friend(s) before. After this informal act of marriage the two families engage in reciprocal gift giving, consolidating the newly formed bond between them. Divorce *(vepaka)*, usually triggered by

extramarital affairs by both spouses, is not uncommon. Bell-Krannhals (1990) documented nine divorces in a total of 34 marriages. A typical way of reacting to an unfaithful partner is the public destruction of his or her personal belongings. Women whose husband has a lover commonly take their (smaller) children and move back to their parents' house. Men often try to repair the bond by offering special reconciliatory gifts *(lula)* to the parents of the woman. Interestingly, there is no Kilivila term for "ex-husband" and "ex-wife."

Husband–Wife Relationship

Kilivila language distinguishes between three (in some accounts four) levels of possessive pronouns: (1) things closest to oneself (e.g., one's skin or one's child) are placed in the first level; (2) things which do not have such a close connection to oneself (e.g., one's cough or one's work) are placed in the second level; (3) things one owns (e.g., one's bushknife or one's canoe) are placed in the third level. Surprisingly, one's marriage partner ranges in the third rather distant category. This can be at least partly explained by the Trobriand concept that one's wife or husband is by definition (albeit, in some rare cases of clan incest, not in practice) a person from another clan; the relationship is a functional one, serving for joint reproduction of offspring and production of food and wealth. This view of two parties, as it were, joining for a limited time is also apparent in the mortuary rites. Despite this categorically very functional definition and classification of one's marriage partner, there is often a close and deep bond between couples. Extramarital affairs, forbidden by traditional law, are quite frequent, and divorce, which is legally easy but emotionally often a very disturbing event, is one consequence.

Other Cross-Sex Relationships

As stated above, premarital and extramarital sexual intercourse occurs, perhaps somewhat less frequently than in modern Western societies. There are certain occasions, especially *kula* expeditions, which provide particular opportunities for men to meet other women and have sex with them. As Leach (1983) suggests, this may be one of the incentives to engage in this costly and potentially risky activity.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Modern education in village schools or the only high school (in Losuia) has reduced the difference in daily activities between girls and boys and will most likely lead to women gaining more influence in the families and the public arena. In recent years a number of young and middle-aged women have decided to receive contraceptive injections every 3 months in order to reduce the number of pregnancies and children—condoms are freely available, but have not been a success. Their decision is in line with a general concern that the fast-growing population will exceed resources in the gardens and the sea. On the other hand, young couples marry earlier and, probably more significantly for the overpopulation problem, do not follow post-partum coitus taboo which was still strictly obeyed even a decade ago. It seems that the partners do not want to abstain from sex for a period exceeding a year, and therefore young women are weaning their infants earlier. This has already led to less spacing between siblings (the interval in the past was 2–3 years) and consequently an ever-increasing number of children. Another change has been produced by women forming socially, politically, and partly economically active groups, mainly in the framework of the churches. Given that politics in Papua New Guina is an almost exclusively male and unfortunately often very corrupt sphere of public life, the entry of Trobriand women into the political arena may help to solve some of the most pressing problems of this emerging nation.

Tswana

Rebecca L. Upton

ALTERNATIVE NAMES

The BaTswana are the largest ethnic group in Botswana. The term "BaTswana," or, in older orthography, "Bechuana," is also commonly used to refer to all citizens of Botswana regardless of ethnicity and can refer to speakers of SeTswana, the majority language in Botswana, derived from Sotho-Bantu languages, that also denotes Tswana culture and traditions.

LOCATION

The Tswana people live in southern Africa and largely populate the country of Botswana, which means "place of the Tswana" in SeTswana. Historically, Tswana populations lived in what is now the northern part of South Africa, and through migration northward currently extend across the Kalahari Desert to the Okavango Delta in Botswana and parts of neighboring Namibia and Zimbabwe.

CULTURAL OVERVIEW

The country of Botswana, and by extension, the Tswana people, has long been held up as a kind of success story in Africa. The Tswana built a relatively stable and democratic government following the peaceful movement for independence from the Republic of South Africa in 1966, when much of Botswana was known as the republic of Bechuanaland. Since that time, the political organization of the Tswana has fallen into two main political parties, the Botswana Democratic Party and the Botswana National Front. Historically, leadership in the community was by the paramount chief or *kgosi* and was extremely hierarchical. In the post-independence era, the *kgosi* remain important leaders for each of the districts in Botswana and are recognized as such by the central democratic government.

The contemporary economy of the Tswana is grounded in the cattle and diamond-mining industries. In the past, cattle provided both social and economic prestige. Today, ownership of large cattle herds has diminished, and export of cattle abroad and for profit has increased. The diamond-mining industry in the southern part of Botswana, extending through South Africa, underpins much of the contemporary economy and has resulted in male-dominated migration streams to these areas. Much of the Tswana economy to the north is centered on the growth of the high-end tourism industry.

The most significant aspect of Tswana cultural life today is the advent of HIV/AIDS and its affect upon gender and social life. At present Botswana has the highest estimated HIV prevalence rate in sub-Saharan Africa with approximately one in three persons infected. Rapid industrialization, along with migration and transportation patterns, has resulted in the rapid spread of the disease through urban areas. Cultural constructions of gender and health play a large role in understandings of the disease (Comaroff, 1993; Klaits, 2001; Upton, 2001).

CULTURAL CONSTRUCTION OF GENDER

For the most part, the Tswana recognize only two categories of gender: female and male. These gender categories, while difficult to describe briefly, can be summarized as parallel to individuals' sexual reproductive status. Women are expected to bear children, and it is not unusual for a woman to have a child prior to marriage or setting up a household with a male partner. A woman's fecundity and ability to bear children influences both her attractiveness and her social status in Tswana society as outlined in greater detail below. Both men and women who are perceived as infertile suffer great social stigma and ridicule, and such status can prove grounds for divorce. This illustrates how fertility is considered integral in the social construction of the Tswana person and what is considered "healthy" gender identity. In general, and particularly in less urban areas, homosexuality is denied and never directly discussed; it has long been considered officially illegal, although individual opinions and cultural perceptions of homosexual relationships may be slowly changing.

Dress is perhaps the most clearly distinguishable expression of gender identity for the Tswana. For the most part, men wear trousers and women wear more traditional style sarongs, wrapped cloth around the torso, or long skirts or dresses. In more urban settings, women will wear suits and trousers, however, and clothing overall tends to be similar to contemporary Western styles. Children who are enrolled in schools wear uniforms that include a dress for girls and shorts and a button-down shirt for boys. Again in more rural areas, women will wear a head tie—a scarf wrapped around the head—and it is particularly important to cover one's head using a scarf or hat at a funeral.

While it is difficult to pinpoint precise markers of beauty, given varying individual tastes and the significance of differing social contexts over time, people who are considered attractive are, in general, those with children. As described below, both menstruation and childbearing are seen as cleansing, strengthening, and healthy characteristics of women, and both men and women will talk about how important it is to have a child in order to be seen as desirable to the opposite sex. With the abundance of media influence from South Africa, Europe, and the United States, young people describe contemporary pop idols, with expensive clothing, slender bodies, and often intricate hairstyles and hair extensions as attractive ideals.

GENDER OVER THE LIFE CYCLE

As Suggs (1993) points out, gender status over the life cycle is primarily determined by achievement of certain tasks and reproductive status. Age is of secondary importance, given that establishment and maintenance of a household, decision-making competence, motherhood, and fatherhood are more often markers of movement between life cycle stages (Burke, 2000).

However, similar to Western perceptions of the life-course, the Tswana divide the life cycle into four relatively distinct stages. These stages include young boy or girl, adolescent or youth, man or woman, and older man or woman. Yet it remains difficult to equate these stages with specific chronological ages. For women, these life cycle stages often correspond to menstruation or the bearing of children. For both genders, transition through these general life stages confers greater responsibility and respect in the community, although such stages are less publicly marked in contemporary society than in the past. As Schapera (1938, 1966/1971) and

Comaroff (1985) note, past initiation rites and rituals conferring adult status were complex, centering on the *bogwera* (for boys) and *bogale* (for girls) initiation rituals. These rituals, while no longer performed, created age regiments for men and provided an introduction to sex and instruction in marital duties for young girls.

Socialization of Boys and Girls

For young boys and girls, socialization is based largely on the performance of certain kinds of tasks. In early years, both boys and girls are primarily instructed, nurtured, and disciplined by mothers and other female kin in the household in which they live. While they are socialized equally early on through their mother, young children are given differing tasks; girls may be asked to care for other siblings, fetch water, and help with food preparation, whereas boys are more likely to be sent to deliver messages or perform other tasks for the household. Young children are often sent to live with and help out older relatives, like grandmothers and aunts, who may in turn become the primary caregivers. Historically, young boys would be sent to assist at the cattlepost and would receive more socialization there through male kin.

Formal education is unusual in that enrollment for girls is higher than boys up through primary education. Unfortunately, many adolescent girls are faced with policies which require them to drop out of formal schooling if they become pregnant (Oppong, 1993). Lack of resources and barriers to upper levels of education (Burke, 2000) appear particularly significant for the further school progression of young girls.

Puberty and Adolescence

As a life cycle stage, definitions of puberty and adolescence are processual and situational. Youth are often described in terms of what they do not have; for example, if they are unmarried, childless, or without independent economic resources, individuals may be considered as youths. For many, a youth or adolescent stage is flexible and associated with participation in educational structures, generally between 15 and 23 years (Burke, 2000, p. 207).

Historically, as described by Schapera (1938, 1966/1971), girls and boys were initiated into different age regiments (*mephato*), usually after the age of 16. For boys, the *bogwera* ritual, including circumcision, marked the passage from boyhood to adulthood. A similar ritual

called *bojale*, which included branding of the upper thigh, was performed for girls. As Comaroff (1985) notes, these rituals signified many of the cultural constructions of gender and community as they were inscribed upon individual bodies. In postcolonial eras, these rituals of adolescence have largely stopped.

Attainment of Adulthood

The attainment of adult status is often described as a product of having had a child and attained the ability to set up an independent household among the Tswana (Garey & Townsend, 1996; Townsend, 1998). While marriage is also often understood as marking a transition to adulthood, the rate of marriage for the Tswana has dropped considerably over the last several decades. In addition, marriage has become increasingly disassociated from child-bearing (mostly due to the increases in male out-migration since the 1940s), with child-bearing now maintaining more of an association with adulthood (Izzard, 1985). Nevertheless, marital status, while generally understood by scholars of the Tswana as processual in nature, typified by exchanges in goods and services between men and women, can still act as a signifier of adult status (Peters, 1983).

Middle Age and Old Age

In general, when adults reach what is considered to be middle and older age, respect is accorded differently based upon gender. Changes in this process have occurred as a result of changes in wage earning and labor migration. In an earlier era, Schapera (1966/1971, p. 285) noted that as women grew older they were afforded a more "comfortable position" as their grown children relieved them of much of their work. Today it is clear that, for women, their status as *basadi bagolo* remains linked to their abilities to care for children, and particularly for grandchildren. Historically, garnishment of respect increased with age and assumptions of increased land and cattle ownership. In more contemporary Tswana society, younger cohorts who have higher wages and independent earning power have shifted these views to some extent.

PERSONALITY DIFFERENCES BY GENDER

Aside from roles that are prescribed by gender in Tswana society, such as the woman's role as midwife and male role as traditional healer, there are few cultural assumptions and stereotypes linked to the cultural construction of gender identity. It is often assumed in literature on child maintenance that men are less nurturing in terms of their financial support of children, but it is difficult to then make the assumption that these kinds of behaviors are linked to particular personality differences.

An interesting, albeit under-researched, aspect of the study of perceptions of personality differences by gender can be found in the Tswana cultural stereotypes about mental illness. Mental illness is in and of itself a particularly gendered state as it is described as a condition where the "womb has gone to the head," a condition that links infertility to mental illness. Mental illness is rare, and research on cognitive differences between men and women in Tswana society is relatively sparse. Mental illness is also stigmatized, and it is difficult to obtain actual statistics on how many individuals are institutionalized despite the presence of a large mental hospital in Lobatse.

GENDER-RELATED SOCIAL GROUPS

An enormous amount has been written on the nature of Tswana kinship and marriage (Comaroff & Roberts, 1981; Krige, 1981; Kuper, 1975; Schapera, 1938, 1966/1971) and the role of gender dynamics in the formation of households and kin networks (Griffiths, 1997). While kinship, ownership of property, and rank used to be figured patrilineally (Tlou, 1985; Tlou & Campbell, 1984), matrilateral relationships and social networks were also important (Griffiths, 1997). For married couples, residence near the home of the husband's family was common historically, though today, largely as a result of migration throughout southern Africa, many couples live in villages other than either of their own natal villages.

GENDER ROLES IN ECONOMICS

Traditionally, Tswana women were largely in control of domestic labor and work within the domain of the household. The preparation of food and even gathering of food and water were seen to be the work of women. Gender roles were marked in the more centralized areas during the colonial and missionary contact period:

The more centralized and hierarchical a chiefdom, the less independent were households, the more gender roles were marked, and the greater was male control; conversely, the less the degree of centralization,

the more autonomous were households, the less marked was the sexual division of labor, and the more attenuated was male authority. (Comaroff & Comaroff, 1992, p. 42)

In postcolonial and missionary times, division of labor among the Tswana has shifted. In the north in particular, the departure of Tswana men to the diamond- and coal-mining industries in the south has contributed to the rise of women as the primary heads of households (Peters, 1983). Almost 40% of men in Botswana between the ages of 14 and 50 are estimated to be absent and participating in national and even transnational migration for extended periods of time. The men return little in the way of remittances. As a result, many women have expanded the traditional craft of basketry as a means of achieving economic security. For this new craft, men are responsible for gathering the reeds, roots, and leaves in order to make baskets, though women are in charge of growing them and eventually dyeing, soaking, and weaving baskets for sale. As Suggs (1993) notes, among contemporary Tswana, most women are employed outside of the home in addition to their charge over domestic labor.

Historically, property was owned by village chiefs and headmen, and property ownership by women was rare. Exchanges of cattle, in the forms of bride payments (*bogadi*) represented exchanges of property and goods between men. In contemporary Tswana society, property and land may be owned jointly by men and women, although ownership is dependent upon marriage under customary or communal statutory law. In the latter, assets are kept separate but a woman cannot claim inheritance. At present, many are lobbying for more equitable structures regarding property and asset ownership (Molokomme, 1990).

Parental and Other Caretaker Roles

Parenting and other caregiving roles among the Tswana are complex and rest upon the traditional process of marriage. That is, as marriage is a process rather than a single event, it serves to provide a social position for children. What defines parental roles are biological kinship ties, and also the payment of *bogadi* (bridewealth cattle to the woman's family) and support of children by the father. Outside of marriage, there is no provision for children under customary traditional law (Garey & Townsend, 1996; Molokomme, 1991). Normative Tswana patterns or parental and caregiving roles are associated with payment

and financial support of children. For the most part then, from a Western perspective, and particularly with the implementation of the child maintenance law, it appears that women do the majority of caregiving and rearing. Today, the caretaking role increasingly rests on the shoulders of older relatives, particularly grandparents, among the Tswana. Historically it was not unusual for children to live with older relatives or to be sent to different villages to help take care of the household (for girls) or tend cattle (for boys). As a result of the HIV/AIDS epidemic, however, many more children are living with grandparents, greatly challenging the financial stability of these caregivers who are primarily older women. While sex preferences for children are difficult to discern with any certainty, many older women will state a preference for sons. They argue that a son will bring a young woman to the household, whereas daughters will eventually leave the household to live with their partners and partners' families.

Leadership in Public Arenas

Leadership in public and political arenas has largely been associated with men. Kin groups, lineages, and government have been restricted to the public domain of men. At the local level, men have always occupied positions of power and leadership roles in the form of village chiefs and as participants in the Tswana traditional public assembly forum of the *kgotla*. Attempts to give women more formal and public leadership authority have been acknowledged by the government (Ministry of Finance and Development Planning, 1997) and through more grassroots organization by women in the form of the women's action group, Emang Basadi! (literally, "stand up women!").

Gender and Religion

The creator and original being in Tswana traditional cosmology is often described as Modimo. However, this is also the more general term for ancestral spirit and is more accurately described as the traditional Tswana term for the many ancestral spirits based upon family and kinship networks. Christianity entered Tswana social and religious life with the appearance of European and African missionaries from the south, the most notable including Robert Moffat and his son-in-law Dr. David Livingstone. During the latter part of the 19th century, Christianity was firmly established among the Tswana in

the form of the London Missionary Society and the Dutch Reformed Church. More contemporary religions have been adopted by the Tswana, including the Zion Christian Church and other smaller Zionist and apostolic churches.

Today, the large majority of the Tswana population identify as Christian, with little differentiation by gender. During the missionary contact period, however, gender and religion became closely intertwined. Missionaries were particularly concerned with the idea of saving a "diseased and suffering" population and particularly focused on ideas about proper housing, with Western-style architecture and ablutions, health, and clothing among the Tswana (Comaroff & Comaroff, 1992). Ideologies of what was considered "civilized" and healthy were linked to Western-styles of dress, particularly the covering of female breasts and the wearing of cotton and wool clothing instead of animal skin vestments (Comaroff, 1993). Missionaries sought to change ideologies of gender and labor and emphasized women's appropriate roles within the realms of home and family and male roles as farmers and "breadwinners" (Comaroff, 1993)—roles that were considered more civilized and in turn more Christian.

Today, gender and religion remain linked, as many of the traditional spiritual healers in Tswana society are men, although many of the traditional midwives and those who help with reproductive disorders are women. Women in general are thought to be those most often practicing witchcraft, although stories of men practicing are also evident. Youths are particularly vulnerable to witchcraft as they do not have the knowledge or resources available to ward off malevolent acts. Witchcraft is generally considered to be a manifestation and product of another woman's jealousy, usually a close female relative such as one's aunt. Church leaders, as well as traditional healers called *dingaka*, are addressing the HIV/AIDS epidemic. Some of the traditional healers will say that it is not a Tswana illness and therefore cannot be cured through traditional herbal or spiritual means. On the other hand, some healers have argued that it is indeed a Tswana illness, akin to diseases caused by the transgression of certain taboos, and that they are capable of curing an afflicted person. Voluntary organizations, whose members are largely women, have grown in the past several years in Botswana, to assist and attend to individuals living with HIV/AIDS, and today many organizations and church outreach groups are focusing on the plight of AIDS orphans in particular.

LEISURE, RECREATION, AND THE ARTS

As noted by Suggs (1993, p. 110), there is an expression among the Tswana that claims "men have all the power and women have all the work." This statement holds true in the sense that women do a large percentage of the domestic work, particularly in more rural areas, and claim to have less leisure time to spend on recreation. As in any society, leisure and recreation are also largely dependent upon class position. It is more culturally acceptable among the Tswana for men to spend large amounts of time frequenting beer halls, drinking, and socializing. Soccer is extremely popular among the contemporary Tswana, although primarily only the men participate. Music and drama, historically significant parts of Tswana life and the oral tradition, are now also constructed as leisure activities. Traditional Tswana music was based upon vocals and stringed instruments with less emphasis on drumming. Today, both sexes listen to music from South Africa and the United States on the radio, and there has been a significant revival in school dance and music troupes. Drama groups attempting to portray awareness of contemporary sociopolitical issues (government, ritual murders, HIV/AIDS) have increased in the past several decades and draw both male and female participants.

RELATIVE STATUS OF MEN AND WOMEN

As noted above, the relative status of men and women among the Tswana is tied, in part, to their reproductive status. In addition, ownership of property, cattle, and, more recently, completion of education and high occupational status (mainly for men) contribute to the more informal demarcation of status among the Tswana. Within the domestic sphere, women maintain a large degree of autonomy and decision-making power. Even in more rural areas, women influence decisions with respect to subsistence and household maintenance. For example, decisions about sending children to various family members are largely the domain of older women.

Formal education is free (albeit school fees and uniforms can be costly) and both girls and boys participate. Yet, as noted, participation by girls drops off significantly after primary school. In addition to passing educational levels, in order to qualify for university education, individuals, both men and women, used to have to

participate in a form of government service entitled Tirelo Sechaba, "work for the nation." This program was aimed at getting youth to participate and give back to communities, other than their own natal villages, but has been recently disbanded by the government in Botswana as it was considered too expensive to maintain. However, it is not uncommon for older Tswana people to comment on this program and suggest that it allowed young people too much freedom and autonomy, and to speculate that it actually caused increases in the pregnancy rates.

Both men and women are accorded deferential status with age as well as with child-bearing. While it is difficult to discern power over sexual decision-making, many women in contemporary society reiterate the need actually to have a child in order to gain status in society.

SEXUALITY

As noted in the section on socialization of girls and boys, initiation and different life-cycle stages among the Tswana correspond strongly to ideologies of sexual reproduction. Having a child is often a means through which one can prove one's fertility and desirability as a sexual and marriage partner. The formation of a child is understood as a coalescing of male and female blood, where female blood has the potential to be considered hot, and potentially polluting and dangerous, and subsequently in need of cleansing and cooling through the passage of blood in menstruation, childbirth, and other ritual healing and cleansing practices (Comaroff, 1985; Klaits, 2001; Staugard, 1985; Upton, 2001).

While Schapera (1933) noted that if a girl engaged in premarital sex and became pregnant she was often described as *o senyile*, "spoiled," more recent research demonstrates how sexual experience is common among young people (Suggs, 1993) and carries less stigma than in previous eras, despite being of increasing concern to national and international healthcare policies. Sex outside marriage has been described as culturally appropriate if a partner, usually the wife, was considered to be unable to bear a child (Schapera, 1938, 1966/1971). In this case a *seantlo*, or substitute would be brought into the home. Given the large out-migration of men for extended periods of time, women have also often engaged in sexual relationships in order to have children, and such children are often explained in culturally appropriate terms such as "sleeping fetuses" (Upton, 2001).

Ideologies of modesty and culturally appropriate sexual behavior have changed in some ways over the last several decades. Largely a result of Christian influence, rules of modesty have become much more similar to Western ideas of covering the body and breasts, though this varies widely by class and, in general, breast-feeding children carries little of the controversy found in some Western societies. Cross-sex identification in the forms of cross-dressing and even homosexuality are not widely culturally accepted among the Tswana. In general, despite knowledge that homosexuality exists, there are some perspectives who treat homosexuality as aberrant and a type of illness. In the face of the current HIV/AIDS epidemic, homosexuality is often closely associated with Western attitudes and behaviors and the advent of the disease. However, it is difficult to discern with any accuracy the levels of homosexuality present in society, given that according to the Botswana Penal Code, homosexuality is punishable by up to 7 years in prison (Botswana Penal Code, CAP 08:01, pp. 164–167).

COURTSHIP AND MARRIAGE

A tremendous amount has been written on marriage among the Tswana and is well reviewed in Griffiths (1997). Two of the more prominent aspects of these discussions have been the varieties of cousin marriage that have been practiced and the fluid construction of marriage as a process. Cousin marriage historically differed by class status, where elites and more politically prominent families favored marriage with kin on the father's side of the family. In contrast, for nonelites, preference for marriage with cross cousins, and in particular for a man, with his mother's brother's daughter was desirable, though often a parallel cousin (the child of a parent's same sex sibling) was a preferred marriage partner. Today, many Tswana individuals maintain that marriage should be a mutual decision between partners and one based upon love and affection.

Payment to a bride's family by a man and his family, or *bogadi*, is expected and historically took the form of cattle, and serves to signify the bonds and relationships between familial networks primarily in terms of lineage of children (Comaroff & Roberts, 1981; Kuper, 1982). Depending upon ethnic group, payment could occur prior to marriage or after children were born to the couple, and is important in the determination of kinship and lineage

affiliation of those children. Typically, once an initial payment or *serufo* cow had been made, a young couple would cohabit together, *go ralala* (Schapera, 1938, p. 135ff; Suggs, 1993), sleeping in the house of the woman's family, and the marriage proposition would be discussed by her elder male relatives. As Molokomme (1990) points out, there are two systems of law, customary and common statutory law, that affect women's status as married persons.

As several authors note, (Brown, 1983; Izzard, 1985; Suggs, 1993) there has been a relatively steady decline in the rate of marriage in Botswana, although given the processual nature of this relationship such statistics should be understood in that context.

Individuals who have been widowed must remain abstinent for a period of 1 year during which they cannot engage in sexual activity without fear of illness in the form of *boswagadi*, "widows disease," a powerful and dangerous illness. Widows and widowers may remarry after that period of time has been observed, and in the past it was not uncommon for those widowed to marry the sibling of the deceased.

Husband–Wife Relationship

It is often noted that a significant number, approximately 44%, of contemporary Tswana households are female-headed (Ministry of Finance and Development Planning, 1997). For married couples, tasks remain somewhat divided in terms of domestic versus more public sexual divisions of labor, but this varies according to class. For many middle- and upper-middle-class Tswana, both wives and husbands are employed full time in the formal sector although this is largely dependent upon education.

If a marriage is not satisfactory for either party, divorce is a possible solution and, similar to rates for ever-married or widowed individuals, is higher in urban areas. Grounds for divorce and payment of support differ under the two systems of law as Molokomme (1990) points out. Under customary law, for example, divorce for women is more difficult to obtain, and under general or common statutory law there is often conflict between Tswana cultural beliefs (such as the payment of *bogadi*) and laws derived from Roman–Dutch law. Historically, Schapera (1966/1971) notes that grounds for divorce could be the suspected inability to reproduce and, while not practiced in contemporary society, polygamy was common among certain ethnic groups.

Other Cross-Sex Relationships

Relationships between brothers and sisters are among the most important cross-sex relationships in Tswana society. The formation of familial support linkages is important for siblings as well as for their children and successive generations. A brother is obliged to look after his sister's welfare and is theoretically entitled to her marriage payment should he need to support her financially (Griffiths, 1997, p. 43). In turn, he is theoretically also responsible for the welfare of her children and may offer them support throughout their lives. The relationship of a man with his sister and her children is such a significant one that one hears the expression "a man and his mother's brother (*malome*) never fight" (Griffiths, 1997, p. 43; Schapera, 1938). This expression reflects the social significance placed upon the supportive relationship that is assumed between siblings of the opposite sex throughout the life course. In a similar manner, the relationship between a woman and her uterine nephew was another important cross-sex relationship where the nephew would be considered an important and honored individual in the family and exchanges of services and even property could occur.

Change in Attitudes, Beliefs, and Practices Regarding Gender

Perhaps the greatest changes in attitudes, beliefs, and practices regarding gender are occurring as a result of the impact of the HIV/AIDS virus. Sexuality and the roles that men and women are believed to play in reproduction and health are increasingly topics of public discourse. The social construction and cultural understandings of how HIV/AIDS is caused, treated, and differently affects men and women in Tswana society are current topics for research and the basis for much of the current government focus in national healthcare policies (Ingstad, 1993; Klaits, 2001; MacDonald, 1996; Upton, 2001). Tswana cultural mores and perceptions of reproduction as central to attainment of certain life cycle stages for each gender are increasingly important in the contextualization and creation of more efficacious AIDS prevention and treatment programs. Certainly women are at a higher risk for contracting the HIV/AIDS virus and their ability to control contraceptive and preventative measures is paramount.

In the 20th century, migration by men to other areas of southern Africa precipitated changes in marriage patterns as well as the increasingly financial independence of women. While large differences exist between classes among the Tswana, and are linked with more rural and urban areas accordingly, economic discrepancies continue to have a large and significant impact on attitudes about gender and ever-increasing calls for gender equality.

Ukrainians

Sarah D. Phillips

ALTERNATIVE NAMES

The native Ukrainian term for Ukrainians is Ukraintsi.

LOCATION

Ukraine is located in Eastern Europe, and shares borders with eight other nation-states: the Russian Federation, Belarus, Poland, Slovakia, Hungary, Romania, Moldova, and Bulgaria. After the Russian Federation, Ukraine is the largest country in Europe.

CULTURAL OVERVIEW

In some interpretations, the literal meaning of Ukraine is "borderland," a term that describes well the nature of the historic geopolitical positioning of Ukrainian lands. Historically, Ukraine has been a frontier between east and west and north and south. The area's strategic position has made it susceptible to conquest by competing groups. Areas of Ukraine have been claimed variously by Greeks, Ottomans, Tatars, Poles, Lithuanians, and Russians.

Ukraine became an independent country when it seceded from the Soviet Union in 1991. Like people in each of the 14 non-Russian Soviet republics, under Soviet rule people in Ukraine were subjected to a program of "russification." Today, the citizens of Ukraine face the task of nation building and they are struggling to forge a national identity (see Wanner, 1998; Wilson, 2000). This poses special challenges in a country that is home to persons identified as "Russian" (their Soviet passport designation was Russian and they speak Russian as a first language), those identified as "Ukrainian" (they are of Ukrainian origin and speak Ukrainian as their primary language), and those who are placed into a hybrid third category of "russified Ukrainians." It has been suggested that at least one-third of Ukrainians are "russified" (Motyl, 1993).

Today, the country's population is between 48 and 49 million. The ethnic make-up of the permanent inhabitants of Ukraine includes mainly those who consider themselves Ukrainian (73%) and those who consider themselves Russian (22%) (Motyl, 1993); 0.9% of the population identify as Jewish, 0.9% as Belorussian, and 0.6% as Moldovan. Other groups represented in Ukraine include Bulgarians, Poles, Hungarians, Romanians, Greeks, Roma (Gypsies), Crimean Tatars, and Armenians, together representing 0.5% or less of the population.

The country is divided into 24 *oblasts* (provinces), plus the autonomous republic of the Crimea. The major industrial centers are all located in the eastern part of the country, and include Kharkiv, Dnipropetrovs'k, Donets'k, Luhans'k, Zaporizhzhia, and Kryvyi Rih. Mykolaiv, Kherson, and Odesa are port cities; Sevastopol' is the home of the Black Sea Fleet; and formerly Hapsburg L'viv is Ukraine's westernmost city. The capital city is Kiev, with a population of around 3 million.

Ukraine has a republican form of government made up of executive, legislative, and judicial branches. The executive branch consists of the President, the First and Deputy Prime Ministers, and the Cabinet of Ministers, which is appointed by the President and approved by the Supreme Council (Verkhovna Rada). The legislative branch includes the Verkhovna Rada, which is made up of 450 elected representatives (deputies): 225 seats are allocated on a proportional basis to political parties that gain 4% or more of the national electoral vote; the other 225 members are elected by popular vote in single-mandate constituencies. Deputies serve 4-year terms. The judicial branch includes the Supreme Court and the Constitutional Court.

Since gaining independence, people in Ukraine have been challenged to undertake economic and political reforms and refashion state institutions. The post-independence economy has been in a constant state of crisis, but in 2001 it showed signs of growth. Major industries include coal, electric power, ferrous and non-ferrous metals, machinery and transport equipment, chemicals, and food processing. Industry comprises approximately 32% of the economy, and agriculture represents 24%. The main agricultural and animal products

produced in Ukraine are grain, sugar beets, sunflower seeds, vegetables, beef, and milk.

The national currency is the hryvnia (UAH). In September 2002, the average monthly salary in Ukraine was between 400 and 600 UAH, or $75–$115 (Syrovatka, 2002). In the face of economic crisis, the pooling of resources among family members is an important survival strategy for many. Owing to a shortage of housing and lack of financial resources, Ukrainian households frequently include from two to four generations of kin. In many instances, each family member contributes his or her earnings or services to the family resource pool. Sixty-seven percent of the population lives in urban areas, and 33% in rural areas.

CULTURAL CONSTRUCTION OF GENDER

Recognized gender categories include men and women, who are generally assumed to have distinct psychological and personality traits and to possess different capabilities. A widespread notion is that, as a result of their inherently different natures, men and women complete one another and need each other in order to live a full life. This conviction is at least partially based on the tenets of the Russian and Ukrainian Orthodox Churches (historically the state religions), which emphasize men's and women's complementary roles.

Men are valued for their leadership skills, authority, and business sense, while women are valued for their compassion, sensitivity, moral qualities, and caretaking roles. Masculinity and femininity are valued, and this is reflected in customs of dress and personal grooming. Maintaining one's appearance is considered especially important for women. Women often wear make-up and "feminine" clothing such as skirts, dresses, and high-heeled dress shoes and boots.

In the context of nation building in the newly independent Ukraine, women are positioned as the keepers of the home hearth and the protectresses of the nation (Rubchak, 1996, 2001). As the alleged descendants of the mythical pre-Christian goddess of the hearth called Berehynia, women are encouraged to take care of their families first and foremost, and to inculcate a sense of national pride in the next generation of Ukrainians. This duty is often assigned to women in the domestic/private sphere, while men's activities are directed towards the public sphere of business and politics.

These trends towards strict separation of gender roles represent somewhat of a divergence from socialist discourses on men and women. Under socialism, women were guaranteed equal rights to education, work, and political representation. While the Soviet gender contract did provide women with many opportunities for education and career advancement, the continued close association of women with the domestic sphere created for women a "double burden" of official paid work and unpaid domestic labor. This unpaid "second shift" for women continues today, and has been magnified by a revival of traditional gender ideals. Many in Ukraine believe that socialism masculinized women and denied them the chance to realize their femininity. Likewise, it is thought that socialism took away men's agency and resulted in the development of weak men. Contemporary gender ideologies represent a drive to refeminize women and remasculinize men. Feminist discourse is usually met with skepticism, because it is often associated with a dangerous form of westernization, hatred toward men, and a threat to the sanctity of the family (Pavlychko, 2000).

GENDER OVER THE LIFE CYCLE

Commonly recognized stages in the life cycle include infancy and childhood, adolescence, adulthood, and old age. These stages are generally identical for men and women.

Socialization of Boys and Girls

Boys and girls are generally valued equally in Ukrainian society. Socialization as gendered subjects begins early. When babies are brought home from the maternity hospital (usually at 6–10 days of age), they are swaddled in a blanket that is wrapped in a colorful bow—blue for boys, and pink or red for girls (the color red traditionally represents beauty in Ukrainian and other Slav cultures). Caretakers usually include parents, maternal and paternal grandparents, aunts and uncles, older siblings, and sometimes other relatives and neighbors. In a typical family, the primary caretakers of children are the child's mother and grandmother(s).

Play is usually divided along gender lines. Boys are expected to display more aggressiveness than girls, and boys are often socialized to play with toy cars and other machines, and to take an interest in construction and

mechanics. Boys often play "war" games, and soccer and fishing are typical pastimes for boys. Girls are usually expected to play with dolls, to enjoy dancing and music, and to engage in quiet play and work (drawing, reading, sewing, and embroidery). Hopscotch and jump rope are typical pastimes for girls. Girls often play "school" and take up the teacher role, and they engage in singing games. The roles of mother and wife are instilled in girls through playing "house," which is called "girls and mothers" in Ukraine. Girls are taught to cook and perform household chores at an early age.

These gender-role expectations continue in elementary school education, which begins at the age of 6 or 7 when children enter the first grade. Cultural expectations dictate that boys should excel in mathematics, science, and computer studies, while girls are expected to do better in the humanities, especially languages. Girls take classes in home economics, while boys study carpentry and other skills. In most public schools, classrooms are coeducational, but some private schools offer separate classes for boys and girls. Such classes often highlight the expected separate roles for girls and boys. Classes for girls emphasize nurturing skills, creativity, and the importance of human relationships, while classes for boys stress patriotism, morals, leadership skills, and self-confidence (Wanner, 1998).

Puberty and Adolescence

Adolescence is called *iunist'* in Ukrainian. There is continuity in socialization from childhood to adolescence. Domestic skills such as cooking, sewing, laundering, and ironing continue to be emphasized for adolescent girls, while boys usually learn skills relating to machinery, electric work, carpentry, and handyman skills. In rural settings, adolescents of both sexes participate in agriculture and farm labor. These tasks tend to be separated by gender, though practices vary among families and regions. Men and boys usually drive and maintain farm machinery, manage horses, and prepare firewood. Women and girls usually milk cows and goats. Both sexes take part in planting and harvesting. As adolescents grow older, they take on more and more responsibilities in the home and on the farm.

Attainment of Adulthood

Passage from adolescence to adulthood is marked by several major life events. For young men, the most important rite of passage is often mandatory military service, which is required for between 1 and 2 years in Ukraine. The average length of service is around 18 months, and it generally begins around 18 years of age. Upon completion of military service, adolescent boys are regarded as men, and they are perceived as eligible for marriage. Not all young men are obliged to serve in the military; some may be exempted due to health problems, educational commitments, and other reasons. Another rite symbolizing passage from adolescence to adulthood for both young men and women is the issue of a passport at age 16. For some this may signify adulthood. Ukrainian citizens may vote at age 18, also an important marker of maturity. Marriage is another event signifying the attainment of adult status for both sexes. The legal age for consent to marriage in Ukraine is 18 years for men, and 16 years for women. Young women living in rural villages tend to marry between the ages of 16 and 19, while young men in villages usually marry between 20 and 24 years of age. In cities, both men and women tend to marry in their early twenties. Most women and men believe that a woman must have children in order to realize herself. Thus, for women, having a child is often interpreted as a symbol of one's passage into adulthood.

Middle Age and Old Age

Middle age is not marked by any significant events or changes in status. Retirement from one's job and the resulting eligibility for a pension (social security) are often interpreted as the passage into old age. Retirement age is 55 for women and 60 for men. These rites are becoming increasing irrelevant, however, since many elect to work past retirement to make ends meet. In 1999, life expectancy in Ukraine was 73.5 years for women and 62.7 years for men (United Nations Development Programme 2001).

Personality Differences by Gender

Certain personality traits are attributed to men, and others to women. In general, men are thought to be practical, and women emotional. Men are said to act with their heads, and women with their hearts. Men are valued as leaders and thinkers, and women as nurturers. Men are expected to be the main breadwinners and decision-makers in their

families, while women are often assigned a dependent role. All these expectations are stereotypes that often do not describe reality.

Women are perceived as too skittish to drive a car, and most women in Ukraine do not have a driver's license. Nowadays more and more women drive cars, but they are often the butt of sexist jokes about "women drivers."

Gender-role expectations affect spheres of work considered appropriate for men and women (discussed below). Men and women in the same profession are often seen to possess different personality traits. Men and women politicians, for example, are valued for contrasting personality traits. Men politicians are respected for their logic, organizational skills, abilities to lead, and strong will. Women politicians are respected for their honesty, kindness, and sense of responsibility (Sknar, 2001).

Despite stereotypes of women as emotional and dependent, in the context of the post-Soviet economic and social crisis in Ukraine, in many ways women seem to cope better than men. Women exhibit less criminality, drink less, and live longer than men (Bohachevsky-Chomiak, 2000). Women express more interest in stability, and they have made the lion's share of efforts to stop up the gaps of the country's troubled welfare system by organizing charitable organizations to assist dispossessed citizens.

GENDER-RELATED SOCIAL GROUPS

Based on the differential status conferred on men and women, it can be said that Ukrainian society is patriarchal. However, general social structures such as the family are not obviously male oriented or female oriented. Residence patterns vary greatly in Ukraine, which means that there is rarely a predictable difference between the importance of patrilineal or matrilineal kin. The ability to move around the country in terms of permanent residence was strictly limited during the Soviet period through laws requiring official registration at one's residence. It is very common to marry, age, and die in or near one's natal village, town, or city. This means that extended families are an important institution and source of social support, but there is no obvious hierarchy between matrilineal and patrilineal kin. However, since Ukrainian independence in 1991, the population has become much more mobile, and internal migration, migration between Ukraine and the successor states of the former Soviet Union, and

international migration are all common. This means that the nuclear family is becoming more and more separated from extended kin.

For both men and women, the most important nonkin associations are work-place ties, which can be either formal or friendly in nature, and ties with former schoolmates. Since in Ukrainian schools pupils move through all the grades with the same cohort of fellow students, close and lasting friendships are forged between classmates. These friendships cross gender lines. A small number of women are members of women's civic organizations. Other clubs and interest groups tend to include members of both genders.

GENDER ROLES IN ECONOMICS

In Ukraine, spheres of labor are frequently divided along gender lines, a phenomenon rooted both in traditional ideas about men and women's unique capabilities, and in discrimination against women in the context of post-Soviet economic crisis. These trends are also influenced by cultural norms in the area of education. Women are considered to be specially suited for the humanities, especially languages and pedagogy. Science is often viewed as a male sphere, and in institutes and universities the departments of computer science, engineering, and mathematics and physics are dominated by men. It follows that the career choices available to men and women based on their educational backgrounds are oftentimes inherently different.

Men dominate in the spheres of business, mining, construction, and transportation, while women dominate in public health, education, and communications. Despite a situation where women enjoy higher levels of professional and education training than men, women usually occupy less prestigious and less remunerative posts. For example, women dominate in spheres such as secretarial work (81%), healthcare (82%), low-level buying and selling (76.6%), education (75.2%), and culture (70.2%). Only 5% of women in these professions occupy managerial positions (Dovzhenko, 1998). While women make up around 53% of personnel in institutions of higher education, they are very poorly represented in positions of administrative power and decision-making authority (Averianova, 1998).

Ukraine's market economy is still developing. In general, business (which is often associated with criminality)

is not perceived as an appropriate occupation for women, and men dominate in the private business sphere. Women occupy only 21% of administrative posts in small businesses, and just 13% in large businesses (Koval', Mel'nik & Godovanets, 1999). However, there are some marginal niches where women dominate. These are market spheres that are organized around household provision and consumption, tasks that had traditionally been women's responsibilities (Zhurzhenko, 2001). These occupations include street trading and "shuttle trading" (traveling across national borders to buy and sell goods) in neighbouring countries.

The economic crisis in the Ukraine since *perestroika* (Gorbachev's program for economic restructuring, which began in the mid-1980s) has had especially deleterious effects for women's position in the labor market. Whereas in the Soviet Union women constituted 51% of the work force in the late 1980s (du Plessix Gray, 1989), women in contemporary Ukraine make up the majority of the unemployed, around 70%. This is partially because women are seen as burdensome and unreliable employees due to their responsibilities as mothers. Eighty percent of workers who perform jobs that carry no social security benefits are women. Some estimates suggest that, in the total economy, women's salary constitutes only 54% of men's (United Nations Development Programme, 2001). In no sector of the economy do women's earnings exceed those of men, even those such as healthcare where the majority of workers are women.

In the family, women are responsible for carrying out almost all domestic chores. While there are some exceptions to this rule (men may sometimes help), they are very rare. Women cook, wash dishes, launder, mend clothing, tidy the home, shop for foodstuffs, and care for children. These tasks are usually very labor intensive, since most Ukrainians do not own labor-saving devices such as electric kitchen utensils, washing machines, dishwashers, and vacuum cleaners. In the home, men do repairs and other physical tasks such as lifting heavy objects and moving furniture.

Separate work spheres for men and women in the household are adhered to most rigidly in rural settings. In addition to the division of men and women's chores in the home, farming tasks are also divided along gender lines. Many of these divisions are based on the belief that women are better suited for tasks that are less physically demanding but require a great deal of stamina (e.g., hoeing), while men possess the capacity to carry out work that requires short bursts of intense energy (e.g., threshing). Traditional women's tasks include milking, hoeing, berry picking, preparing milk products such as sour cream, butter, and cheese, and whitewashing the home. In the past, harvesting wheat was considered a job for women, but today combine harvesters are used. Men's tasks include plowing with horses, threshing hay, chopping firewood, and butchering farm animals. Both men and women take part in grazing farm animals, planting and harvesting crops, baling hay, building fires, and painting the home.

Legislation provides equal rights for men and women to own and inherit property. Traditionally, in rural areas, the youngest son was expected to care for his aging parents until their deaths. As part of this arrangement, he was often the sole inheritor of his parents' property and land. Today, it is more common for spouses to bequeath inheritance to the surviving spouse, or for parents to divide the inheritance among all their children. Decisions concerning inheritance are carried out on a family-by-family basis. Most families are conscientious about making inheritance arrangements, since if no official arrangements are made property and land will be appropriated by the state. Same-sex partners possess no inheritance rights.

PARENTAL AND OTHER CARETAKER ROLES

The parental role involves nurturing and providing for one's children from birth to adulthood. Owing to the central role that the family plays in one's social environment, bonds between parents and children are often very close. Children tend to live with their parents at least to the attainment of adulthood, and usually into early and even middle adulthood. This is because of the close emotional bonds forged between children and parents, economic difficulties, and a lack of affordable housing. Many young couples reside with one set of parents for many years.

Mothers, and oftentimes grandmothers, are the primary child-rearers. They provide physical care for children: they cook for and feed children, change diapers, and bathe children. A man's most frequent interaction with children is usually through play. Though legislation provides either maternity leave or paternity leave for families, working mothers usually take advantage of these benefits. It is very rare for a man to stay home with his children while their mother works. As a rule, working

women take between 2 and 3 years of partially paid maternity leave to stay home with small children. Those who are unable to leave their jobs temporarily to care for children often seek to leave the child with a relative, usually the child's grandmother. Kindergartens are also an option, but many complain that the quality of public childcare facilities has declined sharply since the dissolution of the Soviet Union. Private childcare arrangements are prohibitively expensive for most.

Other child rearing responsibilities such as disciplining, supervising/enhancing education (i.e., checking homework assignments), and dressing children for school are carried out by both mothers/grandmothers and fathers. The assignment of these tasks depends on the specific circumstances of each family and each caretaker's interests, special capabilities, and childcare philosophies.

LEADERSHIP IN PUBLIC ARENAS

While both women and men may run for political office, men dominate in positions of political power. In the Soviet Union, quotas were enforced to ensure women's political representation—50% of representatives in local Soviets (councils) were women, and 30% of deputies in the Supreme Soviet of the Ukrainian Soviet Socialist Republic were women. In contrast, in the 2002 parliamentary election only 5.1% of deputies elected to the Verkhovna Rada were women (23 of 450 deputies). Women are also very poorly represented in regional politics. With some notable exceptions such as Yulia Tymoshenko—a deputy in parliament, leader of the political party Batkivshchyna (Motherland), and former deputy prime minister in charge of the oil and gas sector—few women elected to political office occupy positions of real power. While men dominate in the sphere of official politics, women occupy the majority of leadership roles in nongovernmental organizations. While this can afford women some political influence, in general the nongovernmental sphere is less prestigious and less remunerative.

GENDER AND RELIGION

Under Soviet rule, religious observance was outlawed in Ukraine. Today, people in Ukraine are followers of a number of different religions. The major religion is Orthodoxy. Forty-three percent of Ukrainians are followers of the Ukrainian Orthodox Church (which includes a Moscow and Kyivan Patriarchate) and the Ukrainian Autocephalous Orthodox Church, and 9% are followers of the Ukrainian Greek Catholic Church and the Roman Catholic Church. Other major religions include Judaism, Protestantism (Baptists, Pentecostals, Jehovah's Witnesses, and others), and Islam. While 69% of people in Ukraine say they are "believers," only about 17% regularly attend religious services (Panina and Golovakha, 2001).

In Ukraine, women make up the majority of Orthodox believers and avid churchgoers. While there were women deaconesses in the early church, church law prohibits women deaconesses today. Although women carry out the majority of service roles in the Orthodox Church as *mirianki* (laywomen), such as helping out around the church building, and visiting and caring for the sick, they are not allowed to enter the priesthood. There are female saints, the most notable being St. Olga (the grandmother of St. Volodymyr, who accepted Christianity as the official religion of the territory known as Rus' in 988), St. Barbara, and St. Nina. For both Orthodox and Catholic believers, the Madonna is an important symbol of womanhood, motherhood, and the feminine origins of humankind. Gendered orders in the Orthodox and Catholic Churches in Ukraine include monks and nuns, who live in separate monasteries.

LEISURE, RECREATION, AND THE ARTS

The major leisure activities for men and women include watching television, visiting friends, receiving guests in the home, listening to music, reading, and gardening. Other leisure activities include sports, handicrafts, table games (cards, chess, checkers, dominoes), and computer games. Men read newspapers and watch more television than women, who spend more leisure time with children. Other popular leisure activities for women include embroidery and sewing. Men often enjoy fishing and similar activities. Both men and women like to gather mushrooms and berries. Few people are members of special interest clubs and organizations—only 7.8% of the population (Sydorenko, 2000). Many in Ukraine enjoy attending concerts and theatrical performances.

Most people in Ukraine have little leisure time, and a majority report that they have less and less free time as the years go by (Panina and Golovakha, 2001). Women have significantly less free time than men. It is not

uncommon for women in Ukraine to work 40 hours per week at their official jobs, and 30 or more hours per week carrying out domestic chores. Men also usually work 40 hours per week, but spend much less time working at home.

RELATIVE STATUS OF MEN AND WOMEN

As noted above, men enjoy privileged status in the public arena. In the family, however, the relative status of men and women is shifting and ambiguous. Historically, women in Ukraine have wielded considerable decision-making power in families, especially in rural contexts. Another factor that has enhanced women's authority in the family was the loss of millions of men during World War II. Women today point out that they learned how to be women (and the heads of families) from their mothers, many of whom were widowed during the war.

SEXUALITY

In general, men and women perceive sexual relations as natural and healthy. However, talking about sex in intimate settings is generally taboo, and most parents do not discuss sexuality with their children. Sex education is very rare in schools. Youths learn about sex primarily from their peers, and premarital sex is common. Paradoxically, despite these prudish attitudes towards talking about sex, pornographic images of women abound in public spaces such as newspaper kiosks, the dashboards of taxis, and even on plastic shopping bags (Sperling, 2000).

The age of consent for sexual relations (heterosexual and homosexual) is 16 for both men and women. The problems, and indeed the very existence, of gays, lesbians, and bisexuals in Ukrainian society are largely ignored. There are no legislative acts protecting these groups from discrimination, although a few civic organizations are drawing attention to their concerns. Same-sex couples are not mentioned in Ukrainian legislation, and they possess no legal rights. Transgendered persons possess no legal rights, but they may legally change their documented sex and undergo a sex-change operation.

Modesty is expected of women as they get older, but teenage girls and young women are often valued for their pleasing appearance. For teen girls and young women, wearing revealing clothing is usually not criticized and is often expected. In rural settings, married women are traditionally expected to keep their hair covered with a scarf, a practice that is quickly going out of fashion. Certain religious groups require modest dress of women adherents, most notably Baptists, who often prohibit women from wearing trousers, skirts above the knee, jewelry, or make-up.

COURTSHIP AND MARRIAGE

Owing to financial hardship, the marriage rate in Ukraine continues to fall, and is currently at its lowest since the end of World War II. The divorce rate is high—in 2000, 5.5% of the population registered marriages while 4% registered divorces (Dovzhenko, Nour, & Iaremenko, 2002). Men and women make their own decisions about whom and when to marry. A range of considerations go into a couple's marriage decision, the most important being mutual feelings of love and attraction, and economic considerations. While love probably remains the major basis for courtship and marriage, the possibility of improving one's economic position through the marriage union is also a factor, especially for women. There is no legal marriage for same-sex couples.

Traditionally in Ukraine, men take the initiative in courtship and in proposing marriage. Marriage is usually preceded by a period of dating, and premarital sex is common. During the Soviet era, marriages were carried out almost exclusively in state institutions know as the ZAGS (Registration of Acts of Civic Status), where births, divorces, and deaths are also registered. Today, church weddings are becoming fashionable, and are usually an addition to the official marriage registration at the ZAGS, which is required by law.

In cities, weddings are usually celebrated with family and friends in a private apartment or a restaurant. There is feasting, drinking and toasting, and music and dancing. Village weddings are also celebrated with family and friends. They usually take place in the natal home of either the bride or groom, and they may last for up to 3 days. There is also copious feasting, drinking, and dancing. Traditional Ukrainian wedding customs were repressed during the Soviet period, and they are not very prevalent today. Wedding customs vary with region—some regions boast more "traditional" weddings than others. One custom

sometimes practiced is the mock kidnapping of the bride. The kidnapping is undertaken by different groups of men (i.e., the bridesmaids' boyfriends), depending on regional custom. Preparations for the wedding are strictly divided along gender lines—men are expected to build the wedding hut/tent and prepare the homemade vodka, while women make all the food preparations and serve the food.

Deaths are marked with feasting and family gatherings at 9 days, 40 days, and a year after the person's death. It is customary for a widow or widower to wait at least a year after the death of their spouse before remarrying.

HUSBAND–WIFE RELATIONSHIP

Husband–wife relationships vary from couple to couple. Husbands and wives generally eat together, sleep together, and spend some free time together. As mentioned above, it is often assumed that men are the major decision-makers in families, but in practice this responsibility varies between couples, and decisions are often made jointly or by women.

Divorce is freely available and may be initiated by either the husband or the wife. Among some religious groups, such as Baptists, divorce is highly stigmatized. Either parent may receive custody of children resulting from the marriage, but custody is usually granted to the mother.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Recent years have seen a revival of a matriarchal myth based on the pagan goddess of the hearth Berehynia. Yet the historical record shows an ambivalent picture of male–female relations in Ukrainian history. While Ukrainian society is usually characterized as patriarchal, there is some evidence that women have exercised a significant amount of control over their lives. During the 17th century, for example, the traveling Frenchman de Beauplan was surprised to find that Ukrainian women enjoyed great sexual freedom. Premarital sex was not taboo, and did not negatively impact a woman's marriageability (Le Vasseur & de Beauplan, 1660/1993; cited in Rubchak, 2001). In fact, in some regions of Ukraine, premarital sex was considered an absolute precursor to marriage (Denysiuk, 1993; Vovk, 1995; cited in Rubchak, 2001). Nineteenth century marriage customs described

by Rubchak (2001) also indicate that Ukrainian women commanded considerable respect as brides and spouses.

During the Soviet period (1917–91 in central and east Ukraine, and 1939–91 in west Ukraine), an image of the Soviet superwoman (Rubchak, 2001) was promoted. Women's emancipation was a primary goal of the Bolshevik revolutionaries, and women throughout the Soviet Union were given opportunities for education and career advancement. The gender-specific allocation of domestic responsibilities was hardly questioned, however, and women were expected to be full-time workers, mothers, and housekeepers. In contrast, men's roles were seen to lie squarely in the public sphere. In many ways, post-socialism has seen a return to the traditional myth of the Ukrainian matriarch, and women are encouraged to carry out their womanly duties in the home as "hearth mothers" (Rubchak, 2001). However, this is only a pipedream for many, since socioeconomic crisis makes stay-at-home mothering an option few can afford.

There is some evidence that men and women are beginning to renegotiate their respective roles in families, especially in young families where the wife is the primary breadwinner. Some husbands are taking on domestic chores and childcare, and family structures may be becoming more egalitarian (Averianova, 1998).

Uzbeks

Marianne Ruth Kamp and Audrey C. Shalinsky

ALTERNATIVE NAMES

Uzbeks are also known as Özbeg, O'zbek, and Uzbak.

LOCATION

Uzbeks are located in Central Asia, primarily Uzbekistan, Tajikistan, Kyrgyzstan, Kazakhstan, and Turkmenistan, but also in northern Afghanistan and northwest China (Xinjiang province). Central Asia is a land of high mountains, river valleys, and deserts. Uzbekistan's irrigated farmlands produce cotton, wheat, and an abundance of fruit. In the northeast, the fertile Ferghana valley is Uzbekistan's most densely populated region, while in the northwest, the Qizilkum desert is sparsely inhabited and suitable only for camel grazing. Uzbekistan's capital, Tashkent, is the largest city in Central Asia, with 2.5 million people. The ancient Silk Road cities of Samarkand and Bukhara are home to quintessential examples of Islamic architecture.

CULTURAL OVERVIEW

The ethnonym "Uzbek" refers mainly to Central Asians who were traditionally sedentary, Muslim, and speakers of a Turkic language. After the 15th century, nomadic Uzbeks became the dominant political force in the Silk Road oasis cities of Khiva, Bukhara, Samarkand, Tashkent, Kokand, Hojand, Termez, and Mazar-i-Sharif. In the mid-19th century, emirates and khanates led by Uzbeks had their centers of power and government in Bukhara, Kokand, and Khiva. As Russian, British, and Chinese conquest divided Central Asia, new political entities were created. So-called Afghan Turkistan came more fully under the control of Kabul, while Russia conquered the Central Asian khanates. Kokand became part of a Russian imperial territory named Turkistan, while Bukhara and Khiva became Russian protectorates with sovereignty only in internal affairs.

In 1917, the Russian Revolution raised the possibility of independence for Central Asia, but instead the Bolshevik government reframed the Russian Empire as a union of socialist republics. In 1924 the Soviet government drew borders that were ostensibly related to ethnic group boundaries, thus defining Uzbekistan, as well as the other Central Asian republics. Until 1991, when the Soviet Union dissolved and the Central Asian republics became independent, their social, political, and economic forms were shaped by the USSR's modernizing socialist plans. During the 1920s and 1930s, many Uzbeks emigrated from Soviet Central Asia to Afghanistan in order to escape the Soviet government's repression of religion and enterprise. Uzbeks in Afghanistan generally maintained a distinction between these emigrants and "tribal," primarily rural, Uzbeks who were already a significant population in northern Afghanistan.

Before the socialist period, Uzbeks were urban traders, rural agriculturalists, and herders. During the Soviet period, the state reorganized agriculture, forcing Uzbeks to turn over land and animals to collective farms. The state transformed urban economies, introducing large-scale manufacturing of farm machinery and textiles, suppressing private enterprise, and controlling wholesale trade. Petty trade continued and the bazaar thrived, providing an alternative to the inadequate state supply of food and personal goods. In the post-independence state of Uzbekistan, socialist forms are still dominant in the agricultural sector. The majority of Uzbekistan's population lives in villages and earns a living through agriculture-related activities, especially cotton production. Governmental changes and civil war, beginning in 1978, have disrupted the economy of Uzbeks in Afghanistan. Prior to that period, Afghan Uzbeks followed traditional occupations in the commercial sector, agriculture, and herding.

In rural areas and *mahallas*, traditional urban neighborhoods, the ideal Uzbek home consists of several buildings built of wood, brick, and adobe by local labor, opening toward a courtyard surrounded by high walls. The courtyard is a garden with fruit trees, flowers, and a platform for outdoor eating. Living in the courtyard

house are several generations, including grandparents, one or more of their married children, and grandchildren. Urban residential areas built in the Soviet period were dominated by apartment buildings, usually accommodating nuclear families.

Uzbeks are Sunni Muslims. Islamic education and institutions were strong among Uzbeks until the Soviet regime repressed public religious activity, and remain significant among Uzbeks of Afghanistan. The degree of gender segregation varies by family and region, and may or may not be discursively associated with Islam.

In all the Central Asian states, populations are multi-ethnic. Rural villages may have only one ethnic group, but larger towns and cities are mixed. Uzbeks educated during the Soviet period, especially those with higher education or army service, speak Russian, and some are more comfortable with that language and Soviet cultural forms than they are with Uzbek language and culture. Post-1991 policies have promoted Uzbek as the primary language of education and communication, although Russian remains significant for international, intercultural, and academic communication.

CULTURAL CONSTRUCTION OF GENDER

Gender in Uzbekistan is binary: boy/man, and girl/woman. Gender categories relate to physical appearance, social roles, socialization patterns, and life expectations. Dress follows contemporary international styles or may be "Uzbek"—for women a loose dress with wide pants, and for men loose pants, tunic, and robe—but in either case, choices in color and style are suited to local genderized norms. Girls' ears are pierced in infancy, and throughout life gold earrings are preferred. Numerous features are associated with attractiveness for men and women, including thick black hair, almond-shaped eyes, and dark eyebrows. Eyebrows are such an important feature for women that they use a cosmetic, *usma*, reputed to make them grow. Little girls, especially in rural settings, often have a line of *usma* applied across their eyebrows. Traditional poetry exalts the moon-faced beauty, with light skin, dark eyes, round face, and eyebrows arched like a bow. Weight and body type are less important than facial beauty.

Overt expression of nonheterosexual preferences is rare among Uzbeks; Soviet policies suppressed homosexuality, ending a long, if Islamically disapproved, tradition of the dancing boy or *bachcha*. Touching and holding hands with friends of one's own sex in public is common among women and men, and is not an indication of sexual orientation.

GENDER OVER THE LIFE CYCLE

Gender differences are denoted early in life. The *chaqaloq*, or nursing baby, is not referred to in gendered language, but by the time a child can walk, terms specify gender. Children collectively are *bolalar*, a Turkic term, or *farzandlar*, a Persian term, but these can denote only male children. More precise terms combine the term for son or daughter with the word for child: *o'g'il bola*, "boy child," or *qiz bola*, "girl child." *Qiz* means daughter, girl, or virgin, and is used until a female is married. The girl who grows older without marrying is referred to as *qari qiz*, "old maiden." *O'g'il*, "son or boy," is used from the age of walking until puberty. An adolescent male may be called *yigit*, an ancient Turkic term for a male warrior.

Marriage changes gender terminology. When a female is engaged and is first married, she is called *kelin*, "bride or daughter-in-law." After she has children, she is referred to as *xotin*, "wife or woman." Rarely, women generically are referred to as *ayollar*, connoting female and adult without reference to marital status or children. However, *xotin-qizlar*, "married women and girls," is a more traditional way to refer to all females together. The transition from *qiz* to *kelin* to *xotin* is one of increasing social respect.

Men are also expected to marry. A young man who does so is *kuyov*, "groom or son-in-law." As he grows older and has children, he becomes *er*, "husband or man." Men can be referred to collectively as *erkaklar*, connoting male and adult, which corresponds to *ayol* as a term indicating biological sex.

The elderly can be referred to collectively as *keksalar*. The term *kampir* means elderly woman, while *qari* can mean either elderly person or elderly man. A joining of the terms, *qari-kampir*, means an old married couple. An old married man may refer to *kampirim*, "my elderly wife." Married women of all ages routinely call their husbands, *xo'jayinim*, "my husband," but this term for husband also means owner. Some male terms also have collective use, such as *odamlar*, meaning either people or men. An individual can be referred to in gender-free language, such as *inson* or *kishi*, both meaning "person."

Socialization of Boys and Girls

A child's birth may be celebrated with a *beshik toi*, or cradle celebration, when at 40 days, the baby is first placed in a cradle. Another feast marks the transition from infancy to toddler, and the family watches as a symbolic lump of dough is rolled between the legs of the child who has just learned to walk. At this point, girls and boys are dressed differently and referred to in gendered terms. In Uzbekistan, both boys and girls begin to attend school at age 6 or 7. At age 6, both boys and girls traditionally were thought of as becoming responsible for their own actions, able to sin, and liable to punishment for their actions. Boys undergo circumcision when their age is an odd number (3, 5, 7, 9), but although this is an important moment, it is not seen as a transition between one stage of life and another. The boy is still a boy until he reaches biological adolescence.

If possible, parents hold a circumcision *toi*, "feast," for male friends, kin, and neighbors. The boy's father and male relatives prepare *pilov*, a rice and lamb dish, outdoors, and guests arrive at dawn. The boy is dressed in a gold-embroidered robe and cap, and may be brought to the feast on a festively attired horse. At the feast the Qur'an is recited by an imam or a respected elder, and male musicians play traditional music. Women do not join this feast, but they host their women relatives indoors, with dancing and feasting. Guests present gifts of money to the boy, often tucking them under his pillow after he has had his foreskin cut and is in bed recovering. Girls are not circumcised.

Boys and girls are expected to be obedient and obey their elders, both adults and older siblings. Girls are taught to clean, and by age 10 may start the morning by sprinkling water and sweeping the courtyard and its entrance. Boys and girls help with gardening and fruit picking, and are pressed into work for the cotton harvest. In families that carry out bazaar trade, boys may begin working in childhood, carrying produce, pushing carts, or cooking. Until the 1930s, when the Soviets introduced universal coeducation at the primary level, restrictions on interaction of boys and girls beyond puberty were strict; girls began to veil and were not allowed out of the house unchaperoned.

Puberty and Adolescence

In some Uzbek communities, the onset of menarche was marked by a celebration that included giving the girl a veil, the *paranji* and *chachvon*, a large robe that is worn draped from the head, and a horsehair veil that falls from the top of the head, covering the face and chest. However, some Uzbek girls were veiled before menarche, and others did not veil. This rite of passage disappeared in Soviet Uzbekistan with the end of traditional veiling and the transfer of ideas concerning age to correspond with school cohorts. The transition from boy to young man, *yigit*, can be associated with graduation from middle school and entrance into the army, or into some form of higher education.

As mixed education became normal, strictures on interaction relaxed for teenagers. However, dating or spending time alone with a member of the opposite sex between puberty and engagement is unacceptable.

Adolescent girls demonstrate baking skills by bringing dishes to gatherings. Adolescent boys do not face the same expectations regarding domestic activities, but because men prepare certain dishes, such as *pilov*, for male celebrations, adolescent boys often learn to cook. In adolescence, both boys and girls begin to enter patterns of socializing that will last a lifetime. Girls attend women's gatherings, and boys accompany their fathers to men's.

Middle Age and Old Age

Age brings an increase in power for both men and women. Married couples usually live with the husband's parents, or in housing arranged by his parents. In a courtyard house, daughters-in-law are usually subject to their mother-in-law's demands. While a married couple continue to live with the husband's parents, those parents exercise extensive control over their children and grandchildren. Children are taught to defer to elders; grown children are expected to conform to their parents' wishes and seek their advice in major decisions.

At major life cycle feasts, as well as on religious holidays, men and women all go to the same house, but usually are seated separately, when possible in entirely separate rooms. There are occasions that only men celebrate, such as the groom's party before a wedding. Women alone celebrate the viewing of recently married brides during Ruza Hayit, the feast following Ramadan. Before the Soviet period socializing was so separate that women were entertained by women dancers and musicians, and men by male musicians and by boy dancers, *bachcha*, who dressed up like girls.

Men and women attend religious gatherings more frequently as they age. At a memorial gathering at the Festival of the Sacrifice for someone who died in the past 3 years, women participants usually meet indoors, while the men meet in the courtyard. Among the women, the eldest is seated in the place of honor, with her back to the wall and facing the entrance door, with all others seated in order of age, down to the least respected position, whose occupant has her back to the entrance door. Women recite prayers and scripture, again beginning with the eldest, although a woman who has extensive knowledge of the Qur'an, usually an *otin*, may be the main reciter. The men's gathering is similar.

Personality Differences by Gender

Ideally, women are supposed to be kind, nurturing, and submissive to men and elders, while men should be heroic, but still obedient to elders. However, formal studies of gender and personality have not been published.

Gender-Related Social Groups

Certain social institutions, such as *mahalla* committees, are structured around men. The *mahalla* or neighborhood became a unit of local government during the Soviet period and has increased its functions since independence. The *mahalla* committee is made up of respected, usually elderly, neighborhood men led by a "white-beard," *oqsoqol* or *muisafid*. The committee makes decisions concerning housing, welfare, and the provision of some social services in the neighborhood. Occasionally *mahalla* committees include women; more often women are consulted in some decisions.

The neighborhood itself is a social institution, with participation in various activities, from local clean-up to life cycle events, expected from those who live there. When a wedding takes place, the *mahalla* committee provides tables, chairs, and dishes for the feast. Each family should send at least one representative to a neighborhood wedding with men more obligated in this regard than women. Failure to participate diminishes respect and status.

Most marriages are virilocal. Newlyweds live with the husband's parents in either a courtyard house or an apartment. If parents do not have space for a son's family

in their home, they are expected to purchase other housing for the couple as their contribution to the expenses of marriage, while the bride's parents may pay for interior furnishings. Marriage to someone from one's village or city is preferred; brides usually maintain substantial contact with their families after marriage.

Both men and women belong to a particular social circle of peers. Girls often form friendship circles with cousins and schoolmates. Boys form similar groups. Often these groups of female friends, *dugona*, or male friends, *jura*, last into adulthood. Adults in such groups hold a monthly gathering for conversation, *gap*. The *gap* gathering fulfills numerous social functions; some use it for religious instruction, most for feasting, and many for investment. *Gap* members contribute money to their host, and each member hosts in succession. Members use this money for business purposes, dowry, or other personal expenses.

Gender Roles in Economics

Gender roles in the economy changed during the Soviet period and continue to change in independence. One constant is the division of labor in the home. Women are responsible for cooking, cleaning, taking care of small children, and seeing to clothing. Men take most responsibility for gardening and personal livestock, home repairs, heavy-item shopping, and the family automobile. During the Soviet period, the state promoted labor-force participation for men and women, but women participated less than men, and families expected to rely on the men's income except where men were absent. Gender preferences for occupations arose with the Soviet economy: women entered education, medicine, and textile work more frequently than men; men dominated engineering, politics, and technical professions.

The majority of Uzbeks continue to be rural people who make their primary living from farming. On the collective farm, men dominated technical and management work; women might specialize in the care of small animals, but most often were unskilled farm laborers. Since independence, women and men have been seeking new ways to make a living or at least supplement the meager wages from their official employment. Petty trade and the bazaar dominate commerce in Uzbekistan. Men, women, and sometimes children participate in producing goods for the market and selling them. Women as well as men

are involved in long-distance journeys to obtain goods to market, though there is social disapproval of women who travel alone.

Sons and daughters inherit property from their parents, with sons more likely to receive immovable property, the courtyard house, and daughters to receive movable property, jewelry, or furnishings. Among Uzbeks, the youngest son in the family is expected to remain with his parents after marriage, care for them until their death, and inherit their house; older sons move out and establish their own households, and daughters move away upon marriage. If the parents have purchased housing for the elder sons who moved out, and provided a substantial dowry for daughters upon marriage, those distributions of family wealth are seen as equal to the youngest son's inheritance of the family home.

PARENTAL AND OTHER CARETAKER ROLES

Because most Uzbeks live in extended family situations for at least part of the life cycle, children may have several caretakers. Uzbekistan's laws concerning maternity leave assume that mothers are the primary caretakers of their children, up to age 3. Grandmothers play a large role in raising children, especially when mothers work outside the home. Many mothers choose to stay home and be their children's primary caretaker but society does not disapprove of mothers who work, and good daycare is seen as beneficial to children's learning and socialization. Uzbek society regards as good a father who spends considerable time with his children, carries them in his arms, and provides for them. Aunts and uncles who live in the family home play large roles in caring for small children, as do older siblings. Adult children generally become caretakers for elderly parents and other elderly relatives who have no living children.

LEADERSHIP IN PUBLIC ARENAS

From the 1920s until 1991 the Soviet government sought to ensure that women would be included in government, with some filling prominent positions, and the independent government of Uzbekistan has continued this practice. Thus, while men occupy most positions in local, regional, and statewide government, a small percentage of farm,

mahalla, and district leaders are women. The parliament typically has 5–15% women members. There is a vice-president for women's affairs, and several cabinet members are women. Women often become leaders in professions that they dominate, such as medicine and education, but male leadership is expected in most areas of public life.

GENDER AND RELIGION

Regular participation in prayers at the mosque became rare during the Soviet period because of the state's hostility to religious practice. Since independence, many mosques have opened, making spaces for public prayer easily accessible. While men of all ages attend occasionally, retired men are the most likely to participate in all five daily prayers. Men and women usually retire in their fifties or sixties, and then they are expected to have time to undertake the daily prayers and other forms of religious devotion. Some mosques have separate women's rooms, but women's attendance at the mosque, even for Friday prayer, is unusual.

Owing to the attrition of religious knowledge in the Soviet period, children are initially taught prayers and bits of the Qur'an by the family member who has the most knowledge, usually a grandparent. If parents decide to provide formal religious training for their children, boys are sent to a mullah, a male religious leader associated with the neighborhood mosque, while girls are sent to an *otin*, a female religious teacher. Higher religious education in a *madrassa*, or college of Islamic learning, is available to men, and only men assume leadership in mosques. The mullah and the *otin* both play significant roles in community religious life, reciting the Qur'an, prayers, and religious texts at single-sex gatherings for life cycle events.

Strong commitment to religious observance continued in Afghanistan throughout the twentieth century. Uzbek men participated in Islamist and traditional opposition groups involved in the conflict against the Afghanistan government and its Soviet supporters. Generally, women became part of the refugee population while their menfolk participated in the Afghanistan war.

LEISURE, RECREATION, AND THE ARTS

Typical leisure activities for Uzbeks include walking in parks, attending concerts of popular and traditional music and dance, watching television, and feasting with friends

and relatives. Young urban Uzbeks also go to clubs and dance, though many Uzbek families see this as improper for unmarried girls. Young men play soccer (football) and basketball and attend games; in rural areas they may also participate in *buzkashi*, a horse-mounted chase. Many young women play volleyball, and some do martial arts. It is far more common for men than for women to pursue sport. In the arts, women and men thrive in music; popular music videos feature men and women as singers and dancers. Uzbekistan's film industry declined with the end of the Soviet Union, but state-supported television provides work for many performers and journalists, both men and women. Television shows demonstrating proper manners are frequently shown, as are dubbed foreign soap operas. Thus television becomes a transmitter for contradictory values; Uzbek women, in particular, are instructed to adhere to Uzbek norms of social and sexual conduct, while foreign soap operas and music videos show men and women with little sexual inhibition.

Relative Status of Men and Women

In Soviet theory, work and social opportunities are open to both men and women, and men and women are equal in law. In practice, social restrictions are placed on women that are not placed on men. A divorced woman is denigrated and suspected of sexual improprieties; divorced men do not face the same condemnation. Families with limited resources put more money into a son's education than into a daughter's. In rural communities, sons may move away for higher education; daughters are rarely allowed to live away from home before marriage. Legally, polygyny is not permitted; it is not uncommon in practice. Women are expected to defer to the decisions of father or husband.

Uzbekistan's army filled its ranks through conscription of young men, though wealthier families found ways to keep their sons from going; in 2003, Uzbekistan moved toward a volunteer army. The army takes rural young men, giving them opportunities to see the country, gain skills, make contacts, and have healthcare unavailable to their sisters. Men are respected for their achievements; a woman's personal conduct can destroy her reputation no matter how successful she is. Honor is located in the sexual propriety of women and girls. Those girls or women who bring shame to the family by having, or appearing to

have, sex outside marriage face various consequences, including rapidly arranged forced marriage, expulsion from the community, or daily harassment. Men who engage in sex outside marriage may become the subject of gossip, but face none of these consequences.

Sexuality

Sexuality among Uzbeks is not something to be flaunted. Society expects girls to remain virgins until marriage, and wives to remain faithful to their husbands. Society does not expect men to remain virgins until marriage, and does not demand that husbands remain faithful to their wives. Sexuality is seen as a powerful force, and early marriage is encouraged as a way to contain sexuality. Women usually marry between 17 and 21; a single 22-year-old girl may be seen as an "old maid." Men are usually between 19 and 25 when they marry.

In Uzbekistan, many communities encourage sexual modesty through appropriate dress for girls and women, who typically wear a loose long-sleeved dress, loose pants, and a scarf. More complete Islamic modest dress, with fuller head and face covering, is occasionally seen. In towns and cities, women often wear contemporary international fashion. Men usually wear contemporary international clothing, often with an Uzbek men's robe and cap; wearing shorts or an undershirt in public is discouraged.

Cross-dressing can be seen in humorous stage performance, but not in daily life. Male and female homosexuality is discouraged through social convention, but does not incur legal penalties in Uzbekistan.

Courtship and Marriage

Among Uzbeks, many marriages are arranged. Most marriages take place after an engagement of about 6 weeks. Some urban couples date, but generally dating is viewed as a dangerous precursor to illicit sex. Nonetheless, many Uzbeks do choose their own mates. Couples become acquainted through school, community, or work. If a man decides that he is interested in a prospective partner, he asks his family to send a *sovchi* to her family to ask her parents permission to marry their daughter. *Sovchi*—matchmaker or marriage arranger—is a role that can be played by any adult relative or friend, but is frequently the groom's aunt. His mother and aunt visit the potential

bride's mother, whose daughter is expected to demonstrate her manners by serving the guests tea in elegant style. If the girl's mother thinks the match is desirable, she brings the matter to the girl's father, who decides whether to proceed and enters negotiation with men of the groom's family.

The girl herself is given the opportunity to declare her interest or opposition; girls are not generally forced into marriage against their will unless the family faces some difficulty or the girl has "dishonored" them by entering a sexual relationship. Families learn what they can about each other before agreeing to a match. Sometimes, marriage plans are initiated not by the interested couple, but by parents who decide that it is time for their offspring to marry. Parents of an unmarried son may seek out potential brides by sending a *sovchi* to a number of families until they have a favorable response, and couples may marry without having met at all.

Marriage ceremonies and festivities are numerous. Couples generally have both a civil registration ceremony and an Islamic marriage ceremony; both of these are small, including only immediate family members. Preceding these, separate single-sex celebrations, *toi*, take place for the groom and for the bride. The marriage celebration, if it takes place in a courtyard home, brings guests from the families and the neighborhood to a feast with music and dancing. After the entertainment has begun, the groom, wearing a decorative robe, enters the courtyard in a procession of friends and musicians with drums and horns. The bride, veiled in a robe, is brought out before the guests and the groom, and her veil is removed. After the party ends and guests leave, the bridal couple retire to a room in the courtyard house. One of the bride's female relatives plays the role of *yanga*, making sure that the marriage is consummated. In many families, evidence of the bride's virginity, blood on a sheet, is demanded; in some places the sheet is tucked into the bride's boot and taken to the parents, while in others it is displayed in the courtyard. Lack of proof of virginity can lead to family dispute and rapid divorce. Following the marriage are more festivities, including a gathering of women for the display of the bride's trousseau, and a *kelin salom*—a bridal greeting, in which the bride bows to all her new in-laws while women musicians sing.

HUSBAND–WIFE RELATIONSHIP

Two ideologies of marriage are present among Uzbeks: companionate marriage for love, a relatively newer value, and propagational marriage for building family and community through children. The two do not necessarily conflict, but ideas about the husband–wife relationship vary. Some couples regard each other as close companions and choose to spend time together. In other cases, spouses see each other primarily as the parent of their children, while their most important relationships are with relatives or friends of their own sex. Failure to produce children is generally blamed on women, and can lead to divorce. In Uzbekistan men and women can initiate divorce through the state legal system, but divorce meets with heavy social disapproval and sometimes faces obstruction by local officials.

Men may choose polygynous unions, while the woman or girl involved is pressured into the marriage, although occasionally women willingly enter such marriages. Cowives often live in separate residences. A second or third marriage is not legally recognized by the state in Uzbekistan; it is a *nikoh*, contract or Islamic marriage performed by a mullah. Divorce from a polygynous marriage is also not recognized by the state, and legal protections do not apply.

OTHER CROSS-SEX RELATIONSHIPS

Sibling relationships remain significant throughout life; for example, in case of marital problems, a woman may bring her brothers or uncles to negotiate on her behalf. Sons are taught to defend their mother's interests. Men and women socialize mainly among their own sex, but cross-sex friendships and associations based on kinship, neighborhood, or profession may be important for social and business purposes.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Attitudes, beliefs, and practices regarding gender changed somewhat in the Soviet period as laws and possibilities changed. The government still plays an important role in shaping gender possibilities, as does an Islamic renewal and an ongoing public discussion of Uzbek "tradition." Before the 1917 revolution Uzbeks did not have public spaces or roles for women. In the Soviet period, mandatory free public education for all children made new social and work roles possible, and, for most

families, the idea that girls and boys should be educated became normal, as did the idea that both women and men would work outside the home. While laws discouraged discrimination, the idea that men and women are fundamentally different and should fill different roles in the family and society remained. The framing of difference often establishes women as dependent and less competent than men.

Modernizing policies of the Afghanistan government began to impact Uzbeks there after World War II. Educational opportunities increased for Uzbek men and women, however, women were rarely allowed to pursue university level training. In many cases, Uzbeks in Afghanistan retained traditional norms and customs that have been abandoned in Uzbekistan.

Waorani

Pamela I. Erickson

ALTERNATIVE NAMES

The Waorani are also known as the Huaorani, Wao, Waodani, and Aucas. The subgroups are called Baiwaidi, Geketaidi, Piyemoidi, Tagæidi, Tadominani, and Wepeidi.

LOCATION

The Waorani are located in the eastern lowland tropical forests of Ecuador between the rivers Napo and Curaray.

CULTURAL OVERVIEW

The Waorani are an interfluvial group of lowland tropical rainforest forager/horticulturalists speaking a language, Wao tededo, which is unrelated to any other. Their traditional homeland lies south of the Napo, where the Amazon Basin touches the foothills of the Andes, and may have been a Pleistocene refuge area. When the first Waorani groups were peacefully contacted in 1958, the total population did not exceed 500. These people were the only human inhabitants of an area of about 20,000 km^2, living at a population density of around 0.025 person/km^2. Subsistence was based on manioc slash-and-rot horticulture, with plantain, peach palm (*chonta*), and peanut as important secondary crops. Meat came mainly from blowgun and spear hunting, with peccaries, woolly monkeys, and toucans among the most common game animals. Fishing was a minor activity. *Tepæ*, a *chicha* made from cooked, premasticated manioc left to ferment slightly then mixed with water, was a staple food. Medical examination showed that, before infectious diseases arrived, the Waorani were well nourished and very healthy (Larrick, Yost, Kaplan, King, & Mayall, 1979). Today, subsistence remains much the same, but there is increased reliance on fishing and on staple products bought or traded from the outside such as rice, sugar, salt, and cooking oil. Bread, candy, cookies, and carbonated beverages are much appreciated and are usually brought as treats by Waorani returning from the outside. Men continue to hunt with blowguns, but shotguns have become a welcome addition to the hunting strategy.

The precontact Waorani lived in four geographically separated mutually hostile groups (the Baiwaidi, Geketaidi, Piyemoidi, and Wepeidi—named after prominent elders). These groups inhabited dispersed "neighborhood clusters" of communal houses, usually separated from each other by a walk of 30 minutes to an hour. It was customary for each communal household to maintain two or three different houses and associated gardens, and to move among them every few months. The distance between one neighborhood cluster and another was usually a matter of a walk of a day or two. The distance between neighborhood clusters of hostile groups was ideally maintained at several days walk. The Waorani referred to all non-Waorani as *kowodi* (outsiders), and precontact relationships with *kowodi* were always hostile, although occasionally *kowodi* women were captured as wives. Today, the estimated 1,500 Waorani now living are spread among some 23 small villages, the great majority of them in a Protectorate of area 1,700 km^2 (density >0.6 person/km^2) in which these four groups are still geographically apparent although they are no longer mutually hostile. Many younger Waorani live in the jungle towns closest to the Protectorate—Puyo, Tena, and Coca—and some live in other parts of Ecuador. There are two groups of Waorani, the Tagæidi and the Tadominani, who split off from other groups at the height of the internal warfare and who eschew all contact with both the pacified Waorani and all *kowodi*.

Waorani kinship was bilateral, traced equally through mother's and father's lines. However, kinship classification recognized two kinds of kinsmen in which parallel cousins were classified as siblings and their parents as one's classificatory parents, and cross cousins of the appropriate sex were classified as potential spouses (*ki*) and their parents as potential in-laws. Waorani who did not fall within this kindred were classified as people with whom one had no basis for relationships, many of whom would have belonged to hostile groups (Robarchek & Robarchek, 1998). Marriage was prescriptively with a bilateral cross cousin, and was arranged by the parents of

the young couple. Completed fertility of 5.7 live births per woman was low for a natural fertility population (Larrick et al., 1979). These marriage patterns are still followed today, although young people have considerably more say as to whom and when they marry. Postcontact fertility patterns have shifted to higher completed fertility and more closely spaced births.

The precontact impact of Wao warfare was enormous, with an estimated 61% of all death and emigration a direct result of warfare (Larrick et al., 1979). Internal warfare accounted for 42% of deaths—Waorani speared by other Waorani. The motives for Wao warfare included revenge for prior killings, vengeance for deaths, illness, or other inauspicious events attributed to witchcraft and shamanism, raiding for women and/or prized objects (e.g., machetes, axes, canoes), and entrance of enemy Wao groups or outsiders into their territory (Yost, 1981b). Internal warfare ceased for each communal household of Waorani as it was contacted by missionaries, beginning in 1958. Most households were not contacted until the late 1960s and early 1970s. Although warfare has essentially ceased, there are still occasional spearings, mostly of *kowodi* for infringing on Wao territory or in retaliation for witchcraft.

Due in part to worldwide press attention around the time of first peaceful contact, the Waorani have received considerable assistance from the Ecuadorian government, international missionary organizations, and the oil companies that continue to invade their land. Most Waorani villages now have schools with resident schoolteachers, literate in both Spanish and the Waorani language. Access to medical care is provided by village health promoters and teams of physicians and nurses that visit the villages to provide primary healthcare, vaccinations, acute and preventive care for epidemic diseases, and referral to secondary and tertiary care facilities when needed. The Missionary Aviation Fellowship provides free airlift services to hospital for medical emergencies. Oil exploitation in Waorani territory provides jobs for numerous Waorani and entry into the national economy. Numerous nongovernmental organizations have various development and conservation projects with the Waorani. Thus, in a span of 50 years, the Waorani have entered the global village.

CULTURAL CONSTRUCTION OF GENDER

The Waorani recognized male and female genders, but there was little difference between the two and there were no differences in personality or temperament expectations. All Waorani adults were expected to be autonomous, independent, self-reliant, sexually vibrant, and physically strong and capable. Gender relations were egalitarian, with no rigid sexual division of labor, although men were generally hunters and women gardeners.

Precontact Waorani men wore a string made of cotton with which they tied up their penis by the foreskin. Women also wore a string around their waists. Both sexes wore necklaces made of palm fiber adorned with the teeth, bones, feathers, etc., of peccaries, fish, caiman, and other species hunted for meat. For special occasions such as *tepæ* feasts, Waorani men and women wore crowns made from the feathers of brightly colored birds, primarily toucans and macaws. Both men and women wore armbands woven from cotton fiber, and women went bare-breasted. Children went naked. All went barefoot. Infants were carried in slings made from beaten bark. Today, most Waorani wear Western clothing—mainly shorts and T-shirts. Women sometimes wear dresses or skirts. Most still go barefoot, but rubber boots and sports shoes are prestige items. Some of the older Waorani still use traditional dress, but this is quite rare in the more populated settlements. When they travel outside the Protectorate the Waorani wear modern Ecuadorian dress—jeans or shorts, T-shirts, jackets, shoes, and socks.

Both genders wore their hair long and loose with bangs. The earlobes of both genders were pierced and enlarged to hold balsa plugs, but this was always optional and many older adults alive today do not have elongated earlobes. Piercing usually took place between the ages of 7 and 13 for males and at first menstruation for females. Both genders used *achiote*, a red pigment, to beautify their faces and bodies for festivals. Today, men generally wear their hair short in Western style and most women still wear their hair long, although younger women choose from the range of hairstyles currently in style. Earlobes are no longer elongated and older people who have elongated earlobes no longer wear balsa plugs. Many women now pierce their ears and use Western-style jewelry, and some women use lipstick and other make-up, especially in towns.

Ideals of beauty for females included a round full face and figure, bright shiny hair, and a well-muscled nicely proportioned physique with some fat (J. A. Yost, personal communication). Thinness is not a sign of beauty among the Waorani. For males, the ideal was a strong, well-muscled, and well-proportioned body.

Capacity for hard work in hunting and gardening was prized. Today, when asked directly about attractiveness, both sexes say that to be "normal" is the ideal, and normal encompasses the traits above. Some of the younger Waorani who have traveled outside the Protectorate recognize the Ecuadorian and often the global ideals of attractiveness presented in popular media. Today, as traditionally, fitness is attractive, and among younger people high value is placed on capacity in sports (e.g., soccer and volleyball) for both genders.

GENDER OVER THE LIFE CYCLE

The Waorani traditionally recognized six life stages: (1) *enandin inga*, an infant less than 3 months old; (2) *wemogi inga*, 3 months to walking (about 2 years); (3) *weñænga*, 2–12 years old; (4) *enenenga*, 12–18 years old; (5) *pikænga*, adult of 18 and over; (6) *pikænani*, elders of 50 and older. Ancestors were referred to as *dodani*.

Passages in the life cycle were not particularly marked. Children grew into adulthood gradually learning from their elders how to perform subsistence activities of hunting and gardening. Men recall learning to hunt successively larger animals and the first time they went to hunt by themselves. Men who have been on raids in the past recall being relegated to the sidelines when young and allowed fuller participation with age and experience. However, different skill levels in hunting and raiding do not appear to have been milestones that were ceremonially marked. Both genders recall having their ears pierced and elongated, but not as a ritual occasion at a particular time in their lives. It is perhaps marriage that was the major ceremonially marked transition in Waorani life—the couple were seated in a hammock and sung over. After marriage, the couple lived together and, if both were mature, took on responsibility for provisioning each other with meat and manioc and initiating a sexual relationship. Children were the expected outcome of all marriages. Each birth was accompanied by short ritual restrictions for both mother and father on the kinds of food eaten and the type of work done. The transition to grandparent was also unmarked ritually. The dead—and sometimes the dying—were always buried when possible, but widows and other family members had no special restrictions or proscriptions for their behavior. Today, these life stages are still recognized, although childhood and adolescence are increasingly being defined by schooling needs and choices.

Socialization of Boys and Girls

Males and females were equally valued and reared similarly with the same expectations for strength, self-reliance, independence, and industriousness. The specific content of instruction was dependent on the primary role of men and women in hunting and gardening, respectively, but both sexes learned through active participation in the daily activities of their elders. Males learned from fathers and grandfathers (biological and classificatory) how to hunt and fish, to raid and kill, to clear jungle for gardens, and to make household goods such as blowguns and darts, the curare poison used on hunting-dart points, hunting and killing spears, fishing nets, and stone axes and knives. Females learned from mothers and grandmothers (biological and classificatory) how to garden, fish, cook, and make *tepæ*, and how to make household goods such as hammocks, *shigras* (woven bags), baskets, clothing, and ceramic cooking pots. Both sexes learned to fish and gather wild forest products, how to survive in the jungle, and how to construct houses. Children were never punished, and no one could force a child to do something he or she did not want to do. Sometimes children were beaten with stinging nettles, but this was thought to increase their tolerance for hard work and endurance. There are reports of coercing children into desired behavior through threats of abandonment in the forest (i.e., certain death), but these were rare. All adults and older children in the small kin-based residential group were involved in the care of young children. Children of both sexes played and worked equally. Today, both sexes attend school and participate in sports, continuing the egalitarian treatment of children in Waorani society.

Puberty and Adolescence

The Waorani recognized the period of transition to sexual maturity and as children grew older and matured, they gradually took on more adult responsibilities in their social group. When girls matured sexually, they were eligible for marriage and often married within a year or two of first menstruation—probably between the ages of 16 and 20—but there was no marked change in their social status or in their autonomy and behavior after menstruation and before marriage. First menstruation was traditionally marked by having the young woman sit on a bed of stinging nettles for 1 day to toughen her for future childbearing. There was no similar ritual for young men

at puberty. Rather, boys and young men were commonly subjected to beatings with stinging nettles in order to toughen them for hunting and fighting. Premarital sexual activity and, sometimes, premarital pregnancy both occurred before contact. There was no stigma attached to either. Most people, especially women, married young. Sometimes people were married when still children and taken to live with their future spouse who was usually older than they were, but in such cases sex was not permitted until sexual maturity was reached. It was the elders who decided who would be married to whom and when, and youth had little forewarning of their own marriage. Marriages usually occurred at larger gatherings of several social groups for *tepæ* feasts. Unsuspecting youths would be plunked into a hammock with their future spouse, sung to, and thereby married without notice. Today, there is more courting behavior among Waorani youth, but elders are still important influences on choice of marriage partner. Many Wao youths are still married unawares at larger gatherings, which today are usually associated with intervillage sports tournaments. Consistent with the personal autonomy of the individual, youths married in this manner can choose to remain together or not. Premarital sex is still tolerated, cross-cousin marriage is still preferred, polygamy still occurs, and intermarriage with *kowodi*, primarily lowland Quichua, is now more common.

Attainment of Adulthood

Marriage, the attainment of sexual maturity (for those married as children), and family formation are the main markers of transition to adulthood. However, because of the frequent lack of eligible spouses during precontact times, men sometimes had to wait until their late twenties or thirties before marrying. The point of many Waorani raids was to attain a mate for a bachelor, with the young woman's parents being killed in the process. For males, participation in raids and/or the killing of an enemy was not in itself considered the mark of adult status.

Middle Age and Old Age

Middle age passed much as life in young adulthood for the Waorani, the major difference being the increasing family size and the eventual marriage of children and the ensuing grandchildren. There was no major role change for either men or women during this period. As men and women entered old age (*pikæenani*), and especially when they became less able to care for themselves, they were increasingly apt to be killed by younger Waorani, sometimes their own kin. It was not uncommon for rage that was not assuaged by killing an appropriate enemy to be directed at elderly community members. In addition, accusations of witchcraft were often made against elderly men and women as a justification for their murders. It was not uncommon for elderly people, the younger women, and the children to hide when the warriors came back from a raid to avoid possible death at the hands of their kin. Deaths of people unable to be self-reliant were rarely avenged. Today, many Waorani live into old age and die natural deaths. The end to internal warfare, the missionary message against killing, and the increasing sedentization of the population make it easier for the Waorani to care for their elders who are unable to care for themselves.

PERSONALITY DIFFERENCES BY GENDER

There were no personality differences by gender and no expectations of such differences. Individual autonomy and independence were paramount and guided Waorani behavior. Both genders are considered to be powerful and effective, and in control of their experiences and destinies (Robarchek & Robarchek, 1998). Males were not dominant over women, and adults were not dominant over children. The same pattern holds today, although the Waorani are not immune to the influence of gender discrimination in the wider Ecuadorian society with which they must interact. Gender pressures are also placed on the Waorani through the influence of Christian missionaries, whose gender behavior is guided by the Bible, and through increased interaction with lowland Quichua among whom women and children are more dominated by men.

GENDER-RELATED SOCIAL GROUPS

Social structure was neither male nor female oriented. Most residential settlements consisted of an extended family including a married couple, their unmarried children, and one or more of their married children of either sex and their spouses and children. Married couples moved among residential groupings of relatives at will

and sometimes began a new settlement. Because of the pattern of preferential cross-cousin marriage, a group of brothers would often be married to a group of sisters; thus brothers and sisters might remain in the same settlement or one close by (30 minute walk). Raiding parties were usually made up of intergenerational groups of males, such that one's father, grandfather, uncles, brothers, nephews, and sons might all go on the same raid together. There were no important nonkin associations for either males or females.

Gender Roles in Economics

Waorani men were generally hunters, warriors, and killers, and women were gardeners and caretakers of infants, but men felled trees for garden plots and sometimes harvested manioc and other products, and women hunted when the opportunity presented itself and often accompanied men on long hunting expeditions. Both sexes fished and gathered other forest products such as honey and *chonta* palm fruit. Both sexes took care of children and taught them subsistence activities. Although some men and women were recognized for particular skill in one or another subsistence-related activity (e.g., making hammocks or blowguns, hunting, etc.), there was no marketing or trade of these items, and each family made their own household products and provided for themselves. Men were sometimes away from the settlement on hunting or raiding expeditions, but these were usually of 1–2 weeks duration, and women often accompanied men on hunts and raids. Some women have killed, although this was not common. Property was not "owned" in the Western sense of the word, although kin groups had recognized rights to the areas in which they lived and to particular areas for harvesting the fruit from the *chonta* palms they had planted. Such rights were maintained by continuous habitation and use of these areas. Women had exclusive rights to the gardens they planted and tended and to the products of their labors, and to the meat their husbands hunted (J. A. Yost & J. Regalado, personal communication). Household contents were considered the exclusive property of the people living there, although sometimes such items were stolen during raids. The Waorani fiercely defended the territory they considered theirs—traditionally south of the Napo River and north of the Curaray River—from all *kowodi*, whom they simply killed should trespass occur. The uncontacted Waorani groups have sporadically killed trespassing *kowodi* as recently as October 2001.

Parental and Other Caretaker Roles

Both fathers and mothers played a significant role in parenting, as did other extended family members including grandparents of both sexes, siblings of grandparents, and siblings of the parents (i.e., aunts and uncles). There were no differences in child-rearing strategies between the sexes, except for those related to teaching children traditional male activities associated with hunting and raiding, and traditional female activities associated with gardening and cooking. Children were not usually disciplined in any way, and were free to do as they chose. Family members spent much of their free time together except when the men were away hunting or raiding. Young children accompanied their mothers to gardens and to the river to wash clothes and dishes or to fish. Older children spent much time playing in groups. Affection was lavished on children of both sexes by both male and female family members. These patterns of child-rearing remain largely unchanged today, although most children now attend school at least through the sixth grade and thus spend considerably less time with their elders. The secondary school is located in the largest Waorani community, Toñapadi, and children from other communities wishing to attend must board in this community. The modern necessity for schooling and literacy is eroding the traditional way of life by limiting the time Wao children spend with their elders learning traditional subsistence activities (Rival, 1996).

Leadership in Public Arenas

Among precontact Waorani, social life was extremely egalitarian and individual autonomy the rule for both genders. There were no rank distinctions based on gender or kinship, and no formal leadership roles, no religious or ritual obligations, and no community obligations. Leadership within the small familial social and residence groups fell to different individuals who had capacity in the skill required at the moment (e.g., hunting, raiding, selecting residence site, etc.), but inevitably involved convincing other people to follow his or her lead. Although the four Wao groups

were nominally "led" by an important male elder, it was not incumbent on any Waorani, male or female, to follow his lead. All Waorani were free to do as they pleased and to leave the group and make a new settlement at any time. Authority was confined to persuasion and/or coercion. These generalizations still hold today, although men are much more likely than women to hold political office in ONHAE (Organization of the Waorani Nations of the Ecuadorian Amazon/Organización de Naciones Huaroni de la Amazonía Ecuatoriana), the Waorani political organization that interfaces with the outside world, to be employed by the oil companies or the tourist industry, and to be employed outside the Protectorate. Because of men's more frequent interaction with wider Ecuadorian society, they are also more likely to speak Spanish.

GENDER AND RELIGION

The Waorani had no organized religion and the nonmaterial world appears to have been of little importance to them. They had little concern with supernatural beings or forces. The world was not considered dangerous, hostile, or threatening, and existed for them to exploit. People were considered to be powerful and effective and in control of their own destinies. They were not constrained by powerful supernatural forces. There was little animism, magic, or taboo behavior. Survival and well-being were the responsibility of each Waorani individual. All misfortune was thought to be the consequence of deliberate human actions stemming from rage, envy, and malice, and resulting in homicide or witchcraft leading to illness, death, or other misfortune. Sorcerers and shamans were thought to have familiars (e.g., the *almas*, "souls," of jaguar, caiman, boa, etc.) through which they could effect their intentions both good and evil. Both genders could be sorcerers (*idoidi*) or *curanderos* (*menge kædani waa kæta*, "healers"), but only men could be shamans (*meñe wæmpo*). Traditional ideas about the afterlife conceived of it as much the same as this life, but existing in another realm. Hence, the custom of burying a child with a dying parent can be more easily understood.

Today, many Waorani are nominally Christian, which most Waorani understand to mean an end to spearing and living in peace among themselves. Both genders can have leadership roles in the Waorani Christian Church. Other Waorani have rejected Christianity and maintain more traditional ideas about humans in nature.

As in many Native American societies, there is concern over the loss of shamanic knowledge as the old shamans die and young people have not learned or do not want to continue such traditional roles.

The Waorani have many myths relating to how they learned to survive in the world, but they do not have a creation myth per se. When asked, they say that they were always here, although the world was somewhat different in the distant past, and they had to learn to survive in it.

LEISURE, RECREATION, AND THE ARTS

Both sexes had abundant leisure time which was usually spent in mixed-gender family groups. Everyday leisure activities included bathing and playing in the river, grooming behaviors, story telling, singing, and sleeping or resting. In the evening after dark and in the early morning before dawn, men and women would often chat and/or sing, recounting stories of the past. Periodically, there were drinking feasts in which one household would be the host to members of their kindred who would come for several days of feasting, drinking *tepæ*, and dancing. Such feasts were also opportunities for marriage ceremonies and for having extramarital or premarital sex with cross cousins (*ki*). Today, leisure time is spent in much the same way, although the feasts now usually also include volley ball and soccer tournaments as central activities.

RELATIVE STATUS OF MEN AND WOMEN

Men and women had equal status, rights, and privileges in Waorani society. The familial residential group was often led by a male elder, but his authority was based on persuasion and coercion, not on any ultimate right to authority. Men did not dominate women, and neither women nor children were ever beaten. Men would occasionally kill their spouses, usually over disagreements about taking another wife, but only when they were relatively sure that the death would not be avenged by the woman's kin. There are many incidents of vengeance for the deaths of sisters; thus murder of a wife was rare, although it did occur. More usually, the wife would simply leave her husband in such cases and take up residence elsewhere. There is at least one incident in which a woman was suspected of poisoning her husband. The mutual dependence of men and women for

subsistence made marriage an important institution, and although both genders could exist without a spouse, they were then dependent on family and kin who were not obligated to provide what a spouse would normally provide (i.e., meat or manioc). Although there was sharing of food in families, this was not an ideal situation because self-reliance and independence were so highly prized, and most men and women hastened to remarry after the death of a spouse. In addition, the surviving wives and children of a man killed in a raid were often killed as well if there was no wife shortage because they had no one to hunt for them. As already indicated, it was elder relatives who decided on marriage choices for youth, but, once married, they were relatively free to decide to remain together or not. Because marriage was an economic necessity, bachelors who could not attain a wife by such traditional means sometimes resorted to stealing a woman from her family. In these cases, a raid was mounted and the girl's parents and other kin living with them were usually killed. Extramarital sexual relationships with *ki* were common, expected, and accepted for both sexes. In addition, the Waorani had the institution of partible paternity in which more than one man (ordinarily in a *ki* relationship with the woman) could be father to a child. In such cases, a woman would take one or more lovers in addition to her husband during pregnancy, and since it was thought that it took four to six acts of intercourse to form a baby, several men could be fathers with obligations to provide and care for the child. Elderly Waorani of both sexes who could no longer take care of themselves were often murdered, frequently by their own kin. Today, the Waorani continue this pattern of egalitarian gender relations, although, as already indicated, influences from the wider Ecuadorian society and the global village impinge on the Waorani as they do on others.

SEXUALITY

For the Waorani, sex was a normal, natural, and healthy experience. Because the Waorani had no contraceptive methods except abstinence, intercourse, especially for women, was inevitably related to reproduction. Older women tell stories of being reluctant to marry and initiate a sexual relationship, but this was told more in the spirit of reluctance to take on adult responsibilities than for modesty or fear of sex. Both males and females were expected to have active sex lives, and premarital and extramarital sexual relationships with *ki* were expected

and accepted for both sexes. Modesty about the body was not required for either males or females. Sexuality was rather freely expressed among persons in appropriate *ki* relationships. Both genders could have sex with partners of the same gender if they wanted to. Exclusive homosexuality seems to have been rare, and there are no reports of long-term same-sex relationships. There are stories about women who hunted like men and did not bear children. Nevertheless, such women were married to men who frequently had another spouse as well. Most Waorani were married, regardless of their personal sexual preferences. The Waorani were and continue to be very tolerant regarding the sexual lives of individuals.

COURTSHIP AND MARRIAGE

Marriage was prescriptively with a bilateral cross cousin, and was arranged by the parents or relatives of the young couple, often without their knowledge. Such marriages usually occurred at drinking feasts at which the unsuspecting couple would be seated in a hammock together and thus married. Second marriages could be contracted at the initiative of the marrying individuals, under the sway of the levirate and the sororate. Marriages were most common within the neighborhood cluster. Both polygyny (usually sororal) and polyandry (always fraternal) occurred, apparently in response to fluctuating neighborhood cluster sex ratios (Yost, 1990). Particularly good hunters or aggressive warriors were especially likely to have more than one wife. Marriages among people who were not *ki* were not acceptable and were sometimes punished by death. Marriage was universal among the Waorani, although some men married late due to shortages of potential spouses. Widowers and widows who were still economically productive usually remarried. Sometimes these marriages were arranged by the elders, but the older the person, the more choice he or she had as long as the appropriate *ki* relationship was maintained. Romantic love, in the Western sense, did not play a role in the making of most marriages, although it was sometimes a motive in second and higher-order marriages.

HUSBAND–WIFE RELATIONSHIP

Waorani marriages were characterized by mutual respect, economic interdependence, and affection. Traditionally,

men and women slept in hammocks with their children. For several years after a child was born, men and women slept in separate hammocks on opposite sides of the communal house and were supposed to abstain from sexual intercourse. Family groups usually ate together, although there were no prescribed meal times. *Tepæ* was always available throughout the day, and women would prepare it for men, children, and guests. Divorce was unknown, but separation was possible. Both sexes were free to leave their spouses, although this was not common. Many polygamous households were maintained in precontact times, although currently those in polygamous marriages tend to live primarily with their youngest wife. The other wives either live in the same community or have separated from their husbands and live in other communities. Since the cowives were often sisters, this helped maintain cohesion. Children usually remained with the mother after separation or death of a husband. Today, marriage patterns are similar, but younger people have more say in whom they marry and when, and if married unawares they can choose to stay in the marriage or return to their former homes. Polygamous marriages still occur.

OTHER CROSS-SEX RELATIONSHIPS

Primary relationships are with parents, grandparents, aunts, uncles, and siblings of the same sex, both biological and classificatory. Relationships with grandparents and parents are particularly close. Cross-sex relationships are primarily with *ki*—those who are potential spouses and sex partners. Little is known about the longevity of such relationships or the emotional attachment involved. The Waorani are reluctant to discuss such matters with *kowodi*, especially in light of the missionary influence of the recent past.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The Waorani maintain their traditional egalitarian gender relationships and women still have equal status in the community, in marriage, and in day-to-day activities and decision-making. Both genders are still expected to be self-reliant, independent, and autonomous. The influence of the less symmetrical gender relationships of the larger Ecuadorian society is evident, however, in the political

organization of the Waorani and in employment in non-traditional occupations, which are more likely to be dominated by men. It is also evident in literacy. Although both boys and girl go to school, young males are more likely to go on to secondary school and university, and are more likely to be bilingual in Spanish and to be able to read and write well. It is unclear how much this is due to expectations of the *kowodi*, to the kind of jobs available (e.g., manual labor for the oil companies), or to the early marriage and child-bearing patterns of young Waorani women (e.g., more closely spaced births and higher fertility). It is clear that the Waorani are in transition. They embrace new knowledge and new ways of living while they simultaneously try to maintain aspects of traditional culture that are important to them. Their fierce independence and self-reliance may help them to maintain gender equity despite the outside influences that tend to undermine it.

West Indian Americans

Oneka LaBennett

ALTERNATIVE NAMES

West Indian Americans are also known as English-speaking Caribbean immigrants, and West Indians. While the title of this article refers to "West Indian Americans," immigrants from the Anglophone Caribbean have numerous ways of identifying themselves that vary based on factors including personal preference, class, ethnicity, whether one is a first- or second-generation immigrant, country of origin, and immediate social context. For example, a Jamaican immigrant might identify herself as "Jamaican" in the company of other West Indians. While in the company of Americans, however, the same individual might simply say that she is "West Indian." Alternatively, a second-generation West Indian whose parents migrated from the region might choose to identify himself simultaneously as West Indian and American, or might use the term "West Indian American."

LOCATION

This article focuses on immigrants who have settled in New York City, predominantly in the Flatbush, East Flatbush, and Crown Heights sections of Brooklyn.

CULTURAL OVERVIEW

Settlement Patterns

Although once described as "invisible immigrants" and still sometimes mistakenly lumped with African Americans, "Black" immigrants from the Anglophone Caribbean, including Jamaica, Trinidad and Tobago, Guyana, Barbados, Grenada, St. Vincent, and St. Lucia currently comprise the largest immigrant group in the largest U.S. city, New York (Kasinitz, 2001, p. 257). West Indians comprise over 8% of New York's population if one includes their U.S. born children (Kasinitz, 2001, p. 257). Census Bureau estimates from the late 1990s indicate that the four largest West Indian groups—Jamaican, Guyanese, Trinidadian, and Barbadian immigrants—number about 435,000 in New York City.

Although home of the largest U.S. population of West Indians, New York is not the only U.S. city to which this group has migrated; the second-largest population resides in Miami. However, unlike New York, Miami does not host a densely concentrated and distinctly West Indian neighborhood. New York's West Indian community has overwhelmingly settled in the Flatbush, East Flatbush, and Crown Heights sections of the borough of Brooklyn. While this article concentrates on the majority of West Indian Americans who are descendants of African slaves, it is important to note that significant numbers of East Indian descendants of Indian indentured servants from the Anglophone Caribbean have settled in other New York neighborhoods.

Basic Economy

While once stereotyped as a "model minority" group with a "genius" for business, West Indians have had in the past and continue to have low self-employment rates. Ample scholarly work comparing West Indians with African Americans has revealed that West Indian New Yorkers have higher median household incomes than African Americans (Foner, 2001, p. 14). West Indians have very high labor force participation rates. The group's percentage of households in poverty is lower than that of most immigrant groups; this is partially due to the fact that almost 25% of West Indian headed households have three or more people earning wages (Foner, 2001, p. 14).

Political Organization

West Indians' strong sense of both racial and ethnic identity has had implications for their political involvement in the United States. Since they share phenotypic traits and experiences of U.S. racism with African Americans, West Indians have built political coalitions with African Americans. In the pre-1965 wave of West Indian

immigration, when most Caribbean immigrants settled in the Harlem section of Manhattan, West Indians played instrumental roles in the city's political arena. In fact, they played disproportionately high roles in the city's politics compared with their proportion of the population (Kasinitz, 2001, p. 258). During that time, however, both West Indians and African Americans downplayed their ethnic differences while emphasizing the common African origins that they shared (Kasinitz, 2001, p. 258).

The current wave of West Indian immigrants have different political frames of reference from African Americans and they alternatively ally themselves with and distance themselves from African Americans (Rogers, 2001). The redistribution of Brooklyn's voting districts in the 1990s created two predominantly West Indian districts and added to West Indians' strong political presence in New York City (Foner, 2001, p. 6). This charter revision resulted in the election of a Jamaican immigrant woman, Una Clarke, to the New York City Council. Today, West Indians participate in all levels of the nation's politics, from holding several seats on New York City Council and in the State Assembly, to the appointment of Secretary of State Colin Powell, who is a second-generation West Indian.

Family and Kinship

The family is the traditional primary social unit for West Indians. They trace descent bilaterally but often value matrilateral ties over patrilateral kinship ties. Their kinship terminology is similar to that of the British and the Americans. After migrating to the United States, West Indians maintain consanguineal ties with relatives in their homelands through the transnational flow of remittances, gifts, visits home, and through telephone conversations. Women are the primary caregivers for children in the United States, as is also the case in the Caribbean. Owing to their higher rates of participation in the U.S. labor force, it is not uncommon for West Indian women to migrate before their children. Married women hope to earn enough so they can subsequently send for husbands and children. In the Caribbean, legal marriage, although an ideal for the societies on the whole, is often practiced more by the middle and upper classes than by the lower classes. West Indians from the lower and working classes sometimes leave behind "common-law" husbands and children. Children of unmarried women are often left in the care of matrilateral kin in the Caribbean until their

mothers are able to send for and support them in the United States. New West Indian immigrants utilize their strong networks of previously migrated kin to help them secure housing and employment. Still, working mothers who might have relied on the child-rearing assistance of a close-knit extended kinship network back home sometimes miss the benefits of such an extended network of consanguines after migrating.

Intercultural Relations

The history of race relations in the United States and the presence of a social hierarchy which has placed "Blacks" on the bottom rungs, has shaped how "Black" West Indian Americans interact with other ethnic and cultural groups. West Indians who have migrated to the United States recently face less overt racism than those who migrated before the civil rights movement (Foner, 2001, p. 1). West Indians come to America from societies in which people of African descent are either a majority or, as is the case in Guyana, are slightly outnumbered by East Indians. Therefore these immigrants tend to have a unique understanding of how their own racial identities effect their social interactions. West Indians have sometimes allied themselves with African Americans and at other times formed tense relationships with them.

A few well-known racial incidents in New York City involving West Indians have caused controversy. One incident occurred when a racial riot ensued after a young Guyanese boy was struck and killed by a car driven by a Hasidic Jew. Another occurred when a Trinidadian immigrant was struck and killed after being chased by a group of "White" youths. West Indians are as segregated from European Americans as African Americans are (Foner, 2001). While West Indian Americans share experiences of racial discrimination with African Americans, they "do not attach the same political and ideological meanings to their racial identity" (Rogers, 2001, p. 176). This difference in outlook, accompanied by stereotypes of West Indians as more hardworking than African Americans, might account for some preferential hiring by European Americans which West Indians have experienced (Waters, 1999). Gender has affected West Indians' intercultural relations. Male West Indian youths, more so than their female peers, enjoy greater freedom to travel beyond the ethnically "Black" confines of their neighborhoods and schools. This greater freedom has sometimes resulted in boys reporting more experiences of racial harassment

by European Americans and police. Girls, on the other hand, are more shielded from racial harassment, tend to graduate from high school more than boys, and tend to perceive themselves as having greater chances for job success (Waters, 2001, p. 201). Thus it can be said that West Indian girls have less negative views of intercultural relations involving European Americans than do boys (Waters, 2001, p. 201).

CULTURAL CONSTRUCTION OF GENDER

While West Indians' premigration access to American films and television and their correspondence with previously migrated relatives has influenced their gender conceptions, Caribbean notions of gender do continue to play a role following migration. One such carry-over is the notion of the "respectable female." Colonial influences created constructions of domesticity embodied in the colonial female (Miller, 1992, p. 171). This notion of ideal femininity was predicated on social stratification, adherence to religion and church-sanctioned family structures, and, above all else, women's primary involvement in maintaining the domestic realm (Miller, 1992, p. 172). Masculinity, in turn, was embodied in the oppositional notion of "reputation," whereby men define themselves around exclusively male activities and the peer rivalries and pressures surrounding drinking and street culture (Miller, 1992, p. 172). In this dichotomy, men are almost completely uninvolved in domesticity.

West Indians' conceptions of ideal femininity differ from what is presented in mainstream American films and on television. For example, immigrants from lower- and working-class backgrounds conceptualize the ideal female body type as more full-figured than the American cultural ideal. In addition to cultural conceptions of ideal body types, gender is also culturally constructed through styles of dress and self-presentation. West Indian immigrant adolescents often determine that their notions of how men and women should appear and act are at odds with their parents' more Caribbean ideals.

West Indian females value the styling and maintenance of feminine hairstyles as symbols of beauty. Hairstyles vary from African-influenced braids, Caribbean-influenced dreadlocks, and naturals (hair that is not chemically treated), to relaxed (or straightened) hair depending on one's gender, class background, and personal preference. While it is socially acceptable for men

to wear their hair in braids, men most often wear closely cropped haircuts. West Indians of both genders often dress in the fashions of their American counterparts. However, immigrants utilize fashion to make statements about their ethnic identities. Both men and women wear clothing and accessories (such as keychains and bandannas) displaying the flags of their homelands in order to assert distinctly West Indian identities. Additionally, women sometimes wear thick bangles and other jewelry made from Caribbean gold which act as ethnic markers.

GENDER OVER THE LIFE CYCLE

West Indian cultural names for stages in the life-cycle are in close alignment with American and British names for such stages. One difference is that in the Caribbean, especially among the lower and working classes, adolescence is not as clearly defined as it is in the United States. Girls undergo transition from the childhood stage to the adult stage when they bear children. For boys, this transition occurs when they engage in sexual activity with the opposite sex. Boys gain additional status when they father and provide for their own children. However, West Indian American parents and youngsters grapple between Caribbean norms, which ascribe less freedom and autonomy to adolescents (especially for girls), and American cultural beliefs which construct adolescence as a time of exploration and increasing freedoms.

Socialization of Boys and Girls

In the Caribbean young boys are expected to act "manly"; that is, they are expected to refrain from exhibiting emotional reactions such as crying. While middle-class Caribbean parents tend to value boys over girls in terms of "carrying on the family name," amongst the working and lower classes, girls are frequently valued over boys (Leo-Rhynie, 1997, p. 40). It has been argued that in the Caribbean, lower-class mothers, in particular, value daughters over sons because the mothers think daughters are more likely to care for their elderly parents and because girls are perceived as less troublesome than boys (Leo-Rhynie, 1997, p. 40). West Indian American mothers worry more about the rearing of daughters, since they perceive unsupervised girls as being at risk for teenage pregnancy (LaBennett, 2002, p. 185). This is a marked change from the Caribbean, where 50% of the women

start having children while they are still adolescents and where, amongst the working class and poor majority, young women are eager to become mothers in order to achieve the adult status that motherhood connotes (Leo-Rhynie, 1997, p. 34–35).

West Indian parents socialize boys and girls differently. In the Caribbean and the United States, boys and girls are dressed in gender-specific clothes from birth. Girls' ears are often pierced during infancy as a way of distinguishing them from baby boys. During infancy and early childhood, girls are given toys that are associated with domesticity, such as dolls, strollers, and cooking utensils. Boys, on the other hand, are given toys such as guns, trucks, cars, and military action figures. While girls are expected to keep themselves clean and quiet, boys are allowed to engage in loud messy play (Leo-Rhynie, 1997, p. 41). From early childhood throughout adolescence, girls are expected to be docile and obedient while boys are allowed to be more independent. During infancy and childhood, girls and boys share similar rites such as potty training, attending school for the first time, and religious rituals, such as Christening and receiving the First Communion.

Puberty and Adolescence

Most societies in the Anglophone Caribbean lack puberty rituals and, traditionally, have lacked a special name for adolescence. West Indian American teenagers learn that their conceptions of this life stage are somewhat at odds with those of their parents; their adolescent years are spent learning to cope with the culture of both their parents and their American peers. West Indian adolescents can choose to identify with the mainstream society, to have an identity that is strongly ethnically identified, or to adopt a bicultural identity (Waters, 1996, p. 65).

As previously noted, Caribbean girls from the lower classes tend to start having children when they are in their teenage years. Children are highly valued, and having a child is a way of signaling one's adult status (Leo-Rhynie, 1997). However, West Indian American mothers have come to learn of the difficulties faced by and the limited opportunities open to teenage mothers in America. Adolescent pregnancy is stigmatized as a social problem in the United States and is largely perceived as one that concerns females, thus strategies to manage it are geared primarily towards girls (Nathanson, 1991, p. 244). This awareness often influences mothers to discourage their adolescent daughters from becoming sexually active.

Ethnographic research conducted amongst West Indian adolescent girls and their mothers in Flatbush, Brooklyn, indicates that mothers see the social control of their adolescent daughters' sexuality as one of their primary roles as caregivers (LaBennett, 2002). Unlike their male counterparts, West Indian adolescent girls are often prohibited from engaging in social activities that are not supervised by adults. While boys are not prohibited from dating, West Indian American girls are often not allowed to have boyfriends; those who do struggle to keep relationships with the opposite sex secret from their parents (LaBennett, 2002). The preoccupation of West Indian mothers with this issue is undoubtedly shaped both by the Caribbean ideal of the "respectable" woman and by American perceptions of adolescent mothers.

Even though West Indian popular songs romanticize women who are overtly sexual and glamorize violence among men, West Indian American mothers tend to blame American popular culture as a corrupting influence on their adolescent children (LaBennett, 2002). Adolescence is also characterized by a struggle with parents in regard to access to popular cultural products. While boys often have more freedom to earn money and buy their own clothing and music, girls tend to have to compromise with their mothers over appropriate clothing, the music to which they listen, and the viewing of television programs. During adolescence, West Indian American girls exhibit contradictory attitudes towards sexuality through their consumption of both "respectable" and unconventional gender images (LaBennett, 2002). While mothers strive to keep their adolescent daughters clothed like "respectable" women—that is, dressed in styles that are not overtly sexual—girls identify with and appropriate the styles of popular icons who are both appropriate and inappropriate in their mothers' eyes (LaBennett, 2002).

Whereas in the Caribbean, very young girls are required to assist in domestic duties, including caring for younger siblings, West Indian American girls are usually not given these chores until they reach adolescence. However, adolescent boys are sometimes expected to procure paying employment outside the home and to contribute to the family income. West Indian immigrant adolescent girls often view being American as an opportunity for freedom from parental control and greater equality of sex roles (Waters, 1996, p. 75, 79). However, since boys have greater freedom to travel beyond the home, they

often experience societal exclusions and disapproval from European Americans (Waters, 1996, p. 75).

Attainment of Adulthood

In the Caribbean, rites of passage indicating the transition from boyhood to manhood include engaging in heterosexual sex, and fathering and providing financially for one's own children. The transition from girlhood to womanhood is marked by rites such as reaching menarche and giving birth to one's own child. Caribbean men gain status and respect, and are considered adults, when they can provide for their families (Leo-Rhynie, 1997, p. 35). Young women gain status in their communities when they assume motherhood (Leo-Rhynie, 1997, p. 34).

Because education is so highly valued by West Indian parents, because American youth tend to go to college at higher rates than Caribbean youth, and because of the social stigma attached to adolescent motherhood, West Indian American youth undergo transition to adulthood much later than they would have had they been brought up in the Caribbean. Like their American peers, their adulthood rites of passage include getting their first job after college, marrying, and having their own children. Similar to their Caribbean-reared and American-born peers, certain biological changes (such as menarche) and religious rites of passage (such as the First Communion for Catholics) may be accompanied by parents and other adults telling youth that they are now considered men and women. Still, such rites remain largely symbolic in light of the prolonged period of parental monetary support experienced by youth in America.

Middle Age and Old Age

West Indians are brought up to respect their elders. Older adults are considered to be wise and are well respected in their communities both in the Caribbean and in West Indian immigrant neighborhoods in the United States. While unmarried middle-aged women who have not given birth to children are often stigmatized as spinsters, older persons of both genders are generally respected even if they do not have children. Older adults who have children expect their children to support them in their old age. The social status gained by older adults is evidenced in the West Indian practice of referring to elderly adults as "Grandmother" or "Grandfather" and middle-aged adults as "Auntie" or "Uncle." This is the custom even in

cases in which the person being addressed is not one's biological relative. One gender-based difference in how older adult roles are socially constructed is seen in how grandmothers more than grandfathers are often expected to assist in the rearing of grandchildren.

PERSONALITY DIFFERENCES BY GENDER

Caribbean cultural stereotypes of how men and women ought to be are both challenged and reinforced among West Indian Americans. The aforementioned notions of female "respectability" and male "reputation" are rearticulated by immigrants who have settled in the United States. Adult immigrant women still see the "respectable female" as a cultural ideal that one should strive to become. Similarly, for males, notions of protecting one's reputation are still salient. Yet, adolescent immigrants and second-generation West Indians often find that their parents' notions are at odds with their own American-influenced constructions of how men and women should behave.

Caribbean cultural stereotypes of "proper" women as dependent on men, natural nurturing caregivers, and bound to the home have been contested in the Caribbean and are displaced in the United States because women have greater success in the U.S. labor force, are often heads of households, and sometimes support legal and "common-law" husbands back home. These practices in turn disrupt cultural constructions of West Indian men as dominant independent breadwinners.

GENDER-RELATED SOCIAL GROUPS

West Indian Americans experience a widening of social groups in comparison with the groups they negotiated back home. Legally married West Indian American couples find that whether they live near the husband's family or the wife's family is dictated by which spouse had pre-existing kinship networks in America. The common practice of serial migration, whereby one or more family members predate the migration of the remainder of the family and prepare economically to send for remaining members, results in families being split up, in some cases for years. Since women outnumber men both in numbers who migrate and in labor-force participation in the

current wave of West Indian immigration, it is often members of the wife's family who are already established in the United States. Therefore, matrilineal kin groups are often utilized by immigrants. In the Caribbean, where female single-headed households prevail (Waters, 1999, p. 204), children are often raised within matrilineal kinship groups.

GENDER ROLES IN ECONOMICS

Prior to 1965, most Caribbean women who migrated to the United States reunited with male partners who were already abroad or who were sponsored by previously migrated relatives (Foner, 1986). When the U.S. immigration laws were reformed in 1965, a visa preference system was substituted for racial quotas and West Indians were granted easier access to the United States. Since 1965, Caribbean women have outnumbered their male compatriots in migrating to America (Foner, 1986).

Significantly, West Indian women in particular have high labor-force participation rates when compared with their male counterparts and with immigrants from other regions (Kasinitz, 2001, p. 266). West Indian women are also heavily represented in certain occupations—nursing and nurses' aides, domestic childcare workers, teaching, and in the finance, insurance, and real estate sectors. While West Indian women have formed niches in the nursing, nurses' aides, and domestic sectors, unlike other immigrant groups they have tended not to form autonomous economic enclaves that link coethnic employers, employees, and customers under unified business umbrellas (Kasinitz, 2001, p. 266). It is more difficult to characterize the occupational specializations for West Indian men because they take on more diverse types of employment than their female counterparts (Kasinitz, 2001, p. 266). The men are less heavily niched but, like the women, they are also predominantly involved in the services and public sectors (Kasinitz, 2001, p. 266).

West Indian women in New York (and London) overwhelmingly reported that they experience more independence after migrating abroad (Foner, 1978, p. 62–71). The primary gauge of independence for these women rested in their abilities to hold regular paid employment, something difficult to do in the Caribbean owing to high levels of unemployment and to women's primary role as child caregivers. In the West Indies, the division of household labor is almost uniformly patterned around men performing outdoor chores and women performing indoor chores (Chevannes, 2001, p. 208; Evans & Davies, 1997). Women are responsible for all housework and, in fact, certain female chores such as washing dishes and clothing are considered demeaning and/or polluting to males (Chevannes, 2001, p. 208). Present economic conditions in the Caribbean, coupled with the high number of female-headed households, have resulted in more women working outside the home. For West Indian Americans, this means that women are accustomed to working outside the home but men are not always accustomed to participating in domestic duties. Still, immigrants indicate that West Indian men who migrate learn that they have to contribute to household duties (Foner, 1986).

PARENTAL AND OTHER CARETAKER ROLES

Children are highly valued throughout the Caribbean. West Indian parents of all socioeconomic groups value a restrictive approach to disciplining children (Evans & Davies, 1997, p. 5). Corporal punishment is often used and children are expected to remain quiet in the presence of adults and to obey their parents' wishes unconditionally. Both fathers and mothers participate in the administration of corporal punishment. Mothers might request that fathers flog children in cases of serious offense (Evans & Davies, 1997, p. 45). In addition, while mothers tend to follow up flogging with shows of affection, fathers are typically more harsh in the administration of punishment and are less likely to follow up with affectionate contact (Evans & Davies, 1997, p. 45). Both mothers and fathers are, in general, more authoritarian in administering corporal punishment to boys than they are to girls. Although harsh corporal punishment of children is socially acceptable in the Caribbean, West Indian immigrant parents learn that, in the United States, their children hold them to American customs which define harsh corporal punishment as child abuse. In fact, research has revealed that the attitude towards corporal punishment is viewed by West Indian parents as the most extreme cultural difference they encounter upon migrating to America (Waters, 1999, p. 222).

West Indian fathers and mothers both value education highly; in fact, many West Indians migrate in search of more educational opportunities for their children, and first- and second-generation West Indians believe that

education is paramount to achieving social mobility (Bashi Bobb & Clarke, 2001, p. 232).

Traditionally, West Indian women have been the primary caregivers for children. Single-female-headed households number over 30% in the Caribbean (Leo-Rhynie, 1997, p. 37). In American homes where fathers are present, the demands of the U.S. work force and the absence of extended kinship networks have forced fathers to play more hands-on roles in child rearing and domestic labor. Still, as is the case in the Caribbean, mothers tend to spend more time with children. In their countries of origin, especially among working-class and poor West Indians where legal marriage is the often unattained ideal, many children are raised in households where fathers are either entirely absent or in which they are in "visiting" relationships with the child's mother. The result of this is that boys and girls sometimes have little or no opportunity for direct observation of their fathers performing the father/husband role (Evans & Davies, 1997, p. 10). In the Caribbean, when fathers are present, their role is more commonly defined as that of breadwinner and provider rather than that of caregiver and nurturer (Leo-Rhynie, 1997, p. 35). This definition of fatherhood is somewhat redefined in the United States where, when present, West Indian fathers are expected to contribute to the economic support of the household, to aid in disciplining children, and to perform nontraditional duties such as attending parent–teacher conferences at school and looking after the children while mothers are at work.

GENDER AND RELIGION

The African slaves, Indian indentured servants, and European colonizers who settled in the Caribbean brought traditional African religions, Hinduism and Christianity with them. African religious traditions and Christianity continue to interact in the faiths of West Indians of African descent. "Black" West Indians have belief systems that range from " 'orthodox' Christian denominations through Afro-Christian groups to African cults" (Cary, 1998, p. 49).

The church is an important resource for West Indian immigrant families. Many immigrants belong to ethnically rooted churches and rely on networks formed with pastors, priests, and other parishioners to ease the difficulties of raising their families in new surroundings (Waters, 1999, p. 202). Most of the high-status members of the clergy for Christian faiths are males. Scholars of Caribbean women's roles in Christianity contend that women are in general barred from leadership roles, and are often relegated to tasks such as washing altar cloths and organizing fundraisers and tea parties (Baptiste, 1991, p. 14).

Strong female figures certainly exist in the African religions transported to the Caribbean, and powerful female roles are still held by obeahwomen (conjure women) and by female Shango (cult of Yoruba origin) in various West Indian societies. However, it can be argued that the African and Caribbean-based religions practiced by West Indian Americans place women in contradictory roles which are, on the one hand, powerful and on the other, negative or subordinate. While some practitioners of Rastafarianism, for example, emphasize the gender equality of this faith, some Rastafarian groups observe rituals of female confinement during menstrual flow and West Indian popular culture depicts Rastafarian women in distinctly inferior roles (Cary, 1998, p. 56; Chevannes, 2001, p. 208).

LEISURE, RECREATION, AND THE ARTS

West Indians in both the United States and the Caribbean enjoy varying amounts of leisure time, partially based on class and gender. In their countries of birth, working-class and poor women enjoy less leisure time than men of all classes and than middle- and upper-class women. Middle- and upper-class women in the Caribbean have more leisure time than their working-class peers because they can afford to pay others to perform childcare and other domestic duties. After migrating to the United States, immigrants of varying class backgrounds often find that they have to work long hours at jobs that are low paid by American standards. West Indian women find that they have considerably less leisure time than men because they are expected to work outside the home and to be responsible for most domestic duties.

Whereas in the Caribbean women might have spent most of their leisure time socializing with an extended network of kin, in the United States leisure time tends to be more diversified. Since immigrants often move to the same neighborhoods as relatives (in many cases living in the same apartment buildings), leisure time can still be spent *gaffing* (chatting), as the Guyanese put it, with nearby kin. West Indian immigrant women in the

United States and in London lament that their husbands tend to waste their wages at rum shops and pubs (Foner, 1986). Jamaican immigrant women have reported feeling excluded from pub life both prior to and after migrating abroad (Foner, 1986). In this sense, the sexes are segregated during certain leisure activities. However, West Indian women have reported that, for the most part, life abroad means that they have more privileges and that, since they work full time, their husbands are more likely to help with housework (something husbands never did back home).

Leisure time for women in Brooklyn's West Indian neighborhoods includes shopping, watching television, and attending community gatherings at churches. A leisure activity specific to Brooklyn's West Indian population is the time that many women and men spend preparing for the annual West Indian Day Parade, which takes place during Labor Day weekend and is New York City's largest parade. Other activities specific to this group include eating at Brooklyn's numerous West Indian restaurants and attending local performances by West Indian musical artists.

The leisure activities with which West Indian immigrant youth might occupy themselves are also very similar to those of their American peers: they listen to music, attend cheerleading practice, play video games, attend after-school programs, and "hang out" on the streets of their neighborhoods. However, there are some differences. The lack of movie theaters in Brooklyn's Flatbush, East Flatbush, and Crown Heights sections prohibits adolescents from frequent trips to the cinema. Another difference is the tendency of young West Indian immigrants to assert Caribbean identities by keeping themselves abreast of the latest West Indian musical artists. These youths and the musical artists to whom they listen have contributed to the Caribbeanization of New York City, in that American youths now also enjoy West Indian cultural products.

West Indian adolescents of both genders participate in after-school leisure activities at neighborhood organizations, churches, and ethnic clubs. Activities at these organizations are sometimes gendered, such as the predominantly male activity of basketball and the exclusively female activity of cheerleading. However, boys and girls come together in activities such as learning and performing dances to Jamaican dancehall and hip-hop music. Girls participate in more school-planned activities than boys (Waters, 2001, p. 201).

RELATIVE STATUS OF MEN AND WOMEN

In the Caribbean in general men enjoy higher social status in respect to the power to make economic and community decisions, and in their influence in religion, control of their sexuality, marriage choice, and divorce choice. Males are perceived as household heads despite the fact that women often make household decisions, raise children, and provide partial or total household economic support (Leo-Rhynie, 1997, p. 37). For the most part, West Indian American women enjoy greater social status than do their peers who remain in the Caribbean.

Caribbean women, as mentioned previously, are experienced in heading households and working outside the home before migrating to the United States; the percentage of Anglophone Caribbean women who participate in the labor force of their respective nations is higher than in most other sending regions (Kasinitz, 2001, p. 266). Immigrant women outnumber men in the current wave of West Indian immigration (Burgess & James-Gray, 1981, p. 87). Women's greater incorporation in the U.S. labor force has afforded them higher status and more decision-making power. The large numbers of West Indian women who are heads of households and single parents in the United States has resulted in a higher status for women and greater access to equality of sex roles for these women. Women who migrated before their spouses can achieve relative independence in the United States and opt not to sponsor their spouses. These women can also choose new partners if they so desire, and raise their children without the assistance of their previous male partners.

In the Caribbean, men enjoy greater freedom to partake in street life, public male camaraderie, and bar culture, and to establish notions of status vis-à-vis the concept of male "reputation." Women, on the other hand, are more bound to the home and therefore achieve their status through success in the realms of motherhood, domesticity, and the colonial/religious derived notion of the "respectable" Caribbean female. West Indian immigrant women still lament their husbands' extramarital relationships and tendencies to spend wages in bars (activities largely considered inappropriate for "respectable" Caribbean women, even in the United States) (Foner, 1986). However, for the most part, life abroad means that, because they work full time, West Indian women are more likely to receive help with household

chores from their husbands and are treated more as equal partners.

When adult males are present in immigrant households, they still receive deferential treatment and some of the special privileges afforded to men in their homelands. These privileges include having wives and daughters prepare and serve their meals, and clean up after them.

SEXUALITY

Ethnographic research indicates that West Indian Americans view sexuality as a "natural" part of life (LaBennett, 2002, p. 185). The relative freedom and independence afforded to young men in the Caribbean and in the United States allows the male gender greater sexual liberties. In the Caribbean, men of all classes can engage in extramarital or premarital sex with little or no social prohibition. Women, on the other hand, are expected to respect the marriage vows and to abstain from adulterous behavior. As previously stated, legal marriage is a cultural ideal more predominant among the upper classes in the Caribbean. Men are given more sexual freedom and license to have multiple female sexual partners whether they are involved in a common-law, visiting, or legal union with a woman. In addition, men in the Caribbean often father children with more than one woman and form visiting relationships with multiple families. West Indian immigrant women, under the influence of American norms regarding infidelity, lament their husbands' extramarital relationships.

Men and women in the West Indies think of sex in general as healthy, but caution that too much sex is detrimental (Chevannes, 1993, p. 7). Sex is conceived on the one hand as a healthy stress release, and on the other as draining of one's strength and vitality (Chevannes, 1993, p. 7). While men view sex as primarily a good thing in and of itself, women link sex with childbearing, which they value (Chevannes, 1993, p. 7).

From the age of about 5 onwards girls are taught to be sexually modest. Boys who exhibit sexual precocity are not reprimanded; rather, they are often encouraged (Chevannes, 1993, p. 8). Early and premarital sex for males is socially acceptable and to some extent encouraged because men achieve adulthood through sexual intercourse with women and fatherhood. Additionally, there is strong disapproval of homosexuality, and young men feel pressured into heterosexual relationships by their peer groups (Chevannes, 1993, p. 12). Male sexual prowess is highly valued by both males and females (Chevannes, 1993, p. 9). In fact, some scholars note that, while female gender identity emerges through discussions about sexual relationships with males, gender identity for males emerges by juxtaposing heterosexual and homosexual sex (Parry, 1996, p. 84). While research stresses the social conception of male homosexuality as deviant, there is a paucity of analyses which focus on how female homosexuality is regarded (Chevannes, 1993, p. 30).

The Caribbean-based conceptions of male and female sexuality described above are rearticulated by West Indians in America.

West Indian parents typically do not discuss sexuality with their children and children learn about sex from their peers, from the formal educational system, and from popular culture (Chevannes, 1993, p. 8). The same can be said for West Indian American youth.

COURTSHIP AND MARRIAGE

In theorizing about the origins of marriage and courtship practices in the Anglophone Caribbean, scholars point to the polygynous African societies from which Caribbean slaves were brought and the overtly monogamous European societies from which the colonizers came (Chevannes, 1993, p. 26). The predominant mating pattern throughout the Anglophone Caribbean has been described as one in which people first (and at an early age) form sexual relationships with partners extraresidentially, then go on to living consensually with a partner, and eventually, in later life, enter into legally binding marriages (Chevannes, 1993, p. 3). Thus there are three identifiable types of marital relationships: visiting relationships, in which a man and woman have a sexual relationship but do not live together; common-law unions, in which a man and woman live together and share a sexual relationship although they are not legally married; and legal marriage in which the couple have a legal union and live together (Leo-Rhynie, 1997, p. 34). Legal marriage is the cultural ideal. While some scholars argue that the ideal of legal marriage exists mainly in the upper and middle classes (Leo-Rhynie, 1997, p. 34), others maintain that the mating pattern described above exists in all West Indian social classes and that there is only an increase in the proportion of common-law and visiting unions if one moves from the middle to the lower classes (Chevannes, 1993, p. 5).

Males and females in the West Indies have their first sexual experience and begin the mating stage at different ages. Most girls have their first sexual experience between the ages of 16 and 17, while for most boys it occurs between the ages of 14 and 15 (Chevannes, 1993, p. 10). The patterns of courtship and marriage are complex. In Jamaica, for example, the mutual consent of a couple is sufficient for a socially acceptable sexual relationship; a couple need not be legally married first (Chevannes, 1993, p. 5). However, there is a sexual double standard: while women are expected to remain sexually loyal to their husbands, infidelity is largely socially acceptable for men. Another gender difference is that, although legal marriage makes the couple and their family respectable, women have more to gain from legal marriage than men (Chevannes, 1993, p. 4).

HUSBAND–WIFE RELATIONSHIP

West Indian couples who migrate find that their roles as husbands and wives are redefined so that husbands have more domestic responsibilities and wives gain increased independence (Foner, 1986). In the West Indies, the three types of marital unions (visiting, common-law, and legal marriage) result in complex husband–wife relationships. Couples involved in visiting unions engage in sexual activity but do not live together and may only sleep and eat together occasionally. The practice of serial migration (whereby family members migrate at different times) often results in the separation of husbands and wives for years at a time. Serial migration might also have the effect of highlighting even further the West Indian wife's role as family provider. In some cases in which wives migrate before husbands, wives provide economically for husbands and children who are left behind.

While the stigma that Christianity attaches to divorce might influence West Indians against legally dissolving their marriages, American attitudes toward divorce combined with the freedom one gains if one migrates without one's spouse might contribute to more lax approaches to divorce. In the Caribbean, it is not uncommon for children to be sent to live with relatives such as grandmothers or aunts. This practice, called "child shifting" occurs in situations of father and/or mother absence (due to migration, divorce, death, or other reasons) (Evans & Davies, 1997, p. 7). However, West Indian couples who migrate to the United States together,

have children, and then divorced may find that they have to resort to more American solutions such as joint, partial, or exclusive child custody by one parent, since they may lack the extended kinship networks available to them back home.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

During British sovereignty West Indian women and men were influenced by colonial gender constructions whereby domesticity was embodied in the colonial female. Under this gender framework, West Indian men, although subordinate to the colonizers, had more freedom than women and were able to define themselves around a male camaraderie which existed beyond the confines of the home.

West Indian migration to the United States is usually characterized in two periods; pre- and post-1965. Research has shown that West Indians who migrated in the first wave were already challenging notions of how proper West Indian men and women should behave. Although during the early 20th century West Indian men were thought of as heads of households and leaders in public and political realms, female immigrants of the time were instrumental in forming crucial social networks which influenced the formation of distinctly Caribbean communities in New York City (Watkins-Owens, 2001). Early immigrant women were also largely responsible for the formation of rotating credit unions (informal savings systems), which to this day remain valuable resources for New York's West Indian immigrant families (Watkins-Owens, 2001). Women's migration and involvement in establishing and maintaining social networks, in child fostering, and in organized public resources such as rotating credit unions and boarding houses challenged the colonial notions which subordinated them (Watkins-Owens, 2001). During the early 20th century, West Indian women's social activities were often directed toward social welfare while their male counterparts focused on forming organizations directed toward political influence (Watkins-Owens, 2001, p. 44). Women's significant involvement in labor and political groups, both in the past and during the current wave of migration, remain largely undocumented (Watkins-Owens, 2001, p. 44). However, it is evident that West Indian women, by migrating without their spouses and through examples such as their work outside the home

and their roles as heads of households, demonstrate changing attitudes towards gender construction. Moreover, immigrant men are also demonstrating new attitudes. This is evidenced in their increased participation in the domestic realm in general, and in child rearing in particular.

Yanomami

Gabriele Herzog-Schröder

ALTERNATIVE NAMES

Yanomami are also known as Yanomamï, Yanoama, Yanomamö, Waika, Guaika, Shiriána or Xiriana, Guaharibo, and Sanemá.

LOCATION

The territory of the entire ethnic group of the Yanomami people comprises the southeast of the federal state of Amazonas in Venezuela and the neighboring federal states of Amazonas and Roraima in Brazil. The Yanomami region, which has an area of approximately 190,000 km², is situated west of the Guiana (Guyana) Shield between latitude 5°N and the equator and between longitude 61°W and 67°W. Except for some savanna areas in the north the terrain is mainly tropical rainforest. The linguistic subgroups are as follows: (1) the Yanoam and their subdivision Ninam who live in the northeast and the east; (2) the Sanemá (also known as the Sanuma, Sanïma, or Sanima) in the north; (3) the Yanomam, who live to the east of the national border as well as on the slopes of the Sierra Parima mountain range; (4) the central Yanomami (the Yanomamï or Yanomamö) who live in the center and in the west and south. The last of these groups, particularly the villages near the Upper Orinoco which belong to the Patanowëtheri group, are the subject of this article.

CULTURAL OVERVIEW

The Yanomami are a hunter–gatherer and swidden horticultural society with a population of about 25,000 (10,000 in Brazil and c. 15,000 in Venezuela). The people live in communities of approximately 40–200 individuals. Each village consists of three to eight or more extended families, which are often united by marital relations. Among the Yanomami, in the far south of Venezuela, family homes are built close to each other in a circle. These large palm-thatched circular communal dwellings are called

shapono. The members of each family group work, sleep, and socialize around a central hearth. Second or third partners in polygamous marriages as well as unmarried adult family members maintain their own fire nearby. The only household furnishing is a hammock. New roofs are constructed every 2–7 years and the old settlements are abandoned. Several times a year the people leave their village, together or in groups, to spend a few weeks in temporary camps in the forest or as visitors with allied villages.

The main crop is plantain, although manioc has become increasingly common in recent decades, supplemented by maize, sweet potatoes, and sugar cane. Sources of collected protein are small catfish, crabs, crayfish, caterpillars, large insects, grubs, and nuts. A long bow and arrows fitted with a variety of points made from bamboo, wood, or bone are used for hunting.

Yanomami material culture is simple and functional. Baskets, calabash gourds, forked sticks, and fresh leaves serve as their cooking utensils. However, they no longer use their traditional pottery since metal pots have become accessible. The use of metal axes, machetes, and knifes has also become standard.

Linguistically, as well as anthropologically (genetically and anthropometrically), the Yanomami are distinct from the adjacent ethnic groups; their language is an isolate. Although communities are self-sufficient, networks of alliances are intensified by invitations and visits and by the exchange of commodities. Marital ties strengthen affiliations between communities. Local groups, that are not well known to each other, often suspect each other of causing illnesses and misery. The Yanomami are a relatively egalitarian face-to-face society, which is politically structured by kinship. Cross-cousin marriage is central in social interaction. Affinity is socially emphasized more than cognatic ties. Owing to their remote location in the interfluvial area between the Orinoco River, the Rio Branco, and the Rio Negro, the Yanomami lived in relative isolation until the middle of the 20th century. However, they have experienced a long history of direct and indirect contacts (Ferguson, 1995). Acculturation has

been quite slow compared with other indigenous societies of South America. In Venezuela, Yanomami territory is protected to some extent as a United Nations Biosphere Reservation. However, on the Brazilian side of the territory, road construction and an invasion of miners between the 1970s to 1990s has brought considerable illness and death. International protests forced the Brazilian government to take decisive steps to put an end to this disastrous situation. Now the Yanomami are trying to deal with the consequences of the intrusion with the help of social workers and anthropologists. A demographic increase observed in the late 1990s should not hide the fact that illnesses like malaria, influenza, tuberculosis, and hepatitis are severe threats to all the Yanomami. Epidemics have the potential to wipe out entire communities within a short time if no professional help is available. The miners and the Brazilian government have also failed to keep their promises to grant land rights to the Yanomami.

CULTURAL CONSTRUCTION OF GENDER

The principal gender categories in the Yanomami culture, "male" and "female," are divided into subclasses according to age (see below). The concept of gender is strongly determined by the idea of the couple, an idea that is enhanced in daily life and reflected in abstract conceptions of reality. Neither maleness nor femaleness dominates the concept of gender; rather, the concept entails the presence of both genders. Hence the moon or the sun are neither male nor female, but exist in both forms. All tutelary spirits, through whom the shamans perform their power, exist in a male and a female form, although sometimes one gender is more prominent in songs or tales. A man and a woman need to cooperate to produce tobacco. The man sows the seeds after having prepared the garden site. Then the woman will care for the crop and eventually harvest it, dry it, and store it. It is then her possession and she will prepare the daily wad of tobacco from these leaves for her husband and herself. The tobacco can only be given away as a gift or an object of exchange with the consent of both the man and his wife. Tobacco is a very important offering to enhance alliances, and it is worth noting that a couple, ideally a married couple, is necessary to produce such goods for gift exchange and thus for the formation of social or political affiliation. The fact that neither a man nor a woman alone can traditionally produce tobacco can be taken as a metaphor for political

influence—a single person has no power. This suggests that the Yanomami do not exhibit strong gender antagonism. But how does this fit with the well-known image of Yanomami women as being subjected to severe physical and social repression? Yanomami women have many times been depicted as abused and brutalized, and the Yanomami have been described as a radically gender antagonistic society (Chagnon, 1983; Harris, 1977, 1987). The reason for this assessment is that a relatively high level of violence in Yanomami life seems to lead to the impression of specific brutality against women. Actually, the display of brave and violent behavior is indeed a cultural ideal, but the conception of fierceness is shared by both genders. Further explanation for these controversial representations will be given under "Gender-Related Social Groups" below.

The genders are not spatially separated, nor are there places that men or women are forbidden to enter. There are no secret cults that are open to only one gender, nor are women or men punished if they see a special act or sacred objects. (For more information see the explanation of the *yïpïmou* puberty ritual for girls below.) In their daily lives, Yanomami males and females have slightly different costumes. Girls and young women use polished sticks for adornment which they insert in the facial perforation—the ear lobe, the septum, under the lower lip, and next to the corners of the lips. Men's facial perforation is restricted to the ear lobes, and sometimes a small hole pierced under the lower lip to insert a little feather. Adult men traditionally used to wear a belt around their waist and tied their penis up on their prepuce. Women use more cotton decoration—apron, belt, and strings—than men. There is no substantial difference in hairstyle or in the way that their bodies are painted with vegetable dye. Among the Yanomami of the Orinoco area, females may adorn themselves with flowers, palm fronds, and other plants or leaves, while males prefer feathers and skins or pelts of animals. Women blacken their cheeks when mourning a close relative. Men do not adopt these emblems of sorrow. However, men paint themselves totally black when leaving to raid another village.

GENDER OVER THE LIFE CYCLE

Gender differentiation takes place as soon as the newborn is accepted as a human being after birth. The Yanomami have been reported as practicing preferential female

infanticide, which appeared to explain the sometimes imbalanced sex ratio (Chagnon, 1977). I was unable to verify this assumption and, in addition, Lizot (1988) found in a comprehensive study that more boys than girls seem to be born. The first time a baby boy is nursed he is given the right breast, whereas a baby girl is first fed from the left breast. This is the initial act of culturally inscribing the appropriate gender to the new infant. Serious names are only given after about 3–4 years, although among the Sanemá this may be done shortly after birth (Ramos, 1995). A strictly observed name taboo bans the usage of names for addressing other people. This rule leads to teknonymy, nicknaming, and the use of classificatory kinship terms to speak to or about someone. However, any term used when speaking to or about a person usually includes a gender marker. This is either a suffix that indicates the gender or, in the case of kinship terms, indicates a male or female addressee.

Children are generally addressed by mentioning their sex in an affectionate way: *moka* or the variants *mokawë*, *moroshi*, or *moroshiwë* for boys, and *naka* and its variants *nakami* or *nakasimi* for girls. *Moka* and *naka* relate directly to the sexual organs, as the penis is *pei moka* and the vagina is *pei naka*. A young girl is addressed as *suwë hëri*, "premature woman," from about the time she looses her milk teeth until she reaches puberty (6–17 years). From the conclusion of her puberty ritual until the end of her reproductive phase a woman belongs to the category *suwë moko*, "mature woman," and after that she is *suwë pata*, "old woman." The transition from boy to man is not as clearly defined as that from girl to woman. A boy is considered *ihiru*, "child," and then he is called "*maranapë*," premature, until he becomes *huya*, "a man." However, there is no exact date marking this transition. Seniors are called *pata*, which means both "old" and "honorable" and refers to men as well as women.

Socialization of Boys and Girls

The Yanomami appreciate boys and girls equally. A preference for boys is sometimes expressed verbally, but no differences can be detected in the rearing of boys and girls. If a woman has had several children of the same sex, she generally expresses a desire for a child of the opposite sex. It is considered advantageous to have children of both genders, as the balance of the sexes is essential for the group reproduction. Boys and girls are needed to provide cross-cousins to marry in the future generations—brothers

and sisters who live in the same village are the parents of future spouses. Boys and girls are socialized quite similarly, as the important virtues—showing generosity, willpower, and bravery—are the same for both genders. Caretakers enhance these qualifications, by instructing the children in their rhetoric skills and in the exertion of physical strength. Even though it has been stated that girls are brought up to be submissive among the people of the Upper Orinoco (Chagnon, 1992), both girls and boys are encouraged to retaliate if other children attack them (Herzog-Schröder, 2000).

At the age of about 8–10 years boys were traditionally ordered to tie up their penis at the prepuce, as was the custom among men. This tradition is not always followed now; instead boys start wearing a loincloth or shorts.

In early childhood girls often take the responsibility of caring for younger brothers and sisters while their mothers are working. Girls frequently baby-sit collectively and they regularly join the adult women in the gardens or on trips through the forest. Young boys also accompany their mothers, but they have few duties or responsibilities so that at times they look somehow lost. They often "hang out" and are not much help to anybody. Young girls have less leisure time than boys as they are more involved in obligations connected to the family and the household. However, they are much more involved in the system which provides daily necessities, and they take pride "knowing how to do things."

Attainment of Adulthood

Among the Yanomami of the Upper Orinoco area the transition to womanhood is marked by a ritual called *yïpïmou*. This ritual bears all the features of an initiation process of the "rites of passage" type. It takes place partly in the house but important stages of the process occur in the forest in the presence of females only.

The mother, the grandmother, or an older female relative of the pubescent girl organizes the different phases of the process. In essence the ritual is a performance of "becoming" a woman, an event which is highly esteemed by the entire community. On the appearance of menstruation, the girl withdraws to a small shelter in the back of her home. She will obey a number of restrictions on her behavior; these taboos refer to talking, body position, and diet. She only eats a small amount of banana and crabs. The most important rule is not to touch her body and above all not to scratch her skin and her head with her fingernails. She uses a set of special wooden sticks to relieve itching.

After a few days the curtain which separates the girl from the big communal house is taken away and she is completely covered with red dye. From time to time the initiant leaves her home accompanied by female friends and relatives and goes to nearby creeks to hunt *oko* crabs. This period of transition culminates in a ceremonial crab hunt (*okomou*). During this time the initiant is presumably extremely susceptible to seduction by evil spirits of the forest. She takes care not to talk and moves cautiously. This phase of the ritual represents the metamorphosis from youth to womanhood; the girl ritually performs the "shedding off her skin." As she walks along the creeks, where she drags the crabs out of their tunnels under the shores, her body becomes covered with white clay. After returning to the other women in the forest she cleans her body and in this way "sheds her skin." Then the older women dye her skin with pigment and adorn her with a new garment made from cotton decorated with palm fronds, blossoms, and feathers. Now she can return to the village where all the men give her a rousing welcome when she proudly enters the *shapono*. Hereafter the mother or grandmother might tell the young woman: "Now speak out loudly!" (Cocco, 1972). This suggestion implies the status of being an adult, of defending oneself, and of becoming politically and socially active.

The Yanomami image of the transformation of the initiant is the crab. A crab periodically sheds its old shell to continue a supposedly new life and thus represents recuperative vitality. The periodic regeneration of the crab, which sheds its shell, is metaphorically linked to the menstrual cycle of the adult woman. A girl's future husband has the option of participating in this ritual. If a man's desire to marry the girl is serious, he will also follow her diet and use the sticks to scratch his body and head, as he too will then actually feel the itch on his body and thus perform the "shedding." Couples who have experienced this ritual jointly often seem to have long-lasting marriages (Herzog-Schröder, 2000).

The main gender difference in socialization is that boys do not have a "rite of passage." A boy is viewed as starting the process of becoming an adult when his voice starts to break. Success in hunting and bride service for his future parents-in-law are the markers for a boy becoming a man. It is important to note that the rules and taboos which are to be respected at the time of puberty are very similar to the rituals that have to be undergone, mainly by warriors, after having killed a person. Therefore to have the will and strength to fight, and hence to kill an enemy, is also a marker of adulthood.

Middle Age and Old Age

Most men and women aged between 20 and 40 are married. After the death of a partner, new marriages often follow the rule of the levirate or the sororate, or a new mate is chosen who fits the position of a classificatory marriage partner. When a woman's second child has been weaned, the food taboos become much less restrictive. She is considered a successful mother and is generally more respected by both group members and visitors from outside. Their male partners who have not achieved a shamanic initiation before marriage often now undergo spiritual instruction and inauguration.

Elder men and women are respected, and their opinions and suggestions concerning issues of community interest are often followed. The authority of old persons, who may be aged 80 or more, depends strongly on their physical ability as well as on their capacity to speak in public. When their physical state is deteriorating, they rely on close kin for support and care.

PERSONALITY DIFFERENCES BY GENDER

The main virtues of generosity, the ability to negotiate cleverly the exchange of goods and social commitments, the enactment of force and power, and readiness to defend oneself and close kin against antagonists are the same for both genders. A sense of humor is also an attribute that is shared by both genders. In general, man's public speech is louder and more expressive than that of women, especially when village leaders engage in ritualized dialogs, like *himou*. A powerful form of discourse for elder women is the intelligent application of gossip and hearsay; however, when they feel the necessity they scold loudly. Important men and women will both make a public declaration of their opinion regarding issues of general interest, but men do so more often.

GENDER-RELATED SOCIAL GROUPS

Although stated otherwise in some ethnographies (Chagnon, 1977; Lizot, 1988), the central Yanomami are not organized in patrilineages. As noted above, the pair—be it the brother–sister pair or the married couple—is the most important unit in the social structure. Family groups

are formed around these pairs. Groups of bi-gendered siblings tend to intermarry and ideally form the cluster of a local group on the basis of affinal relationships. The strongest ties of political alliances are based on affinal relations, which means ultimately on marriage between bi-gendered siblings. In daily life affinity is constantly manifested by naming each other using classificatory kinship terms.

The high value of affinal relations is explicit in the term *shori*, which means both brother-in-law and friend. Sisters-in-law are also often very close to each other. Not only are sisters-in-law married to each other's brothers or first cousins, but they are prescriptive mothers-in-law of each other's children. Accordingly, they will most probably seek to marry their respective children to each other. This position gives them considerable power in the construction of the social and political group, which should not be hidden by the fact that it is mainly their husbands who make public speeches.

GENDER ROLES IN ECONOMICS

Women and men work together in many complex activities like gardening, where men clear the sites, both genders plant and cultivate, and women generally harvest for the needs of the family. However, there are also gender-specific tasks. Men go hunting cooperatively quite often, it is mainly in groups of two or three who are often brothers-in-law. Women regularly hunt and gather on their trips through the forest together with some children. Although only men use the bow and arrow, the concept of hunting is not restricted to males. Women's crab-catching and fishing with bare hands is referred to as "hunting." Household activities are mainly the responsibility of women and their daughters, but older men or second husbands in polyandrous marriages often prepare food or clean up and other men also do so if necessary. Thus there is a strong tendency toward gender division of household activities, but there are no restrictions that would make it impossible for one sex to engage in certain activities.

As the central Yanomami are remote from markets, trading for metal tools or aluminum pots is of great importance. Exchange of commodities has a highly symbolic purpose. Whereas women were depicted as objects of exchange (Chagnon, 1977), an analysis of women's possessions identified them as being active in the exchange of objects (Herzog-Schröder, 2000, 2003). Women exchange objects with both men and women, but more so with women. Most exchange is with members of other local groups, chiefly with people they address in affinal kinship terms. In addition to economic necessity, the inherent aim of exchange is to build and reinforce social bonds on the metaphorical basis of affinity. Heritage is largely unknown to the Yanomami. To avoid reminiscence, talking about deceased persons is strictly taboo. All a person's possessions are destroyed after death.

PARENTAL AND OTHER CARETAKER ROLES

Fathers and mothers are generally concerned about their children and care for them lovingly. Mothers are more important in the first few years, as are grandmothers who take significant decisions when the mother herself is young. Children are reared in close contact with the mother and babysitters. When men are at home they spend much time playing with their little children, as do other members of the extended family. Grandmothers often care for the previous child when a younger sibling is born. Sometimes an older wife of the child's father or an aunt looks after the infant.

Beliefs about conception are essential for the definition of the genitor's role. Children are thought to be conceived during several sexual acts. Thus several fathers can be considered to have cooperated in the creation of a child. As long as the potential fathers are brothers and/or cohusbands they are all considered as fathers. If the men who are thought to have collaborated in the creation of a child are not closely related, the baby might be considered to be "disturbed" or "confused". This could be a reason for infanticide.

Fathers do not play an important role in educating their children. The mother's brother, who is also the ideal father-in-law, has much more authority. Children of both sexes are thought to be closely attached to their mothers throughout life.

LEADERSHIP IN PUBLIC ARENAS

Yanomami political structure is diffuse both internally and externally. Each local community is composed of several family groups. The eldest or most celebrated man with charismatic skills represents each family in an informal

council. The standing of the leader can also change depending upon the issue. Decisions concerning the local community are made consensually. One of the family speakers usually acts as the leader in dealings with other Yanomami local groups. This spokesperson does not have the power to give orders. He articulates the will of the group and also strives to convince the members of his own group by the power of his rhetoric. The standard rhetoric device for public speech is the *patamou*, a loud address to the whole community. The rhetorical form of official talks between representatives of different village is the *himou*, a ceremonial dialog, in which political positions are negotiated.

Women are regularly present at public debates; their influence in communal decisions is informal but persuasive. They often interrupt the men's speeches to give their opinion and they are listened to respectfully. Older women also make public comments concerning local scandals or worries. In addition, older women have a considerable influence in relationships with other local groups. At times of intergroup conflict, when few people are willing to risk meeting the enemy, they are often the main participants in political negotiations. Women who have been abducted in earlier years may also initiate contacts with their original group and thus the making of new alliances.

Boys practice the skills of "talking," which is essential for persons of influence. With her change of status after having completed her maturity ritual, a woman is expected to be competent to "talk." In men, rhetoric is mainly expressed in the ceremonial dialogs (*wayamou* and *himou*). The *shapori*, "shaman," also uses speech in a powerful way. Speech and chant are the most significant capabilities of a spiritual specialist, a role that is taken only by men. Obviously speech is more important in men's lives, but it is also an important aspect of women's expression, although not quite as clearly ritualized as in men's ceremonial discourses.

GENDER AND RELIGION

Among the central Yanomami, religion is mainly practiced in the form of shamanism. Only men achieve the status of a shaman and most men will go through the process of the initiation at some point. Only a few aspirants attain the ability to keep their spiritual power. In most villages there are several shamans with different abilities and domains. Women do not engage in shamanic

ritual practices, although these are not prohibited for them. Women have their own access to magic and ritual spheres, for example, in the *yïpïmou* ritual. Older charismatic women generally act first in the contexts of some illnesses, such as loss of soul; during their maneuvers to recover the vital principle, they cooperate with the shamans and thus contribute to healing.

Both genders have their own symbolic representations: for men it is more the bigendered spirit-helpers of the shamans, whereas for women it is more the wild forest spirits they control and handle in direct contact with the principles of nature. However, the vital forces, which are dealt with in spiritual contexts, are never gender antagonistic. As mentioned earlier, entities in the external universe—like the sun and the moon or the beings of the nonvisible world—are commonly bigendered, which supports an ideological gender accommodation for the Yanomami.

LEISURE, RECREATION, AND THE ARTS

The Yanomami are a leisure-intensive culture. Work is seldom considered to be arduous and laziness is morally accepted. For both genders, achievement of economic activities fills people with pride and satisfaction. While most work is done in the mornings, the afternoons and the long evenings are generally spent with the closest family members, with friends from the neighborhood, or with visitors. In the afternoons men frequently gather communally, take the *epena* snuff-drug, and engage in shamanic activities like singing, dancing, and telling myths. Women do not engage in spiritual activity as a form of socializing. Rather, they socialize informally, talking and exchanging news when they visit each other.

Handicrafts are made by both genders; men prepare weapons and lead in the construction of buildings. Artistic expression involves decorating artifacts like baskets, quivers, or arrows, or in adorning the bodies with fibers, cotton, or vegetable dye, which is also done by both genders.

RELATIVE STATUS OF MEN AND WOMEN

Men and women are generally relatively equal in status. Fundamental to the rank of a person is his or her security in the social network, which is based on kinship and the

ability to talk. Individuals without close kin are rarely respected. Boys or young men are teased, and at times tormented, before they have established in-law relations. Younger women who arrive in a village alone are aware that they may be subject to rape. This is mainly the case when a woman is captured on occasion of a raid or if a woman leaves her village to join an unrelated group on her own. Here she cannot count on the support mechanisms of the kinship system—mainly a husband or brothers—to protect her. The act of "incorporating" the new member can be violent unless some powerful persons—often women—protect the isolated woman. The danger of rape for an incoming female has led to the idea that Yanomami society is male centered and that women have exceptionally low status. But in fact this idea results from the focus on warfare and aggressive behavior in certain ethnographies (Chagnon, 1977). In war, men are usually killed. Women are sometimes abducted, but they generally are allowed to live.

As far as the *waitheri* complex is concerned, the notorious ferocity (*waitheri*) is not restricted to males. Aggression is not only directed against women but also against both sexes by both men and women. Men might fight men and sometimes men fight women in intergroup conflicts. Women also fight women with sticks or with bare fists. However, women seldom attack men. They find other ways of penalizing or scolding men, or they may enlist help from kin, especially brothers, to defend them.

SEXUALITY

Sexuality is an open topic. Much joking, comment, gossip, and teasing involves erotic allusions. Accusations of failure also sometimes focus on sexual themes. Therefore children become acquainted with sexual practices and rules in a frank way, although it should be noted that sexual acts are mainly performed in privacy outside the village.

To practice sex, which is taboo before reaching puberty, a girl needs to be prepared by the mother or grandmother some time before adolescence. In some areas the older woman will remove the hymen and thus "open her channel." This act is in accord with the principle that women control the reproductive domain, as has been described in the context of the first menstruation ritual and which is also true for all circumstances of childbirth. Young children are seldom rebuked for sexual play. However, at the age of 6–10 boys are told to bind up or hide their penis and girls are admonished not to expose their private parts and sit or move with caution so as not to allow indecent views.

Each act of sexual intercourse is considered a contribution to a future birth. Therefore, sexuality is closely linked to reproduction. After birth, a post-partum taboo is obeyed for about 15–18 months, the time a Yanomami child needs to learn how to walk. After sexual relations are resumed, the next child is hoped for after about another year. Shamans have to obey a sex taboo after initiation as the spirits dislike erotic sex.

Extramarital relations are frequent and in many cases they are accepted, if the kinship system favors the bond. In visiting events it might even be considered a gesture of generosity to allow sexual relations between the guests and the hosts. However, at times of intergroup conflict, love affairs are taken as a justification for the fission of a village community.

Homosexuality seems to be exceptional. It may be acted out, especially in play situations among young boys or girls, but it does not exist as a form of cohabitation.

COURTSHIP AND MARRIAGE

Young people are generally matched for marriage long before they reach adulthood. Young girls are sometimes married to much older men. If the girl dislikes the assigned partner, she is seldom forced into the union.

There is no clear dictum concerning postmarital residence; it depends on the age of the marriage partners and their circumstances. A young married couple will most likely—in the context of the groom's brideservice—live with the family of the bride initially and later move next to the husband's family. If the marriage partners come from the same local group there is no noticeable residence distinction.

An in-law relationship functions as a source of social protection. A young man who does his brideservice is obliged to hunt for the bride's family, work in their garden, respect and fear his mother-in-law, and to adhere to many avoidance rules. But brideservice also gives him the confidence that he will be supported in situations of conflict and be supplied with food and tobacco.

Forced marriage as a result of abduction is highly spectacular as well as speculative. This practice has been explained as being due to the lack of women because of an imbalanced sex ratio in some villages. Reports of the

numbers of abducted women among the Central Yanomami differ from less than 2% (Lizot, 1988) to 17% (Chagnon, 1990). This marriage practice is unknown in other Yanomami areas (Alès, 1984). Women are "stolen" in many different circumstances. They may have been seduced, deliberately left to live with a lover, or have refused to marry a man and were unable to overcome the will of their family. Also a woman is sometimes considered to be "stolen" when she comes from another village and relations between her home and her present village are no longer peaceful. Occasionally, she may have been abducted forcefully. But even under these conditions, the victim will find a way to return to her home groups if she does not want to stay. If she stays, she subsequently accepts the seizure. In essence, the capture of women is an institutionalized form of marriage for the Yanomami. It mainly represents a union for which no brideservice has been performed for the woman's family and group. Older women, who are almost invariably widows, can get married without the groom having to fulfill family obligations, but brideservice is essential to marry a young woman.

HUSBAND–WIFE RELATIONSHIP

Most marriages are characterized by solidarity. Loving affection is seldom shown in public by older couples. Young people often try different matings before they find the right partner, unless they are required to marry to strengthen a political alliance.

The couple eat and sleep together, often work in the garden jointly, and generally make family decisions together. Disagreements are discussed in the open as showing one's temper is considered positive.

Polygyny is common, mostly in the form of sororal marriages. Polyandric unions are not unusual. The latter are more often of transitory nature compared with polygynous unions. Lizot (1988) claims polyandry to be at least as common as polygyny. This high occurrence is not supported by data from other authors, but unquestionably polyandry is a customary family setting (Herzog-Schröder, 2000). If the cowives are sisters, their relationship is generally harmonious, but jealousy is not unusual between multiple wives. The difference in time spent with the husband and the imbalance in receiving presents from him often trigger conflict within polygynous families. Older wives are frequently abandoned as sexual partners, but even then they are very powerful in making

decisions about the children and family. Divorce is not considered scandalous and can be initiated by either a husband or a wife. Apart from young couples, more marriages end through the death of one partner than through divorce. Among the Upper Orinoco Yanomami, children generally stay with their mother after divorce or with the mother's family after the mother's death. In contrast with this rule, among the eastern Yanomami (Brazil), where patrilineality is evident, children commonly stay with the family of their father (Ramos & Albert, 1977).

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

Contact with the Venezuelan society is increasing and the need to interact with non-Yanomami has become unavoidable in accessible areas. Names are traditionally tabooed, but it has become customary to use Christian names to address others in the context of the mission stations or schools. This is a decisive step toward a cultural change. Traditionally, every person is placed in particular relationships within social interactions by referring to one another using kinship terms. These are intimately linked with gender meanings, as every term specifies a certain form of conduct and commitment. Now other forms of social distinction have been introduced, like jobs with different salaries or diverse access to modern resources; these will inevitably lead to a higher level of social inequality.

In some parts of Brazilian territory the Yanomami have suffered tremendously from the intrusion of illegal miners. Again and again the Yanomami are being threatened by the presence of prospectors as well as by the Brazilian Armed Forces. Sexual relations between foreigners and Yanomami women result in the spread of venereal disease. Sexual relations, which are traditionally a form of generosity embedded in a complex of friendship and alliance, now threaten death and social instability on a large scale.

Yapese

Richard A. Marksbury

LOCATION

The Yap group, classified as continental islands, consists of four large and six small islands located in the Western Pacific as part of the Western Caroline Islands, Micronesia. More specifically, it is situated approximately 6,651 km west of San Francisco, 1,850 km southeast of Manila, 1,450 km north of New Guinea, and 870 km southeast of Guam. By most standards, Yap would appear to be a very isolated place, but in fact it is little more than an hour away by jet service from Guam International Airport.

Yap is comprised of the individual large islands of Yap, Gagil-Tamil, Maap, and Rumung, as well as several smaller uninhabited islets with a total land area of 95 km^2. The land area is surrounded by a fringing reef with seven natural channels, which forms a wide reef flat. Most of the shoreline is bordered by a thick mangrove swamp with occasional breaks of sandy beaches.

Yap's climate is tropical, with high temperatures and humidity offset by cool sea breezes. In relative terms, there are two seasons: rainy and dry. The average yearly rainfall is 307 cm, with 170 cm falling in the rainy season from June through October. The average daily temperature is 27.2°C, and seldom the temperature seldom falls below 21°C or rises above 33°C. Typhoons are mostly seasonal problems; most form in the months from June to December.

CULTURAL OVERVIEW

Yap is within the culture area of Micronesia, which is comprised of the Caroline, Gilbert, Marshall, and Mariana Islands. Although the peoples found throughout Micronesia represent a wide range of linguistic, physical, and cultural differences, the one unifying aspect of Micronesian cultures is the scarcity of land. Prior to contact with Europeans, Yap was a densely populated island with as many as 40,000–50,000 inhabitants. Following generations of catastrophic depopulation, Yap's numbers finally stabilized by the late 1940s at around 2,500 inhabitants. Many current Yapese customs and traditions reflect the culture's adaptation to prior times of dense population.

Yap's first contact with the Europeans probably occurred in 1526 with the sighting by the Portugese explorer Diego de Rocha. Except for occasional trading ships and whalers, little contact between Yap and the West took place for approximately 350 years. In 1874, Spain proclaimed sovereignty over Yap and then in 1886 established the first Catholic mission (Capuchin). Yap was subsequently a colony of Germany, and then Japan. From 1945 to 1986, Yap was a part of the United States Trust Territory of Micronesia. Yap is currently a state within the Federated States of Micronesia, which has a political relationship of Free Association with the United States.

Yap might well be the most rigid and rank-conscious society in Micronesia. Prestige and status hold dominant values in Yapese society. Two castes and eight classes form the basis of the political system. Rank is determined by caste and class, and each of the 129 villages in Yap is inhabited by members of the same caste and class. The two castes are *piiluung* or "high," "chiefly," and *pimilingaay* or "low," "servant." The village of one's birth determines one's caste and class.

CULTURAL CONSTRUCTIONS OF GENDER

In relative terms, the entire world of the Yapese is classified as either *tabugul*, "pure" or "sacred," or *ta'ay*, "polluted" or "profane." Yapese dichotomize both the real and supernatural world into these categories. Yapese folklore tells of how two men, Kee and Mel, tricked the Yapese into believing that all men were *tabugul*, while women were *ta'ay*, and that there should be certain restrictions governing behavior between the two. The *tabugul–ta'ay* classification applies not only to people, but also to spirits and lands. If a village is classified as *ta'ay*, "polluted," then all people born share the essence of being polluted. The opposite is true for those born into high-caste village.

The *tabugul–ta'ay* classification is also applied to members of a Yapese nuclear family. The father/husband is *tabugul* to his wife and children, and a woman is *ta'ay* to her husband and postadolescent son, but is *tabugul* to her children. Upon reaching puberty, brothers are *tabugul* to their sisters. Both men and women become more *tabugul* and/or less *ta'ay* with age. Menstrual blood and death are considered the two most contaminating or polluting aspects of daily life.

Gender over the Life Cycle

Socialization of Boys and Girls

All Yapese children are born into the *tabinaew* of their father. Although the Yapese *tabinaew* may have a patrilineal descent bias, it is much more than a kinship group. The *tabinaew* is the most prominent reference group because of its kinship, political, economic, and religious associations. The physical house and the stone foundation upon which it is built is referred to as one's natal *tabinaew*, "household" or "estate." Yapese children are given a name that belongs to the *tabinaew*. These names are fixed in number and are thought to be the names of the original founders of the estate. In most instances, the names associated with a particular estate are four or fewer for each sex. The women's names are those of the wives of the founders. Rank and status are determined according to one's natal estate, which in turn determines one's name.

Yapese social stratification extends to age grades for both sexes. Four grades are associated with males, and five are associated with females. Although Yapese do not have elaborate ceremonies marking the transition from one grade to the next, they do honor some rites of passage and adhere to special social responsibilities associated with each group.

For men, the grades are: *bitir ni ba pagal*, "small child" (roughly ages 0–20); *pagal*, "young man" (roughly 20–45); *pumo'on*, "middle-aged man" (roughly 45–65); *pilabthir*, "old man" (roughly anyone over 65).

For women, the grades are: *buyal*, "small child" (roughly ages 0–12); *rugood* "adolescent" (roughly 12–25); *luk'ana'rwol*, "young mother" (roughly 25–45); *puweelwol*, "beyond menopause" (roughly 45–65); *pilabthir* "old woman" (roughly anyone over 65).

Membership in an age grade is not based on absolute age. Variables, such as the number of siblings, number of age peers in a village, and the rank of one's estate, are all taken into consideration for determining the appropriate age grade.

The number of loincloths worn by a Yapese male varies with age. A small boy wears one wrapping. Sometime between the ages of 7 and 12 a second wrap is added and then a third when he reaches puberty. The final item of the male ensemble is the *kafaar*, "hibiscus wrap," which is overlaid with the loincloth. The Yapese boy who wears the *kafaar* is seen as having attained manhood. No similar stages in dress exists for Yapese females. Yapese women wear grass skirts (both an inner and outer skirt) which can be made from grasses, bananas, or hibiscus. For both sexes, aspects of dress have been heavily influenced by Western styles, and it is rare to find Yapese in traditional dress outside the village environment.

Puberty and Adolescence

Before recent cultural changes, the onset of puberty brought about a new world of restrictions for both sexes. Young men, upon reaching puberty, began participating in the *yoogum*, "stratified and ranked eating classes." Consequently, a young man could and did begin formally participating in village ceremonies and became more active in subsistence activities. Nevertheless, Yapese boys well into their teens and twenties still led lives dominated mostly by play. Every Yapese village had at least one men's house, and it was here that a young man often slept and interacted with his peers and adults. The men's house fulfilled an important socialization role for young men in learning the intricacies of Yapese customs.

On the other hand, when a Yapese girl became "*rugood*" at the onset of her first menstruation, her life drastically changed. Girls who were "*rugood*" were considered extremely *ta'ay*, "polluting," necessitating their adherence to many restrictions. Each Yapese village had at least one *dapal*, "menstrual house," where menstruating women had to remain for at least a week each month. Following a girl's first menstruation, she went to the menstrual house for an extended period of time ranging from 6 to 18 months. After this, she was required to spend an additional 6–12 months in the *tarugood*, "place for menstruating women," (somewhat of a place for purification), a specific parcel of land distinct from the menstrual house. Upon departing the *tarugood* for the first time, a Yapese woman would wear a black cord of hibiscus fiber, *marfaa'*, around her neck to symbolize the attainment of

womanhood. Throughout the rest of her life, a woman would never be seen without her *marfaa*'. Although the menstrual house did not function in the same socializing ways as the men's house, young women did learn about cooking, weaving, folklore, and childbirth while remaining there. Upon her first return to her natal estate, the young girl would find that her father had constructed a separate sleeping house for her. Her polluting status was so great that she could no longer sleep in the same house or eat with the rest of her family. Many older Yapese women refer to the onset of puberty as a sad time in their life, since they could no longer interact in ways they had been used to with members of their immediate family.

Attainment of Adulthood

Yapese consider a man to be a "young man" well into his thirties and often into his forties. A young man can still eat in the company of women, whereas an adult man cannot. A prolonged period of youth is typical in Yap for both men and women, since Yap is a highly stratified society in which positions of prestige and rank are generally reserved for the older generation. Yapese women are recognized as reaching a certain level of adulthood with the birth of their first child. After giving birth, a woman is no longer considered a highly polluting *rugood*, but a young mother, and thus has fewer social restrictions. Overall, the change in status of a woman following marriage and childbirth is much greater than changes in status incurred by her husband.

Middle Age and Old Age

The sharp distinction between the roles of men and women lessens with age, but never disappears. With age, both Yapese men and women become less polluting, but a woman never attains the level of *tabugul*, "purity," achievable by a man. The attainment of middle age by a man, coupled with his inheritance of the family estate, establishes him as the leader of the estate and positions him to participate fully in village ceremonies and large multivillage ceremonial exchanges. In addition, a high-caste man who reaches this status is eligible to participate in the more restrictive eating classes. The higher the level of "purity" reached by a man as he ages, the higher his overall status and political influence, but it also requires that he lead a more restrictive life. Old men are honored and respected, but they also must be protected.

As a general rule, a woman improves her relative status and rank as a consequence of her husband's attaining *pumo'on*, "middle age," and *pilabthir*, "old age." However, the greatest increase in status for a woman comes about after reaching menopause. Following menopause, a woman has more freedom to move about her village. In contrast with an old man who has increasing restrictions, an old woman has fewer restriction and limitations than she did as an adolescent or during her childbearing years. An old woman no longer shares food with those women younger than she but only with women of commensurate status. A Yapese woman who has reached old age and who comes from an important estate is respected by her younger relatives, both male and female, and her opinions in estate matters carry weight.

GENDER-RELATED SOCIAL GROUPS

Until the last quarter of the 20th century, all high-caste males, upon reaching puberty, would begin participating in the village *yoogum*, "eating classes." High-caste villages had seven named and ranked eating classes which were interwoven into the daily social life. High-ranked low-caste villages generally had three or four eating classes, but low-ranked low-caste villages had none. Social restrictions and limitations carried over to the wives of men who belonged to eating classes, but membership was for males only. In relative terms, the lower-ranked eating classes were less "pure" than the higher-ranked ones. Once a high-caste man began participating in an eating class, he could no longer receive or give food to a woman, child, or member of the low caste. Membership in the highest-ranked eating classes prescribed that food come from designated plots of land and be cultivated and harvested by women who had to adhere to very strict guidelines and limitations.

All Yapese belong to a matrilineal clan, *gaanang*, with membership determined by birth. There were approximately 35 unranked matrilineal clans in Yap that cut across social and political classes and the ranking system. The *gaanang* is an exogamous, egalitarian, and dispersed unit. The *tabinaew* is the most important social group for day-to-day activities. The *girdii'en ea tabinaew*, "people of the estate," do not all reside within the estate at a given time. Thus, even though the "ownership" of the estate traditionally passed from father to oldest son along with its concomitant rank, status, and privileges, the *tabinaew* is not

strictly a descent group, since membership could occur through other means.

Although not a technical social group, there was a category of women who more or less served as the *mispiil*, "mistress," of a men's house. As a general rule, a *mispiil* would be kidnapped by force or through a raid of another village. One or more could be assigned to a men's house. The men in the village treated the *mispiil* with respect, and since she was not required to work in the garden they also provided her with food. She lived in a small house adjacent to the men's house. Although the *mispiil* did not lose the respect of the people in her natal village, the women in the village in which she served as the *mispiil* would not speak to her. If and when a *mispiil* became pregnant, one of the members of the men's house would marry her. In the early twentieth century, the German administration outlawed the practice of having *mispiil* in men's houses.

GENDER ROLES IN ECONOMICS

Prior to the Yapese cash-based economy of today, Yap's subsistence economy was divided strictly along a male–female division of labor. The fundamental division of labor in Yap was that women worked the land, and men worked the sea. A meal in Yap was not considered complete unless it contained food from both the sea and land, which is a requirement to this day. Although a man's labor was at times required for working the land, women were not allowed to work the sea. Female spirits protected the sea while male spirits oversaw the land, which in turn led to the creation of a number of mandatory restrictions and limitations for men entering the sea and women entering land plots designated as "pure."

Men did all woodworking (e.g., house-building, canoe-making, tool-making), while women made pottery (only low-caste women) and most basketry. Women worked in the gardens on a daily basis and were responsible for all aspects of food preparation, while men provided the heavy labor needed to establish a garden.

As a result of the restrictions surrounding the collection, cooking, and consumption of food for men who participated in "eating classes" that were considered "pure," only older Yapese women could fulfill the role of food producer. A young woman in an "estate" could only attend those plots of land commensurate with her rank and status. Taro, for example, had to be harvested from

designated ranked plots by women whose age-grade status matched that of the person for whom the taro was intended. A daughter could never collect or cook food for her father or older brother. Even while adhering to these standards, a woman was required to follow certain restrictions and taboos before and after entering a taro patch. These included wearing a grass skirt designated for use only in the patches suitable for her husband.

PARENTAL AND OTHER CARETAKER ROLES

Until changes in the late 20th century, once a Yapese woman became pregnant, both mother and father were required to adhere to a number of taboos that included restrictions on eating certain foods and coitus. Following the birth of a child, the mother and baby would spend approximately 100 days in the menstrual house, which provided young girls with an opportunity to learn more about birthing and caring for a newborn. After childbirth, a number of restrictions, lasting for about a year, fell upon the new mother. These restrictions were lifted once a *malekagtir*, "visit to father's sister's home," took place. It was the father's sister who publicly announced a child's name for the first time and who also oversaw the first haircut. Once named, the child was considered a full member of the estate. Infants have always been treasured in Yap, seldom suffering from lack of attention. Restrictions on children's behavior in Yap is minimal, but when it is necessary, the role of primary disciplinarian falls to the mother. When Yapese discipline their children, they may accuse them of behaving like *faak ea mitigruuw* or "offspring of the same father but different mother." As a general rule, parents do not praise their children openly or speak of their accomplishments to others.

LEADERSHIP IN PUBLIC ARENAS

In Yapese society, it falls upon the men to provide public leadership. Men in a position to provide such leadership tend to be at least in their mid-forties and have assumed the position as *tafean*, "head," of their estate, which makes them eligible to participate in village councils. All *tabinaew*, "estates," in a village are named and ranked. The leader of the highest-ranked estate within a village is entitled to serve as the village chief, an example of why

the Yapese say, "The land is the chief, not the man." Given the drastic depopulation that Yap underwent, it now happens that a woman might actually be in control of a highly ranked estate and thus hold the position of *tafean*. However, a woman who is *tafean* of an estate can never hold the position of *mataam*, "male leader of the estate." A woman in this position may not speak publicly for the estate. Nevertheless, she can, and surely does, exercise persuasive economic and political influence in less public forums. Furthermore, a woman who is the *tafean* of an estate and who also has reached the final age-grade stage could command some attention to her wishes which at times would be acknowledged publicly. In any particular Yapese village there are a number of chiefs (e.g., "section chief," "chief of the dance," "chief of young men," and "chief of war"). In each instance, a man is eligible to hold this position if he controls the estate that entitles him to do so. Each of these titles comes with *lunguun*, "rights and obligations," that the male estate leader has to perform publicly.

Associated with all Yapese estates are the *mafaen*, "those who have a duty to protect the estate." Traditionally, there were three distinct and separate individuals entitled to this status: father's sister, father's father's sister, and father's father's father's sister. In addition, the matrilineal descendants of these three females were recognized as being "people of the *mafaen*." The most important *mafaen*, "guardian of the estate," was a man's father's sister. It was the duty of the estate guardian (always a woman) to ensure that her brother's sons and families honored and respected the duties and obligations of the land over which they were the head. The *mafaen* had the right to criticize publicly the behavior of her brother's son if they failed to honor the family estate and, furthermore, she could confiscate the estate if the offense were serious enough to warrant such action.

GENDER AND RELIGION

A cosmology formed the basis of the Yapese belief system. Although the pantheon of sky gods played an important role in magic, it was the myriad of male and female spirits inhabiting Yap and the waters around it that more prominently affected daily life. *Maeriilaeng*, "land spirits" (male), are distinguished from *madaay*, "sea spirits" (female). In addition to these spirits, the ancestral ghosts, *thagith*, of both men and women remained in the villages

for several generations. The ghost of a woman always returned to the lands associated with her husband's estate. Cutting across all social and political boundaries were individual totems inherited from one's mother.

Both men and women needed to follow strict taboos when entering the sea and land, respectively, to harvest resources. For example, a man about to go on a sea expedition first had to reside for a specific period in the men's house to purify himself from existing sexual contamination. This period of isolation could last for a few days or a few months. Similarly, a woman who was menstruating or had just given birth to a child could not enter a garden or taro patch.

Yapese religious leaders and specialists could be either male or female, with the exception of the *p'eataliiw*, "most revered and powerful religious leader." The *p'eataliiw* was the primary spiritual leader of a village. A *tamaarong*, "magician," could be either male or female. By definition, a magician had the ability to manipulate the spirit world to bring about a desired outcome. Yapese magicians could be specialists in gardening, ceremonies, war, love, sickness, fertility, rain, fishing, dancing, and more. The services of a male or female magician might be sought for individual use or to benefit an entire village or an even larger political organization. Yapese magicians practiced both "white" and "black" magic. Whereas both men and women practiced "white" magic, only men practiced "black" magic. Divination, *bey*, was an integral part of the Yapese belief system, and both men and women could be diviners. Generally, it was the diviner who suggested the appropriate type of magic to be utilized.

LEISURE, RECREATION, AND THE ARTS

The greatest amount of leisure time for both young Yapese men and women is dedicated to dance. Elders participate in dance as well, but the amount of practice time is less than for those who must still learn the fundamentals. Yapese boys and girls participate in dance when they are as young as 5 years old. All village and multivillage ceremonies are accompanied by dances that play a significant part in the function being celebrated.

Yapese dances are strictly segregated by sex. Both sitting and standing dances are performed by young women, mature women, and sometimes mixed age grades. A similar breakdown occurs for men's dances. Certain dances categorized as erotic, "love dances," are

performed by both men and women. These dances are held only after the small children have gone to bed. Dance practices are always supervised by elders who teach and criticize the performance. Even when the dance is to be performed by women, the male leaders of the village determine when enough practice has taken place. On the day the dance is to be performed before the public, much attention is paid, by both male and female dancers, to their appearance. In addition to bright clothing, hibiscus skirts for women and loincloths for men, dancers also adorn themselves with brightly colored flowers, turmeric, and face paint.

Prior to the Japanese administration, Yapese men and women adorned themselves with tatoos. As a general rule, women tattooed their legs, arms, hands, and lower torso, and sometimes their genitalia. Women who were *mispiil*, "men's house mistress," had a distinctive tatoo pattern. Yapese men often had full-bodied tatoos. Elaborate tattooing for both men and women was restricted to the high caste. Low-caste men and women could adorn themselves with tatoos, but the patterns were limited, as was the amount of body that could be so adorned.

Prior to the German administration (1896), village warfare was commonplace in Yap. During these times, young men were required to dedicate much of their time to learning the intricacies of weaponry and battle. Many dances and games were specifically designed to train young warriors. Early accounts of Yapese warfare state that a formal declaration of war was always delivered by a man before the opening of the battle, but it always fell to a woman to make the initial peace offer (Muller, 1917).

Relative Status of Men and Women

The most obvious statement to be made about male–female relationships in Yap is that, compared with one another, men are considered *tabugul*, "pure," and women are considered *ta'ay*, "polluted." As a baseline principle, the "pure–polluted" classifications has an effect on all social, political, economic, and personal relationships between a Yapese man and woman. Generally speaking, it is the woman who must take the necessary precautions. With age, both men and women become less polluting, but a Yapese woman can never achieve the degree of purity available to her husband or brother. It is

the degree of pollution associated with a woman that dictates her daily movements and social requirements. Death, for example, is considered a highly polluting stage. A corpse is considered very *ta'ay*. As a result, bodies are buried on low-caste (polluted) lands and women prepare the body for burial. Conversely, a Yapese man has no contact with a corpse.

Notwithstanding the overall polluting nature of women, if one asks, "Who is the most important in Yap, men or women?" the response is generally "The woman." A man with many sisters is considered to be most fortunate, whereas a woman with many brothers is considered to be unfortunate. The rationale for this is simple: a sister must provide economic support for her brother(s) during many ceremonial exchanges.

Courtship and Marriage

Yapese, as typical Micronesians, conducted their courtships in relative secrecy. It could happen that a young girl was betrothed prior to her reaching puberty. Such arranged marriages were generally initiated by the fathers of both the girl and boy and were called *tabinaew ea ke m'aug*. When an adolescent girl was not restricted by this parental arrangement, early puberty was the time for dating and sexual exploration. It was generally the duty of a boy to establish the courtship. Rendezvous took place after dark and, prior to meeting, the boy and girl would spend considerable time adorning and cleaning themselves. The girl would sneak out to meet the boy without attracting attention from her parents. Courtship consisted primarily of conversation and sexual intercourse. It is important to note that, while premarital sex was accepted and approved, promiscuity or "sleeping around" during courtship was not.

If the courting couple decided that they would like to marry, the young man would express their intentions to his father. The boy's father would then select a close male relative to visit the parents of the girl, present them with a symbolic payment of "stone money," and announce the marriage wishes of the young couple. If the girl's parents agreed, they would accept the valuable and give "shell money" in return. (In Yap, stone money was considered a primary male valuable, while shell money was considered a primary female valuable.) Following this exchange, the couple had the necessary blessings and approval to live openly together and be seen in public.

Two other ceremonial exchanges solidified Yapese marriages. One followed the wife's first pregnancy and the other was after the birth of the first male child. Each of these ceremonial exchanges solidified the rights of the couple and their offspring to the estate and patrilineage. Marriage ceremonies united not only two individuals, but also two estates. Yapese marriage has always consisted of a bias toward rank and status along with a general rise in status for both a man and woman.

Although the newly married couple usually lived in a house of their own, Yapese residence rules generally followed a virilocal pattern, with the young couple residing on a parcel of land bestowed on the man by the leader of his estate. Polygyny was accepted in Yap, but was rare, except among the highest classes of the high caste. It seems that divorce has always been rather common in Yap, but any children born to the marriage remained with the father and his estate. If a wife were beaten or constantly mistreated by her husband, she could seek refuge in her natal estate. In such instances, her father would act as the mediator. Even in these conditions, if the marriage were terminated, the children would remain with the father. In the past, the levirate was practiced in Yap; following a man's death, one of his younger brothers would *mun fungiich*, "jump to a visit" (marry) his brother's widow and bring her children into his estate. In Yapese kinship terminology, a man refers to his brother's wife as "my wife." When a married woman dies, her spirit remains in the estate of her husband and does not return to her natal estate.

HUSBAND–WIFE RELATIONSHIP

Until recent times, the overall *tabugul–ta'ay*, "pure–polluted," belief system had day-to-day implications regarding husband and wife relations, interactions, and behaviors. For example, a husband and wife would never show affection publicly and, when traveling together, never walk side by side; the wife would always follow a number of steps behind. The layout of the traditional Yapese house best exemplifies the husband–wife restrictions.

The traditional Yapese house consists of one large rectangular room and a front and back veranda. The right side of the house is considered "pure," and that is where the husband sleeps. By comparison, the left side is "polluted," and that is where the wife and children sleep. The rear veranda is considered "pure," and that is where the husband entertains his male guests. The wife never sits on the rear veranda. The front veranda is considered to be more "polluted" than the rear, but the right side of the front veranda is more "pure" than the left, so when the husband is on the front veranda with his wife, he sits on the right side and she on the left.

When the wife of a man who was participating in the eating-class system entered the garden plot where food for her husband was to be collected, she would wear a grass skirt to be used only when entering the designated "pure" land plots. The husband's food was grown in plots separate from the rest of the family, harvested in baskets that were kept separate, and then cooked in separate pots. The restrictions associated with the men's eating classes were especially burdensome on the wife. And, at the end of the day, the Yapese husband and wife did not eat together.

OTHER CROSS-SEX RELATIONSHIPS

In the traditional Yapese estate, the oldest sibling, male or female, was the recognized authority figure. However, such authority was not permanent. If the oldest sibling were female, she would hold authority over a younger brother until he reached puberty, at which time he assumes leadership over all siblings. Girls in this situation were told by their parents that someday they would marry and leave the estate, but their brother would marry and stay within the estate. The prescribed relationships between a prepubescent and postpubescent brother and sister were as different as night and day. Young brothers and sisters were constant companions, playing and eating together in the company of their mother or friends. An adolescent Yapese male had little or no social restrictions pertaining to his relationship with his prepubescent sister. However, once a Yapese girl had her first menstruation, her daily interaction with both her younger and older male siblings was changed forever. When a sister returned to her estate following her first visit to the menstrual house, she would find that her father had built a separate sleeping place within the family compound. In addition, she would have a separate cooking place. During the months she spent in the menstrual house, she would receive instruction regarding behaviors and interaction with her brothers. No longer would she have a playful relationship with her brothers; new rules of strict avoidance accompanied any interaction she would have with them.

Following the first menstruation, a sister could no longer face her brother when conversing. Yapese refer to the period that this avoidance began as the time when a sister had the *bun dowangin ea piin*, "smell of a woman." With this change, a brother and sister had to sit side by side or back to back when talking. If a brother and sister should meet on a village path, the sister stepped off of the path and turned her back as her brother passed. A man never referred to his sister in any public forum. Many of the taboos that fell upon brother–sister relations were extended to include a man's sister's children, especially her daughters. Frequently, a married Yapese woman would *pof*, "adopt," one of her brother's children. By so doing, a woman would raise a child who was from her natal estate as her own.

CHANGE IN ATTITUDES, BELIEFS AND PRACTICES REGARDING GENDER

The last quarter of the 20th century represents a significant transitional stage in Yapese beliefs and practices as they pertain to male–female relationships. The American administration of Micronesia from 1945 to 1986 ushered in a new era of trade, education, and infrastructure, as well as a cash economy. The Yapese may not be as "modernized" as other Micronesian societies, but neither can one state that they have remained unchanged. The relationships between men and women in Yap today are reflective of the economic choices they enjoy. The availability of cash-paying jobs for both men and women and an open educational system (required up to age 14) has resulted in a shift in traditional patterns of courtship, marriage, and overall social behavior between men and women. Status in Yap is now sought and gained in ways unconnected to the traditional *tabugul–ta'ay* system.

The use of menstrual houses declined steadily from 1945–75 and has now ended. Yapese girls could hardly attend school and be forced to miss at least a week each month to go to the *dapaal*. Similarly, fathers no longer construct a separate house for their adolescent daughters; the daughters remain part of the main house even after reaching puberty. Although one would still not see a teenaged girl sitting on the veranda of a men's house, it is not uncommon to see younger girls within very close proximity of a men's house. Men no longer participate in the traditional eating classes except during certain ceremonial occasions. As a consequence, the restrictions placed on the wife regarding her daily gardening activities have been significantly reduced. Overall, it is fair to state that Yapese women have gained much freedom of movement during the last quarter of the 20th century.

The port town and capital of Colonia serves almost as a "tradition-free zone." It is quite common in Colonia to see young Yapese men and women dressed completely in Western attire, speaking with one another, and participating in courtship. The same could be said of the United States administered Yap High School which opened in 1966. When the high school first opened, it was not unusual for a brother who was in a class with his sister to be changed to another room. This is no longer the case since there is a general acceptance that brothers and sisters will eat in the same cafeteria, ride the same school bus, and take the same classes. School books, movies, and television shows depicting families eating together and brothers and sisters conversing and doing things together socially have all had an impact on changing the position of men and women. Cross-sibling avoidance is almost impossible in the Yap of today.

Courtship is more public, and marriage has become more personalized and individualized. Traditional marriage ceremonies are rare events today. Some Yapese opt for a church wedding, but, more commonly, young couples just live together. Yapese women with an education and/or job are taking more of an active role in selecting a spouse or making the decision to marry at all. Consequently, the number of female-headed households in Yap has increased greatly during the last few decades. Self-reliant single mothers are on the rise in Yap, and all indications are that their numbers will increase. Brothers and sisters now talk in public, but they still avoid conversations on sexual matters. Traditional kinship terminology is giving way to a kinship system that has been Americanized. Young Yapese boys and girls are unfamiliar with the details of Yapese kin terms and prescribed behaviors associated with them. Old limitations and restrictions placed on Yapese women continue to be lifted, and the quickly changing roles of men and women are finding a balance.

Yupik Eskimos

Carol Zane Jolles

ALTERNATIVE NAMES

Yupik Eskimos are also known as Siberian Yupik, Yupiget (plural form for Yupik), Massinga, and Yup'ik (older spelling for Yupik). Yup'ik and Yupiit (pl.) refer to a related, but culturally distinct Eskimo culture.

LOCATION

St Lawrence Island, Alaska, U.S.A. (Yupik name, Sivuqaq) is the homeland of Alaska's Yupik Eskimos. They are also called Siberian Yupik Eskimos to distinguish them from the mainland Yup'ik Eskimos of southwest Alaska. St Lawrence Island is situated at the bottom of the Bering Strait in the north Bering Sea that separates northwestern North America from northeastern Asia (Figure 1). There are two Yupik Eskimo communities on the island. Gambell (also called Sivuqaq), the older community, has roots that go back to 500 CE. Its location is a level gravel spit on Northwest Cape at the northwestern tip of the 102 mile long island; Savoonga, the younger community, was formed after 1914 and is located on the northern shore, about 40 miles east of Gambell.

Figure 1. St. Lawrence Island, Alaska, U.S.A.

CULTURAL OVERVIEW

Culture and Language

St Lawrence Island is home to two federally recognized Alaska Native tribes: the Native Village of Gambell and the Native Village of Savoonga. Together they constitute St Lawrence Island Yupik Eskimo society. The most closely related Yupik communities reside in Chukotka on the Russian mainland. The focus here is the St Lawrence Island communities. Residents speak Siberian or Chaplinski Yupik as their first language. The language includes both Russian and English loan words. St Lawrence Island Yupik is characterized by a large number of Anglo-American loan words that reflect the island's inclusion in the state of Alaska as well as the dominance of American culture in the community.

St Lawrence Island Population Characteristics

Total island population, according to the United States 2000 Census, was 1,292, with residents equally divided between Gambell and Savoonga. Like most contemporary rural Eskimo communities, the islanders support themselves by combining wage labor and subsistence work: marine mammal hunting, fishing, gathering of greens and berries, and related food-management tasks. Unlike most other Eskimo communities, kinship among St Lawrence Islanders is figured unilineally rather than bilaterally, and a distinguishing characteristic of St Lawrence Island and Chukotkan Yupik societies is patrilineal descent and overlapping patriclan-type units (Hughes, 1958, 1960). The island's engagement in the American capitalist system and the traditional subsistence system along with its continued adherence to a patrilineal kinship system are integral to understanding island gender concepts. Most importantly, the island is American, with all that this implies, and has been since 1867. Children and adults participate fully in contemporary American culture while maintaining a modern form of traditional Yupik culture.

Cultural Construction of Gender

Marine-Mammal-Based Subsistence Economy and Gender-Role Concepts

Regardless of extensive participation in the modern market economy, subsistence foods, primarily marine mammals, and their harvest, storage, and distribution are central to local economic and social life and are the basis for gender-defined tasks and concepts. Subsistence traditions are keys to the interpretation of male and female relations, male and female symbols, and values associated with men's and women's contributions to society.

Gender, the Patrilineal Descent System, and Gender Symbols

The patrilineal descent system and the patriclan structure provide the framework in which these relations, symbolic representations, and associated values operate and through which they are articulated. The gendered character of Yupik society is shaped by the division of subsistence task responsibilities between men and women and the complementary gender roles that grow out of this system, generating the symbols representative of each sex. For example, symbols associated with men such as the *angyapik* (walrus-hide hunting boat) derive from a man's role as a marine mammal hunter, particularly as a hunter of bowhead whales and polar bears. Symbols associated with women such as the *qayuutaq* (serving tray or meal tray) and the *ulaaq* (woman's knife) derive from her role as household manager, especially the preparation, storage, distribution, and serving of subsistence foods along with subsistence-related sewing tasks.

Gender over the Life Cycle

St Lawrence Island society is biased toward a male exercise of authority, reinforced by the patriclan kinship system and by a well-known system of respect for elders of both sexes. Senior men in particular, and older persons generally, have authority over younger, stronger over weaker, and males over females.

Socialization of Boys and Girls

In households, older children exert control over their younger siblings whether it be to demand their younger siblings' pieces of chewing gum or to pass on a chore that has been assigned to them by an elder. Elders seldom interfere with this process. As children grow older, male children assert dominance over female children, with fewer household tasks required of them and greater freedom given them. As boys become men, they have continuous alliance with their own male relatives, especially their brothers, parallel cousins, fathers, and fathers' brothers. These men usually work together as boat crew members. A senior man is captain of the walrus-hide hunting boat (*angyapik*) used for spring whaling. Women, who usually marry outside of their own patriclan unit, do not continue the close working relationships they once had with their mother, grandmother, sisters, and aunts.

The Socialization of Boys as Hunters.
Boys learn hunting tasks and equipment preparation from their older male kin. Instruction begins within the household when a boy is 6 or 7 years old or even younger. In contemporary communities (c. 2002), instruction by a boy's male family members competes with hours of attendance required in the local school, but public schools in Alaska make special allowances for male hunting tasks and allow school boys to take "subsistence leave" in order to help out their families with spring whaling or other hunting needs.

The Socialization of Girls as Food Managers.
Theoretically, girls could take subsistence leave also, but this is much less common. Girls, in contrast with boys, are unlikely to have mastered the subsistence-related sewing and food-preparation tasks once considered the hallmark activities and achievements of females until after they leave home to join their husband's family. For this reason, they are less likely to have the skills needed by their families in conjunction with subsistence work and less likely to ask for subsistence leave.

Recognition of Boys' Hunting Achievements.
When a boy takes his first marine mammal, usually a seal, his achievement is celebrated within the family in much the same way it would have been celebrated in the past. His mother or another female relative divides up his catch once he brings it home and carefully distributes all of it to senior elders, being careful not to keep any for the immediate family. The skin is carefully cured by his mother or another senior woman from his family and it, too, is distributed to an elder.

Recognition of Girls' Sewing and Gathering Achievements.

Because of the shift in learning traditional subsistence tasks among girls, a girl's sewing achievements or food-gathering and/or preparation achievements are less likely to be celebrated at home, since these will most likely take place after she has married or in the context of instruction in a "culture" class in the local high school. In the past, these tasks would have been mastered at home under the instruction of a grandmother or an elderly aunt (one of her father's or grandfather's unmarried sisters, or one of her father's brother's wives) and celebrated within the home. A girl's first sewing accomplishment would have been given to a senior elder. Her first collection of greens or berries would have been given to a senior woman outside her immediate family or to a respected widower.

Puberty and Adolescence

Contemporary Experience of Puberty and Adolescence among St Lawrence Island Yupik Youth.

Today, boys and girls experience puberty and adolescence much as other teenagers in the United States. Theirs is a world of clothing, dates, school dances, and worries about diet. This is likely to be a time when young people reject traditional Eskimo foods and no longer don "traditional" Eskimo clothing such as the brightly colored gingham parka covers that older women in the community sew and wear. Pizza, soda pop, and chips figure prominently in the diets of St Lawrence Island teenagers. Staying up all night to listen to the latest teen rock, rap, or hip-hop singer is common, as is viewing videos starring the latest movie or television idol. During the period 2000–2002, teenagers were swept up in hair fashions. Teenaged boys and girls peroxided their naturally dark brown or black hair with stripes of red, blond, or even blue or green color, much to the dismay of their parents and grandparents.

Experience of Puberty and Adolescence among St Lawrence Island Yupik Youth in the Early to Middle 1900s.

Adults who entered adolescence through the 1940s had a different kind of experience. At that time it was common for a girl entering her teens to begin the tattooing on her face, hands, arms, and even breasts that would mark her as a young adult. Only a few women in their eighties and nineties were still alive in 2002 who could show these tattoo patterns on their bodies. Boys, who would have commenced boat hunting with their male relatives by the time they reached their teens, or perhaps even have participated in a funeral, were tattooed at their joints and on the corners of their mouths. Girls and boys would have been promised in marriage even before they entered puberty, a pattern that continued into the 1940s and 1950s. Girls were often married at a very young age, in their early teens, and their behavior was carefully monitored until they actually married. Boys were more likely to be married in their twenties. Once young people reached their teens, they began to take part in courting games that took place on the beach in spring. Ball games, played between boys and girls, were especially popular. These games could only begin after the community took its first whale of the season and after all major tasks involved in honoring the whales had been completed by each patriclan unit. Courting and subsistence were connected in this way.

Attainment of Adulthood

Probably the most important single rite of passage that moved and continues to move a boy or girl to manhood or womanhood is marriage and/or pregnancy. Often pregnancy is the motivation for marriage in the present. However, many choose not to marry. This is a difference from past practice when almost everyone married. Not surprisingly then, marriage itself is where many of the distinguishing elements of gender distinction can be found.

Middle Age and Old Age

Middle age for both men and women is a time of hard work. Most men and women are married and have children and grandchildren by the time they reach middle age. Men will have achieved some measure of success as hunters and women as food managers by this time and most will have several children in the community schools. Because of the need for cash, this is also a time when men and women are likely to be employed in both aspects of the economy, carrying out extensive subsistence work while also working at some form of wage labor. In subsistence work, men work most closely with other men of their family at this time, as do women. In wage labor, by contrast, men and women share work

places and also work with persons other than those of their own immediate patrilineage or clan.

GENDER-RELATED SOCIAL GROUPS

Patrilineal Descent Groups

The patrilineal descent system with patriclan divisions, which still dominates in Yupik society, originally created a pattern in which women lived and worked together with the women in their husband's family's home or with close relatives from the patriclan unit living in one of several settlements scattered all around the island shore. The same was true for men.

Housing and Patrilineal Descent Groups.
Following a devastating famine and unidentified epidemic between 1878 and 1880, a significantly reduced population gathered first at the present site of Gambell and later divided into the two current communities. New homes were built in these concentrated settlements with residents positioning themselves by clan group or lineage group. This pattern continued until the U. S. government began to build new housing in both communities and to make that housing available to nuclear families following similar patterns common in the rest of the United States. Currently (c. 2002), women work with their husband's female relatives in homes situated near their own homes or travel across the village to join together in family groups. Men of the same lineage or clan work together when they travel to the beach or when they embark on a group project such as boat-building. Since the 1970s, the clan and lineage groups have begun to intermix in the collections of new homes, but so far it has not significantly affected the work-group pattern and the older pattern can still be discerned.

Community Organizations

Other institutions in Gambell and Savoonga include the corporations (Sivuqaq Incorporated, Savoonga Incorporated), the tribal councils (the Native Village of Gambell, the Native Village of Savoonga), the schools, the churches, and the Boat Captains' Associations. With the exception of the Boat Captains' Associations, there is no specific gender division present. However, in general, more men tend to be members of Boards of Trustees than women, although both sexes can be found on all community boards.

GENDER ROLES IN ECONOMICS

Both men and women participate in both aspects of the island's economy—the cash economy and the traditional subsistence economy. Cash comes from employment in the few hourly wage paying and salaried jobs and from unearned income. According to the U.S. 2000 Census, unemployment was high in both communities: 19.8% in Gambell, and 37.4% in Savoonga. There appears to be little gender-based discrimination associated with employment itself. In summer, men and women work together on community utility projects or serve as village tour-group guides. Men and women work as schoolroom bilingual aides and clerks, fill maintenance positions for the Bering Strait School District and community-based public agencies, and enlist in the armed services. While little overt discrimination is evident in wage labor, this does not mean that equal numbers of men and women work in the market economy. Until the early 1980s, most women worked primarily in and around their homes and summer camps. Nevertheless, when women do put themselves forward, their efforts are supported by community members. Discriminatory work-place pressures appear to come from clan or lineage conflicts rather than gender conflicts.

The summaries below illustrate the level of participation of men and women in wage-labor jobs and in subsistence-related work for the community of Gambell in 1993. The summaries are drawn from research that first appeared in Jolles (1997). Research in 1993 indicated that, at least in Gambell, the more conservative of the two communities, both men and women were employed in both types of work. Some jobs are distinguished by gender, but many were filled opportunistically. A few jobs, such as operation of heavy equipment, are reserved for men. Women were more likely to do food-preparation work in the school. It is unclear, however, whether a man would have been prevented from performing this type of work. Subsistence jobs, in contrast to wage-labor jobs, are highly distinguished by gender, with hunting work performed by men and food-management and sewing tasks performed by women.

Participation in the Cash Economy and the Traditional Subsistence Economy

Summaries of data indicating levels of participation in the cash or wage-labor economy and the traditional subsistence-based hunting economy in Gambell in 1993 are given in Tables 1–4.

Table 1. Household Data for the Native Village of Gambell (1993)

Total number of households	116
Nuclear family households	45
Extended family households	47
Bachelor households	24

Table 2. Part-Time and Full-Time Job Data for the Native Village of Gambell (1993)

Wage-labor jobs filled by a man in 1993	14
Wage-labor jobs reserved (usually filled by) for men	6
Wage-labor jobs filled by a woman in 1993	21
Wage-labor jobs reserved (usually filled by) for women	4

Table 3. Subsistence Worker Data by Gender for the Native Village of Gambell (1993)

Retired full-time subsistence workers	11 men; 0 women
Full-time subsistence workers	74 men; 52 women
Part-time subsistence workers	74 men; 62 women
Total number of part-time and full-time subsistence workers	148 men; 114 women
Total number of households with subsistence workers	102+ households

Table 4. Wage Laborer Data for the Native Village of Gambell (1993)

Retired full-time wage laborers	8 men; 0 women
Full-time wage laborers	64 men; 64 women
Part-time wage laborers	17 men; 4 women
Total number of full-time and part-time laborers	81 men; 68 women
Total number of households with active wage laborers	69+ households

Property Ownership

Both men and women are heads of households in the two communities and are also likely to be property owners. This refers only to homes and not to land, however. As a result of the Alaska Native Claims Settlement Act of 1971, tribal land is owned in common as shares. Thus no individual owns the land on which his or her house sits. Homes can and are passed on to children and grandchildren. Overall, more men in their roles as husbands own homes than women. When a husband dies, his wife assumes ownership, suggesting that homes are essentially joint property. Men and women are each likely to have ownership of other valuable goods such as snowmobiles and all-terrain vehicles, while hunting-specific equipment belongs to men and equipment needed for sewing, household management, and management of game, once it has been delivered to the home, belongs to women.

PARENTAL AND OTHER CARETAKER ROLES

Parental Roles

Men and women share parental roles. Children are highly valued and both men and women take on the tasks of infant care and feeding, changing diapers, and child supervision (baby-sitting). Older brothers and sisters also share in these tasks, and it is quite usual for a teenage boy to change diapers or give a baby bottle to an infant sibling. However, older sisters are more often asked to care for younger brothers and sisters than older brothers. This is, in part, because older brothers are more likely to be engaged in hunting tasks, but it is also because childcare is considered a more female task than a male task. Between 1990 and 2000, there was an increase in the number of grandparents taking over the care and supervision of their grandchildren, although there are no data to demonstrate the degree of change.

Tribal Adoption of Children

On St Lawrence Island it is also common for babies to be adopted by other members of the family through "tribal adoption" procedures. This takes place for a number of reasons and is a decision that can be made by a senior elder, that is, the husband's parents or grandparents. It can

also be made by the couple, but not without the endorsement of the husband's senior family members. Marriage is not complete without children. When a couple is childless, a sister or sister-in-law will give up a new baby to them. Elderly couples are sometimes given babies to raise so that they will not be lonely. In some instances, the first-born child of a newly married couple will be given to the young wife's parents to take her place. When a couple has many children, a baby may be given up for adoption because of the difficulty the couple faces in trying to manage another child.

LEADERSHIP IN PUBLIC ARENAS

Male Leadership

Until the 1980s, most leadership roles in the community were held by males. It was also less common for girl children to be allowed to continue their public-school education beyond the sixth or seventh grade. Elementary schooling was available in the communities, but high school required leaving the home community to attend one of several American Indian boarding schools operated by the Bureau of Indian Affairs. The net result was that men were more likely to have completed a high-school education than women. They also had more experience dealing with the world beyond the island where English was the commonly spoken language. In most respects, a woman's place was considered in her father's or her husband's home. In the 1960s and 1970s, a few young women began to attend high school. In 1980, the communities experienced increased communication with the introduction of television. Homes already had telephones, but television was a way to bring the outside American lifestyle into the home. As the population increased, more young people were also exposed to non-Native teachers and non-Native expectations. In 1976, the community built its own high school and with this and the increased level of communication generally more young girls began to receive a high-school education and both boys and girls began to consider seriously the importance of college.

Female Leadership

In 2002, both men and women served in positions of community-level leadership, as directors and managers of the local Native corporations, as village mayors, as members of the city council, and as elected board members of the Tribal Council organization and the Native Corporation. Both men and women have managed the village cooperative all-purpose grocery and dry goods store. Men and women hold positions in the village health clinic and men and women both serve on the advisory education board. Only positions on the Eskimo Whaling Commission and the Eskimo Walrus Commission are reserved exclusively for men.

GENDER AND RELIGION

Christian Conversion

Contemporary St Lawrence Islanders are members of two Protestant Christian denominations, the Presbyterian Church and the Seventh-day Adventist Church. Christianity was introduced by American teacher–missionaries beginning in 1894, and by 1940 many in the two communities had embraced Christianity. Both men and women sought baptism and the dominant church, the Presbyterian, has regularly had both men and women as church leaders. In Savoonga, one woman has become an ordained minister and has done extensive missionary work in Russian Yupik communities in Chukotka.

Traditional Spiritual Leadership

In the past, however, spiritual leadership was in the hands of shamans and highly successful hunters, who had acquired significant spiritual power to enhance their hunting success, and reflected both the importance of hunting and a preoccupation with the spirits that made successful hunting possible. The community was focused especially on the taking of whales and polar bears. Nevertheless, the ritual ceremonies that were meant to bring food into the communities involved men and women participating together.

Rituals

General Hunting Rituals.   Nowhere was the exchange or complementary performance of duties more visible than in the performance of religious duties. Captains of whaling boats and their crews were significant actors in the major

ceremonies, but at the same time women also played critical roles as both food managers and performers. Food preparation was carried out as an extension of household duties, but food itself was central to all ritual performance. Gifts of food to ancestor spirits as well as the spirits of the great sea mammals were deemed pleasing to *Apa* (translated literally as great-grandfather), the being now understood to be the Christian god (Jolles, 1990, 2002), and could not be undertaken without the able participation of women. Women's ritual duties performed in conjunction with subsistence suggest that their ceremonial roles were highly valued by members of Sivuqaq society.

Whaling Rituals.   The rites associated with the taking of a bowhead whale figured at the center of island religious belief and practice in a series of rituals performed over several months. Each phase included male and female ritual components. Women prepared and stored the foods which accompanied each ritual. Both men and women recited prayers and sang songs at the beginning of the whaling season. Women also performed rituals that would assure the sanctity of the walrus-hide hunting boat *(angyapik)*; they paid respect to the whale's spirit with special songs, they sang welcome songs when successful boat crews, and they respected the taboos that accompanied a successful harvest. Whales, in turn, were the source of the symbols that marked the rites of passage in a person's life: taking a whale or polar bear, and participating in a funeral. Tattoo markings that men and women received in adolescence derived specifically from bowhead whales (Dorothea C. Leighton Collection, 1940: Paul Silook: *Autobiography*, pp. 103–112; Moore, 1923, p. 345). A whale's tail tattoo on men's joints and on women's hands and cheeks showed that they had participated in these activities. Marine mammals and their harvest supplied the symbols and served as the basis for the complementary participation of men and women in this activity. In this and other matters of ritual, women received equal recognition and/or participated in a meaningful way on such occasions.

Rituals and Hunting Success.   At one level, all hunting rituals tend to highlight the cooperation of men and women in the physical and spiritual aspects of subsistence. On another, they demonstrate the manner in which respect for each gender is maintained through an ideology based on obligatory exchanges. Whaling is especially important as an illustration of maintaining respect. In Gambell and Savoonga, as elsewhere in the Arctic, human–animal relations are often explained as exchanges among "persons." While hunters maintained respectful relations with the animals they hunted, especially the whale and the polar bear, no man hunted alone. His wife was an integral member of the hunting party although she did not actually sit in the boat with him.

Hunters, particularly boat captains, depended on their wives' behavior at home during the hunt. For instance, if a captain's wife moved slowly and stayed quietly in doors, whales were more likely to be drawn to his boat. If his wife paid no attention to her movements while her husband was out hunting, the whales would be aware of her disregard for this hunting rule and take themselves away from the unfortunate hunter.

While the significance of a wife's behavior and her observance of special hunting rules is well-known in Arctic communities, on St Lawrence Island these observances had their own particular features and characteristic behaviors. For example, in one of the two largest clans, the Aymaramka, once a whale had been killed, the boat captain and his crew returned to shore. Their *angyapik* (walrus-hide boat) was greeted on the beach by the captain's wife. She held up food offerings that she gave or "showed" the animal and Kiyaneq (a powerful spiritual figure) in a small baleen bucket. Her gift was an important indication of respect for the slain animal and an indication of its welcome in the community. For the occasion, the captain's wife dressed in a specially designed and decorated parka of bleached seal intestine with auklet feathers of red and blue sewn into the narrow parallel seams. After all offerings had been completed, the captain and his striker (the man who actually harpooned the whale) stepped from the boat. The wife, in her symbolic role as whale and woman, took part in a metaphoric reenactment of the whale's gift of itself to the captain and his crew. The captain's wife spread her legs wide so that her husband could hurl the harpoon between them (Collins, Henry Bascom, Jr. (1899–1987), Papers: Paul Silook's Notes 1928–32). Once this dramatic reenactment had concluded, the wife gave fresh water to the whale so that it might truly feel welcomed to the land and to her home.

LEISURE, RECREATION, AND THE ARTS

Small villages have limited forms of entertainment available. On St Lawrence Island, the community schools have gymnasiums that are used for basketball games. These

games are perhaps the most constant local entertainment that involves whole families. School teams and local men's and women's teams compete on a regular basis. During the school year, "open" gym nights allow young people to engage in athletic games and other activities.

The communities also sponsor nightly bingo games for adults. These are very popular since they combine adult games with financial rewards. Individual families play cards and board games together. Scrabble and Yahtzee are popular. Men and women play these games together. Adults and children alike play Nintendo and other computer games. Family members vie with each other for access to the equipment.

Church-sponsored events also attract both men and women. Church events are especially in evidence during holidays. The same is true for other community events. Traditional dancing and singing are both entertaining and a feature of most community celebrations such as Thanksgiving and the fourth of July. At Thanksgiving, Christmas, New Year, and the fourth of July, all members of the communities join together to cook village feasts and to engage in dancing, singing, and traditional athletic events.

Outdoor activities such as crabbing combine a subsistence activity and an entertainment. Large numbers of adults, particularly middle-aged and older adults, enjoy crabbing. It draws both men and women out onto the winter ice. Men and women also go out for rides across the tundra on all-terrain vehicles and snowmobiles. In summer, everyone who does not have to work at a wage-labor job travels to summer camp to fish, to hunt birds, and to spend time away from the village.

These leisure activities engage both men and women. Community leaders from the various community organizations (corporations, mayor's offices, tribal councils) work together to organize the community-wide celebrations. There seems to be no particular distinction among organizers, and men and women work together on these tasks.

Divisions between the sexes do not seem to characterize modern leisure time activities to any extent. Sports activities are both mixed sex and sex specific. For example, men and women play basketball together, or alternatively, compete among themselves, or have "male" versus "female" team competitions.

Some leisure time activities actually contribute to household income. For instance, artistic production such as ivory carving or skin sewing could be considered both a leisure activity and a form of self-employment.

Those who work most consistently are those who are engaged both as wage earners and as subsistence hunters and food managers. These are the persons least likely to have much leisure time. Both men and women engage in both aspects of the local economy and are those who often attain leadership positions because they are so productive.

RELATIVE STATUS OF MEN AND WOMEN

Status within the Family

Male Status. Men have always had significantly greater status and concomitant authority than women in St Lawrence Island Yupik society. While the occupations and duties of men and women have changed over time, men continue to exercise more authority in the community than women, regardless of the changes that have taken place. The patrilineal kinship system focused and still focuses on male patrilineal and patrilateral ties. Men maintain these relationships throughout their lives. Hunting, through which men provide most of the protein consumed in the community, continues. As a result, men who hunt are held in especially high regard, as they were in the past. In the past, a man could expect to arrange to have more than one wife, based on his hunting achievements and his successful management of the men under his immediate authority within his household and his boat crew. Hunting thus not only reinforced kinship ties, as it does today, but it opened avenues to increased number of offspring and greater political influence within the society on the basis of numbers of persons under a man's direct influence and control. While taking more than one wife is no longer acceptable, men still reinforce their overall position and solidarity through patrilineal and patrilateral kin ties with their hunting partners. Men are and were the heads of households. They were also the most powerful of the pre-Christian religious figures (the shamans or *alignalghiit*) and the most important political leaders. The position of men as heads of households has been reinforced by the adoption of Christianity which gives emphasis to men's authority within the home.

Female Status. Women, overall, have less status and authority in St Lawrence Island Yupik society than do

men. The patrilineal kinship system dictates that women move from their birth homes, within their fathers' households, to their husbands' households. In a woman's husband's household, she is subservient in the beginning to her husband's older unmarried sisters, to her husband's brothers' wives, and especially to her husband's mother. A woman's status does change, depending on the number of children, especially male children, that she contributes to her husband's family. It also changes dependent on such factors as her contributions to household and her personality. A woman is required by marriage to follow her husband's wishes. In general, women ask permission of their husbands before carrying out any important task within the family. A woman is also under the direct authority of her mother-in-law, an arrangement that suggests that if she survives long enough, she too will become a mother-in-law, a position that will increase her status and authority within the family.

Status within the Community

Numerous changes have taken place in St Lawrence Island Yupik society since the 1950s. Not the least of these is the imposition by the U.S. government of several communitywide organizations through which the society is managed. These include a tribal form of government (introduced originally in 1934 through the Indian Reorganization Act by the federal government), a mayor and city council (Gambell and Savoonga are considered second-class cities by the State of Alaska and as such are to be administered by a mayoral form of government), and a Native corporation (each community has designated lands as a result of the Alaska Native Claims Settlement Act of 1971, and these lands are administered by the Gambell Native Corporation [known as Sivuqaq Incorporated], and the Savoonga Native Corporation [known as Savoonga Incorporated]). Each of these organizations is a source of local employment and of relatively powerful management positions within the community. Both men and women work in these offices as administrators, as managers, and as assistants and secretaries. Nevertheless, men are perceived as more authoritative and of higher status than women in the communities' administrative bodies. This is true regardless of whether a man or a woman is serving as mayor or as head of a tribal council. In the case of the tribal councils and the land corporations, men are more prevalent and more powerfully situated than women on the corresponding Boards of

Trustees. Boat Captains organizations are exclusively male. No corresponding female organizations exist.

SEXUALITY

Male and female attitudes toward sexuality are both natural and healthy, in most respects. Until the arrival of missionaries in 1894, men and women wore few items of clothing within the home. Both wore leather briefs, sometimes decorated with a fringe or beadwork. Women wore wide ribbons of leather crisscrossed across their breasts. These ribbons, to which were attached beads and amulets, were both decorative and protective. Small children often wore no clothing inside the small warm traditional dwellings. Missionaries instilled a sense of embarrassment and shame in regard to covering the body that had not existed prior to their arrival. The traditional Yupik society also included, as a part of its social and religious organization, an accepted system for extending family boundaries and responsibilities through formalized spousal exchanges. These relationships were passed down generationally through the male line. Two men from different lineages became partners and gained rights to each others spouses. These were named relationships.

Women's menstrual blood was considered dangerous, and care was taken to prevent a menstruating girl or woman from touching or stepping over any hunting implements. Additionally, women were not expected to go out in the hunting boats because their presence could keep game away from a hunter. While some of the feelings about menstrual blood seem to have disappeared in the present, attitudes about a woman's presence in a hunting boat still prevail.

Lovemaking, premarital sex, and attitudes toward sex are quite relaxed, as are attitudes toward other bodily functions such as elimination. It is not at all uncommon, for example, for a young unmarried couple to sleep together in either of their parents' homes. In the present-day communities, as elsewhere in the United States, however, spouses and boyfriends/girlfriends are expected to practice fidelity. When someone in a recognized partnership is unfaithful, the cuckolded partner is often jealous and hurt, and such behavior has been known to precipitate domestic abuse. In general, women are expected to practice modesty to a greater degree than men but, overall, modesty is expected only when outsiders are present.

Both young men and young women begin to cover themselves when they become teenagers. Before that, modesty is not a major concern. In the past, sexual expressions, both heterosexual and homosexual, were recognized terminologically. Such expression does not seem to be an issue, although some sexual joking does occur when someone is known to be homosexual.

COURTSHIP AND MARRIAGE

Marriage Arrangements, Brideprice, "Groom's Service," and Tradition-Based Marriage Ceremonies

The pattern whereby men continue to work together within their families and with their fathers, brothers, and uncles as their primary allies, while women marry away from their original support base and must develop a new support base, is illustrated best through a description of the marriage process. (This discussion of courtship and marriage is based on Jolles [2002, pp. 121–149] and Jolles and Kaningok [1991].) Marriage itself was once arranged by senior elders, and contemporary gender concepts and living patterns reflect older patterns common in the late 1800s and early 1900s. One aspect of marriage was lineal and clan alliance. Only since the late 1960s has it become accepted for young people to "marry for love." Marriages in 2002 still included a "buying" ceremony in which the groom's *ramket* (clan group) collected gifts to be presented to the bride's *ramket*, particularly to the members of the bride's lineage. While no strict rules of exogamy apply in the village, the two largest clans, Pugughileghmiit and Aymaramka, regularly perform "buying" ceremonies and arrange marriages between them. A groom's work period (a local term for what is usually referred to in the anthropological literature as "bride service") of 1 year is combined with temporary matrilocal residence in the bride's father's home. A return gifting ceremony concludes the temporary residence period and the married couple return to the groom's family, escorted by the bride's patrilineage. In 2002, traditional marriage was reinforced, upon completion, with marriage in one of the two local churches, either the Presbyterian Church or the Seventh-day Adventist Church. The bride, having become a wife, gave up her close ties to her father's patrilineage and assumed membership in her husband's father's household. Her name, once included among those in her father's line, could be added to the roster of names in her husband's lineage. She began instructions from her mother-in-law and her husband's patrilateral aunts (his father's unmarried sisters and his father's brothers' wives). Her husband's family then expected her to allow her girlhood friendships and ties with the female relatives of her father's lineage to diminish and new friendships to develop with his unmarried sisters and his sisters-in-law. When a bride received meat brought home by her husband and his male relatives to distribute, she was expected to distribute to the women of her husband's lineage, while it remained her husband's respectful duty to make sure that his new bride's mother received some of his catch.

The Effects of Kinship on Female Status in Marriage

Local marriage contracts, identified as "buying a woman" or "stepping on" the bride-to-be symbolize a woman's transfer from her parents' home and control to that of her husband and his family. The general pattern is one in which male solidarity is reinforced when women join their husband's family. At the beginning of a marriage a woman has yet to form the new alliances and friendships with her husband's female relatives and therefore she has very little support. However, several factors affect a woman's relative authority. The first factor is that the longer she remains in her husband's household and bears his children, the more consideration and respect she receives. If she lives to old age, her husband's family members will consider her an elder of their line. If she outlives her husband she might even be considered a senior elder in her husband's lineage, with the authority to select names for the newest members of the family. A second factor is that she can gain respect and authority through her skillful handling of subsistence resources and her management of the celebrations that are associated with those resources.

Another factor that affects gender status and the relative authority of men and women within families and patrilineages is the role of exchange. Kinship, marriage, and most activities are expressed in the communities through obligatory exchanges. These exchanges, found at every level of Sivuqaq society, are potentially capable of generating respectful relations between men and women.

Giving and receiving are considered contracts between individuals and patrilineages. Both giving and receiving (or asking) imply the value or respect accorded the participants. While marriage is a "buying" ceremony, for example, parties to the marriage are valued precisely because they do honor the contractual arrangements. Although young men and women marry "for love" these days, marriage is still initiated through a formal request. The elders of the young groom-to-be travel to the home of the bride-to-be and make a formal request of the parents and other senior clan members for the young woman. These requests affect social relations between the two lineages, and possibly between the two patriclan groups of which they are a part, for years to come and also affect the way in which the girl will be treated by the boy's family. It is at this point that the young woman's family can choose to reject the young man, regardless of the desires of the young people. Once permission is given for the marriage, the young man's family gathers gifts to cement the contractual arrangement. Goods given to a woman's family imply both respect for her family and her own worth as a prospective bride. That respect is then advertised when the groom's *ramket* parades through the village with gifts piled onto sleds, all-terrain vehicles, and snowmobiles. Once the ceremony is finished, the groom-to-be moves to his fiancé's father's house to begin his service. The contractual arrangement between the two lineages is not complete until the young woman is escorted by her clan members to her new home along with a new collection of gifts to present to her husband's family. The series of exchanges demonstrate respect for both patrilineages and suggest that both the bride and the groom are worthy of respect as well.

Regardless of the "balancing effects" of the marriage contract, the patriclan system strongly influences gender status. Marriage is still understood as a conceptual transfer of "belonging." In addition, male authority within marriage has been enhanced by the society's acceptance of Christianity. Women routinely ask permission first of their fathers and later of their husbands when they wish to engage in some activity, whether it is a serious step such as a trip to the mainland for medical treatment or accepting a job as a wage earner outside the home, or simply taking a ride down the beach or going to visit someone in their free time. The assumption is that girls were especially under the authority of their elders and their parents, with males within the family having more authority than females. Once they are married, girls "belong" to their husbands and are expected to ask permission to engage in many routine tasks or to participate in routine events.

HUSBAND–WIFE RELATIONSHIP

Arranged Marriages

Older marriages, those that were the result of arrangements made by clan elders, vary rather extensively in terms of degrees of love, affection, and companionship. In some cases, men and women who have been married as long as 40 or 50 years remain hostile and aloof, even after producing many children. On the other hand, these same men and women eat, sleep, and spend time together. Because of the degree to which males are recognized as "heads" of households, men in these families are the decision-makers. In these older marriages, too, there is more likely to be a focus on traditional subsistence work rather than wage labor. Subsistence work is generally gender defined, so that these men and women are less likely to work outside of the home in mixed male–female company. Depending on the relationship which the wife has with her husband's lineage, she may find herself doing much of her work alone because of the unsettled nature of her marriage relationship.

Contemporary Marriages (After 1950)

Marriages taking place after the 1950s and 1960s, in which the couple have been actively involved in choosing their partner, are much more likely to be affectionate, loving, and companionable. In these families, husbands and wives almost always eat together, sleep together, and spend their spare time together doing such things as taking rides down the beach. Household decisions usually involve a lot of discussion between the two spouses before the husband actually "makes" a decision. Within households, however, the relatively strict gendered division of subsistence tasks is maintained. Men seldom do cooking or food-management-related tasks. Women are unlikely to work on boat-carpentering tasks or to repair hunting equipment.

In the past, the most successful men sometimes had more than one wife. This was a tribute to their ability to feed two families. Such an arrangement has not existed in

the St Lawrence Island communities since the early 1940s when members of both communities were baptized into the Presbyterian Church.

Divorce

In the past, even when a marriage was not satisfactory, divorce was uncommon. Divorce itself was a recognized feature of the society, but it was instituted by the husband's family or the wife's family for specific reasons. The husband's family might initiate a divorce if the young woman was infertile or lazy (i.e., if she failed to perform the necessary food-management and sewing tasks required of a woman). The wife's parents might initiate a divorce (or a temporary "pulling back" in order to renegotiate the terms of the marriage) if the husband was abusive or if he failed to provide her with food and shelter. If the divorce became permanent and there were children from the marriage, the children remained with the husband's family since, through the patrilineal system, they belonged to the husband's "side."

In contemporary society, there are two types of divorce. The first is traditional and includes leaving the children with the husband's family. The second type is through the American legal system and involves going through the courts and accepting whatever decision about the placement of children is mandated by the court. Either husband or wife can initiate this process. While a few divorces do take place, divorce is still uncommon in the communities. The reasons for divorce include infidelity, problems with alcohol, and problems with abusiveness. These same problems often precipitate divorce in other American families.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The most significant changes have occurred in conjunction with the shift away from the traditional Yupik cultural and economic system and toward the American mixed-market system, the adoption of Christianity, and the institution of American-style public schooling. In other words, Yupik society is in the ongoing process of modernizing and becoming a full participant in the globalizing world system. Men and women work for wages, increasingly depend on the media for ideas about how men and women should behave toward each other,

respond to notions about consumption of "male" and "female" products, draw conclusions about "love and marriage" from the American media, and seek educational opportunities away from their home communities and are thus influenced by all of the non-Native cultures that they encounter once they leave home. These changes are so numerous and comprehensive that it is impossible to detail them all. And, it is ongoing.

Yuquí

Allyn MacLean Stearman

ALTERNATIVE NAMES

Biá or Mbiá (the "m" preceding the "b" may be used to indicate nasalization) is the name the Yuquí call themselves, which means "people" or "human beings." The origin of the name "Yuquí" is unknown, but may have been derived from the frequently heard kinship term, "yaqui," meaning "younger relative." Yukí is an alternative spelling. The Yuquí have appeared in some writings and in the local vernacular as "Chori." This is a pejorative term meaning roughly, "savage," and is probably of indigenous origin. It is employed by Bolivian nationals to mean any uncontacted group of native people who reside in the forest.

LOCATION

Prior to contact, the Yuquí traveled over a large territory in lowland Bolivia that included parts of the Santa Cruz and Cochabamba Departments. As a nomadic foraging society, they rarely camped in any one place for more than a few days, moving continually in search of food and to avoid hostile encounters with local farmers, ranchers, and loggers.

Today, the Yuquí are settled at a New Tribes Mission community on the lower Chimoré River in the westernmost part of the Department of Cochabamba (64°56′ W, 16°47′ S) now called Biá Recuaté which means "the place of the Biá (people)."

CULTURAL OVERVIEW

The Yuquí are most likely descendants of remnant groups of Guaraní warriors and their followers who frequently traveled from what is now Paraguay into Eastern Bolivia in search of captives. They bear cultural and physical similarities to Parguayan peoples such as the Aché. Many of these forays were occurring at about the time of the European conquest, which may have disrupted movement through the region and ultimately trapped several of these groups in the Bolivian lowlands. The Yuquí are also linguistically related to other Tupí-Guaraní-speaking indigenous peoples in eastern Bolivia now known as the Guarayo, Chiriguano, and Sirionó.

With a long-standing history of warring with virtually all other groups sharing their territory, the ancestors of the people now known as the Yuquí continued to retreat into the more remote areas of the lowlands to avoid hostile encounters. Their numbers were probably never large to begin with, but further reduction of the Yuquí population occurred when colonists moved into Yuquí territory and encounters became more frequent. This reduction in population no doubt contributed to Yuquí deculturation, or a gradual loss of cultural content.

The process of deculturation is the most probable explanation for the apparent inconsistencies that mark Yuquí culture. At the time of contact, they were true foragers. Even the Sirionó, often described as a "classic" hunter–gatherer people, seasonally planted crops. The Yuquí did not engage in any form of horticulture, yet they maintained common Tupí-Guaraní words in their vocabulary for domestic plants: *dió* (manioc) (*Manihot esculenta*) and *ibachí* (corn) (*Zea mays*). They also had a more formal system of leadership than one would expect to find among a foraging band. Leadership was inherited through males and there was a "line" of male leaders that was generally followed. In addition, and perhaps most remarkable of all, the Yuquí had a hereditary caste system of slaves, something unknown among foragers. At the time of sustained and peaceful missionary contact with the first group of Yuquí in the mid-1960s, there were only 43 people remaining in the band. Yet they had managed to sustain a system that designated certain individuals as slaves (*Enembaco*) and others as masters (*Saya*). Since their numbers were so depleted, *Enembaco* and *Saya* often had to intermarry, but rules of patriliny prevailed: children of *Saya* fathers were *Saya*; children of *Enembaco* fathers were *Enembaco*.

Until the time of contact and sedentarization, the Yuquí not only had no functional relationships with any outside groups, but also considered other Yuquí bands,

from whom they had split a few generations earlier, enemies and evil spirits. Thus each band of Yuquí probably only three or four in existence by the 1970s, thought of itself as the only living people on earth.

The band rarely camped in any one place for longer than 3 days. These camps were compact, with the entire group sleeping in a tight circle of hammocks for protection against jaguars or other intruders. The Yuquí built no structures and had lost the ability to make fire and so it had to be carefully preserved.

Yuquí material culture was also limited. To a large degree this is true for all people who are nomadic. Nonetheless, the inventory of material items the Yuquí possessed was extremely sparse. Women were string-makers, working with the shredded bark of the *imbai* tree (*Cecropia* spp.) which was twined into string for making hammocks, baby slings, bowstrings, and bindings for arrows. Men made bows and arrows that were over 2m long and constructed from black palm wood (*Bactris* spp.) Arrows were of only two kinds: a barbed arrow used for smaller game, and a large lanceolate bamboo "bleeder arrow" fashioned for large game. The arrow shaft of both arrow types was made from arrow cane (*Gynerium saggitatum*), and the arrow was fletched with the wing feathers from any large bird. The only other tool known to the Yuquí was the *guachi*, made from an agouti incisor (*Agouti paca*) and used to make notches at the base of the arrow where the bowstring engaged. Both men and women could also quickly weave palm mats, fire fans, and hastily but poorly made palm-leaf baskets to transport meat or fruit after a foraging excursion. Hair was cut with slivers of bamboo, and honey was carried in palm flower sheaths (the bracts), both of which were discarded after use. Although pottery was not in use by the Yuquí at the time of contact, older Yuquí women possessed the knowledge to make small undecorated coiled-clay pots that were fired by placing them in cooking fires.

The Yuquí practiced no visual or decorative arts and had no musical instruments, although they engaged in chanting during storms and when a member of the group died. The chants consisted of the repetition of two notes, a higher and lower, with stress placed on the first note (*húnh*-hunh, *húnh*-hunh, *húnh*-hunh, etc.) and had no words. There was no tradition of verbal arts such as storytelling, other than what occurred on the day's hunt or engaging in camp gossip. It was forbidden to mention the names of the dead so there was no oral history beyond the parental, or infrequently grandparental, generation.

The Yuquí wore no clothing other than the baby sling that hung across the shoulders of the women.

The Yuquí subsisted primarily on game, fish, fruit, and honey. Meat was the most prized item in their diet and they expressed hunger with two different verbs: "meat hunger" (*eyebasi*) and hunger in general (*toria i*). As colonists moved into the area in larger numbers, the Yuquí raided farms for corn, manioc, or other food crops, often at great risk to themselves.

In addition to their paucity of material culture, the Yuquí had no religious specialists and their cosmology was fragmented. They speak of the sun as a ball of burning tapir fat and the stars as the splashes of burning fat from the sun. The moon is congealed fat in the bottom of a pot. The Yuquí are animists, believing that both people and animals are "animated" by spirits that are deemed to play an ambivalent role in the lives of the living. Spirits are believed to have the capacity to heal or harm people and are generally feared. The Yuquí believe that the forest is inhabited by spiritual beings that can take the form of animals and are considered malevolent.

In 1986 and 1989, two additional bands of Yuquí were contacted by mission teams and brought to Biá Recuaté. The acculturated first group quickly attempted to enslave the second, and then the third. Missionary intervention prevented these old patterns from becoming reestablished. All three groups are now intermarried.

Since contact by New Tribes missionaries in the late 1950s, the Yuquí have been exposed to the teachings of Christianity. Although the missionaries consider their work among the Yuquí to be largely unsuccessful in that the Yuquí have not embraced the strict rules of conduct that the missionaries teach, the Yuquí consider themselves to be staunch "Creyentes" ("Believers"—the term used in Latin America to signify Protestant evangelicals).

Following contact, the Yuquí gradually became more trusting of outsiders, and violence toward outsiders as well as among themselves diminished. The mission provided them with clothing, housing, mosquito nets, and firearms, all of which were readily adopted by the Yuquí and which are now considered necessities. The men have also learned to fish with hook and line and nets. Yuquí diet has changed considerably since contact, and includes items such as rice, corn, wheat flour, potatoes, onions, noodles, sugar, cooking oil, salt, spices, and other prepared or canned foods that can be purchased at the community store or from local people in the area. Nonetheless, male status is still tied to the ability to hunt, and foraging remains a major part of daily

activity. Although the missionaries and others have attempted over the years to teach the Yuquíto farm, they dislike this activity and have never produced crops so as to predictably contribute to their dietary needs. Those few Yuquímen who have successfully raised crops such as rice and corn often prefer to sell them for trade items than store them for later use. The Yuquíuse Bolivian currency and the large majority prefer day labor to farming in order to raise cash to purchase market commodities.

In 1992, a Presidential Decree provided the Yuquí with an Indigenous Territory of 115,000 ha that has contributed to their cultural survival. However, their small numbers and pressures from the larger society to assimilate into the lowland peasantry may eventually overwhelm this struggling remnant population of foragers.

CULTURAL CONSTRUCTION OF GENDER

Gender among the Yuquíis clearly defined as male and female, without other gender categories. Homosexuality may be practiced from time to time by the Yuquí among both men and women, but this behavior is usually seen as sexual play and is most frequent among children. No sanction is levied against homosexual activity, which may occur occasionally among adults, especially when members of the opposite sex are unavailable.

Prior to contact, Yuquí women plucked their eyebrows and brow hairs from the forehead, giving them the appearance of balding men. Following contact, this practice was discontinued, although older women, who had plucked their hair for many years, usually have few eyebrow hairs and abnormally high foreheads. Men cut the hair across their foreheads into 'bangs" using bamboo slivers. Today, men cut their hair short, in the Western fashion, and women may cut their hair short or braid it in the style of many Bolivian peasant women. Yuquíwomen also wore baby slings that marked their gender, something that a man would never do. If men transported children, they would do so by carrying them on their shoulders with the child clinging to their hair to keep from falling.

GENDER OVER THE LIFE CYCLE

Socialization of Boys and Girls

At birth, children were typically given the names of animals hunted by their fathers shortly before or after their birth. There were animal names used for girls and others designated for boys. Names were also chosen that described certain characteristics of the child: Yeyudetsa (fisheye), or Amachi (light skin). The Yuquí also used teknonomy, referring to someone, for example, as "your husband's sister." Today, the Yuquíselect Spanish names for their children.

Boys are more highly valued than girls because they will become hunters and provide women and their children with meat. In traditional Yuquísociety, if the first-born child were a girl, little notice would be paid to her and in some cases, these first-born females failed to thrive. The children of Saya were given great latitude in their behavior, enjoying play periods or helping female relatives gather fruits and other foods in the forest. The children of slaves were expected to begin to assist their Saya masters as soon as they were old enough by carrying infants, collecting firewood and keeping fires burning, preparing game, and generally attending to the needs of their masters. Often, however, children were left in camp to attend to their own needs while adults went off on hunting trips. Little formal training occurred with either sex.

Boys and girls begin sexual experimentation at an early age. If brothers and sisters are caught engaging in sexual activity, they are punished with a few blows to the back with a bow stave, and made to sit away from the fire. However, sexual behavior is considered a normal part of life and little attention is paid to sexual play among children as long as it is not actual intercourse with a sibling. Even so, among adults, sexual alliances and actual or perceived misconduct (see below) are often the cause of violence among the Yuquí and is a constant source of intrigue and gossip.

Since contact, boys and girls attend school and are socialized as Bolivian nationals. The gender roles of Hispanic culture are taught in school by Bolivian schoolteachers or missionaries, which, with each successive generation, are gradually reconfiguring traditional Yuquí gender roles. The Yuquíare very attuned to conforming to the expectations of outsiders in terms of what constitutes "civilized" behavior. As a consequence, they experience a strong sense of shame when they are criticized or called "savages" (Chori) by local peasants. Thus, as they spend more time with outsiders, young Yuquí consciously work to affect many of the behaviors that they feel will bring greater acceptance when they are out in the world.

Puberty and Adolescence

Prior to contact, the Yuquí believed that a girl must engage in sexual intercourse if she were to *yecuaquiú*, or menstruate and come into adulthood. Thus, girls became sexually active at an early age, and the man or boy with whom she had sex at the time of her first menses was credited with causing this to happen. When a girl first menstruated, she was painted black with *Genipa* (*Genipa americana*), and if she had already paired with a young man, he would be painted as well. The Yuquí believed that this would encourage the growth of pubic hair. Her forehead would also be newly plucked and she would be placed at some distance from the camp, "behind leaves." All menstruating and postpartum women were segregated from the group by requiring them to remain "behind leaves" for the duration of the menstrual period. This involved remaining behind a few palm fronds that had been broken off at the base and then planted in the ground to form a screen.

Other than playing a role in the sexual maturity achieved by women and possibly undergoing the *Genipa* painting ritual, young Yuquí men did not have a rite of passage into adulthood. As soon as they were sexually active and, more importantly, able to hunt as an adult and provide meat on a consistent basis, young men were considered marriageable. Even so, most males did not marry until they were in their late teens, somewhat later than girls who sought mates at 14 or 15 or perhaps even earlier if sexually mature.

Attainment of Adulthood

Marriage marked entry into adulthood for both females and males. As previously noted, both boys and girls engaged in sexual experimentation with a large number of partners throughout late childhood and early adolescence, although according to the Yuquí pregnancy rarely resulted from these childhood liaisons, perhaps attributable to the young age of the girl. However, because of frequent premarital and postmarital sexual activity with multiple partners, many Yuquí women were uncertain of the paternity of their children. In this regard, the Yuquí believed that a fetus would not develop properly if the women did not have many sexual partners during pregnancy. According to the Yuquí the semen from many men helped the child grow and develop in the womb. In the past, paternity was not of great concern to anyone. With exposure to the norms of the outside world, however, issues of actual paternity can now cause considerable strife in the group.

The Yuquí attributed conception to sexual intercourse. Nonetheless, they also believed that the spirit of a child came from another human, most often a deceased Yuquí who was seeking reincarnation. For this reason, the names of Yuquí dead might be given to children who, at birth, were thought to resemble deceased relatives, hence overriding the proscription against speaking the names of the dead. In another case, Abadn ("little Abǎ, [Abá = non-Yuquí -dn = diminutive]) was given her name because at about the time of her conception, her mother saw a Bolivian hunter in the forest and believed that his spirit jumped into her body.

Incest rules did exist, but were frequently broken and only mild sanctions were levied (see above) if the offending couple were caught or suspected of having sex.

Middle Age and Old Age

Not many Yuquí reached "old age" prior to contact. Interviews with some of the older Yuquí at Biá Recuaté indicate that the average life-span was only about 45–55 years. Most Yuquí describe their lives as nomadic foragers as hard, and they lived with a great deal of insecurity. Infirmity or illness that affected one's ability to travel would spell certain abandonment and shortly thereafter death from starvation (see also Holmberg, 1969, pp. 225–226).

Unlike their male peers, who did not have dietary taboos, those women who reached their late forties and were still menstruating bore the additional burden of having to depend on males who were older than they to provide them with meat. According to traditional Yuquí beliefs (but no longer in practice), when a woman was "behind leaves" during her menstrual period, younger men were prohibited from hunting for her since it was considered contaminating. Thus, as women got older and outlived older men, it became increasingly hard for them to get enough meat, the dietary mainstay, to maintain their health. Increasing food deprivation no doubt hastened the demise of older women.

Today, the Yuquí especially women, are living well into their sixties and even their seventies. Medical care provided by the mission and, more recently, by Yuquí health practitioners has greatly extended life expectancy. Unlike many recently contacted groups that lose large

numbers of people from European diseases, the Yuquí population has actually increased since contact.

PERSONALITY DIFFERENCES BY GENDER

The Yuquí are notable for their high degree of expressiveness among both men and women. They show all emotions openly and there is no stigma for either sex in showing joy, anger, or sadness. Because of this, to outsiders they appear to be reactive or excessive in their response to any situation they find exciting, joyful, distressing, or antagonistic. When unhappy or sad (e.g., on the death of a member of the group), both sexes will cry openly for days. During these periods of intense grief, the Yuquí allow large strands of mucus to hang from the nose and then wipe it on their hair as a demonstration of the depth of their feelings. A man will cry out of anger or frustration, or speak in a rapid high falsetto, just as frequently as will a woman, when agitated. There are no social rules that encourage the control of one's emotions, which as a consequence are completely uninhibited. Anger often escalates into physical violence, as much among women as men.

Personality among the Yuquí tends to be based more on individual differences than on gender. Some men are more aggressive and extroverted than others, and the same is true for women. Overall, there are no apparent norms that govern how the ideal man or a woman "ought" to behave and children are not socialized as to what kinds of behavior might be preferred. Like adults, children are expected to express themselves freely and are not expected to show respect to their parents or other adult relatives.

In recent times, the Yuquí are less likely to show emotion to the same degree as in the past because of prevailing attitudes of Bolivian nationals and others who visit the community.

GENDER ROLES IN ECONOMICS

In traditional Yuquí culture, broadly interpreted, men hunted and women gathered. However, men often gathered on their return from a hunt, particularly if they were unsuccessful in capturing game, and women were known to hunt the slower and more easily captured animals, such as sloths, armadillos, and tortoises. An elder Yuquí related that his mother used a bow to kill fish, something

admittedly rare, but nonetheless pointing to the fact that women were not prohibited from using men's weapons—they simply did not learn how to use them in most cases. Women were invaluable on the hunt to call animals such as monkeys, and often dispatched them as they fell to the ground wounded by an arrow. Thus, in precontact times, although men most often hunted and women most often gathered, the quest for food was so critical that both sexes would do whatever was necessary to assure that the group would eat. Any social constraints on gender roles rapidly gave way to the greater and more urgent necessity of procuring food.

Today, the Yuquí follow many of the European-influenced gender roles found among the Bolivian peasantry. With the introduction of firearms, for example, hunting has become a male-dominated activity, with women less likely to participate as frequently as they did in the past. Even so, just as women formerly could "own" an arrow, which they earned by performing some task for a man, women can now purchase shotgun shells, which they earn through trade or labor. Ownership of an arrow or shell entitles a woman to a share of the animal captured.

As Bolivan settlers have moved closer to the Yuquí and small communities have built up in the region, a few Yuquí women have periodically taken jobs as maids or cooks in nearby colonies. These jobs seldom last long, however, since Yuquí women do not cook or keep house well by Bolivian standards, and they are soon let go to return to their families. Men will also work as day laborers or find other unskilled jobs, but do not seem to have the stamina of Bolivian peasants and also will not stay in a job for long.

The commercialization of trade items such as fish, honey, forest fruits, fresh and dried game meat, and handicrafts has become primarily a male role, mostly because Yuquí men speak better Spanish and can access outside markets. However, women will often demand their share of the profits, particularly if they have provided the goods being sold such as hammocks or bags made from *imbai* fiber. The perceived or actual failure of men to return the full value of these profits is leading to increased strife between the sexes.

PARENTAL AND OTHER CARETAKER ROLES

During infancy, mothers are generally attentive to their infants, but also take them on extensive hunting trips that

stress both mother and child. Nomadism was such a necessary part of Yuquí survival prior to contact that trekking on a daily basis was a normal part of an infant's life. Carried snugly in a baby sling made of *imbai*, an infant traveled quite comfortably and could suckle at will. During rest periods or at night when the group camped, infants slept in the hammock between both parents. The child would also be passed among both male and female relatives, and would be scrutinized for injuries or abrasions. The mother or another female relative would use these occasions to pluck brow hairs to make the infant, male or female, "pretty."

Both men and women take care of children. Men may be seen with small children in their hammocks playing with them or watching them while the woman prepares a meal or is engaged in some other activity. Once children are considered self-sufficient, usually by the age of about 4 they are shown little attention or affection by either parent, particularly if another child has been born who now occupies the mother's time and interest. From the Yuquí perspective, the act of giving food to young children is a show of kindness and affection.

LEADERSHIP IN PUBLIC ARENAS

Yuquí leaders, or *Ererecua*, had considerably more power than the consensual leadership typically associated with a band level of political organization, again pointing to deculturation. Typically, leadership passed from father to son, although it was not uncommon for a nephew or other male relative to be given the role of leader if the Ererecua's male heirs were deemed unworthy of the position. Although women did not hold public positions of power, they were markedly influential in the decisions reached by their husbands, sons, and brothers.

With contact, Yuquí leadership shifted from the traditional hereditary patrilineal leadership passed down from father to son along a particular line of *Saya* males, to men possessing other skills such as the ability to speak, read, and write in Spanish and to interact comfortably with Bolivian nationals.

GENDER AND RELIGION

Prior to contact, the Yuquí had no religious specialists, and other than a man who was considered for a time by the mission as a lay preacher, they still do not.

Today, the Yuquí consider themselves Evangelical Christians. The missionaries have great expectations that a few of the younger men will become true Christians, or "Believers," and will take on the role of spiritual leaders of their people. The missionaries, who follow conservative biblical teachings, are not selecting or training young women for these roles.

LEISURE, RECREATION, AND THE ARTS

As with many areas of Yuquí culture, artistic expression was very limited. Body painting was practiced, but apparently not for any form of artistic expression. The Yuquí painted their bodies with a red plant colorant *erucú* (*Bixa orellana*), which they believed made them invisible to jaguars and snakes. They also painted themselves with *Genipa* dye (*Genipa americana*), called *dijá* in Yuquí a fruit juice which after applied, turns a dark, virtually indelible, blue-black color. The fruit is also consumed when ripe. *Genipa* dye, because of its dark color, was believed by the Yuquí to make them invisible to their enemies. Neither of these colorants was applied in such a way as to imply a decorative purpose; rather, both were simply smeared over the body and limbs in a somewhat haphazard manner. *Genipa* was also believed to have some curative properties and was often applied to wounds or abrasions.

The Yuquí remain very fond of the color red, and given the choice, will always select clothing or other articles of adornment that are red.

RELATIVE STATUS OF MEN AND WOMEN

As noted elsewhere, today the Yuquí are sensitive to the expectations of Bolivian national society and greatly desire to conform to acceptable behavior as defined by their Bolivian peers. In addition, missionary teachings stress traditional Western male-centered gender patterns. Men are expected to be the dominant members of the group, be the cultural brokers between the Yuquí and the larger society, hold public positions of power, and be the head of the household. This pattern is further reinforced by patrilineal and patrilocal traditions in Yuquí culture, which were historically undermined when they became a small band of foragers. Food insecurity, constant imminent danger of being killed by outsiders, and the small

size of the group created a situation where women became more vocal and involved in decision-making. As a consequence, at the time of contact, women, or at least *Saya* women, were relatively powerful and held sway over the opinions and decisions of men. Because of the physical exertion of being constantly on the move, women were also in good physical condition and so freely engaged in physical violence with men and other women, making them forces to be reckoned with. Of the few Yuquí who reached middle age, most were *Saya* women, and if not infirm, were often quite powerful in their own right.

SEXUALITY

There is a general perception by outsiders that Yuquí women are sexually aggressive. Bolivian nationals often find this exciting and will readily engage in sex with Yuquí women if given the opportunity. The Yuquí typically view this type of sexual conduct with outsiders as a seduction by the Yuquí woman because the woman has probably visited the man at night or arranged an encounter in the forest. These trysts are invariably discovered. If the woman involved is married, she is likely to be severely chastised or even beaten by her husband and perhaps by some of her male relatives. The offending outsider male is then told to leave. If the woman is unmarried and the outsider gets along well with her male and female relatives and wants to remain, he will be accepted into the community. Yuquí men, on the other hand, are quite timid with regard to Bolivian women. Sexual relationships between Yuquí men and Bolivian women are rare, and typically occur outside the Yuquí settlement and are initiated by the women.

The Yuquí view sex as a major source of pleasure, entertainment, gossip, and conflict. Virtually all the arguments that occur between individuals or groups of families within the band originate over food or sex. Women most often initiate sexual encounters, and do so by going off into the woods to make a "nest" (*queesa*). They set up their mosquito net along the hunting trail of the man they wish to seduce and then wait for him to walk by. The seduction may be about taking away the man from another woman out of spite, getting even with a husband, obtaining more meat, or securing a mate. Men seem incapable of resisting such a seduction and actually are not expected to. Virtually all Yuquí engage in this type

of sexual activity throughout their adult lives and the "scandals" that it causes create exciting topics of conversation if not open conflict. In the past, these conflicts tended to be more physical, with wrestling, choking, punching, scratching, and biting occurring between males, between females, or between males and females over illicit sexual conduct.

What constitutes "illicit" behavior is always complex and largely based on context. Whether a man is providing food or commodities to a young woman's family may determine whether his sexual relationship with her is condoned. Married couples engage in spouse-swapping which causes no concern as long as all partners are in agreement. But if a woman or man has sex with another partner who has not been vetted by the spouse, then certainly there will be repercussions. Women comment that when they are tired or not feeling well and a husband requests sex, they might suggest the husband's brother's wife or some other close relative as a substitute partner. This behavior is considered entirely acceptable.

Sex is viewed as much a form of recreation as procreation, and displays of physicality may be part of the sex act. It is not uncommon for women and men to return from the woods, the place where most sexual activity takes place, with arms, neck, and face bitten and scratched. These are signs of having had pleasurable sexual activity, and everyone makes note of these love marks.

Finally, the Yuquí believe that too much sex will turn a person's hair gray, something quite unusual for these people who normally gray very little as they age.

COURTSHIP AND MARRIAGE

Courtship among the Yuquí prior to contact involved early sexual experimentation and sex play among preadolescent boys and girls. Boys would also bring game and other gifts of food to a prospective bride and her parents to gain their favor. Generally, *Saya* girls and boys tried to select partners from their own caste; however, if none were available, or were considered unattractive or undesirable for some reason, a member of the *Enembaco*, or slave caste, would be selected. If parents were not enthusiastic about the match, there would be attempts to curtail further involvement, but since there were many opportunities for the couple to meet in the forest in secret, these attempts were usually unsuccessful. Once a relationship began to be deemed serious, the boy would approach the

girl's mother and ask that she make a hammock for them. The act of making the hammock could take several months, since during that time the boy was expected to provide meat and fish to his prospective mother-in-law. Once the hammock was completed, it was presented to the couple who would then occupy the hammock together, hanging it with the rest of the band.

The Yuquí have no memory of polygyny, although their ancestral groups practiced this custom. Rather, they more typically engage in serial monogamy, if spouses become dissatisfied with one other. The most common reasons for divorce are a man's lack of skill in procuring food or the inability to conceive children, which is blamed on the man, not the woman.

Traditionally, at marriage a Yuquí woman would most likely sleep by her husband's fire with his father and mother and siblings. However, since all of the Yuquí were closely related, all of the husband's kin were also the wife's relatives. Thus residence patterns were only loosely patrilocal. Today, the Yuquí live in separate houses and it is customary for the wife to reside with the husband in their own house or a segment of a compound house with the husband's parents or other close relatives.

In current practice, the Yuquí still engage in courtship by participating in furtive meetings in the forest. The prospective husband is still expected to provide gifts to his future parents-in-law, and this has become even more important now that many trade goods are available.

A wedding ceremony is now part of Yuquí marriage, both as a result of missionary presence and their desire to imitate Bolivian nationals. Typically, one of the Yuquí men will celebrate the ceremony, which consists of a long and repetitive talk during which the couple is admonished to "be good" and follow the teachings of the Bible. At the close of the ceremony, the Yuquí then kiss each other, mimicking Western-style weddings they have witnessed in nearby villages.

HUSBAND–WIFE RELATIONSHIP

Although generally dominated by Yuquí males, Yuquí women have always had a great deal of control over their own lives and sexuality. Women exercise control over men by witholding sex, the threat of killing male children at birth, humiliating the spouse in public, refusing to prepare meals, or by untying the hammock cord so that the man falls on the ground when he tries to rest. Women also will abandon the conjugal hammock and begin living with another man if the husband fails to provide adequately for her and her children, or mistreats her often. The missionaries have attempted to instill in Yuquí men the idea that the man should be the head of the household, maintaining control over his wife and children at all times. In reality, this attempt to influence Yuquí marital behavior has had only limited success.

It is also common for women, just as men, to initiate extramarital relationships and engage in physical fighting with their husbands if these relationships become troublesome. Spouses may also temporarily swap partners as noted above, and if done with the consent of all, is seldom cause for comment by anyone. It is also Yuquí custom for a man to have sex with his sister's daughter the night before she marries. Although the Yuquí have curtailed some of what is viewed by the missionaries as promiscuous sexual behavior, they have mostly learned to be more circumspect in exhibiting or discussing their sexual activities in front of outsiders. However, when illicit sexual behavior, now also defined in terms of missionary moral codes, is observed or discovered, it is still likely to cause upheaval in the group and occasion days of arguments, recriminations, silence between partners, and other reactions that create turmoil that may escalate into violence.

In the day-to-day relationships between spouses, men are expected to spend much of their time procuring food in the forest or fishing in the river. A woman may decide to accompany her spouse into the forest to assist with the hunt and help to transport larger animals back to camp. She also makes these trips in order to engage in sex with her husband, eat fresh-killed animals before they are subject to being shared, and to be certain that other women are not trying to seduce her husband while he is in the forest.

Zapotec

Lynn Stephen

ALTERNATIVE NAMES

In Spanish the Zapotec language is called Zapoteco and those who speak it Zapotecos. In native terms, the name for Zapotec varies slightly depending on which branch of Zapotec is being referred to. Linguists have documented at least four different branches of Zapotec. In the Central Valleys of Oaxaca, the Zapotec language is called *dizaa* (Zaachila) and in the Isthmus of Tehuantepec *diidxazá* or *didxazá* (Juchitán) (language/words of the clouds).

LOCATION

One of 15 different ethnic groups (based on the criteria of language) originating in the state of Oaxaca, Mexico, Zapotec communities are concentrated in the central and eastern parts of the state, ranging from the Sierra Juárez in the north, to the Central Valleys located around Oaxaca City, to the Isthmus area of the state bordering Chiapas, to the Sierra Sur that backs onto the Pacific coast of Oaxaca. Because the Zapotec have always been entre-preneurial and have traveled widely and migrated throughout their history, communities and individuals are also found in Mexico City, in northern Mexican border towns such as Tijuana and Ensenada, and throughout the United States, with the largest concentration in the Los Angeles greater metropolitan area. The 2000 Census puts the Zapotec-speaking population at about 350,000 within the state of Oaxaca.

While Mexican government census data relies on the criteria of ability to speak one of the five branches of the Zapotec language family as the sole indicator of "Zapotecness," contemporary anthropological concepts of ethnicity focus on the expression and practice of ethnic identity in action and on processes of identity construc-tion. In the state of Oaxaca, language as a basis for a sense of shared Zapotec ethnic identity is a recent phenomenon, tied to the emergence of a national movement for indige-nous rights and autonomy in the 1990s. Traditionally, peo-ple who speak Zapotec identified themselves more closely with their community of origin than with the fact that they were Zapotec speakers. Through the process of migration, particularly since the 1980s, language became the basis of a pan-Zapotec identity outside of Oaxaca and for a pan-indigenous identity among migrants (Kearney, 1995a, 1995b, 1996). Nevertheless, while language is still critical to self-definitions and boundaries in many parts of contemporary Oaxaca, as the Zapotec and other indige-nous groups migrate to other parts of Mexico and the United States, language is not necessarily the only or primary ingredient of ethnic identity. Shared identity based on customs, forms of social organization, place of origin, and shared cultural elements increasingly function along with or in place of language as markers of ethnicity for Zapotecs born outside of Oaxaca or who have migrated. In fact, a majority of the Zapotec population are now bilingual in Zapotec and Spanish.

CULTURAL OVERVIEW

Groups of Zapotec-speaking people who developed a cul-turally distinct set of settlements and city-states, such as Monte Albán, are believed to have at least a 3,000 year his-tory in the region now known as Oaxaca. Documented as stratified societies with nobles, commoners, landless sharecroppers, and traders, Zapotec city-states and com-munities have long-standing internal differences in status, prestige, and material wealth. This also affected gender roles historically within Zapotec communities, where roles for elite men and women were different from those for commoners (Sousa, 1997; Spores, 1997). Well-known for their traders, merchants, and in the case of Juchitán for their fierce sense of autonomy and independence (see Campbell, 1994), the Zapotec have dominated other ethnic groups in the Oaxaca region for hundreds of years. In the Isthmus of Tehuantepec, the Zapotec drove out the Huave and the Chontal to marginal areas of lagoons and coast 200 years or more before the arrival of Cortes. In the mountains of the North, the Zapotec have dominated trade and com-merce, marginalizing other ethnic groups such as the Mixe.

Unlike indigenous groups further south in the state of Chiapas, the Zapotec were able to remain in possession of their land for the first part of the colonial period. In many areas they held more land grants than did the Spanish through the 16th century. Land grants held by the Zapotec could be defended in Spanish courts. While the ability of Zapotec communities to hang onto their land varied throughout the state, in general indigenous communities continued to control significant amounts of land during the last 100 years of colonial rule (Taylor, 1972). Historically the Zapotec have engaged in a wide range of economic activities including farming (both for subsistence and trade), craft production, and trade. In larger population centers Zapotec elites emerged that were able to maintain family dominance in community politics, economic, and social life.

In the state of Oaxaca, and even when they have moved elsewhere, people from Zapotec communities have maintained locally rooted cult celebrations of patron saints and other significant religious holidays (see Chiñas, 1973). In the Central Valleys of Oaxaca, these are known as *mayordomías*.

CULTURAL CONSTRUCTION OF GENDER

If we understand gender as the learned behavior that is associated with the different gender categories and roles within a gender system and as not inherently linked to the physical body of an individual, we can see how it is possible for a three-gender system to exist. In both Isthmus Zapotec communities and in some Valley Zapotec communities, there is a third-gender category for people categorized as biological males. This third-gender role for biological males, like the gender role for social males and social females, is not linked to a particular sexuality. I have argued elsewhere (Stephen, 2002), that Zapotec gender identity is not historically linked to particular types of sexual identities. In fact, the concept of sexuality itself and recent (middle to late 19th century) Western formulations of different types of sexualities (i.e., homosexuality, heterosexuality, bisexuality) are not concepts that are historically present in Zapotec culture. Until very recently, through the influence of migration and the emergence of sexual-identity-based movements in Mexico (gay and lesbian), sexuality as a source of identity or social organization has not been relevant in Zapotec communities; gender roles and gendered behavior have been.

Individuals with bodies that are categorized as biological females are socialized with a female gender role that has major implications in terms of the division of labor, the ways that women are expected to behave sexually, the kind of ritual responsibilities they have, and the care of children (see below). Socially mature adult women are expected to be married and to bear children. If they do not, they can obtain status through specialized medical, trade, or political roles and through displaying personal charisma and leadership. Until about 20 years ago, most girls and women were dressed differently from men. In the Central Valleys, older women continued to wear the traditional wool cloth draped as a skirt and held in place with a sash and topped off by an embroidered blouse and black shawl. Younger women and girls wore flowered pastel polyester dresses that buttoned down the front covered by an apron. Now many girls and younger women wear pants, blouses or T-shirts, the result of high levels of migration to other parts of Mexico and the United States. Many young women and girls continue to wear black shawls and to keep their hair long, often in braids. In the Isthmus women continue to wear embroidered *huipiles* of polyester or velvet with a long flowing skirt. Such attire is still mandatory at fiestas. An attractive women is one who looks healthy and is well dressed. This usually means a woman who has a strong body, who is fairly full figured, and whose hair is thick, shiny, and clean.

Individuals with bodies that are categorized as biological males may, within the designation of male, be socialized into a corresponding male gender role that works in complementarity with the female gender role. Such a role emphasizes exhibiting physical strength in rural labor, specialized economic and ritual roles, public political leadership, and maintaining a public face of authority in their homes and in public. Social adulthood as a male also requires marriage and fatherhood. Again, as for women, men can also distinguish themselves through ritual and medical (curing) expertise or as charismatic leaders. Increasingly for men and women higher levels of education and professional employment are also a way to build status.

Men's dress has not changed during the past several decades. They have consistently worn tennis shoes or boots, blue jeans or other dark pants with button-down shirts or T-shirts. Straw cowboy hats are common, as are leather jackets or cloth shorter-waisted jackets. Men wear their hair short and are usually clean shaven or wear

a mustache. Beards are unusual. An attractive man is one who is muscled, is clean shaven, and dresses neatly and well.

A small number of Zapotec boys and men will move into a third-gender role, called *muxe* in the Isthmus. Chiñas (1995, p. 294) describes *muxe* as "persons who appear to be predominantly male, but display certain female characteristics" and fill a "third-gender role between men and women, taking some of the character-istics of each." While *muxe* do not demonstrate all the characteristics associated with masculinity in Juchitá, they do not necessarily reject them. *Muxe* are perceived as being different from other men, but some marry and have children. Others form long-term relationships with men. An important distinguishing characteristic of many *muxe* is that they do women's work such as embroidery or decorating home alters, but not all do. Many are now teachers, have white collar jobs, and are involved in pol-itics. The *muxe* role is not a sexual role, and while some *muxe* may engage in sexual relationships with other men, not all do. It is an institutionalized gender role for bio-logical males that in many communities is socially toler-ated and in same cases even praised by mothers who maintain that *muxe* sons are much more loyal and helpful than non-*muxe* sons. In Teotitlá del Valle in the Central Valleys region, there is also a third-gender category for men similar to the *muxe*. Called *biraš*, this category includes fewer men than that of *muxe* (one study esti-mates that 6% of males in one Isthmus Zapotec commu-nity in the early 1970s were *muxe* [see Rymph, 1974, cited in Chiñas, 1995, p. 300]). While living in Teotitlá, I found about seven men who were publicly acknowl-edged as fitting this category. Four of them were married, two lived with their parents, and one lived alone. They were identified by their speech and way of walking and the work they engaged in. Several were experts in mak-ing ceremonial candles, a vocation they shared with a few women in the community. They were not referred to as "homosexual" and were not made fun of in any public context. Some people appreciated their special artisan skills and sense of esthetics.

GENDER OVER THE LIFE CYCLE

As individual boys and girls grow and mature, they enter into distinct social categories that are related primarily to their capacity as workers and their readiness to marry,

have children, and to assume leadership roles in the community.

Socialization of Boys and Girls

As in many societies, the first question about a new baby in Zapotec communities is whether is it a "little man" or a "little woman." Preference is usually expressed for a "little man." Thus, from the instant a child is born, they are gendered in conversation and in the way they are treated.

What I will say here and elsewhere regarding the life cycle is a general picture from which there may be consid-erable variance given the conditions of the family or extended family within which a child is raised. If a child is the only child, has only male siblings, only female siblings, or loses a parent (circumstances that can prevail in a sig-nificant number of households), their gender socialization will often be quite different from the general pattern I describe. High levels of migration and young parents who raise their children for part of their lives in the United States, Mexico City, or other areas outside of Oaxaca are also changing the way that children are socialized.

In general, very young children—from birth to age 3—are treated indulgently, particularly if no younger sibling comes along. Infants and toddlers are often held, are carted around by older siblings as well as parents, and generally accompany their mothers and sometimes their fathers on errands close to home. Girls and boys are dressed differently and usually observe men and women engaged in different activities, but are not themselves pushed to engage in any adult gendered tasks. If infants and toddlers are reared in a Zapotec community in Oaxaca, they often play with animals in their yard, with boxes, and increasingly with gender-specific toys. Girls are often given dolls; boys are given balls and trucks.

If a younger sibling is born, toddlers aged 2–3 years may begin to do more for themselves and be asked to begin helping with gendered household tasks. Boys are asked to help carry water and firewood. Girls may be asked to carry plates, help wash dishes, or to watch a baby that cannot yet move. By the time children are 4 or 5 they are integrated into gender-specific labor routines around the house and yard, and in the case of boys may begin to tend to animals such as sheep, goats, or cattle. Young girls will feed chickens and pigs.

Until about 10 years ago, many girls did not receive more than a few years of primary education although

some boys completed primary school and went on to secondary school. During the past 10 years, the rates of completion of elementary school have risen significantly for girls. Depending on the availability of school, an increasing number of girls as well as boys are attending primary school. This school experience, as well as what they watch nightly on television, has become a significant source of socialization for children and may conflict with ideas instilled by parents.

The period between toddlerhood and early adolescence is when boys and girls are each categorized as asexual child-like individuals. At home, they will be taught gender-specific chores and behavior. In general, boys are given much more latitude in terms of coming and going at will. They are permitted to play in the streets with friends, ride their bicycles around town, and engage in sports. Girls between the ages of 3 and 12 are allowed to socialize with girlfriends living close by, but must ask permission to leave and are usually accompanied by an older sibling or relative if they go farther than to the house next door. Young girls are often sent on errands by their mothers. They may go alone, but are closely monitored. They are taught to be accountable and grow used to asking for permission to leave. Increasingly, girls are learning to play sports such as basketball and volleyball in school and may get together to play these games outside school. This is still discouraged by some elders. In cases where children come from poor families, their parents may pull them out of school to have them engage in paid work to help out their families. For young boys this might be tending goats or cows, working in construction, or simply being a servant for another family. For girls this might involve making tortillas for sale, caring for children, or working as a maid.

Puberty and Adolescence

Linguistic labels for children change at about the age of 11 or 12. Girls are categorized as young women, implying that they are almost capable of having children and are reaching a period of sexual attractiveness. Boys are labeled as young men, but not held accountable in the same way that girls of the same age are. Many girls of this age report that they are no longer allowed to visit girlfriends, go on errands alone, or appear in public unaccompanied. Boys are able to wander freely in the communities. Because of significant class and regional differences, levels of education for adolescents can vary.

Until about 10 years ago, most rural Zapotec girls were completing only three or four primary grades. Now more are finishing the sixth grade and some go on to secondary school. Adolescent boys traditionally had more years of elementary school than girls and were more likely to go on to secondary school. In cities like Juchitán, a higher level of education has been attained than in rural areas. For those Zapotec living in Mexico City and the United States, education levels are significantly higher with people finishing high school and some going on to finish college. Recently, in better-off communities such as Teotitlán del Valle, a few boys and girls—usually sons and daughters of merchants—have finished professional careers as accountants, lawyers, and doctors. In general, the age of marriage for girls has risen from 14 to 16, largely due to increased levels of education. This trend is not unique to the Zapotec, but is seen overall in Mexico.

Attainment of Adulthood

There are a number of different paths that allow young men and women to become recognized as adults. Confirmation in the Catholic Church is one step that many Zapotec men and women take in moving toward adulthood. Increasingly Zapotec girls are organizing *quinceañeras*, an age-based ritual for girls that is a kind of "coming out" for them as young women, eligible for marriage. While this ritual involves attending mass and dressing the young woman in a dress that resembles a bridal gown, the ritual also has secular elements that in some ways parallel non-Zapotec elements included in weddings that are common throughout Mexico—a large cake, a feast, dancing, and presents. There is no parallel ritual for young men.

The marking of social adulthood occurs most generally when men and women have children. Getting engaged and married (as described below) is one of the paths that produces children, but women and men who are not married and have children can also achieve social adulthood, although they may have less respect in their communities.

Middle and Old Age

Middle and old age are recognized linguistically for men and women and also in terms of increasing levels of respect for them if they have followed a life that conforms to community norms and expectations—contributing service to the community through taking on religious and

civil cargos (both men and women), being considerate to neighbors and family, and raising children who are productive adults. Once they are past childbearing age and no longer have charge of younger children, women in particular can see an expansion in the degree of freedom they have to leave home, travel, engage in trade, open small businesses, participate in community politics, and demand better treatment from men. Older women and men are most deeply recognized within the ritual sphere where they are accorded the highest levels of respect.

PERSONALITY DIFFERENCES BY GENDER

While there are no consistent personality differences by gender, there are different cultural expectations for how men and women should behave and what kinds of behavior are typical and acceptable for each. In general, men are given more latitude in being angry and aggressive than women, but these characteristics are not valued and if a man is chronically angry and aggressive, efforts will be made to curb his behavior through counseling by elders and eventually by time in the local jail if the aggressive behavior continues and is associated with drinking, insults, and domestic and other violence. Women are viewed as more likely to be nurturing, patient, and hard working than men. However, there are exceptions to this that are tolerated and discussed in communities.

GENDER-RELATED SOCIAL GROUPS

Gender is a fundamental organizing principle in most aspects of Zapotec life in Mexico. There are gender-specific economic tasks, ritual tasks, domestic, and caretaking tasks, and public space is divided by gender for large-scale events. In Oaxacan communities, women spend most of their time with other women and men with men. This is fairly consistent through the life cycle. This pattern of gendered separation can change radically with migration to Mexico City or the United States, as women and men are usually in the paid labor force and married couples in particular have to plan together, rotate care of children and household chores, and often cross gender roles in an effort to survive economically, with each working in at least one job in the paid labor force and helping out with domestic chores and childcare when not at work.

In Zapotec communities in Oaxaca, sons are preferred in terms of receiving land and usually will live with their parents when first married. Increasingly, however, women are pressuring their young husbands to establish independent residences and houses soon after marriage. Married couples who do live with the husband's family eventually separate their household, even if they live in the same vicinity.

GENDER ROLES IN ECONOMICS

There is a significant gendered division of labor in terms of rural living in most Zapotec communities. Agricultural labor is done predominantly by men, although women and children do significant work at planting and harvesting time, and if no men are available, women may go to the fields to supervise plowing. Care of larger farm animals such as cows, oxen, and horses is done by men and boys. Women take care of pigs, chickens, ducks, and smaller domestic animals. Both men and women engage in commerce of all kinds. In communities where there is a specific form of craft production, the division of labor may vary. In weaving communities, both men and women now weave, and even in embroidery-producing communities men and women have each developed separate products.

Women and girls are usually in charge of housecleaning, washing clothes, shopping for food, and food preparation. Men generally sweep yards and sometimes inside the house, carry water, and may be responsible for firewood. As men and women have migrated to Mexico City and elsewhere both alone and together, this division of labor has changed somewhat.

Both men and women can inherit all kinds of property. Because of past traditions of patrilocality, sons are still favored in the inheritance of house plots, farmland, and houses themselves. If there are few or no sons, women may also receive a share of land. Increasingly, as young men leave, women may inherit land and houses if their brothers migrate and they remain behind to care for their parents.

PARENTAL AND OTHER CARETAKER ROLES

Both men and women are involved in parenting children. Decisions about education and discipline are often shared

between men and women. Women tend to spend more time with young children (under the age of 5), but older men will often help to take care of grandchildren, as will older women. As boys approach the age of 6, they spend more time with their fathers, often passing the entire day with them aiding in chores. Girls spend more time with their mothers, learning female domestic chores. Both parents display physical affection for their children. Women are generally viewed as the guardians of children's health and spiritual well-being, bringing them to mass or to healers and medical clinics.

LEADERSHIP IN PUBLIC ARENAS

While in many Zapotec communities in Oaxaca women have been excluded from participating in the local political system as manifested in community assemblies and the assignment of civil cargos (volunteer community service jobs such as mayor, judges, police, committees for school, irrigation, communal land, forest resources), increasingly women are participating in community politics and taking on public service roles through the civil cargo system (Rubin, 1997; Stephen, 1996). In communities where local social movements have resulted in changes in traditional political systems and have brought in political parties or shaken up male-dominated political systems, women now attend community assemblies and are named to civil cargos. Traditionally, each household had to have a head who contributed to the community through taking on public service jobs known as civil cargos. Usually such household heads were males, but single mothers could pay someone else to assume their duty or take on female-appropriate tasks.

As levels of migration of both men and women have increased during the past 20 years in most communities, many men and now women are absent. In a number of Zapotec communities in Oaxaca with heavy male out-migration, women are staffing a majority of civil cargo jobs in their communities. In many communities women have begun to demand that they be able to attend community assemblies and increasingly are being named to civil cargo position, usually first in relation to schools, health, markets, and other "female" concerns. There have been several Zapotec women who have served as *presidentes municipales* or town mayors recently and one Zapotec woman was elected to the Mexican National Congress.

GENDER AND RELIGION

Contemporary Zapotec for the most part practice a syncretic type of Catholicism that involves strong engagement with local pantheons of saints and virgins that in some cases are thin overlays for pre-Colombian deities. Both female icons in the form of virgins—most importantly in the Virgin of Guadalupe who is the patron saint of Mexico—and male icons in the form of a variety of saints are important in family and local religious life. While all Zapotec communities and hamlets in Oaxaca have churches and chapels, relatively few have resident priests. Local men and women who take on the cult sponsorship of community patron saints as *mayordomos* are seen as religious leaders and custodians of the community.

The celebration of a *mayordomía* involves a male–female pair of *mayordomos*, usually but not always husband and wife, who organize and carry out rituals and festivities associated with the saint in their charge. Often the set of festivities extends over an entire year, with a concentrated period around the particular calendar day identified with the saint. In the Isthmus region, these celebrations are called *velas* and are elaborate celebrations lasting a week or more that involve processions, masses, food preparation and blessings, drinking, and dancing organized around neighborhoods and families. In addition to the cult celebrations of local saints, people in Zapotec communities also engage in ritual activities at times of change in the life cycle including birth, baptisms, marriage, and death. More recently, more secular celebrations such as individual birthdays, *quinceañeras* for 15-year-old girls, and school graduations have been incorporated into the ritual calendar and often have some of the same elements as traditional religious ceremonies associated with the saints—special food, drink, music, and dancing. All of these ritual occasions—religious or secular—involve dozens or hundreds of guests, cooking large meals, and entertaining. Those in attendance are linked by kinship as well as *compadrazgo* (often called ritual kinship) and form important social networks within and outside communities (Cohen, 1999; Peterson Royce, 1975; Rubin, 1997; Stephen, 1991).

Ritual space associated with the ceremonial occasions is segmented by age and gender. In both the *velas* of Juchitá and the *mayordomías* and other life cycle events such as marriages, funerals, and baptisms celebrated in the Central Valleys and northern and southern mountain regions, the division of labor is gendered, as is eating,

drinking, and dancing. Exceptions to this may occur in celebrations of more secular rituals such as birthdays and graduations. In Juchitá, during *velas*, women eat, drink, and dance together. Men eat and drink together and sometimes dance with women. In the Central Valleys, men and women dance in pairs in formal dances, but all other activities in ritual space are segregated with men and women eating, drinking, and talking in separate groups.

During the pre-Lenten celebrations of *carnaval* in the Central Valleys, gendered ritual space is further complicated. In Teotitlá del Valle, for one week in February, rotating households sponsor dancing for a troop of male dancers who are dressed as *ghul*, masked clown figures who are also prominent during the Dance of the Conquest. During this topsy-turvy ritual, about half of the hosting men are cross-dressed as women and wearing masks. The cross-dressers ask other men to dance and the men who are not cross-dressed ask women to dance. Within this ritual space of *carnaval*, the gendered order of "normal" ritual space is played with and partially inverted.

LEISURE, RECREATION, AND THE ARTS

Both men and women work long and hard in most Zapotec communities, so leisure time is not a strong cultural concept. Time spent in artistic activities usually revolves around local religious holidays and the life cycle rituals. Dancing, music, storytelling, socializing with friends, the cooking of special meals, and drinking are centered around ritual. During ritual events men are able to sit and enjoy the events without doing an excessive amount of work. Younger women will spend their time working very hard in constant food preparation and clean-up, only able to relax late at night to dance and perhaps drink a bit.

Young men have more leisure than young women in rural communities and often engage in playing soccer and basketball in the evenings and on Sundays. Artistic activity is often associated with "work" such as the creation of decorated candles, fashioning of embroidered goods and clothing, and weaving.

RELATIVE STATUS OF MEN AND WOMEN

As I have argued (Stephen, 1991), the cultural logic in most Zapotec communities in Oaxaca does not permit an assignment of absolute status to either men or women.

What makes more sense is to outline the ways in which men and women may achieve status in different spheres of social life. While, overall, men often have more ways in which they are valued and can assert authority, rights, and privileges, there are also many situations and spheres in which women may have high status.

As mentioned above, the arena in which men continue to have more status, rights, and privileges than women is in the public political culture of community assemblies and the assignment of civil cargos. However, this is changing rapidly in some communities. In the ritual sphere described above women have high levels of status and respect usually parallel to those of men. Women can be ranked higher than men ritually, depending on their age and experience.

In terms of the domestic sphere and household decision-making, the types of relationships that men and women have varies according to each couple and local convention. While in some communities women control most financial resources, make most purchases, and determine the education and health care of children, in others men and women do this together. As women age, they often acquire more respect and may become well-established business women. Men tend to have greater influence over the sexual life of couples. Divorce is uncommon because Mexico is a Catholic country and it is against the law. What happens instead is that both men and women establish second relationships without going through a formal divorce, and the community understands that they have moved into a second "marriage."

SEXUALITY

As stated above, I do not believe that "sexuality" existed in Zapotec culture as a concept distinct from gender or even as a concept at all. Thus it does not make sense to discuss "heterosexuality" or "homosexuality" as such because until quite recently, as described below, these words were not a part of local descriptions of behavior. Women's and men's experience of sexuality tends to vary significantly by age and by migration status.

Migrant women and many young men are usually no longer under the authority of their parents and can choose their own sexual partners. Even in such situations, however, women are concerned about their sexual reputations. Cohabitation is considered a legitimate form of sexual expression; having multiple sexual partners is not.

Young men are discouraged from having sexual affairs when married, but, in contrast, are often told to experiment before they settle down.

In many communities, both married men and married women may be rumored to be having sexual affairs. While some men jealously guard their wives (even insisting on driving them to the marketplace), others allow their wives and daughters considerable independence. Wealthier men may spend much of their time in the state capital of Oaxaca or traveling and may be presumed to have sexual affairs.

Sexuality is certainly linked to gender in most Zapotec communities, but is not usually a separate aspect of social identity in public discourses in the community. This has begun to change significantly among Zapotec living in the United States, where sexual identity terms from the lexicon of popular American culture—gay, bisexual, homosexual, bisexual, lesbian, and *joto* and *maricón* (derogatory terms for a passive homosexual man)—have become part of people's vocabularies. These labels have begun to be imported into the community and used by some there as well. There are now some Zapotec men in Oaxaca City who may use the label of "homosexual" to describe themselves. In Zapotec communities, men who may engage in sexual relations with other men are not likely to use this label. They may use one of the labels for a third-gender category or none at all.

In the Isthmus, women eat, drink, and dance together at fiestas. They are occasionally rumored to have sexual liasons and relationships with one another while married (see Chiñas [1995] for discussion of *marimachas*—women who have sexual relations with other women). However, the physical affection shown between women is not an indication of sexual attraction. It is a normal part of friendship (Ruiz Campbell, 1993, pp. 138–139). Some married women have also had sexual relations with men other than their husbands. At the same time, women are often victims of domestic abuse, may have to negotiate with their husbands on a variety of issues, and with some notable exceptions have not assumed political leadership roles in city, state, or grassroots politics (Rubin, 1997, pp. 230–233).

In general, migration appears to be the major factor in changing sexual interactions among young men and women as they move out of their parents' sphere of authority and cohabit outside marriage. The contrast between this type of marital and sexual relationship and the notions of preserving virginity, the "theft" of women,

and formal petitions for marriage suggest the influence of Spanish colonial systems of gender, honor, and sexuality, and urban Mexican and U.S. cultures and experiences. The existence of a third-gender role for men that is blended with marriage and fatherhood signals the continued importance of indigenous systems of gender.

COURTSHIP AND MARRIAGE

In Zapotec communities in the Valleys of Oaxaca, traditional engagement parties involved the young man's family coming to petition for the bride at 4 a.m., bearing large baskets of chocolate, bread, and giant candles. This ceremony is one of several ceremonies associated with traditional weddings performed over a period of years. After the official engagement ceremony, a young woman will go to live with her future husband and will often have one or two children with him before the church wedding. Even this formal set of ceremonies exhibits an interesting disjuncture between virginity and formal marriage. The other prominent form of engagement is *por robar* (by theft), which usually means a carefully planned voluntary elopement. Most women in the community, whether young or old, are concerned with protecting their sexual reputations. Many girls are still strictly watched and not allowed to walk the streets alone after the age of 10 or 11.

Most older Zapotec women (over 40) have been married either by a traditional set of engagement and wedding ceremonies or by elopement and a smaller wedding ceremony—the former being dependent on access to financial resources. As the number of female migrants increases, more and more younger women are entering into common-law marriages that follow a pattern of serial monogamy in the places where they live outside of the community—Mexico City, Tijuana, Rosarita, and Los Angeles. After some years, a couple may decide to return to their community of origin (if both are from the same town) and go through the traditional series of ceremonies culminating in a wedding.

Isthmus forms of Zapotec marriage can include a marriage petition which involves a groom by way of his parents and a group of respected old men asking for a woman's hand in marriage. An elaborate speech and petition follow in which the young woman is asked whether or not she agrees to the proposal. If she answers yes, then a wedding date is set and a 3-day fiesta follows. Proof of a woman's virginity is usually presented on a sheet or

handkerchief on the Monday following the consummation of the marriage (Henestrosa, 1993, p. 130; Ruiz Campbell, 1993, pp. 130–133). A second form of marriage known as *rapto* (when a man carries off a woman to be his bride) may occur when the request for marriage is denied. This can involve taking women against their will, and some women have described it as extremely shameful and denigratory action for women. Obdulia Ruiz Campbell writes of her mother and other relatives being abducted with such "violent force, that they received blows to their legs so that they could not resist so much and were later pulled by their hands to the houses of their boyfriends where they were deflowered" (Ruiz Campbell, 1993, p. 138). Younger women take pains to avoid *rapto*.

HUSBAND–WIFE RELATIONSHIP

Husband–wife relationships can vary significantly in their nature. While some couples may have a very close, caring, and affectionate relationship that is lifelong, other relationships are plagued by conflict and, for women, by domestic violence. In Oaxacan communities men and women pass much of their time in gender-separate spheres, but once they migrate this changes and often communication increases and relationships may involve more back and forth and exchange than automatically following socialized gender roles. See other sections above for more details.

OTHER CROSS-SEX RELATIONSHIPS

Extended families in general tend to share social space, and men and women within an extended family will rely on one another. These relationships tend to focus along same-gender lines, although brothers and sisters may be close and help one another if they get along.

CHANGE IN ATTITUDES, BELIEFS, AND PRACTICES REGARDING GENDER

The most significant impact on changes in attitudes, beliefs, and practices regarding gender and sexuality stem from high levels of migration out of Oaxaca to other parts of Mexico and to the United States. In general, individuals

with migration experience are likely to have had to change some of the gender roles and activities they were socialized with. They may bring these new attitudes and knowledge back to their communities and integrate it into their marriages and own families, if they are younger. The influence of U.S. popular culture and media as well as experiences people have at work, in their neighborhoods, and at school in the United States are all important factors in change. Knowledge of human reproduction, sexually transmitted infections, AIDS, and other information about reproductive health are some of the ways that the migrant experience has changed attitudes and knowledge about gender and sexuality.

ENCYCLOPEDIA OF SEX AND GENDER

Men and Women in the World's Cultures

EDITED BY CAROL R. EMBER AND MELVIN EMBER

Published in conjunction with the Human Relations Area Files at Yale University, New Haven, Connecticut

In many animal species, one can hardly tell the difference between females and males. Their size, coloring, and behavior may be so similar that even experts cannot readily tell the difference until they are ready to reproduce. In contrast, human females and males differ not only in secondary sexual characteristics, but they also generally exhibit differences in height, weight, and ratio of muscle to fat. Given the reproductive differences, as well as differences in appearance between males and females, it is hardly surprising that most, if not all, societies conceive of females and males as important social categories. These reproductive and biological facts by themselves cannot explain the enormous variability in the way societies treat persons of the different biological sexes. The most sexually egalitarian societies may hardly treat males and females differently. But there are no societies that clearly give more overall advantages to females than to males, and those that advantage males vary considerably from mild to extreme inequality.

The central aim of this encyclopedia is to give the reader a comparative perspective on issues involving conceptions of gender, gender differences, gender roles, relationships between the genders, and sexuality. This is done within the two main sections within the encyclopedia: Topics and Cultures. The topical overviews are divided into four sections:

- cultural conceptions of gender;

- observed differences between males and females in behavior and personality;

- institutionalized aspects of gender; and

- sexuality and male–female interaction.

The Cultures section contains 82 specific cultural articles written by anthropologists or other social scientists who have lived with the people they write about and are able to give a vivid portrait of life in that society. Each provides a "portrait" of how boys and girls grow up and become men and women in that society. Cultures from the widest possible spectrums are presented—from egalitarian to stratified; from foragers to intensive agriculturalists; from those with kin groups structured around males to those structured around females; from those where the status of women and men is relatively equal to those where status is mostly unequal. Also, these cultures are from every major geographical region. The combination of topical overviews and varying cultural portraits is what makes this encyclopedia unique.

This major reference work will be an essential part of any institution's library and belongs in the library of everyone interested in cross-cultural variation in sex and gender.
