

ENCYCLOPEDIA OF

EUROPEAN PEOPLES

CARL WALDMAN AND CATHERINE MASON

A to Z

Encyclopedia of
EUROPEAN PEOPLES

Carl Waldman and
Catherine Mason

*For Gina Sikelianos . . .
honoring her European spirit.*

—Carl Waldman

*For Carole Mihalko, first-generation Lithuanian-American,
who spent many years in the South Pacific as an educator and whose
joy in life and laughter were a joyous contagion. Passed away on
July 5, 2004, after more than a decade fighting cancer.*

LIST OF ILLUSTRATIONS AND MAPS

Two Albanian boys in traditional clothing, 1923.	17	Stone relief shows Celtiberian warrior carrying a Celtic shield and Iberian sword.	140
Two Albanian shepherd boys playing nose flutes, 1923.	17	Bronze figure from western Austria, probably sculpted by a Celtic people.	146
Tomb of Saxon king Sebert and queen Athelgoda.	27	Celtic helmet, first century B.C.E.	154
Gold coin used by the Arverni.	40	Golden votive offering made by a Celtic craftsperson.	160
Austrians searching for food in Vienna, early 20th century.	42	Cossack soldiers astride their horses, late 19th century.	183
Bashkir woman in front of her house, 1910.	56	Two Croats posing for a photograph, 1855.	187
1617 painting showing Belgian family.	68	Late 19th-century facade of the cathedral at Šibenik, Croatia.	189
Bosnian peasants congregate, late 19th century.	72	Idol from the Cycladites found in Amorgos, 2500–1100 B.C.E.	193
Two women walking in Brittany, early 20th century.	78	People crossing the Charles Bridge in Prague, Czechoslovakia, late 19th century.	201
Celtic iron and bronze linchpin, early first century C.E.	91	Danes in a courtyard in Nyborg, Denmark, late 19th or early 20th century.	212
1895 print showing Julius Caesar leading Romans to Britain in 55 B.C.E.	92	Etching showing a seated Dutchman holding a shovel, late 19th century.	220
Queen Boudicca of the Iceni, from a 19th-century painting.	94	Dutch boy standing in front of a windmill, early 20th century.	221
Bulgarian girl herding sheep, late 19th or early 20th century.	103	Queen Elizabeth I of England, 16th century.	230
Philip the Bold, duke of Burgundy (1342–1404), and his wife, Margaret of Flanders (1350–1405).	112	Shakespeare performing before Queen Elizabeth I and her court.	235
Cemberlistas Obelisk, column of masonry erected by Constantine the Great, 330 C.E.	114	Etruscan bronze votive figure, fourth century B.C.E.	242
Female figure representing Rome, carved by Byzantines, late fifth century C.E.	116	Etruscan warrior in bronze, c. 300 B.C.E.	245
Female figure representing Constantinople, carved by Byzantines, late fifth century C.E.	116	Sixteenth-century representation of Clovis I, king of the Franks.	270
Carthaginian coin, late fifth century B.C.E.	132	1833 painting of Joan of Arc.	280
Caucasian man smoking his pipe, late 19th century.	137	Louis XIV of France, 1699.	281

- Napoleon I of France, 1814. 281
- Statue of a male warrior crafted by Gauls in southern France, late first century B.C.E.. 288
- Bronze plaque crafted by Gauls in northern France, first century C.E.. 292
- Germanic bronze helmet plate, sixth or seventh century C.E.. 323
- Germanic medallion, sixth century C.E.. 324
- 19th century painting of Martin Luther burning the papal edict in Wittenberg, 1517. 327
- Portrait of Martin Luther. 328
- German men and women cutting rye near Schwarza, Germany, early 20th century. 334
- 1584 print of Greek scholar Strabo holding a globe of the world. 351
- Bust of Pericles. 353
- Ruins of the Parthenon in Athens. 358
- Terra-cotta relief of the Greeks, 460 B.C.E.. 363
- Silver stater, depicting Pegasus, used by Greeks in about 550 C.E.. 363
- Ancient Greek architecture: Temple of Theseus; Temple of Segesta in Sicily; view of ancient Athens; Tower of the Winds; western front of the Parthenon; Choragian monument of Lysicrates. 364
- Ruins of the theater at Delphi in Greece. 370
- Print of Ptolemy of Alexandria. 374
- Phidias's statue of Athena and other Greek and Roman sculptures. 375
- Greek women harvest tea, early 20th century. 386
- One artist's conception of Attila the Hun. 395
- Iberian torc (neck ring), possibly early fourth century B.C.E.. 404
- Small silver cup used by Iberians of Portugal, third to first century B.C.E.. 405
- Icelanders walking along a street in Reykjavík, 1938. 410
- Celtic coin. 411
- Illyrian warrior depicted in bronze situla from Slovenia, seventh or sixth century B.C.E. 413
- Gold boat model crafted by the Irish, first century B.C.E.. 423
- 1872 lithograph showing St. Patrick taming serpents. 441
- Irish man and woman in front of their house, early 20th century. 447
- Irish woman smoking a dudheen, early 20th century. 447
- Neapolitan peasants milking a goat, 1869. 449
- Seal crafted by ancient Jews. 462
- Ashkenazim (German Jews), 1876. 463
- Scene from Latvian city of Riga. 481
- Lithuanian woman mending a fishing net, late 19th century. 492
- Gold stater showing Alexander the Great, mid-fourth century B.C.E.. 503
- 1898 painting of Alexander the Great consulting the Delphian Oracle. 504
- Macedonian family, 1900. 507
- Maltese woman hanging laundry, 1940s. 512
- Celtic coin. 520
- Minoan vase shaped as a bull's head, c. 1550 to 500 B.C.E.. 523
- Linear A tablet produced by Minoans, c. 1450 B.C.E. 523
- Linear B tablet produced by Mycenaeans on Crete, c. 1400 B.C.E.. 523
- Minoan beaked clay jug from Phaestos, c. 1850 to 1700 B.C.E.. 525
- Moldovans shopping at a fruit-and-vegetable stand, Kishinev, Moldova, 1940s. 526
- Slavs in rowboats netting fish in Montenegro, early 20th century. 532
- Moorish couple seated at home, c. 1876. 536
- "Mask of Agamemnon," gold funerary mask, 16th century B.C.E.. 541
- Mycenaean terra-cotta figurine, 14th or 13th century B.C.E.. 547
- 1732 portrait of William the Conqueror. 562
- Norman Gate, Windsor Castle, in New Windsor, Berkshire, England. 563
- Norwegians standing atop Pulpit Rock near Stavanger at Norway's Lyse Fjord, early 20th century. 569
- Cloak pin used by Ostrogoths, fifth century C.E.. 574
- Gold stater used by the Parisii, first century B.C.E. 580
- Sword chape, type of metal trimming, used by the Picts. 595
- Stone carving of a Pict on horseback, eastern Scotland. 596
- European leaders partitioning Poland, 18th century. 602
- Polish family, early 20th century. 603

Portuguese ship captain, 1865.	609
Celtic coin.	616
Romanian woman and child standing by a farmyard fence, early 20th century.	619
Romanian man and woman posing in traditional-style costumes of their Saxon ancestors.	620
Sculpture of Romulus and Remus and a she-wolf. . . .	625
Roman scenes.	635
19th century representation of Julius Caesar.	636
Arch of Hadrian, built by Athenians in 131 C.E.	639
1829 drawing of the Roman emperor Trajan hunting wild boar.	641
Pope Gregory in his vestments.	643
Roman guard depicted in detail of a relief carving. . .	650
Late 19th-century photograph of the exterior of the Colosseum in Rome.	651
Two Rroma women, late 19th century.	662
Rroma mother sits with her baby on a roadside near Orsova, Hungary, early 20th century.	663
Four Rroma stand near a domesticated bear, probably in Bulgaria, 1930s.	664
Church in St. Petersburg, Russia, named after Vladimir I (St. Vladimir).	672
Portrait of young Peter the Great of Russia.	675
Portrait of Catherine the Great of Russia.	678
Priest of the Russian Orthodox Church, outside the Verkhoturkskii Monastery in Russia, 1910.	679
Three Russian women offer berries to visitors near the Sheksna River.	680
Detail of a frieze showing Samnites, fourth century B.C.E.	687
Archer, possibly Sarmatian, c. 6500 B.C.E.	694
King Egbert of West Saxons with his coat of arms above a warrior and map of Britain, 1645.	696
Bronze collar of the Scots, first or second century C.E. . .	702
Monymusk reliquary used by Scots, eighth century C.E.	703
Five women in stovepipe hats, Scotland, about 1860. . .	710
Two children dance in Scotland, early 20th century. . .	710
Leopard crafted by Scythians, seventh to sixth century B.C.E.	724
Bronze figure of an archer from the island of Sardinia, possibly a warrior of the Sea Peoples, ninth to seventh century B.C.E.	725

Serbian boy fiddles on the streets of Belgrade at Christmastime, 1918.	729
Pagan obelisk constructed by the Slavs.	749
Playing cards from the 1920s representing historical figures of Bohemian history.	753
Slavic people hauling flour in an ox-drawn cart, early 20th century.	757
Slovenian woman poses in traditional clothing, 1897.	774
Charles V, king of Spain and Holy Roman Emperor. . .	779
Spaniards stand on a beach with fishing boats, late 19th century.	782
Swedes plant crops on a farm near Jönköping, Sweden, early 20th century.	787
Scenic view of the Swiss Alps.	792
Swiss standing by a boat on the shore of Lake Brienz in Switzerland, late 19th century.	793
Tatars repairing a road in the Crimea, 1895.	796
Murad (Amurath) IV, sultan of the Turks, 17th century.	807
Ukrainian women farming, early 20th century.	816
Ukrainian woman posing on her farm, early 20th century.	817
Plaque in whale bone carved by Vikings.	835
Hogback crafted by Vikings, mid-10th century C.E. . .	837
1893 photograph of a replica Viking <i>drakkar</i> , or dragon ship.	838
Rook, one of the so-called Lewis Chessmen, crafted in Norway out of walrus ivory.	839
1819 print of Welsh women washing clothes.	865

LIST OF MAPS

Migrations of Germanic Peoples to the British Isles in the fifth century C.E.	24
Core lands of the Avar khanate in the seventh century C.E.	47
Locations of some Baltic-speaking peoples in the ninth to twelfth centuries C.E.	51
Basque lands	58
Some tribal groupings of Britons in the first century C.E.	90
Extent of Bulgar lands in the eighth and ninth centuries C.E.	107
Byzantine Empire under Justinian, 527–565 C.E.	114

Carthaginian and Roman territory during the Second Punic War, 218–201 B.C.E.	131	Location of the Magyars in about 1000 C.E.	509
Locations of some contemporary North Caucasians . . .	135	Minoan cities on Crete	522
Locations of some Celtiberian tribes and other peoples on the Iberian Peninsula in about 500 B.C.E.	139	Mongol invasions of eastern and central Europe, 1230s–1240s C.E.	531
Extent of Celtic settlement in the second and first millennia B.C.E.	144	The Moors on the Iberian Peninsula in the early 10th century C.E.	534
Surviving Celtic languages	145	The Mycenaean world in the second millennium B.C.E.	540
Location of the Dacians in the first century B.C.E.	206	Towns of the Franks raided by the Vikings in the ninth century C.E. and the subsequent Duchy of Normandy in the eleventh century C.E.	560
Etruscan territory in about 500 B.C.E.	242	Movements of the Ostrogoths in the fifth century C.E.	574
Distribution of Finno-Ugrian peoples by the eighth century C.E.	249	Location of the Pechenegs in about 1000 C.E.	581
The kingdom of the Franks in the eighth and ninth centuries C.E.	268	Lands of the Picts in the fourth and fifth centuries C.E.	590
Locations of some Celtic tribes in Gaul in the first century C.E.	288	The Poles under Mieszko I in about 970 C.E., showing locations of Polonians and absorbed tribes	598
Raids on the Roman Empire by Germanic tribes in the third century C.E.	296	Roman expansion on the Italian Peninsula, sixth to second centuries B.C.E.	621
Lands held by Germanic peoples in western Europe and North Africa in the early sixth century C.E.	297	The Roman Empire at its greatest extent, 117 C.E.	624
Invasions by the Goths in the 250s–260s C.E.	337	Lands of the Rus in the 11th century C.E.	667
Distribution of ancient Greek dialects	342	Lands of Sarmatian tribes in the first century C.E.	693
Extent of the Athenian Empire in the fifth century B.C.E.	343	Tribal groupings in Scotland in the first century C.E.	702

Locations of some Iberian tribes in the third and second centuries B.C.E.	401	Some tribal groupings of Slavs in the seventh to eighth centuries C.E.	737
Location of Illyrian peoples in about 500 B.C.E.	412	The Ottoman Empire in Europe and the Middle East, 1369–1520 C.E.	805
Some Celtic tribal groupings in Ireland in the second century C.E.	421	Movements of the Vandals in the fifth century C.E.	822
Some Italic and pre-Italic peoples on the Italian Peninsula in about 500 B.C.E.	454	Viking raiding and trade routes in the late eighth and ninth centuries C.E.	831
Location of the Khazars in about 1000 C.E.	474	Movements of the Visigoths in the fifth century C.E.	844
Movement of the Lombards southward in the sixth century C.E.	495		
The empire of Alexander the Great in Europe, Asia, and Africa, 334–323 B.C.E.	502		

PREFACE

What constitutes a *people*? A group referred to as a *people* typically have one or more of the following in common: language, beliefs, sense of shared history and of common origin, political organization, institutions, territory and/or kinship. In a more specific sense, the term also can mean the enfranchised citizens of a state.

As used in the *Encyclopedia of European Peoples*, the term *people* refers to different kinds of commonality as indicated. It refers to shared language. The Celts, Germanics, and Slavs are each an example of a *language family*—without any other defining characteristics—discussed as *people*. Groups of a shared language family and geography, such as the Celtic-speaking Britons, Scots, and Irish in the British Isles and the Celtic-speaking Gauls in France and surrounding regions, also constitute a *people* for the purposes of the encyclopedia.

Other *peoples* are defined as distinct groupings on the basis of shared culture apart from language. *Peoples* of differing languages and ancestry came to be defined as Greeks, Romans, and Byzantines (as language became more uniform over the ages). Thus a *cultural group* also might constitute a *people*.

The encyclopedia also describes as a *people* an *ethnic group* with relatively intact bloodlines since ancient times. In the case of the Rroma (popularly known as Gypsies), for example, ethnicity is the main determining factor. In the case of the Jews, shared ancestry and shared religion have been used historically to define what it means to be Jewish. The Saami (popularly known as Lapps) are related ancestrally, linguistically, and geographically, although some among them no longer speak their native language and instead use the language of those nations that formed around Lapland. Likewise, with regard to the Basques, ethnicity, language, and geography all can be cited as defining factors.

Groups who have different degrees or types of sociopolitical organization are defined as *peoples*. An important type of political organization that the reader will come across often in this work is the *tribe*, a social group comprising families and clans, typically united over generations. A tribe's shared tradition leads to a sense of common purpose. Tribes are often composed of a number of subtribes or towns. A confederation of tribes also might be defined as a *people*. In European studies the term is most often to be

applied to ancient groupings. Because of Roman records concerning the lands they occupied, the former existence of a great number of Celtic tribes is known, many of them having a short entry. For later history, however, inhabitants of a *political entity* or polity—kingdom, principality, or duchy—might be referred to as a *people*. Some of these political entities became parts of nations, often as states or provinces. Inhabitants of *modern nations*, and in some cases their politically defined *regions*, are also defined as *peoples*. The *peoples* of Britain throughout history are an example of these distinctions: The names Angles, Jutes, Saxons, Anglo-Saxons, Normans, English, Scots, Welsh, and British connote varying degrees or types of sociopolitical organization.

The distinctions among sociopolitical organization, ethnicity, language, and culture, as cited previously, are obviously blurred. Geography and history are mixed in as well. The Vikings are another group classified as one *people* partly because they originated in a general region and, for a particular time in history, traveled widely and came to be grouped together and named by other Europeans as distinct from the other Germanic-speaking *peoples* from among whom they had emerged. They actually consisted of different tribal or political groups from a number of different Scandinavian regions, speaking different languages, all of them Germanic. The same can be said of the Saracens, who spoke a Semitic language but who came to be distinguished from other Semitic *peoples* by the Europeans with whom they came in contact. In the case of the Sea Peoples, that name and concept, applied by modern scholars, are, based on minimal evidence—Egyptian inscriptions and depictions—from ancient times.

Scandinavians have an entry as a *people*, as do other *peoples* defined purely by geography, for the sake of convenience because the term appears in many other texts. In some cases, for purposes of clarification, two similar terms are defined; the regional Bavarians and tribal Bavarii, for example, both have entries.

A large part of the challenge in a reference project of specific length—even in a two-volume set—is to decide what groups *not* to include as individual entries even though they might turn up in other texts as classifications. Prehistoric cultures, determined archaeologically, do not have separate entries. Instead they are summarized in the Chronology of

European Prehistory and History. References to tribal peoples about whom little is known appear in ancient texts. They may be the same people as those known by another name. The Aestii are an example of a frequently cited people of uncertain background who have been given an entry. There are hundreds of such names not included. Only some of the many peoples cited in historical writings solely by the name of the political entity where they lived, such as the Bavarians mentioned earlier, have been included. To attempt to list all would weigh the encyclopedia too much toward a political history of Europe, defeating the purpose of focusing on the shared ethnicities and traditions of peoples.

Deciding on what name to be used for a people can be arbitrary. For example, because Slavic is a general name used in texts for the language family and Slavs, for the people speaking a Slavic language, Slavs is an obvious choice. Some authors use the name Germans for ancient Germanic-speaking peoples, who are often referred to as ancient Germans. Yet in modern usage the name Germans typically refers to a nationality. The authors have therefore decided to use Germanics, a shortened form of Germanic peoples, for speakers of Germanic languages. Such is the case of the Turks and Turkics. In the case of the Balts, Caucasians, and Finno-Ugrians those names are used for the ancestral grouping, whereas Baltic, Caucasic, and Finno-Ugric are applied to the language family. The name Finns is used for both an ancient tribal grouping and a modern nationality. The authors have also had to choose arbitrarily a particular spelling over several others. For example, they have chosen Curonians over Cours, Courans, Courones, Cori, Curi, Curlandrs, Kurs, Kurons, Kursa, Kursi, Kurshi, Kurzemians, Kurlanders, and Kershes, any of which might appear in other texts. Moreover some names are used in historical texts for more than on people. Other names not listed may also exist. The certainly do in other languages.

The question of what constitutes a people has to be addressed, as discussed. The question of how to determine whether a people are “European” in a general sense also has to be decided. The encyclopedia limits itself to people who occupied territory in Europe over a period of time as a distinct group. Although it may mention migrants who have made Europe their home or even have become European citizens, it does not provide particular entries for all the nationalities now living there. For example, Arabs, who migrated as individuals or families to European nations, do not have an entry heading, but the partly Arabic Moors, who occupied the Iberian Peninsula for centuries, do have one. The Carthaginians are on the list not because they invaded the Italian Peninsula but because they occupied territory on the Iberian Peninsula. Likewise, the Huns and Mongols out of Asia occupied parts of eastern Europe. The Persians who failed in their invasion of Greece did not make the list. But it should be kept in mind that the story of European peoples cannot be separated from that of Asian and African peoples, especially in eastern and southern Europe. Another point: The encyclopedia does not discuss European colonials abroad. The focus herein is on the geographical region of Europe.

The entry headings may be considered a somewhat arbitrary classification system devised for the purpose of understanding history. The challenge of devising such a system is compounded by the constraints of historical studies. Many views of connections among peoples—genetic, linguistic, political, and cultural—especially in ancient times, are highly speculative and in flux. Written sources are often unreliable. Archaeological evidence is often inconclusive. Artifacts and customs may have passed to a people through trade rather than from contact with incoming migrants. There is often a distinction between what linguists and what archaeologists say. It is debated, for example, to what degree Indo-European-speaking peoples actually migrated to ancient Greece and displaced indigenous peoples, as opposed to ideas from Indo-Europeans who reached indigenous peoples in Greece through trade, shaping new cultures and groupings. Mythology mixes with history in written sources. Spoken and written language gives clues, but not definitive answers of degree of contact. In many cases the most important piece of information about tribal names, or place-names derived from them, is not the group of people to whom they refer but rather the people who devised them and how and why those who did so applied them to a given group. (Perhaps the most important and prolific namers of peoples were the Romans, whose names and classifications often, although not always, reflected Roman desires and purposes more often than reality.)

Information is often personalized, politicized, or biased. A general might have exaggerated his report on the organization or numbers of an opposing people to justify his request for more support or to glorify his accomplishments. Or a historian might have classified people on the basis of some popular misconception. Julius Caesar was both a general and a historian. A great deal of what is known about ancient Celtic tribes is based on his writings. His classifying the tribes of northern France, Belgium, and the Netherlands as the Belgae, for example, is based on limited information. But despite the fact that his views took hold and even led to a nation’s modern name, there is no other evidence besides geography (and place names) to indicate that these tribes were distinct as a group from tribes in central and southern Gaul. Scholars also might develop a theory and become attached to it because of their academic career or their sense of nationalism. Europe has always been a melting pot, with considerable movement among peoples and mixing of customs and bloodlines. New studies in deoxyribonucleic acid (DNA) confirm this movement and intermingling. Yet purity of bloodlines over thousands of years has often become part of a political nationalistic agenda as among the Nazis during World War II. More recently the varying degrees of the Scandinavian Germanic ancestry of the Rus as opposed to Slavic ancestry has been debated by scholars, often with a nationalistic and/or academic agenda. One must maintain healthy skepticism along with curiosity. Historical facts are not immutable natural objects, but evolving points of view. Context is critical to information from and about the past. The flow and interaction of peoples and the great cultural exchange throughout the ages, rather than the fixed nature of a people, should receive the emphasis.

HOW TO USE THIS SET

HEADINGS AND CROSS-REFERENCES

The *Encyclopedia of European Peoples* begins with a master list of entries, followed by the entries themselves, alphabetically arranged. This book has cross-references placed alphabetically between entries as well as within entries. The cross-references that stand alone between entries cite alternate names likely to be encountered but, for the most part, not the many subgroupings discussed within the entries. (That is to say, there is a cross-reference “Hellenes. See GREEKS,” but not an “Athenians. See GREEKS.” For the latter case the index better serves as a guideline to subject matter.) At the entry heading are often found alternate names or alternate spellings of names. Those included are versions likely to be encountered in other readings in English. Others may exist. Moreover the encyclopedia does not generally include names as they appear in other languages.

Within the entries, the first time the name of a people having an entry appears, it is cross-referenced by means of small capital letters. (Not every time a modern European nation is mentioned are its people cross-referenced; the modern nationality entries are identified as “ALBANIANS: NATIONALITY,” for example, and when a cross-reference will be helpful “see ALBANIANS: NATIONALITY” is added parenthetically.) At the end of some entries *see also* references direct the reader to larger categories.

The entries are not designed to stand alone. To make the most of the information presented, follow the thread of cross-references and use the various appendixes.

LONG ENTRIES

Accompanying the main entries—those covering the larger groupings or those most often cited in historical texts—are summaries of information, or fact sheets, containing the following categories: *location*, *time period*, *ancestry*, and *language*. A *time line* of important dates in that people’s history also accompanies the text. This encapsulated information will give the reader a quick overview of the people in question. For *location* modern nations are typically cited, as opposed to ancient regions that might be mentioned in the text. The *time period* generally gives the time frame of the historical record of a people as discussed in the text and not necessarily the span of a people’s existence. *Ancestry* and *language* are often the same, depending on usage of terms.

These entries are further divided into the following: an introduction, *Origins*, *Language*, *History*, *Culture*, and a conclusion. Those sections might be further subdivided. Under *Origins* might be found *Origin Myth* or other subdivisions. Under *History* might be found sections with varying headings related to the material. Under *Culture* might be found the following sections: *Economy*, *Government and Society*, *Military Practices*, *Dwellings and Architecture*, *Clothing*, *Personal Habits*, *Transportation*, *Other Technologies*, *Art*, *Music*, *Literature*, and *Religion*. And these sections in turn might be subdivided with additional headings for convenience. The largest groupings of peoples, such as the Celts, Germanics, Greeks, Romans, and Slavs, are likely to include most of the sections.

MEDIUM AND SHORT ENTRIES

Medium-length entries, typically subgroupings of the longer, more general ones—and cross-referenced to them—have fact sheets but not time lines, or the sections listed previously. They are broken into paragraphs, however, for accessibility.

Those very short single-paragraph entries with only several sentences defining a grouping and cross-referenced to other entries do not have fact sheets because the entries themselves serve the same purpose as a fact sheet.

The shorter entries often discuss peoples about whom little is known or who were numerically small or had only a brief existence. Many of these are subgroups or subtribes of larger ethnic or linguistic entities. The Chorvati, for example, are a small group believed to have spoken a Slavic dialect. It is strongly recommended that the reader refer to the larger entry, in this case that of the Slavs, for information that puts the subgroup in a historical context and also for discussion of the cultural characteristics of its people. For reasons of space, such matters are not repeated for every subgroup but are discussed in the relevant large entry.

MODERN NATIONALITIES

The entries listing European peoples based on modern nationalities are set up differently from those for other peoples. The headings have *nationality* after the name for clarity. For example, *Lithuanians: nationality* distinguishes the people of the modern nation of Lithuania from the tribe listed simply as *Lithuanians*. The introductory summaries (fact sheets) for modern nationalities include the following sections: *nation*,

derivation of name, government, capital, language, religion, earlier inhabitants, and demographics. The *time line* summarizes important events in the history of the nation from its time of first recognizable statehood, both political and cultural, as a continuation of the story of the various peoples who settled there and who are discussed in other entries. Text sections for the modern nationalities include *Geography, Inception as a Nation, and Cultural Identity.* For the most part the Cultural Identity sections focus on traditions that have helped shape the people of the nation rather than on modern cultural life. To understand the flow of peoples through the lands that formed a modern nation, readers should see the name of peoples mentioned in the fact sheet under *earlier inhabitants and demographics.* Some of the information provided in the modern nationality entries overlaps with that provided in other entries if a people has maintained a distinct identity since ancient times.

The authors have decided to treat these modern nationality entries differently—without the same detailed text sections on history and culture—because present-day nations consist of many different ethnic groups and often different languages as well, with diverse traditions that endure apart from changing borders and governments. The encyclopedia is not trying to be a general history of Europe with a focus on evolving political status, but rather a study of the myriad peoples who occupied Europe from ancient times.

REGIONAL ENTRIES

Some people are identified by the name of the region where they lived regardless of varying ancestry. For clarity these regional entries include the alternate names *people of*, as in *Pannonians (people of Pannonia).* The people of the still extant regions of the British Isles—English, Irish, Scots, Welsh, Cornish, and Manx—are listed as regional entries because they presently have people of varying ancestry, but their people can be defined as a particular language family (Celtic, etc.) in ancient or medieval times. (There are also the entries *British: nationality* and *Irish: nationality* to give an overview.) For the most part the regional entries—short summaries of the history of the region—do not have fact sheets because the fact sheet categories do not all apply.

FURTHER READING

Many entries have a final section, *Further Reading*, which provides a list of books relating to the people in question. But others have no titles listed because no particular books exist on them. For these peoples relevant books can be found listed under the larger groupings. For example, a book might not exist on a particular Celtic tribe, but information about that tribe or about history and customs relevant to that tribe is found in books about Celtic-speaking peoples in general. Or information about them might be found in one of the general books on European history and culture listed in the Bibliography at the end of the second volume. Works by ancient authors mentioned in the text that have survived are found in the Bibliography.

Many of the books listed are reprints or revised editions, information that is not indicated unless that edition is con-

sidered a classic in the field. For many, the latest edition is cited. Check the Internet for available editions. Some of the texts—or portions of them—can be accessed online.

INDIVIDUALS

The thrust of this encyclopedia is groupings of peoples. Yet the story of those peoples is of course tied to individuals. It goes beyond the scope of the book to mention all noteworthy individuals from European history. A biographical dictionary of the kings and queens of Europe alone, or of military figures, for instance, is a formidable work unto itself. Yet to give another view of the subject matter, a number of individuals critical to the shaping of European history, especially the establishment of European groupings, or critical to the recording of the history of the groupings, have been included as sidebars to entries. And a list of individuals mentioned in the text (those through the 19th century) is included in the appendices.

BACK MATTER

The appendices at the end of the second volume include the following: (1) a master alphabetical list of entries, with alternate names and language family or other classification; (2) the entries organized by language family, ethnicity, nationalities, or regions; (3) a table listing the languages of Europe, past and present; (4) a summary of the geography of Europe; (5) a summary of the prehistoric hominids who once inhabited Europe; (6) a list of individuals mentioned in the text, organized alphabetically according to European peoples; and (7) an alphabetical list of those individuals featured in biographical sidebars, citing the entries where the sidebars are located.

A chronology of European prehistory and history, a glossary of cultural terms, and a general bibliography—with general titles on European history and culture, prehistory, and ancient writings—also supplement the text. Specific articles are not included in the bibliography; nor are Internet Web sites. (The Internet has become a valuable resource for studies on European peoples, but some sites are based on highly speculative theories and some present a nationalistic agenda, so a researcher should be wary.) An index offers the reader additional access to the information.

The back matter is designed to give differing overviews of history and culture. But, the various systems of classification applied to them should not be considered as absolutes but rather as handy tools in sorting out complex information.

MAPS AND ILLUSTRATIONS

Throughout the book original maps clarify some of the information in the text. (One point about geography: The phrase *Eastern Europe* in popular and even official usage to refer to nations that are actually in central Europe; geographically the term *eastern Europe* is more accurately applied to western Russia and part of Ukraine; this book uses that term because much of the content involves periods before the inception of modern nation-states, except in those cases where the modern concept is relevant.) Photographic images as well as original pen-and-inks provide another visual glimpse of history and culture.

ACKNOWLEDGMENTS

The authors would like to thank all the people who helped in researching the *Encyclopedia of European Peoples*. Their great interest, talent, and enthusiasm helped make the book what it is. They include Tetra Balestri, Deboraha Carbone, Alexander Casagrande, Frank Coffey, Patti Erway, Eva Fognell, Breath-Alicen Hand, Ben Harnett, Thai Harnett, Pamela Livingston, Elizabeth Plymell,

Amanda Schecher, Kathleen Taylor, Chloe Shannon Waldman, and Wayne Wright.

The authors would also like to thank Claudia Schaab, editor, for her vision and patience; Susan M. Thornton, copy editor; and Melissa Cullen-DuPont, editorial assistant, in addition to all the other talented people at Facts On File who helped with this project.

ENTRIES A TO Z 

Abazians (Abazins; Abaza; Apswa; Ashvy)

The Abazians are a Caucasian-speaking people, who live for the most part in the northwestern Caucasus region of southwestern Russia. The majority inhabit the foothills along the Big and Little Zelenchuk, Kuban, and Kuma Rivers in the Karachay-Cherkessia Republic, but some have settled in neighboring regions as well. Their language is classified as part of the North-West (Abkhazo-Adygheian) branch of North Caucasian and closely related to the language of the Abkhazians (Abkhaz; Absua), most of whom live to the south in the Asian nation of Georgia. Abazin, as the language is known, is divided into two dialects corresponding to two kinship communities, Tapanta and Shkaraua.

Like the Abkhazians the Abazians are descended from proto-Abkhaz tribes, who, possibly as early as the second millennium B.C.E., inhabited lands near the Black Sea. By the ninth century C.E. they had separated into the two distinct tribes, Tapanta and Shkaraua. In the 13th century the Tapanta moved southward to the northern Caucasus, followed by the Shkaraua the next century, although some of the Shkaraua were assimilated by Abkhazians and other CAUCASIANS known as CIRCASSIANS. The Abazians reached their peak of power in the 15th and 16th centuries but were subject to the Kabardians, a subgroup of the Circassians in the 17th century. In the 18th

and 19th centuries the Russian SLAVS and TURKS competed for the region, and many Abazians were relocated to Russia and Turkey. Many SLAVS settled in their homeland. The traditional Abazian way of life, raising livestock (sheep, cattle, and horses, the latter for which they were renowned) in the highlands and cultivating the lowlands (originally millet, then maize), was disrupted.

In the 20th century the Abazians came under further pressure. During the civil war that followed the Soviet rise to power, Abazians fought for both the Red Guards and the White Guards. During the existence of the Soviet Union (USSR), the Abazians faced further deportations, collectivization, and the suppression of traditional customs and their Islamic religion.

See also RUSSIANS: NATIONALITY.

Abricantes (Abricanti; Abricantui)

The Abricantes are classified as a Celtic tribe. They lived in Gaul around present-day Avranches in northwestern France and are discussed as CELTS or GAULS. The ROMANS referred to them along with other tribes as Armoricans, that is, tribes living between the Seine and Loire on or near the Atlantic Ocean in the region of Armorica (roughly present-day Brittany and eastern Normandy), occupied by forces under Julius Caesar in 55 B.C.E. Legedia on the site of Avranches became a capital of a

Achaean (Achaioi)

The name *Achaean* appears in the epic poem the *Iliad*—presumably written by the poet Homer of the ninth or eighth century B.C.E.—in reference to one group of the GREEKS who were said to have sacked Troy, an event that may have occurred in 1184 B.C.E. or a century earlier. Before archaeological discoveries of the 20th century that dramatically realigned the chronology of Greek prehistory, it was assumed the Achaeans were the first Hellenic people, that is, the first of the ancient Greeks who spoke Greek. It is now known that Indo-European speakers of an early form of Greek had been in Greece for well over 1,000 years before the Trojan War. This period saw the rise, flowering, and collapse of an entire civilization, of which Homer and later Greeks of the classical period knew very little—that of the MYCENAEANS—that lasted for almost 400 years (1600–1200 B.C.E.). Thus it makes little sense to apply the name *Achaean* to people much

before the time of the Trojan War. Various groups of Indo-European speakers first appeared in Greece perhaps as early as the fourth millennium B.C.E., long before this time. From at least 1600 B.C.E. peoples in southern Greece were highly influenced by the MINOANS on Crete. By the end of the Greek Dark Ages, from the demise of Mycenaean civilization to about the eighth century B.C.E., a people living in a region called Achaea in the northern Peloponnese spoke a dialect, called Arcado-Cypriot, that resembled Mycenaean Greek more than any other in Greece.

ORIGINS

It is debated as to whether the Achaeans were the direct ancestors of the three main ethnic divisions of the later Greeks, the AEOLIANS, IONIANS, and DORIANS, or whether these represent the product of new Indo-European migrations into Greece. After the mysterious collapse of the Mycenaean civilization in the 13th century B.C.E. there is a long dark period in Greece, during which writing was lost, cities vanished, and civilization stagnated or went into retreat. In the *Iliad* by Homer from the ninth or eighth century B.C.E., based on oral histories dating from these earlier Greek Dark Ages, the Achaeans are said to be the principal Greeks who sacked Troy (Homer also mentions Argives—people from Argos—and Danaans as taking part). By the beginning of the Archaic period in 750 B.C.E., however, only a small group of Greeks on the Peloponnese called themselves Achaeans; they lived in a small area of the northern Peloponnese, bordered on one side by high mountains and on the other by the Gulf of Corinth.

The origin of the Achaeans is clouded with uncertainty due to a lack of historical evidence from the Greek Dark Ages and the period before it and a relatively incomplete archaeological record (in part caused by the unscientific, treasure-hunting style of 19th-century excavators of Greek sites, particularly those of the Mycenaeans). It has also been somewhat controversial because of the association of the Hellenes with the roots of Western culture. For this reason the ancestors of the Hellenes were avidly sought by scholars, on the assumption that the progenitors of so great a race as the Greeks, the first bearers of Western civilization, must be very special. The early attempts to understand their origin resorted to interpreting the mythical story of the sons of Hellen, to whom Greece was

Achaean time line**B.C.E.**

12th century Movement of warrior groups with non-Mycenaean culture (possibly people later called Achaeans) across Aegean Sea and Greek mainland in wake of collapse of Mycenaean civilization

eighth century Greeks rise out of Dark Ages, begin to found city-states, rediscover writing with Phoenician alphabet; Homeric poems mention Achaeans as principal Greeks.

seventh century First Achaean League is founded in Achaea; Achaeans from Patras take part in a migration to Sicily; poems of Hesiod detail origin myth of Hellenes.

fourth century First Achaean League dissolves.

336–335 Alexander the Great unites Greece by conquest.

280 Second Achaean League is founded to oppose Macedonian conquerors.

247 Achaean League in strife with Sparta; Macedonians invited back to help them; Macedonians regain control.

198 Achaean League sides with Rome against Macedonia; granted control of nearly all the Peloponnese.

146 Romans conquer Achaea, making it a Roman province.

parceled out as their inheritance, and who migrated with their people throughout Greece, warring and allying among themselves, until they finally produced the ethnic divisions found during the Archaic period. At that time these myths found their voice in the Boeotian poet Hesiod, who probably lived in the eighth century B.C.E.

These myths seemed to fit in well with 19th-century linguistic analysis of the origins of Greek as an Indo-European tongue. In this interpretation the Achaeans were a tall, fair-skinned people who migrated from central Europe and encountered a shorter dark-skinned Mediterranean people, related to the Minoans of Crete. By a process of conquest, these people came to inhabit Greece sometime between 1600 and 1500 B.C.E.

What archaeological evidence there is, however, combined with the presence of a large number of non-Indo-European place-names and roots in Greek, indicates that intermixing, and not conquest, was the rule. Moreover, other analyses place the appearance of Indo-European speakers in Greece much earlier, as far back as the fourth millennium B.C.E., and paint the picture of a long, gradual process of migration and repeated mingling with local populations.

Furthermore, current thinking on ethnicity has moved away from simple linkages between culture and genetic traits such as skin color and body type. Such genetic differences indeed have long existed between Europeans living in different regions of the continent; they are most pronounced in regions around the periphery, such as Scandinavia and the Mediterranean region, where people were genetically isolated. But the study of prehistoric movements of genetic traits is not sufficiently advanced to give more than a very general idea of such movements, and certainly not fine-tuned enough to assign suites of traits such as height and skin color to bearers of cultures known only archaeologically.

The picture of the Achaeans as a tall, fair-skinned people who entered Greece from the north may have more to do with the desires and beliefs of modern lovers of Greek civilization, especially in 19th-century Germany and Great Britain—the desire to have some genealogical connection with the classical Greeks, however distant, and the racist belief that the glories of Greek civilization could not have been the product of dark-skinned southern Europeans alone. It is of course entirely possible and even probable that blond-haired, fair-skinned peoples entered Greece at some

point in its history, but evidence for this before historical times (when the CELTS invaded, for example)—when it happened and whence they might have come—is lacking at present.

LANGUAGE

The Achaeans spoke perhaps the earliest form of Greek, referred to as Achaean. It is thought to be related to Mycenaean. Later in their history some among them probably spoke other Greek dialects, depending on location, such as Arcado-Cypriot (Arcadian and Cypriot) and Attic.

HISTORY

Around 1450 B.C.E. the Minoan civilization collapsed, and the Mycenaean civilization that had emerged on Greece during the Minoan New Palace period (from 1600 B.C.E.) took over the Minoan trading network in the Aegean and eastern Mediterranean. This civilization was located primarily on the Peloponnese and called Mycenaean after the city of Mycenae, which was excavated in the 19th century, providing the first glimpses of the riches of this second Aegean civilization.

The records of a people of Asia Minor, the Hittites, mention a group who settled the islands of the Aegean and parts of Asia Minor during the 14th and 13th centuries B.C.E., and call them the Ahhiyawa. This word may be related to the word *Achaean*; the identity of the Ahhiyawa is uncertain, however. They could have been Mycenaean Greek traders. They could have played some role in the 12th-century fall of Troy, which was located in Asia Minor, and could have later been remembered in Homer's time as the Achaeans. However, there is no evidence that the Mycenaean participated in the 12th-century destruction of Troy. This event occurred in the context of a tidal wave of destruction that swept the eastern Mediterranean around 1200 B.C.E., bringing down Mycenaean civilization; threatening the great powers of the time, the Egyptians and the Hittites, as well as states in Syria, Palestine, and Cyprus; and causing widespread population movements, depopulation, and devastation of some regions. Taken at face value the *Iliad* indicates that the Achaeans in the Trojan War were among the agents of this destruction (whether they were primary agents, or merely the beneficiaries of events caused by other forces). Thus whatever the relationship the Ahhiyawa/Achaeans had with Mycenaean civilization, they seem to have played a role in its

downfall, possibly as part of internecine rivalries among Mycenaean power blocs that furnished the material for the *Iliad* and other related poetic epics of later times.

There is much evidence of aggressive warrior groups raiding far and wide in the Mediterranean region in this period. Egyptian records of the time tell of armies of warriors whom the Egyptians called collectively SEA PEOPLES. Among these were a group called by the Egyptians the Shekelesh. A new kind of pottery dating from this time found in southern Italy and Sicily may have been made by the Shekelesh, whose name lived on in later times as SICULI, Iron Age inhabitants of Sicily. Another group called the Shardana by the Egyptians may have been from or lived on the island of Sardinia.

Egyptian depictions of the Sea Peoples show them wearing distinctive horned helmets corresponding to those worn by bronze statuettes found throughout the Mediterranean dating to after the demise of Mycenaean civilization and in a clearly new style not derived from Mycenaean art. Non-Mycenaean pottery (“Barbarian” or “Coarse” Ware) and weapon types from this time with affinities to material from north of Greece have been found in Greece and Troy, lending credence to the idea that warrior groups from abroad had entered the region.

Because the numbers of these artifacts, however, are small, organized, wholesale invasion is unlikely. What we seem to be seeing in the evidence concerning the Sea Peoples is the waxing in strength and numbers of pirate groups from all over the Mediterranean, who had long been preying on the lucrative trade routes of the Mycenaean and others; at some point the Sea Peoples may have been joined by warriors from the north. As did the VIKINGS of the first millennium C.E., who began as small-scale raiders and later caused great swathes of destruction, the Sea Peoples, a diverse group of warrior bands, may have helped bring down Mycenaean civilization.

The Ahhiyawa/Archaeans may have been one group who were part of the Sea Peoples; other groups may have been ancestral to the Dorians, Ionians, and Aeolians who constituted the main linguistic/ethnic groups of post-Dark Ages Greece. On the other hand, by the end of the Dark Ages, a group speaking the dialect closest to Mycenaean Greek, Arcado-Cypriot, called themselves Achaeans. They lived between the mountains of Arcadia and the Gulf of Corinth in a remote area known as

Achaea. Their dialect was also spoken on Cyprus, where the majority of European-made swords and knives dating from immediately after the Mycenaean collapse have been found. Here a brief phase of prosperity and cultural flowering took place, in stark contrast to most of the larger region. A bronze statuette of a warrior with horned helmet was found at Enkomi on Cyprus. This combination of Mycenaean-derived language, cultural flowering, and northern artifacts may point to an alliance between Mycenaean elites and northern warrior bands. Groups of Mycenaean nobility, accompanied by Achaean warriors hired to protect them, could have fled central Greece to Cyprus to the east and to Achaea, protected by mountains, to the west. In any case, whether the term *Achaean* refers to a group of Mycenaean or to a tribe of northern warriors remains an open question.

Achaea

In the seventh century B.C.E. the Achaeans founded at least 12 cities in Achaea, including Patras, which were joined for mutual defense into the First Achaean League. The Achaeans of Patras sent colonists to Sicily during the seventh century alongside other Greeks, but Achaea largely remained isolated from the rest of the Greeks and the conflicts of that time. The First Achaean League dissolved in the fourth century B.C.E. after joining Greek opposition to the invasion by MACEDONIANS under Philip II. In 323 B.C.E. his son, Alexander the Great, completed the conquest of Greece, putting an end to classical Greece and ushering in what is known as the Hellenic period.

The Second Achaean League formed in 280 B.C.E. and, with additional cities, managed to expel the Macedonians from Corinth in 247 B.C.E. Strife with the people of the city-state of Sparta interrupted any hopes for the liberation of Greece, when the Achaeans enlisted Macedonian aid against them and then fell back under their control. In 198 B.C.E., during the war between Rome and Macedonia, the Achaean League went over to the ROMANS and won control over almost all of the Peloponnese. The Romans themselves warred with the Achaeans in 146 B.C.E., defeated them, and created the Roman province of Achaea.

CULTURE (see also GREEKS; MYCENAEANS)

Because the identity of the Achaeans is not known with certainty, it is impossible to define

their culture beyond that presented in conjunction with theories of their history. Well-crafted swords and statuettes of warriors with horned helmets perhaps are evidence of the Achaeans as a warrior people something like the Vikings.

The study of the Achaeans and attempts to determine their relationships with the other peoples of ancient Greece—the Minoans, Mycenaean, Aeolians, Ionians, and Dorians—draw on mythology, literature, linguistics, and archaeology. Much of their story takes place in prehistoric times, and it is next to impossible to connect names recorded centuries later with peoples known only through scattered artifacts.

Adigh See CIRCASSIANS.

Adriani

The Adriani lived near the PALMIENSI and PRAETUTII in the present-day province of Teramo in the northern region of Abruzzi in present-day east-central Italy, assumed to be there at least from the eighth century B.C.E. Along with those tribes, the Adriani are sometimes grouped with the PICENES living to their north beyond the Tonto River, although it is generally believed that the Adriani, Palmiensi, and Praetutii spoke Italic dialects, placing them among the ITALICS, and the Picenes either Illyrian or pre-Indo-European dialects. To the south of the Adriani lived the VESTINI, classified as Italics.

The Adriani had a trading settlement known as Matrinum on the Adriatic Sea at the mouth of the Piomba River or the Vomano River. The region was pacified by the ROMANS in the third century B.C.E. during and after wars with the SAMNITES and Romanized in the second century B.C.E.

See also ILLYRIANS.

Aduatuci (Aduatici; Atuatuci; Audatici)

The Aduatuci are classified as a combined Celtic-Germanic tribe that is, as both CELTS and GERMANICS. (In general, the distinction between Celtic and Germanic tribes in northern Gaul and east of the Rhine in the first centuries B.C.E. and C.E., based for the most part on ancient Roman writings, is difficult to make, since Roman classifications are often arbitrary and cannot be confirmed by other evidence.) They lived in Gaul in present-day northeastern

Belgium and southeastern Netherlands and are also discussed as GAULS. They are sometimes grouped among the BELGAE, a subdivision of Gauls. Because they claimed partial descent from the Germanic CIMBRI and TEUTONES, who had been an earlier threat to Rome, the Aduatuci were attacked by the ROMANS under Julius Caesar; their entire population was sold into slavery in 57 B.C.E.

Aducinates

The Aducinates are classified as a Celtic tribe. They lived in Gaul near the lower Rhone in present-day southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Aedui (Haedui; Haeduers; Eduans)

The Aedui are classified as a Celtic tribe. They lived in Gaul along the Rhône and Saône Rivers around present-day Autun in east-central France and are discussed as CELTS or GAULS. Because of their location along the Rhône and their trade contacts with Mediterranean peoples, they were one of the more powerful and influential of the Gallic tribes. Some GERMANICS may have settled among them. Their chief town of Bibracte at Mont Beuvray was the location of a school run by the Druids, where Celtic nobility sent their young to be educated. Their allies probably included the AMBARRI, AMBIVARITI, BRANNOVICES.

After 120 B.C.E., an alliance with the Aedui against the ALLOBROGES and the ARVERNI gave the ROMANS control of the Rhône Valley. In 71 B.C.E., the Celtic-Germanic SEQUANI and the Germanic SUEBI, allied under the Suebian Ariovistus, defeated the Aedui and probably HELVETII allies. The Aedui supported Julius Caesar in the Gallic Wars of the 50s B.C.E. Divitiacus, a ruler as well as a Druid, was a friend to the Romans. They at first did not support Vercingetorix of the Arverni in his rebellion of 52 B.C.E. Their aid at Gergovia, however, enabled the rebels to drive back the Romans and delay ultimate Roman victory. Some among them again rebelled in 20 C.E. along with the TREVERI.

Augustodunum on the site of Autun was a *civitas* capital of the Aedui during the Roman occupation lasting until the fifth century C.E. During the reign of Claudius I in 41–54 C.E., Aeduan aristocrats became the first Gauls to serve in the Roman Senate.

AEOLIANS**location:**
Greece**time period:**
Third millennium to
fourth century B.C.E.**ancestry:**
Hellenic**language:**
Aeolic (Greek)**Aeolians (Eolians; Aeolic Greeks)**

The Aeolians are one of the four main divisions of ancestral GREEKS, or Hellenes; the others are the ACHAEANS, IONIANS, and DORIANS. A form (or order) of architecture, known as Aeolic, was named after the Aeolians.

ORIGINS

The origins of the Aeolians are unclear. They are only known to history as speakers of one of the several dialects that rose to dominance during the Greek Dark Ages after the collapse of the MYCENAEANS in about 1200 B.C.E. Their ancestors were among the groups of Indo-European speakers who began filtering into Greece, probably mostly in small groups, sometime after the fourth millennium B.C.E. and for many centuries thereafter. There is no evidence to pinpoint exactly when during this long period their direct ancestors entered Greece. Earlier theories of waves of Indo-European invaders who displaced pre-Hellenic (or Aegean) populations called PELASGIANS by later Greeks have largely been abandoned.

By the end of the Dark Ages in the late ninth century B.C.E. Aeolians were living in Thessaly, a broad plain in north-central Greece bordered by the mountains Pindus and Ossa and the Aegean Sea. Aeolic speakers were also dominant in Boeotia, the territory of the later classical city-state of Thebes, which extended down to Attica (the surrounding territory at Athens) and the Gulf of Corinth.

Origin Myth

In his genealogy of the Greeks, or Hellenes, the Boeotian poet Hesiod, who probably lived in the eighth century B.C.E., recorded that the Aeolians took their name from Aeolus, who ruled over Thessaly as his inheritance from his father, Hellen, the legendary ancestor of all Greeks. Hellen was the son of Deucalion and Pyrrha, the only two mortals to survive a devastating flood, which was sent by Zeus to destroy humankind because of his disgust at the cannibalism practiced in Arcadia, a region

of Greece. The Arcadians persisted in sacrificing a boy every year to Zeus; when the god went in mortal disguise to investigate, he was offered soup made from the boy's intestines. Enraged, Zeus turned everyone at the gruesome meal into a wolf then sent the all-engulfing floods. Deucalion and Pyrrha, who survived in a wooden chest, landed on the heights of Mount Parnassus. Their son, Hellen, gave birth to Dorus (supposed progenitor of the Dorians), Xouthus (from whom were born Ion and Achaeus, the progenitors of the Ionians and Achaeans), and Aeolus (father of the Aeolians). Mythological history holds that the Aeolians were driven from parts of Thessaly by the descendants of Dorus (the Dorians) while being ruled by Lapithes, the grandson of Aeolus. The son of Lapithes, called Lesbos, sailed from Thessaly to the island that thereafter took its name from him.

LANGUAGE

Aeolic, the Greek spoken by the Aeolians on mainland Greece, as well as parts of Asia Minor and the Near East, is regarded as one of the oldest forms of Hellenic speech. (Many of the words in ancient Greek are not of Indo-European origin and must have been borrowed from the pre-Hellenic population.)

HISTORY**Migrations to Asia Minor**

Between 1225 and 1175 B.C.E. the Bronze Age civilizations around the Mediterranean, including that of the Mycenaeans, entered a period of sharp decline, the cause of which is still uncertain; it may have been caused by a combination of natural disasters, civil strife, piracy, and famine brought on by climate change, such as a period of severe drought. Possibly to escape these conditions, many Aeolians apparently began to migrate eastward over the Aegean Sea. Between 1130 and 1000 B.C.E., the Aeolians made a great migration across the Aegean, inhabiting the island of Lesbos and the northwest coast of Asia Minor, between the Dardanelles (the strait linking the Aegean with the Sea of Marmara and Black Sea, and called in ancient times the Hellespont) in the north and the Hermus River in the south. Judging by later settlements, the Aeolians colonized other areas of the Mediterranean as well.

Aeolis

By the time written records were being made by Greeks, the cities of Asia Minor founded by

Aeolians time line**B.C.E.****12th century** Aeolians migrate to Lesbos and Asia Minor.**546** Aeolians and Persians agree to treaty.**494** After revolt Aeolians are defeated by Persians.**479** Aeolians join other Greeks against Persians.

the Aeolians (in the northwestern Anatolian Peninsula) were known collectively as Aeolis (or Aiolis). The Greek historian Herodotus identified 12 cities forming the Aeolian League, for defense and trade, in opposition to the Ionian League. These were Temnos, Smyrna, Pitane, Neonteichos, Aegirusa, Notium, Killa, Cyme, Gryneum, Larissa, Myrina, and Aegae; many other cities were founded as well. They flourished in an area that was more fertile and wetter than Ionia to the south in Asia Minor and were concerned mainly with farming. By the eighth century B.C.E., because of increasing trade contacts throughout the region, the use of an alphabet borrowed and modified from the PHOENICIANS spread throughout the Hellenic peoples of Greece, both on the mainland and on Aegean islands and in Asia Minor. Iron smelting, thought to have been developed in Greece when imports of copper and tin used to make bronze dwindled with the demise of the Mycenaean trade networks, also spread throughout the Hellenic population, revolutionizing farming as iron plows came into use.

Originally the cities were governed by kings, as they had been on the mainland, but in the seventh century B.C.E., many of the kings were driven out and replaced by oligarchies or tyrants. For a time Lesbos was the most powerful settlement of the Aeolians and exercised substantial control over the Asia Minor settlements. In 570 B.C.E. the Aeolians of Lesbos founded the colony of Naucratis in Egypt.

Warfare

During the mid-sixth century B.C.E. armies out of Lydia in western Asia Minor, under the leadership of Croesus, the last king of the Lydian empire, conquered the Greek cities of Asia Minor. The Aeolians of Lesbos entered into a treaty with Croesus, increasing Lydian seafaring capabilities. The Persians (people of present-day Iran) under Cyrus II conquered the Lydians, consolidating much of the Near East under their rule. Cyrus set up a tyrant to rule Lesbos. The Aeolians, who signed a treaty with the Persians in 546 B.C.E., revolted but were subjugated entirely after their defeat at Lade in 494 B.C.E. Aeolians accompanied the Persian emperor Xerxes I in his invasion of mainland Greece with 60 ships in 480 B.C.E. After the Persian army, a formidable force that modern scholars believe to have been composed of about 200,000 men and 1,000 ships, suffered a defeat at the Battle of Mycale in 479 B.C.E., the

Aeolians of Lesbos joined with the Greeks of the mainland against the Persians.

The alliance seems to indicate that a strong cultural identity existed among the Hellenes, despite their differences. Indeed, over the next centuries, distinctions among the Aeolians, Ionians, and Dorians received less emphasis as various city-states became the determining political entities.

CULTURE (see also GREEKS)

The architecture of the Aeolians owed much to the Ionian architecture of Ionia in Asia Minor. Temples were constructed out of stone, usually limestone, painted white with marble dust. The Aeolic order of columns resembles Ionic columns, except for the capital, which has a palmette thrusting up between two volutes, or carved spirals.

Two of the earliest—seventh to sixth century B.C.E.—and most renowned Greek Lyric poets (who composed shorter poems accompanied by the lyre and sung with a different meter from that of the Homeric epics) were from Lesbos: Sappho and Alcaeus. Both were strongly influenced by the earlier Homeric poetry, including the *Iliad* and the *Odyssey*, which many believe originated in northern Greece, as oral poetry in the Aeolic dialect, though the main language of Homer was passed down to us as principally Ionic, with some Aeolic and Arcado-Cypriot features. It was strictly a literary dialect, used only in Homeric verse.

In the Homeric poems the terms *Hellene*, *Ionian*, *Dorian*, and *Aeolian*, if they appear at all, refer only to small groups from distinct geographic areas. On mainland Greece the differences among the various groups of Greeks were not clearly to be found. For example, the Corinthians, living in a city with a name derived from the pre-Hellenic inhabitants, were mainly of Aeolian descent but spoke Doric. The flood myth must have originated in an effort to explain the three different and clearly defined Greek populations of Asia Minor: the Aeolians, who lived in the north of the Anatolian Peninsula; the Ionians, who inhabited the middle; and the Dorians, who lived in Caria in the south. Although the myth is generally close in its broad outlines to the known movements of different peoples throughout Greece and the relationship of the Greeks, it vastly simplifies the much more complicated interactions that occurred. The Aeolians, Achaeans, and Ionians

constitute one group of people, who diverged slightly in language as they settled in different parts of Greece and conquered and intermixed with preexisting tribes. The Dorians were a separate group, also Indo-European and from the north who moved into Greece, intermixing with and—possibly—conquering or putting pressure on the remnants of earlier peoples, who either remained or migrated.

Aequi (Equi; Equians; Aequiculi)

The Aequi are classified as *ITALICS*, probably a branch tribe of *SABINES* of the central Apennines in present-day Italy. The Aequi came to inhabit hill country in northern parts of the region of ancient Latium (part of modern Lazio) in present-day west-central Italy north of the *HERNICI* and *VOLSCI*. They were early enemies of the *ROMANS*.

ORIGINS

The Aequi migrated from the central Apennines into northern Latium during the sixth century B.C.E., as the power of the *ETRUSCANS* began to wane.

LANGUAGE

The Aequian language was one of the Sabellian subgroup of the Oscan group of Italic languages, related to Marrucinian, Marsian, Paelignian, Sabine, Vestinian, and Volscian.

HISTORY

In about 500 B.C.E. the Aequi in Latium moved to the south, threatening Roman settlements, including Praeneste (modern Palestrina) and Tibur (modern Tivoli), which they may have razed. By 493 B.C.E. they had

allied themselves with other Italics in Latium, the *VOLSCI*; the Romans responded in kind, securing an alliance with the *HERNICI* and *LATINS*.

In 486 B.C.E. a period of continued warfare began between the Romans and the Aequi and *VOLSCI*. In 457 B.C.E. the Roman army was routed at the hands of the Aequi at Mt. Algidus. Archaeology has given indirect evidence of the seriousness of the threat the Aequi posed to Rome, as there is a discernible drop off of public building projects in the mid-fifth century B.C.E., a sign that the economy was suffering. According to perhaps legendary accounts the Roman general Cincinnatus was called off his farm to lead the Romans as dictator and rescue their army. Sixteen days later, his mission accomplished, Cincinnatus is said to have resigned, returning to his plow (his action long serving as an example of ideal Roman behavior). In 431 B.C.E. the Romans under A. Postumius Tubertus fought another engagement with the Aequi, at the pass at Mt. Algidus, and this time they triumphed.

Although the power of the Aequi was broken, they continued to resist Roman expansion, but with little effect. In 304 B.C.E. Rome successfully defeated the *SAMNITES* and their allies, ending the Second Samnite War and gaining complete control of Latium. During this war, in a campaign lasting 50 days, numerous strongholds of the Aequi were systematically taken one by one and their inhabitants slaughtered en masse. The Aequi were granted limited Roman citizenship, and under Roman rule, their culture and language disappeared.

CULTURE (see also ITALICS)

Little is known of pre-Roman Aequi culture, other than that they subsisted on herding and agriculture and were warlike. The colony established by the Romans at the Aequi town of Alba Fucens in 304 B.C.E. signaled the gradual intrusion of the Latin language and culture into Aequi territory.

Aequi time line**B.C.E.**

- c. sixth century** Aequi migrate into northern Latium from central Apennines as power of Etruscans declines.
- c. 500** Aequi are pushed into and attack Roman territory.
- c. 493** Romans sign treaty with Latins and *HERNICI*, in response to alliance of Aequi and *VOLSCI*.
- 457** Aequi defeat Romans at Mt. Algidus.
- 431** Romans defeat Aequi at Mt. Algidus.
- 304** At end of Second Samnite War Rome secures ultimate control over all of Latium; Aequi are incorporated with limited voting rights into Roman Republic.

The Aequi were one of many peoples of the Italian Peninsula whose history is tied to that of the Romans. Knowledge of them has been filtered through the Roman point of view.

Aernici See *HERNICI*.

Aestii (Aestae; Aestyans; Aistii; Aistians; Austii)

The exact identity of the Aestii, a people mentioned in ancient texts, is not known. They were a farming people of the Baltic Sea region in north-central Europe, who traded in amber.

ORIGINS

An early mention of the Aestii appears in the writings of the Roman historian Tacitus, in about 98 C.E. The name may have originally been applied to one tribe, then later applied to all the peoples of the region. Most scholars consider the Aestii to have been the ancient **BALTS**: That is, Baltic-speaking peoples who are known to have lived along the coast in ancient times and to be ancestors of peoples living near the Baltic Sea who had engaged in gathering and trading amber since at least the Bronze Age. Thus later Baltic peoples, such as the **BORUSSIANS** (Old Prussians), **LETTS**, and **LITHUANIANS**, known to have developed the amber trade from the fourth to ninth centuries, are likely to have been their descendants. Alternately, the original Aestii could have been **CELTS**, **FINNO-UGRIANS**, **GERMANICS**, or **SARMATIANS**.

The name Aestii perhaps derived from the Aestia River; or it may mean “east,” as used by Scandinavian peoples across the Baltic Sea. The name of the **ESTHS**, a Finnic people, is probably related etymologically to Aestii, although they are not considered direct descendants of the Aestii. Estonians started referring to themselves as *Eestlased* in the 19th century. Before that time they simply referred to themselves as “the country people”—or *Maarahvas* (see **ESTONIANS: NATIONALITY**).

LANGUAGE

Because of their supposed geographical location the Aestii are thought to have been Baltic speakers, but they may have been Celtic, Finnic, Germanic, Sarmatian, or Slavic.

HISTORY

According to the Danish historian Saxo Grammaticus (writing in the 13th century), Ermanaric of the **OSTROGOTHS** organized a successful military raid against the Aestii in the mid-fourth century C.E. Other Roman and Gothic historians, such as Cassiodorus and Jordanes of the sixth century, also mentioned the Aestii, the latter describing them as peaceful. In about 523–26, Cassiodorus, in the name of King Theodoric of the

Ostrogoths, sometime soon before his death, wrote a letter to the Aestii, thanking them for the amber sent to the king. As late as 833–36, the Aestii were mentioned in *Vita Caroli Magni* (Life of Charlemagne) by Einhard of the **FRANKS**.

CULTURE

The Aestii are associated with the amber trade with the **ROMANS**, starting in the first century C.E., which led to the formation of the Roman “amber road” to the Baltic region (although amber had been traded to the Mediterranean from the Baltic region for millennia). The Romans traded items of bronze, primarily coins and brooches, fashionable during that age, in exchange for amber (*glaesum* in ancient texts).

Tacitus claims that the culture of the Aestii was similar to that of the Germanic **SUEBI**, although their language resembled “British”—Celtic rather than Germanic. They worshipped the Mother of the Gods and wore images of boars as an emblem of their cult. It is hard to know how to assess the accuracy of Tacitus’s descriptions of tribes of this remoteness from Rome. Most Celtic peoples worshipped a variously named Mother Goddess, and boars were an important motif in Celtic art, lending credence to Tacitus’s account. On the other hand, boars were important to Germanics as well. The identification of their language as British could well have originated in the account of a trader who, whether Germanic or Roman, recognized the significant difference of the Aestii’s language from the more predominant Germanic languages in central Europe and concluded that it must be like the language of another non-Germanic northern people, that is, the **BRITONS**. Further confusing the matter is the fact that Tacitus said that the Aestii word for amber was *gle-sum*, which is Germanic. This may mean only that Aestian amber producers used the Germanic word to facilitate communication

with the Germanic and then later Roman traders among them.

The Aestii are an example of a people who evidently played a significant role in ancient European history, but about whom little is known. Their trade in amber and the economic impact it had on other peoples make them an intriguing subject of research.

Agessinates (Agesinates; Cambolectri Agessinates)

The Agessinates are classified as a Celtic tribe. They lived in Gaul around present-day Angoulême in present-day western France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Another group to the west, the CAMBOLECTRI (or Cambolectri Atlantici), were probably related ancestrally.

Aigosages

The Aigosages are classified as a Celtic tribe, from eastern Europe; they are discussed as CELTS or GALATOI. They were recruited as mercenaries by Hellenistic rulers to go to Bithynia in Asia Minor in 218 B.C.E. but were wiped out by their employers after rebelling.

Alamanni (Alamani; Alemanni; Alemans; Allemanni; Allemans)

The Alamanni were a tribal confederacy of GERMANICS that emerged east of the Rhine and south of the Main River in present-day southwestern Germany in the third century C.E. in territory formerly inhabited by the SUEBI and spread to neighboring regions, including Alsace west of the Rhine in present-day northeastern France and later southward into the northern Alps. Territory in France and Germany on both sides of the Rhine became known as Alamannia; part of it was later referred to as Swabia derived from the tribal name Suebi.

ORIGINS

The exact makeup of the Alamanni is not known. They may have consisted of a core of

Suebian peoples located in central Germany in earlier centuries, such as the HERMUNDURI, NARISTI, and SEMNONES. Or they may have been a core group who invaded Suebia territory from elsewhere. Other tribes joined them later, such as the IUTHUNGI in the fourth century C.E. Their confederacy may, like that of other Germanic confederacies such as the GOTHs, have been a multiethnic, multicultural one. Their name was derived from *alamans*, meaning “all the people.”

LANGUAGE

The Alamannic dialect is related to Swabian (Suebian). Some inhabitants of the Black Forest region of present-day southern Germany as well as the independent principality of Liechtenstein still speak Alamannic.

HISTORY

Early Incursions onto Roman Territory

Those tribes grouped as Alamanni ranged widely from their homeland in southwestern Germany. The Alamanni are the first large Germanic tribal confederacy mentioned in historical sources: Coming to the notice of the ROMANS, they were driven out of Upper Germany by an army under Emperor Caracalla in 213 C.E. Caracalla's victory did not deter the Alamanni for long, and they broke through the Roman *limes* (fortifications) in the mid-third century, pushing westward across the Rhine as far as present-day Trier (Trèves) on the banks of the Prüm River in western Germany and settling south of the Danube near Lake Constance on the present-day border of Germany, Austria, and Switzerland. With the GOTHs they are considered the first Germanics to occupy what had been Roman-held territory. Their incursions were one of the reasons the Romans gave up defending the Rhine-Danube frontier in 260. The Alamanni did not proceed deeper into Roman territory until later that decade, when they began carrying out raids in northern Italy. In 268 a Roman force under Claudius II defeated them in the Battle of Lake Benacus (Lake Garda) near Milan.

In 275 the Alamanni were among Germanic forces, also including Goths and VANDALS, who overran part of the Roman province of Dacia in the steppe region of the Lower Danube basin west of the Black Sea, defeating a force of SARMATIANS. By about 300 groups of settlers were occupying territory between the Black Forest and the Upper Danube. From there they began attacking the Upper Rhine valley and eastern Gaul.

Later Encounters with the Romans

In the fourth century some Alamanni moved westward into Alsace, also part of Gaul. The Romans under the soon-to-be-emperor Julian fought and defeated them at Strasbourg in 357, at which time their king, Cnodomarius, was taken prisoner. In 368, after an Alamanni force under Macrianus had attacked present-day Mainz on the Rhine, the Romans under Emperor Valentinian I carried out a successful counterattack. Yet the Alamannic resistance persisted, and Valentinian, needing his troops to quell the QUADI and Sarmatians to the east, made peace with Macrianus. Some of the Alamanni served in the Roman army. Among them were the Alamannic king Fraomarius, who led a contingent to Britain as reinforcements.

In 380 Alamannic enemies, the BURGUNDII, who had settled to their south the century before, won territory from them between the Main and Neckar Rivers. The Romans used the Burgundii to impede Alamannic expansion.

The Alamanni were part of the great movement of Germanic groups across the frozen Rhine River in the winter of 406–407, which spelled the beginning of the end of Roman control of Gaul. Some among them settled in Alsace between the Rhine River and the Vosges Mountains in northeastern France.

Franks, Ostrogoths, and Alamanni

In 496 the FRANKS under the Salian king Clovis I defeated the Alamanni at Tolbiacum (modern Zülpich), and Alamannic lands became part of the eastward-expanding Frankish Empire. After defeat the Alamanni resettled in southern Germany, taking up residence in the present-day German state of Baden-Württemberg in the Black Forest region as well as in Switzerland and controlling the best land in the northern Alps. They continued to conduct raids in Gaul, Italy, and the Upper Danube region, but not intensively enough to seize territory. At this time they entered under the protection of Theodoric of the OSTROGOTHS.

During and after the sixth century the Franks imposed increasing dominion over the Alamanni until the Frankish leader Charles Martel took them into his empire in the eighth century. Alamannia in northeastern France and southwestern Germany on both sides of the Rhine was a Frankish province for centuries. There is debate about when it became a formal duchy in the Frankish Empire; it may have occurred in 713 or later.

Alamanni time line

C.E.

213	Alamanni attacked by Romans under Emperor Caracalla.
268	After Alamanni invade northern upper Italy, they are defeated by Romans under Claudius II near Milan.
275	Alamanni along with Goths and Vandals overrun part of Roman province of Dacia, defeating Sarmatians.
357	Alamanni defeated by Romans under Julian at Strasbourg.
368	Alamanni defeated by Romans under Valentinian I.
406–407	Alamanni are among horde of tribes crossing frozen Rhine.
mid-fifth century	Alamanni settle in Alsace; later in century, they occupy parts of Baden-Württemberg in Germany and Switzerland.
496	Alamanni conquered by Clovis I of Franks.
730	Duchy of Alamannia incorporated into Frankish Empire.

Alamannic Subtribes

Alamanni who settled varying regions adopted local names. Among those known by the fourth or fifth century were the Brigavi in the region known as the Breisgau; the Bucinobantes living on the Rhine opposite the mouth of the Main River; the Lentienses on the north shore of Lake Constance; and the Raetovarii in the Roman province of Raetia.

Descendants

The majority of the population of the northern Black Forest in Germany are descendants of the Alamanni (*see also* GERMANS: NATIONALITY). In the early 19th century, people of the region began to discuss the Alamanni and Suebi as separate groups, with the inhabitants of the regions of Baden claiming Alamannic ancestry and those of Württemberg claiming Suebian ancestry. (The two became merged into one state, Baden-Württemberg, in 1952.) Many among modern-day Liechtensteiners of the principality of Liechtenstein south of Lake Constance are also descended from the Alamanni (*see* LIECHTENSTEINERS: NATIONALITY).

CULTURE (*see also* GERMANICS)

Government and Society

In a sense the Alamannic confederacy was a creation of the Romans—or came into being as a result of Roman military actions against the tribes of which it was formed, notably in the Marcomannic Wars of the second century C.E. (*see* MARCOMANNI). Unlike the Goths, BURGUNDII, and LOMBARDS, the Alamanni did not preserve many of their ancient tribal traditions; nor were they organized into large groups with important

kings or war leaders. Their entry into the Roman Empire was little noticed by Roman authorities, with small groups of warrior peasants crossing the Rhine to serve in the Roman army or to settle in small enclaves.

The Alamanni—"all the people"—did not at first have a centralized government. They moved and settled in relatively autonomous groups, each group having its own ruler or king. As mentioned, at first their groups were too small for major war leaders or kings (*duces* or *reiks*). But as warfare became increasingly prevalent, their groupings became larger, though never as large as those of the Goths. The rugged terrain of the northern Alpine territory that they occupied in the fifth century reinforced this tendency. Archaeologically their most impressive remains in the Alps are the strongholds of local chieftains. Late in their history, for the duration of a campaign, they united under a joint command of two leaders.

Because the Alamanni underwent their transformation into a fully militarized society within the Roman Empire itself, unlike the Goths, they did not preserve an ancient name—such as Goth—or tradition, although they did sometimes refer to themselves as Suebi, the old tribal name of some of their people. They seem not to have had a mythic origin narrative.

Dwellings and Architecture: Settlements and Strongholds

The sites of several Alamannic strongholds in southwestern Germany have been excavated. One of them was located on a hilltop called the Runderberg near Urach. Its area is small, only some 230 by 164 feet at its widest; it was fortified with a timber rampart in about 300 C.E., which enclosed many timber buildings, while other buildings were built outside the rampart on the slopes of the hill. It is impossible to assess patterns of settlement in the region because many sites probably were built over during the medieval period and are now lost. The Alamanni were attracted to former Roman settlements; they partially rebuilt villas at Holheim and Praunheim. Roman gold coins and military accoutrements have been found at Alamannic sites, either booty from raids or relics of Alamannic warriors who joined the Roman army. There is evidence of the latter at Neuburg on the upper Danube from about 330 and later.

Religion: Burials

In the absence of contemporary records about them most of our knowledge about the Alamanni when they first emerged is derived from their

burial practices. Around the end of the third century, the layout of their burials west of the Rhine attests to a new attitude toward disposal of the dead that seems to have been influenced by the greater importance of war in society. Increasingly, at this time, men were being buried with a full panoply of weapons, a practice largely unknown previously. As the fourth century went on, this practice became more prevalent; the dead now also were interred in rows with a common orientation, either east-west or north-south. East of the Rhine in unconquered territory, burials began to contain Roman articles such as belt decorations that probably had been taken home by warriors who had completed their service in the Roman military. Cemeteries oriented in rows began to appear in Free Germany as well, demonstrating that cultural connections were not deterred by Roman boundaries. In general the burials attest to the emergence of a wealthy warrior class.

The Alamanni were more like the Franks than the Goths in forming their identity in the very shadow of the walls of Rome. Their emergence took place under close Roman influence, whereas the sojourn of the Goths near the Black Sea had given them time and breathing space to evolve a highly distinct culture and social structure before they began to clash with Rome. The Goths' distinctness, and that of the Visigoths and Ostrogoths, including their Arian Christianity, throughout their career stood in the way of a true rapprochement with the Romans. The Alamanni, for their part, might have achieved such a fusion were it not for their defeats at the hands of the series of great Frankish leaders.

The name of the Alamannic homeland, from the Germanic word *alamans* for "all the people," survives today in most Romance languages as the name for Germany, including the French *Allemagne* and the Spanish *Alemania*.

Alans (Alani; Alanoi; Alanians; Sarmatians)

The Alans, an Indo-Iranian people, lived in the region north of the Caucasus Mountains in present-day western Russia. Originally steppe peoples, descended from SCYTHIANS or SARMATIANS OR

ALANS

location:

Caucasus; France;
Iberian Peninsula

time period:

language:

Ossetian (Iranian)

both, they have a history that relates both to the peoples of the Caucasus and to eastern Germanic tribes, in particular the VANDALS, with whom some among them migrated to western Europe. Descendants of the Alans, the OSSETS, still live in the North Caucasus.

ORIGINS

The Scythian-Sarmatian ancestors of the Alans are thought to have lived in the steppe region north and east of the Caspian Sea in present-day western Kazakhstan (in Asia) and in western Russia between the Volga and Don Rivers. By the first century C.E., when they were first mentioned by the ROMANS, the Alans were living south of the Don River and north of the Caucasus Mountains. They are perhaps the same people listed by the Greek historian Herodotus as the Geloni (Gilans). Several ancient authors considered the Massagetae of the southeast shores of the Aral Sea, from the Iranian *Massyagata*, meaning “fishers,” to be ancestral to the Alans.

LANGUAGE

The Alans spoke Ossetian, an Iranian language, part of the larger Indo-Iranian family (the eastern branch of Indo-European). It is still spoken by people of the Caucasus. The two modern dialects are Digor and Iron.

HISTORY

From their homeland in the North Caucasus, the Alans, skilled equestrians, carried out raids on Asia Minor. Some Alan groups are thought to have migrated westward across the Don in the first half of the third century C.E. By the second half of that century, they had settled parts of present-day Moldova and Romania. With pressure from the GOTHs, some settled in the northern foothills of the Caucasus and came to rule some of the CAUCASIANS there. The HUNS under Balamir reached the lands of the Alans by about 372 and along the banks of the Don routed them. Some Alans were absorbed into the Hunnic army. Others managed to escape westward to the Danube and remain independent. Some are thought to have helped shape an alliance of the Eastern SLAVS, people who were known to ancient writers as the ANTES.

One group of Alans under the leader Safrax allied themselves with the VISIGOTHs. The Romans allowed this group of people to settle south of the Danube on the eastern Balkan Peninsula in Thrace. In 378 horse-mounted Visigoths under Fritigern, along with Alans,

Alans time line

C.E.

first century Alans first mentioned in Roman literature.

c. 372 Alans, overwhelmed by Huns, flee westward to Danube.

378 Alans join Visigoths against Romans in Battle of Adrianople.

406 Alans invade Gaul with Vandals and Suebi.

409 Alans, Vandals, and Suebi invade Iberian Peninsula; Alans settle in Lusitania.

418 Alans join Vandals in Gallaecia.

429 Alans accompany Vandals into North Africa; in 439 Vandals and Alans capture Carthage.

451 Some Alans accompany Attila the Hun in invasion of Gaul.

455 Vandals and Alans sack Rome.

defeated a Roman force under Valens, emperor of the East, at the Battle of Adrianople (modern Edirne, Turkey). A community of Alans was later settled by Gratian as Roman *foederati* (federates) on the Sava River in the province of Pannonia (roughly modern Hungary and north of surrounding countries).

By the early fifth century a number of different Alanic groups had formed in eastern and central Europe. Some became allies of the Vandals and SUEBI under Gaiseric and in 406 crossed the Rhine with them in their invasion of Gaul. Some Alans settled near Valence on the Rhône in present-day southeastern France. Others crossed the Pyrenees onto the Iberian Peninsula in 409 with the Vandals. The largest group under Addac settled in Lusitania (roughly modern Portugal). For a time they held the Roman settlement of Felicitas Julia (modern Lisbon). Another group settled around Cartagena, the port city in the southeast.

The Visigoths defeated Addac's followers between 416 and 418. Survivors joined the Asding Vandals to the north in what had been the Roman province of Gallaecia (the name of the region known as Catalan [present-day Catalonia] is derived from the Alans' name). In 429, because of continuing Visigoth pressure, united Vandals and Alans crossed to Africa under Gaiseric, who was known officially as “king of the Vandals and Alans.” In 439 the Vandals and Alans took Carthage, the ancient city founded by the CARTHAGINIANS, from the Romans and were part of the force that sacked Rome in 455.

In 451 a group of Alans were settled at Orléans in north-central France by Flavius

Aetius as Roman federates. Under Sangiban, they became part of the combined Roman-Visigoth force battling the invading Huns under Attila. Others fought as allies of the Huns.

From Alans to Ossets

The one group that maintained its identity into medieval modern times were those who stayed behind in the North Caucasus. The Alans endured successive invasions by the KHAZARS, Arabs, and Seljuk Turks (see TURKICS). They formed a state in the region in the eighth century with cultural links to the Georgians south of the Caucasus; it lasted until the 13th century, when it was destroyed by the MONGOLS. Many of the Alans dispersed into the mountains while others joined the service of the Mongols, forming important contingents of the allies. They later came under the control of the Kabardians and finally the Russians, who still control the North Caucasus (see RUSSIANS: NATIONALITY). Modern-day Alans are known as Ossets (Ossetians), but their ancient name endures etymologically in that of Alania (North Ossetia, or North Ossetiya), a republic in the Russian Federation.

CULTURE

The Alans originally were steppe pastoralists, who, as did other steppe peoples, lived by both herding and raiding. In their homeland in the North Caucasus, they adopted a more sedentary, agricultural way of life.

The Ossets long preserved a body of heroic sagas concerning the adventures of a band of heroes called the Nartah, or Narts. Their leader, Batraz, had a magical sword (reminiscent of Excalibur of the hero of the BRITONS, King Arthur) which he had obtained with the help of his aunt, a seer called Satana, "The Mother of a Hundred Sons" (a title that suggests she was the ancestor of the Narts). Armed with this mighty weapon, Batraz avenged his father's death and then led a band of his fellow Narts on many wonderful adventures. The absolute power bestowed on Batraz by his sword seems to have gone to his head, however, and he became increasingly embroiled in factional wars with his own people, slaughtering them in vast numbers until only a remnant remained. At the last, he came to his senses enough to recognize the disaster he had wrought and realize that as long as he lived and possessed the sword he would endanger his people's survival. He told his men that God had willed that he should die and he wished to comply; however, as long as the sword was in existence, death was impossible for him. He ordered that the sword be taken and thrown

into the sea. The Narts tried to accomplish this but found the sword too heavy to lift, let alone throw. They therefore hid it instead. When they went before Batraz, however, he knew that they had not carried out his orders and sent them off again. This time they succeeded. Immediately, the sea heaved, turning blood red as it received the weapon of so much death; hurricanes raged and lightning bolts shot across the sky. These were the signs of the sword's disappearance that Batraz had been waiting for, and thereupon he lay down and died.

The Alans are among the few Indo-Iranian peoples to be part of the European story and the only group among them who represent a continuum to the present as Ossets.

Albanians: nationality (Albans; people of Albania)**GEOGRAPHY**

Albania's total area is 11,100 square miles. It borders Greece to the south, the former Yugoslav Republic of Macedonia (FYROM) to the east, Serbia and Montenegro to the north and northeast. The Adriatic Sea lies west of Albania. About 70 percent of Albania's terrain is mountainous, and the fertile Adriatic coast comprises the other 30 percent. In the extreme mountainous terrain of the north lie the Dinaric Alps. Mount Korabit along the Macedonian border is Albania's highest point at 9,066 feet. Albania's rugged terrain has isolated Albania from neighboring countries, thus enabling the preservation of its culture. Albania's most heavily populated region is the west coastal region, which consists of low hills and valleys that open up onto the coastal plain. This in turn is a key area for farming. The coastal climate has wet winters and dry summers, whereas Albania's mountainous interior has

Albanians: nationality time line**C.E.**

fifth century Illyrian territory in present-day Albania becomes part of Byzantine Empire.

732 Byzantine emperor Leo III makes Albanian Church part of Eastern Orthodoxy.

1054 Christian Church divides into Eastern and Western branches; southern Albania is part of Eastern Orthodox Church in Constantinople; northern Albania is part of Roman Catholic Church in Rome.

11th century The name Albania is in use; Albanians first migrate in large numbers to Greece and become known as Arvanites.

1388 Ottomans invade Albania.

1443–68 Skanderbeg (George Castriota) rules.

1444–66 Albanians resist invasion by Ottoman Turks.

1462 Oldest known document in Albanian language is recorded.

1506 Ottomans reoccupy Albania, spreading Islam.

1750–1831 Bushati family dominates northern Albania.

1788–1822 Ali Paşa Tepelene rules southern Albania and northern Greece.

mid-18th century Albanian style of icon painting is developed.

1878 Albanian leaders found League of Prizren to unify all Albanian territories.

1887 First Albanian play, *Emma*, by Italo-Albanian Anton Santori, deals with Albanian diaspora.

1908 Alphabet based on Latin is implemented.

1910–12 Albanian nationalist forces resist Ottomans, who refuse to give Albania self-rule.

1912 In First Balkan War Serbian, Greek, and Bulgarian armies defeat Ottoman dynasty; Albania declares independence.

1913 At conference of Great Powers—Britain, Germany, Russia, Austria, France, and Italy—Albanian independence is recognized; region of Kosovo is given to Serbia and parts of Çamëria region to Greece.

1920 Albania is admitted to League of Nations; two political forces emerge: conservative landowners and tribal leaders, led by Bey Zogu, and liberals seeking modernization, led by Fan S. Noli.

1922 National Library is founded in Tirana.

1925 Prime Minister Noli unsuccessfully attempts to implement Westernized democracy.

1928–39 Zogu rules as King Zogu I.

1937 Patriarch of Constantinople recognizes Albanian national church known as Albanian Autocephalic Orthodox Church.

1939–45 During World War II Albania, Kosovo, and Çamëria are invaded by Italy.

1943 German forces defeat Italy and control Albanian state.

1944 Secretary General of Communist Party Enver Hoxha rules Albania.

1948 Albania sides with Communist ideals of Soviet Union (USSR).

1953 Theater of Opera and Ballet is founded in Tirana.

1961 Under Hoxha regime, Albania breaks ties with USSR and supports China.

1963 *The General of the Dead Army*, novel by Ismail Kadare, is published.

1966 Palace of Culture is completed in Tirana, new home of National Library and Theater of Opera and Ballet.

1967 All religions are banned; Albania becomes official atheist state.

1976	National Art Gallery is founded in Tirana.
1981	National History Museum is founded in Tirana.
1985	After Hoxha's death Ramiz Alia preserves Communist state.
1988	International Center of Culture is founded in Tirana.
1990	Independent political parties are established; Communist power dissipates; Western embassies give Albanians rights to foreign travel, and thousands flee country.
1991	Name of People's Republic of Albania is changed to Republic of Albania; Albanian leadership achieves Kosovo's independence from Yugoslavia.
1997	Parliament elects socialist Rexhep Mejdani as president.
1998	Albania receives Kosovo refugees after Serbian attacks in Kosovo.
1999	International plan for peace is negotiated in Kosovo.

severe winters and mild summers. The principal rivers are the Drin, Mat, Shkumbin, Vijose, and Seman, all difficult to navigate. The Drin is the longest, at 175 miles. The Shkumbin River divides the country into two distinct dialect groups, the Ghegs and the Tosks. The three major lakes, Lake Scutari, Lake Ohrid, and Lake Prespa, lie along the Albanian borders. Forests and swamps cover about one-third of Albania's landscape, and pastures another one-third. Only one-fifth of Albania is cultivated.

INCEPTION AS A NATION

The tribes of southern ILLYRIANS, remaining culturally unified, established an early state that slowly came to be known as Albania (the name derived from a dominant group among the Illyrians). SLAVS and BULGARS came to inhabit the region. The Ottoman Turks (*see* TURKICS) occupied the Albanian territory in 1388. In 1912, after the First Balkan War, Serb, Greek, and Bulgarian forces defeated the Ottoman Empire, and Albania declared self-rule.

During World War II (1939–45) Italy invaded Albania and eventually Albania was turned over to Germany. After the war Albania became a Communist state under Enver Hoxha. In 1991 the former People's Republic of Albania established democracy and became known as the Republic of Albania.

CULTURAL IDENTITY

The Albanians are among those European peoples whose homelands caused them to be relatively isolated from socioeconomic trends developing elsewhere across Europe. The mountainous Albanian territory caused the Illyrian ancestors of the Albanians who lived inland from the coast to maintain fiercely inde-

pendent clans in their isolated valleys. Meanwhile the coastal area participated in only a limited way in trade until GREEKS established trading colonies in the region in the seventh century B.C.E. Traders from among the MYCENAEANS had bypassed the eastern Adriatic coast because of its dangerous, rocky harbors and prevailing northeastern gales, while the Balkans prevented much contact with eastern and southern Greece, so that the Illyrians knew little of the cultural influences from the Near East that had fostered the rise of Mycenaean and then Hellenic civilization of the Greeks. Thus people in Albanian territory retained a relatively loose, tribal society based on clans while peoples elsewhere in the Mediterranean were developing powerful states. By the time Illyrians had begun to establish states of their own, they were outmatched by others, first the MACEDONIANS and then the ROMANS, who made the region part of the Roman Empire, and later the BYZANTINES.

For these reasons, Illyrian, then Albanian cultural identity formed in a context of striving to keep their distinctness as a people alive, a struggle they have faced from the time of the Roman Empire to today. The isolation that made them relatively weak politically in turn fostered a powerful and vibrant ethnic culture, one that nevertheless has successfully absorbed influences from abroad. The visual arts of Albanians were strongly influenced by Byzantine art, and by the steppe tradition introduced to the Balkans by the Slavs and Bulgars. Later, art styles from Italy, just across the Adriatic, were important.

Cultural "conservatism" (in the sense of preserving traditional culture) caused Albanians to keep alive their oral narrative and poetic tra-

This 1923 photograph shows two Albanian boys in traditional clothing. (*Library of Congress, Prints and Photographs Division [LC-USZ62-92148]*)

dition long after other peoples in Europe had left theirs behind for written literature. Tales were passed down through the generations in the form of heroic songs, legends, and epics. Some probably dated to Homeric times as part of the tradition out of which Homer's epics emerged. The oldest known document in the Albanian language dates to 1462. During the 19th century Albanian traditional culture benefited from the rise of interest in the deep ethnic roots of cultures and the identification of these with nationhood. In the latter part of the century an underground literary movement promoted linguistic purity and Albanian patriotism.

Albanian folk music arose out of the same substrate as the oral poetic tradition—the two are actually indistinguishable—and it is highly likely that the Homeric epic tales that resemble Albanian tales were sung in the Greek Dark Ages by bards who accompanied themselves on the lyre. In modern Albania singers play the *lahute* (lute). The songs accordingly contain themes of honor, loyalty, and courage. In the south, where foreign influences are more prevalent, Albanians developed a more musically complex style of song or ballad called a

lieder, which is accompanied by instruments. Also in the south *saze* (small orchestras) composed of four or five instruments play music for folk dancing on special occasions.

Throughout Albanian cultural productions, including theater and film, run the theme of resistance to foreign assimilation and the tension between old and new. Albanians call themselves *Shqiptar*, meaning “sons of eagles,” a reference to their soaring countryside and their fierce independence. Today with actual political independence, the government has made a conscious effort to encourage and preserve the nation's rich folk life. There are some 4,300 cultural institutions of various sorts in the country.

Albici

The Albici are classified as a Celtic tribe. They lived in Gaul around present-day Riez in present-day southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Allobroges (Allobrogi; Allobrogae)

The Allobroges are classified as a Celtic tribe. They lived in Gaul near Lake Geneva in present-day southeastern France, separated from the HELVETII by the Rhône River, and are discussed as CELTS or GAULS. Their town Vienne was an important trade center. Along with their allies the ARVERNI, they were conquered in 121 B.C.E. by the ROMANS. The Roman general Quintus Fabius Maximus given the honorific title of Allobrogicus in commemoration of his victory. The Allobroges became allies of the Romans during the campaigns of Julius Caesar in the mid-first century B.C.E.

The first historic reference to the Allobroges (by the second-century B.C.E. Greek historian Polybius) concerns their failed attempt in 218 B.C.E. to prevent the CARTHAGINIANS under Hannibal from crossing the Alps.

The Allobroges had vast agricultural lands that were famed for their wheat. They probably had extensive vineyards as well. They practiced animal husbandry, forestry, and probably mining. The Allobroges controlled part of the Rhine Valley, a major Roman trade route into Gaul. In addition, their territory contained the point where all the roads across the Alps arrived. They probably imposed tolls on the traders who passed through their territory. Among these was the Via Agrippa, the major Roman road connecting Arelete (modern Arles) near the Mediterranean coast with Lugdunum (modern Lyon), the capital of Gallia Comata.

The Allobroges were reportedly among the wealthiest and most advanced of Gaulish tribes. The *oppidum* of the Allobroges grew from the village described by Strabo in the early years of the first century C.E. into what Tacitus calls in his *Annals* of about 98 C.E. a

historic and imposing city. It had the second-largest theater in Gaul. The well-preserved ruins in Allobroges territory give an idea of their religious worship. Although there are no remains that indicate the worship of the Celtic horse goddess Epona, important in other Celtic lands, a statue of the Gaulish hammer god Sucellus has been found, as well as a temple to Cybele, a goddess of Asia Minor whose worship the Romans had adopted. Because this temple had been built on top of an earlier, pre-Roman building dating from the second century B.C.E., Cybele's name may have been given to a similar local goddess. A statue of the tutelary goddess of Vienne stood in the baths at Saint-Romain-en-Gal. As elsewhere among the Celts, springs were holy places, and there was a major healing sanctuary at the town of Aix-les-Bains, dedicated to a southern Gaulish healing god, Barvos. The fact that he was not supplanted by Apollo (who took over the healing function of most native deities) attests to his importance.

The Allobroges maintained a presence among the Romans through the period of Roman occupation lasting until the fifth century C.E.

Ambarri (Ambarres; Ambarisii)

The Ambarri are classified as a Celtic tribe although they probably had GERMANICS among them as well. They lived in Gaul between the Rhône and Saône Rivers in present-day eastern France and are discussed as CELTS or GAULS. They were allies of the AEDUI, their neighbors to the north and west. In the mid-first century B.C.E., some of them migrated into Italy and were allied with the ROMANS against the HELVETII.

Ambialates (Ambialati)

The Ambialates are classified as a Celtic tribe. They lived in Gaul around present-day Lamballe in northwestern France and are discussed as CELTS or GAULS. Julius Caesar mentions them as an ally of the VENETII, so it is assumed that they were Armoricans, that is, tribes living in the geographical region between the Seine and Loire on or near the Atlantic Ocean in the region of Armorica (roughly present-day Brittany and eastern Normandy). The territory of the Ambialates was occupied by the ROMANS in 55 B.C.E.

Ambiani

The Ambiani are classified as a Celtic tribe. They lived in Gaul around present-day Amiens

ALLOBROGES

location:

Caucasus; France; Iberian Peninsula

time period:

First to 13th century C.E.

ancestry:

Indo-Iranian

language:

Ossetian (Iranian)

in northern France and are discussed as CELTS or GAULS. They were among the tribes Julius Caesar considered BELGAE. The Ambiani surrendered to the ROMANS in 57 B.C.E., although some fought as allies of the ARVERNI under Vercingetorix against the Romans in 52 B.C.E. Samarobriva, on the site of Amiens, became a *civitas* capital in Roman Gaul; Amiens takes its name from the tribal name.

Ambibarii

The Ambibarii are classified as a Celtic tribe. They lived in Gaul in present-day northwestern France and are discussed as CELTS or GAULS. The ROMANS referred to them along with other tribes as Armoricans, that is, tribes living between the Seine and Loire on or near the Atlantic Ocean in the region of Armorica (roughly present-day Brittany and eastern Normandy), occupied by forces under Julius Caesar in 55 B.C.E. The exact location of the Ambibarii is not known; their only mention is in Caesar's writings. They are perhaps the same tribe as the Abrincatui, mentioned by the second-century C.E. Alexandrian geographer Ptolemy.

Ambidravi

The Ambidravi are classified as a Celtic tribe, grouped among the CELTS. They lived in the Alps within the kingdom of Noricum in present-day Austria. They were part of a powerful coalition of tribes in the second and first centuries B.C.E. with the NORI, RAETI, and TAURISCI.

Ambivariti

The Ambivariti are classified as a Celtic tribe. They lived in Gaul west of the Meuse River in present-day northeastern France or eastern Belgium at least by the first century B.C.E. and are discussed as CELTS or GAULS. Another group by the same name—typically spelled Ambivareti—are thought to have been allies of the AEDUI living to the south.

Amsivarii (Amsivari; Ampsivari; Ambivarii)

The Amsivarii are classified as a Germanic tribe. They lived east of the Rhine and north of the Danube in present-day western Germany and are discussed as ancient Germans or GERMANICS. By the third century C.E. they had become allied with other tribes—the BRUCTERI,

CHAMAVI, CHATTUARI, and TUBANTI—in the loose coalition known as the FRANKS.

Anagnutes

The Anagnutes are classified as a Celtic tribe. They lived in Gaul in the present-day Vendée region of western France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Anares (Anari)

The Anares are classified as a Celtic tribe. They lived near present-day Marseille in southeastern France when the ROMANS passed through in 223 B.C.E. By the second century B.C.E., some among them had migrated to present-day northern Italy south of the Alps near the BOII and CENOMANI. They are discussed as CELTS or GAULS.

Anartes (Anarti)

The Anartes are a Celtic tribe, grouped among the CELTS. They lived on the north bank of the Tisza River in Dacia (roughly modern Romania) by at least the first century B.C.E.

Ancalites

The Ancalites are classified as a Celtic tribe. They lived in eastern Britain and are discussed as CELTS or BRITONS. According to Julius Caesar, they were allies of the TRINOVANTES and surrendered to the ROMANS in 54 B.C.E., along with the BIBROCI, CASSI, CENIMAGNI, and SEGONTIACI.

Andecamulenses

The Andecamulenses are classified as a Celtic tribe. They lived in Gaul in present-day central France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Andecavi (Andecaves; Andes)

The Andecavi are classified as a Celtic tribe. They lived in Gaul around present-day Angers in western France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Juliomagus Andecavorum, on the site of Angers, became a *civitas* capital in Roman Gaul; Angers takes its name from the tribal name.

Andis (Andians; Qwannab; Khivannal)

The Andis are various Caucasian-speaking tribes, living for the most part in the northern Caucasus

Iberians; Celtiberians; Moors; Franks; Catalanians

demographics:

One-quarter of the population are native-born Andorrans; the remainder are largely French and Spanish immigrants.

Mountains of western Dagestan, a republic in southwestern Russia. Their dialects are classified as part of the North-East (Dagestanian) branch of North Caucasian and closely related to the dialects of the neighboring DIDOS. A related language known as Avarish is used for writing (see AVARS). Among the peoples considered part of the Andian linguistic family are the Andis proper, as well as the Akhvakhs, Bagulals, Botlikhs, Chamalals, Godoberis, Karatas, and Tindis, each tribe with its own traditions.

As is the case with other CAUCASIANS, the Andis are considered indigenous to the region and have probably maintained tribal identity since the second millennium B.C.E. Over the centuries they have been influenced by the many invading peoples from both Europe and Asia in their homeland.

The economic life of the Andis and related tribes throughout much of their history has revolved around the raising of livestock, including sheep, goats, cattle, oxen, and horses. Terracing has allowed some farming for those communities in the rugged highlands, especially around the Andi-Koisu River, where wheat, rye, and flax are the main crops. They have maintained traditional extended family structures, as well as a village assemblies and councils of elders.

The Andis are primarily Muslims, Islam was introduced to the region by Arabs in the eighth to ninth centuries. Animist influences persist, however. (Andi women are known for the sewing of black woolen *burkas*, female garments covering the entire body with holes for the eyes, typically worn by Muslim women.) For part of their history, some among the Andis also practiced Christianity.

In 1991 Dagestan, consisting of 19 different ethnic groups, became a republic within Russia and subsequently a member of the Russian Federation.

Andorrans: nationality (people of Andorra)**GEOGRAPHY**

With an area of 181 square miles, Andorra is one of the smallest states in Europe. The landlocked Andorra is situated between Spain on the south and west and by France on the north and east. It is dominated by the high peaks of the Pyrenees with numerous narrow valleys and gorges; a variety of mountain streams flow

together to form the country's largest river, the Valira; the lower valleys offer good pasturelands.

INCEPTION AS A NATION

The most ancient peoples of the region that became Andorra were IBERIANS and CELTIBERIANS. Those people considered ancestral Andorrans migrated to Andorra from the ancient land of Catalonia (see CATALANIANS). Andorra's rugged landscape has, over the centuries, ensured the small population a life of relative isolation. Its independence emerged by decree of Charlemagne of the FRANKS, who drove the MOORS from the region in 803 C.E. In 843 Holy Roman Emperor Charles II granted bishops of the Spanish city Seco de Urgel control of Andorra.

A count from Foix in southern France was granted cogovernance of Andorra with Urgel's bishops in 1278 and 1288. The French head of state would eventually assume cogovernance with the representatives of Urgel's bishops, and Andorra paid a nominal sum to each over the years. From 1589, when Henry II of Foix became Henry IV of France, Andorra was ruled by French kings. Essentially this feudal arrangement of government remained in place until 1993, the last of its kind in Europe. The Andorrans first received some self-governance in 1419, with the establishment of a local parliament, the Council of the Land.

Andorrans voted for their first constitution in 1993, establishing a parliamentary democracy. But in an anachronistic anomaly, the bishop of Seco de Urgel and the president of France technically remain coprinces of the independent country of Andorra. Andorra joined the United Nations in 1993.

CULTURAL IDENTITY

Because the Catalán language of the Andorrans was once considered a dialect of Provençal and is now claimed as a Hispanic language, its speakers in both Catalonia (in Spain) and Andorra feel independent culturally from either France or Spain, whom Catalán speakers consider foreign conquerors. Catalán literature flourished in the Middle Ages, reaching a zenith of achievement in the 15th century made possible by the brilliant courts of Provence in southern France. It was strongly influenced by the poetry of Provençal troubadours at a time when southern France had its

own culture distinct from the Frankish culture to the north. Catalanians in Catalonia and the future Andorra also benefited from Catalonia's unification with Aragón in Spain in the 12th century; the pairing of the two polities led to a rise in Aragonese-Catalanian power and wealth. By the 15th century Catalán literature had evolved its own forms distinct from those of Provençal literature, which had begun to wane after the 13th century as France and French gained dominance in southern France. Catalán took on the status of a minority language in a landscape of growing language hegemony, which had begun with the imposition of French from the north, after Aragón lost its independence to Castile in the latter 15th century. Provençal largely disappeared until its 19th-century revival; Catalán, spoken in mountainous regions more remote from trends in France and Spain, has fared better. The economic strength of Catalonia, which was the first region in Spain to industrialize, has also helped to preserve Catalán. It is the preferred language of most Catalanians, who number some 6 million people.

It is characteristic of minority peoples to engage in symbolic acts or customs in order to affirm their ethnocultural distinctness in the absence of a nationality. Catalanians find it difficult to maintain their cultural unity when their population lives within separate political entities. One unifying element of Catalanian culture is the egalitarian circle dance, the *sardana*. It represents qualities that Catalanians hold dear, such as harmony, democracy, and brotherhood. Sardana dancers link hands with raised arms, forming circles that grow bigger and bigger as more people join in. When the circle gets too big, the dancers form more circles. One of the main features of the dance is its spontaneity—for instance, except on special occasions, dancers wear everyday clothes. Thus a crowd of Catalanians—people of all ages and ranks in life—may start to dance the *sardana* whenever the communal spirit moves them.

before ninth century	Andorrans migrate from ancient land of Catalonia in present-day northeastern Spain.
803	Charlemagne drives out Muslims from Andorra; Andorra is declared free state.
843	Holy Roman Emperor Charles II grants rule of Andorra to bishops or princes of Urgel.
1159	Andorra becomes subject of struggle between count of Foix in France and Catalán bishop of Urgel.
1278	First Act of Joint Overlordship is drawn up, in which bishop of Urgel and count of Foix both control Andorra.
1288	Second Act of Joint Overlordship is drawn up.
1419	Local parliament, Council of the Land, is established.
1589	Rule of Andorra passed to French kings.
1793	French monarchy is overthrown in French Revolution, leaving Andorra without protection of French government.
1806	Napoleon I Bonaparte reestablishes overlordship of French government.
1870	President of France becomes overlord of Andorra.
1970	Andorran women gain right to vote.
1991	Agreement with European Union (EU) regulates tax-free trade, setting duty-free quotas to encourage tourism.
1993	Andorra becomes parliamentary coprincipality under first constitution; Andorra joins United Nations (UN).
1997	University of Andorra is founded; courses are offered in conjunction with universities in Spain and France.

Angles (Angli; Engle)

The Angles, a Germanic tribe, originally occupied territory on the Jutland Peninsula and in Angeln, a region in present-day northeastern Schleswig-Holstein, a state in northern Germany, once a duchy of Denmark. They were among the GERMANS, along with the FRISIANS, JUTES, and SAXONS who, in the fifth and sixth centuries C.E., settled in Britain and eventually became known as ANGLO-SAXONS. Some writers refer to the Angles as a subgroup of the Saxons.

ORIGINS

The exact location of the original territory of the tribe that the Roman historian Tacitus of the first and second centuries C.E. refers to as the Angli has been difficult to determine, partly because of contradictory accounts on the matter by Ptolemy of Alexandria in his *Geographia*, in the years to follow, and other Roman writers from that period on. Tacitus's

Angles time line**C.E.****first century** Angles mentioned by Tacitus.**fifth to sixth century** Angles, Frisians, Jutes, and Saxons settle in Britain, acquiring territory by force from native Britons.**seventh century** Tribes of Angles unite into kingdoms of Mercia, Northumbria, East Anglia, and Middle Anglia.

mention of the Angles' worshipping a goddess called Nerthus on an island in the sea suggests they were a coastal people, and many similarities of the cult of Nerthus, as described by Tacitus, with religious practices of Danes and Swedes have led scholars to theorize that the island of Nerthus was Sjaelland (Zealand) in the Baltic Sea off the east coast of southern Jutland. The Anglo-Saxon historian Bede, who lived and wrote in the seventh and eighth centuries, states that the homeland of the Angles was a land called Angulus. In the ninth century King Alfred of Wessex identified this place with the district that is now called Angeln in the province of Schleswig.

After the migration of the Angles to Britain in the fifth and sixth centuries C.E., the tribal name Angli no longer appears in European written records except for a medieval law code of the German province of Thuringia, the *Lex Angliorum*.

The prehistoric culture, society, and trading links of the Angles were closely similar to those of their western neighbors, the Jutes. People in the region in which the Angles later emerged were part of the same long-range trade networks that in the Neolithic Age spread the idea of megalithic tomb building from Iberia all along the Atlantic coast to the North Sea and Baltic region. They were also impacted by Bronze Age trade with people of central Europe and the Carpathian Mountains. And the influences on them from the Romans were similar. It was in part the shock wave caused by the collapse of the Roman Empire in the fifth century, and the power vacuum it left behind, that sent the Angles along with other tribes in their region on their migration to Britain.

LANGUAGE

The Angles spoke a now-extinct Low German dialect similar to that of the Jutes and Saxons. After their migration to Britain the dialects of the Angles, Frisians, Jutes, and Saxons grew

grammatically closer to one another, and out of this synthesis English emerged.

HISTORY

The first recorded mention of the Angles was that of Tacitus in the first century C.E., who called them Angli. In the fifth to sixth century, some Angles, along with Jutes, Frisians, and Saxons, abandoned their homeland in what is now Schleswig-Holstein in Germany near the Danish coast and invaded the British Isles. According to a traditional story recorded by Gildas of the BRITONS and the Anglo-Saxon Bede of the Anglo-Saxons in subsequent centuries, Vortigern, a king of the Britons, invited the Saxons to Britain, along with the Angles and Jutes, to help fight the PICTS. The time frame given by some scholars for their arrival is 446–454 C.E., although Germans had migrated there earlier after governance by the ROMANS ended in 410 and they continued to do so into the sixth century. The Angles occupied eastern, central, and some parts of northern Britain, extending as far north as present-day Edinburgh and the Scottish Lowlands, out of which the kingdoms of Mercia, Northumbria, East Anglia, and Middle Anglia emerged by the seventh century.

The Angles, Frisians, Jutes, and Saxons collectively became known as the Anglo-Saxons as early as the seventh century. Soon afterward the name ENGLISH, derived from Engle, the Old English word for Angle, began to be used for the Anglo-Saxons as a whole. The name Angli (in both Latin and Common Germanic) later mutated in Old English to Engle, the nominative form, and Engla, the genitive. Engla land referred to the home of all three tribes, and both the Anglo-Saxons King Alfred of Wessex, who ruled in the ninth century, and Abbot Aelfric, author and grammarian in the 10th–11th centuries, subsequently referred to their speech as Englisc, later known as English.

CULTURE (see also GERMANICS)

According to Tacitus the Angles worshipped a goddess known as Nerthus on the isle of Sjaelland (Zealand) during the first century C.E. The kings of the Saxon kingdom of Wessex in England traced their ancestry ultimately to a certain Scyld, who in Scandinavian tradition is associated with the ancient royal residence at Leire in Sjaelland. Scyld may be identified with Skioldr, the mythical founder of the Danish royal family. Thus the goddess of Sjaelland

whom Tacitus calls Nerthus was probably not exclusively venerated by the Angles, but a goddess whose favor was desired by kings of any of the tribes of the northwest region of Europe on the North and Baltic Sea coasts, demonstrating a close kinship among them all. The island of Nerthus may be similar to Mount Olympus in Greece, the island of Delos in the Aegean Sea, or the Hill of Tara in Ireland in being a site where worshippers were of many different and sometimes competing tribes and kingdoms.

Tacitus referred to Nerthus as “Mother Earth.” In Norse myth she was often paired with a god called Njörðr, perhaps as twin. It was a custom in Germanic lands to place wooden statues of a male and a female on bridges and tracks over marshlands, perhaps in propitiation of spirits or deities of water; such statues may have been of Nerthus and Njörðr. According to Tacitus Nerthus’s sanctuary was in a sacred grove on an island and within the copse was a cart with a covering, presumably hiding an image of the goddess. Nerthus would occasionally visit her shrine and direct the priest there to hitch her sacred cart to cows and let them wander freely. Wherever Nerthus’s cart went, peace had to be declared and weapons put away, because Nerthus, although unseen, was always nearby. When the sacred cart finally returned to the shrine, slaves took it and its contents to a lake to be washed. So holy was their task that, according to Tacitus, when they had finished, the slaves would be swallowed up by the lake. Tollund man, an amazingly well-preserved Iron Age body found in a peat bog (a former lake) in Jutland, could have met his death in some such way.

The Angles, one of the many Germanic tribes whose distinct identity was largely lost after their migration, nevertheless have the distinction of giving their name to both a region of the British Isles and a language.

The name *Angle* had an even more exalted transformation when, in the late sixth century, Pope Gregory I the Great saw some Anglian slave boys for sale in Rome. Struck by their fair skin and blond hair, he asked what nation they belonged to. On being told “Angles,” Gregory, fond of punning, said they were messengers (in Latin, *Angeli*) of god. Gregory’s pun gave rise to the word “angel,” its variants in Germanic languages (such as the German *Engel*) used to connote the spiritual beings mentioned in the Bible as attendants and servants of God.

Anglo-Saxons (Old English; Engle)

Anglo-Saxons is the collective name given to GERMANICS from the North Sea coast of Europe who invaded and settled in large areas of southern and eastern Britain during the first millennium C.E. As the imperial government of the ROMANS in Britain was waning during the late fourth and fifth centuries, FRISIANS living along the North Sea coast in present-day Netherlands, ANGLES of Schleswig, SAXONS from the lower Elbe and Weser region and inland toward central Germany, and JUTES from present-day Denmark, partly because they were under pressure from other Germanic tribes on the move through Europe and partly because flooding had considerably reduced arable land acreage in coastal areas, began attempting to settle in Britain. In this process they contested for territory and displaced the native BRITONS, including the CORNISH, many of whom fled to Brittany, where they became known as BRETONS. The Saxons are most often mentioned in Roman contemporary sources, but this name was probably applied fairly indiscriminately to any raiders to Britain from across the North Sea. The Anglo-Saxons were mostly unsuccessful in invading the territory of the WELSH in western Britain, that of the PICTS and SCOTS (ancient) in northern Britain, and that of the IRISH across the Irish Sea, but they had established kingdoms in southern and eastern Britain by the sixth century.

ORIGINS

In common with the other Germanic people living in the northernmost regions of western and central Europe, inhabitants of the region where the tribes comprising the Anglo-Saxons would later emerge experienced the series of climatic and socioeconomic changes that moved through Europe after the end of the last Ice Age later than peoples farther south and east did. In addition they escaped the often disruptive effects of direct contact with the civilizations of the Mediterranean world until the beginning of the first century C.E.

On the other hand, the Angles, Frisians, Jutes, and Saxons were perhaps among the least isolated of all the Germanic peoples because of their coastal location on the North Sea, which had given them contact with the Atlantic coastal trading network already in the early

Bronze Age. Even among them, however, social stratification remained minimal, and society continued to be organized along familial and tribal lines.

When the Romans extended their empire northward to the English Channel coast, with its border along the Rhine, trade had the most impact on Angles, Saxons, and Frisians living along the Roman border. These groups began to develop a market economy in which coins were desired, not simply for the metal they were made of, but as a medium of exchange. An important component of this trade was in slaves from the Baltic regions. Social stratification began to increase and many market centers appeared and grew.

The experience of the Jutes, farther away from the border, was different. There a more archaic prestige goods economy was practiced,

rather similar (although on a lesser scale) to that of the Celtic Hallstatt chiefs in southern Germany and eastern France of the mid-first millennium B.C.E. (see CELTS). In this trade local chieftains, facilitating the flow of goods between the Romans and the hinterlands to their east, grew rich.

For some 200 years this situation remained more or less stable. Then the societies in the hinterlands inland from the North Sea coast Germanics by the middle of the third century C.E. began to impinge upon them. An aggressive warrior society had grown there, partly as a means to procure slaves and partly as a result of competition for the relatively few prestige goods from Rome that filtered in to them from afar. The inherent instability of warrior societies, coupled with population increases, seems to have encouraged tribal migrations on a par with

10th century English and Hiberno-Norse forces contest control of Northumbria.

early 10th century English and Hiberno-Norse forces contest control over Northumbria.

910 Large-scale incursion in Wessex by Danes of Northumbria ends in their crushing defeat at Tettenhall by Edward, son of Alfred.

912 Edward and his sister, Aethelflaed, conduct separate campaigns into Danelaw, regaining some territory.

920 Edward receives Raegnald's submission, along with that of Scots, Strathclyde Welsh, and all Northumbrians.

927 Athelstan, son of Edward, reconquers remaining Danish-held territory; kings of Wessex become kings of England.

mid-10th century Last large Norse forces routed and Northumbria becomes permanent part of kingdom of England.

1051 Edward the Confessor banishes Earl Godwine and his sons for defying royal authority.

1052 Harold invades England and forces Edward to restore family.

1066 King Edward dies and Harold is crowned as his successor; Tostig, Harold's brother, and King Harold III of Norway join forces and invade England; they are defeated and killed by Harold at Stamford Bridge.

Harold defeated by William of Normandy at Battle of Hastings, ending Anglo-Saxon rule in England.

those among the Celts nearly a thousand years earlier. Previous to the actual migrations, the rich trade along the North Sea coast had begun to suffer increasingly from pirate attacks during the third century, possibly by warrior groups from the hinterlands, including some among the Saxons themselves living inland from the coast. These raids may have disrupted the flow of goods significantly enough to destabilize the regional socioeconomy, and that destabilization may have contributed to the disrupting migrations of the fifth century.

LANGUAGE

The language of the Anglo-Saxons was Old English, part of the Anglo-Frisian branch of the West Germanic languages. There were four major dialects of Old English in the four major kingdoms: the Northumbrian, the Mercian, the West Saxon, and the Kentish. The first two evolved from the dialect of Anglia, the West Saxon from that of Wessex, and the Kentish from that of the Jutes. Most of the extant literature in Old English, including *Beowulf*, is in the West Saxon dialect. Until about the 12th century Anglo-Saxons in England used a form of the Germanic runic script called *futhork* from its first six letters, which may have been developed from the Etruscan alphabet of northern Italy (see ETRUSCANS) and was perhaps also later influenced by the Latin alphabet.

HISTORY

Early Incursions

Germanic peoples from northern coastal Europe had made themselves known in Britain centuries before they began larger-scale incursions. The Saxons, especially, had been raiding the south and east coasts of Britain since the third century C.E. The Romans in response built substantial coastal defenses and reorganized the military by creating an office called *comes*, or count, who was not permanently stationed in any one territory but had a mobile command. The count could take troops to any location along the coast that was being attacked. This office is mentioned in a contemporary document called the *Notitia dignitatum* (Latin, worthy of record). The *Notitia* records that the military commander known as the Count of the Saxon Shore controlled nine forts, the names of which are given as well as the units garrisoned in each. Coin hoards dating from 270 to 285 found in southeast Britain suggest growing concerns with local security.

The Romans in Britain and Gaul successfully contained the Germanic incursions of the third century with their defenses on the British coast and along the Rhine, and the situation remained stable for more than 100 years. Since the first century C.E. Germanics had been recruited into the Roman army, after their service receiving rewards of land in the many territories of the empire. In the fourth century Germanic *foederati* (federates), allied troops, were invited to settle in Britain as a reward for their service, a possible source for the early medieval tradition that the Germanic tribes, in particular those led by a Jutish leader named Hengist, had been invited in the mid-fifth century to Britain by a British leader named Vortigern, who needed allies in his war against the Picts and Scots.

Fifth-Century Migrations

The story of Vortigern, mentioned by the sixth-century British writer Gildas, served Gildas's purpose as a cautionary tale on the iniquities of early British leaders and satisfied the taste for the dramatic of early medieval readers. However, although his account may have some basis in fact, the impetus for the Anglo-Saxon invasions was far broader than the actions of any single leader. In winter 406–407 Germanic peoples began a mass movement across the Rhine into Gaul, overwhelming the Roman defenders. In response, Roman troops were withdrawn from Britain (which had already been depleted of troops by a Roman general named Magnus Maximus in 383, who had withdrawn them in a failed attempt to conquer Gaul). In 410 the emperor Flavius Honorius issued an order to Roman Britons, presumably in response to a call for help, to take up arms in self-defense. Roman Britain was indeed being attacked by the Picts from the north and Scots from the northwest; for the heart of Roman Britain, which comprised the southeast, the most pressing need probably was help against the Angles, Frisians, Jutes, and Saxons. It seems likely that some of the socioeconomic pressures, outlined previously, which had caused VANDALS, BURGUNDII, and SUEBI to cross the Rhine, were instrumental in causing the migrations of the Anglo-Saxons as well.

The Anglo-Saxons may have been spared the most immediate cause of the mass movements to their south—the incursions of the HUNS into eastern Europe—for they seem not to have had a major impact on Britain in terms of conquest and migration until the sixth century. It is possible that Romano-Britons were able to

hold them off for about a hundred years, although this period is a Dark Age in terms of reliable historical sources (see BRITONS, WELSH). The Anglo-Saxons' initial impact may have been similar to that of the VIKINGS 400 years later: coastal raiding leading to establishment of settlements used as pirate bases. They established some of these in Gaul, as well, by the mouths of the Garonne and Loire Rivers. In contrast to the situation in Gaul and Italy, however, there was no seamless transition from Roman to Anglo-Saxon governance, with the latter taking over Roman institutions. One exception may have been Northumbria, where the Angles' seizing of the Romano-British palace of Yeavering suggests an acceptance of Romano-British institutions. The same may have been true in York. But in the south, Roman towns became deserted ruins (a process that had begun before the end of the Roman era) and the practice of Christianity disappeared. The native Britons

probably were enslaved or reduced to servile status, but after several generations of intermarriage, at least among commoners, they seem to have been absorbed into Anglo-Saxon culture. After about the seventh century the term English began to be used for all of the people in Anglo-Saxon-ruled areas (see BRITONS).

Early Anglo-Saxon Kingdoms

By the end of the sixth century the core territories of the different tribes had been established: The Jutes settled in present-day Kent; the Saxons in Essex, Sussex, and Wessex; and the Angles in East Anglia, Middle Anglia, Mercia, and Northumbria. The earliest Anglo-Saxon kingdom to emerge was that of Kent, where, according to tradition, the Jutish brothers Hengist and Horsa first landed. Kent reached its height under King Aethelberht in the late sixth century, but further territorial expansion, crucial for the maintenance of political power

A Saxon king and queen, Sebert and Athelgoda, are buried in this tomb. (*Library of Congress, Prints and Photographs Division [LC-USZ62-113136]*)

Alfred: Man of Action and Letters

Alfred (or Aelfred), who came to be called Alfred the Great, was born in 849. As the son of King Aethelwulf, he succeeded his older brothers Aethelbald, Aethelberht, and Aethelred I, the last of whom he assisted as *secundarius* (viceroy) in battles against the Viking Danes. In 871 C.E. he assumed the Wessex throne. In the 870s–880s, he successfully defended England against Danish armies, recapturing London from them in 886. As a result, he became king of all of England.

As king of Wessex, Alfred promoted education and literacy among the clergy and youths of the court. He was a thoughtful legislator who sought justice for the weak and established new legislative codes influenced by the old codes of earlier leaders, Aethelbert of Kent, Ine of Wessex, and Offa of Mercia. He, as did his father, defended Christianity and sought to preserve and integrate the faith into his centralized monarchy. He created a navy and, an effective diplomat, built alliances with neighboring Welsh kings.

A scholar in his own right, Alfred mastered Latin and translated many works. He has been called the presiding genius of Old English prose. He was a great champion of learning and believed that the depredations of the Vikings were a judgment sent by God on a people whose lack of learning prevented them from knowing the will of God. He deplored the decay of Latin and made its study mandatory for churchmen. On the other hand he was concerned with English literacy and wished all young freemen of adequate means to learn to read their native tongue. He thought it important that people have access to books in their own language. Another important contribution to knowledge was his sponsorship of the compilation of the *Anglo-Saxon Chronicle*.

Alfred had one daughter, Aethelflaed, and a son, Edward the Elder, who supported his father against the Vikings and inherited the Wessex throne upon his death in 899.

at this stage of Anglo-Saxon history, was blocked by the kingdom of Sussex to the west by the seventh century, and Kentish kings lost dominance. Sussex in turn was losing ground to the kingdom of Wessex, which during the sixth century had gained valuable territory in western Britain and north of the Thames.

In the seventh century Aethelfrith, the Anglian king of the former British kingdom of Berenicia, united his kingdom with that of Deira of the Britons to form Northumbria, exiling the Deiran prince Edwin, who sought refuge at the court of Raedwald of East Anglia. Aethelfrith offered Raedwald a bribe to murder Edwin; instead, Raedwald invaded Northumbria, killing Aethelfrith and installing Edwin as king. Thereafter Northumbria's power grew as it expanded its territory northward—rivaling, however, by the growing power of the midland kingdom of Mercia, with which Northumbrian kings struggled for dominance. Mercian kings were able to expand their territories westward toward, but not into Wales, and they annexed territory from Wessex. Meanwhile the power of Northumbria suffered a disastrous reverse when in

685 King Ecgfrith and his army were annihilated by the Picts at the Battle of Nechtansmere, ending Northumbrian expansion.

The weakening of Northumbria allowed the rise of Mercia, which reached its greatest power under Offa in the eighth century. An able leader, Offa was the first Anglo-Saxon king to take important steps to foster trade in his kingdom, including reforming his coinage. He turned away from the practice among Anglo-Saxon kings of bolstering their political power through warfare alone, as he gave up attempting to expand his kingdom into Wales and instead, in 780, built a defensive dyke along his border with the Welsh kingdom of Powys.

Later Kingdoms

From the mid-eighth century a succession of able kings in Wessex gradually increased its scope of influence. Wessex kings won important military victories over Mercians. King Ecgberht (Egbert) gained all of Devon and Cornwall and put Surrey, Sussex, and Kent permanently under West Saxon rule. Kings of Wessex also were successful against the Viking Danes, who during the ninth century attacked Britain with ever larger forces. Of all Anglo-Saxon kings, only those of Wessex were able to stand up to the Danes. The Danish incursions were largely (although not completely) ended after 878, when Alfred of Wessex (Alfred the Great) (see sidebar) defeated a large Danish army at the Battle of Edington. After their surrender the Danish Viking king, Guthrum, was baptized, with Alfred standing as sponsor; the following year the Danes settled in East Anglia known as the Danelaw (Danish territory in England). In 886 Alfred recovered London and was accepted as overlord by all the English not subject to the Danes. Alfred reorganized his army; built ships and fortresses, planning to ring Wessex with them; and made the Welsh kings his allies.

In the 10th century Wessex's power continued to grow under Alfred's son, Edward, who put down renewed Danish incursions into Wessex in the Battle of Tettenhall in 910 and moved against Vikings from Ireland who were attempting to conquer Northumbria. Edward also completed his father's planned ring of fortresses. In 912 Edward and his sister, Aethelflaed, conducted separate campaigns into Danelaw and regained some lands. In 920 Edward received the submission of Raegnald, a Viking leader from Dublin who had conquered the city of York, along with that of the Scots and the Strathclyde Welsh, who were also cam-

painging in Northumbria, and of all the Northumbrians. In 927 Edward's son, Athelstan, reconquered the remaining Danish-held territory and the kings of Wessex became kings of England as a whole. In the decades that followed, the last of the Hiberno-Norse forces were routed, and Northumbria was never in jeopardy again for the rest of the Anglo-Saxon period.

The unrest and political rivalries of the past resumed in the reign of Edward the Confessor, under whom powerful earls wrested de facto political power in England away from the Crown. Godwine, earl of Wessex and Edward's father-in-law, together with his sons, was the chief of these. He and his family played a significant role in defending the realm and in pacifying the Welsh border but, in the old way, tried to use their success in war for political advantage, quarreling with Edward's authority. Although Edward banished Godwine and his sons from England for defying royal authority in 1051, Godwine's eldest son, Harold II (Harold Godwinson), invaded England the next year and forced the king to restore the family. Harold's own power was weakened by rivalry with his brother, Tostig, who backed Harold III (Hardraade) of Norway as Edward's successor.

The Arrival of the Normans

It was King Harold III's and Tostig's attempted invasion of England in 1066 when Edward died that, by distracting Harold from a far greater threat, abetted the victory of the NORMANS under William (William the Conqueror) at the Battle of Hastings. Harold was the last Anglo-Saxon king of England.

Although William was crowned king of England in 1066, this was just the beginning of his campaign to secure the country. Starting from his base in the southeast of England, William imposed Norman rule on the southwest, the Midlands, and Yorkshire in 1068, meeting little resistance and ordering castles built wherever he went. In 1069 multiple revolts culminated in an invasion by King Sweyn II of Denmark. William defeated the rebels and laid waste to the country between Nottingham and York, causing widespread famine in 1070. The last Anglo-Saxon rebel, Hereward the Wake, held out in the Lincolnshire fens until 1072.

In all about 10,000 Normans accompanied William and took over the country inhabited by about a million Anglo-Saxons. About 4,000 English earls were replaced by 200 of William's

barons. Not all Anglo-Saxons resisted; Edward the Confessor had many connections with Normandy, where he had spent time in exile and had Norman nobles in his court. Edward had at least considered making William his heir, and after the Norman Conquest, English church authorities accepted William as God's chosen successor to Edward.

CULTURE (see also GERMANICS)

Economy

Farming Crops of the Anglo-Saxons were little different from those of peoples of the Iron Age and Roman periods. Along with the bread wheat, spelt was still grown, as were barley and oats. Among the vegetables peas, leeks, and onions were grown. There were a black bean known as the Celtic bean and wild cabbage; also a white carrot and wild celery.

Fruits included gooseberry, currants (red, white, and black), wild blackberry, raspberry, strawberry, and elderberry. Crab apples, quinces, sloes, damsons, greengages, and pears grew wild or in orchards. Figs and grapes are known from the period. Reeds and sedges of various sorts and also the coppice strands of hazel and willow were all useful in the building industry, and flax could be used both for its oil and for the making of textiles. Woad, madder, weld, and other dye plants were then used to color the fabrics.

The farm animals of Anglo-Saxon England were, on the whole, smaller than modern varieties and less highly bred. Pigs, for example, were much shorter than the modern farm pig, with a more slender snout. We know from manuscript illustrations that the Anglo-Saxon pig had a curved back, the "hog-back" shape, showing its close relation to the wild boar.

Trade In the kingdom of Mercia, which comprised the whole of England south of the Humber Estuary, trade had become important by the early eighth century. Southampton and London were important trading centers, or *wics*, from the early 700s. Excavation has shown that defended settlements or proto-towns developed also at Hereford, Worcester, Gloucester, Tamworth, Winchcombe, and elsewhere within the Mercian heartlands. Ipswich in East Anglia seems to have been fairly populous by the standards of the time, judging by the amount of seventh- and eighth-century pottery that has been found there; it was the only sizable town in the region. Much of the pottery was imported from the Rhineland, as well as glassware.

In the second half of the eighth century the Mercian king, Offa, further fostered trade by reforming the coinage, including minting silver coins, the first pennies, more useful in a market economy than gold. It is likely that Mercia's towns were the focus of a new international market economy. The weight and fineness of Mercian coins were comparable to those of coins made in mainland Europe during the eighth century, revealing a trade link. Certain Mercian goods, such as millstones made of volcanic lava, that have been found were traded across Europe from Tamworth to Poland.

Kings in this period who promoted trade are thought to have done so mostly to achieve a monopoly on the importation of prestige goods, such as wine or fine textiles, which they used to attract followers for their own political gain. The tolls they charged on imports were also an important source of wealth.

The Viking Danes, however, introduced trading on a large scale to East Anglia. After their arrival Ipswich was joined by two more cities, Norwich and Thetford. In the 10th century both cities quickly became huge by medieval standards.

Government and Society

The Invaders The social organization of the invading Anglo-Saxons was simple. There was no centralized leadership; names that have come down to us, such as Hengist and Horsa, may be semimythical. Most of them arrived organized as small war bands and settler groups. The Anglo-Saxon invasion was not a wholesale migration like that on the mainland of the VISIGOTHS or VANDALS, but a more piecemeal process that took place over a longer period. The North Sea coastal zone, both in Britain and on the mainland, which had benefited greatly from trade with the Romans, changed considerably during the invasion period, with many settlements abandoned and never reoccupied. Many large cremation cemeteries fell into disuse after the mid-fifth century, attesting to large-scale population movements during this time.

Leadership among Germanic peoples before the migrations seems to have been organized into a hierarchy of tribal, provincial, and national leaders—high kings or overlords. The high king, in Old English the *bretwealda*, may have been elected only in times of emergency. The Anglo-Saxon scholar of the seventh and eighth centuries known as the Venerable Bede, describing Saxons on the mainland, said that they had no kings, but

only “satraps,” and elected a war leader when danger threatened the whole people. Among the Anglo-Saxons in Britain, however, hereditary kings who ruled whole territories soon emerged and engaged in struggle with one another for ever larger kingdoms.

Developments in Britain The process of migration, which fractured old tribal groupings and was in general a tumultuous and probably traumatic affair, fostered the emergence of strong leaders whose power was mostly derived from their success in war. Such leaders were needed much more under the circumstances of invasion and conquest abroad than they were in the old homeland, where war had been no more serious than occasional cattle raiding.

The warrior in Germanic society began to attain a higher social status during and after the migrations than ever before, as attested by burials, which for the first time began to approach, in richness of grave goods, burials of the Celtic Hallstatt chiefs of south central Europe some 1,000 years before. The famous Sutton Hoo ship burial in Suffolk, for example, thought to be that of Raedwald, who was king of East Anglia in the early seventh century, is the richest grave ever found in Britain. The Old English poem *Beowulf* depicts the warrior's life of fighting and feasting—fighting to achieve acts of heroism that could be celebrated while feasting—little different from the Celtic warrior ideal of the past. (Again we see the peoples of the north recapitulating social transformations that had occurred in central Europe centuries earlier, and in Homeric Greece, centuries before that.)

The Sutton Hoo burial gives a sense not only of the wealth of Anglo-Saxon kings, but of their wide-ranging cultural connections. The custom of ship burial is Scandinavian. The helmet and shield in the grave were made in Sweden; the sword may be of the FRANKS; some of the hanging bowls were British. Articles from Byzantium included silver bowls and spoons. The garnets that embellish the gold jewelry were definitely Frankish, as were the gold coins.

Symbiosis of Kings and Warriors Kings, to accumulate and retain power, had to attract the loyalty of warriors. They could do this with rich gifts (which in Germanic society imposed duties of loyalty and obligation on the recipient) and lavish feasts; perhaps most important was success in war, which provided both the wherewithal for gifts and feasts and, crucially,

the opportunity for heroism. The inherent instability of this system lay in the continual need for war to gain both booty and lands, and only kings who were able to keep the cycle going prospered. The varying fortunes of the Anglo-Saxon kingdoms illustrate the importance of this principle: Those who could continue to expand their frontiers were most successful. In the sixth century, before territorial boundaries had been firmly established, the southeastern kingdoms of Kent and Sussex had scope for military adventures and their kings remained powerful. By the seventh century they were hemmed in by Wessex and their power waned. Thereafter the kingdoms of Wessex, Mercia, and Northumbria, which could expand westward and northward, were most successful.

Despite similarities between the Celtic and Germanic aristocratic societies, perhaps the essential difference between them was this expansionism of the latter, brought about by the social dislocations the Germanics experienced during their migrations. The difference is most clearly seen by comparing contemporary Irish and Anglo-Saxon kings. Although warfare was endemic in Ireland, it was on a much smaller scale than among the Anglo-Saxons. The different royal dynasties of Ireland, relatively unaffected by Rome or the turmoil caused by Rome's collapse, had maintained a sort of equilibrium for centuries. (This situation was beginning to change, however, as some Irish dynasties took advantage of the demise of Roman authority to carve out territories in Britain, notably the DÁL RIATA in Scotland.) The primary role of the Irish king was not that of war leader, except for the purpose of protecting his people; rather, he was the spiritual leader and intercessor between his people and the gods. Irish society preserved many of the institutions that had existed in much of pre-Roman Europe. Anglo-Saxon society, however, was evolving the institutions of the future.

Evolution of Kingship Although a king's political power was based on continual warfare, Anglo-Saxon kings after the seventh century, in part because of the growing influence of Christianity, began to assume a greater role than that of war leader. As elsewhere in Europe kings increasingly sought power without recourse to warfare and in fact were trying to stabilize their kingdoms and rein in the warrior class. Ine of Wessex and Offa of Mercia both promulgated law codes—Ine in 694—and

Offa's building of a defensive dyke in 780 between his kingdom and the kingdom of Powys in Wales in all probability minimized friction between the kingdoms and stabilized his borders with minimal bloodshed. Alfred of Wessex was perhaps the greatest exemplar of this new type of king, successful in government as well as at war.

The Kin Group The kin group was an important social and legal institution; it had both rights and obligations that sometimes transcended those of individuals within the group. The kin group possessed certain rights in the land held by its members and also was responsible to any of its members who had suffered criminal wrong. In the case of murder, the kin had a duty to bring the guilty to justice, even in some circumstances to kill the wrongdoer. This was the practice of blood feud that Alfred sought to curb.

Social Stratification In common with that of other Germanic peoples, society among the Anglo-Saxons was strictly stratified into the aristocracy, each of whose members was termed an Aetheling (also spelled Atheling, or Etheling), free commoners called *ceorls* or churls, and slaves or semifree servants. Because the basis of justice in these violent societies was the "blood price" exacted from the kin of wrongdoers to be paid to the kin of the victims, on a par with fines for cattle stealing and the like, a man's status in society was measured in pragmatic monetary terms startling to modern ideas. Each man had his "man price," *wergild* in Old English. A free commoner was worth 200 shillings; an aristocrat was worth at least three times that. This valuation was even applied to the worth of a man's oath in court, where the testimony of an aristocrat far outweighed that of a commoner.

After the Norman Conquest Many Anglo-Saxon political institutions survived long after the Norman takeover. Well into the 12th century, the whole structure of royal government remained fundamentally Anglo-Saxon: the king's council, the royal seal and writing office, the shire system and the sheriffs, and the twofold royal revenue system consisting of the produce of royal estates and a direct tax levied on the landowning class.

The Norman Conquest affected the Anglo-Saxon aristocracy most immediately, but the process of turning free commoners into serfs—peasants bound to the land and a lord—accelerated under the Normans.

Dwellings and Architecture

A distinctive type of building in Anglo-Saxon England is the pit-type house. This is a simple structure raised over a pit excavated into the ground. Scanty evidence, with pits and post-holes the typical remains found, has made it difficult to find out what sort of structure covered the pits. Formerly it was thought that people lived on the floor of the pit, the sides of which provided walls; the peaked roof of timbers and thatch rested directly on the ground above the pit. New evidence suggests that, instead, the house had wooden plank floors and the pit provided a cellar beneath. Houses were rectangular in plan, spacious and open inside, with wattle and daub walls over a timber frame—the mud-daubed parts white-washed—and a thatched roof.

Art

Polychrome Ornamentation The metalwork of the Anglo-Saxons, in common with that of other Germanic cultures of the mid-first millennium C.E., is notable for the development of techniques to decorate metalwork with brilliant-colored gems and enamels. These included channel work to hold enamels, and techniques to encrust metal with semiprecious stones, among which garnet was most favored.

Manuscript Illumination In Northumbria particularly, Anglo-Saxons were inspired by the Irish manuscript illuminators who entered their midst with the foundation of the great monasteries on the island of Lindisfarne and at Wearmouth and Jarrow during the seventh century. The ancient Celtic La Tène decorative tradition of curvilinear forms—scrolls, spirals, and a double curve or shield motif known as a pelta—was integrated with the abstract and geometric ornamentation of the pagan Anglo-Saxon metalwork tradition char-

acterized particularly by bright colors and zoomorphic interlace patterns, thus producing a Hiberno-Saxon school of art. Among its greatest products were the *Lindisfarne Gospels* (early eighth century), the *Book of Durrow* (seventh century), and the *Book of Kells* (c. 800). The Hiberno-Saxon style had an important influence on the art of the Carolingian Empire.

Literature

With the advent of Christianity in England began the rise of monastic centers of learning, perhaps inspired by those of the Irish. Canterbury, the earliest religious center, became a famous center of learning among Anglo-Saxons as well. Benedict Biscop (Benet Biscop) founded both Jarrow monastery, where the historian and Benedictine monk known as the Venerable Bede (see sidebar) spent his life, and Monkwearmouth monastery in the seventh century. Possibly because of Romano-British influences retained in Northumbria from the former British kingdoms of Berenicia and Deira, this kingdom early became the most culturally advanced in England. Benedict was a great builder of churches and monasteries, who imported craftsmen from the mainland to beautify them with frescoes and stained glass. Others were soon established, of which Jarrow and Monkwearmouth in Northumbria were preeminent. Another was the school of York, founded by Bede's pupil Archbishop Egbert in the eighth century, which attracted students from the mainland and from Ireland. The scholar Alcuin was educated at York in the eighth century.

Anglo-Saxon as well as Irish scholarship was of first importance to the Carolingian emperor Charlemagne, who ruled what is present-day northern France and western Germany. Charlemagne surrounded himself with clergy from the British Isles. As the first non-Latin speakers in the West to have embraced Christianity, both the Irish and Anglo-Saxons had developed methods and textbooks for the teaching of Latin. Written Latin was important in eighth-century Gaul because spoken Latin was evolving into the French language, jeopardizing comprehension of the Bible and the liturgy. The new Christians in Germany were in like need, and Anglo-Saxon and Irish scholars and teachers with their textbooks, as well as a new method of pronouncing Latin that they had devised, were in the forefront of Latin education.

The Venerable Bede: Scholar and Saint

Born near present-day Durham in 672 or 673, the Anglo-Saxon historian and theologian Bede (also Baeda or Beda) was orphaned early in life and raised under the care of a Northumbrian nobleman, Benedict Biscop, who founded the Jarrow monastery where Bede spent his life. The library Benedict collected enabled Bede to study a broad range of subjects: Greek and Latin classics, Hebrew, prosody, mathematics, medicine, history, and what was known at the time of physical science. His greatest work was the *Historia ecclesiastica gentis Anglorum* (Ecclesiastical History of the English Nation). Bede introduced the custom of dating events from the birth of Christ. He died in 735 and was canonized in 1899.

Anglo-Saxon Chronicle The *Anglo-Saxon Chronicle* is a chronological account of events in Anglo-Saxon and Norman England. It began life in the reign of Alfred of Wessex, who had historical materials compiled into a single narrative; these included Bede's *Historia ecclesiastica gentis Anglorum* (known as *Ecclesiastical History*), genealogies, regnal and episcopal lists, some annals (year-by-year accounts of contemporary events) from northern England, probably some sets of earlier West Saxon annals, and a set of Frankish annals for the late ninth century. Copies of the *Chronicle* were soon made and obtained by courts and monasteries throughout England. New material, including yearly annals, was added to many of these copies; of the seven surviving manuscripts, the longest runs until the year 1154, well into the Norman period. The different versions contain different material, such as regional records, two of them evidently compiled in the north of England, for example, because they include interpolations of material of northern interest taken from Bede. These versions are known as the northern recension.

Alfred the Great King Alfred of Wessex had an important influence on Anglo-Saxon letters. He translated some books himself with the help of scholars from Mercia, Wales, and the mainland. Through his own and his scholars' efforts, the works of Bede, Orosius of the fifth century, Augustine of the fourth and fifth centuries, and *De consolacione philosophiae* (*The Consolation of Philosophy*) of Roman philosopher Boethius of the fifth–sixth century were translated. Alfred himself was a prose writer of note, contributing beautiful passages to the translation of Bede's *Ecclesiastical History*. He may even have translated Boethius's *Consolation* himself as the title page states, or with the assistance of his court scholars. This work, which includes retellings of the Greek myths of Orpheus and Eurydice, and of Ulysses and Circe, had an enormous influence on later English literature.

Two preeminent Old English prose writers were Aelfric, abbot of Eynsham, and Wulfstan, archbishop of York. Their sermons in the 10th and 11th centuries set a standard for the art of preaching.

Poetry As the Irish had once they became Christian and literate, Anglo-Saxon scribes wrote their tales, annals, and poetry, hitherto transmitted only orally. In their homeland they had had professional bards called *scops*, “shapers” of song and story. Many *scops* were attached to royal courts and served the roles

both of entertainer and of historian, recorder of the heroic deeds of their patrons and keeper of the deeds of their patrons' ancestors. *Scops* also kept alive the mythology of their tribe. The primary poetic form of the *scop* was the *lay*, a partly lyrical but mostly narrative work composed as the *scop* looks on the scene of battle and recounts it. *Lays* were delivered in a rhythmic chant without rhyme or fixed metrical pattern, with alliteration supplying the organizing principle. *Lays* made use of naive and simple metaphors called *kennings*, which interrupted or varied the narrative flow only a little. This was a poetry intended to be heard while feasting.

The heroic epic was a stringing together of many *lays* about a single hero. Although the Anglo-Saxons were the first Germanic people to commit their poetry to writing, beginning in the seventh century with a work known as *Widsithis* (The far journey), only one full-length heroic epic survives in Old English: *Beowulf*. Many more manuscripts were lost, and allusions in *Beowulf* to older Germanic heroes and battles of a deep and distant past give a sense of the scope of what was never written. The version of *Beowulf* that is extant was composed by a Christian poet, probably early in the eighth century. The Christian elements, however, are a thin overlay on an essentially pagan work. *Beowulf* was probably composed in Northumbria in the first half of the eighth century. Although the hero Beowulf possesses nearly superhuman physical abilities, most notably prowess at swimming and also gripping, it is clear that the author of the poem, or authors, used Beowulf as an embodiment of ideals of social and personal conduct—courage, honor, and loyalty—that his audience could and should strive to emulate. Many elements in the poem have striking parallels in 13th-century Norse sagas: male and female monsters, a giantess whose arm is cut off by the hero, and a cave behind a waterfall that the hero reaches by diving, with a marvelous sword hanging on its wall.

The lyric mood is reached in Old English poetry through what are called elegiac poems. In contrast to lyrical poetry of the later Middle Ages and beyond, lyric poetry among the Anglo-Saxons hardly touches on the passion of love or on mourning for personal loss. Instead the poet sings of the larger, more impersonal themes of the capriciousness of fate and the impermanence of existence, contrasting a happy past with a desolate present, possibly an expression of the great change that overtook the Anglo-Saxons when they embarked from

their homeland to a foreign shore, never to return.

In the Christian era poetic narrative versions of biblical stories were composed. Only two poets are known by name. Caedmon of the seventh century, mentioned by Bede, who also records a few lines of his poetry, is the earliest known English poet, although the body of his work has been lost. The name of Cynewulf (ninth century) is given as author of the poems "Elene," "Juliana," and "The Fates of the Apostles"; no more is known of him. The finest poem of the school of Cynewulf is "The Dream of the Rood," an early example of the dream vision, a genre later popular in Middle English literature. Other Old English poems include various riddles, charms (magic cures, pagan in origin), saints' lives, gnomic poetry, and other Christian and heroic verse.

Religion

Pagan Belief The Germanic peoples had many gods in common, many of them projections of their ideals and of the character of their warrior society. Woden, Wotan, or Odin was the cunning war leader; Thor the powerful warrior; and Valhalla the reward of slain warriors. It was a councilor of Edwin of Northumbria, quoted by Bede, who made the famous analogy depicting the cosmological outlook of the Germanics, that human's existence was like the flight of a bird from outer darkness through a bright, warm, and cheerful hall, back into darkness again. The councilor made this remark in the context of advising Edwin whether or not to embrace Christianity, going on to say, that if this new teaching brought more certainty it was worthy to be followed. The bleakness of this view of the beliefs of the pagan past may owe much to the fact that it was written by a fervid Christian.

Archaeological evidence of pagan Anglo-Saxon practices includes cremation urns in eastern and central England. Stamped and incised designs, and the size and shape of the pots themselves, may have reflected the age, gender, social status, and, in some cases, religious affiliation of the deceased. The runic letter for *T*, for example, may indicate the god *Tiw*, and the swastika may symbolize the god *Thor*.

The face-mask, a stamped representation of the human face, is commonly found on objects of the pagan period. It has been suggested that it was a symbol of Anglo-Saxon identity and may represent one of the pagan gods. The symbols are known on cremation urns from both England and the Continent,

and on coins, drinking cups, brooches, and buckets. The Sutton Hoo full-face helmet has been thought to be a ceremonial mask, an indicator of the Saxon king's mythological descent from the gods; face-mask decorations are also found on the Sutton Hoo ceremonial whetstone scepter.

Pendant triangles are the most common decorative motif on sixth-century cremation urns in East Anglia. The silver-gilt mounts of the Sutton Hoo drinking cups and the rim bands of some drinking horns are hung with pendant triangles, as were many buckets. Pendant triangles, always associated, aside from cremation urns, with eating and drinking vessels, may have been a symbol of the ritual consumption of food or drink, a practice that would later be forbidden by church authorities (discussed later).

Drinking horns in particular were probably intrinsically pagan objects. The goat was sacred to the Germanic goddess Freya. A burial site at Yeavering in Northumbria, thought to be of a pagan priest, contained a metal staff that terminates in what appears to be a stylized goat, and the remains of a goat's skull were found at the foot of the grave. Yeavering, the most important royal and ceremonial center in the north of England in the sixth century, had the Anglo-Saxon name *Ad-Gefrin*, the Hill of the Goats. The Christian portrayal of the Antichrist was often a goatlike figure with cloven hooves and horns. This image is traditionally explained as a memory of the classical god *Pan*, but a reflection of an Anglo-Saxon veneration of goats is perhaps a more likely explanation.

Burials During their first centuries in the new land, the Anglo-Saxons often located their burials near the sacred sites of their predecessors. First British and then, by the seventh century, also Roman sites were being reused. The seventh century was a time of Anglo-Saxon kingdom formation and dramatic religious and social changes in lowland Britain, and the reuse of old sites may have been a means by which the new polities as well as practitioners of the new religion sought a sense of stability and continuity in a changing world. The Anglo-Saxons often preferred round barrows for burying their dead, yet burials are also found in or beside Roman villas (as at Orpington in Kent) and forts (Longthorpe in Cambridgeshire), or at temples, such as the single high-status burial at an isolated temple on Lowbury Hill on the Berkshire Downs. They are also found in Neolithic long barrows (as at Hampnett in the

Cotswolds) and in hill forts, such as Highdown Hill in Sussex.

Most famous of all is the Anglo-Saxon royal palace at Yeavinger in Northumbria, where a line of timber halls and two cemeteries were centered on a single Bronze Age barrow and a stone circle.

Early medieval literature illuminates this practice. In *Beowulf*, in the *Life of St. Guthlac*, and elsewhere are references to people who traveled to ancient barrows to make contact with supernatural forces. Similar stories are found in Scandinavian and Irish literature. By burying the dead, depositing artifacts, and building religious structures at ancient monuments, individuals and communities were establishing and maintaining relationships with the supernatural world, perhaps as a source of spiritual and political authority. Social identity and status, control of land, and even the success of crops may have depended on the ritual veneration of these ancient sites.

This was only a temporary phenomenon, however. The subsequent history of the royal palace at Yeavinger, as shown by archaeological remains, was one of abandonment. Yeavinger is very possibly the place where in 627, according to the *Anglo-Saxon Chronicle*, the Christian Gospel was first preached to King Edwin of Northumbria by a priest from the Roman mission based at Canterbury. Edwin and his noblemen were converted, the latter baptized in a nearby river. Edwin, however, had a church built in York, the location of the former Roman diocese, and was baptized there. After Edwin's death his successors reverted to paganism. Yeavinger was destroyed by burning, probably by Mercian forces in the seventh century, after which, according to Bede, it was abandoned, perhaps because of associations with the unsuccessful first attempt to establish Christianity. Subsequently York, with its Roman associations, became the center of Christianity in the north of England.

Conversion to Christianity The first successful Christian mission to the Anglo-Saxons was to the kingdom of Kent. The Kentish king Aethelbeht, who by 595 had become overlord of all the kingdoms south of the river Humber, had as his wife Bertha, daughter of Charibert, the Frankish king of Paris. Bertha was a Christian, and it may have been for that reason that Pope Gregory I sent Augustine on a mission to Aethelbeht's court in 597. Subsequently missionaries from Kent traveled to other Anglo-Saxon kingdoms to spread the Gospel.

The actions of Raedwald, ruler of the East Angles at this time, illuminate the process of Christianization. Raedwald was under the overlordship of Aethelbeht and accordingly converted when his ruler did, whether willingly or not. According to Bede, Raedwald, "seduced by his wife and certain evil teachers and perverted from the sincerity of his faith," had both a pagan and a Christian altar in the same building. His son, Eorpwald, was not a Christian until he was converted in the late 620s by Edwin of Northumbria. After his short reign his successor was also pagan. Only under Eorpwald's brother, Sigbert, did Christianity become more firmly established. Sigbert had been in exile in Gaul, possibly at the court of the Merovingian Frankish king Dagobert, where he would have experienced a higher level of civilization than had been achieved as yet in the rough-and-tumble warrior world of Anglo-Saxon royalty. Sigbert was accompanied by a Frankish bishop named Felix, who, noted Bede, brought the great happiness of the Gospel to the East Angles.

Despite initial successes the Gregorian mission to the Anglo-Saxons, especially in Northumbria, had no lasting impact, and the successors of Edwin of Northumbria reverted to paganism, so that Paulinus, Gregory's last missionary, fled back to Kent. Instead the Irish missionary centers of Iona and Lindisfarne (*see IRISH*) were the driving force behind the conversion of the Anglo-Saxons, perhaps because they represented a church that was such a product of northern barbarian culture, with its heroic "White Martyrs" such as the former warrior Columba, far closer in outlook to that of the Anglo-Saxons than the urban Greco-Romans sent by Pope Gregory.

In important doctrinal disputes between the Roman and Irish churches, however—most notably the method of calculating Easter, as well as tonsures (removing hair from the crown of the head) for Irish monks, which were thought to derive from Druidic practice—the fact that the Anglo-Saxons sided with Rome in 663–664 at the Synod of Whitby, where these issues were decided upon, illustrates Rome's continuing importance for them. When Benedict Biscop wanted to found a monastic foundation, he traveled to Rome and to Gaul for its books. His double monastery of Jarrow and Monkwearmouth probably had the best-stocked library in northern Europe, a greatly enabling influence on one of its monks, Bede, the greatest scholar of his time in northern Europe.

By the 680s all of the Anglo-Saxon kingdoms had been converted, at least nominally, and their kings began to enforce Christianity by law. After the seventh century the Catholic Church in England was vigorous and secure enough to send missionaries to pagans in Germanic Europe—in Frisia, Saxony, and central Germany. Many suffered savage martyrdom, but gradually, during the eighth century, particularly through the work of Boniface of Wessex, the establishment of Christianity began. Boniface was supported in his work by the Frankish rulers, Charles Martel and his son Pippin III, and the church organization he helped reform, with its firm ties to the Roman papacy, was an essential foundation for the rise of the Carolingian dynasty.

Survival of Paganism The historical literature makes it clear that paganism continued to flourish in Anglo-Saxon-controlled areas throughout the seventh, eighth, and even ninth centuries. In addition, seventh–eighth-century pottery made in eastern England may have been designed specifically for use in pagan ceremonies. The evidence perhaps suggests a greater de facto tolerance of paganism in this period than is suggested by church pronouncements alone, or by a literal reading of historians such as Bede.

The early church certainly made efforts to absorb paganism into its own ceremonies, as if in recognition of the strength of popular feeling. Bede, in his *Ecclesiastical History*, quotes Pope Gregory's letter to Abbott Mellitus, an envoy sent to join Augustine in England in 601, in which the pope demanded that altars be set up in pagan shrines, and that pagan sacrifices and feasts be replaced by Christian festivals. Many scholars regard Christmas as one example of such a replacement for the Germanic winter solstice celebration called Yule.

We also know from Bede that idols were still being destroyed in Kent decades after the conversion of Aethelbeht at the beginning of the seventh century. Moreover the traditional robes of the Christian cleric may reflect an adoption of the costume of pagan priests for, according to the Roman historian Tacitus of the first and second centuries, they dressed as women in Germany.

The seventh-century *Penitentials* of the seventh-century Greek prelate Theodore, archbishop of Canterbury, a list of proscriptions, attest to the continuing strength of paganism. They proscribed such practices as “sacrificing to devils,” augury (divination from omens), eating food offered as sacrifice, and burning grain for the

well-being of the dead. Burnt grain is occasionally found in pagan Anglo-Saxon graves—for example in the cemetery at Portway in Hampshire. The *Penitentials* also required heathens to be baptized and existing pagan marriages to be solemnized by a Christian ceremony. Penalties were listed for Christian clerics who performed pagan divinations.

Documents continue to indicate the survival of paganism in the eighth century. In 747 one of the canons of the Synod of Clovesho—an unknown location somewhere in England—stated that every bishop should inspect his diocese each year and forbid pagan practices such as divination, soothsaying, and the use of omens, amulets, and spells. As late as 786 papal legates admonished the English for dressing “in heathen fashion” and slitting their horses' nostrils in the pagan manner. Laws proscribing pagan practice were still being introduced in the ninth century, under Alfred, and again in the 10th century.

This determined effort against paganism seems, however, to have made an exception in the case of Ipswich Ware, pottery made in the important trading town of Ipswich in East Anglia. This type of pottery, first produced in Ipswich around 720, used stamped and incised decoration. Overtly pagan designs such as swastikas or runes were not used, but there is one Ipswich Ware vessel decorated with stamped face-masks. And pendant triangle motifs are common.

During the eighth century Ipswich may have been a center of pagan worship. No church of that date has yet been found in the town, nor have burials with Christian features or objects with Christian symbols. In addition Ipswich was the main redistribution center for imported goods on the east coast of England. The two other major ports of southern England, London and Southampton, were mainly supplied by Frankish merchants, who were Christian. Ipswich is likely to have been mainly supplied by Frisians, who were by and large pagan. Trading links with Frisians may have continued to foster paganism in Ipswich. At the least the lucrative trade with mainland Germanics may have induced East Anglian authorities, although Christian themselves, to turn a blind eye to the pagan motifs of Ipswich Ware.

In a sense the Anglo-Saxons began to lose their identity as a contentious collection of tribal

invaders when, after about the seventh century, they began to refer to themselves as the ENGLISH. This identification strengthened along with the process toward unification of the different Anglo-Saxon kingdoms under a single “king of England,” a process that was spurred by the incursions of the common enemy of the English, the Danes. The Anglo-Saxons conquered by the Normans had largely left behind their tribal past and were moving toward an early modern society.

Antes (Antae; Anty; Ants)

Antes is the name applied by ancient historians to a group of uncertain ethnicity who, sometime before the fifth century C.E., migrated southeastward to north of the Black Sea in southern Ukraine and Moldova, possibly from a homeland north of the Carpathian Mountains in present-day eastern Poland and western Ukraine, Belarus, and Russia. The Greek form of the name is Antae and the Ukrainian, Anty. Antes is not a Slavonic word and may have been given to or adopted by a proto-Slavic people who had come under the domination of another group.

The name Antes was later given to the first SLAVS mentioned in written records, who appeared on the northern borders of the Eastern Roman Empire of the BYZANTINES along the Danube River in the sixth century C.E. The other main group of these Slavs were called SCLAVENI by the Greeks, although these two were said to have been formerly united in a group called the Sporoi (close to a Slavic word for multitude). Slavs who settled to the west became known as WENDS, a name

derived by early medieval writers, especially FRANKS, from the collective name VENEDI. GREEKS and ROMANS applied the name *Venedi* to all peoples living in eastern Europe, and SCLAVENI to those to the southwest, although the exact makeup and geographies of these classifications are uncertain.

Starting in the 520s, along with the Sclaveni, the Antes, known from contemporary Roman accounts (who again are only tentatively identified with the fourth-century group of the same name), carried out raids on the BYZANTINES of the Eastern Roman Empire, reaching as far southwest as the Balkan Peninsula later in the century. Many of them settled in present-day Bulgaria and Yugoslavia and merged with Southern Slavs. In the late sixth and early seventh centuries, the Antes were defeated in a number of engagements by the Avars, another people out of Asia, leading to their further dispersal and the disappearance of their name from the historical record. Some of them reportedly became part of a tribal federation among the Eastern Slavs known as the DULEBIANS.

Aorsi

The Aorsi were an Iranian-speaking tribe, their nomadic ancestors originally out of Asia; they are classified as SARMATIANS. They lived east of the Volga River in present-day western Russia. Some among them migrated westward by the third century B.C.E., settling along the lower Don River northeast of the Black Sea. The Greek geographer Strabo of the first centuries B.C.E. and C.E. recorded that in about 65 B.C.E. they had 200,000 horsemen serving under King Spadines, a much larger cavalry than that of the Sarmatian SIRACES living to their south. By the end of the first century C.E. the Aorsi were displaced by the ALANS, another Sarmatian group. The name Aorsi in Hungarian means “sentry” or “patrol” and is probably derived from the tribal name. The Yen-Tsai in Chinese texts are thought to have been the Aorsi.

Apuli (Apulians; Dauni)

On the basis of their Messapic language, it is assumed the Apuli were ILLYRIANS. They are thought to have migrated to present-day southeastern Italy from the western Balkan Peninsula by the ninth century B.C.E. or earlier, settling in the region of Apulia (modern Puglia). They are sometimes grouped with

other Illyrians as IAPYGES, or cited as descendants of Iapyges, but they may have been a later migrating group.

A seagoing people, the Apuli supported themselves in part through piracy, but also by trading of grain with other peoples of the Adriatic Sea.

They were influenced by the GREEKS across the Adriatic by the eighth century B.C.E., as indicated by changes in their pottery. Gradually spreading inland, they mixed with the local population—mostly ITALICS—and founded cities organized in a loose confederation, including Arpi, Brundisium (modern Brindisi), Canusium (modern Canosa di Puglia), Gnathia, Herdonea (now Ortona), Lupiae (modern Lecce), Manduria, Rubi (Ruvo di Puglia), Rudiae, Sipontum, and Uria (modern Oria).

The Apuli rebelled against domination of the SAMNITES as allies of the ROMANS in the Second Samnite War of 322–304 B.C.E. but supported the CARTHAGINIANS against the Romans in the Second Punic War 218–201 B.C.E., when Hannibal defeated the Romans at Cannae in Apulia in 216 B.C.E. They were absorbed into the Roman Empire; some among them joined various tribes against Rome in the Social War of 90–88 B.C.E.

Aquitani (Aquitanians)

The Aquitani are classified as a Celtic tribe. They lived in Gaul in the region between the Garonne River and the Pyrenees in present-day southwestern France and are discussed as CELTS or GAULS. Julius Caesar wrote about the people of the region as ethnically distinct from Gauls to the north. According to his classifications, Aquitania became a division of southwestern Gaul in 27 B.C.E., extending from the Pyrenees all the way to the Loire; afterward the name Aquitani (or Aquitanians) was sometimes applied generally to tribes in this greater region by the ROMANS to distinguish them from the CELTAE and BELGAE to the north. The present-day region of Aquitaine takes its name from the tribal name.

Arabs See MOORS; SARACENS.

Arecomici (Aricomi; Volcae Arecomici)

The Arecomici are classified as a Celtic tribe. They lived in Gaul in present-day southern France at least by the first century B.C.E. and are

discussed as CELTS or GAULS. They are considered a subgroup of the VOLCAE.

Arevaci (Arevacii; Arevacos; Arevacians)

The Arevaci are classified as a Celtic tribe. They lived in present-day north-central Spain; and are discussed as CELTS or CELTIBERIANS. They became the dominant tribe in the region in the late centuries B.C.E., with strongholds at Okilis (modern Medinaceli) and Numantia. In 133 B.C.E. Roman legions under Scipio Aemilianus Africanus Numantinus (Scipio the Younger), after a 16-month siege, destroyed Numantia.

Arvanites (Arberor; Shqiptar; Albanian Greeks)

The Arvanites are a people out of Albania presently living in Greece and can thus be classified as Greeks, although they are associated historically with Albanians (see GREEKS: NATIONALITY; ALBANIANS: NATIONALITY). Arvanites is the Greek version of their name, and Arberor, the Albanian version. In northwestern Greece the native name for Albanians is Shqiptar.

ORIGINS

The Arvanite presence in Greece resulted from migrations of Albanian Christians from Albania, or from the redrawing of borders, which led to Albanians' becoming citizens of Greece. As do other Albanians, they have ILLYRIANS among their ancestors.

LANGUAGE

The Arvanite language, known to Greeks as Arvanitika (or to Greek Albanians as Arberichte), is South Albanian (Shqip or Tosk), as opposed to North Albanian (Gheg). Arvanitika has three main dialectical variations: one in Thrace in northeastern Greece, one in northwestern Greece near the Albanian border, and one in central and southern Greece. Because a written form has not been passed down, both the Greek and Latin alphabets have been used to write it. Most Arvanites are now bilingual, also speaking Greek.

HISTORY**Migrations**

The earliest Arvanite migrations from what became present-day Albania to present-day Greece are thought to have occurred as early as

the 11th and 12th centuries. Others migrated in the 14th and 15th centuries, at the invitation of the BYZANTINES, when Greece was part of the Byzantine Empire. After the Ottoman Turks (see TURKICS) gained control of the Balkan region by the end of the 15th century, other Arvanites are thought to have fled forced Islamization. Another wave of migrations occurred in the 18th century, still during the Ottoman period.

In the early migrations most of the Arvanites settled in the administrative regions known as Central Greece and the Peloponnese peninsula in southern Greece, or on Greek islands, such as the Cyclades island of Andros. Fewer numbers migrated to north-eastern Greece to the east (the Greek regions now known as Central Macedonia and Eastern Macedonia, and Thrace). When the homeland of some of those families who had settled in eastern Thrace became part of Turkey by the terms of the Treaty of Lausanne in 1923, some of them were relocated to Greece, because the treaty called for an exchange of population; Muslims of Greece resettled in Turkey, and Christians of Turkey resettled in Greece.

The territory of Arvanites in the north-western regions of Epirus and Western Macedonia became part of Greece as a result of a redrawing of the political map in the early 20th century after the disintegration of the Ottoman Empire. Arvanites near the border, formerly part of a region of southern Albania known as Chameria, are referred to as Chams.

Since the 1950s many Arvanites have been emigrating from their villages to the cities, especially to Athens, the capital of Greece.

Arvanite Identity

For a time after the Greeks won independence from the Ottoman Turks, the Arvanites, some of whom aided the Greeks in the rebellion of 1821–28, were accepted as a separate cultural group within the new Greek nation. Yet Greece ultimately adopted a policy of Hellenization with regard to Arvanites. The growth of an Albanian nationalistic movement in the 20th century exacerbated the issue, contributing to resentment against Arvanites.

The use of Arvanitika has been declining because of Hellenization and urbanization. As for all other minority languages in Greece, except Turkish, Arvanitika has no legal status and is not taught in schools, and Arvanites who move away from ancestral villages are

less likely to use it. Their church services—of the Greek Orthodox Church—are held in Greek.

Since the 1980s efforts have been made to preserve Arvanite culture. A number of cultural associations and publications that promote Arvanite identity have been formed. Recordings of traditional songs have furthered a sense of community among the Arvanites.

CULTURE

The traditional Arvanite way of life is built around the farming village. Most Arvanites are Orthodox Christians.

It is estimated that there are about 200,000 citizens of Greece who are identifiable as Arvanites and speak Arvanitika. Yet perhaps as many as 1.6 million Greek citizens have Arvanite ancestry.

the more powerful Celtic tribes, they sometimes allied themselves with the SUEBI and other GERMANICS against rivals. Along with their allies the ALLOBROGES, they were conquered by the ROMANS in 121 B.C.E.

An Arverni nobleman by the name of Vercingetorix led a rebellion against the Romans in 52 B.C.E. (see sidebar “Vercingetorix” under GAULS). The AEDUI, traditional enemies of the Arverni, joined the revolt as well, forcing the Romans to abandon their siege of the Arverni town of Gergovia on the Gergovie plateau. Other tribes whose warriors participated in the rebellion included AMBIANI, ATREBATES, AULERCI, BELLOVACI, BITURIGES, BOII, CARNUTES, HELVETII, LEMOVICES, MEDIOMATRICI, MENAPII, MORINI, NERVII, NITOBRIGES, PARISI, PETROCORII, PICTONES, RAURICI, RUTENI, SANTONES, SENONES, SEQUANI, SUESSIONES, TURONES, plus some from the region known as Armorica (modern Brittany and eastern Normandy). Yet a Roman victory led by Julius Caesar on the Vingeanne River forced Vercingetorix to retreat northward to Alesia, a town of the MANDUBII, thought to be located about 32 miles northwest of present-day Dijon. After a long siege at Alesia, the rebels surrendered in October 52 B.C.E. Vercingetorix was executed in 46 B.C.E. as a part of Caesar’s victory celebrations.

Augustonemetum in Arverni territory, on the site of present-day Clermont-Ferrand, became a *civitas* capital in Roman Gaul through the period of occupation lasted until the fifth century C.E.

Arviens (Aulerci Arviens)

Arviens are classified as a Celtic tribe. They lived in Gaul around present-day Laval in northwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Asculani See PICENES.

Asding Vandals See VANDALS.

Aspiates

The Aspiates are classified as a Celtic tribe. They lived in Gaul in the northern Pyrenees around present-day Accous in southwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Astures (Asturii)

The Astures are classified as a Celtic tribe. They lived in present-day northwestern Spain, and are discussed as CELTS or CELTIBERIANS. They resisted the ROMANS along with the CANTABRI and GALLAECI but were finally defeated in 19 B.C.E.

Atacini

The Atacini are classified as a Celtic tribe. They lived in Gaul in the present-day region of Narbonne in southern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Atrebates (Atribati)

Two separate tribes of the name Atrebates are known in mainland Europe and in the British Isles. Both Celtic, they are assumed to be related ancestrally. The continental Atrebates lived in Gaul around present-day Arras in northern France; Artois, a former province, takes its name from them. They are discussed as CELTS or GAULS. Some among this group settled near the NERVII in present-day central Belgium and fought as their allies against the ROMANS under Julius Caesar; they were thus among the tribes Julius Caesar considered BELGAE. Afterward, in 51 B.C.E., their king, Commius, fled to Britain.

The Atrebates of Britain, perhaps an alliance of smaller groups, occupied the present-day counties of Sussex, Hampshire, Berkshire, west Surrey, and northeastern Wiltshire in southern England. They are discussed as Celts or BRITONS. The CATTUVELLAUNI, TRINOVANTES, and they were the three most

powerful tribal kingdoms in Britain in the first centuries B.C.E. and C.E. In about 40 B.C.E. the Atrebates struck the first British coins inscribed with their ruler's name; they bear the name Commios, thought to be an alternate spelling of Commius. The Atrebates were pro-Roman. In 42 C.E. they successfully resisted an attack by the anti-Roman Catuvellauni. An exiled leader of the Atrebates by the name of Verica played a part in encouraging the Roman emperor Claudius I to launch his invasion of 43 C.E. During the period of Roman occupation into the fifth century Nemetacum on the site of present-day Arras became a *civitas* capital in Gaul, and Calleva Atrbatum on the site of present-day Silchester became a *civitas* capital in Britain.

Simon Bean. *The Coinage of the Atrebates and Regni* (Hatfield, Mass.: Oxbow, 2000).

Attacotti (Attacots)

The Attacotti were a tribe or confederation of tribes living in present-day northwestern Scotland and nearby islands, including the Hebrides and the Orkneys. They are thought to be related to the PICTS, possibly speaking a similar non-Celtic language (or possibly a dialectic combination of Celtic and non-Celtic). They joined with the Picts and ancient SCOTS in attacks on BRITONS, the CELTS who lived to the south. They are thought also to have helped Picts, Scots, and SAXONS attack Roman Britain in 367 C.E.

Aukstaiciai See LITHUANIANS.

Aulerci

The Aulerci are classified as a Celtic tribe or confederation of tribes. They lived in Gaul in present-day northwestern France and are discussed as CELTS or GAULS. They were allies of the UNELLI. In 52 B.C.E. some among them fought as allies of the ARVERNI under Vercingetorix against the ROMANS. The name Aulerci was common to several tribes who are considered separate groups, including the ARVIENS, BRANNOVICES, CENOMANI, DIABLINTES, EBUROVICES, and ESUVII.

Aurunci (Aruncians)

The Aurunci are classified as ITALICS, that is, Italic speaking, although they may have had

mixed ancestry. They lived in the southern part of Latium (part of modern Lazio), a region in present-day west-central Italy, at least by the fourth century B.C.E. They had a five-city alliance, referred to as the Aurunci Pentapolis: Ausona, Minturnae (modern Minturno), Sunuesssa, Suessa Aurunca (modern Sessa Aurunca), and Vescia. The city of Terracina is also associated with them, although it may have been controlled by the VOLSCI, living to the north of the Aurunci.

An earlier pre-Indo-European people in the region, according to some ancient texts, were the Ausoni (perhaps the same as the OPICI or perhaps related to the ENOTRI). If the Ausoni existed, they may have been among the ancestors of the Aurunci, or simply allies.

The Aurunci joined a confederation of tribes known as the Latin League in a revolt against the ROMANS in 341 B.C.E.; their partners were the LATINS, CAMPANI, SIDICINI, and Volsci. The alliance collapsed by 338 B.C.E. under pressure from both the SAMNITES and the Romans.

By 314 B.C.E. the Aurunci had disappeared from the historical record. The Aurunci and Ausoni Mountains, a complex bordering the Tyrrhenian Sea north of the coastal towns of Terracina and Gaeta, are named after the Aurunci and the possibly related Ausones.

Ausci (Auscii; Auici)

The Ausci are classified as a Celtic tribe. They lived in Gaul around present-day Auch in southwestern France and are discussed as CELTS or GAULS. They surrendered to the ROMANS under Julius Caesar with the fall of Aquitania in 56 B.C.E. Eliberrum (later Augusta Auscorum) on the site of Auch became a *civitas* capital in Roman Gaul; Auch takes its name from the tribal name.

Ausoni See AURUNCI.

part of the Austrian Alps, possesses the highest elevation (12,457 feet). The majority of the mountain ranges run east to west across the country. The Danube is Austria's chief river; it enters Austria along the German border. A principal lake, the Bodensee, is located along the western border at Austria's point of lowest elevation (377 feet).

INCEPTION AS A NATION

In 788 C.E. Charlemagne of the FRANKS created the first eastern march in modern-day Upper and Lower Austria. Emperor Otto I seized the march in 955 from the MAGYARS, who occupied the area. The march was merged with Bavaria in 976 and given to Leopold of Babenberg, who is recognized as the founder of the first Austrian dynasty.

During the long Hapsburg dynasty, Austrian territory expanded and contracted. In 1867 Austrian leaders joined Hungarian nationalists to create the Austro-Hungarian Monarchy. After World War I (1914–18) the dual monarchy was dissolved and the boundaries were established for modern Austria.

The German occupation of Austria starting in 1938 bound Austria to the Third Reich, Hitler's government (see GERMANS: NATIONALITY). After Germany's defeat in 1945 the Allies negotiated to reestablish an independent Austria. The Allies divided Austria and separately controlled each of the occupational

zones. The democratic constitution was reinstated. In 1955 Austria's full sovereignty was recognized and it joined the United Nations. Austria was also established as a perpetually neutral state.

CULTURAL IDENTITY

Austria is usually considered to have a basically German culture (see GERMANICS) fostered by the fact that the language of Austria is German. Yet Celtic and Roman influences helped shape the modern nation. Much of the territory of present-day Austria was held by CELTS for centuries, and the first characteristically Celtic culture emerged there, based on the wealth of the salt mines of Hallstatt, after which this earliest flowering of Celtic culture was named. Under Roman influence the first state in the history of the eastern Alps was established: the kingdom of Noricum, whose borders basically coincide with those of modern Austria. Celts in Austria underwent a process of Romanization, as the ROMANS went to great lengths to win the hearts and minds of the native aristocracy. The Romans also created artificial tribes by unifying elements of hitherto separate tribes under a king whom they had chosen. The importance of Noricum to the Romans lay in its great mineral wealth, especially in iron, which was transformed into steel (*ferrum Noricum*), and in its vital

In this early 20th-century photograph, Austrians sort through piles of garbage outside Vienna in search of scraps of food. (Library of Congress, Prints and Photographs Division [LC-USZ62-68390])

- 788** Charlemagne of Franks builds defense against Avars, creating first eastern march in modern Upper and Lower Austria.
- 976** After reconstituting march and union with Bavaria, Otto II gives march to Leopold I of Babenberg, founder of first Austrian dynasty.
- 1156** Emperor Frederick I organizes Austria as duchy.
- 1253–78** Otakar II of Bohemia claims Austria.
- 1278** Rudolf I of Hapsburg conquers Austria.
- 1498** Vienna Boys Choir is founded by Holy Roman Emperor Maximilian I.
- 1519–56** Holy Roman Emperor Charles V inherits Hapsburg holdings along with Spain because his mother was daughter of Ferdinand II and Isabella I of Spain.
- 1524–26** Peasants' War grants Austrian peasantry some rights.
- 1526** Imperial Library is founded in Vienna.
- c. 1556** Austria, Bohemia, and Hungary are united under Ferdinand I.
- 1618–48** Protestants of Bohemia rebel against Ferdinand II, instigating Thirty Years' War.
- 1620** After White Mountain battle Austria takes Protestant Bohemia and Moravia.
- 1699** Under Peace of Karlowitz, Austria receives Slavonia, Transylvania, and most of Hungary.
- 1713** Austria is granted Spanish Netherlands, Sardinia, and Naples.
- 1740–48** Bourbon king Philip V of Spain, Augustus III of Poland, and Charles VII (Charles Albert), elector of Bavaria, make claims against Maria Theresa for Austrian throne in War of Austrian Succession.
- 1756–63** During Seven Years' War also involving England and France, Austria and Prussia compete for control of German lands.
- 1772** Austria, Russia, and Prussia partition Poland; Maria Theresa, wife of titular husband Francis I, Holy Roman Emperor, negotiates with Prussia and Russia.
- 1780s** Joseph II engages in widespread reform of empire along Enlightenment principles.
- 1781** Composers Franz Joseph Haydn and Wolfgang Amadeus Mozart become friends, influencing each other's music.
- 1792** Austria engages in war against Napoleon I Bonaparte during French Revolution.
- 1795** Austria expands its eastern boundaries during Poland's third partition.
- 1804** Francis II becomes "Francis I, emperor of Austria."
- 1806** Holy Roman Empire dissolves.
- 1814–15** Napoleon is defeated; at Congress of Vienna, Austria, reclaims Lombardy, Venetia, Istria, and Dalmatia and loses former territories in Netherlands and Baden.
- 1827** Composer Franz Peter Schubert, inventor of form of *lied* (art song), a piece of romantic or lyrical poetry set to music, is torchbearer in funeral procession of German composer Ludwig van Beethoven, whom he idolized; some 10,000 other Viennese attend.
- 1848** Metternich is expelled from ministry because of revolutions of 1848; democratic constitution is formed.
- 1856** Botanist Gregor Johann Mendel begins breeding experiments with peas, furthering knowledge of genetics.
- 1859** Austria loses Lombardy in Italian War of 1859.
- 1860** "October Diploma" and "February Patent" implement legislative reforms.

(continues)

Austrians: nationality time line (continued)	
1866	Prussia defeats Austria at Sadowa in Austro-Prussian War; Austria loses political power in Germany and cedes Venetia to Italy.
1867	Dual state, Austro-Hungarian Monarchy, is established with Hungarian nationalists. Composer Joseph Strauss writes waltz "The Blue Danube."
1890	Essay by dramatist and critic Hermann Bahr, <i>Zur Kritik der Moderne</i> , establishes "modernism" as literary term.
1892–95	Sigmund Freud develops treatment that becomes basis of psychoanalysis.
1893	Former physician Arthur Schnitzler has play <i>Anatol</i> produced about turn-of-century Viennese life, beginning career as playwright and novelist.
1897	Vienna Succession, in which Gustav Klimt and other painters break away from academic painters, leads to new school of Austrian painting.
1897–1907	Composer Gustav Mahler serves as director of Imperial Opera in Vienna.
1899–1936	Poet, satirist, and critic Karl Kraus publishes polemical review <i>Die Fackel</i> .
1908–22	Franz Kafka works for insurance agency in Prague; he draws on themes of alienation for career as writer as in "Metamorphosis," published in 1915, and other stories.
1914	World War I begins; Austria-Hungary supports Germany and Turkey against France, Great Britain, Russia, Italy, Japan, and from 1917, United States.
1918	Charles I resigns, and German Austria is declared republic belonging to Greater Germany.
1919	After World War I borders are determined for modern Austria without political or economic union with Germany.
1920	Imperial Library becomes National Library; Salzburg Festival, combining theater and music, is founded.
1921	Two political parties emerge, "Red" Socialists and "Black" clericalists; pan-German party is fueled by national socialism. Composer Arnold Schoenberg invents 12-tone method of atonal composition known as serialism.

passes through the eastern Alps connecting points to the north, south, east, and west. Noricum also contained the all-important Danube corridor, and early on the Romans built Vindobona, the progenitor of Vienna, on the river on the site of a Celtic settlement. The Romans established trading concerns within the Celtic kingdom itself, and Roman art styles, concepts, materials, and tech-

niques, in pottery, painting, sculpture, and architecture, were greatly influential.

In part because of its geographic position, Austria's close ties with Italy and Roman Catholic Europe endured through the era of great invasions by GERMANICS and later SLAVS and Magyars that swept away the Roman Empire. The Germanic Franks established a bishopric in Salzburg (which calls itself "the

Rome of the North") in the seventh century C.E. to help spread Christianity in the Danube-Balkan region. This primacy of Austria in promoting Roman Catholicism was further strengthened when the Hapsburg dynasty of the Holy Roman Empire made Vienna their capital and took the lead during the Counter-Reformation against Protestantism. Thus essential elements in what it has meant to be Austrian were the Hapsburg Empire and Roman Catholicism.

These elements have not always proved to be beneficial. In the past, particularly during the late 18th century, when revolutionary fervor was spreading in Western Europe, some commentators accused the Austrians of a certain political passivity and lassitude, perhaps the product of long rule by the absolutist Hapsburgs and perhaps also by Catholicism. (One such commentator, a German immigrant to Vienna, the composer Ludwig van Beethoven, noted in a letter that as long as Austrians had enough to eat and drink they would never revolt.) In contrast to conditions in France, progressive change in Austria came from above, as the emperor Joseph II instituted many reforms, which, however, were soon revoked after his death. Austria became once again a bastion of opposition to change; during and after the Napoleonic Wars it became a true police state through the repressive policies of the chancellor Metternich, who made Austria the center of European reaction against the progressive forces let loose by the French Revolution. The bent of Austrians for escapist artistic products (such as the Viennese magic play) in the face of political impotence led to the popular craze for the waltz, which began during the wars, as dance halls replete with mirrors, potted palms, chandeliers with thousands of candles, where gentlemen burned 100-guilder notes to light their cigars, opened. By the late 19th century other expressly Austrian characteristics arose out of its imperial status. Artists of the time gave voice to a certain foreboding, a sense of having an overripe civilization on the brink of collapse.

In addition to having a sense of being different from Germans by virtue of their Catholic culture, Austrians consider themselves more cosmopolitan because of Austria's centuries long status as the capital of a great empire, as well as the country's position along the major east-west route of the Danube and its proximity to Latin Europe and the Mediterranean and also to Slavic countries. The coexistence of the different cultural groups has formed Austria's

characteristic identity. Austrians today are particularly aware that appreciating the special qualities of one's own people is inseparably linked to the willingness to respect what is special about other peoples.

Auteri (Auterii)

The Auteri are classified as a Celtic tribe. They lived in the present-day county of Galway as well as parts of the counties of Mayo and Roscommon in western Ireland at least by the first century C.E. and are discussed as CELTS or IRISH.

Avars (Juan-Juan; Varchonites)

The Avars, a nomadic people originally from Asia, created a powerful empire in central Europe by the end of the sixth century C.E., centered in present-day Hungary and northern Serbia and extending south to north from the Adriatic Sea to the Baltic Sea and from the Elbe River to the Dnieper River. It endured for more than 200 years.

ORIGINS

Little is known about the origins of the Avars, although they are generally believed to have been an Asian people of Mongolic or Turkic ancestry. They were known to the Chinese, whom they raided as the Juan-Juan. After migrating through northern Iran, they settled in the steppes of present-day western Kazakhstan and southern Russia. They mingled with other peoples both Turkic (see TURKICS) and Hunnic (see HUNS), primarily the Turkic Uygurs. By the sixth century at the latest they had reached southwestern Europe. They also fought or mingled with the CAUCASIANS, some among whom claim to be descended from the Avars.

The Byzantine historian Theophylactus Simocattes of the sixth and seventh centuries

provides us with much of what we know about the Avars. Theophylactus distinguishes between true Avars and false Avars (Pseudavaroi). The true Avars were the people known formerly as the Juan-Juan: a people of Mongol stock who had been masters of Mongolia throughout the fifth century, until crushed and superseded by the T'u-chüeh Turks in 552. The "false Avars" were those of European medieval history, who usurped that formidable name. These are said to have comprised two united hordes: that of the Uar (or Var), whence the name Avar, and that of the Kunni or Huni; the latter term suggests a Hunnic origin. The two linked names of Uar and Huni would thus stand for Avar and Hun. It is also claimed, however, that these Uars and Huni, from whom the BYZANTINES coined their word Ouarkhonitai, were two tribes of Ogor; or the Uygur. But the Uygur of history were TURKICS, whereas the Avars of Europe seem to have been mostly Mongols.

LANGUAGE

The dialects of the ancient Avars are not known with certainty. As it is known today, Avar or Avarish is a North Caucasian language that is part of the North-East or Dagestani group of languages, originating around Dagestan, Russia, and including the Andi and Dido languages. Avarish is the only language in the group with a written form and is also used for intertribal communication by Andi and Dido-speaking peoples. Other related languages in the Dagestani group are Lak-Dargwa and Lezgian.

HISTORY

In the fourth and fifth centuries C.E. the Avars, skilled horsemen, dominated the high steppes

of western Asia and eastern Europe. In about 460 they defeated the Uygurs, a Turkic people, and absorbed them. The Avars are known to have been in the Caucasus region by 558. At that time they sent an envoy to the BYZANTINES centered at Constantinople (present-day Istanbul, Turkey) and on the lower Danube to the north by 561; sometime later they were decisively defeated by the Turkics. Survivors, many of them Uygurs led by Avar chiefs, split into two groups. One group remained in the east; the others migrated westward, settling in present-day Ukraine and along the Danube River in Romania, Bulgaria, Hungary, and Yugoslavia.

In 567 the Avars became involved in tribal wars among the GERMANICS and joined the LOMBARDS to overthrow the GEPIDS, who were allies of Byzantium. They founded the Avar *haganat* (empire), centered in the Hungarian plain between the Danube and Tisza Rivers, and from there they carried out raids on Byzantium. In 568 the Avars invaded Dalmatia on the Adriatic coast (parts of modern Bosnia and Herzegovina, Croatia, and Yugoslavia). Justin II, emperor of the Byzantines, sent a large force; the resulting war lasted three years, after which the Byzantines were forced to pay huge yearly tributes. In 599 after continuing conflict, when the Byzantines under Maurice refused to pay ransom, the Avars executed a reported 12,000 Byzantine prisoners. They seized more territory on the Balkan Peninsula. From the mid-sixth century into the seventh century the Avar Empire was at its height. In 626 the Persians, Avar allies at the time, were stymied at sea by Byzantine naval forces, and the Avars failed to occupy Constantinople (modern Istanbul). The Avars also mounted attacks on the Merovingian FRANKS.

The Avar Empire ultimately extended south to north from the Adriatic Sea to the Baltic Sea and between the Elbe and the Dnieper Rivers. Baian was their *khagan* (leader) during the period of expansion of the late sixth and early seventh centuries. One important result of the Avars' hegemony was the movement of large numbers of SLAVS from the region. (Some of them invaded new lands as allies of the Avars; others migrated on their own.) Many of the Slavs moved south to the northern Balkans, where they have remained.

Later in the seventh century internal disputes, especially expansion by the BULGARS and the creation of a Bulgarian state in the

Balkans in 679, weakened the Avars. The Avars never regained their former influence as both the Slavs and Bulgars grew in power.

Charlemagne of the Franks effectively crushed the Avars, destroying the “Avar Ring”—their military fortifications—in 791 and defeating their armies in 805. The MORAVIANS subsequently attacked and dispersed the Avars further. Early in the ninth century Krum, the Bulgarian khan, was victorious against Avar remnants. Those Avars who

did survive were assimilated by the Slavs who settled in the Hungarian plain.

Although they were absorbed by other peoples, a group known as Avars have endured in the Caucasus region in the Dagestan Republic of southern Russia; these Avars, who call themselves Maarulal as a group and consist of a number of tribes, including ANDIS and DIDOS, speak Caucasian dialects. Shāmil, who in 1834–59 unsuccessfully led the people of the Caucasus in their

struggle for freedom from Russia, reportedly was an Avar.

CULTURE

Economy

The basis of the Avar economy, like that of all steppe peoples from time immemorial, was grazing. The harsh climate of the steppes, bitter winters and parching hot summers, meant that grasslands were few and far apart, sometimes as much as 1,000 miles. Thus life for the Avars was a continual search for the best grazing grounds, endless migrations from pasture to pasture, driven mainly by the needs of their herds. Groups of nomads would circulate throughout a territory, a movement sometimes not completed for centuries as a result of the vast distances involved. Everything about these people—their physical build and their way of life—had become adapted to this way of life. Another activity of the Avars, skilled at warfare on horseback, was raiding of agricultural peoples in or near their territory and of the trade routes that spanned central Eurasia. Some among them settled down among local populations as farmers after they had invaded Europe. As did nomadic groups of the steppe, Avars probably also engaged in exchange of goods between peoples to their north, who had such goods as furs and amber, and civilizations to their south, which provided manufactured goods of metal and cloth.

Government and Society

The nomadic way of life of the Avars, as of most steppe nomads, worked against centralization of authority among them, and their society probably consisted of loose networks of kinship groups ruled by elite warriors whose status was based on protection of their moving families and the booty they obtained in raids. This pattern changed, however, when circumstances such as war or famine brought on by adverse weather (such as a grass-killing drought) made it necessary for these loose networks to join in a more disciplined group, either to fend off invaders or to invade other territories where grazing was still available. Avar men, women, and children would unite in a horde. Periodically, in a ripple or domino effect, disturbance emanating from a given point would travel across Eurasia as different peoples were forced to migrate in hordes seeking relief in a new territory, displacing early inhabitants who were forced to move in turn. This happened when the Avars were driven

from Mongolia by the T'u-chüeh Turks in the sixth century. Avar chiefs bore the ancient Turko-Mongol title of *tudun*. *Khagan*, similar to the Mongol *khan*, was another title.

Clothing and Appearance

Avar men were similar to Huns in appearance, but with their hair in two long plaits down their back. As did all steppe horsemen, they wore trousers. Earrings, fibulae (clasps), and other jewelry were common ornaments among the Avars. In later periods waist belts, better suited for holding the clothing of horseback riders, became more prevalent than fibulae.

Technology

Evidence from Avar gravesites indicates that the Avars were the earliest people in Europe to use stirrups and probably introduced them to other European peoples.

Art

Through the seventh century the primary Avar motifs were geometrical, with a Byzantine influence. A transitional period followed. After 720 B.C.E. figures of animal and plants became commonplace, indicating an Asian influence, which was thought to result from new migrations from the east.

Archaeological finds in Hungary illustrate the character of Avar art, a branch of steppe art, with stylized animal forms and spiraling geometric or plant motifs gracefully interwoven and covering the entire surface of an object, whether belt buckle or goblet. The assortment of objects made by Avars is typical of steppe peoples: belt plaques and buckles, ornaments on equipment or harness, hooks, and fibulae. The Avar finds of Hungary have similarities with bronzes made by the Juan-Juan and T'u-chüeh Turks. Avar art also bears a particular affinity to the Siberian art style known as that of the Nomad Horsemen. Avar goldsmiths created works of exceptionally high quality and were counted among the ruling class.

Religion

Burials Avar elites were buried with their horses, horse trappings, and weapons. If their funerals were similar to those of other steppe peoples, they were probably occasions for sometimes extravagant acts of mourning, such as the gashing of face and arms by mourners, and possibly sacrifice of horses, retainers, and wives. Avars were shamanists, as were most steppe peoples. Theophylactus mentions one

of their sorcerers, called a *bocolabras* (from the Mongol *bōgā*, sorcerer).

Igbi Festival Several modern groups who trace their ethnicity to the Avars (in the Caucasus in the Republic of Daghestan) hold a special festival each February 5, which may have originated in the ancient Avar religion. The festival is called Igbi Day, after the ring-shaped loaves called *igbi* (singular, *ig*) that play an important role. The festival features a group of youths called “wolves” who collect *igbi* from each household, threatening to punish anyone who will not comply. Masks are worn on these rounds to represent forest peoples—a devil, skeleton, doctor, policeman, and so on. Masks for these characters are made out of animal skins or papier-maché. The climax of the festival is a ceremonial naming of the good and bad deeds of the villagers, which then are blamed on a demon, called the Kvidili. The demon is ritually “executed,” as a scapegoat freeing the villagers of

guilt for bad conduct. Before this moralistic tone was imposed on the festival, its import was probably purification of the village from bad luck and evil spirits before the start of the agricultural year, symbolized by the grain with which the loaves were made.

Considering the extent of the Avar Empire and its importance to the early medieval history of central Europe, it is remarkable how little is known about this people.

Baiocasses (Bodiocasses)

The Baiocasses are classified as a Celtic tribe. They lived in Gaul around present-day Bayeux in northwestern France and are discussed as CELTS or GAULS. They were perhaps a subgroup of the ESUVII. The region was occupied by the ROMANS under Julius Caesar in 55 B.C.E. Augustoduram on the site of Bayeux became a *civitas* capital in Roman Gaul; Bayeux takes its name from the tribal name.

Balkars (Malkarli; Mountain Tatars)

The Balkars are a Turkic-speaking people, living mostly in the North Caucasus region of Karbardino-Balkaria, a republic in southwestern Russia (Balkaria is the southern mountainous part). Their ancestors included TURKICS—possibly KARACHAY, KIPCHAKS, KHAZARS, and BULGARS—as well as ALANS and CAUCASIANS. They are included among the people known as TATARS, going back to the 13th century. The Balkar language, related to that of the Karachay, is of the Turkic Northwestern (Kipchak) group, Karachay-Balkar, but with some Iranian elements.

The Balkars were incorporated into the Russian Empire in 1827. In 1922 Karbardino-Balkaria was organized by the Soviet Union (USSR) as a region; it became an autonomous republic in 1936. The Kabardians, a subgroup of CIRCASSIANS, shared the region (with growing numbers of SLAVS as well). In 1943–44

Joseph Stalin accused the Balkars of collaborating with Nazi Germany and had the majority deported and scattered throughout present-day Kazakhstan and Kyrgyzstan. In 1956–57 after Stalin, the Balkars were allowed to return to their homeland. But they presently make up less than 10 percent of the population of Karbardino-Balkaria.

The Balkars were traditionally nomads. Until the mid-18th century they practiced an animist religion; they were converted to Islam by the NOGAY and Crimean Tatars. Their nomadic lifestyle gradually changed to farming and stock raising. In 1991 the First Congress of the Balkar People met with the aim of promoting the Balkar identity.

Balts (Baltic peoples)

The name Balts refers to people who speak Baltic—an Indo-European language—and who lived in north-central Europe in the region of the south and east Baltic Sea, centered in present-day Latvia, Lithuania, western Russia (the enclave around Kaliningrad Oblast), and northern Poland. The term was first used in the 19th century in reference to peoples living near the coast and later applied to peoples of the entire language family. The name AESTII refers to people in that region in ancient texts, but there is no way to know with certainty whether they spoke a dialect of Baltic or some other language.

PRUSSIANS used for all inhabitants of the historical region of Prussia), among whom can be grouped Bartians, Galindians, Notangians, and Sembians. The NADRUVIANS and SKALVIANS, living to the north of the Borussians are sometimes classified as Borussians and sometimes as western Lithuanians.

There were movement and intermingling among these peoples, so drawing cultural and historical distinctions among them based on language differences is difficult. For example,

southern Curonians occupied northern parts of Lithuania, the Semigallians lived in both northern Lithuania and southern Latvia, and the LIVS, a Finnic-speaking people, occupied parts of what is now northern Latvia. These groups intermingled and no doubt share in the ancestry of modern Latvians and Lithuanians. It can be said that the western Balts are generally considered to have evolved into the modern Latvians and Lithuanians. The eastern Baltic tribes tended to spread eastward into present-

day Belarus and Russia and were Slavicized after the northward expansion of the SLAVS, which started in the seventh century C.E. The Borussians were Germanized over the centuries.

ORIGINS

The Corded Ware pottery culture began after 3500 B.C.E., when a pastoral, cattle-raising way of life, along with the pottery style, was adopted over a wide region in northern and central Europe. It may also have been at this time that people adopted the ancestral Indo-European language. For Balts, as for peoples elsewhere, the Corded Ware way of life entailed far greater mobility than at any time since the beginning of the Neolithic Age when farming was adopted. Corded Ware graves typically contain an assemblage of pottery vessels—cups, strainers, and flagons—that appear to indicate rituals of hospitality involving drinking perhaps alcoholic beverages. Such rituals would have eased the strain of meeting with strangers during travel and helped to forge social bonds. Corded Ware graves also contained stone battle-axes (rather than the woodsmen's axes of the past) indicating another means of dealing with possibly hostile strangers.

By 3000 B.C.E. ancestors of various FINNO-UGRIANS had settled the Baltic Sea region. The original home of the proto-Baltics, meanwhile, was probably situated in present-day western Russia northwest of the upper reaches of the Dnieper River. They may have been descendants of Neolithic peoples from the Danube region and peoples of the Corded Ware culture. They probably migrated westward to the Baltic Sea region by about 2000 to 1500 B.C.E. The Baltic language family was probably evolving at this time as well. The last millennium B.C.E. saw the first typical Baltic culture appear, in particular, brushed pottery and the appearance of hill forts. This period also saw the first burial cremations.

The first Baltic tribes known from written sources emerged in the valleys of the Niemen and Neris (Wilja) Rivers in the period between the first and fourth centuries C.E. Coastal peoples of the Baltic Sea are mentioned in ancient texts as *glaesum* (amber)-gathering Aestii, probably Baltic speaking, with whom trade relations were established by the ROMANS. Linguistic evidence (based on names of rivers and other bodies of water) suggests a boundary between Baltic speakers and Slavic speakers in early modern times (during the latter half of the first millennium C.E.). The boundary ran on a northwest-to-southeast line east of the Vistula River from the Bay of Gdansk to the Pripet Marsh, and from

there northeastward to the Niemen River. East of the Niemen were Finnic-Ugric groups. The western boundary of this Baltic territory roughly coincides with the change in ecological zone from deciduous and pine and oak forest in the west to deciduous-spruce forest in the east, which may in part have led to the cultural difference. It is thought that proto-Balts and proto-Slavs in the boundary area between the two groups intermingled their cultures to a considerable degree until historic times.

LANGUAGE

The only Baltic languages to have survived are Lithuanian and Latvian. Old Prussian, of which there are surviving written records, has been extinct since the 17th century. Other Baltic dialects, such as Curonian, died out even earlier. Scholars originally placed Baltic and Slavic together as one of the Indo-European branches, labeled Balto-Slavic (or Balto-Slavonic). But it is now generally believed that the similarities of Baltic and Slavic dialects result from extensive contact among peoples rather than from a shared linguistic parent. Finnic elements also helped shape some Baltic dialects.

HISTORY

The second-century C.E. geographer Ptolemy, living in Alexandria in North Africa, was the first to identify specific tribes of Balts—the Galindians, a subtribe of Borussians, and the Sudovians, an alternate name for Yotvingians. Not until the ninth century did other specific tribes come to be cited by names that endured and can be verified. In the earliest accounts the Balts are described as seafaring peoples who, by the fifth century, carried out raids on other coastal peoples, especially in Scandinavia.

Balts and Vikings

In about the ninth century, the beginning of the Viking Age in the East, the Vikings from Sweden and Denmark battled the Balts—in particular the Curonians in Courland along the Baltic Sea and the southwest shore of the Gulf of Riga. A motive for the attacks was retribution against the successful raids on Swedish and Danish trading towns; another factor was the struggle for control of the river mouths and usable ports from which traders could penetrate the Continent and trade with the Mediterranean region. The Balts would continue to offer fierce opposition to the VIKINGS for centuries as they expanded southward.

Balts and Crusaders

In the late 12th century Latvia was visited by merchants from western Europe who set out on trading journeys along the Western Dvina (Daugava) River to Russia. With them were Catholic missionaries, who attempted to convert the pagan Baltic and Finnic tribes. The first Catholic missionary to the homeland of the Balts in 1160 was a German priest named Father Meinhard. His goal was to establish a foothold in the region for the Roman Catholic Church by converting the Livs. As an enticement toward conversion, he decided to build a church and a castle at Ikskile to provide the native population with a stronger fortified position. In return he induced the Livs to be baptized in the Daugava River. After the castle was completed, the local population returned to the Daugava, this time to wash off their baptism. Father Meinhard convinced Pope Innocent III that a more aggressive approach was needed. This occurred in the form of the first Baltic crusade, sanctioned by Pope Innocent III in 1198. Bishop Meinhard was succeeded by Bishop Berthold, who arrived with a contingent of German soldiers. Berthold, who took an active role in the fighting, was killed. Berthold was replaced by Albert von Buxhoevden of Bremen in 1199. Albert's strategy to subjugate the recalcitrant Balts was to take hostages to Germany, where they were taught to be good Catholics. The soldiers who accompanied Albert were given land grants called fiefs, a policy that established German landholders in the region.

Albert began the construction of the city of Riga in 1201; because of its location it became the center of trade and military expansion in the Baltics. In 1202 Albert founded the Order of the Brothers of the Army of Christ (also known as the Brothers of the Sword, the Sword Brothers, and the Sword Bearers), which managed to unite and control the various military factions. The Brothers of the Sword subdued the Livs by 1207, thereby creating a new tax base for the Catholic Church and producing soldiers for the conquest of the remaining tribes. In 1209 the Brothers of the Sword conquered the Selonians, who had retained major control of the Daugava waterway. In 1210 the Curonians attacked Riga, destroying a number of German vessels.

Over the next years the Germans fought with the remaining tribes. Brutalities in these cruel wars were committed by crusaders, immigrant German knights and burghers, nobles, militiamen, and mercenaries, as well as by native allies. Native troops were responsible for

gathering loot, rounding up prisoners, and searching fields for hiding places and refuges.

The task of the crusaders was made easier by the fact that the tribes had no central government. In 1214 the Letts fell, after which the ESTHS, a Finnic people, turned to Russia for support against the German onslaught. In response Albert received the assistance of Denmark in his final push for domination. In 1219 the Danish and German forces were able to overpower the Esths.

Albert died in 1229. In 1236 new Germanic recruits arrived in Livonia eager to engage in conquest. After suffering a defeat at the hands of the Lithuanians and Semigallians at Saule (near modern Siauliai) in northern Lithuania and losing many of their knights, the Brothers of the Sword joined with the Teutonic Knights of Prussia to form the Livonian Order of the Teutonic Knights in 1237. The Teutonic Knights had been campaigning in Prussia since a call for a crusade to them by the POLES against the pagans in 1226. In 1242 the allied knights suffered a defeat by the Russian Slavs under Alexander Nevsky at Lake Peipus at the boundary of western Russia, which checked their eastward expansion. Soon afterward the Baltic tribes to the south—Lithuanians and Samogitians—were united under Mindaugas, who became the first king of Lithuania in 1253.

The Curonians succumbed to the Livonian Order in 1269. The next year saw the establishment of the state of Livonia, a political union of territories belonging to the Livonian Order of Teutonic Knights and the Catholic Church in Latvia and Estonia. By 1283 in Prussia the Teutonic Knights had defeated the Borussians and Yotvingians and established the region as a papal fief, practically exterminating Baltic-speaking people there. In 1466 East Prussia was ceded to Poland, and West Prussia remained under the control of the Teutonic Knights as a fief of Poland and later became part of Germany (*see* GERMANS: NATIONALITY).

The Teutonic Knights continued to vie for power in Lithuania over the next century. In 1410 a united Lithuanian-Polish army defeated them at Tannenberg (modern Stebark, Lithuania). Although the Balts had preserved authority in their homeland, the independence of the Baltic peoples was lost for centuries in the 1560s, the start of a period during which Latvia and Lithuania were handed back and forth by Russia, Poland, and Sweden. After the decline of the crusading orders many of the knights remained in the region as a landowning

aristocracy and enjoyed special privileges under foreign rule.

CULTURE

Economy

Early Balts are thought to have been raiders more than settled agriculturalists—seafarers who, as did Vikings, raided coastal settlements. Those who farmed and herded domesticated animals also kept bees, hunted small game, and gathered berries and mushrooms. They were also traders. Besides providing an access to the east, the Baltics had other natural resources that were desirable to foreign marketers. Amber, honey wax (the by-product of beekeeping), grains, and fur and forest products needed for shipbuilding were some of the natural resources that attracted merchants to this region. The presence of artifacts from throughout Europe, as well as Arabia, at archaeological sites offers proof of extensive established trade routes.

Amber In the fifth to ninth centuries the BORUSSIANS developed trade, mostly in amber and its products, along the “Amber Way” up to Pannonia (roughly modern Hungary). An important by-product of the conquest of the Balts by Germans was the decline of the local amber-working traditions. After taking control of Prussia, the Teutonic Order also seized the rights to all amber. The local people who kept amber for themselves were hanged. A public scaffold was erected as a reminder of the punishment for “stealing” amber.

Hanseatic League The lack of universal currency in the city of Riga caused constant economic instability as various tribal factions minted their own coins using different silver content and weights. Not until 1282 did the German merchants of Riga join the Hanseatic League, a commercial union of German cities and towns and their merchants, which increased their political and economic power base. The towns of Cesis, Limbazi, Koknese, and Valmiera soon followed. The Hanseatic League regulated trade throughout the Baltic region and encouraged monetary standardization.

Government and Society

Isolated Baltic farms were typically united for economic and defensive purposes, with councils electing leaders and making community decisions.

The society of the Balts was known for the lack of beggars. The richest people reportedly

provided for poor tribal members, and a thief would be forgiven if he could prove he had stolen for food.

Dwellings and Architecture

Baltic tribes built large hilltop fortresses from logs. Building in stone and brick began only after the arrival of Christian missionaries and crusaders.

The wooden buildings of farmsteads were usually arranged in two groups: Surrounding a clean yard stood the living quarters and the granary, and around the farmyard were barns for threshing and livestock, and other farm buildings. The dwelling house was a long wide structure, equally divided by a large chimney with an anteroom on each hearth. Wooden buildings were used for public assemblies—to deliberate, to cook food together, or simply to amuse themselves.

Technology and Art

The Balts had a highly evolved sense of decoration, as demonstrated by their elaborate patterns on clothing. They had a unique folk art and their own writing symbols. Gifted craftsmen made luxurious and durable clothes for celebrations, as well as weapons and tools comparable to those throughout the rest of Europe.

Music

Lithuania has been referred to as the “land of songs.” Many of the *dainos* (folk songs) sing of pastoral life and work, such as tilling, harvesting, and grinding corn. There are many love and wedding songs, humorous songs, and songs about the lot of the woman. The Lithuanians have a highly original type of singing, peculiar to them alone, the so-called *sutartines*, unique polyphonic songs in which two or three melodies are sung in parallel. Dance is closely linked with song. Very popular are round dances (the dancers form rings and dance while singing). Most of the dances also reflect various work tasks.

Latvia is also known for its traditional folksongs. More than a million quatrains (a group of four lines of verse) reportedly exist. Men played *kanklēs* (stringed instruments of varying shapes and designs, found throughout the Baltic Sea region, among Finnic peoples as well) and various wind instruments, while women sang.

Religion

Paganism Among the deities of the various peoples were Father Sky and Mother Earth

Uralian (Turkic)

(Mara) and the spirits who aided her, such as the Mother of Forest and Mother of Wind. Thunder is another god, responsible for rain that punishes one's enemies. Laima is the giver of life and establishes destiny. Velis is a name for the "spirit" after death that travels to the Land of Velis ruled by the Mother of Velis. Religious celebrations revolved around the change of seasons, such as winter and summer solstice, and the growth cycles of crops and various rites of passage.

Conversion to Christianity The Balts were the last European people to convert from paganism to Christianity. Many of them still worshipped their old gods and observed their old customs as late as the 16th and even the 17th century. Upon its arrival in Lithuania, Christianity eventually did away with many of the old customs and traditions while dressing some others in Christian robes. Christian holidays, such as Christmas and Easter, retained pagan elements, which varied from one ethnographic region to another.

Burials Archaeological investigations indicate that by the second century some Balts, especially those living closer to the coast, stopped using collective burial mounds and instead buried their dead unburned in individual, level skeletal graves. Inland Balts began the practice by the fifth–sixth century.

Historians of various medieval cultures depicted the ancient Balts as barbarians to whom the religious orders bore the one true religion and advanced culture. Yet archaeological finds have demonstrated the richness of their traditions.

Bashkirs

The Bashkirs are a Turkic-speaking people, living primarily in Bashkorostan (Baskiria; Baskihkir Republic) in the southern Ural Mountain region of European Russia. They originally settled the region between the Volga River and the Ural Mountains as part of the Kipchak khanate, ruled by MONGOLS and their vassals the Volga BULGARS, in the 13th century. They are included among the people known as TATARS, descended in large part from the TURKICS. Their language is of the Uralian group of the Northwestern (Kipchak) Turkic family. Some of them may be descended from FINNICS.

In the second half of the 16th century the Bashkir homeland was colonized by Russian SLAVS, who founded Ufa. Bashkir uprisings led to Russian repression and the dispersion of many tribal members. In 1919 the Bashkir Autonomous Republic was formed, among the first such republics in the Soviet Union (USSR); after the breakup of the Soviet Union it became the Republic of Bashkorostan (or Bashkir Republic), part of the Russian Federation.

Originally nomadic herders, the Bashkirs became largely sedentary agriculturalists living

A Bashkir woman sits in front of her house in 1910. (Library of Congress, Prints and Photographs Division [LC-DIG-prok-10657])

in small villages. Although traditionally Islamic, some among them are Russian Orthodox Christians.

Basques (Vasco; Vascons; Vascones; Vascongado; Euskotarak; Euskaldunak)

Most Basques live in their ancestral homeland in the western foothills of the Pyrenees in northern Spain and southwestern France along and near the Atlantic's Bay of Biscay. País Vasco (Basque Country) is a Spanish *comunidad autónoma* (autonomous community) and is subdivided into the *provincias* (provinces) of Álava, Guipúzcoa, and Vizcaya (Biscay). Navarra to the east is an autonomous community and a province (the historic region known as Navarre included part of France). The Basques in France are found primarily in the department of Pyrénées-Atlantiques, their lands known informally as Pays Basque (Basque Country). The Basques, although playing a role in the histories of Spain and France, have maintained a distinct identity. Some among them continue to struggle for political autonomy and independence as a Basque nation. Euskotarak and Euskaldunak are alternate spellings of the native name; *Euskadi* is the Basque name for Basqueland in general, and *Euskera* is the Basque name for their language.

ORIGINS

The origins of the Basques have long remained elusive. They are so different from neighboring peoples such as the Spanish and French that they have been called a "people island"—a distinct group amidst a sea of strangers. They have a distinctive physique in comparison to many French and Spanish, especially in pre-modern eras when the French and Spanish tended to be of lighter build. Basques, in contrast, were of more robust build, larger overall, with thick chests and wider shoulders. Basques today continue to have this distinctive body type. After archaeological discoveries of the earliest modern humans to live in Europe some 35,000 years ago, similarities were seen between them and the Basques in terms of this more robust build. These similarities, however, are not close enough to say definitively that the Basques are descended from these earliest European *Homo sapiens*. This has not prevented scholars from

theorizing that the Basques' isolating terrain preserved a population of their Ice Age ancestors intact without the intermingling that most European peoples have experienced at least since the Neolithic Age. (Scholars who favor this theory use the old term "Cro-Magnon man" for the first European *Homo sapiens*.)

There is evidence that the Basques have been racially isolated for a very long time; this is found in their blood types. Basques have the highest incidence of type O blood of any population in the world, almost 50 percent (and higher percentages in more remote areas). They also have the highest incidence of Rh negative blood. Proponents of the Cro-Magnon theory of Basque ancestry point out that people in other isolated regions where Cro-Magnons are known to have lived, such as the Atlas Mountains of Morocco and the Canary Islands, also have a high incidence of Rh negative blood. (This, however, may be a factor that can exist only in isolated populations. Since pregnant mothers with Rh negative blood are at high risk of losing their unborn babies if the latter have positive blood, the genetic predisposition to Rh negative tends to disappear from populations with a large gene pool through natural selection. Only in populations with a restricted gene pool can such a disadvantageous trait survive to any extent, a different reason for the similarity between Basques and the other peoples mentioned above than common ancestry.)

In any case, based on linguistic studies the Basques are considered separate from the various tribes known as IBERIANS, who have also

occupied the Iberian Peninsula since ancient times, as well as the Celtic peoples who intermingled with the Iberians, the CELTIBERIANS. The ancient tribe known as the VASCONES are assumed to be ancestral to the Basques, and the name in a variety of spellings is also applied to the modern people.

LANGUAGE

The Basque language, Euskera, is non-Indo-European. Scholars have attempted to classify it with a number of other non-Indo-European languages, such as Hamitic dialects in North Africa, but such connections remain hypothetical. Philological research indicates that the names of rivers in various parts of Europe, evolving from ancient times, seem to relate to Basque.

The fact that the Basque language is not Indo-European and, indeed, is based on very different grammatical principles than other European languages provides another piece of evidence of long isolation. Basque words for

tools such as ax, hoe, and knife, and for actions such as cutting or digging, are all derived from the Basque word for stone, suggesting the language originated before the use of metal. Basque shares with the few other European languages that are not Indo-European—the Finno-Ugric tongues spoken in Finland, Hungary, and among the SAAMI—the characteristic of being agglutinating, that is, forming phrases by adding suffixes to certain basic words instead of by combining strings of separate words, so that a single long word takes the place of a phrase consisting of separate words. This linguistic characteristic has led to attempts to link Basque with the Finno-Ugric languages, without success. Some scholars believe that Basque is the oldest European tongue.

HISTORY

Ancient Basques

The Vascones and perhaps related tribes from ancient times whose descendants make up the

Basques have used the mountainous terrain to their advantage in retaining autonomy from invading groups—keeping if not all their lands at their greatest extent, then at least their core country. Vascones were valued as mercenaries by both the CARTHAGINIANS, among them in the third century, and the Carthaginians' enemies the ROMANS. Basque Country was part of the Roman provincial system from the second century B.C.E. (and the reorganized system under Emperor Augustus in 13 B.C.E.). The Roman general Pompey founded Pamplona in their territory in 75 B.C.E. Yet the Basques were only nominally under Roman rule and were not as assimilated into the culture of the outsiders as Iberian and Celtiberian groups.

Gascony and Navarre

The Basques survived pressures over the next centuries from a series of peoples, all with designs on the Iberian Peninsula. In the sixth century C.E. they successfully resisted the VISIGOTHS. Late that century, before the FRANKS had coalesced into an empire, the Basques expanded northward into the region of Aquitania (or Aquitaine) in France, which became known as Gascony, its name (Latin: Vasconia) derived from the tribal name. They organized the duchy of Vasconia in 601. In 778 the Basques, who had been forced to accept vassalage under Charlemagne, destroyed the Frankish rear guard at Roncesvalles. (The *Chanson de Roland*, [*Song of Roland*] of the 11th or 12th century was a *chanson de geste*, or medieval French epic poem, describing the tragic defeat and death of Roland, Charlemagne's most celebrated commander.) But Gascony subsequently became part of the Frankish duchy (and later kingdom, then duchy again) of Aquitaine, which was ruled by both the Franks and, from the 12th to the 15th century, the ENGLISH. In any case, despite the shifting territorial situation and nominal vassalage to the Franks, the Basques remained in effect autonomous.

In 824 at Pamplona the Basques founded the kingdom of Pamplona, which later became known as the kingdom of Navarre. Guernica on the coast became the seat of Basque assemblies. By the previous century the Visigothic kingdom had been absorbed by the MOORS, who dominated most of the Iberian Peninsula until the 11th century. Over the next centuries the Basques resisted Moorish expansion through both warfare and alliance. The Moors controlled territory as far north as the Ebro River. During the reign of Sancho III Garcés, in

1000–35, the Basques were united under one government.

Basque territory in Spain was gradually appropriated. Guipúzcoa became united with Castile in 1200; Álava, in 1332, and Vizcaya (Biscay), in 1350. In 1512 Ferdinand II of Aragon conquered the last Basque stronghold in Spain, the southern part of Navarre (see SPANISH: NATIONALITY). The northern part became part of France when Henry of Navarre became Henry IV of Bourbon, king of France in 1589 (see FRENCH: NATIONALITY). Yet both the Castilian and Bourbon kings allowed for partial Basque self-rule and privileges in matters of trade, taxation, and military service. Basques even maintained separate diplomatic relations with foreign nations.

The Carlist Wars

Basque privileges continued under the Spanish monarchy over the next centuries. The Basques, generally supporting movements in defiance of the government to counter its growing strength, became embroiled in the efforts of the Carlists, members of a Spanish royalist faction in 19th-century Spain. The movement known as Carlism originated in the 1830s among the followers of Don Carlos de Borbón, count of Molina and brother of King Ferdinand VII. Don Carlos (known to his followers as King Charles V) opposed the succession of Ferdinand's daughter, Isabella II, to the throne, based on the Salic law (originating among the Franks), excluding women from succession. The First Carlist War took place in 1833–39, as a traditionalist faction, including the Basques and others, attempted to wrest power from a liberal faction headed by Ferdinand's widow, María Cristina de Borbón, who acted as regent for the infant Isabella. After defeats, Don Carlos was forced to go into exile. In 1845 he renounced his claim to the throne in favor of his son Don Carlos, count of Montemolín (pretender to the throne as Charles VI). The younger Don Carlos attempted to organize a revolt in 1860 but was captured. His son Don Carlos, duke of Madrid (as Charles VII), continued the struggle, which led to the Second Carlist War in 1872–76, but without military success. In 1873, because of their support for the Carlists, the Basques lost some of their rights of autonomy.

The Spanish Civil War

In 1936 the Carlist movement was revived. Carlist *requetés* (volunteers) from Navarra, eager to see the republic (Loyalists) overthrown,

supported the insurgents (Nationalists) under General Francisco Franco in the Spanish civil war. The other Spanish Basque provinces, however, defended the republican government. During the war the Republican government established an autonomous Basque state. In 1937 aircraft, thought to be German, bombed Guernica (as depicted in a painting of that name by Pablo Picasso) in the province of Vizcaya and a symbol of the Basque nation. In 1939 when Franco gained power as dictator, he appointed Carlists to important posts in his regime but rescinded rights of the Basques, many of whom went into exile. After Spain had reinstated a liberal Spanish monarchy in 1975, the Basques engaged in demonstrations for autonomy; they gained some measure of it in 1978–79. In 1980 the first Basque parliament was elected.

ETA

The Basques are generally united in seeking political autonomy on both sides of the international border. In 1968 a Basque separatist organization, known as Euzkadi Ta Azkatasuna, or ETA, Basque for Basque Homeland and Freedom, was founded in Spain. ETA takes a hard-line position favoring secession and has sponsored terrorist activity, targeting especially Spanish soldiers and police officers. In 1998–99 Spanish and French officials negotiated a cease-fire with the ETA, but a permanent peace accord could not be reached. In recent years Basque nationalist candidates have won considerable support in parliamentary elections; those candidates aligned with ETA have a much smaller base of support.

CULTURE

Economy

Along the lower slopes of the Pyrenees Basque farmers have tended to develop small acreages in valleys, using the hillsides for growing grass that is cut and fed to stabled cows and other livestock. A typical homestead includes a garden, vineyard or orchards (often apple), woodland, and pasture. Sheep pastures extend into the mountains.

In addition to a tradition of fishing, the Basques developed whaling as a commercial industry in the Bay of Biscay as early as the ninth century. By the mid-16th century, when those waters became depleted, Basque whalers sailed to other distant waters. Shipbuilding was part of their maritime activity. The Basques were hired as mariners on numerous expeditions. Juan Sebastián del Cano, who participated in the

expedition of the Portuguese Ferdinand Magellan for Spain in 1519, was a Basque. On the death of Magellan in the Philippines in 1521, Del Cano continued the journey and captained the ship, the *Victoria*, which completed the first circumnavigation of the world in 1522.

Basque Country contains mines of iron ore, and Basques have worked as miners and metalworkers over the centuries.

Government and Society

Traditional Basque culture revolved around the *caserío*, an independent farmstead, scattered throughout the foothills and loosely organized into villages. An ancient law of inheritance, based on primogeniture and of great importance, ensured the descent of the farm to a single heir or heiress and helped give permanence to the family structure.

Ancient Basque laws governing Basque society are known as *fueros* in Spain and *fors* in France. They are administered by *juntas*, democratically elected assemblies from all backgrounds and professions.

Clothing

Part of the traditional Basque costume that is still common is the *boina*, a blue or red beret. Writings from the 12th century observe that Basque men wore short skirts, leading to one theory that they were descendants of SCOTS.

Personal Habits: Jai Alai

A favorite game of the Basques and invented by them is jai alai (the word is Basque, from *jai* for festival and *alai* for merry), played on a walled court with a ball and a long curved wicker basket strapped to the wrist. (The Basques were the first Europeans to use balls made of rubber from the Americas.) Jai-alai *partidos* (games), originally played professionally on Sundays and holidays by the Basques, are now played around the world.

Religion

The Basques originally practiced an animist religion, elements of which are still found in folklore. The Basques as a people were converted to Christianity in the 10th century, and Roman Catholicism has played a central part in their life. Yet they have maintained a stubborn independence even in this aspect of their life, resisting domination by outside ecclesiastical authorities. Some of their rituals date to the Middle Ages, such as the Corpus Christi processions and Procession of the Crosses, which include traditional dances.

The Basques have also produced such figures as the religious leader St. Ignatius of Loyola, founder of the Jesuit order; the Jesuit missionary St. Francis Xavier; and the theologian Francisco de Vitoria.

There are currently about 2 million Basques in País Vasco and Navarra in Spain, and some 250,000 in Pays Basque in France. Many Basques have immigrated to America; it is estimated that about 250,000 Basques live in South America and about 70,000 in the United States, many of whom maintain livestock. Despite the enduring Basque identity in Europe, urbanization and industrialization have led to some loss of traditional culture, and Spanish and French are more likely to be spoken in the larger towns. The Basque language endures for the most part on the *caseríos* in the more remote mountain regions. Yet among all Basques the tradition of “neither slave nor tyrant” endures.

Bastarnae (Bastarni; Bastarnians; Peucini; Peucinians)

The Bastarnae are classified as GERMANICS; their name means “bastards,” however, implying a mixed background, probably with both CELTS and SARMATIANS as ancestors. They lived primarily east of the Carpathian Mountains, claiming territory between the upper valleys of the Dniester River and the delta of the Danube River in present-day Ukraine, Moldova, and Romania. They are considered the easternmost of Germanic-speaking tribes.

The MACEDONIANS under King Philip V conscripted the Bastarnae as soldiers against the ROMANS in the Second Macedonian War of 201–200 B.C.E. About that time some Bastarnae, known as the Peucini, settled on an island,

Peuce Island, in the mouth of the Danube on the Black Sea, while others returned north. (The name Peucini is sometimes applied to all Bastarnae.) Bastarnae also fought under the Macedonian king Perseus in the Third Macedonian War of 171–168 B.C.E. And they served in the forces of Mithradates VI Eupator of the kingdom of Pontus in present-day Turkey in Asia Minor against the Romans in the 80s–60s B.C.E.

The Bastarnae were subdued by the Romans in 29 B.C.E. In the early second century C.E. they joined the DACIANS under Decebalus in their wars against Rome. By the end of the second century some of them had merged with the GOTHs. Others settled in the Roman provinces of Dacia and Thrace. In the third century, with other Germanic tribes, the Bastarnae attacked various weakening Roman areas. In 279–280 C.E. once again the Romans prevailed as Emperor Marcus Aurelius Probus settled a number of Bastarnae south of the Danube River. Surviving Bastarnae communities were defeated by the HUNS in the fourth and fifth centuries.

Bastetani

The Bastetani are classified as IBERIANS. They lived in the present-day coastal Almería region and the mountainous Granada region of Andalusia in southeastern Spain east of the TURDETANI. They are believed to have had extensive contacts with the PHOENICIANS, who founded trading colonies among them at the end of the second millennium B.C.E. They remained one of the more populous tribes during the occupation of the CARTHAGINIANS in the third century B.C.E. and that of the ROMANS starting in the second century B.C.E.

In the early centuries C.E. the Iberian Peninsula was part of the provincial system of the Roman Empire, with Baetica in the south. The Bastetani were one of four tribes whom the second-century C.E. Alexandrian geographer Ptolemy recorded as situated in Baetica, along with the BASTULI, Turdetani, and TURDULI.

Bastuli

The Bastuli are classified as IBERIANS. They lived along the coast and inland to the Guadalquivir River in Andalusia in present-day southern Spain south of the TURDETANI. The PHOENICIANS founded trading colonies among them in about 1100 B.C.E., including Gadir (later Gades; modern Cádiz). The second-century C.E. Alexandrian geographer Ptolemy recorded

their location and claimed they were Phoenician by descent, although they were probably an Iberian-Phoenician mix. The CARTHAGINIANS in the third century B.C.E. and the ROMANS from the second century B.C.E. occupied their homeland.

In the early centuries C.E. the Iberian Peninsula was part of the provincial system of the Roman Empire, with Baetica in the south. The Bastuli were one of four tribes whom the second-century C.E. Alexandrian geographer Ptolemy recorded as situated in Baetica, along with the BASTETANI, Turdetani, and TURDULI.

Batavi (Batavii; Bataves; Batavians)

The Batavi are classified as a tribe of GERMANICS, although they may have had ancestors among the CELTS as well. In the first century B.C.E. they had contact with the ROMANS under Julius Caesar, who reported that they lived on the Meuse River near the mouth of the Waal in present-day Netherlands. Their capital was Noviomagus (modern Nijmegen).

In the first century C.E. the Roman historian Tacitus reported that they lived on an island in the Rhine formerly held by the CHATTI, some of whom are thought to have merged with them at some point. The Batavi provided the Romans with men, weapons, and armor. The Batavian leader of a Roman cohort of Batavi known by the Roman name of Gaius Julius Civilis led a revolt against the Romans in 69 C.E., along with SUGAMBRI allies, but was defeated by a force under Petillus Cerealis the next year.

There is no historical mention of the Batavi after the third century; it is thought they were absorbed by the FRANKS or FRISIANS. For a short time in the late 18th and early 19th century the Netherlands was known as the Batavian Republic.

Bavarians (people of Bavaria)

The name Bavarians refers to those people living in what became the state of Bavaria, situated in present-day southeastern Germany. The term is used in a general sense regardless of tribal background or ethnicity although the majority of those peoples living there can be grouped as GERMANICS. The territory that became known as Bavaria was seized by the ROMANS in the first century B.C.E. Some Germanic tribes grouped collectively as SUEBI—among them the BAVARII (sometimes referred to as Bavarians themselves), whose

name passed to the region—migrated there in the early centuries C.E. The Suebi became tributary to the FRANKS in the sixth century and part of Charlemagne's Frankish Empire in 788. Later a duchy of the Holy Roman Empire, Bavaria was divided into Upper and Lower Bavaria in the 13th century and, over time, was annexed by Austria, France, and Germany. It became a state of the Federal Republic of Germany in 1949 (see GERMANS: NATIONALITY).

Bavarii (Baiovari; Baiuvari; Baiuoarii; Boiarii; Bojuvari; Bojovares; Bavarians)

The Bavarii were a Germanic tribe or a collection of tribes of GERMANICS. Their ancestors are thought to have lived originally in Bohemia in the present-day Czech Republic, the former homeland of the Celtic BOII. They may have displaced or have been descended from the MARCOMANNI and QUADI, or perhaps the RUGII, SCIRI, and other tribes who lived in that region.

Some among these peoples—sometimes classified together as SUEBI—later moved to the present-day state of Bavaria in southern Germany, perhaps as early as the first century C.E. By the sixth century C.E. the migrants became known as the “people from the land of the BOII.” a description that evolved into the name Boiarii (or the variants Bavarii and Bavarians). Descendants of other tribes already living there also were referred to as BAVARIANS.

Belarusians: nationality (Belarusans; Belorussians; Byelarussians; Byelorussians; Bielorussians; people of Belarus)**GEOGRAPHY**

Belarus is bounded by Poland to the west, Latvia and Lithuania to the northwest, Ukraine to the south, and Russia to the north and east. Belarus's area of 80,200 square miles is made up of hilly lowlands. Northern Belarus is a region of lakes and forests. Other than the Belovezhskaya Forest, western Belarus consists mostly of agricultural terrain. A broad, elevated plain lies in the east, and to the south lie the Pripet Marshes marked by rivers, swamps, and rich peat soil. The highest point in Belarus is Mount Dzyarzhynskaya at 1,135 feet. Principal rivers include the Dnieper, which flows along the eastern shoulder, and the Western Dvina (Daugava), which runs westward from Russia.

Belarusians: nationality time line**C.E.**

10th century City of Polotsk (Polatsk) of northern Belarus emerges, becoming center of activity and capital of principality of Polotsk.

late 10th century Principality of Polotsk is annexed into Kievan Rus.

11th century Cathedral of St. Sophia is built in Eastern Orthodox style in Polatsk.

1240–63 Mindaugas of Lithuania reigns; east Lithuanian and west Belarusian territories become Grand Duchy of Lithuania and Rus; Navahradak becomes capital.

1323 Vilnius becomes capital of Grand Duchy of Lithuania and Rus under ruler Grand Duke Gediminas.

1341–77 Grand Duke Algirdas of Lithuania rules and expands duchy eastward into Moscow.

1385 Grand Duke Jogaila of Lithuania marries queen of Poland, uniting and ruling both countries.

1468 King Kazimir IV of Lithuania sponsors Code of Laws, first compendium of criminal and procedural laws of Grand Duchy of Lithuania.

1498–99 Polotsk and Minsk become self-ruled.

1500 Grand Duchy of Lithuania, Rus, and Samogitia fight against Moscow.

1517–25 Frantsysk Skarnya of Polatsk publishes editions of Bible in Belarusian, first printed books in eastern Europe.

1569 Grand Duchy of Lithuania, Rus, and Samogitia are annexed by Poland; Union of Lublin establishes Commonwealth of Poland.

1654–67 Polish Commonwealth declares war with Russia; Muscovy cedes Smolensk.

1664 Belarusian scholar and poet Simeon Polotsky moves to Moscow and propagates unity of Slavic peoples.

1686 Russo-Polish “Eternal Peace”; Russia wins Smolensk, Chernigov, and Kiev.

1772–95 Poland is partitioned; Belarus becomes part of Russia.

1863–64 Anticzarist revolts occur in Poland, Belarus, and Lithuania led in Belarus by Kastus Kalinouski.

1902 Belarusian Socialist Hramada emerges; beginnings of Belarusian political state.

1906–16 Influential Belarusian newspaper *Nasha Niva* (Our Cornfield) is published in Vilnius.

1917 First All-Belarusian Congress in Minsk declares republican government in Belarus; dismissed by Lenin’s Bolsheviks.

1918 At end of World War I Belarus declares independence as Belarussian People’s (National) Republic.

1919 Bolshevik Russia annexes Belarus in 1919 and proclaims it Belarussian Soviet Socialist Republic.

Maksim Haretski’s novel *Two Souls*, reflecting on life in Belarus during period of war and revolution, is published.

1919–21 Russo-Polish War occurs; Belarus is divided between Belarussian Soviet Socialist Republic and Poland.

1920 Belarusian State Academic Theater is founded in Minsk.

1922 Belarus becomes part of Soviet Union (USSR).

1926 Yakub Kolas, selected as Belarusian People’s Poet, promotes literary use of Belarusian language.

1932 Opera and Ballet Theater and Belarusian Musical Academy are founded in Minsk.

1939–44 During World War II Belarus is occupied by Nazi Germany.

1944 At Moscow conference Curzon Line becomes part of Poland’s eastern border.

(continues)

**BELARUSIANS:
NATIONALITY****nation:**

Belarus; Byelarus;
Republic of Belarus
(Respublika Belarus)

derivation of name:

Meaning “White
Ruthenia”; Rus is a Viking
root.

government:

Republic

capital:

Minsk

language:

Belarusian and Russian,
both East Slavic lan-
guages, are the official
state languages; Polish
and Ukrainian are also
spoken.

religion:

About 50 percent of the
population are Eastern
Orthodox Christian; 13
percent are Roman
Catholic; and the remain-
ing citizens are generally
atheist or nonreligious;
smaller groups of Eastern
(Uniate) Catholics, Jews,
Protestants, and Muslims
are also present.

earlier inhabitants:

Scythians; Sarmatians;
tribal Slavs
(Dregovicians; Drevlyans;
Krivichians;
Polochanians;
Radimichians; etc.); Rus;
Mongols; Lithuanians

demographics:

Belarusians make up
about 80 percent of the
population; about 14 per-
cent are Russians; other
minorities include Poles,
Ukrainians, and Jews.

Belarusians: nationality time line (continued)

1945	Belarus becomes part of United Nations as constituent republic of Soviet Union.
1991	Belarus declares independence from Soviet Union and joins Commonwealth of Independent States. National Museum of Culture and History of Belarus is founded in Minsk (reorganized from 1922 institution).
1992	National Library of Belarus is founded in Minsk (reorganized from 1922 institution).
1996	Belarus's current constitution is adopted.
1999	Arts Museum of the Republic of Belarus receives national status.

Of the thousands of lakes in Belarus, Lake Narach in the northwest is the largest.

INCEPTION AS A NATION

Between the sixth and eighth centuries C.E. various tribes of SLAVS settled on the Western Dvina River and later in the vicinity of the Pripjat' and Sozh Rivers. By the late 10th century the city of Polotsk, a northern Belarusian territory, united with the Kievan Rus', founded by the RUS. When the MONGOLS invaded Kiev in 1240, Belarusian lands were given to the Grand Duchy of Lithuania, although the Belarusians maintained some autonomy. In 1569 Lithuania and Poland were united by the Union of Lublin as the Commonwealth of Poland. When Poland was partitioned in the late 18th century, Russia gained present-day Belarusian territory.

The Russian Revolution of 1917 overthrew the Russian monarchy, leaving Belarus vulnerable to Poland, Russia, and Germany. The Treaty of Brest-Litovsk in 1918, ending World War I between Russia and Germany, left Belarus under German control. Belarus temporarily declared independence as the Belarussian People's (National) Republic. Bolshevik Russia annexed Belarus in 1919 and proclaimed the Belarussian Soviet Socialist Republic. The Treaty of Riga of 1921 ended the war between Russia and Poland; western Belarus was ceded to Poland and eastern Belarus became part of the Soviet Union (USSR). When the Soviet Union dissolved in 1991 (see RUSSIANS: NATIONALITY), Belarus became an independent nation.

CULTURAL IDENTITY

The territory of Belarus, landlocked, largely lacking in mineral resources, did not foster the emergence of a powerful elite who could develop an organized state, as occurred in neighbor-

ing Russia and Lithuania during the Middle Ages. The Slavic tribes who filtered into the area from about the sixth century C.E. continued to practice a relatively simple farming way of life. Probably as a result of trade routes through Belarus and Russia pioneered by the Rus in the ninth century, by the late 10th century a principality had emerged; it was soon, however, annexed by the powerful Kievan state (see RUS). From this time until the 20th century Belarusians have been ruled by others, notably Russians, LITHUANIANS, and POLES. Their location west of Russia has caused them to receive influences from the west and to transmit them to Russia. For example, Belarusians were the first people in Eastern Europe to adopt Baroque architecture (a Western Christian style) and literary style, and they had the first printed books in Eastern Europe. Under Lithuanian rule Belarusians became more self-consciously Slavic in ethnicity, and when Poland took control, they had to maintain their Eastern Orthodox religion in the face of pressure from Poles to become Roman Catholic. In the Stalinist era Belarusians suffered greatly from Soviet purges of intellectuals who were promoting Belarusian nationalism and others; hundreds of thousands of Belarusians were murdered outright and untold thousands more deported to Siberia.

Under siege from both East and West the Belarusian sense of unique cultural identity based on ethnic roots may not be as fiercely promoted as that of other people. Many Belarusians feel a cultural affinity to Russia. Although Belarusian was made the official language of the state, few in urban areas speak it in daily life. Primary facts of life for Belarusians stem directly from Soviet Russian domination of the country. One of these is the severe decline of the economy, in part brought on by the government's continuation of Soviet-style central control of both industry and agricul-

ture, and in part by the fact that the thriving Belarusian economy of the Soviet era was dependent on membership in the Soviet Union, based on cheap fuel from Russia and the Soviet demand for military equipment, both factors that have since disappeared. Fuel prices from Russia have risen dramatically, and much of the population now lives in poverty. Another major factor is pollution caused by Soviet failure to institute even basic measures to clean up industrial waste and air pollution. The Chernobyl nuclear power station, in particular, contaminated large areas of Belarus; 10 percent of the arable land of the country was lost and the incidence of radiation related cancers is a major public health problem.

Nevertheless, cultural and intellectual life continues to thrive in Belarus in the form of literature, theater, and music, and Belarusian artists are au courant with trends from western Europe, such as existentialism. It may be that this devotion to the arts is central to Belarusian cultural identity in the face of the many disasters brought on the country by foreign domination.

Belegezites

The Belegezites were a Slavic tribe known to have been in present-day northern Greece by the seventh century C.E. In the previous century SLAVS had spread to the present-day nation of Macedonia and the region of Macedonia in present-day Greece. Although the origins of the Belegezites are unknown, they are assumed to be descendants of the SCLAVENI, that is, Slavs who settled in present-day Macedonia and northern Greece.

In 677 C.E. other Slavic tribes also about whom little is known other than a name from

the historical record—the Drugubites, Rynchines, and Sagudates—besieged Thessalonica, the port city at the head of the Gulf of Salonika, as allies of the AVARS. The Belegezites reportedly provided the city with enough grain to survive the siege until relief from the BYZANTINES under the Emperor Constantine IV. Attacks by the Slavs on Thessalonica occurred over the centuries, one recorded in 584 and another one in 877.

Belendi

The Belendi are classified as a Celtic tribe. They lived in Gaul around present-day Belin in southwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Belin takes its name from the tribal name.

Belgae

The Belgae, according to Roman sources, are classified as a Celtic division of tribes. They lived in the northern part of Gaul—in present-day northern France, Belgium, southern Netherlands, western Germany—and are discussed as CELTS or GAULS. Some of them probably had Germanic ancestry as well as Celtic.

Julius Caesar of the ROMANS referred to the Belgae as an ethnic division of tribes, as distinct from the CELTAE and AQUITANI to the south. Among the Belgic tribes are sometimes grouped the AMBIANI, ATREBATES, ADUATUCI, BELLOVACI, CONDRUSI, EBURONES, LEUCI, MEDIOMATRICI, MENAPII, MORINI, NERVII, PAEMANI, REMI, SUESSIONES, TORNATES, TREVERI, and VIROMANDUI. The Romans conquered them in 57–56 B.C.E. In 27 B.C.E., according to Caesar's classifications, Gaul was divided into the three provinces of Gallia Belgica, Galli Lugdunensis (Gallia Celtica), and Gallia Aquitania.

A tribe in Britain, occupying parts of present-day southern England, were also recorded as the Belgae and are probably related ancestrally to the continental Belgae; they may have migrated to Britain from the mainland in about 100 B.C.E. They are discussed as Celts or BRITONS. Venta Belgarum on the site of present-day Winchester was a *civitas* capital of the British Belgae during the Roman occupation lasting until 410 C.E.

The modern nation of Belgium thus takes its name from the Belgae, thought to be derived from Bolg (which may be related to the mythological people of Ireland known as Fir Bolg or Érainn—see IVERNI and IRISH), meaning “shine” or “flash” and associated with a thunder god.

Belgians: nationality (people of Belgium)**GEOGRAPHY**

Belgium is bounded to the northwest by the North Sea and to the north and northeast by the Netherlands. Germany lies to the east, Luxembourg to the southeast, and France to the southwest and west. Belgium, along with Luxembourg and the Netherlands, forms part of the Benelux countries.

Flanders, the northern half of Belgium, is predominantly the home of the FLEMINGS. The low-lying plain of Vlaanderen lies to the northwest; to the northeast are the plateaus of Kempenland (Campine). Both of these marshy

regions are considered Lower Belgium, part of the great European Plain. Bordering the North Sea is a wide band of sand dunes and dykes known as the Maritime Flanders region. The southern half of Belgium, called Wallonia, is predominantly the home of the WALLOONS. High (Upper) Belgium in the southeast is a densely forested highland (Ardennes highlands). This region, including Belgium's highest point, Mount Botrange (2,277 feet), extends south of the Meuse River valley. South of the highlands is the hilly region of Belgian Lorraine, called Côtes Lorraines. Middle Belgium consists of the fertile Central (Bas) Plateaus, which are dissected by the Schelde

Belgians: nationality time line**C.E.**

843 Charlemagne's Frankish Empire is divided; Belgium becomes part of Lotharingia and later duchy of Lower Lorraine.

10th–14th century Several independent principalities emerge.

12th century Lower Lorraine disintegrates, replaced by duchies of Brabant and Luxembourg and bishopric of Liège.

1384 Count Philip II of Burgundy gains control of Flanders and becomes vassal of king of France.

1477 Houses of Burgundy and Hapsburg are united by marriage.

1504 Belgium is under Spanish Hapsburg rule; during Reformation Belgium divides between northern Dutch-speaking Protestants and southern French-speaking Roman Catholics.

1579 Southern provinces pledge allegiance to Roman Catholic Spanish king; in 1581 Protestant northern provinces successfully rebel against Hapsburg rule and form United Provinces of the Netherlands; Flanders, now Spanish Netherlands, remains under Hapsburg rule.

1701–14 Philip V, grandson of Louis XIV of France, inherits Spanish throne, precipitating War of Spanish Succession; consequently Spanish Netherlands is given to Austrian Hapsburgs.

1797 Under Treaty of Campo Formio Belgium is controlled by France.

1815 At Napoleon I Bonaparte's defeat Congress of Vienna gives Belgium to newly formed kingdom of Netherlands.

1830 Royal Museum of Fine Arts of Belgium is founded in Brussels.

1830–31 Belgians revolt against Dutch rule to establish Belgium as independent, approved by European powers at London Conference; Liège participates and becomes part of Belgium.

1831 Prince Leopold of Saxe-Coburg-Gotha becomes Leopold I when elected king of Belgium.

1837 National library, Bibliothèque Royale Albert I, is founded in Brussels.

1839 Final Dutch-Belgian peace treaty is signed; Belgium is recognized as independent kingdom and declares neutrality.

1865–1909 Leopold II reigns; colonizes large territories in Africa's Congo River basin; supports industrialization.

1890 Royal Museum for Fine Arts is founded in Antwerp.

1893 Leopold II grants universal male suffrage.

(Escaut) River and its tributaries. Belgium's two main rivers, the Meuse and the Schelde, are important arteries for commerce.

Belgium's temperate maritime climate is conducive to agriculture and lush forests and pastures. It has a moderate supply of natural resources—chalk, limestone, and building stones are found in abundance. The once-productive coal mines in the Sambre-Meuse valley and the Kempenland region are now exhausted.

INCEPTION AS A NATION

The ROMANS conquered the BELGAE and other GAULS, occupying their territory, northern Gaul, in the first century B.C.E. Belgica was a

Roman province through the fifth century until the Merovingian dynasty of FRANKS took control. Under the Carolingian dynasty (which had its roots at Herstal in Belgium) in the ninth century C.E. Belgium was first incorporated into Lotharingia and then into the duchy of Lower Lorraine.

Belgium royalty ruled the duchies of Luxembourg, Brabant, Flanders, and Hainaut throughout the Middle Ages. Self-governing principalities emerged between the 10th and 14th centuries, establishing borders of current provinces. In the late 14th century Philip of Burgundy gained control of Flanders. The count of Flanders became a vassal of the king

- 1907** Architect Henri Clemens van de Velde helps found Weimar School of Arts and Crafts in Germany, promoting Art Nouveau; in 1919 it becomes part of Bauhaus school of design.
- 1909–34** Albert I reigns during World War I and postwar reconstruction.
- 1911** Poet and playwright Maurice Maeterlinck wins Nobel Prize in literature.
- 1914–18** During World War I Germany occupies Belgium.
- 1920** Treaty of Versailles abolishes Belgium's neutral status; negotiates defense agreement with France.
- 1921** Belgium and Luxembourg form economic union.
- 1927** *Images de la vie Saint François d'Assise* (Scenes from the life of St. Francis of Assisi), play by Adémar Adolphe-Louis Martens (pseudonym, Michel de Ghelderode), pioneers concept of total theater with advanced theatrical techniques.
- 1930** Belgian parliament divides country between two languages, French and Dutch, and decrees two separate administrations.
- 1936** National Orchestra of Belgium, centered at Palais des Beaux-Arts in Brussels, is founded.
- 1940–44** During World War II German troops occupy Belgium; King Leopold III surrenders unconditionally, although Belgian cabinet, in exile at London, opposes Germany.
- 1944** Belgian underground army aids British and American troops to liberate Belgium.
- 1947** Belgium forms customs union with Luxembourg and Netherlands.
- 1948** Women win right to vote.
- 1949** Belgium joins North Atlantic Treaty Organization (NATO).
- 1951** Leopold III's son, Baudouin, becomes king; divisions and conflict between Flemings and Walloons increase.
- 1957** Belgium joins European Economic Community (EEC), which evolves into European Community (EC).
- 1970s** Sweeping constitutional reforms begin in response to animosity between Flemish- and French-speaking sections; three partially autonomous regions (Flanders, Wallonia, and Brussels) and three politically recognized ethnic communities (French, Flemish, and German) are established.
- 1982** New coalition (composed of Flemish and Walloon Socialist Parties, Christian Social Party, and Flemish Volksunie Party) controls government.
- 1993** Parliament votes to amend constitution; Belgium is declared federal state composed of three autonomous regions; Belgium becomes one of 12 original members of European Union (EU).

This 1617 painting shows a Belgian family.
(Library of Congress, Prints and Photographs
Division [LC-USZ62-7284])

of France during this period. Foreign domination began, after the death of Mary of Burgundy in 1482. In the late 15th century the houses of Burgundy and Hapsburg were joined by marriage. All of present-day Belgium was under Spanish Hapsburg rule by 1504.

France occupied Belgium during the French Revolutionary War until Napoleon I's defeat at the Congress of Vienna in 1815 reunited Belgium with the Netherlands under the house of Orange. In 1830 Belgians rebelled against Dutch dominion and won independence by 1831, approved by the London Conference.

CULTURAL IDENTITY

Belgium is one of the few countries in Europe that have two equally dominant languages, French and Flemish. Moreover, the two languages belong to the two main language families of Western Europe: French, part of the Latin-derived Romance family, and Flemish, closely related to Dutch, a Germanic tongue. The country is divided geographically along linguistic lines; French-speaking Walloons living in the five southern provinces and Flemish-speaking Flemings in the five provinces in the north. An officially bilingual zone centered on the city of Brussels lies between them.

Culturally speaking, the Walloons and French speakers in Brussels have close ties with France, and its artists often see themselves as part of the cultural sphere of Paris, whereas

the literature of the Flemings, because the number of Flemish speakers is small, is distinct. For centuries artistic production by Belgians has had a strong international character. For example, the great 15th-century composer Josquin des Prez lived for many years in Italy and merged Italian elements with Flemish to create a style that formed the basis for the music of the Renaissance all over Europe; the 16th-century painter Pieter Brueghel was strongly influenced by Dutch painters; and the 19th-century composer César Franck worked within both French and German musical styles.

From its days as the Roman province of Belgica to modern times the region that modern Belgium comprises has almost continuously been occupied by foreign powers: Spain, Austria, France, Netherlands, and Germany. Thus Belgians make a virtue of being critical of any form of authority, and laws, rules, and regulations are not taken very seriously (tax evasion has been called a national sport). This individualistic, antiauthoritarian attitude is perhaps best exemplified by the famous literary figure of Thyl Uilenspiegel, who mocked the Spanish authorities during the 16th-century occupation.

The international character of Belgium has helped bring about the multilingual, multicultural, and multinational status of Brussels, where many international organizations have their headquarters.

The many contacts with various cultures have made Belgians tolerant and flexible. On the other hand, the centuries of foreign rule and the skepticism toward government and authority have led to a relative lack of national pride. Belgium may well be one of the least nationalistic countries in the world. In a world in which nationalism has led to devastating wars and persecutions, this makes Belgians a people from whom others could learn. However, doing so would be difficult because Belgians are among the few peoples who will criticize their own country to foreigners. Some Belgians feel that their compatriots give an unduly pessimistic view of the country. In a true antiauthoritarian spirit Belgians tend to focus on what goes wrong. This can lead to an image of Belgium as a country on the brink of social and economic collapse, a characterization that could hardly be further from the truth of one of the richest countries in the world, whose economy routinely outstrips that of larger industrialized nations.

In a subtle way Belgians combine traits of the Romance and Nordic worlds. They definite-

ly ascribe to the French and Italian love of the “good life” as exemplified by the rich and complex Belgian cuisine, typified by the famous Belgian waffles, chocolate, and beers. On the other hand the Belgian tendency to maintain a reserve with strangers and the aversion for self-promotion and self-righteousness is very similar to tendencies in Scandinavian countries.

Belli (Belos)

The Belli are classified as a Celtic tribe. They lived in the Jalón Valley in present-day north-central Spain near the TITTI at least by the first century B.C.E. and are discussed as CELTS or CELTIBERIANS.

Bellovaci (Bellovici; Ballovaci; Bellovaques)

The Bellovaci are classified as a Celtic tribe. They lived in Gaul around present-day Beauvais in northern France and are discussed as CELTS or GAULS. They were among the tribes Julius Caesar considered BELGAE. Some Bellovaci fought as allies of the ARVERNI under Vercingetorix against the ROMANS in 52 B.C.E. Caesaromagnus, earlier known as Bellovacum, on the site of Beauvais became a *civitas* capital in Roman Gaul; Beauvais takes its name from the tribal name.

Berbers See MOORS.

Bercorates

The Bercorates are classified as a Celtic tribe. They lived in Gaul in the present-day Gironde region of southwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Berones (Beroni)

The Berones are classified as a Celtic tribe. They lived in present-day northern Spain at

least by the first century B.C.E. and are discussed as CELTS or CELTIBERIANS.

Bibroci

The Bibroci are classified as a Celtic tribe. They lived in Britain and are discussed as CELTS or BRITONS. According to Julius Caesar they were allies of the TRINOVANTES and surrendered to the ROMANS in 54 B.C.E., along with the ANCALITES, CASSI, CENIMAGNI, and SEGONTIACI.

Bigerriones (Bigerri; Begerri)

The Bigerriones are classified as a Celtic tribe. They lived in Gaul in the northern Pyrenees around present-day Tarbes in southwestern France and are discussed as CELTS or GAULS. They were allies of the CONVENAE. They surrendered to the ROMANS under Julius Caesar with the fall of Aquitania in 56 B.C.E.

Bituriges (Buturiges; Biturges)

The Bituriges are classified as a Celtic tribe. They lived in Gaul in present-day central and western France and are discussed as CELTS or GAULS. The Cubi around present-day Bourges and the Vivisci (Vibisci; Vivisques) around present-day Bordeaux are considered the two Biturigian groups.

The first-centuries B.C.E. and C.E. Roman historian Livy wrote that an early powerful Biturigian king, Ambigatus, to rid his kingdom of the troublesome throng of young warriors constantly seeking battle, sent two young kinsmen, Bellovesus and Segovesus, leading a mass migration, one group to go east to the Danube River and the other to Italy. The dates are uncertain, possibly as early as the sixth century B.C.E.

In 52 B.C.E. Bituriges fought as allies of the ARVERNI under Vercingetorix against the ROMANS under Julius Caesar. Avaricum on the site of Bourges became a *civitas* capital in Roman Gaul during the period of occupation lasting until the fifth century C.E.; Bourges and Bordeaux take their names from the tribal name.

Blanii See EBLANI.

Bodiotonci

The Bodiotonci are classified as a Celtic tribe. They lived in Gaul in the western Alps around present-day Digne in southeastern France at

Bodryci See OBODRITES.

Bohemians (people of Bohemia)

The name Bohemians refers to people living in the ancient kingdom of Bohemia, which is situated in the present-day western Czech Republic. (The name *Bohemia* itself is derived from the Celtic people known as BOII, who lived there in ancient times.) Western SLAVS, among them the CZECHS, settled the region around the sixth century C.E. It became a tributary to the Holy Roman Empire, then part of Moravia in 870 (see MORAVIANS), before becoming a duchy of Germany. At its widest extent Bohemia extended across Moravia, parts of Silesia, Slovakia, Kraków, Styria, Lusatia, and Brandenburg. By the 18th century Bohemia was part of Austrian holdings, then under the Austro-Hungarian monarchy. With Moravia and Slovakia, it declared independence in 1918, but then was invaded by the Germans in 1939. It became part of Czechoslovakia in 1945 and the Czech Republic in 1993 (see CZECHS: NATIONALITY).

Boii (Boi; Boyards)

The Boii are classified as a Celtic people. They lived in various parts of Europe and are discussed as CELTS or GAULS. The ancestral homeland of the Boii was the region that came to be known as Bohemia, named after them, in what is now the western Czech Republic.

Probably in the fifth century B.C.E. some among the Boii migrated south of the Po River to present-day northeastern Italy around the modern city of Bologna, also named after them. In Italy the Boii were associated with the ANARES, CENOMANI, INSUBRES, LINGONES, SENONES, and other Celtic peoples who settled the region. They were influenced culturally by the ETRUSCANS. The ROMANS defeated them along with the Insubres at Telemon west of Lake Bolsena in 225 B.C.E., ending Celtic power.

In about 60 B.C.E. the northern Boii were defeated by the DACIANS invading from the east, as were the SCORDISCI and the TAURISCI. Their homeland became known to classical writers as the “desert of the Boii” after survivors fled to the HELVETII and joined them in their attempted migration westward, which was thwarted by a force under Julius Caesar in 58 B.C.E. Some Boii

fought as allies of the ARVERNI under Vercingetorix against Caesar’s legions in 52 B.C.E.

Boikos (Bojko; Boikians; Verkhovyntsi)

The Boikos are a Slavic people currently living in Transcarpathia, that is, the Carpathian Mountains and surrounding regions. Their homeland in southwestern Ukraine is known as Boikivshchyna; their East Slavic dialect is known as Boiko. To their west are the LEMKOS, and to the east, the HUTSULS. All three groups of SLAVS, who speak distinct dialects, are among the people known as RUSYNS, or Carpatho-Rusyns.

Boikos refer to themselves as Verkhovyntsi for “mountain people,” a name that distinguishes them from a branch tribe to the south, the Dolyniany, the “valley people”; both are agricultural people who typically made their homes in Carpathian valleys. The Tukhol’tsi are a Boikian subtribe who live around present-day Skole. Slavs lived in the region as early as the late fifth century C.E.; the exact time the Boikos assumed a distinct identity is not known.

All three groups, isolated from other peoples, have preserved Ukrainian traditional agricultural culture in terms of rituals, tools, architecture, and clothing. They still make use of *kadovby*, clay receptacles for grain. Their wooden homes typically share the same roof as the farm buildings. The Dolyniany typically live in two-room houses, with an entranceway and a single room. The Boikos are known as cattle breeders; the Tukhol’tsi, as merchants.

See also UKRAINIANS: NATIONALITY.

Boresti

The Boresti are classified as a Celtic tribe. They lived in Britain in present-day northern Scotland and are further classified as CALEDONIANS, CELTS, or SCOTS. The ROMANS under Gnaeus Julius Agricola reportedly took hostages from them during Agricola’s campaign in Scotland in the 80s C.E. The Boresti were possibly part of a confederation of tribes formed by about 200 C.E. who are referred to as the MAEATAE.

Borussians (Borussi; Prussi; Old Prussians)

The name Borussians, used interchangeably with Old Prussians, refers to Baltic-speaking peoples of the Baltic Sea region between the Neman and Vistula Rivers in present-day north-

BOIKOS**location:**

After fifth century C.E. to present

ancestry:

Slavic

language:

Boiko (East Slavic)

eastern Poland and the enclave of Russian territory around Kaliningrad. The region is sometimes referred to as East Prussia, a former province of the kingdom of Prussia (the term PRUSSIANS is also applied to later inhabitants of varying languages of both East Prussia and West Prussia). The Borussians are classified among the BALTS. A number of tribes are classified as Borussians, including the Bartians, Galindians, Notangians, and Sambians. The NADRUVIANS and SKALVIANS to the east and north spoke dialects with both Borussian and Lithuanian influences and as a result are classified as either Borussians or LITHUANIANS. The same can be said of the YOTVINGIANS (Sudovians) to the east.

ORIGINS

It is thought that proto-Baltics migrated to the Baltic Sea region by about 2000 to 1500 B.C.E. and spread southward into Prussia at least by the fifth century B.C.E. The Galindians were one of the first Baltic tribes mentioned by name; that tribe was cited by the second-century C.E. geographer Ptolemy of Alexandria. Other identifiable tribes had coalesced in the region by the ninth century. The name Bruzzi for the Borussians was first mentioned in 965 in a text by a Bavarian geographer.

LANGUAGE

The language of the Borussians, usually called Old Prussian, known from written records, constituted the western branch of the Baltic language group. It has been extinct since the 17th century. The only Baltic languages to have survived are Lithuanian and Latvian. The earliest Old Prussian (and Baltic) written record is a German-Prussian vocabulary of 802 words, known as the *Elbing Vocabulary*. It is thought to have originated in about 1300, with the oldest surviving copy from about 1400. Other important Old Prussian written records are three 16th-century catechisms based on Sambian dialects of Sambia and translated from German. Sambia (or the Sambian Peninsula), near modern Kaliningrad, was the last area where Old Prussian was spoken. The names Bruzzi and Prussi are possibly related to Prutenia, a place-name from medieval heroic sagas adopted from the name of the legendary priest-king Pruteno.

HISTORY

The Borussians had early trade contacts with the Germanic VIKINGS out of Scandinavia. The SAXONS, GERMANICS living to the west, unsuccessfully attempted to convert them from

paganism to Christianity in the 10th century. In 997 a missionary by the name of Adalbert (the first Slavic bishop of Prague, probably of Czech ancestry) was martyred there, not because of his preaching but because of his profanation of a tribal forest sanctuary.

In the 13th century the Teutonic Knights, a military and religious order made up of German nobles and others who had been active in Crusades to the Near East, followed a call in 1226 by the Polish duke Conrad of Mazovia and crusaded against the Borussians in exchange for conquered lands. Holy Roman Emperor Frederick II granted the order vast privileges. In 1234 Hermann von Salza placed the conquests under papal suzerainty with the intention of organizing them as a separate German state. The POLES unsuccessfully asserted a claim to suzerainty over the order. In 1236–40, the Teutonic Knights occupied many forts and towns. The defeat of the order by the Russian SLAVS under Alexander Nevsky at Lake Peipus in 1242 gave the Borussians the opportunity to revolt, but they were again temporarily pacified in 1247. In 1263 a new crusade was begun; more knights entered the region from all over Europe. In 1274 the Teutonic Knights defeated the Borussians, wiping out entire villages. Afterward they founded numerous towns and fortresses of their own encouraging German and Dutch peasants to settle the region. In 1283 the knights also defeated the Yotvingians and henceforth ruled the region as a papal fief. Surviving Borussians were reduced to serfdom. A revolt in 1295 was unsuccessful.

In 1386 the Lithuanians and Poles entered into a dynastic union, and in 1410 they defeated the Teutonic Knights. The Treaty of Torun in 1411 ended warfare only temporarily. By a second Treaty of Torun in 1466, East Prussia was ceded to Poland, and West Prussia remained under the control of the Teutonic Knights as a

fief of Poland and later became part of Germany (see GERMANS: NATIONALITY). In 1525 East Prussia became a duchy under Polish suzerainty.

Over the ensuing centuries, while various nations contended over Prussia, the region was increasingly Germanized and Slavicized, and the Borussians ceased to exist as a distinct people.

CULTURE (see also BALTS)

The basic territorial community of the Borussians was the *lauks*, a group of farms allied for both economic and defensive purposes. A council of adult males met to elect a leader and chief. The leader supervised daily matters; the chief oversaw the building of roads and fortifications and the posting of guards. Various allied *laukses* maintained tribal territories.

The names Prussia and Prussian have been associated with German history, despite the original Baltic makeup of the area's tribal population.

Bosniaks See BOSNIANS.

Bosnians and Herzegovinians: nationality (Bosniaks; Hercegovinians; people of Bosnia and Herzegovina)

GEOGRAPHY

Bosnia is bounded by Croatia to the north and west, and by Serbia and Montenegro to the east. A narrow 12-mile-coastal strip between

Croatian territories provides an outlet to the Adriatic Sea. Bosnia and Herzegovina has an area of 19,741 square miles. The country is divided into the northern region of Bosnia and the southern region of Herzegovina. Its terrain is mostly mountainous; the Dinaric Alps run along the Croatian border of western, northern, and southern Bosnia. Mount Maglić, Bosnia's highest peak at 7,831 feet, is situated on the border with Serbia and Montenegro. The Sava plain and forested terrain lie in the north, and fertile farmlands are found in the south. The Karst, a limestone plateau disrupted by ridges and depressions, makes up part of Bosnia in the southwest. Principal rivers include the Sava, flowing north to the Danube, and its tributaries, the Bosna and the Neretva, flowing south to the Adriatic Sea.

INCEPTION AS A NATION

SERBS began settling in present-day Bosnia as early as the seventh century C.E. The first mention of "Bosnia" in a document was in 958, at which time the region was ruled by Croatian kings. Ban ("governor" or "viceroy" in Croatian and Hungarian) Kulin united the first state in 1180, but it was tributary to Hungary. However, not until the rule of Ban Stephen Kotromanić (1322–53) did Bosnia experience its first real consolidation as a nation and expansion to include many surrounding territories, including, in 1326, the duchy of Hum. Hum regained its

A group of Bosnian peasants congregate in the late 19th century. (Library of Congress, Prints and Photographs Division [LC-DIG-ppmsc-09319])

958	The name Bosnia is first used in historic document.
1180	Viceroy Kulin forms Bosnian state, tributary to Hungary.
1322–53	Viceroy Stephen Kotromanić reigns; unites Bosnia and Hum (present-day Herzegovina).
c. 1376	Tvrtko Kotromanić reigns as “king of Bosnia and Serbia.”
1391	Herzegovina becomes independent duchy.
1448	Independent Herzegovina formed.
1463	Ottomans conquer Bosnia.
1483	Ottomans conquer Herzegovina.
1875	Bosnian peasants revolt against Turkish rule.
1878	Congress of Berlin ends final Russo-Turkish War; Austria-Hungary governs province of Bosnia and Herzegovina.
1888	National Museum of Bosnia and Herzegovina is founded in Sarajevo.
1908	Austria-Hungary officially annexes Bosnia and Herzegovina.
1914	Bosnian Serb, Gavrilo Princip, assassinates Austrian archduke, Franz Ferdinand, leading to World War I.
1918	World War I ends; Austria-Hungary breaks up; Bosnia-Herzegovina becomes part of Kingdom of Serbs, Croats, and Slovenes, renamed Yugoslavia in 1929.
1939–45	During World War II Bosnia-Herzegovina region is annexed by Nazi-occupied Croatia.
1945	National and University Library of Bosnia and Herzegovina is founded in Sarajevo.
1946	Bosnia-Herzegovina becomes republic under Yugoslav Socialist Federation.
1961	Ivo Andrić, Serb raised Catholic in Bosnia, wins Nobel Prize in literature; his novels, such as <i>Na Drini ćuprija</i> (<i>The Bridge on the Drina</i>), published in 1945, include theme of Bosnian unity.
1984	Winter Olympic games are held in Sarajevo.
1992	Bosnia and Herzegovina declare independence; ethnic conflicts between Croat and Muslim nationalists and Serbs erupt into civil war. National and University Library of Bosnia and Herzegovina is destroyed by shelling by Serb Nationalist Forces; reconstruction commences in 1995.
1995	Dayton Peace Accords establish two states in federalized nation; Muslim-Croat federation and Serb Republic, together comprising Republic of Bosnia and Herzegovina. Filmmaker Emir Kusturica’s 1995 depiction of civil war, <i>Bila jednom jedna zemlja</i> (<i>Underground</i>), is condemned in Sarajevo.
1999	Bosnian parliament approves composition of new national anthem.

independence in 1448 and became known as Herzegovina.

Bosnia fell to Ottoman Turkish rule in 1463, and Herzegovina (or Hercegovina), in 1482 (see **TURKICS**). After the Russo-Turkish War (1877–78) both were handed over to Austro-Hungarian administration and officially annexed in 1908. By the end of World War I in 1918 Austria-Hungary was dissolved; Bosnia and Herzegovina became part of a newly formed

Kingdom of Serbs, Croats, and Slovenes, renamed Yugoslavia in 1929. During World War II (1939–45) Bosnia and Herzegovina became part of German-occupied Croatia. With the allied victory in 1945, Yugoslavia was reinstated as a Communist state. By 1991 the entire Eastern bloc was destabilized. After the secession of Croatia, Slovenia, and Macedonia, Bosnia and Herzegovina also voted for independence from Yugoslavia (now Serbia and Montenegro).

demographics:

Muslim Bosnians (Bosniaks) make up about 44 percent of the population; about 37 percent are Serbs; about 14 percent are Croats; Roma make up a small minority.

The next year Bosnia and Herzegovina was recognized as an independent nation by the European Community.

CULTURAL IDENTITY

Bosnia and Herzegovina, so recently created and home to fiercely nationalistic and highly diverse subgroups, has little governmental reality, and expectation of the emergence of an overarching Bosnian cultural identity would be premature. For Serbs in Bosnia, their loyalties given to the concept of a “Serbian nation,” it was unthinkable to be a minority in a country of Muslims (called Bosniaks or Bosniacs), whose population by a small margin formed the ethnic majority in the country, and of CROATS. The latter felt similarly. Thus the Bosnian state was no sooner formed than Serbs and Croats formed their own “statelets,” and their citizens began agitating to join their compatriots in Serb-controlled Yugoslavia (now Serbia and Montenegro), as it was then known, and in Croatia. The Bosnian Serbs were especially vehement in wanting independence from—or at least dominance within—the Bosnian-Herzegovinian state and soon declared their own independent republic. Bosnian Croats had also declared their own community with the backing of the Croatian government and army. In the referendum of 1992, however, many Croats joined the Muslim Bosniacs in voting for independence from the Bosnian Serb Republic, which was recognized by the international community. Bosnia and Herzegovina then joined the Bosnian Serb Republic in a loose federation, the two parts of which soon were locked in civil war.

The militant Serbian nationalism of Bosnian Serbs erupted in the “final solution” of ethnic cleansing—mass deportations and killings—of all non-Serbs in territory they took in the war. Croats soon broke away from the Bosnian-Herzegovinian state, joining their territory to Croatia and attempting to annex more territory in Herzegovina by force. This action led to ethnic cleansing by both Croats and Muslims. After the civil war the state was again divided into Serb and Muslim-Croat entities, run by the same leaders as during the war. Little seemed changed at first, but by the late 1990s moderate, nonnationalist parties began attracting enough votes to become a force for change. Many observers hope that tolerance may eventually override destructive nationalism in reshaping Bosnia into a state comprising many ethnicities living together in peace.

The values held by Bosnians to be important—hospitality, spontaneity, and the gifts of storytelling and wit—are those of a relatively

extroverted society. As in Greece, a favorite summer pastime is the *korza*—promenades through town to meet neighbors and friends—and throughout the year popular meeting places are *kafane* (traditional coffeehouses) and *kafici* (modern café bars). Turkish influences on Bosnian cuisine consist of stuffed vegetables, coffee, and sweet cakes of the baklava type. Folk music uses Slavic singing styles as well as the ancient Balkan tradition of partly memorized, partly improvised epic singing.

Brannovices (Auleri Brannovices)

The Brannovices are classified as a Celtic tribe. They lived in Gaul in present-day northwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. They were allies of the AEDUI.

Bretons

The name of the Bretons is a French version of the name BRITONS. It was given in the early medieval period to Britons, in particular the CORNISH, who migrated from southwestern Britain in the fifth and sixth centuries C.E. to the northwestern peninsula of France, now called in French La Bretagne and in English Brittany. The region, called Armorica by the ROMANS, was already inhabited by CELTS who were part of Roman Gaul (see GAULS). The peninsula that forms Brittany, jutting far out into the Atlantic, with its natural harbors, fostered the skills of fishing, seafaring, and navigation among its inhabitants. The peninsula further brought its people into contact with the wider world from early times, as did the presence there of tin and rich iron deposits.

ORIGINS

Atlantic Coastal Zone

At least since the Bronze Age Armorica, the region that would later become Brittany, was part of the Atlantic coastal network along which trade goods and cultural ideas flowed from the Mediterranean to coastal Spain to Armorica and on to Britain and Ireland and from the Netherlands on to Scandinavia. Even as early as the Mesolithic Age when the earliest known boats were being made, there may have been traffic of some kind along this route, judging by cultural similarities throughout the coastal zone. It is probable that farming peoples as well as knowledge about the practice of agriculture spread from the Mediterranean to regions along the zone from about 4500 B.C.E. The remarkable similarity of the megalith building tradition throughout the Atlantic zone provides further evidence of cultural commonality among Atlantic peoples living thousands of miles from one another. There is evidence that this tradition may have originated in Armorica. The passage graves of the Tagus region, Armorica, Ireland, and Orkney in northern Britain arose out of a knowledge system that included beliefs and rituals, technical skills of construction, and common decorative motifs. The peoples of this zone probably engaged in cycles of gift exchange, the precursor of trade.

Iron Age

In the Iron Age evidence indicates that Armorica continued its long-distance trading contacts. Cultural traits recognizable as being from the Celtic late Hallstatt and early La Tène periods in decoration and styles of weapons, jewelry, and pottery document Armorican contacts with Celtic interior Europe, including the Rhine area and eastern Celtic areas.

As Armorica was to receive emigrants from Cornwall in England in the fifth and sixth centuries C.E., it is possible that people from Iron Age Celtic regions may have moved there as well during the first millennium B.C.E. Aside from Greco-Roman sources, which have no information on this subject for Armorica, the only substantial body of contemporary historical information on Iron Age Celts is found in ancient Irish annals (*see* IRISH), which are thought to outline a sociohistorical pattern analogous to that throughout Celtic Europe. The annals tell of a series of invasions of Ireland; if these are true, Armorica probably

experienced the same conditions. Many of these invasions, which often involved lineages (such as the sons of King Milesius), may not have been of whole tribes but of elites or family groups. The picture is not necessarily one of wholesale displacement but of meeting and mingling. This tendency may have been true of Armorica as well.

LANGUAGE

The Breton language, in Breton Breiz or Brezhoneg, evolved from Cornish, a western dialect of the Brythonic branch of the insular Celtic language group spoken in the British Isles. Many Bretons still speak Breton, which evolved from Cornish and probably also from the Continental Celtic language spoken by the indigenous Celtic tribes.

HISTORY

Bretons and Romans

Roman interest in Gaul in general and in the overland tin trade route to and from Cornwall and Brittany (which they called Armorica, country by the sea), in particular is illustrated by their establishment of a citizen colony in 118 B.C.E. at Narbo Martius (Narbonne) near the mouth of the River Aude, where the route began. Evidently they intended to gain control of the tin trade, a motive borne out as their armies in subsequent decades followed and secured the route all the way to the Atlantic by seizing control of Tolosa (Toulouse), a key strongpoint. Meanwhile during the late second and first centuries B.C.E. large quantities of Roman wine were being traded to Armorica, attested by numerous finds of Italian wine amphorae there. The VENETI from Quiberon Bay and the CORIOSOLITES from the north coast at Alet transshipped Roman wine to Hengistbury Head in central-southern Britain, the main port there before the Roman invasion, in return for metals, grain, cattle, and hides.

The CORIOSOLITES, ESUVII, OSISMI, LEXOVII, RHEDONES, UNELLI, and VENETHI were the main tribes of Armorica at the time of the Roman invasion led by Julius Caesar in 55 B.C.E. Despite mustering large armies against the Romans, and managing to forge an alliance among the Unelli, Coriosolites, and Lexovii under the command of Viridovix of the Unelli, the Armoricans were subdued by the Romans fairly quickly. The Romans met and defeated the Veneti in a sea battle. Armorica became part of the province of Lugdunensis.

Migrations of the Britons

After the collapse of the Roman Empire in about 500 C.E. Britons from Cornwall in south-western Britain, who had had close trading and other contacts with Armoricans since at least the Early Bronze Age, began migrating to Armorica. They may have been seeking refuge from the ANGLO-SAXONS, who were beginning to wrest territory from native Britons in southern Britain during the sixth century. However, the main Cornish tribe, the DUMNONII, held off the Anglo-Saxons for centuries, and Cornwall was not fully under their control until the eighth century. A more probable reason for Cornish and other Britons' emigration to Armorica was that in the 380s, the Roman general Magnus Maximus, leading troops from Britain, used Armorica as a staging area for his attempted conquest of Roman Gaul. According to the semilegendary historical accounts by early medieval writers of Britain, Maximus was accompanied by a Welsh leader called Conan Meriadoc. After securing Armorica, Maximus bestowed it on Conan as a reward for his aid. Conan's soldiers settled in their new lands but lacked wives. Because Conan had an ally in Donaut, the king of the Cornish tribe, the Dumnonii, he sent to him for wives for his men rather than to his native Wales. A storm prevented the Cornish ladies from reaching Armorica, however, so Conan's men took wives from among the local inhabitants.

Meanwhile so many Britons arrived in Armorica in the fifth and sixth centuries that they and their language became dominant there. Yet it is probable that the Celtic language spoken by native Armoricans was little different from that of tribes across the English Channel, an immemorial sea lane that, far from separating the peoples on each side, had fostered close contacts between them for millennia. The Breton place-names Cornouaille and Domnonée attest to the Cornish/Dumnonian presence in Brittany.

Although the specifics of persons and happenings in Arthurian legend may be mostly mythical, the stories reflect the close connection between Brittany and Britain, particularly in the person of Lancelot, son of King Ban of Brittany, who traveled to Camelot to serve King Arthur, the legendary king, the earliest known mention of whom is by the WELSH.

Competing Powers

In succeeding centuries as Conan's descendants split into different dynasties and other leaders rose to power, Brittany saw a series of struggles and wars for dominance, similar to those in contemporary Ireland and Britain. Leaders of the FRANKS as well as British kings sometimes took part in these wars as allies of one side or another, and Frankish power and influence increased in the region. In about the 10th century the kingdom of Brittany was reduced to a duchy, and in 1196 Arthur I, a member of the powerful French dynasty the Angevins, became duke, thus embroiling Brittany in the rivalry between France and England. The War of the Breton Succession (1341–65), part of the Hundred Years' War (1337–1453), erupted as England and France vied to replace Arthur's now-extinct line. After the dukedom was won by the house of Montfort, the dukes of Montfort tried to remain neutral during the remainder of the Hundred Years' War. The powerful French king Francis I formally incorporated the duchy into France in 1532. Brittany had its own *parlement*, the French form of local judicial body, which met at Rennes and was important until the French Revolution.

Bretons in the French Revolution

Perceiving themselves as essentially different from the rest of the French and the French monarchy, Bretons at first enthusiastically supported the outbreak of revolution in 1789, but for different reasons from those of revolutionaries elsewhere. For them, it was not a war for

liberty, equality, and fraternity among all men fought under the aegis of the Enlightenment ideal of reason instead of revealed truth. Rather, for the Bretons it was a war of national independence. But staunchly and conservatively Catholic, Bretons came to resent the anticlericalism of the French Revolutionary government, and Brittany became an anti-Revolutionary stronghold. In 1796 French royalist émigrés, backed by Great Britain, tried to land at Quiberon in Brittany, but they were routed by government forces, and Breton sympathizers suffered fierce reprisals.

19th and 20th Centuries

Parallel to that of the Irish, Breton nationalism grew during the 19th century, fueled by the continuing anti-Catholicism in France. During the 1970s Breton nationalists were again active. Groups such as the Breton Revolutionary army and the Movement of National Liberation by Socialism, as did the Irish Republican Army, adopted violence, such as exploding a bomb in the palace of Versailles in June 1978, as a tactic.

CULTURE (*see also* BRITONS; CELTS; CORNISH)

Economy

Farming Despite the important trade system centered on Brittany, Cornwall, Wales, and Ireland in the Iron Age, the economic basis of the majority of the population was one of simple farming and herding. Few luxury goods have been found in these regions.

Trade With the advent of knowledge about metalworking during the third millennium B.C.E., trade in the coastal Atlantic zone of Europe, which had existed for centuries, greatly accelerated, because a number of its regions, including Armorica, were rich in highly sought ores. At this time the Atlantic zone fostered the rapid spread of the Bell Beaker warrior ideology. Whether it was spread by actual invasion and migration is difficult to determine. By the end of the third millennium B.C.E. influences from the Unetice bronze-hording culture of central Germany and Czechoslovakia, following the old Beaker routes, had reached Brittany. Weapons, weapon designs, tin and other materials, as well as, we may surmise, elements of living culture such as myths and heroic poetry, flowed back and forth through this network, a precursor of the Celtic world to come.

Copper and gold were being extracted in considerable quantities and distributed through existing networks as well as along

new routes extending deep into mainland Europe along the major river valleys. Daggers made from honey-colored “Grand Pressigny” flint from the Loire valley and amber from the North Sea coast of Jutland were also entering the exchange networks. Following new trade routes pioneered in the early second millennium B.C.E. by traders from new flourishing bronze industries in the Carpathian Mountains, the predominantly east-west Únětice trade expanded to include north-south connections, and Carpathian weapons, most notably swords, reached Atlantic areas.

By the sixth century B.C.E. the competition of the Greeks with the CARTHAGINIANS for tin from Brittany and Cornwall, as well as high-quality bronze made from arsenical copper found in Ireland and Wales, led the Greeks to pioneer an overland route, which bypassed the sea route along the Iberian coast controlled by the Carthaginians. From the Greek trading town of Massalia on the Rhône, the route crossed France and ended in Brittany, whence ships crossed the English Channel to Britain. Great quantities of high-lead bronze were turned into ax-shaped ingots in Brittany for distribution elsewhere in France and to south-central Britain as well as back to Greece. The Greek trader Pytheas of Massilia embarked from Brittany in about 330 B.C.E. to explore the northern waters around Britain.

The Coriosolite tribe seems to have been particularly enriched by this trade, judging by the huge number of their coins that have been found (more than 20,000), exceeding those of all other Celtic tribes. Hoards of these coins have been found in Brittany, as well as on the island of Jersey and in present-day Normandy.

In the Roman era the *pax Romana* imposed in Gaul and the improved Roman roads made overland travel more viable than ever, and transport by land became more prevalent. These circumstances did not lessen Armorica’s role in trade with Britain, however, as evidence of a number of shipwrecks bears witness.

The dangerous conditions for overland travel after the Roman Empire collapsed, as raiding and warfare became endemic again and the Roman roads fell into disrepair, restored the Atlantic seaways to their old importance. The period from 500 to 1500 C.E. saw the communities of the Atlantic facade reestablish themselves as a dominant force in European development. By the end of the Middle Ages the volume and range of goods moved by sea were enormous, including wine, wool, linen, salt fish, dried fruits, and pilgrims.

Two Breton women walk along a road in Brittany in this painting from the early 20th century. (*Library of Congress, Prints and Photographs Division [LC-USZ62-105293]*)

Government and Society

A warrior society emerged in Armorica in the Bronze Age with the advent of the Beaker culture, which spread throughout the Atlantic zone. Artifacts from this time show that circular shields, long daggers, and spears were the normal equipment of the warrior. Other artifacts suggest that feasting was also important in this society: cauldrons, hooks probably used for clawing hunks of meat out of stews, and spits for roasting meat. The distribution of artifacts shows that these same social values were adopted throughout the Atlantic zone.

Comparison of mineral-rich areas of Brittany with those in the east-central region not so endowed may show how resources shaped the society of the time. Later Beaker burials in western Brittany were no longer placed near Neolithic sites as they had been in the past. Rather, after some amount of time they were located near mineral deposits and trade centers, suggesting a shifting of focus away from the land and agriculture, on which Neolithic ceremony had been centered, to this new form of wealth. In contrast, in east-central Brittany, where farming still predominated, the *allées couvertes* continued in use.

In the Iron Age the settlement pattern in Brittany consisted of small defended homesteads surrounded by circular ditch and bank constructions, similar to the rounds of Cornwall and the raths of Wales and Ireland.

Dwellings and Architecture

Allées couvertes *Allées couvertes*, or passage graves, monumental stone mortuary houses covered with long earthen mounds, began to be

built in Brittany in the fifth millennium B.C.E., around the same time that farming began. Such mounds became the focus of community life, symbols of connection to the land through the intercession of the ancestors whose bones they held. Domestic sites, in contrast, were insubstantial. The passage graves were built at first of drystone walling built up into corbelled vaults; later, large uprights were propped up against one another for strength so that they could bear even larger vertical dolmens. Islands in the Gulf of Morbihan, off southern Brittany, have some of the most impressive examples of such constructions. In about 3800 B.C.E., possibly in response to the advent of the Corded Ware culture, remarkable efforts at reconstruction were made, in which great stones were broken and used as capstones for new, even larger passage graves. One of these, the tomb on Gavrinis Island, has 28 massive granite wall slabs profusely covered with enigmatic ornamentation, a remarkable achievement given the hardness of granite.

Somewhat later long stone-lined cists, called gallery graves, were made in areas away from the older megalithic centers on the coast. They contained successive and layered interments of several hundreds of individuals. Such tombs served settlements patterned differently from the earlier single villages. Instead, in these “expanded villages,” small hamlets were scattered evenly across an area but centered on the local gallery grave. This compromise between aggregation and isolation of settlement is thought to have resulted from the final absorption of Mesolithic hunter-gatherers into the Neolithic way of life.

Breton Bell Beaker Culture and Stonehenge

The builders of the final phase of Stonehenge may have been influenced by their Beaker counterparts in Brittany. The shape and alignment of parts of the monument—including the horseshoe of trilithons—and the carvings on some of the stones have no parallels in Britain but echo numerous sites in Brittany.

Fogous Another example of the close connection of Brittany with Britain is the construction near their dwellings of stone-lined, elongated underground chambers called *fogous*, which are found nowhere else in France but are common in Britain. The purpose of these chambers is obscure. There is evidence for their use for grain storage but also in ritual and as hiding places in times of danger.

Transportation

By at least the Middle Bronze Age plank boats definitely capable of sea journeys were being made in the Atlantic coastal region of which Brittany was a part. Because evidence of wooden boats is rare, as a result of the deterioration of wood over time, they may have been made in much earlier times. The same is true for skin boats, of which the earliest evidence dates to the first century B.C.E.

Julius Caesar described the sturdy ocean-going ships of the Veneti of Armorica—massively constructed with thick nailed planks, high prowed and square rigged with sails of rawhide to withstand the Atlantic gales.

Art

La Tène Influences in the Iron Age The influence in Iron Age Brittany of the Celtic La Tène style is seen most clearly in pottery, on which La Tène motifs, arcs, palmettes, spirals, and other curvilinear features, but seldom the animal shapes common in other Celtic lands. Derived from metalwork, these motifs were incised and stamped. Pottery was decorated with graphite, giving it a metallic gray color.

Stone was another important medium at this time: stelae engraved with the same La Tène elements used for pottery and friezes with repeated S shapes, triangles, swastikas, or Greek key patterns. Some stelae are nearly of human height with longitudinal grooves resembling those of Greco-Roman columns; others had flat surfaces affording space for decoration. Such stelae are found only in Armorica, and many of them are reworked menhirs first erected in the Neolithic and Early Bronze Ages.

Breton Song Tradition The Breton language is kept alive in part by the rich tradition of sung poetry. Breton singers continue to write lyrical songs about love, both that of men and women and of the Breton countryside. The *fest-noz* (night festival) tradition calls singers, players of traditional instruments, including a form of Breton bagpipe; and dancers together.

The canticle-singing tradition of Brittany is embodied in one of the richest collections of traditional canticles in Europe, still sung in the many concerts and recitals in the churches and chapels across the region.

Literature

The earliest known examples of written Breton, from the seventh century C.E., consist of explanatory glosses in Latin manuscripts; only by the 14th century were extended compositions in Breton first written down. Thereafter until about the 17th century a fairly sizable corpus of religious mystery and miracle plays was written, among the best known *Mellezour an maru* (Mirror of Death). An important prose work was a Life of Saint Catherine, *Buhez Sante Cathell*, a translation of a Latin text written in 1576.

The rise of Breton nationalism, an essential part of whose character was a conservative and devout Catholicism, brought about a revival of Breton literary endeavors, including an 1827 translation of the Bible into Breton (in itself, no doubt, an act of protest against the anti-Catholicism in French-speaking France). Orally transmitted poetry, folktales, and other folk forms such as the riddle were written down at this time.

The Breton language continued to give birth to important works in the 20th century, perhaps the most well known the novel *Our Lady of the Carmelites* (1942) by Youenn Drezen. There are scholarly study of Breton and a vibrant literature of poetry and drama.

Religion

Bronze Age The astronomical alignments of many megalithic constructions may reflect the reliance of the seafaring peoples of the Atlantic coastal zone on celestial phenomena for navigation.

As elsewhere in the Atlantic zone, people of the Bell Beaker warrior ideology in Brittany, after an initial period of placing their burials away from the older Neolithic ceremonial sites, began to use passage graves to deposit offerings, most usually small gold ornaments rather than weapons. Later, in an apparent withdrawal from this form of rapprochement, they

cleared new areas on the edge of the Morbihan for their burials. At this time the great stone avenues of Carnac and Erdeven were built, perhaps in response to this threat. Later still Bell Beaker ideologues cleared entirely new areas for their burials near mineral deposits, perhaps signaling an end of compromise and a break with the past.

Iron Age Burial hoards containing multiple weapons, large amounts of pottery, and other offerings are found in Armorica as elsewhere in the Celtic world. Worked granite stelae mark the burials. The fact that many of these are reworked menhirs from millennia earlier shows a strong continuity of tradition embracing the newer Celtic elements. Shrines in the form of rectangular ritual enclosures have their analogues in other Celtic regions.

Christianity Many of the Britons who emigrated to Brittany in the fifth and sixth centuries were Christian, although the native Armoricans apparently were not. There is some evidence of Christian worship in Brittany by about 450; in about 520 Saint Samson, a Welsh monk who was a bishop in Cornwall, received a vision from God instructing him to evangelize in Brittany.

Many of the thousands of saints recognized in Brittany—but not officially canonized by Rome—are probably Christianized local Celtic or even older deities, judging by the fact that many of them are associated with holy healing wells and springs, the locus of worship for Iron Age Celts. Others heal specific maladies—headaches, digestive problems, and the like—while still others protect animals: Horses, cattle, and even chickens have their special saint. To the present Bretons have had an essentially pagan relationship with their saints, worshipping them for the aid they can give in this life as much as or more than their aid in the next. The seven founding saints of the Armorican bishoprics are all male: Saint Patern (Vannes), Saint Corentin (Quimper), Saint Briec, Saint Tugdual (Téguier), Saint Samson (Dol), Saint Malo, and Saint Pol-Aurélien (Saint-Pol-de-Léon). But the patron saint of Brittany, Saint Anne, is probably a Christian apotheosis of the great Celtic goddess Ana.

Pardons Special gatherings of pilgrims called pardons are a particularly Breton form of worship. Originating in the 15th century and still practiced today, pardons feature, aside from solemn masses, colorful processions of people wearing traditional garb—notably elaborate

white headdresses worn by women—and carrying crosses and statues. In coastal towns priests board boats and bless all the vessels in the harbor or bless the waters.

As they have for millennia, the people of the Armorican peninsula share a transnational culture with links all along Atlantic coastal Europe. Breton culture continues its robust independence from that of the rest of France, and Brittany has the distinction of being the last place in mainland Europe where a Celtic language is spoken.

Brigantes (Brigantii)

The Brigantes are classified as a Celtic tribe or confederation of tribes. They lived in Britain from the North Sea to the Irish Sea in the present-day counties of Cleveland, Durham, and Lancashire and the former county of Yorkshire, in present-day northern England. They are discussed as CELTS or BRITONS. The CORIONOTAE may have been a subtribe.

The Brigantes rulers Venutius and his wife, Cartimandua, made an alliance with the ROMANS in 43 C.E. Caractacus (Caradoc) of the CATUVELLAUNI, leader of a rebellion against Roman occupation, sought refuge with the Brigantes in 51 C.E., but Cartimandua turned him over to the Romans. She also supported the Romans against her husband, who became her rival. She held power for a time as a Roman client-queen until he regained control of the kingdom in 69 C.E. Rebel elements among the Brigantes repeatedly attacked Eboracum (modern York), provoking a Roman campaign against them in 72–74 C.E. The Romans finally subdued rebel elements 10 years later. Isurium Brigantum,

BRIGANTES

location:
North England

time period:
First century B.C.E. to fifth century C.E.

ancestry:
Celtic

language:
Brythonic (Celtic)

on the site of present-day Aldborough, was a *civitas* capital during the Roman occupation lasting until 410 C.E.

A group of Brigantes also lived in the present-day counties of Carlow, Kilkenny, and Laoighis in southeastern Ireland. The chief goddess of the Brigantes, Brigantia, has been referred to as the Gaelic Minerva and the mother of the gods. She is associated with St. Briget (Bridget or Brigid), the founder of a monastery at Kildare.

Brigantini

The Brigantini are classified as a Celtic tribe. They lived in Gaul around present-day Briançon in southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Briançon (formerly Brigantio) takes its name from the tribal name.

British: nationality (Britons; Brits; people of the United Kingdom of Great Britain)

GEOGRAPHY

Britain, a large island, is separated from mainland Europe by the English Channel, the Strait of Dover, and the North Sea. To the west, separating it from Ireland, are St. George's Channel, the Irish Sea, and the North Channel. In the north and west (Scotland, Wales, and parts of England) high hills and mountains make up the highland zone. In the south and east, rolling plains make up the lowland zone. Important rivers are the Thames and the Severn in England, and the Clyde and the Forth, now joined by a canal, in Scotland.

Numerous smaller islands are also considered part of the United Kingdom. Off the south coast is the Isle of Wight. Off the northwest coast of Wales is Anglesey. In the English Channel lie the Isles of Scilly. To the west of Scotland is the Hebrides archipelago, including the Inner and Outer Hebrides. To the northeast of Scotland are the Orkney Islands and the Shetland Islands. The Isle of Man in the Irish Sea and the Channel Islands in the English Channel are dependencies of the United Kingdom, with their own systems of government.

The term British is derived from the term Britain (or Great Britain), which is sometimes used interchangeably with United Kingdom, but more accurately describes the specific island of Britain, part of the archipelago known as the British Isles, as distinct from the

island of Ireland. The United Kingdom consists of three administrative divisions on the island of Britain—England in the south, Scotland in the north, Wales in the west—and Northern Ireland on the island of Ireland (see ENGLISH; SCOTS; WELSH; IRISH).

INCEPTION AS A NATION

Celtic Britain, the homeland of BRITONS, became a Roman province in the first century C.E. and was divided into the provinces of Britannia Superior and Britannia Inferior. Germanic tribes such as ANGLES, SAXONS, JUTES, and FRISIANS invaded the isles in the beginning of the fifth century (later becoming grouped as ANGLO-SAXONS). VIKINGS seized the lands in the eighth century; Wessex became a centralized kingdom later that century. In the 11th century the NORMANS conquered and expanded the feudal state; Henry II annexed Ireland in 1169–71, and Wales was made a principality in 1284. In the 16th century the English monarch became head of the Church of England, and Wales officially united with England. Scotland united with England and Wales in 1707, forming Great Britain. England formed a legislative union with Ireland in 1801 that officially established the United Kingdom of Great Britain and Ireland.

CULTURAL IDENTITY

British cultural identity, rather than arising out of a traditional ethnic culture, developed out of the birth of a modern nation and the evolution of a governmental system of parliamentary democracy aimed at promoting individual freedom. For the different ethnic groups of the British Isles—Scots, Welsh, and Irish—as they were absorbed into the political entity of Great Britain, mostly by force, the process of becoming British was one of shedding particular ethnicities and languages for an identity based on elements of modern economic and national life. These included being participants in democracy, in the burgeoning capitalistic economy, and in empire building. The older ethnicities were partly subsumed into identification with one's city or economic region (London, Edinburgh, Glasgow, Liverpool, Manchester, the Midlands, Welsh mining districts, Highland versus Lowland Scotland, etc.) and into religious affinities. This pattern left little room for a group cultural identity based on a long and ancient tradition—folk art and customs, traditional dress, food. Folk elements that still existed were steadily eroded from

BRITISH: NATIONALITY

nation:

United Kingdom (U.K.); United Kingdom of Great Britain and Northern Ireland

derivation of name:

From Britons, meaning "painted"; possibly from the Celtic goddess Brigid

government:

Constitutional monarchy

capital:

London

language:

Principally English is spoken; Welsh and Scottish Gaelic

religion:

About 45 percent of the population are Anglican, about 12 percent are nonreligious, and about 10 percent are Catholic; other religious minorities include Muslims, Hindus, Jews, and Sikhs.

Britons; Welsh; Scots; Irish; Picts; Cornish; Manx; Romans; Angles; Saxons; Jutes; Frisians; Anglo-Saxons; Vikings; Normans

demographics:

About 94 percent are British of varying Germanic and Celtic ancestry; ethnic minorities include Asian Indians, Pakistanis, Bangladeshis, Chinese, Caribbeans, and Africans.

about the 16th century, a process greatly accelerated by the Protestant Reformation, and also by increasing urbanization. The British pioneered modernity, becoming the first fully modern nation in which people left old folkways behind as the products of antique superstition and unreason for which society had no more use. (The history of the British version of Christmas is a noteworthy case in point; it was banned by Puritans after the Civil War as fostering social disorder and popery, then, after reinstatement, fell into disuse during the 18th century as much of the population moved into cities, breaking ties with old customs more typical of rural life. Then in the 19th century as part of the romantic wish to regress to the pre-Enlightenment past the traditional Christmas with its good cheer and generosity to the poor was used by the writer Charles Dickens and others as a means of decrying the heartless utilitarianism of modern British society and held up as a symbol of much that had been lost.)

The British did not leave behind their highly stratified class system, likewise based on tradition rather than reason, until the 20th century, and the British monarchy, with its pageantry, pomp, and circumstance, still serves as a point of cultural unity for the country. The sovereign is a symbol of more than a millennium of history and tradition and of the Anglican faith.

With the growth of empire Britons became internationalists, and part of what it meant to be British was to be involved in a world enterprise aimed at spreading British civilization to all peoples.

Today, as first the non-Ulster Irish and then the Welsh and Scots have gained political independence (in the case of the latter two a process called devolution), a great revival of the traditions of those peoples is taking place. Many among the English, who once formed the cultural center of gravity of the British, with the diffidence that is a typical English characteristic, find it awkward and difficult to assert their own cultural identity—even to know what it is. Waving of flags at international football matches has been one means of such assertion—Scots, for example, wave their flags with St. Andrew's Cross. Many English have followed their lead by waving flags with St. George's Cross; others feel that this sort of sentimental patriotism is beneath them. The devolution of Great Britain has left the English in what many feel is an anomalous

situation, expected to take the lead in carrying on the business of the British state after their former compatriots have left. (The Welsh and Scots are still part of Great Britain in the sense of maintaining allegiance to the monarchy, and the policies of the British government still have important consequences for all people living on the British Isles.) Although most English are justly proud of the achievements of the English people and simultaneously willing to see themselves as British, they do so with a certain sense that the term British has outlived its usefulness—or at least has shifted considerably in meaning. Plans by the British government in recent years to devolve England itself further into regions with autonomous parliaments have provoked calls to insist on the preservation of English nationhood alongside Scottish and Welsh nationhood.

A modern phenomenon that has had a profound effect on what it means to be British is the influx to Britain of people from former British colonies seeking economic opportunities, whose populations—West Indians, Indians, Pakistanis, and Africans—were granted British citizenship. London may now be the most cosmopolitan city in the world. Three hundred different languages are spoken there; there are some 50 communities with populations of 10,000 or more who were born elsewhere. Almost a third of London's residents were born outside England (2.2 million) and many tens of thousands more are second- or third-generation immigrants. But ethnic minorities are not restricted to London. More than half live elsewhere in the country. A great many of these, and particularly those born in Britain, consider themselves British without, however, abandoning their non-British ethnic identity. Asian and African British have evolved their own subcultures, with their own food, music, and English slang. Moreover, lifestyle groups, subcultures based on shared enthusiasms—music, football, horseback riding, bird watching—have in many ways substituted for notions of Britishness.

Englishness itself, in part through the development of the English language from Anglo-Saxon and Norman French, arose out of an amalgam of different cultural identities, as did Britishness, with its blend of English, Scottish, Welsh, and Irish cultures. It remains to be seen how the current meeting of cultures from around the world under the umbrella of British cultural identity—this time not accomplished by force—will fare.

British: nationality time line**C.E.**

- 1066** Normans conquer Anglo-Saxon England.
- 1169–71** Henry II acquires territories in France and invades Ireland.
- 1215** Magna Carta is signed.
- c. 1320** Birth of Dafydd ap Gwilym, greatest poet in Welsh language.
- 1337–1453** France defeats England in Hundred Years' War.
- 1381** Peasants' Revolt breaks out.
- 1400** Poet Geoffrey Chaucer does his final work on *Canterbury Tales* (never fully completed as he had planned), whose characters travel route taken in 1381 by rioters in Peasants' Revolt from Canterbury to London.
- 1455–85** Civil wars known as War of the Roses lead to Henry Tudor, as Henry VII, beginning Tudor dynasty.
- 1513** James IV of Scotland attempts to invade England; Battle of Flodden marks his defeat.
- 1516** Statesman and writer Sir Thomas More writes *Utopia*, which uses fictitious and ideal island realm to criticize English society.
- 1534** Henry VIII establishes and heads Church of England.
- 1536** Wales unites with England.
- 1575** Queen Elizabeth grants composers William Byrd and Thomas Tallis a patent for exclusive printing and selling of music.
- 1588** England, under Elizabeth I, defeats Spanish Armada.
- 1590** Sir Walter Raleigh, on reading through Edmund Spenser's draft of *The Faerie Queene*, encourages him to accompany him to London, where he presents celebrated poet to Queen Elizabeth.
- c. 1601–11** William Shakespeare writes, among other plays, many of his best-known tragedies, including *Hamlet*, *Othello*, *King Lear*, *Antony and Cleopatra*, and *Macbeth*, as well as plays in a new vein, tragicomedies *Cymbeline* and *The Winter's Tale*, and *The Tempest*, his last complete play.
- 1603** James VI of Scotland ascends English throne as James I, beginning Stuart line.
- 1607** Theologian Lancelot Andrewes is chosen to lead project to make new translation of Bible, which will come to be called King James Bible.
- 1620** *Novum Organum*, by Philosopher Francis Bacon is published; it helps to establish primacy of observation and experimentation in science.
- 1621** Poet John Donne is named dean of St. Paul's Cathedral, where he delivers brilliant and eloquent sermons.
- 1629** Charles I, son of James, dissolves Parliament; "the Eleven Years' Tyranny" begins.
- 1642** Charles I declares war on Parliament.
- 1644** After meeting with Italian astronomer Galileo Galilei in Florence, poet John Milton (who refers to Galileo's telescope in *Paradise Lost*) records their conversation in his celebrated plea for freedom of speech, *Areopagitica*.
- 1649–60** Oliver Cromwell governs England as commonwealth.
- 1660** Royal Society (Royal Society of London for Improving Natural Knowledge) is founded.
- 1660–69** Statesman Samuel Pepys keeps diary, documenting such events as London's Great Fire and ravages of plague.
- 1664–66** Mathematician and natural philosopher Isaac Newton produces his theory of universal gravitation, begins to develop calculus, and discovers that white light is composed of colors of spectrum.

(continues)

British: nationality time line (continued)

- 1667** Architect Christopher Wren receives first of several appointments that will put him in charge, for 50 years, of rebuilding of London, including St. Paul's Cathedral, after Great Fire of 1666.
- 1668** John Dryden becomes poet laureate.
- 1681–85** Charles II dissolves Parliament; rules as absolute monarch.
- 1688** William of Orange invades England.
- 1689** Henry Purcell composes opera *Dido and Aeneas*.
- 1690** Philosopher John Locke writes *Essay Concerning Human Understanding*, which sets forth conceptual basis for empiricism, maintaining that knowledge can come from experience alone and human mind is blank slate (*tabula rasa*) upon which experience writes.
- 1707** England and Scotland are formally united, forming Great Britain.
- 1714** First Hanoverian king, George I, ascends throne.
- 1719** *Robinson Crusoe*, adventure novel by Daniel Defoe, is published.
- 1726** *Gulliver's Travels*, novel by Jonathan Swift satirizing British society, is published.
- 1728** Poet Alexander Pope writes *The Dunciad*, lampoon on dull-witted verse of bad writers of his time.
- 1739–40** *A Treatise of Human Nature*, philosopher David Hume's most influential work, is published.
- 1739–41** War of Jenkins's Ear pits England against Spain over mercantile and maritime issues.
- 1741–68** Sir Robert Walpole, Whig member of Parliament, handles "South Seas Bubble."
- 1753** British Museum is founded in London.
- 1754** Architect Robert Adam travels in France and Italy, studying classical architecture that will influence his expression of Georgian style of architecture.
- 1755** *Dictionary of the English Language* by Samuel Johnson is published.
- 1756–63** In Seven Years' War England and France struggle for overseas empire.
- 1768** Portrait painter Joshua Reynolds, whose subjects included nearly every important personage of his time, is elected president of newly formed Royal Academy.
- 1769** Inventor James Watt receives his first patent on improvements to steam engine.
- 1770** Thomas Gainsborough paints *The Blue Boy*.
- 1775–83** American colonies gain independence in American Revolution.
- 1776** Economist Adam Smith writes *An Inquiry into the Nature and Causes of the Wealth of Nations*.
- 1784–86** Robert Burns discovers his poetic vocation as he learns about Scottish folk tradition and poetry composed in Scottish dialect; he produces some of his best known poems, such as "Hallowe'en" and "To a Mouse."
- 1789** Novelist-to-be Jane Austen, 14 years old, writes a story called "Love and Friendship" [sic], a parody of melodramatic fiction, foreshadowing by contrast irony that she would employ in her greatest novels.
- 1795** James Hutton, often called "the father of geology," summarizes his ideas in *Theory of Earth*.
- 1796** Physician Edward Jenner inoculates a boy with cow pox virus, successfully immunizing him against smallpox and laying groundwork for science of immunology.
- 1798** Poets Samuel Taylor Coleridge and William Wordsworth publish their collaborative work "Lyrical Ballads," considered founding inspiration for English romantic poetry movement.

- 1798** Economist Thomas Robert Malthus writes *An Essay on the Principle of Population*; his ideas, especially that populations have no inherent means of checking their growth, gave Charles Robert Darwin his starting point in developing his theory of natural selection by survival of fittest.
- 1801** Great Britain and Ireland are formally united.
- 1804** William Blake in his poem "Jerusalem" depicts "dark Satanic mills" of industrialization blighting "England's green and pleasant land."
- 1808** Chemist and physicist John Dalton publishes *A New System of Chemical Philosophy* in which substances (called elements) are classified according to weights of their atoms relative to weight of hydrogen atom; his system forms basis of periodic table of elements.
- 1811** 16 Luddites resist mechanization of their industry.
- 1812** First two cantos of *Childe Harold's Pilgrimage*, poem by Lord Byron, is published, whose main character introduces embodiment of English romantic sensibility.
- 1814** Walter Scott, in part because of poetic rivalry with Byron, transfers his focus from poetry to write his first novel, *Waverly*; he goes on to create genre of historical novel.
- 1815** William Smith publishes his *Geological Map of England and Wales, with Part of Scotland*, first such survey.
- 1816** Poet John Keats, 20 years old, passes difficult examinations to become apothecary and composes his first masterpiece, "On First Looking into Chapman's Homer."
- 1821** Poet Percy Bysshe Shelley writes "Adonais," elegy for John Keats.
- 1824** National Gallery is founded in London
- 12-year-old Charles Dickens, because of his father's indebtedness, is taken from school to work in shoe polish factory, experience that forms basis of his novel *David Copperfield*.
- John Constable's painting *The Hay Wain* is exhibited in Paris; its style and its painter's practice of painting outdoors would influence artists for decades, including French impressionists of latter 19th century.
- 1825** Royal Philharmonic Society performs German composer Ludwig van Beethoven's Ninth Symphony, commissioned by Society, one of its first foreign performances.
- 1830** Royal Geographical Society is founded in London.
- 1831–36** Naturalist Charles Darwin accompanies world voyage of *Beagle*.
- 1840** Artist Joseph Mallord William (J. M. W. Turner) paints *Slavers Throwing Overboard the Dead and Dying—Typhon [sic] Coming On (The Slave Ship)*.
- 1840s** Physicist James Prescott Joule experiments with weights falling through water to arrive at his calculation of mechanical equivalent of heat.
- 1842** Poet Alfred Tennyson, at end of 10-year self-imposed hiatus from publishing after death of his close friend Arthur Hallam, reveals *Poems*, which contains "Morte D'Arthur," based on Arthurian romance, "Lockesley Hall," and other classics.
- 1847** Three novels by sisters, Charlotte Brontë's *Jane Eyre*, Anne Brontë's *Agnes Grey*, and Emily Brontë's *Wuthering Heights* are published.
- 1848** Young Ireland movement rebels on behalf of Irish home rule.
- 1854–56** In Crimean War United Kingdom is ally of Ottoman Turks.
- 1856** National Portrait Galley is founded in London.
- 1871–72** *Middlemarch*, novel by Mary Ann Evans (pseudonym, George Eliot), is published.

(continues)

British: nationality time line (continued)

- 1873** Physicist James Clerk Maxwell writes *Treatise on Electricity and Magnetism*, which summarizes his ideas on essential identity of light, electricity, and magnetism.
- 1874** *Far from the Maddling Crowd*, romantic novel set in pastoral surroundings by Thomas Hardy, is published.
- 1877** British Empire around world reaches its greatest point of expansion.
- 1879** Shakespeare Memorial Theatre opens in Stratford-upon-Avon; in 1925 Royal Charter is granted; in 1960 Royal Shakespeare Company is formed.
- 1887** In his story "A Study in Scarlet" Arthur Conan Doyle introduces the character Sherlock Holmes.
- 1894** *The Jungle Book*, novel by Rudyard Kipling, is published; in 1907 he wins Nobel Prize in literature.
- 1899–1902** In Boer War United Kingdom defeats and annexes Transvaal and Orange Free State.
- 1907** National Museum of Wales is founded in Cardiff.
- 1913** Philosopher Bertrand Russell, along with Alfred North Whitehead, publishes *Principia Mathematica*.
- 1914–18** In World War I United Kingdom sides with Allies.
- 1916** Easter Rebellion against British rule erupts in Dublin.
Gustav Holst composes orchestral suite *The Planets*.
- 1919** League of Nations is established.
Nuclear physicist Ernest Rutherford sets off first artificially induced nuclear reaction.
- 1921** The Anglo-Irish Treaty creates Irish Free State (later known as the Republic of Ireland) within British Commonwealth of Nations.
- 1922** Poet T. S. (Thomas Sterns) Eliot writes *The Wasteland*, based on Arthurian Grail legend but informed by carnage and destruction of World War I; in 1948 he wins Nobel Prize in literature.
- 1924** *A Passage to India*, novel by E. M. (Edward Morgan) Forster, is published.
- 1927** British Broadcasting Corporation (BBC) is established as public corporation.
- 1932** Novelist and playwright John Galsworthy wins Nobel Prize in literature.
- 1933–38** Statesman and writer Winston Churchill completes *Marlborough His Life and Times*, hailed as one of greatest historical works of 20th century, about his 18th-century ancestor, military commander John Churchill, first duke of Marlborough.
- 1936** Economist John Maynard Keynes publishes *The General Theory of Employment, Interest, and Money*, theorizing that government spending is only way to lift an economy out of depression or recession and is necessary to maintain resistance to fluctuations in private investment.
Sculptor Henry Moore creates *Reclining Figure*.
- 1939–45** During World War II London is bombed by Germany.
- 1945** United Kingdom joins United Nations.
- 1949** United Kingdom joins North Atlantic Treaty Organization (NATO).
Nineteen Eighty-Four, satirical novel with concept of "Big Brother" by George Orwell, is published.

Britons (Britanni; Brittones; Brythons; Brithons; Hyperboreans)

The Britons were those people living in Britain and speaking Brythonic dialects of Celtic at the time the ROMANS arrived there in the first century B.C.E. through the time of the invasion of the Germanic ANGLES, FRISIANS, JUTES, and SAXONS (who became known as the ANGLO-SAXONS) in the fourth–fifth centuries C.E. The name is from the Latin name for Britain, Britannia, which may derive from Priteni (Pritani, Pretani, Prytani), the name the inhabitants of Britain called themselves in the fourth century B.C.E., according to the Greek navigator Pytheas of Massilia. Writing in the sixth century B.C.E., Hecataeus of Miletus, whose works are mostly lost but who is quoted by others, gave them the name Hyperboreans. These were people of Celtic culture, classified with other Celtic-speaking peoples in the embracing group CELTS. Britons as a classification also include WELSH and CORNISH. Britons from Wales migrated to southwestern Scotland, founding the kingdom of Strathclyde in the fifth century C.E. Other Britons, fleeing incursions of the ancient GERMANICS, settled among the GAULS in present-day Brittany in France in the sixth century C.E. and became known as BRETONS.

ORIGINS

The various Celtic-speaking peoples were the descendants of the tribes of the Bell Beaker and other Bronze Age cultures and before that of the peoples of the Neolithic cultures that developed after the introduction of farming practices to Europe. In Britain evidence of a distinctive burial style attributed to the Bell Beaker culture dates from around 2500 B.C.E.

Sources written by Romans and the archaeological record both indicate that a tribal people with a culture strongly influenced by the culture of the continental Celts inhabited Britain and Ireland at the time of the Roman conquest in the first century C.E. Their presence is attested, as well, by the Celtic languages spoken in Scotland, Wales, Cornwall, Ireland,

and the Isle of Man well into the modern era and, in the case of parts of Ireland and Scotland, to the present day. (Celtic languages are considered “markers” for the existence of other Celtic cultural features in the lives of their speakers.)

It was once assumed that this “Celticization” of the British Isles must have happened by conquest and the large-scale arrival of Celtic immigrants. However, the rich and fairly well studied archaeological record has failed to substantiate this process. The picture provided by archaeological evidence is rather one of undoubted influence from the Continent, which was absorbed and transformed into a distinct native culture. The carriers of such influences are more likely to have been traders than immigrants, for the most part; the only invasion for which possible evidence exists was that of the BELGAE, from the region of present-day Belgium, in the second century B.C.E. Chariot burials in Yorkshire bear a close resemblance to those of the PARISII of the Seine region in France, suggesting that a group from this tribe may have emigrated to Britain. But most contact must have been through the agency of the well-established and widespread trading networks of Celtic Europe, which had existed since the Bronze Age and greatly increased in scope with the beginning of large-scale exploitation of iron in the latter eighth century B.C.E.

Continental Influences in Britain during the Late Bronze Age

The first widespread culture generally identified as Celtic is called the Hallstatt culture, named after a site in the area of Hallstatt in the Austrian Alps. Although it reached its height in the Iron Age, its distinctive characteristics began to emerge in the Late Bronze Age around 1000 B.C.E. as a result of wealth acquired from its exportation of salt. Elements of the Hallstatt culture, which was influential in central temperate Europe from France to Poland, can be seen also in Britain. Improved metalworking techniques from Hallstatt Europe were adopted in Britain after 1000 B.C.E. Hallstatt-type hill forts were built in Britain, although there were also distinctly British forms, such as the crannog (see section on “Dwellings and Architecture”). Other important trends in Europe included the shift from inhumation to cremation around 1300 B.C.E., known as the Urnfield revolution, and

changes in farming practices occurred in Britain as well.

Climate Change in the Late Bronze Age

At the beginning of the Bronze Age the climate in Britain was warmer and drier than it is today, but during the period these conditions changed steadily until by the latter part of the second millennium B.C.E. the cooler, wetter climate was seriously impacting agriculture as formerly arable land became submerged in bogs and marsh. This condition was exacerbated by overgrazing and poor land management. Farmland was now a relatively scarce resource, and economic instability and competition for land are thought to have played a role in the greater importance of war in society. Although the hill forts and crannogs that came into use during this time had a defensive purpose, they also concentrated settlement and spared precious arable land for farming.

Arrival of the Iron Age in Britain

Knowledge of ironworking entered Britain before the end of the eighth century B.C.E. The earliest known sites where iron slag is found also contain artifacts in the style of what is called the Hallstatt C culture. Imported bronze and iron swords in Hallstatt C style have been found in different areas in Britain, especially in the southeast. However, typical Hallstatt C burials and settlements have not been found, their lack indicates the insular nature of British culture, in which only selected elements were chosen for imitation.

Only relatively few Hallstatt D (fifth–fourth century B.C.E.) artifacts have been found in Britain; these include daggers, razors, and horse trappings, some of them imported, the majority from native workshops. As in earlier times, native burial and settlement patterns persisted.

After the fourth century B.C.E. Britons partook of the La Tène culture, named after its type site in Switzerland, adopting many La Tène elements into their work in metals and other materials, but again reinterpreting them into their unique style. In common with other Celtic groups at this time, Britons in some areas increasingly aggregated into large hill forts.

LANGUAGE

The Britons spoke dialects of Brythonic or Brittonic, one of the branches of Insular Celtic (the other is Gaelic or Goidelic). Insular Celtic languages evolved in Britain and Ireland from

Continental Celtic, which comprised Celtic languages spoken in mainland Europe, including Gaulish (or Gallic), all of which have disappeared and are little known. The Brythonic dialects are thought to represent a later evolution from Continental Celtic than the Gaelic dialects, which retain archaic features of pronunciation and grammar. Another set of terms for the two main Insular Celtic groups is p-Celtic (Brythonic) and q-Celtic (Gaelic), referring to the fact that Brythonic dialects substitute the letter *p* in words for *q*, another sign of evolution away from Continental Celtic. The British language spoken in areas of Britain aside from Wales and Cornwall did not survive the Anglo-Saxon period and little

Some Tribal Groupings of Britons in the First Century C.E.

is known about it; there are fewer inscriptions in British than in Gaulish. The Breton language developed among descendants of

Britons who fled the Anglo-Saxons to settle in Brittany and probably has much in common with its ancestor.

HISTORY

The Early Britons in Greek Sources

The earliest historical sources on the Celts in general and the Britons in particular were Greek, probably as early as the sixth century B.C.E. The primary contacts of GREEKS with Celts took place in present-day southern France, where they established trade routes along rivers north into Hallstatt territories and in about 600 B.C.E. founded Massilia (modern Marseille, France) as a trading emporium at the mouth of the Rhône. But their trading interests included Britain, and an important trade route ran through the Carcassonne Gap in France and along the Garonne and Gironde Rivers to Brittany and Cornwall, both rich sources of tin used to make bronze. Greek travelers and traders probably visited Britain from at least this period forward. Later writers on Britain quote from a lost source of the sixth century, Hecataeus of Miletus, who called the Britons Hyperboreans. Another source, also lost but quoted by others, was Pytheas of Massilia, who from 320 to 310 B.C.E. sailed along the Atlantic coast to Britain and circumnavigated the island. Pytheas is known to have written a book about his voyage called *Peri tou okeanou* (On the ocean); and the information that the island of Britain was called by its inhabitants Albion, and that they called themselves Pretani or Priteni may have originated with him. Priteni is in all probability the derivation of the Latin Britannia. Pytheas made remarkably accurate measurements during his voyage; he estimated that in total the coastline of Britain was 42,500 stades (approximately 4,800 miles), comparable to today's estimate of 4,710 miles.

The Roman Diodorus Siculus, writing about Gaul and Britain, drew on the fourth–third-century B.C.E. Greek historian Timaeus of Tauromenium, whose own source is thought to have been Pytheas. Diodorus describes the inhabitants of Britain as being very friendly and as having adopted a civilized way of life as a result of their contacts with traders from the Mediterranean world. He writes that their behavior was “simple, very different from the shrewdness and vice that characterize the men of today,” and that their lifestyle was modest without luxury or wealth. Britain had a large population and an extremely cold climate. British kings and chiefs generally lived at peace with one another.

The Early Britons in Roman Sources

According to Julius Caesar subtribes of the Belgae invaded southeastern Britain and were

This iron and bronze linchpin, decorated with enamel studs, was used by Britons in the early first century C.E. (Drawing by Patti Erway)

living in coastal regions at the time he visited in 55 and 54 B.C.E.; he gives no date for these raids. Finds of Gallo-Belgic coins show that some sort of contact between Britons and Belgae dated from the end of the second century B.C.E.; by the time of Caesar's visit coins were being made in Britain. Through migration or trade by the end of the first century B.C.E. southeastern Britain had more in common with the Belgic regions across the English Channel than with many regions in the rest of Britain.

There seems to have been some migration of British tribes within Britain as well; probably in the first century B.C.E. Britons moved into southwestern Scotland and founded a kingdom in Strathclyde whose capital was Dumbarton.

Early Roman Expeditions

In 55 B.C.E. Julius Caesar led an expedition to southern Britain, probably because tribes there had sent aid to Armorican tribes in Brittany who had staged a revolt against the Romans the year before. Caesar embarked from Portus Itius (Boulogne) with two legions, comprising some 10,000 troops, and after crossing the English Channel landed at present-day Deal in Kent. Although initial skirmishes with British troops were successful for the Romans, bad weather

This 1895 print shows Julius Caesar leading Romans to Britain in 55 B.C.E. (*Library of Congress, Prints and Photographs Division [LC-USZ62-72046]*)

prevented necessary cavalry troops from joining Caesar, forcing him to cut the expedition short.

The next year, 54 B.C.E., Caesar sailed to Britain again with a much larger force of five legions and 2,000 cavalry troops. With this force Caesar encountered little resistance from Britons, allowing him to march 12 miles inland to the river Stour. British forces made a stand at a ford on the Stour (later the town of Canterbury) but were easily dispersed. The Britons then retreated to a hill fort, which the Seventh Roman legion attacked and captured. However, as had happened a year earlier a storm hampered Caesar's plans by wrecking many of his boats, forcing him to retreat to the shore and build a land fort to guard against the sabotage of the rest of his fleet, which had been beached for protection against the weather.

This hiatus gave the Britons under Cassivellaunus, ruler of the CATUVELLAUNI, a chance to regroup and assemble a large force. The Romans were able to handle this force as well, though less easily. Cassivellaunus, unable to win an outright battle against the Romans, resorted to guerrilla and scorched-earth tactics and used chariots to harrass the Roman legions. He also launched a counterattack against the Roman stronghold on the coast. His

efforts were jeopardized, however, by neighboring tribes who resented domination by Cassivellaunus; these included the TRINOVANTES and their allies the ANCALITES, BIBROCI, CASSI, CENIMAGNI, and SEGONTIACI (the latter five tribes, known to us only through Caesar's account), who declared themselves allies of the Romans. In the end Cassivellaunus surrendered to Caesar. He was given lenient terms, however, and further unrest in Gaul caused Caesar to end his expedition.

Extension of Roman Influence before Conquest

An apparently important burial, in a cemetery in Lexden, contained a medallion issued by the Roman emperor and an iron stool, a symbol of power. This grave had been covered by a huge barrow, further marking its significance. Roman sources attest that princes from Britain visited Augustan Rome, where, in all probability, they were presented with medallions and other gifts (even as Native American tribesmen were presented with medals by the United States government) as Augustus sought to widen Rome's sphere of influence.

The distribution of coin finds from this period documents the emergence of two distinct kingdoms on the sides of the river Thames. The northern kingdom encompassed the tribal territories of the Catuvellauni and Trinovantes, which were united in about 10 C.E. by the Catuvellaunian king Cunobelin (Cymbeline). The kingdom south of the Thames was ruled by kings who were courting Roman favor, judging by their coins stamped with the image of a vine leaf, symbol of the Roman wine that was being imported into Britain in vast amounts.

Important *oppida* (towns) at this time were Camulodunum (modern Colchester) of the Trinovantes and Verulamium (modern St. Albans) of the Catuvellauni; these, along with other large *oppida* in southern Britain, would later develop into important Roman towns.

The Roman Invasion

The Romans under the emperor Claudius I invaded Britain in 43 C.E. Far less is known in detail about this invasion because it lacked a chronicler of the caliber of Caesar. Claudius very likely organized the campaign in the hope of a victory to consolidate his hold on power in Rome, which was threatened by a movement to restore the republic.

The invasion apparently was launched mainly from Richborough in Kent, where a

major Roman military installation dating from this time has been found. The motives for the invasion are unknown. The initial campaign was so successful that later in the year Emperor Claudius himself traveled to Britain to receive the surrender of the *oppidum* (town) Camulodunum of the Trinovantes. The Romans then moved north to Lindum (modern Lincoln) and west to Deva (modern Chester) and Isca Silurum (modern Caerleon) of the SILURES. The Britons' resistance was led by Caratacus (Caradoc) and Togodumnus of the Catuvellauni, who had divided the kingdom of Cunobelin between them. The British forces gradually retreated before the Romans. Eventually Caratacus found refuge with either the ORDOVICES of Powys, or the CORNOVII of Shropshire in western Britain. After a final losing battle in 51 C.E. Caratacus was betrayed to the Romans by Queen Cartimandua of the BRIGANTES, among whom he had sought protection. He was taken to Rome in chains, along with his wife and family, and paraded before Claudius. The fortitude of his bearing impressed Claudius so much that he pardoned him and maintained him and his family in comfort in Rome for seven years. During this time many of his family became Christians, and after they returned to Britain, they worked to convert their fellow Britons.

According to the account of the invasion by the second–third-century C.E. Roman writer Dio Cassius (Cocceianus), the Romans invaded after an appeal for help by an exiled king Verica of the southern ATREBATES. On the other hand the Roman historian Tacitus of the first and second centuries C.E. tells of the implacable resistance of the Britons, followed by subjugation and enslavement. In the words of the British chieftain Calgacus, reported in the *Agricola* written by Tacitus about his father-in-law, Agricola's campaign in Britain, the Romans created desolation only to call it peace.

Many scholars now question Tacitus's version of events, particularly in light of evidence that important British tribes were practically Roman allies, and that trade with some Britons was flourishing. The Greek writer Strabo of the first centuries B.C.E. and C.E. tells us that British kings dedicated offerings to Rome and had virtually made the island a Roman province. Togidubnus of the REGNI engaged in a large-scale building program of palaces and temples and promoted the growth of towns and of municipal self-government along the line of towns in Gaul.

Togidubnus's capital was at Noviomagus (modern Chichester); an inscription found

there calls him Great King of Britain. A complex of Roman buildings near Fishbourne near the south coast of Britain was discovered to include a large Claudian military stores depot, suggesting that the invasion was launched from here as well as in Kent, further evidence that Togidubnus was an ally. The excavators of Fishbourne found that later in the first century C.E. the depot had expanded into a palace. A gold signet ring found there was inscribed "Tiberius Claudius Catuarus"; the last name is British. This evidently was a Briton granted Roman citizenship by the emperor Claudius; moreover he had been given senatorial or equestrian rank, as only the Roman aristocracy was entitled to wear a gold ring. This evidence suggests that whatever the scale of the invasion, it was welcomed by at least some British tribes as a way of increasing their wealth and status. It may even be that the Fishbourne palace belonged to Togidubnus himself.

During the first 20 years after the Roman arrival steady growth continued in the region. The old tribal center on the coast at Selsey was abandoned for Noviomagus; in the north Calleva (modern Silchester) continued on the same site. A self-governing *municipium* was established at the old Catuvellaunian center of Verulamium. This promising beginning was interrupted, however, by the Boudiccan revolt in 60–61 C.E.

Queen Boudicca's Revolt

In 60–61 C.E. Queen Boudicca (Boadicea) (see sidebar, p. 94) of the ICENI in eastern Britain led her people as well as Trinovantes in a revolt in which Camulodunum, Verulamium, and Londinium (modern London) were sacked and destroyed. This war was directed as much against fellow Britons as against Romans, because Verulamium was a self-governing *municipium* of the Trinovantes, and Londinium, founded by the Romans in about 50 C.E., was home to many Britons as well. Roman accounts say that 70,000 Romans were killed. The revolt succeeded in part because the governor of Britain, Suetonius Paulinus, was away on an expedition to deal with the SILURES in northern Wales. The revolt was finally suppressed when Suetonius gathered his armies and met Boudicca in battle at an unknown site, reportedly killing 80,000 of her warriors. She herself also died, possibly by taking her own life.

Tacitus, in emphasizing British opposition to Roman rule, may have downplayed the role of Rome's powerful British allies in helping to quell the Boudiccan rebellion; the fact

Queen Boudicca: Leader of the Briton Resistance

Boudicca is also known as Boadicea. Little is known of her early life. She was the wife of Prasutagus, the king of the Iceni, a tribe of Britons in the present-day county of Norfolk and in parts of adjoining counties in eastern England. She had at least two daughters.

In 43 C.E. the Iceni had surrendered their kingdom to the conquering Romans and the rule of Emperor Claudius. Prasutagus had been allowed to rule as a client-king of the Romans. Upon his death in 60 C.E. he left half his property to the Roman emperor Nero and half to his daughters.

According to the Roman writer Tacitus, Queen Boudicca's revolt of 60–61 C.E. started as a protest against the arrogance of the legionary veterans in the new *colonia* at Camulodunum. The corrupt procurator of the province seems to have attempted to encroach on the queen's prerogatives and those of other noble Iceni. Moreover the legionary veterans were not kept under adequate control and committed various acts of repression that inflamed the Iceni. Finally Boudicca was beaten publicly and her daughters were raped. The Roman writer Dio Cassius maintains, however, that the real cause of the revolt was the calling in of large loans made to the province by the Roman philosopher Seneca, which caused financial hardship among the Iceni.

In any case the Romans underestimated the leadership capabilities of Queen Boudicca. She led a rebellion in which the Iceni destroyed a number of Roman-held towns in the region, reportedly wiping out the populations and dismantling the houses stone by stone. She also defeated the Ninth Legion in battle, the largest such action taken by Britons. The Iceni continued pillaging Roman settlements for nearly two years until the Roman governor Suetonius Paulinus raised an army and defeated the Iceni in a battle, the site of which is not known. It is thought that soon after this defeat in 61 C.E. Queen Boudicca took her own life by poison rather than be taken prisoner.

Queen Boudicca is a British icon of national resistance. During the Victorian age a number of different painters and sculptors honored her. She has been cited as a feminist heroine in numerous texts. A statue of her stands on the Westminster Bridge in London. One theory holds that her body lies under London's King's Cross underground station.

From her Chariot, Queen Boudicca of the Iceni rallies Britons before a battle with the Romans, in this late-19th-century painting. (*Library of Congress, Prints and Photographs Division [LC-USZ62-122138]*)

that Togidubnus's towns of Calleva and Noviomagus were untouched may be evidence that his armies protected them. More compelling are that even after such a devastating rebellion, much of southeastern Britain remained in the hands of British kings and few Roman forts were built in the region. Togidubnus's realm was expanded after the rebellion, possibly as a reward for his aid. His territory may now have included the area of Aquae Sulis or Bath; at this time a new and unusual temple to Neptune and Minerva was constructed at Bath, at vast expense, to house the sacred spring of the British goddess Sul.

Continuing Conflict

Important campaigns against other British tribes included one waged from 72 to 74 C.E. against the Brigantes, who repeatedly attacked Eboracum (modern York) in northern Britain, and another against the Silures from 74 to 77 C.E. Resistance to Roman rule by the Ordovices caused then-governor Gnaeus Julius Agricola to lead a campaign from 79 to 85 C.E. to subdue them. This culminated in a victorious battle in 84 at a place called Mons Graupius, whose location is unknown but may have been north of Perth in Scotland. Securing the region north to the Firth of Forth, Agricola then led his armies all the way through Scotland, called by the Romans Caledonia, to the Firth of Clyde. The only source of information on this campaign is the Roman historian Tacitus, son-in-law of Agricola. Agricola and some of his troops were recalled in 84 C.E. to aid in campaigns against Germanic tribes east of the Rhine, and no further attempts were made to annex Caledonia.

Many scholars believe Tacitus exaggerated British resistance to make Agricola's northern campaign appear more glorious; some even doubt that the Battle of Mons Graupius was ever fought. There seems to have been debate in Rome as to whether his campaign so far north was necessary and whether the territory offered enough economic incentive to justify the effort and expense involved in its annexation. After the border was rolled back to the line of Hadrian's Wall, the northern tribes were successfully contained behind it for many years; it may be that Agricola's campaign and decisive victory were the deterrents responsible for this; on the other hand, the tribes may never have posed much of a threat, so his campaign was unnecessary. Thus it was certainly in Tacitus's interest to help his father-in-law politically by portraying the

northern tribes as a threat to Rome. In any case Agricola was recalled to Rome after his campaign and never served in Britain again. No further efforts were made to secure the territory north of the Forth, and the tribes there, the PICTS, were never subjugated. Tacitus notes with evident bitterness that his father-in-law's efforts to add another province to the empire had simply been abandoned.

Hadrian's Wall

Hadrian's Wall was built after the emperor Hadrian toured Britain in 122 C.E. and determined that the territory to the north should not be annexed. A deadly rebellion seven years before, in 115, in which northern tribesmen annihilated the Roman garrison at Eboracum, had shown the need for a change in the status quo. Hadrian's solution was to build a fortified wall 73 miles long, reaching from Solway Firth, on the Irish Sea, to the mouth of the Tyne River. The wall was actually a sort of extended fort, with fortified structures or "fortlets" at set intervals along its length.

Twenty years later another wall, called the Antonine Wall, was built across the narrowest part of the island, from the Firth of Forth to the Firth of Clyde, but the territory between it and Hadrian's Wall to the south functioned as a "no man's land," or buffer zone, between the northern tribes and Roman territory. For 200 years Hadrian's Wall marked the effective northernmost limit of the Roman Empire. It attracted small settlements of subsistence farmers along its length, probably for the security provided by the presence of Roman troops. However, it does not seem to have fostered economic growth in its immediate region. Its function seems to have been more as a forward staging area for expeditions by Roman troops to the north.

For the rest of the Roman era three legions were needed to keep northern Britain secure; this compares to the whole of northern Africa, which needed only one. The situation was far different in the south, where few Roman forts were built.

The End of Roman Britain

Germanic tribesmen, including Angles, Frisians, Jutes, and Saxons, from across the English Channel in present-day Schleswig-Holstein in Germany near the Danish coast, began raiding in Britain in the early fifth century and possibly as early as the late fourth century C.E. Roman governance in Britain ended in

410 with the withdrawal of the legions and government officials. Emperor Honorius, in issuing the order for the withdrawal, commanded that the Britons should now look after themselves. In about 430 groups of the Germanic tribesmen, whom historians call collectively Anglo-Saxons, began to settle in eastern Britain, with the main episode of early settlement in the mid-fifth century. Only in the sixth century did the Anglo-Saxons win control of most of lowland Britain. A generation or more separates established large-scale Anglo-Saxon settlement from the collapse of the Roman order.

The exact cause of the Roman collapse and how much of a role in it the Anglo-Saxons played are unclear. Events elsewhere in the empire, such as economic instability generated by loss of territory and tax revenues and the need to send the troops in Britain to defend other borders, undoubtedly were important factors. Another was a series of revolts by the army in Britain during the period 340–411, in which usurpers wanting to rule over Britain were backed each time by the Britons. These were Magnus Maximus in the 380s and Constantine III, who declared himself emperor of the whole Roman Empire in 406.

Anglo-Saxon Invasion and the Survival of the Britons: Myth and Legend

The Anglo-Saxon incursions had begun after Germanic *foederati* (federates), allies of the Romans, were invited to settle in Britain as a reward for their service in the fourth century C.E. According to a traditional story recorded by the British writer Gildas, Germanic tribesmen, mostly Angles, Jutes, and Saxons, were invited by a British king named Vortigern to help defend his kingdom against the Picts in the mid-fifth century. It is not known whether or not this really happened. The tradition of the Britons' inviting into their midst peoples who would ultimately lead to their own destruction may have derived from fourth-century German settlements that were sanctioned by Romano-British authorities. Unrest between these mercenaries and their employers in the southeast of England led to large-scale Germanic incursions and settlements near the coasts and along the river valleys. The Franks were part of this invasion. The incursions were halted for a generation by native resistance. Tradition associates this resistance with the names of Ambrosius Aurelianus and a British war leader named Arthur or Artorius (who may have served as the model for King Arthur),

which culminated in a victory in about 518 (some sources say 500) by the Britons at the Battle of Mons Badonicus (Mt. Badon) at an unidentified location.

This victory, if it happened, only temporarily stemmed the Anglo-Saxon tide, and before the sixth century had ended, the Britons had been driven west to the borders of Dumnonia (modern Cornwall and Devon), once the homeland of the DUMNONII, and to the Welsh Marches, while invaders were advancing west of the Pennines and northward into Lothian. In western Britain the Britons were able to keep out the Germanic tribesmen, and for some centuries a British hegemony was established there, particularly in Wales, which seems to have maintained some elements of the previous Romano-British culture, such as Latin literacy, classical tastes, and trade links with the Mediterranean. This culture has sometimes been interpreted to mean that Britons in the west retained the whole political framework inherited from the Romans of the fourth century. However, it may mean no more than that the native elites used the forms and symbols of *Romanitas* to legitimize their claims to wealth and power. Their Roman-looking material culture may have been no more than a thin veneer. But British Celtic languages continued to be spoken in Wales and Cornwall almost to the present day.

Many Britons in Anglo-Saxon territories in the east survived to become slaves or servants of their conquerors. Excavations of cemeteries there show that about half of the graves during the fifth and sixth centuries are of Britons and half of Anglo-Saxons; the weapons and rich grave goods of the latter show they were clearly masters and the poverty of British graves indicates they were servants.

The term Britons ceased to be used to designate a specific nation or people about that time. The Britons who lived in areas dominated by the Anglo-Saxons had assimilated with them to the extent that a new term came into use: English. Britons and Anglo-Saxons had fused into a new people. The Britons who had emigrated into western Britain, together with indigenous tribes, were called after this time the Welsh. Tribes in the southwesternmost peninsula of Britain came to be called Cornish. All these peoples are grouped together as British.

CULTURE (see also CELTS)

Economy

Farming in Bronze Age Britain British society, like that of the rest of Celtic Europe, was

based on farming. The majority of the population lived in farming homesteads scattered fairly evenly over the countryside. In regions where a substantial proportion of the land was wetland, arable land was spared for farming by building crannog settlements on artificial islands in lakes. In the case of some hill forts, much of the land within them was farmed and subjected to intensive soil improvement measures such as manuring. The earliest use of Danebury hill-fort in Wessex in the seventh and sixth centuries B.C.E. was apparently as a communal grain storage area and cattle pen, probably during the autumn and winter. People living in areas where streams or rivers were prone to flooding had recourse to building walled areas to protect fields, cattle, and stored grain.

The climate and hilly landscape of Britain differed from that of Celtic European lands in being more suited to stock farming than cereal raising; sheep were important. Britain was especially affected by the cooler, wetter climate of the Late Bronze Age. Cereals were grown but in only garden-scale plots; cereal such as barley may have been more important for brewing beer than for baking bread. In the Late Bronze Age and into the Iron Age the increase in the numbers of animals being kept led to wall construction and increasing landscaping.

A common farming technique, especially in northern Britain, was the use of “cord riggs,” narrow ridges of earth about a yard across formed by spades or hoes rather than plows.

In Iron Age Britain wild animals and plants seem to have formed an insignificant proportion of the total diet. But where wild animal remains are found on sites, they often are from ritual deposits, possibly indicating that hunting and eating wild animals and fish are taboo and only allowed on special occasions.

Trade Trade with the Continent in the Late Bronze Age and Early Iron Age was organized into two basic networks: one along the Atlantic coast to western Britain and another from northern France and present-day Belgium and Netherlands carrying goods from the interior along the Rhine. Trade with Britain had been important since the beginning of the Bronze Age because one of the few sources of tin in Europe, which was alloyed with copper to make bronze, was in Cornwall. Dartmoor had copper, gold, and silver. Ireland was particularly rich in gold, and British traders acted as middlemen to transship Irish gold to Europe. One

important port was Mount Batten, a headland on the south bank of the Plym estuary in Devon, located 12 miles south of Dartmoor; ores would have been transported by boat along the Plym River. From there they probably were transported to Brittany, the Kingdom of Tartessus in present-day southern Spain, and, after the seventh century, to the Greek trading city of Massalia in present-day southern France.

In the earlier Iron Age trade with the Continent centered on Wessex with its port at Hengistbury; three different rivers in the region are called Avon, probably derived from the Celtic word for river, *afon*. After the Belgae established themselves in eastern Britain, they traded extensively with other Gauls. As long as the traffic consisted in small quantities of relatively precious materials, the river routes centering on the three Avons were the best channels of long-distance contact.

When materials began to be carried in bulk, as trade with the Romans became more important, the Thames corridor, with its wide, east-facing estuary (convenient for the Rhine and the Seine), began to be a more suitable route of entry. Thus the importance of London as a trading center was a product of the Romans' expansion of trade. Britons obtained large quantities of wine from the Romans in exchange for hides.

Government and Society

Throughout much of the Celtic period society in Britain remained relatively unchanged and was very similar to that in other Celtic areas, as most of the population engaged in little more than subsistence farming. Kings and warrior elites existed, as attested by the hill forts and by luxury items such as finely wrought swords, shields, and jewelry from the period, but their lifestyle was more probably the exception than the rule. In some areas, such as in southeastern Britain, hill forts were the dominant settlement form, demonstrating the existence of a hierarchical society; more of Britain, however, featured scattered agricultural settlements of varying character and size, whose long histories show that people had found a way of living in a stable equilibrium with their environment. Each community was relatively self-sufficient, with craftsmen supplying their needs for metalwork, cloth and clothing, pottery, and other items. Metalworkers, in particular, probably were held in high esteem in society.

Society during the Celtic period was not static, however, and there was a trend toward

greater social stratification with accumulation of wealth by the elite, as well as an increasing importance of trade, which both fostered and was strengthened by the increasing size of population centers. The growing influence of Rome accelerated these changes.

Romanization of the Britons The extent to which Britons accepted Roman rule and culture has been difficult to assess. There has been a tendency for scholars to describe Romanization of the Britons as either highly successful or strongly resisted throughout the Roman period. Archaeological finds answer some questions. Some tribes in the south do seem to have welcomed the coming of the Romans; others did not.

The Roman road system, established within a generation or two after the Roman occupation in the first century C.E., played a crucial role in transforming Britain into a Roman province. The road system fostered the growth of planned towns and in turn of the economic system. Roads were laid out with a sophisticated surveying system, with gravel surfaces and bridges where necessary. In contrast to the roads of the Britons, which followed natural routes such as river valleys, the routes of Roman roads in many cases were dictated by economic or military needs and would not necessarily follow the easiest route in terms of landscape but would connect forts or towns by the shortest route. As a result the relationship of people to the landscape was greatly altered. Rivers were also an important mode of transportation, particularly of bulk trade goods; the Romans facilitated the use of rivers by creating harbors at ports to aid loading and unloading.

The Romans founded colonies (*coloniae*) of Roman citizens. These were organized into *civitates* (singular, *civitas*), self-governed regions based largely on tribal territories. Each *civitas* had a capital, often at the location of a British *oppidum*, although new towns were sometimes established. They were typically governed by the Britons themselves, although under the supervision of Roman provincial administration based in London. This system saved money and made allies of potential enemies, in effect Romanizing the Celtic aristocracy. These *civitates* generally had an elected council and magistrates. New building materials and Roman architectural styles were used to construct shops, public buildings, and large private homes.

Parts of Britain were organized into the Roman villa system of large farming estates; in

regions farther from the town-road system, farming patterns, including primary crops and field systems, remained unchanged. Many of the changes by the Romans, such as expansion of trade and abandonment of hill forts, had already been under way before the conquest. Roman influence had preceded Roman arms.

Large-scale surveys of rates of building in Roman towns and cities across Britain reveal a clear pattern of high activity in urban areas from about 75 to 150 C.E. in public building, and construction of most private townhouses took place from about 150 to 225. Urban occupation (measured by rooms in use) reached peak levels in the early third century. After that, however, civic construction work largely ceased as resources were diverted into building town walls in the mid- to late third century C.E. From around 325 Romano-British towns faced terminal decline. Few new buildings were erected, and by about 400 many old ones were abandoned.

The villa system also was central to Romanization of the British economy. Roman villas were worked by slaves and serfs called *villeins*, perhaps the fate of many of the British natives. Archaeological surveys show that 300 marked the peak of new building work undertaken on villas; by the year 350 this amount fell by almost two-thirds. A majority of villas had been abandoned by about 375 and virtually all by about 400.

Native villages and farmsteads fared somewhat better, but many were still deserted or contracted sharply in the fourth century. A survey of 317 native rural sites in the Severn valley/Welsh Marches region discovered a decrease of 27 percent in the number occupied between the years 100–150 and 350–400.

Dwellings and Architecture

Roundhouses The dwellings of the Britons were similar to those of most Celtic peoples; the roundhouse was the basic building style, with smaller rectangular structures used as outbuildings. Buildings were made with the wattle and daub technique, consisting of upright timbers interwoven with hazel, oak, ash, or willow saplings, and plastered with a mixture of clay, straw, and manure. Roundhouses had conical thatched roofs and sometimes an entrance porch. The saplings used in building and also for firewood were probably obtained by coppicing, the practice of cutting down trees to stumps from which saplings sprouted, a far easier method of

obtaining usable wood than cutting down full-sized trees. In northern Britain roundhouses were more commonly made of stone; farmsteads were often surrounded by roughly rectangular enclosures consisting of a stone wall or a bank and ditch.

Roundhouses had raised wooden platforms against the interior walls to use as seating and also as beds. At the center of the house was an open hearth fire, which would have been kept burning at all times. They had no chimneys; instead, the porous thatched roof absorbed smoke. Pots made of local clay and, for the wealthier, bronze cauldrons suspended by a chain over the fire were used for cooking. Wheel-thrown pottery began to be made during Iron Age Britain.

Oppida *Oppida*, sometimes built as hill forts, were enclosed villages in which much of the acreage was given over to farm fields. A farm settlement in Cornwall studied by archaeologists is typical, although relatively large, covering some 30 acres. It contains the remains of about 90 structures; most of these represent the repeated rebuildings of about 10 farmsteads, each consisting of about four roundhouses and a four-post structure, possibly a small grain store. The settlement, located in a floodplain, was repeatedly flooded during its early years; the houses built then were insubstantial thatched structures supported on rings of narrow stakes. The earlier settlement lacked the deep bell-shaped pits usually used by Britons for long-term storage. Despite the transient nature of these dwellings, each is surrounded by a broken (“pennanular”) storm-water gully showing the inhabitants’ attempts to cope with their wet environment. House entrances faced southeast, as was traditional in the British Iron Age. Stone-lined underground passages, called *fogous*, are often associated with settlements; their purpose is unknown. Various possibilities include grain storage, hiding places in case of war, and shrines for religious rituals.

Later in the Celtic period as trade increased in importance some *oppida* began to resemble towns more than farming hamlets, with most of their area given to houses organized along streets, and people worked in craft industries. At Danebury hill fort in Wessex in the latter half of the sixth century the first in a long series of what were probably shrines was built in the center facing the east entrance. Much more of its area was given to dwellings built along roads in addition to larger granaries

than earlier in its existence. Occupation in Danebury continued for centuries, and multiple, well-stratified occupation and rebuilding layers can clearly be seen. During its last phase, until 100 B.C.E., when its main gate was burned, stone-measuring weights found there suggest trading activity, as do the salt containers, iron ingots, imported shale for making of bracelets, and evidence of bronze making. Pits near the entrance contained mutilated bodies, evidence that Danebury, perhaps because of its wealth, met its demise in war.

In general, *oppida* were well organized, with paved roads and distinct work and settlement areas. Metalworking, pottery making, and the fashioning of shale, bone, and amber into ornaments took place on a larger scale in hill forts than in most of the countryside. The largest *oppidium* yet found in Britain, near Reading, may have been as much as 300 acres in area. Dozens of timber and thatched houses in the hill fort were arranged in regular rows; each house was nearly eight meters in diameter, some with extensions that may have been porches. There is evidence of steam baths that may have taken the form of tents in which water was poured over heated stones. Wells some four meters in diameter and a meter and a half deep provided water. Environmental evidence shows that wheat, barley, and flax were grown.

Defensive Structures Many Late Bronze Age defensive sites in Britain consisted of simple enclosures of banks and ditches with ramparts faced with timber framing and filled with earth and stone rubble. They are distributed fairly evenly over the countryside, illustrating the lack of much concentration of political power, but also suggesting that warfare was probably endemic. Late Bronze Age hill forts in Britain, though fewer in number, were basically similar to those built all over the mainland as far away as Poland.

Another form of defensive structure typical of the British Isles was the crannog, an artificial island built in a lake or marsh by driving a circular framework of vertical timbers into the lake floor and filling it with boulders and clay topped with a timber, clay-covered platform on which a house was built. Many crannogs were used for centuries, long after it was forgotten that they were not natural formations. One unusually large crannog was built in Flag Fen in Peterborough, England, around 1000 B.C.E.; an estimated million logs were used in its construction. It supported multiple rectangular buildings, a departure

from the usual roundhouse. Some have proposed that crannogs were built less for defensive purposes than for reservation of valuable arable land to farming. The rich water meadows of Flag Fen would have been prime grazing grounds. The timbers preserved by their immersion in water show the very high level of woodworking skill of the builders, even though they were using only adzes and chisels unchanged from those of the past.

Organized systems of timber trackways were built in the wetland regions to connect crannogs and other settlements. Tracks were constructed of transverse bearers pegged into place by long stakes driven through holes in the planks and resting on a substructure often of birch and alder brushwood. Other tracks had walking surfaces of bundles of brushwood pegged into place along the sides and in the middle.

Transportation

Several British boats have been found dating from the Late Bronze Age to the Iron Age, built with planks, stitched together with bindings of yew and caulked with moss held in position with oaken laths. Transverse timbers connected the bottom planks laterally. The ends of the boats were closed with watertight transoms (horizontal timbers); they would have been propelled by oars. Flat-bottomed boats of this kind date from as early as 1350 to as late as 800 B.C.E., showing that this building tradition was long-lived. The boats seem to have been used for river travel.

Other Technologies

Metalworking In Late Bronze Age Britain native metalworking was strongly influenced by Hallstatt styles. After 1000 B.C.E. new metal types were introduced, including leaf-shaped swords or flanged-tanged swords, leaf-shaped spearheads, spearheads with peghole fixings instead of loops, and socketed ax heads. British smiths mastered the casting of sockets and rivet holes and the production of large and complex objects using clay and metal molds. By the beginning of the Iron Age they had also mastered the “lost-wax” technique, used for casting on the handles of buckets and cauldrons. Britons used bronzes alloyed with lead, possibly because they allowed large-scale and rapid production of popular types of artifacts. Numerous leaded bronze objects from this time were poorly finished and perhaps were intended for a mass market.

British smiths made thin bronze shields useless for defense, as did smiths in Europe, underscoring the fact that bronze was at least as important as a precious metal as gold, used for display and prestige. On the other hand many useful items were made of bronze, such as flesh hooks to lift pieces of meat out of stews simmering in cauldrons.

Resources Britain was an important source for both tin and copper, which were needed to make bronze; ingots of these ores, as well as bronze itself, were exported from Britain to the rest of Europe throughout the Bronze and Iron Ages. Britons also exported gold and silver.

Coal was first used as a fuel in Britain in the Iron Age before the arrival of the Romans. Large quantities of coal fragments, many of them burned or charred, have been found in the defensive ditches of an enclosed Late Iron Age settlement at Port Seton near Edinburgh.

Romano-British Technology A major lead-mining operation was created by the Romans in an area of Wessex called the Mendips; this natural resource was hardly used by the pre-Roman peoples. In general, under the Romans, the levels of production in many existing industries increased dramatically, such as that of pottery. Innovations such as the potter's wheel also came into use on a large scale at this time. In the construction industry bricks, tiles, shale, and stone began to be used in addition to wattle, daub, and timber.

Art

British artisans were highly influenced by the stylized curvilinear art style called La Tène, which originated in the Rhine-Moselle region of France and Germany. They reinterpreted the La Tène style into a local variant in which certain motifs and forms were favored. For example, a comma-shaped decorative motif common in La Tène art borders and for evocation of sprouting plants was used by British artisans in threes to form disks reminiscent of the Chinese yin-yang symbol. Dragon pairs were a common motif on British swords. Characteristic of British metalwork at this time were the incised geometric or curvilinear shapes that were set off by areas of cross-hatching, giving an impression of shading.

Fine examples of British art include the Battersea Shield, the Thames bronze helmet, and the Snettisham gold torc (torque), a necklace of twisted metal. The Battersea Shield (from as early as the fourth century), actually a bronze cover for a wooden shield, is in the La Tène style. The bronze helmet is the only Iron

Age helmet with horns ever to have been found anywhere in Europe. The torc, dating from the first century B.C.E., was made with just over a kilogram of gold mixed with silver. It is made from 64 threads of gold wire, which were twisted together to make eight separate ropes of metal. These were then twisted around each other to make the final torque. The elaborate terminals of the torque were mold cast and then welded onto the ropes. The complexity of design and execution of the torc rivals others made at the time anywhere in the world, including Greece, Rome, and China.

One of the most famous artworks of the Celtic period in Britain is the Uffington White Horse, a 110-foot-long figure cut into the turf-covered chalk south of Uffington village on the Berkshire downs. The cuts made into the green turf reveal the white chalk beneath. The horse shape is evoked with masterful economy by a single curving line from tail tip to nose, with four graceful lines for legs, giving an impression of flowing speed. The horse is situated below an Iron Age hill fort but was made earlier, in the Bronze Age around 1000 B.C.E. In subsequent centuries other similar figures were made elsewhere in Britain, perhaps inspired by the Uffington horse. Iron Age Britons may have identified the horse with the horse goddess Epona. The chalk cuts need to be scoured clear of vegetation periodically, as has been done continuously since it was created; it is thought that in Celtic times this scouring took the form of a religious ritual.

Romano-British Art Pottery and other artifacts made in Britain after the Roman conquest evolved into a distinct style incorporating elements of both Roman and British styles into a true synthesis. Pottery in the new style is known initially around 130 C.E.; at this time even Roman soldiers began using pottery with recognizably British characteristics—in type of clay used, shape, and decoration. An important industry in this new style is called Castor ware, made in large quantities in Northamptonshire. It had a highly glazed surface and ornamentation in relief resembling Samian Ware, the dominant Roman pottery type. There were many animal groups on this ware, particularly hunting scenes, but only rarely human figures, possibly because British artisans lacked the specialized training needed to create human figures with enough realism to satisfy Roman customers. The reliefs were made not by stamping with dies as Romans did but by squeezing out wet clay from funnels somewhat

like those used today to decorate cakes with icing.

A masterwork of Romano-British art is a relief from the temple of Sul-Minerva at Bath, made during the first century C.E. It shows the face of a bearded Gorgon on the shield of the Roman goddess Minerva.

Literature

The Roman officer Agricola is said to have thought that the Britons were superior to the Gauls in literature and rhetoric. Yet no British poet or writer of the Roman era has left a name for posterity. It is in the realm of religion and philosophy that the British monk and theologian Pelagius and the Irish patron saint Patrick made their mark in the fourth and fifth centuries. Pelagius developed a Christian theology that challenged the prevailing ideas of St. Augustine and became influential enough to warrant being damned by the Roman Church as heresy. Pelagius preached the freedom of the human will, in contrast to Augustine's insistence on predestination and God's grace as the only hope of salvation. St. Patrick's most famous work is *Confession*, an account of his career.

The writer, the earliest British writer known by name, Gildas was a monk born in Scotland of noble British parents in about 516. He was educated in Wales. After embracing Christianity and living for a time in Ireland he retreated to an island off the coast of Brittany. There he wrote *De excidio Britannae liber querulus*, which includes an outline of British history from the Roman invasion to his own time, and an epistle of severe rebuke addressed to five petty British kings, Constantine, Vortipor, Cyneglas, Cynan, and Maelgwn. In the same epistle he addresses the British clergy, accusing them of the sins of sloth and simony. His writings reveal Gildas to be a man of considerable culture for his time, with a thorough knowledge of Scripture. He died in 570 and was later canonized as a saint of the Roman Catholic Church. Gildas is considered the first British historian and was quoted by the later Anglo-Saxon historians Bede and Alcuin.

Religion

Religious practices among the Britons were not confined to special ritual sites. The sacred pervaded every aspect of life, including daily activities. Religious belief documented in medieval Welsh literature has close analogues with that of Ireland. As in other Celtic lands, the names of gods and goddesses differed, but their functions were similar. The Irish goddess Brighid,

for example, had British equivalents in the goddess Sul (Sulis), the healing goddess of Bath (known to the Romans as *Acquae Sulis*), and Brigantia of the tribe of the Brigantes of northern Britain. The Welsh Llew was called Lugh in Ireland, and Lugus in Gaul. This god may be the same as the god Caesar calls Mercury. There is some reason to believe that Britain was the heartland of the Druids' religion, and that Stonehenge, a monumental stone construction built in the Early Bronze Age, was a center of Druidic worship. Julius Caesar mentions that the seat of Druidic learning was in Britain and that Gauls would send their sons there to study.

Romano-British Religion Although the impact of the Romans on British religion appears dramatic, judging by the many temples they built in Roman style, the native British and Roman religious systems were similar in a number of ways. Both venerated sacred places in the landscape and practiced ritual sacrifice and corresponding festivals during the year. Celtic gods had many analogues with gods of the Romans. Though Roman temples had many classical elements, their style represented a true fusion of the Roman and the Celtic, as did the cults practiced in them. Burial practices changed, and there was a general shift toward cremation. In all, however, the Roman tradition of religious tolerance ensured that a strong strain of indigenous British religious practice would endure.

Many sacred sites from the pre-Roman period remained so after the invasion. Many were rebuilt in the early Roman period on virtually the same plan and directly on top of preceding British temples, only differing in being larger. Even at Bath, one of the most truly classical sites in Britain, continuity probably prevailed. Although the appearance of the sacred spring changed dramatically, this was in all probability merely an overlay upon the cult of the Celtic goddess Sulis, now called Sul Minerva. The use of sacred springs and rivers as ritual sites had a long history among Britons. Bronze and gold objects such as torcs and pieces of horse gear were "sacrificed" by being thrown into rivers, such as the Thames, where many objects have been found.

Christianity Christianity was established in Britain under the auspices of the Romans, and by the fourth century C.E. Britons were sending missionaries to pagan peoples. The most famous of these was probably St. Patrick, who established Christianity and a distinctive Celtic form of church organization in Ireland in the fifth century. With the Anglo-Saxons,

Christianity disappeared in all but western and northern Britain and Scotland.

Until the expansion of the Roman Empire into Britain it is not clear that in terms of ethnicity its inhabitants had changed to any great extent since the Neolithic Age or even earlier. In culture as well as people, the Britons participated in the long trends of cultural and ethnic change that, from time to time, slowly pulsed across the Eurasian continent and in the Iron Age culminated in the pan-Celtic culture.

Their end as a distinct people, like that of so many others, occurred as the pace and magnitude of change increased dramatically with the coming and collapse of the Roman Empire, and a millennia-old world was swept away. The effect of this on the Britons was mediated by a situation favorably balanced between isolation and connection with the mainland, between the insular and the continental—the island of Britain was large enough to contain a variety of environments, which generated a variety of lifeways among its people. British culture, both cosmopolitan and local, combined the flexibility to absorb new influences with a tough resiliency. The appearance of an “English” culture only some 200 years after large-scale migration of Anglo-Saxons into Britain, consisting of an equal partnership of British and Anglo-Saxon elements, is a testament to the staying power of British culture and the Britons.

Bructeri (Bructerians; Bructi; Brutteri)

The Bructeri are classified as a Germanic tribe. They lived east of the Rhine in present-day western Germany by the end of the first century B.C.E. and are discussed as ancient Germans or GERMANICS. By the third century C.E. they had become allied with other tribes—the AMSIVARII, CHAMAVI, CHATTUARI, and TUBANTI—as FRANKS.

Bruttii (Brittiii; Bruzi; Brezi)

In the historic period they were speaking Oscan (as well as Greek), leading to their classification as ITALICS. The Bruttii are classified as an Italic tribe. They lived in the region of Bruttium, present-day Calabria, on Italy's southwestern peninsula opposite Sicily. Their principal towns consisted of their capital Consentia (modern Cosenza), Clampetia (modern Amantea), and Petelia (near modern Strongoli).

In the mid-fourth century B.C.E. the Brutii, along with the LUCANI, neighbors to their north, made war on colonies of GREEKS, seizing Hipponium (modern Vibo Valentia) in 356 B.C.E. Alexander I, king of Epirus and Agathocles, tyrant of Syracuse, pacified them, but they regained the town in the early third century B.C.E. The Bruttii supported the Greeks under Pyrrhus, king of Epirus, against the ROMANS. After his defeat at Beneventum (modern Benvento) in the Pyrrhic War of 280–275 B.C.E. the Romans claimed half the Bruttii territory in the Sila Forest and established colonies

at Hipponium and Rhegium (now Reggio di Calabria).

The Bruttii rose up again against the Romans in support of the CARTHAGINIANS under Hannibal in the Second Punic War of 218–201 B.C.E. After Roman victory the Bruttii lost independent status. The Romans built a road to the region in 132 B.C.E. During the slave revolt against Rome under Spartacus in 73–71 B.C.E. the rebels stayed for a time in Bruttium. Although the Bruttii did not openly support him, some among them may have joined his force.

Bulgarians: nationality (people of Bulgaria)

GEOGRAPHY

Bulgaria has an area of 42,855 square miles. The Danube River separates the nation from Romania in the north. The Black Sea extends from the east. Serbia and Montenegro and Macedonia are situated to the west; Greece and Turkey lie to the south. The Balkan Mountains run east to west across central Bulgaria. To the southwest lies the Rhodope range, where Bulgaria's highest point, Mount Musala (9,592 feet), is located. The northern Bulgarian plateau extends from north of the Balkan Mountains to the Danube River. The Thracian plain lies to the south of the Balkans. Important rivers in Bulgaria include the Danube, which constitutes its northern border; the Iskur; the Maritsa; and the Struma.

INCEPTION AS A NATION

During rule by the ROMANS, the area that was to become Bulgaria was divided into the provinces of Moesia and Thrace. The BULGARS settled north of the Black Sea around the fifth century C.E. After Bulgar armies defeated Byzantine emperor Constantine IV in 681, a treaty designated an area between the Balkans and the Danube as Bulgar territory, establishing the first Bulgarian state. In 865 Boris I, ruler of the First Bulgarian Empire, adopted Christianity, which helped unite diverse peoples, including SLAVS. Simeon I declared himself czar of the Romans and the Bulgars in 925.

The BYZANTINES annexed Bulgarian territories in 1018 after defeating Bulgarian forces. In the 13th century, during the Second Bulgarian Empire, Ivan Asen II expanded Bulgarian terri-

A Bulgarian girl herds sheep in the late 19th or early 20th century. (*Library of Congress, Prints and Photographs Division [LC-USZ62-105350]*)

tory across the Balkan Peninsula except Greece. In 1396 the Ottoman Turks (see TURKICS) conquered Bulgaria. The Russo-Turkish Wars of the 19th century produced an autonomous Bulgaria although it was still governed as part of the Ottoman Empire. In 1878 the Congress of Berlin narrowed Bulgaria's boundaries to the region between the Danube River and the Balkan Mountains. In 1908 Prince Ferdinand of Saxe-Coburg-Gotha declared himself czar and established an independent Bulgaria.

CULTURAL IDENTITY

Bulgarian society experienced a considerable restructuring along socialist lines from 1946 to 1990, which placed the needs and activities of labor at the center of society. It also created a government for the first time purged of the religious influences that had dominated the theocratic Byzantine and then Ottoman Empires of which Bulgaria was a part for centuries. Socialist ideology did not replace religion in Bulgaria, however; nor did it do away with the country's much older traditions. For example, the Bulgarian family kept its place as an important structural element of society. Many households consist of an extended family comprising parents and one of their married sons—usually the youngest—or daughters.

derivation of name:

Meaning "land of the tribe formed of many tribes"; *Bulgha*, a Turkic word meaning "mixed"

government:

Republic

capital:

Sofia

language:

Bulgarian, an Altaic language, is the official language.

religion:

About 85 percent of the population are members of the Bulgarian Orthodox Church; 13 percent are Muslim; the remaining minorities include Jews, Roman Catholics, Uniate Catholics, and Protestants. Prior to the religious reforms of the late 1980s, the government enforced atheism, professed by an estimated 65 percent of the population.

earlier inhabitants:

Thracians; Greeks; Macedonians; Romans; Heruli; Sciri; Slavs; Bulgars; Byzantines; Pechenegs; Cumans; Ottoman Turks

demographics:

About 85 percent of the population are Bulgarian; Turks constitute about 9 percent; Roma and Macedonians each make up about 3 percent; Armenians and Russians are also small minorities.

Bulgarians: nationality time line**C.E.**

- 679–681** Bulgar tribes under Asparukh cross Danube, subjugate Slavs, and occupy territory of Bulgaria, establishing First Bulgarian Empire.
- 811** Bulgars under Krum defeat invading force of Byzantines.
- after 863** Missionaries Cyril and Methodius translate religious works from Greek into Old Church Slavonic, starting tradition of Bulgarian literature.
- 865** Boris I adopts Christianity and unites various people living in Bulgaria.
- 870** Constantinople recognizes independence of Bulgarian Church.
- 925** Simeon I assumes title of czar of the Romans and Bulgars.
- 976–1014** Czar Samuel reigns; western territories become independent state.
- 1018** Weakened Bulgarian Empire is annexed by Byzantine emperor Basil II.
- 1186** Second Bulgarian Empire emerges; Ivan Asen I is crowned czar at Veliko Turnovo.
- 1205** Kaloyan defeats Emperor Baldwin I of Constantinople.
- 1218–41** Second Bulgarian Empire reaches its height under Ivan Asen II, who conquers much of entire Balkan Peninsula except Greece.
- 1330** Macedonian Bulgaria is conquered by Serbia.
- 1396** Bulgaria becomes part of Ottoman Empire.
- c. 1762** *Istoria Slaviano-Bolgarska* (History of the Slavic-Bulgarians) by monk Paisij is published in Old Church Slavonic mixed with popular vernacular.
- 1835** Ottoman Turks permit opening of Bulgarian schools.
- 1870** Bulgarian Church is reestablished.
- 1876** Revolutionary poet and freedom fighter Christo Botev is killed by Turkish troops.
- 1878** Treaty of San Stefano ends final Russo-Turkish War and establishes self-rule for Bulgaria within Ottoman Empire, under Russian occupation; Congress of Berlin prevents Russia from annexing Bulgaria; Bulgarian territory is reduced.
- Sts. Cyril and Methodius National Library is founded in Sofia.
- 1885** Alexander I (Alexander of Battenberg), first prince of Bulgaria, annexes Eastern Rumelia, provoking war with Serbia.
- 1900** Earliest Bulgarian opera, *Siromachkinya* (The poor woman), by Emanuil Manolov, opens.
- 1908** Prince Ferdinand of Saxe-Coburg-Gotha declares Bulgaria's independence from Ottoman rule.

Bulgarian culture combines folk traditions with a high arts culture created during Ottoman rule that helped to define Bulgarian identity; both of these elements have received the impress of socialist thought. The fact that the content of much art created in the 19th century nationalist revival focused on the Bulgarian people and their life made the step to the social realism espoused by the government a somewhat natural one. Bulgarian painters depicted the daily life of the Bulgarian people, rural scenery, scenes of old Bulgarian towns, village portraits, and scenes and themes from Bulgarian history. To these,

forming part of Bulgaria's struggle for cultural freedom, social realism added the theme of the fight for social justice.

Bulgaria's population is largely culturally homogeneous, the Bulgarian ethnicity derived from the fusion of Slav and Bulgar ethnicities. The country played a central role in South Slavic culture, in part because it was the first in which the Slavic language was written, beginning in the ninth century, when the missionaries Cyril and Methodius created the alphabet for Old Bulgarian (Old Church Slavonic). The Bulgar state was the first independent state in Slavdom, and the first Balkan

- 1911–12** Bulgaria defeats Turkey in First Balkan War.
- 1912** Ivan Mincov Vazov has success with English translation of novel *Pod Igoto (Under the Yoke)*, originally published in 1894.
- 1913** After Second Balkan War Bulgaria loses southern Dobruja and large part of Macedonia under Treaty of Bucharest.
- 1915** Bulgaria favors Germany and Austria-Hungary when it enters World War I.
- 1918** Boris III succeeds Ferdinand; after war Bulgaria loses outlet to Aegean Sea and Greece and Yugoslavian territory.
- 1923** Aleksandŭr Stambolyiski, prime minister who redistributed land to peasants and reformed legal system, is overthrown in bloody coup.
- 1935** Boris III rules as virtual dictator.
- 1940** During World War II Germany forces Romania to restore southern Dobruja to Bulgaria.
- 1941** Bulgaria occupies parts of Yugoslavia and Greece (including Macedonia) and declares war on Great Britain and United States.
- 1944** Soviet Union (USSR) declares war on Bulgaria; pro-Allied political forces (Communists, Agrarians, and pro-Soviet army officers) seize power; Bulgaria declares war on Germany; Communism replaces monarchy.
- 1946** After World War II Bulgaria is proclaimed people's republic; Georgi Dimitrov is premier.
- 1947** Under peace treaty with Allies, Bulgaria retains southern Dobruja; new constitution is enforced; Bulgaria becomes one-party state.
- 1953–56** Christo (Javacheff) studies painting, sculpture, and stage design at Academy of Fine Arts, Sofia, before launching international career and becoming known for sculptural installations.
- 1955** Bulgaria becomes member of Warsaw Treaty Organization and United Nations (UN); Communist sentiment dissipates.
- 1973** National Museum of History is founded in Sofia.
- 1981** Novelist and essayist Elias Canetti wins Nobel Prize in literature.
- 1986** President Todoz Zhivkov experiments with limited economic reforms and launches "Bulgarization" campaign to assimilate Turkish culture.
- 1990** Zheliu Zhelev, non-Communist leader, is elected president.
- 1991** New constitution establishes parliamentary democracy.

polity to achieve independence from the Byzantines in the early Middle Ages.

BULGARS**location:**

Russia; Bulgaria, and surrounding regions

time period:

Fourth century to 1431 C.E.

ancestry:

Turkic; Hunnic

language:

Bulgarian (Turkic or Altaic); plus some Slavic

Bulgars (Bulghars; Bulgari; Bolgars; Bolghars; Bolgari; Bulgarians; Ogurs; Onugurs)

The Bulgars, a people primarily of Turkic ancestry, can be classified among the **TURKICS**, although their early history relates to that of the **HUNS**. They became known as a distinct people in Europe from the fifth century C.E. after the Huns were no longer a major factor in the course of events. The Eastern Bulgars had a powerful state in eastern Europe north and east of the Black Sea and Sea of Azov. The **CHUVASH** claim to be descended from them. Those Bulgars who migrated west in the seventh century were among the ancestors of modern Bulgarians (see **BULGARIANS: NATIONALITY**).

ORIGINS

The ancestors of those who constituted the majority of Bulgars originated in central Asia. During the fourth century they were under the dominion of the Huns, migrating westward to the European steppes west of the Volga River in about 370 C.E. Some among them are assumed to be part of the Hunnic force that moved through Europe under Attila in the mid-fourth century, then retreated eastward after the breakup of the Hunnic Empire in 455. Others may have joined the Huns after their retreat. Huns and Bulgars, who are sometimes grouped together as Hunno-Bulgars, along with other elements in the population, such as **SAR-MATIANS**, settled north and east of the Black Sea

in about 460. The name Bulgars is derived from *bulgha*, meaning “mixed.”

LANGUAGE

The Bulgars originally spoke a Turkic language (although some scholars consider Bulgarian to be a related but separate Altaic language family). Some of those Turkic tribes, or clan unions, who, intermingled with the Huns, were known as Bulgars, were Ogurs of the Northwestern (Kyipchak) language group, sometimes called Ogur Turks, the Kutrigurs, Onogurs, and Utigurs with varying names with *oguri* or *orgurs* or *igurs* as a suffix, meaning “tribes of.” Some groups of Bulgars adopted the languages of other peoples; those who settled in present-day Bulgaria spoke a variation of Slavic with Turkic influence.

HISTORY**Early Centuries**

After settling in eastern Europe in present-day Russia after the retreat of the Huns, the Bulgars became both a resource and a consideration for the **BYZANTINES** of the Eastern Roman Empire. In the 480s the Byzantines recruited them as mercenaries to fight against the **OSTROGOTHS**, the first time the name Bulgars was known to be used in reference to them. By the sixth century Bulgars were powerful enough to attack the Byzantine provinces. In the 560s they were forced to defend themselves from the **AVARS** out of Asia—some tribes killed, displaced, or absorbed by them.

Great Bulgaria

Surviving Bulgar tribes had united under a single ruler, Kurt (or Kubrat). During the first half of the seventh century the Bulgar khanate became known to the Byzantines as Great Bulgaria. The southern extent of Bulgar territory was the Kuban River in southern Russia.

After Kurt's death in 642, his five sons each assumed power over a tribe or horde. One tribe, with lands extending from the coast of the Sea of Azov, was eventually absorbed by the **KHAZARS**. A second horde migrated westward into central Europe, where they merged with the Avars, who had created an extensive empire by the late sixth century. Another migrating group merged with the Germanic **LOMBARDS** in Italy. The remaining two hordes maintained their identity as Bulgars.

Eastern Bulgars

One son of Kurt by the name of Bezmer (or Bat-Bayan) led his horde northward from the

Khazars and settled them in the country near the confluence of the Volga and Kama Rivers. They subsequently became known as the Eastern Bulgars, Volga Bulgars, or Kama Bulgars. This horde merged with other peoples in the region and subdivided into three groups allied in a confederation, which endured for some six centuries.

In about 922 the Eastern Bulgars converted to Islam and founded a powerful khanate. In 1237 they fell under the dominion of the MONGOLS, but retained some autonomy. The Mongols again invaded their territory in the 1390s, led at that time by Tamerlane (or Timur). The Eastern Bulgars gradually lost their distinct identity after the Russians out of

Boris I: Unifier of Bulgaria ✦✦

Boris, whose birth date is unknown, succeeded his father, Pressian, in 852 as ruler of the Bulgars and other peoples of the First Bulgarian Empire, including Slavs, Thracians, and Vlachs. His goal was to unify these diverse peoples and gain acceptance of Christian leaders by choosing Christianity as the state religion. He himself converted to Christianity from paganism in 865. At this time the Catholic Church in Rome and the Eastern Orthodox Church in Constantinople were competing for power in Europe, and Boris had to choose between the two. With pressure from the closer Byzantines and with the pope in Rome resisting the idea of creating an independent Bulgarian archbishopric, Boris chose to accept the ecclesiastical jurisdiction of Constantinople.

Boris was active in promoting Christianity in his empire, sponsoring mass baptisms, the building of churches, and missionary educational activities. To unify his people and nationalize his church further, he made Slavic the official state language and replaced Greek with it in church services. By 899 Boris abdicated the throne and retired to a monastery, his son Vladimir succeeding him. Yet Boris reserved the right to be involved in the affairs of government. When Vladimir proved incompetent and became the instrument of a pagan and anti-Slavic revolt, Boris emerged from retirement in 893 to depose him. He ordered the blinding of Vladimir to make him unfit to rule and then replaced him with his younger brother, Simeon. Simeon (called the Great) expanded the empire. Boris, who lived out his life in a monastery and died in 907, is recognized as a saint by the Eastern Orthodox Church.

Moscow captured the city of Bulgar and surrounding regions in 1431 (see **RUSSIANS: NATIONALITY**). They are thought to be ancestral to the modern **CHUVASH** and **NOGAY**.

First Bulgarian Empire

Another one of Kurt's sons, Asparukh, led the fifth horde westward across the Dniester River and southward across the Danube, settling on the plain between the Danube and the Balkan Mountains, formerly part of the Roman provinces of Moesia and Thrace, an area then claimed by the Byzantines. The Byzantines made repeated attempts to reclaim it. In 679 Asparukh established his new state, the start of the First Bulgarian Empire. In 680 he made an alliance with seven Slavic tribes and the next year invaded Thrace. Pliska, where he built a fortress, became the capital of the new state. Khan Asparukh died in 700 while fighting the Khazars near the Danube.

During the eighth century the Western Bulgars grew in power in the region, absorbing other peoples. Consisting of a new ethnic mix that, in addition to **SLAVS**, included **THRACIANS** and **VLACHS**, this group can be defined as the first Bulgarians to differentiate themselves from ancestral Bulgars.

Under Krum, who ruled in 803–814, the First Bulgarian Empire continued to grow, with new lands in Macedonia and Serbia. In 811

Krum defeated an invading force of Byzantines. He also was victorious over the Avars, seizing present-day Hungary and the region of Transylvania in present-day Romania. To the west the **FRANKS** controlled territory.

In 865, under Boris I (see sidebar), Christianity became the official religion of the Bulgars. Eastern Orthodoxy became the chosen creed over Catholicism in 879. The Bulgarian Christian Church used a Slavic dialect from the Bulgars' Macedonian possessions (known as Old Church Slavonic), which helped create a common culture among Bulgars, Slavs, and other peoples of the region. The Bulgarian state reached its largest territorial expansion during the reign of Boris's son, Simeon I (Simeon the Great), in 893–927, with additional lands wrested from the Byzantines.

During the reign of Simeon's son, Peter, in 927–969 Bulgarian power declined. Other peoples put pressure on their holdings, such as the **MAGYARS** and **RUS**. Meanwhile other Turkic peoples, such as the **PECHENEGS**, **KIPCHAKS**, and **CUMANS**, settled among them. In 1018 ancient Bulgaria was incorporated into the Byzantine Empire.

Second Bulgarian Empire

In 1185 Balkan peoples revolted against the Byzantines. With independence the Bulgarians created what is known as the Second Bulgarian Empire. By 1241 the Bulgarian dynasty of Asen ruled most of the lands from the Danube River to the Aegean Sea, and from the Adriatic Sea to the Black Sea. In 1396 the Bulgarians fell to the Ottoman Turks, who ruled the region until 1878, when an autonomous Bulgarian principality was established under Ottoman suzerainty. Bulgaria became independent of Turkey in 1908.

CULTURE (see also **TURKICS**)**Government and Society**

The Bulgar state was the first independent state in Slavdom, and the first Balkan polity to achieve independence from the Byzantines in the early Middle Ages. Henceforth sociocultural influences ran both ways between the Bulgar khanate and Byzantium, in contrast to the core-periphery type of relationship Byzantines had had with peoples in the Balkans. The Carolingian **FRANKS** were not slow to appreciate this and allied themselves with the Bulgars in a number of wars, including the one that smashed the Avar khanate in the eighth century. The Bulgars became involved in Byzantine politics, taking advantage of schisms

between the two reigns of Justinian II, in 695–705, to expand their own power.

This expansion was accompanied by increasing political centralization of the Bulgar state. A characteristic feature of this centralization was the way in which the original core group of Bulgars maintained the sort of cohesion they had known as nomadic warriors: they lived in settlements close to one another in a restricted area of the Lower Danube, yet scattered through this region in separate enclaves. This was similar to the way in which as nomads they had moved through the vast steppelands in separate armies or hordes, each surrounding its leader and each horde in constant touch with all the others. This practice, on a vastly inflated scale, guided the governance of the khanate, as its enormous territory was divided into 11 areas, each ruled by an official chosen by and beholden to the central authority.

The Slavs played an important role in the khanate, possibly because of the usefulness of their language as a lingua franca throughout much of its territory. For a time Slavs retained their ethnic identity and tribal leaders, but as the Bulgars created new settlements for the purpose of governance of their newly gained territories, Slavic forces loyal to the khanate and their leaders were resettled as well, breaking down former allegiances and helping to forge a new Bulgaro-Slavic ethnic identity. This process would further develop into the Bulgarian *ethnos*, a fusion of the two, of the medieval Bulgarian state.

The Bulgar elite were greatly influenced by the Byzantine aristocracy, adopting many aspects of imperial organization, the elaborate court ritual, and cultural outlook. It is thought that this estranged the Bulgarian nobility from their own people and may have contributed to the ultimate weakening and demise of the khanate.

Religion

The pagan belief of the Bulgars involved a spiritual entity called the Tangra, the God-Heaven, part being and part realm, apparently related to ancient Iranian belief before the advent of Zoroastrianism. But the Bulgarian state arose at a time of great religious fervor sparked by the rise of Islam among Muslims and also Christians galvanized to oppose this new threat to their spiritual centrality. Thus missionaries of both these faiths and also of Judaism traveled to the khanate.

The establishment of rival religious communities threatened the cohesion of the Bulgar

state. Khan Boris I, whose forces fought alongside those of Charles II (Charles the Bald) of Francia, seems to have been impressed by the benefits of the religious unity he observed among the Franks. He invited Byzantine missionaries to Bulgaria and converted in 864. This process was facilitated by the similarity of the Tangra with the Christian god. The schism between East and West of the Christian Church perhaps meant little to Boris, for in 866 he changed his allegiance to the papacy, only reverting to the Byzantine rite in 870, after the pope refused to authorize a Bulgarian bishopric. Boris's conversion of his subjects was by force and involved bloodshed, even directed against his own son, whom Boris had blinded for making gestures favorable to paganism. Boris, who had retired to a monastery and turned over the khanship to his eldest son, now deposed him and raised his younger son, Simeon, in his stead.

Khan Simeon made a signal contribution to the further spread of Christianity to Slavic lands when he invited the brothers Cyril and Methodius to minister to his people. Cyril devised a precursor to the modern Cyrillic alphabet and translated the gospels and liturgical books into the Slavic language used in the khanate, which became known as Old Church Slavonic and is still used in Eastern Orthodox ritual.

The Bulgars, absorbing ethnic, linguistic, and cultural elements from many different peoples, developed as a unique people with their own traditions and gave rise to a nation.

Burgundians See BURGUNDII; FRANKS; FRENCH.

Burgundii (Burgunds; Burgundiones; Burgundians)

The Burgundii were a tribe of GERMANICS who, by the first century C.E., lived in present-day central Poland. In about 260 they settled in present-day south-central Germany. In the fifth–sixth centuries, they held two kingdoms in western Europe with close ties to the ROMANS, one along the Rhine River in western Germany, with a capital at Worms; and one extending from the Rhône River in present-day eastern France into western Switzerland, with a capital at Geneva. In the early sixth century it

1378	Burgundy ceded to France and becomes a province, then a region.

became part of the empire of the FRANKS. The place-name Burgundy (Bourgogne in French) from the tribal name was applied to varying types of political divisions—kingdom, duchy, and county—with varying boundaries through the Middle Ages, which eventually evolved into a region in east-central France. The name Burgundians can refer to the ancient Burgundii tribe or to any inhabitants of Burgundy.

ORIGINS

The Burgundii are thought to have originally lived on the south shores of the Baltic Sea; the name of the island of Bornholm (formerly Burgundarholm), now part of Denmark, might be taken from their name. They lived along the Vistula, Oder, and Warta Rivers in present-day Poland by the first century C.E. and are thus grouped with other East Germanic peoples and are perhaps related to the GOTHs. When in

Germany, Burgundii claimed descent from the Romans, who may have named them after their border fortifications known as *burgi* (such descent would make a connection to Burgundarholm uncertain).

LANGUAGE

The Burgundii spoke a Germanic dialect, referred to as Burgundian; it is thought to be related to dialects of other East Germanic tribes, but this connection is hypothetical.

HISTORY

The Burgundii, similar to the VANDALS, had had only long-distance contact with the Romans as compared to many other Germanic tribes closer to the imperial border. They are thought to have played a role in the important trade in slaves to Rome, capturing slaves in their raids (long a Germanic custom) for sale to tribes to their west, who became wealthy as middlemen. Emulation of their wealthy neighbors (and possibly pressure from the latter) may have caused them to increase the rate of raiding; weapon-rich burials in their region show that warfare became more important among them than ever before.

The Burgundii are thought to have migrated westward into Germany from their homeland in Poland in about 260 C.E. because of pressure from the GEPIDS, an aggressive and warlike Germanic people who had migrated from Scandinavia to Poland in the previous century. The movements of the Burgundii at this time took place in the context of migrations and displacements of peoples all over Germania (as the Romans called the Germanic territory outside the empire), which had been set in motion by the aftereffects of the Marcomannic Wars between Germanic peoples and Rome in the second century. Many Germanic tribes had joined for mutual aid into aggressive confederacies with large armies, leading to warfare on a larger and more devastating scale than the tribal raiding of the Germanic past. Some Burgundii in this way may have joined the Goths, one of the greatest of these tribal confederacies, which formed in the Black Sea region to the southeast. Those who traveled west battled the ALAMANNI, another confederacy, and settled to their south between the upper Main and Danube Rivers. They also pushed south of the Danube into the Roman province of Raetia in present-day Austria and eastern Switzerland but were defeated in 278 by the Roman emperor Marcus

Valerius Probus. In 380 the Burgundii gained territory from the Alamanni between the Main and Neckar Rivers.

Early Kingdom

In 407, with pressure from both the Vandals and the HUNS, the kingdom divided and some Burgundii under Gundicar relocated even farther to the west across the Rhine. They were part of the mass migration of Germanic tribes across the frozen Rhine into Gaul in 406–407, which was the beginning of the end of Roman control of Gaul. They seized a large area of eastern Gaul and later attempted to expand into Belgica (roughly modern Belgium). They established a kingdom with a capital at Worms in 413, the first Germanic kingdom within the old Roman imperial frontier. Their rule over the indigenous Gallo-Roman population was moderate, compared to that of other Germanics. They took only such lands as they needed and allowed Roman institutions to continue under the nominal rule of Rome. Many Burgundii served as *foederati* (federates), or auxiliaries, in the Roman army in various campaigns throughout Europe. Arian Christianity became the official religion. The community east of the Rhine probably survived well into the fifth century. The power of the western Burgundii was diminished through a devastating defeat by Huns. In 437 Gundicar of the western community was killed in battle with the Huns, who probably attacked the Burgundii with the complicity of the Romans under the general Flavius Aetius.

Expanding Realm

Burgundii fled their Rhine homeland to territory in eastern France, western Switzerland, and northern Italy. In 443 the Burgundii organized a new kingdom, with a capital at Geneva (sometimes referred to as the First Kingdom of Burgundy). In 451 tribal members, along with other Germanic peoples, helped the Romans under Aetius defeat the Huns at the Catalaunian Fields south of modern Châlons-sur-Marne. They fought against some other Burgundii who had joined the Huns. The Romans allowed refugees to settle around Lugdunum (modern Lyon) in east-central France. In 471 the Burgundii under Chilperic drove the VISIGOTHS from the Rhône valley. They later defeated the Alamanni, expanding their territory, which at its height in about 480 included the present-day region of Burgundy in France, territory along the Rhône as far south as Arles, and western Switzerland.

In about 500 the Burgundii were defeated in battle by the Franks under Clovis I, founder of the Merovingian dynasty. In 506 their leader at the time, Gundobad, formed an alliance with the Franks, and his niece, Clotilda, became Clovis's wife. Vienne on the Rhône River was the capital of the Burgundii at this time. The next year the Burgundii helped the Franks defeat the Visigoths at Vouillé, northwest of present-day Poitiers. King Sigismund, son of Gundobad, converted from Arianism to Catholicism. In 523 he was defeated and imprisoned by the Franks under Clodomir. Sigismund's brother Godomar managed to kill Clodomir at Vienne in 524.

Frankish Rule

In 534 the Merovingian Franks under Chlotar I, the son of Clovis, gained control of the Burgundian realm, then ruled by Godomar. Upon Chlotar's death in 561, Frankish lands were subdivided among his sons. Guntram secured the Kingdom of Burgundy, which ultimately included former Burgundian lands, the diocese of Arles in Provence, the Val d'Aosta east of the Alps, and lands in north-central France. A key center of Burgundy was the ecclesiastical province of Lyon, controlled by Gallo-Roman senators. King Guntram relied heavily on these aristocrats to run his administration and in general was more influenced by Romans than other rulers in Francia. In the 570s Guntram moved his court to Châlons, which he developed as a religious as well as political capital. Burgundy remained a separate Merovingian kingdom until Charles Martel, the grandfather of Charlemagne, subjugated it to Frankish Austrasia in 719.

In 843 by the Treaty of Verdun, which divided the Frankish Empire of Charlemagne among his three sons, Burgundy was included as part of Lorraine (or the Middle Kingdom). With continuing power brokering, the duchy of Burgundy was carved out from land in the northwest chiefly between the Rhône and Saône Rivers in 877. And the Free County of Burgundy (Franche-Comté was carved out of lands to the east. Two new Burgundian kingdoms were founded in the same period, Cisjurane Burgundy (Lower Burgundy) in 879 and Transjurane Burgundy (Upper Burgundy) in 888. In 933 these two were united as the kingdom of Arles (sometimes called the Second Kingdom of Burgundy), with its capital at Arles. In 1032, this kingdom became part of the Holy Roman Empire.

Burgundy was ceded to France in 1378 and was a province until the French Revolution in

This is a representation of Philip the Bold, duke of Burgundy (1342–1404), and his wife, Margaret of Flanders (1350–1405). (Library of Congress, Prints and Photographs Division [LC-USZ62-85685])

1789. It is now classified as a region of France (Bourgogne).

CULTURE (see also GERMANICS)

Government and Society

The Burgundii originally had two types of kings. There was a *sinistus*, an elder who served as a kind of high priest. There was also a *hendinos*, from a class of princes, who was responsible for the tribe in terms of food supply and warfare. This system parallels the practice common among Germanic tribes of having a sacred king called a *thiudans* and a war leader called a *reiks*.

In the early sixth century, during the reign of Gundobad, the Burgundii codified their laws into the *Lex Burgundionum* (or *Lex Gundobada*), which typifies Germanic law of the period. Gundobad also sponsored the codification known as *Lex Romana Burgundionum*, which provided laws for his Roman subjects with regard to his people. These law codes of the Burgundii did not prohibit interaction and intermarriage with Romans. King Sigismund wrote down the *Prima Constitutio*.

Because Merovingian Burgundy contained the most Roman territories in the Frankish kingdom, Burgundian society and culture soon fused with Roman. Roman traditions of justice took firm root here, and the Crown, especially under Guntram, who seems to have been a genuinely pious Christian, became imbued with Christian ideas of a monarch's duty to his people as spiritual leader.

Literature

The late phase of their Rhineland kingdom provides the source for the Germanic epic *Nibelungenlied* (Song of the Nibelungen) of the early 13th century, also known as the *Nibelung Epic* and the *Siegfried Saga*. Although a legendary account—the Nibelungen are an evil family who possess a magic hoard of gold—it draws on history, with much of the action at Worms and a character, Gunther, based on Gundicar, and Etzel, based on Attila the Hun.

Religion

The Irish monk Columbanus traveled to Burgundy in the sixth century during the reign of Guntram, a Frank, not specifically to conduct missionary work but rather to follow the White Martyrdom being undertaken by many Irish at this time, which consisted of journeying as the spirit prompted them and living a monastic and ascetic life among strangers. Guntram was impressed by Columbanus and gave him and his companions a ruined fortress at Annegray in the Vosges Mountains. Columbanus's form of heroic Christianity appealed to the Burgundii and he attracted a large following. He established a monastery at Annegray and later two more at Luxeuil and Fontaines. However, his success created antagonism among the Gallo-Roman episcopacy, exacerbated by his Irish form of Christianity, which did not hold that abbots were subservient to bishops, and after a quarrel with the royal family he left Burgundy for other parts of Francia. But his monastery at Luxeuil played an important role in fostering monasticism in Francia.

The name of the Burgundii survived into modern times through the region in east-central France known as Burgundy. The Burgundii also hold a special place in German literature as the subject of the *Nibelungenlied*.

Buzhanians (Buzhians; Boujans)

The Buzhanians are classified as a tribe of Eastern SLAVS. They lived along the Upper Western Bug River, a tributary of the Vistula in present-day western Ukraine. They occupied some of the territory of the DULEBIANS by the

10th century C.E. They are thought to be ancestral to the VOLHYNIANS, a Ukrainian people.

Byzantines (Romaioi; Rhomaioi; Romans; people of the Byzantine Empire)

The Byzantine Empire resulted from a reorganization of the Roman Empire. Constantine I transferred the capital of the Roman Empire from Rome to Byzantium in 330 C.E.; it became known as Constantinople (modern Istanbul). The empire was divided into the Eastern Roman and Western Roman Empires under two emperors in 395. After the fall of the Western Roman Empire in 476 the Eastern Empire endured for almost a millennium, the stage typically referred to by historians as Byzantine, with

varying boundaries for its vast territory in southern Europe, southwestern Asia, and northern Africa. The core of the empire consisted of the Balkans and Asia Minor. The empire's political structure was Roman, as were most of its leaders (or, if born elsewhere in the empire, they were at least Romanized), and its official language Latin. Its prevalent language and much of its culture were Greek, however. Its religion was Orthodox Christianity, known as Greek Orthodox or Eastern Orthodox. Inhabitants of the vast territory that made up the empire considered themselves Rhomaioi, or ROMANS. Western Europeans, who had their own Roman Empire, thought of them as GREEKS or Orientals. But the empire was a melting pot of many peoples. For the sake of convenience, and in distinguishing between Roman history

as emanating from Italy and as emanating from Constantinople, the peoples of the Byzantine Empire—at least the ruling class—can be grouped together as Byzantines and the state and culture that developed around them as Byzantine.

ORIGINS

Emperor Diocletian, who ruled in 284–305, in his reorganization of the Roman Empire to help contend with unwieldy bureaucracy and external threats divided its administration between two emperors, each with the title of Augustus, one in the East and one in the West. He himself decided to rule the East, with a capital at Nicomedia (modern Ismid); his colleague Maximian became Augustus of the West. On their voluntary retirement in 305 Diocletian left two Augusti, Constantius I and Maxentius. The next year Constantius died, and his son, Constantine I (see sidebar, p. 115), moved to claim the throne, becoming sole emperor in 324. He chose to rule from the East and set about building a new capital.

The city of Byzantium had been founded in about 660 B.C.E. by GREEKS on the European side of the Bosphorus, the narrow strait between present-day Turkey in Europe and Turkey in Asia. With a location midway between the Mediterranean Sea and the Black Sea, it became a center of commerce between Europe and Asia Minor and a natural choice for a political center. Constantine, starting in 326 C.E., had the ancient city rebuilt as New Rome—the name Constantinople later took hold—with Roman institutional centers and beautified with Greek works of art. Having converted to Christianity, Constantine dedicated the city to the Virgin Mary.

Emperor Julian I, during his brief reign in 361–363 C.E., again encouraged paganism, but Theodosius I, during his reign in 379–395, designated Christianity as the state religion. He was the last ruler of a united Roman Empire. At his death in 395 he left the Eastern portion to one son, Arcadius, and the Western portion to another, Honorius. With regard to their henceforth distinct histories the eastern portion is generally termed Eastern Roman Empire until the collapse of the Western Roman Empire in 476, after which the name Byzantine Empire is more commonly applied to what remained of the Roman Empire. The name Byzantium also is used to refer to the entire empire and not just the ancient city.

LANGUAGE

Both Latin, the official language, and the widespread Greek served as a kind of lingua franca in the Byzantine Empire, with the various peoples speaking many different tongues depending on their homeland.

HISTORY

Early Invasions

The late fourth century, when the Roman Empire was divided once and for all, was a period of great unrest all over Europe, and for a time both the Eastern and Western Roman Empires seemed likely to meet their demise. The arrival of the HUNS from the Asian steppes in the Black Sea region in the 370s led to new alliances, new migrations, and new threats to Roman territories. In 378 the VISIGOTHS, who had taken refuge on Roman lands, defeated a Roman army under Valens, emperor of the East, at Adrianople (Adrianopolis; modern Edirne) to the northwest of Constantinople in eastern Thrace. Valens himself was killed.

Constantine I: First Christian Emperor

Constantine was born Flavius Valerius Constantinus about 274 C.E. His father, Constantius I, and mother, Helena, a Christian (who was later canonized as Saint Helena), were members of the military ruling class. Young Constantine proved his military talent battling the Picts in Scotland alongside his father and battling the Franks on the lower Rhine. Upon his father's death in 306 C.E., the troops of Britain and Gaul declared Constantine emperor. At the time, however, there were six claimants to the throne of the Roman Empire. Constantine formed an alliance with Licinius, emperor of the East, and in 312 he consolidated his power by defeating Maxentius, another claimant, at the Battle of the Milvian Bridge. Announcing that his victory was due to a vision from the Christian God, Constantine commemorated the event in 313 by issuing with Licinius the Edict of Milan which increased the rights of Christians, and by building the Arch of Constantine in Rome in 315. Over the next years Constantine strengthened the Roman Empire's borders and was victorious against the Franks, Sarmatians, and Goths. In 324 after a growing rivalry Constantine defeated Licinius at Adrianople and became sole ruler of the empire.

Constantine administered military and legislative reforms and issued new gold coins. He centralized the Roman senate under *sacrus consistorium* and separated civil and military authority. He called the Council of Nicaea in 325, at which the Nicene Creed was adopted in an attempt to suppress Christian Arian heresy. Constantine decided to rule his empire from the East and chose the ancient city of Byzantium, renaming it Constantinople, as the location of New Rome. He began to rebuild it in 326. Although his religious conviction was at its inception questionable, he is hailed as the first emperor to rule under the name of Christ. Most modern scholars believe that in time his faith became sincere. Constantine was baptized just before his death in 337. Although he had attempted to unify the empire, he arranged for his three sons to inherit it, Constantine II, Constantius II, and Constans I. He is often referred to in texts as Constantine the Great.

Theodosius, who succeeded him, negotiated a settlement with the Visigoths, allowing them to settle in Roman lands and removing any threat to Constantinople. The Huns remained a threatening presence in eastern Europe and even moved on Constantinople in 441, but through adequate defenses, successful diplomacy, and bribes, the Eastern Roman Empire managed to hold them off, and the Huns and their allies invaded western Europe under Attila, where they were defeated in 451 by Romans and their allies.

In the west it was the GERMANICS who threatened the Roman Empire and led to its ultimate collapse. In the first half of the fifth century the VANDALS had seized Roman territory in northern Africa, and the Visigoths, after an invasion of Italy further weakened the empire, seized Spain. In 455, arriving by sea, the Vandals sacked Rome. In 476 the Scirian ruler Odovocar, heading an alliance of SCIRI, HERULI, and RUGII, captured Ravenna, the capital of the Western Roman Empire and deposed the last Western Roman emperor, Romulus

Augustulus. In 488–493 the OSTROGOTHS under Theodoric, at the behest of the Byzantine emperor Zeno (who hoped Theodoric and Odovocar would weaken each other while fighting), invaded and conquered Italy.

The Eastern Empire, too, was hard-pressed for a time by the invasions and also by religious dissension in its provinces of Syria and Egypt over the nature of Christ, a dissension that threatened further schism in the empire. However, gradually the Byzantine Empire's natural advantages in comparison to the Western Empire, most important its strong economy and urban life, helped it weather the storms. A consensus was formed by all religious factions centered upon the ideal of a God-appointed Christian empire. Economic prosperity was reflected in lavish building all over the empire. The government bureaucracy was immeasur-

ably strengthened by the emergence of a highly educated and dedicated class of civil servants, for whom the Byzantine Empire was the center of both their spiritual and their secular life.

One of these bureaucrats, Anastasius, became emperor, and through wise government, including limiting spending and cutting taxes (the bane of the Western Romans), stabilized finances and bequeathed to his successors an empire with the potential to revive Rome's past glory.

Byzantine Expansion

Expansion was the goal of Justinian I (see sidebar, p. 117), who ruled from 527 to 565, and initially it seemed he would succeed. In his reign, although some contemporaries complained he was “ruining the Roman Empire”

The female figure in this ivory plaque, carved by Byzantines in the late fifth century C.E., represents Rome. (Drawing by Patti Erway)

and “bringing everything into confusion,” the Byzantine Empire reached its greatest extent. Justinian had to deal with political factions, and he did so with the help of largely Germanic armies under the generals Belisarius and Narses. After securing his authority, his armies checked Persian expansion from the east and then regained what had once been Roman territory to the west. In 535–534 Belisarius regained Carthage territory from the Vandals in northern Africa, and in 552–555 Narses retook Italy from the Ostrogoths. They also recaptured Sicily, Sardinia, and southern Spain. Justinian’s wife, Theodora, formerly an actress, played an active role in his government, especially furthering Christianity. She and Justinian had churches and other public buildings erected and encouraged a flowering of the arts. In 532–562 they oversaw the building of Hagia Sophia—a project started by Constantine—which would become the seat of Eastern Orthodoxy. Tribonian, Justinian’s chief legal minister, presided over the codification of Roman law.

Despite Justinian’s military victories, his domestic policies undermined his government. He saw the empire as the terrestrial mirror of God’s heavenly kingdom, with the emperor as God’s personal representative on Earth. This stance gave him a certainty about God’s will that fostered an uncompromising rigidity in both religious and political affairs. He enforced religious orthodoxy with an iron hand and transformed the Byzantine bureaucracy, formerly a supple institution with a degree of autonomy, into his own personal instrument, replacing professional bureaucrats and government experts with his own henchmen, many of them deeply unpopular and autocratic, who carried out repressive political and fiscal policies. Justinian’s policies resulted in a savage uprising in 532, which only confirmed his view of the need to rule with a stern hand, in which Theodora encouraged him.

Justinian’s dream of restoring the universal empire seemed to become unattainable after a series of disasters. The bubonic plague decimated the Byzantine population in 542–546, with catastrophic effects on urban and economic life. In the 540s Persia launched a successful invasion in the east, pagan SLAVS appropriated areas of the Balkans, and the Ostrogoths under their able king, Totila, rolled back Byzantine-held territory in Italy to a few coastal outposts.

In spite of the apparent demise of his greatest hopes, Justinian held on, repelling

Justinian I: Restorer of the Empire

Justinian (born Petrus Sabbatius; Latin in full, Flavius Petrus Sabbatius Justinianus) was born in Illyria in 483. He was the nephew of the Eastern Roman emperor Justin I, who made him coemperor shortly before his death in 527.

Two years earlier Justinian had married Theodora, an actress renowned for her beauty. She had great influence over him until her death in 548. Two powerful political factions—the Blues and the Greens organized around two chariot teams who raced in the oval racing track of the Hippodrome—caused unrest in Constantinople. This led to the Nika riot of 532, in which a mob rescued their leaders, whom Justinian had condemned to die for criminal activity. They then attempted to overthrow the emperor. Justinian, at the reportedly impassioned urging of Theodora, remained in the city to suppress the rebellion rather than flee. The protestors were tricked into gathering at the Hippodrome and were slaughtered by forces loyal to him.

Justinian, with the help of his able generals Belisarius and Narses, regained territory throughout the Mediterranean, defeating rival powers, the Ostrogoths and Vandals, and expanding the empire to its former greatness. To maintain a unified empire, he sponsored the codification of Roman laws known as the Justinian Code (also called the *Corpus juris civilis*, or Body of civil law), enacted in 529. This document is the legislative foundation for most modern European nations. He implemented imperial supremacy over the church known as Caesaropapism policy, although his efforts were later interpreted as heresy.

Justinian’s organizational skills helped create a unified and artistically prolific era. He promoted a renaissance of Hellenism. He commissioned many other public works throughout the empire—churches, monasteries, forts, and government buildings—including the church Hagia Sophia (the Church of Holy Wisdom, also known as the Great Church). Completed in 562, it served as the seat of the Eastern Orthodox religion for more than nine centuries. His reign is documented mainly through Procopius’s writings. Justinian died in Constantinople in 565 and was succeeded by his nephew Justin II. He is referred to in many texts as Justinian the Great.

invasions and sending Narses back to Italy, where he defeated Totila’s forces at Taginae (near modern Gubbio), killing Totila and regaining Italy for the Byzantines in 552. By the end of his reign he had very nearly succeeded in accomplishing a rebirth of Rome’s world empire. Africa, including Egypt, and Italy were once more imperial territory; lands from Greece north to the Danube border were held by the Byzantines; and north of the Alps, the BURGUNDII were under the rule of the empire’s allies, the FRANKS. Spain was still held by the Visigoths, but only uncertainly, and Byzantine forces had taken the area around Cartagena, a development that promised further gains. Furthermore Justinian’s ideal of a universal Roman Christian empire accomplishing God’s will on Earth took firm root among the Byzantines and was held by all succeeding emperors. Culture and society continued along late Roman lines (in their Greek reinterpretation) without substantial

disruption despite almost two centuries of turmoil.

New Threats in the Sixth–Ninth Centuries

Byzantium remained rich and powerful even after Justinian's adventures. Forces that would lead to eventual decline, rather than past wars and overtaxation, included the weakening of the economy caused by the plague. A more serious problem was the essentially civilian character of the Byzantine Empire, which created difficulty in raising enough troops to counter the mounting military threats of the fifth century and beyond. This was one area in which the Germanic-dominated West, whose polities, most important the Frankish kingdom, were the descendants of the Roman military, had the advantage over the Byzantines.

With the many northern European peoples in motion as a result of the collapse of the Western Roman Empire, however, the Byzantines were hard-pressed to hold territory. Two growing threats after the death of Justinian in 565 were the LOMBARDS, who invaded and gradually occupied much of the Italian Peninsula in 568, and the AVARS, who invaded the Balkans. Meanwhile the BULGARS and the SLAVS also carried out raids in the Balkans and in Byzantine provinces to the north of Constantinople. At times these peoples formed alliances against the Byzantines—the Avars and Lombards, and the Avars and Persians, for example. The Slavs had been empowered by the Avars, who formed them into a loosely organized empire based on tribute and pillage. From 570 onward the Slavs' raids were devastating in their effects on the Byzantine Empire. The weak emperor Phocas was unable to prevent the Avars and Slavs from taking over most of the Balkans and Greece aside from some coastal enclaves.

An Avar force besieged Constantinople itself in 626, and citizens of Thessalonica, the Byzantines' most important European city, could credit its salvation from the invaders only to divine intervention by the city's patron saint, Demetrius.

The Avars also had an indirect effect on the empire when their pressure forced the Lombards out of Pannonia (roughly modern Hungary), causing them to launch the most destructive and long-lasting Germanic invasions of Italy. Some in Italy actually welcomed the Lombards as deliverers from Byzantine taxation and rigorous enforcement of Eastern religious orthodoxy. Support from the Franks in the 580s enabled the Byzantines to some extent to push back the

Lombards, preventing them from taking the whole peninsula. But all that remained to the empire were Rome and Ravenna, a fragile corridor connecting them, and coastal enclaves around Venice, Genoa, and ports in the south.

Despite the lamentations of Pope Gregory the Great about the “unspeakable” Lombards, the effects of their invasion on Italy were not uniform all over the peninsula. The worst-hit areas were the frontiers between Lombard- and Byzantine-held territories, where fierce fighting created a desolate no man's land. In the Lombard heartland in the north the quick takeover by Lombard elites actually had relatively little effect on ordinary people, peasants with no wealth to plunder, who experienced merely a change of their landlords, as well as relatively little effect on inhabitants of cities able to hold out against the Lombard disorganized sieges. On the other hand areas that remained under imperial control suffered considerably from increasing maladministration by bureaucrats appointed by Justinian and subsequent emperors for their loyalty rather than experience.

Meanwhile the renewed vigor of Persia posed an even greater threat to Byzantium's most valuable and populous provinces. In the disastrous reign of Phocas in the early seventh century the Persians ravaged Anatolia and conquered Syria, Palestine, and Egypt, carrying off the empire's most treasured relic, a piece of the True Cross in 614, and reaching the Bosphorus by 626. Nevertheless, galvanized by the loss of the True Cross, possession of which in some sense formed the core of the Byzantine Empire's very reason for being, the emperor Heraclius, in a stunning turnaround, defeated the Persians in 628 in Nineveh in present-day Iraq, annihilating their forces and for the time being ending their threat. Heraclius, founder of the Heraclian dynasty, also neutralized the Avars by buying them off.

Soon, however, yet another threat arose from the east, partly made possible by the power vacuum created in the Byzantine-held parts of the Near East and Africa as Persia and Byzantium were locked in their struggle to the death. In the mid-seventh century the Arabs of the Arabian Peninsula, inspired by their new religion of Islam, founded by Mohammed in 622, swiftly captured Byzantine territory in the Near East and North Africa. Within 10 years the Byzantine provinces in the east had become part of the new Arab Empire. An important reason for the Arab Muslims' success was the alienation of many in these regions from the Byzantines' political and religious policies and

their Greek culture. Coptic and Aramaic speakers who followed the Monophysite Christian faith, persecuted by the Orthodox Byzantines, saw the Arabs as fellow Semites and deliverers. They hoped for, and received, religious tolerance from their new leaders. On the other hand, Anatolia, the most staunchly Orthodox Byzantine province, held out against repeated attempts at conquest by the Arabs.

But the Byzantine war against the Arabs in Asia Minor devolved into a bitter war of attrition, as the Byzantine traditional division of power between civilian and military authorities was abandoned, and control over military zones, called *themes*, was given over wholly to military commanders. These commanders adopted a scorched-earth policy that devastated the Anatolian plateau, making farming impossible in many areas. Many commanders became in effect warlords taking land for themselves. Anatolian cities became mere fortresses as trade routes were cut off by continual guerrilla war. The emperor-general Leo III, founder of the Isaurian dynasty, finally regained Asia Minor from the Arabs with a victory at Akroinon in Phrygia in 739. But the reconquest as a whole was a Pyrrhic victory, with a transformation of the Byzantine world—whose hallmark had been its high standard of culture and its essentially civilian nature—into a militarized society too poor to afford the retirements of civilization comparable to that in western Europe.

Dealing with the Arabs distracted the Byzantines from their holdings in the west—they withdrew soldiers and reduced their subsidies to the Franks (as documented in the disappearance of Byzantine coinage from Frankish coin hoards of the time); as a result the Lombards benefited most conspicuously. In 643 the strong Lombard king, Rothari, captured the Byzantine outposts in the regions of Liguria and Veneto in northern Italy; by 680 the Byzantines were forced to recognize the Lombard kingdom. In 679 the Bulgars invaded present-day Bulgaria, establishing the First Bulgarian Empire.

In 711 Arab Muslims and Berbers—known as MOORS—invaded the Iberian Peninsula, destroying Visigothic power in a single battle. The Visigoths had continued to resent the Byzantines to the end, even after they had given up their heretical Arian form of Christianity in 586 and allowed the Roman Church to hold regular councils that legislated on both secular and religious affairs. Even the great scholar Isidore of Seville, while prudently

advocating cooperation with the Byzantines, considered them deceitful and unmanly Romani. Nevertheless, the loss of Spain to Islam was another severe blow to the empire.

The city of Constantinople with its three defensive walls (whose construction began in 413 during the reign of Theodosius II) itself repelled repeated attacks during this period of Byzantine history: by the Avars in 626 and the Arabs in 673–677 and 717. Also in the seventh century to counter external cultural pressures, Byzantine rulers actively promoted Hellenism.

Still another power was emerging in western Europe, the Germanic Franks. In 773 their ruler, Charlemagne, defeated the kingdom of Lombardy in Italy, and in 800 he was crowned emperor of the West (which would evolve into the title of Holy Roman Emperor) by Pope Leo III, an act that gave both the Franks and Rome new power. Charlemagne also decisively defeated the Avars by 805. The Byzantines recognized Charlemagne's authority in 812 out of political expediency in the face of the Frankish military machine.

In the ninth century while pressure on Byzantium from the new ruling Islamic dynasty, the Abbasids, lessened as they shifted their focus to the east, moving their capital to Baghdad, Arab states in the west, including Spain, engaged in serious raids by sea. Crete in 828 and much of Sicily in the 870s fell to Arab pirates. To the north the Bulgars, who had moved into the power vacuum created by the collapse of the Avar state and had assumed control of the Slavic population, defended their territory against the Byzantines, defeating and killing Emperor Nicephorus in 811 and making his skull into a drinking cup. Even their conversion to Christianity did little to curb their threat to Byzantium, for the Bulgars made use of the more sophisticated government administration that accompanied conversion. Moreover they became literate by means of the Slavonic alphabet. They thus were able to challenge Byzantine universality both politically and theologically, claiming legitimacy as a rival, God-appointed empire. The Kievan RUS also began raiding Byzantine territory.

Internal Disputes

As it resisted external military pressures Byzantium endured political intrigue. A number of these conflicts arose around theological issues concerning the nature of Christ and the use of images in liturgy. Violence ended the reigns of 29 of the 88 Byzantine emperors, if not by death than by blinding to make them

unfit for rule. With the endemic political intrigue and frequent usurpation of power, a number of dynasties held power in Byzantine history.

The early Byzantine leaders were considered part of the Julio-Claudian dynasty, which dated back to Augustus and his rise to power in Rome in 31 B.C.E. The Heraclian dynasty, which began with Heraclius in 610, lasted until 717 through 12 emperors, the last Theodosius III. Leo III then gained power, the start of the Isaurian dynasty, which also had 12 rulers, until 867 and Michael III's reign.

Macedonian Dynasty

The longest dynasty in latter-day Byzantine times was the Macedonian dynasty, founded by Basil I, emperor in 867–886. It endured for more than two centuries until 1081 and consisted of 25 reigns.

The early Macedonian dynasty oversaw a period of expansion and resistance against pressures from the Bulgars and Rus, testament to the great resiliency of the Byzantines. The evolution away from Justinian's autocratic ideal of Byzantium's God-given absolute and universal rule toward a far more pragmatic and flexible approach played a primary role in the Byzantines' reemergence. Their theological agenda was administered by Slav-speaking missionaries, who furthered Byzantine interests with persuasion rather than armed might. Basil I's armies and fleets prevented further Muslim expansion and strengthened Byzantine interests on the Balkan and Italian Peninsulas. The Byzantines exploited the Lombard's weakening by Arab raids, establishing themes in Calabria and Langobardia (present-day Apulia). Dissension and disunity in Italy in the late ninth century, as Lombard lords, Frankish kings, and the papacy struggled for dominance, exacerbated by Arab and also MAGYAR raiders, enhanced the prestige of Byzantium, its civilization and culture contrasting with that of uncouth Franks and Lombards.

In 907 during the reign of Leo VI, Basil's son, the Rus of the Kievan Rus principality with Slavic allies, led by Oleg, failed in an attempt to capture Constantinople (an earlier attempt in 860 had also failed). Basil II, who was coemperor in 976–1025 with his ineffectual and uninvolved brother, Constantine VIII, defeated the Bulgars in 1014, incorporating their lands into the Byzantine Empire four years later. He also expanded Byzantine territory into present-day Armenia, Georgia, Iraq, and Syria. Trade was expanded in the Mediterranean and Black Seas.

Along with the territorial and economic growth was a revived intellectual life. Basil I also presided over a reorganization of finances and a recodification of laws. His son, Leo VI, known as Leo the Wise, continued his father's work and wrote verse and theological studies. Leo's son, Constantine VII, was a patron of the arts and wrote political treatises and a biography of his grandfather. Throughout this period classical Hellenic traditions were revived in art and literature. Ancient manuscripts were recopied and analyzed, and encyclopedias were compiled. Scholars drew on Arabic studies as well, especially in mathematics and the sciences.

The late Macedonian period, however, saw a decline in political, economic, and cultural life in Byzantium. The concentration of land and wealth among a few wealthy individuals and families and the church hurt the general economy. Meanwhile western Europe and the Muslim world were making new technological breakthroughs, and their armies were becoming more efficient. Byzantium became even more isolated from the Christian West in 1054, when the Eastern Orthodox Church and the Roman Catholic Church suffered a final break, a schism that had begun with the dispute between the patriarch Photius and Pope Nicholas two centuries before.

A new Muslim threat was growing in the east. The Seljuk Turks (*see* TURKICS), followers of Islam, defeated the Byzantines at Manzikert (Malazgirt) in Asia Minor and captured Emperor Romanus IV in 1071 (he was released but died the same year in exile). His successors, Michael, who ruled in 1071–78, and Nicephorus III, who succeeded him, lost much of Asia Minor to the Seljuk Turks. Nicephorus, who abdicated after only three years, was the last emperor of the Macedonian dynasty. The Comnenian dynasty of 13 emperors began with Alexius I in 1081.

The Crusades

Palestine in the Near East—considered a Holy Land by the adherents of the Jewish, Christian, and Islamic religions (*see* JEWS)—fell to the Arab Muslims in 638. Yet the region remained relatively open, a center of commerce and religious and intellectual activity until the late 11th century, when the Seljuk Turks became the dominant Islamic people in Asia Minor and took control of Jerusalem. Their harassment of Christian pilgrims to Jerusalem and their aggressive stance toward Constantinople became a concern to Christian leaders. Emperor Alexius I

appealed to the West for help defending against invaders. Soon afterward in 1095 Pope Urban II gave a speech at the Council of Clermont in France encouraging aid to Byzantium against the Islamic threat. In response, from the late 11th century through the late 13th century a number of military expeditions, the Crusades, were undertaken by European Christian powers to liberate the Holy Land. In most of these endeavors Constantinople served as a gathering place for armies heading south and east.

The First Crusade consisted of organized armies under a number of nobles. Other people joined them en route or traveled to port towns, then sailed to Constantinople on their own to meet up with the crusaders, creating a force of an estimated 25,000 to 30,000 in late 1096 and early 1097. The majority were Franks. From Constantinople the crusaders crossed to Asia Minor and traveled southward overland through Muslim states and principalities in present-day Turkey, Syria, Lebanon, and Israel. Major victories in the First Crusade included the capture of Nicaea (modern Iznik in present-day Turkey) in 1097, the capture of Antioch (a site in present-day Turkey) in 1098, and, in a bloody massacre in which the crusaders annihilated most of the Arab and Jewish inhabitants, the capture of Jerusalem in 1099 and the creation of the Latin Kingdom of Jerusalem. Other crusader states founded at this time were the County of Edessa (in northern Syria and southern Turkey), the Principality of Antioch (in Syria), and the County of Tripoli (in Lebanon). Some crusaders thus maintained a presence in the region, in particular members of the military orders, the Knights Hospitalers and the Knights Templars; others returned home. Byzantium took advantage of the victories to gain some land in Asia Minor. Subsequent crusades were intended to offer support to the crusader states and expand Christian-held territory, yet none had the success of the First Crusade.

The Fourth Crusade, in 1202–4, never reached the Holy Land. Its Frankish leaders joined the VENETIANS of the city of Venice on the northern Italian Peninsula, retaking Zara (Zadar) on the Adriatic coast of present-day Croatia, part of the Kingdom of Hungary. The Franks then joined in a dynastic struggle for Constantinople itself. In 1205 after seizing and looting the city, with the support of Alexius IV, they deposed Alexius III and established the Latin Empire of Constantinople in Thrace, Macedonia, and Greece. Alexius V led a revolt

against them, killing Alexius IV, but he himself was soon killed. Theodore I, son-in-law of Alexius III, fled to Nicaea and founded a new capital of the Eastern Roman Empire. One result of the change in power was that now the city of Venice in the Italian Peninsula controlled the sea route between the two cities, as well as much of the empire's commerce and wealth. The Venetian connection with the Byzantines resulted in much cross-cultural influence between Italy and the East. Moreover, even though Pope Innocent III condemned the crusaders' acts of violence against fellow Christians, the events surrounding the Fourth Crusade contributed to the ongoing dispute between the Roman Catholic and Greek Orthodox Churches. Byzantine power continued to be centered at Nicaea through the reigns of three emperors until Michael VIII, founder of the Palaeologan dynasty, recaptured Constantinople in 1261.

Decline and Fall

The Palaeologan Empire's resources were very limited and stretched thin throughout its existence, however, and the Byzantine decline continued, with its borders shrinking. Another emerging threat were the Ottoman Turks. After the breakup of the Seljuk Turk empire Osman I founded the Ottoman or Osmanli Turks, descendants of one of the latest invading tribes from central Asia. He waged a campaign in Asia Minor against the Byzantines, capturing Bursa shortly before his death in about 1326. In 1362 Adrianople fell to Murad I. Under Bayezid I, his son, the Ottomans continued to expand their holdings in the Balkans, defeating the SERBS and their allies at Kosovo in present-day southern Serbia and, in 1396, the Hungarians (*see HUNGARIANS: NATIONALITY*) and their allies at Nicopolis (modern Nikopol) in present-day northern Bulgaria. In 1397 Bayezid besieged Constantinople. Tamerlane (Timur), leader of a rival Turkic empire centered at Samarkand in present-day Uzbekistan, defeated the Ottomans at Angora (modern Ankara) in Asia Minor, forcing Bayezid to raise the siege.

The Ottoman Empire was fragmented for a time, but Mehmed, Bayezid's son, reunited it, and his successors, Murad II and Mehmed II, secured additional territory. Murad defeated a crusading European army at Varna in present-day eastern Bulgaria in 1444. Mehmed personally commanded the siege of Constantinople in which new large cannons were used to breach the wall that had withstood so many invasions. Constantine XI was killed defending one of the gates of the city. Constantinople fell on May 29,

1453. Mehmed's first act after the victory was to convert Hagia Sophia into a mosque. He also named the city Istanbul. Remaining Byzantine outposts would also soon fall.

The year 1453, the end of the Byzantine Empire, is one of the dates cited as the beginning of the modern age.

CULTURE

Economy

At the time of the separation of the Roman Empire into eastern and western portions in the fourth century, the Eastern economy was far stronger than that of the West. An urban economy thrived in some 900 cities, headed by that of Constantinople, the supreme emporium between East and West, while cities in the West were becoming depopulated ruins. The Western empire was heavily indebted to Byzantium, as it borrowed money to finance its wars. Agriculture prospered in the East. Differentiation between rich and poor in the West was extreme, with most wealth held by a few individuals, while in the East a bureaucratic class whose position was based on merit formed a thriving urban "middle class," which contributed to the commercial prosperity of the upper class as well.

The monetary system created by Constantine I, based on the gold *solidus*, which lasted into the middle of the 11th century, also contributed greatly to the Byzantine economy, by allowing empirewide monetary stability and fostering imperial unity. This was true even though the government's purpose in regulating the coinage was to facilitate tax collection and disburse payments to troops and officials. In general the imperial government played a central role in the economy, with regulations on the purity and supply of precious metals, as well as on the organization of commerce and skilled crafts.

Agriculture was practiced on large estates, on the Roman villa model. The church had vast holdings, as did the emperor. As in the West, heavy taxation led to the abandonment of arable land by peasants, as did depopulation caused by bubonic plague.

Byzantine Sea Power Byzantine sea power was crucial in maintaining the trade networks that knit together the empire. Africa and especially Egypt remained the "breadbasket" for the Eastern Empire, and the important corn dole (provision of grain to the populace) in Constantinople was supplied from Egypt by sea. The Byzantines protected their many

coastal provinces with their navies. When the Vandals in the fifth century preyed on the trade routes between Africa and Italy, they destroyed long-distance traffic in the western Mediterranean (which would not recover for centuries), which eliminated the northwest African trade in foodstuffs. Byzantine sea power was crippled by Arab fleets in the seventh century but recovered after the rise of the Abbasid dynasty.

The challenges to Byzantine sea power diminished trade and other contacts between Byzantium and the West. Previously long-distance trade between East and West had been heavily backed by the imperial apparatus; as this ceased to function in the West, Syrian and Jewish traders took over specializing in eastern luxury items prized by the Germanic elites in the West. This trade was seriously disrupted by the Arabs in the seventh century; nevertheless the flow of goods from East to West never dried up completely, often taking the form of diplomatic gifts from the Byzantines to allies and important churchmen.

Government and Society

Flexibility of the Byzantines Examples of change after the seventh century include ending of the corn dole in Constantinople, now beyond the empire's means; employing Slavs as new manpower to bolster the plague-ravaged Byzantine population by encouraging their resettlement in the empire; and replacing civilian aristocracy, hidebound in its obsession with rank and a convoluted (positively "Byzantine") protocol, with military officials whose positions were based on merit. The government found ways to enlist its people's support by using "populist" symbols and beliefs. Large estates were replaced by free village communities of peasants.

Byzantium for centuries had preserved the organization of the Roman state and civilization as it had been at its height (in the West that organization had withered away long before the actual end of the Western Roman Empire in 476), urban based, with a balance between civil and military authority. Under Byzantine rule countries over a wide area of Europe and the Near East were bound by a common culture and governmental structure and an interconnected economy. After the Persian and Arab wars when most urban life was extinguished except in Constantinople itself, Byzantium resembled the old Greek city-states. Yet even they had depended on the urban civilization they transplanted to new

lands—Syracuse in Sicily and Alexandria in North Africa. Byzantine cities became mere fortified centers more on a par with many towns in the West, and in its degree of militarization the empire resembled Germanic kingdoms such as that of the Franks. And Byzantine rulers were considered kings, a break from the classical Greek tradition.

Question of the Beginning of the Byzantine State

This “sea change” of the Byzantine state in the mid-seventh century has created an ambiguity for many scholars, concerning when Byzantine history actually began—with the creation of Constantinople as Eastern Roman capital from the Greek city of Byzantium by Constantine I, or with the new beginning some 400 years later. The “Byzantines” of the first 400 years considered themselves Romans, and in many ways their society was Roman. Perhaps the crucial departure of Byzantine Rome from the Western Roman tradition lay in Justinian’s formulation of the emperor as God’s instrument; in contrast, in the West the bishops of Rome and their papal successors claimed spiritual centrality. Or perhaps it occurred with the increasing importance of Hellenic traditions in the 10th century. Certainly the Byzantine state as distinctly “Byzantine” evolved over centuries as it strove to achieve a synthesis of late Roman institutions, Orthodox Christianity, and Greek culture.

Taxation Of critical importance to the life of the Byzantine state was the administrative apparatus for taxation inherited from Rome, consisting of a body of salaried and well-educated officials who efficiently managed tax registers all over the far-flung empire and directed tax collectors. In the Germanic West such functions depended on a ruler’s military prowess and ability through personal charisma to maintain the loyalty of his vassals—all matters fraught with uncertainty. In contrast the tax-collecting machinery of the Byzantines allowed them to make effective use of what wealth existed in their provinces (which in many cases were not much richer than lands in the West).

Justinian Code Control of justice was another major element of the Byzantine state. The basic legal principle, inherited from Rome, was that all legal (along with spiritual) authority emanated from the emperor. In practice all courts in the empire of whatever level were administered by centrally appointed judges. Law codes were promulgated by emperors, beginning with Justinian’s *Corpus juris civilis*, a compilation and systemization

of a thousand years of Roman law. Because of the many copies made of this work, it survived the collapse of the Byzantine Empire and, through the revival of interest in Roman law in 11th-century Italy, become the basis of civil law all over Europe. Leo III ordered the collection of laws called the *Ecloga* in 739, and Leo VI promulgated the authoritative *Basilica Code*.

Militarization of Local Government The Byzantines maintained the Roman model of civilian local government based in municipalities until the invasions of the seventh century forced them to adopt a form more suited to military necessity. Local theme commanders were given a large degree of autonomy to deal with conditions in their districts. Their soldiers were given tax-exempt lands to encourage their continued presence, and to spare the central government the obligation of paying them. The main difference between this scheme and that of the Germanic kingdoms was that Byzantine emperors could exercise a greater degree of control over local commanders through an elaborate system of written instructions (made possible by the central bureaucracy), inspections by central government officials, and, most important, disbursement of funds.

Military Practices

Byzantium’s armies were streamlined after the disastrous seventh century into an elite expeditionary guard called the *tagmata* and into army crops called *themata* (themes), which remained permanently in thematic districts. Each was commanded by a *strategos* (general), who acquired civil and military authority over his army district.

The Byzantine navy enjoyed a monopoly of sea power in the eastern Mediterranean until Arab fleets in the seventh century bested them, seizing Cyprus and Rhodes and twice blockading Constantinople. When the Arab Abbasid dynasty turned away from the Mediterranean, Byzantine sea power recovered, now based on more localized thematic fleets that patrolled and were supplied from particular areas. This solution proved problematic in the long run, as a number of the naval themes revolted. Nevertheless Byzantine navies remained strong because of the technical superiority of their ships, the skills of their seamen, and the greater availability of timber and other naval supplies compared to those of the Arabs. Only after the ninth century, when the Byzantine subject cities of Venice and Amalfi began developing

their own naval power, was Byzantine supremacy seriously challenged.

The Varangian Guard was founded by Emperor Basil II in 988, with 6,000 warriors from among the Kievan Rus, possibly sent by their king, Vladimir, to gain favor with the emperor. (In Byzantium the term Varangian did not only apply to the Rus, but to anyone of a nationality other than “Greek”; there is reason to believe, that Varangian was a term used for a foreigner in the service of the Byzantine government.)

Art

By the late Roman era even before the collapse of the Western Empire a significant cultural divide had opened between East and West. Already the Eastern Empire’s basis in Greek culture and thought distinguished it from the Latin West. After the fall of the Roman West knowledge of the Greek language was increasingly confined to the great minds of the day, such as Boethius. Later Latin ceased to be the official language of the Byzantine Empire. When the Ostrogoths took power in Italy, they exploited suspicions of Italians of the “unmanly” Greeks. In Byzantium religious controversy was sometimes seen in terms of Roman versus Greek, as when in the seventh century a dissident theologian was accused of “loving the Romans and hating the Greeks.”

Yet Byzantine influence on the West, particularly on the plastic arts, was strong throughout her history. As indigenous Roman culture withered away, Byzantine art objects, often given as diplomatic gifts to allies in Italy, kept local craftsmen aware of new styles and techniques. Papal records show that such gifts consisted of holy relics in sumptuous containers, elaborate vestments richly embroidered, ornaments such as icons worn around the neck on gold chains, and luxury textiles such as silk. One can gain an impression of the impact such treasures had on the raw new kingdoms of the West from an account of Abbot Suger of Saint-Denis in Francia in around 1140. He describes a “precious chalice out of one solid sardonyx” crafted more than a thousand years earlier, in the Alexandria of Queen Cleopatra. The abbot comments that he often queried travelers who had been to Constantinople as to “whether the things here could claim some value in comparison with those there.” Even at this late date distant Byzantium remained the center of the cultural world of Europe.

But Westerners a few years later accomplished the final severing of the Byzantine cul-

tural tradition. In 1185 Norman pirates from Sicily sacked and looted Thessalonica. In 1204 Venetians and crusaders of the Fourth Crusade systematically emptied Constantinople itself of its treasures.

Icons The Byzantine iconographic tradition is the aesthetic heart of Byzantine society. Iconography was a programmatic art in the sense that it was completely infused with theological concepts, with a religious program. The making of icons had been strictly regulated since the Seventh Ecumenical Council in Nicaea in 787. The sanctity of icons derived from their high degree of stylization prescribed by church law, intended to arouse reverence for their prototypes, which, it was claimed, dated from the time of Christ. Thus the making of icons was isolated from the normal evolutions in style and taste most artistic traditions undergo. To change the style of icon painting would be to stray from the divine originals that icons existed to reflect. Icons were intended to give the viewer direct contact with the divine, the aim of all orthodox liturgy. To this day they play an integral part in Eastern Orthodox ritual, as worshipers make processions through the church to kiss the icons. Icons are believed to heal and work miracles.

Portraiture was greatly influenced by iconographic style. Portraits of emperors are rigid and impersonal, submerging the individual personality beneath the public image, the personification of the Byzantine Empire. A central concept to this art, and indeed to the political posture of the Byzantine emperors, was *taxis*, the belief that the gestures, actions, and raiment both of liturgical ritual and of the rituals of court protocol created or brought down to Earth an experience of that divine order that was the goal of humanity. The purpose of the Byzantine Empire was to promote and defend this divine order.

The concepts informing Byzantine art are imbued with the thought of the ancient Greek philosopher Plato, particularly his teaching concerning material versus spiritual reality. Plato denigrated sense experience of the material world as a means of arriving at true knowledge, saying that our senses are too prone to error and delusion. Only the ideas or archetypal forms that derive from the one, which is universal truth, are real, and the forms we see with our senses are mere shadows or reflections of them. The concept that icons are reflections of divine originals is actually far from the thought of Plato, for whom the Ideas and Forms are to be grasped through philosophical discourse,

abstract reasoning, and mathematical study, particularly of geometry. But the icon makers' neglect of the world they saw before their eyes in favor of the forms handed down to them by the iconographic tradition bears a Platonic stamp. It was communicated to Christian theologians by Augustine, whose study of the philosophy of Neo-Platonism taught him to conceive of the spirit as immaterial and to hold that physical matter bears the impress of the divine only in its form. For Augustine evil was matter devoid of form.

The discussions over the nature of Christ—determined after the Council of Nicaea in 325 to be the same substance as the father, rather than merely of like or similar substance—were later continued by the Byzantines on the question of whether Christ was of one nature, wholly divine, or of two, divine and human, inseparably present in a single being. Again this paradox of opposite substances combined in one is reflected in the icons, material objects imbued through their form with the divine, the invisible rendered visible.

Religion

Christianity had a greater hold on the whole of society in the Eastern Empire than in the West, where its spread among Germanic peoples was for centuries more superficial and failed to penetrate to the society's core. Through monasticism Christianity instead provided an alternate social and political organization to that of government. Among the Byzantines, however, service to the empire amounted to service to God, whose temporal city was Constantinople. Religion formed the temporal as well as spiritual center of gravity for Byzantium's diverse and far-flung empire.

Even after Byzantium's temporal power had waned, its spiritual and cultural influence over a vast region continued to be great. It can be seen in the Balkans; in northern Russia, Coptic Egypt, Ethiopia; and in the European West, where its influence emerges in Sicily, Naples, and Flanders. The spread of Christianity into Slavic lands in the ninth century and also among the Kievan Rus in the 10th were signal victories for the Byzantines. The church, in a sense the conduit by which the political principles of the Roman Empire were conveyed to rulers of the Middle Ages, was a model of the concepts of territorial and hierarchical organization that could make states out of tribal territories. All over Europe its teachings transformed princes whose charisma derived solely from their wealth and success in battle into kings possessing the attrib-

utes and responsibilities of national leader and judge. The anointing of a king as first Christian of the realm clothed him in a mantle of spiritual as well as temporal authority.

Theological Disputes Because of the centrality of religion to Byzantine society in both temporal and spiritual matters, theological disputes had wide-ranging, often violent effects. The First Ecumenical Council, convened by Constantine I, met at Nicaea (modern Iznik) in Asia Minor in 325 and condemned Arianism, a movement founded by Arius, a Greek ecclesiastic in Alexandria, Egypt. Arianism proclaimed that Jesus was not equal in his divinity to God the father. Nestorius, patriarch of Constantinople in 428–431, preached a doctrine making a distinction between Jesus as a divine being and Jesus as a man begotten by God the father and a mortal woman. He was condemned as a heretic by the Third Ecumenical Council at Ephesus in 431. The nature of the Holy Trinity and the divinity of Christ continued to be debated among religious factions over the centuries. Monophysitism, a movement in the fifth and sixth centuries, maintained that in Christ there was one nature, divine in Christ, but not two, divine and human, and the Monophysites became a formidable religious and political force.

Iconoclasm, opposition to the religious use of images and the resulting idolatry, became another contested issue. In 726 Emperor Leo III had all icons removed from churches and destroyed. The emperors Constantine V and Leo IV also actively promoted iconoclasm. Irene, who served as regent to her son, Constantine VI, from 780; as his coruler in 792; and as sole ruler in 797–802 after having him imprisoned and blinded, summoned the Seventh Ecumenical Council at Nicaea in 787, which sanctioned the use of sacred images. Leo V, emperor in 813–820, again removed the icons. In 843 Theodora, as regent for her son, Michael III, had the patriarch Methodius (later a missionary to the MORAVIANS) proclaim the final restoration of icons.

In 858 during his reign Michael appointed Photius as patriarch of Constantinople. Photius also served for a time under Michael's successor, Basil I. His dispute with Pope Nicholas I in Rome over control of dioceses and theological matters resulted in what is known as the Photian Schism between East and West.

In 1436 Emperor John VIII Palaiologos made a state visit to Italy with high prelates from the Orthodox Church, hoping through negotiation and discussion to resolve points of

difference between the Eastern and Western churches. The effort failed.

Perhaps the most remarkable characteristic of the Byzantine Empire is its endurance through centuries of turmoil equal to any in human history. And although the popular image of Byzantium is one of rigid, almost otherworldly social and political immobility (an image perhaps fostered in the West by the Byzantine religious icons and portraits of their emperors, stiff and unreal in execution, unchanging in style), in reality the opposite is true. Its ability to survive its crises was derived from a capacity for reinvention. This is seen in Justinian's creation of an ideal Byzantine Empire that aroused in his people the zeal to attempt to reincarnate the universal Rome of the past, and equally in the Byzantines' laying aside that ideal when its time had run its course, in favor of a new pragmatism suited to new conditions.

Cadurci (Cadurces)

The Cadurci are classified as a Celtic tribe. They lived in Gaul around present-day Cahors in southern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Divona, on the site of Cahors, became a *civitas* capital in Roman Gaul; Cahors takes its name from the tribal name. The ELEUTETI were perhaps a subgroup.

Caerenii (Caereni)

The Caerenii are classified as a Celtic tribe. They lived in Britain in present-day northwestern Scotland at least by the first century C.E. and are discussed as CELTS, CALEDONIANS, or SCOTS. It is possible that they were PICTS and not Celtic speaking, however.

Caerosi (Caeraesi; Caeroesi)

The Caerosi were a tribe of GERMANICS or CELTICS, or a combination of the two. They lived north of present-day Trier (Trèves) on the banks of the Prüm River in western Germany. They had contact with the ROMANS under Julius Caesar in 57 B.C.E.

Caledones (Caledonii)

The Caledones are classified as CELTS or PICTS. They lived north of the Grampian Mountains in Britain in present-day western Scotland. A number of Celtic and non-Celtic peoples

became grouped as CALEDONIANS or ancient SCOTS, as distinguished from BRITONS, in their contacts with ROMANS in the first century B.C.E. and early centuries C.E., among them the Caledones. The Caledones, along with other tribes in the region, were defeated by the ROMANS under Gnaeus Julius Agricola in the 80s C.E.

Caledonians (Caledones; Caledonii)

The name Caledonians was applied by the ROMANS to the tribes of ancient Scotland above the isthmus connecting the Firth of Forth and the Firth of Clyde. The term is sometimes applied interchangeably to the ancient SCOTS and PICTS as opposed to the BRITONS in Britain to the south (the Scots and Britons are both discussed as CELTS). The first–second-century C.E. Roman historian Tacitus uses the name Caledonia for the entire region and discusses the BORESTI as a Caledonian tribe. The second-century Alexandrian geographer Ptolemy uses the name CALEDONES (or Caledonii) in reference to one tribe. Among the other tribes recorded in the region are the BORESTI, CAERENII, CARNONACAE, CORNOVII, CREONES, DECANTAE, EPIDI, LUGII, SMERTAE, TAEXALI, VACOMAGI, VENICONES, and VERTURIONES. Tacitus also writes that the Romans under Gnaeus Julius Agricola defeated a coalition of Caledonian tribes at the Battle of Mons Graupius in about 84 C.E.

In 142 C.E. the Romans built the Antonine Wall across the Forth-Clyde line. In 208 C.E.

Oscan (Italic)

the Roman emperor Lucius Septimius Severus invaded Caledonia in an attempt to pacify the resisting Scots, but he died at York before accomplishing his goal. By that time a second confederation had been formed, referred to as the MAEATAE, which included the Verturiones and possibly the Boresti and Vacomagi. The concept of the Caledonians as a people endured through the Roman occupation of Britain, which ended in 410 C.E.

Caleti (Caletes)

The Caleti are classified as a Celtic tribe. They lived in Gaul near present-day Le Havre on the north coast of France and are discussed as CELTS or GAULS. The ROMANS referred to them along with other tribes as Armoricans, that is, tribes living between the Seine and Loire on or near the Atlantic Ocean in the region of Armorica (roughly present-day Brittany and eastern Normandy). Armorica was occupied by forces under Julius Caesar in 55 B.C.E.

Cambolectri (Cambolectri Atlantici)

The Cambolectri are classified as a Celtic tribe. They lived in the present-day Vendée region of western France at least by the first century B.C.E. and are discussed as CELTS or GAULS. They are thought to have been related ancestrally to the AGESSINATES, also known as the Cambolectri Agessinates. They lived to their east.

Campani (Campanians)

The Campani are classified as an Italic tribe. They lived in the present-day region of Campania in southwestern Italy around present-day Naples. They were an Oscan-speaking people who had coalesced into a nation by the mid-fifth century B.C.E., after the ETRUSCANS lost their power in the region. They formed the Campanian League of city-states in about 420 B.C.E.

In 343 B.C.E. the First Samnite War erupted over a dispute between the SAMNITES and the SIDICINI, allies of the Campani. The Samnites invaded Campania and defeated the Campani near modern Capua on the Volturno River. The Campani requested help from the ROMANS, who defeated the Samnites in 341 B.C.E.

The Campani joined the confederation known as the Latin League in a revolt against the Romans that same year, 341 B.C.E.; in addition to the Siducini, their partners were the AURUNCI, LATINIS, and VOLSCI, fellow ITALICS.

The alliance collapsed by 338 B.C.E. under both Samnite and Roman pressure.

Cangi

The Cangi are classified as a Celtic tribe. They lived in Britain and are classified as CELTS or BRITONS. They were defeated by the Romans in 61 C.E. along with the ICENI under Queen Boudicca (Boadicea).

Cantabri (Cantabrii; Cantabros)

The Cantabri are classified as a Celtic tribe. They lived along the coast of present-day northern Spain and are discussed as CELTS or CELTIBERIANS. They resisted the ROMANS along with the ASTURES and GALLAECI but were finally defeated in 19 B.C.E.

Cantiaci (Cantii)

The Cantiaci are classified as a Celtic tribe. They lived in Britain in the region known as Cantium (modern Kent) on the coast of the English Channel in present-day southeastern England and are discussed as CELTS or BRITONS. In the first century B.C.E., they had contact with the ROMANS under Julius Caesar, who praised them for their civilized ways. For a time they were part of the dominion of the CATUVELLAUNI. Durovernum Cantiacorum on the site of present-day Canterbury became a *civitas* capital during the Roman occupation; Cantium and Canterbury take their names from the tribal name.

Cantii See CANTIACI.

Carantanians (Karantanians; Carinthians; Carinthian Slavs)

Carantanian or Carinthian is a name given to SLAVS living in a region called Carantania by the FRANKS of the eighth and ninth centuries C.E. Located on the upper reaches of the Drava and Sava Rivers in present-day southern Austria and northern Slovenia, the area was of great strategic importance to the Franks, forming both a march land (buffer zone) and a staging area for attacks on Moravia.

Slavs first came to this region in the late sixth or early seventh century. They interacted with local Germanic groups. Some of them united under the Frankish merchant named Samo. The resulting culture has been called the Carinthian culture. Around 740 the Carantanians asked the duke of Bavaria for protection against the AVARS and thereafter came

CARANTANIANS**location:**

South Slavic

under Bavarian rule (see BAVARIANS). When Charlemagne of the Franks deposed the duke of Bavaria in 788, Carantania came under Frankish rule. In 976 it evolved into a duchy, Carinthia, or Kärnten, in the Frankish Empire and eventually a state of modern Austria. The SLOVENES, who settled in present-day Slovenia to the south of Carinthia, were probably in part descended from the Carantians.

Carelians See KARELIANS.

Carinthian Slavs See CARANTANIANS.

Carnonacae

The Carnonacae are classified as a Celtic tribe. They lived in Britain in present-day northwestern Scotland at least by the first century C.E. and are discussed as CELTS, CALEDONIANS, or SCOTS. It is possible that they were PICTS and not Celtic speaking, however.

Carnutes

The Carnutes are classified as a Celtic tribe. They lived in Gaul along the Loire around Chartres in present-day northern France and are discussed as CELTS or GAULS. They fought as allies of the ARVERNI under Vercingetorix against the ROMANS under Julius Caesar in 52 B.C.E. According to Caesar, a Druid holy site, the center of all Gaul, was situated in the territory of the Carnutes. Autricum on the site of Chartres became a *civitas* capital in Roman Gaul; Chartres takes its name from the tribal name.

Carolingians See FRANKS.

Carpenati (Carpenatians)

The Carpenati were among those peoples of the Italian Peninsula who prospered in the region of Latium (part of modern Lazio) in present-day west-central Italy before the rise of the ROMANS as a dominant people in the fourth century B.C.E. Their origins are not known because they spoke a unique language, with Etruscan, Latin, and Oscan influence.

The Carpenati were bordered by the FALISCANS to the north, the Tiber River to the east, the SABINES to the south, and the ETRUSCANS centered in the stronghold of Veii to the west. Their principal cities were Capena, Feroniae, Lucus, and Saperna. The Tiber, flow-

ing into the Tyrrhenian Sea, allowed for many cultural and economic exchanges among the various peoples.

From the late seventh to the early sixth century B.C.E. the Carpenati were under the influence of the Etruscans, which culminated in their admission to the Etruscan League. In the fourth century B.C.E. they aligned with Rome against the Etruscans over control of the Tiber region. They were eventually absorbed by the Romans.

Carpetani

The Carpetani are classified as an Iberian tribe. In the first millennium B.C.E. they lived along the Tagus (Tajo) River in the vicinity of present-day Toledo, the site of their capital, and Madrid in central Spain. They had contacts with the tribes to their north classified as CELTIBERIANS, with mostly Celtic ancestry, who settled the northern and western regions of the Iberian Peninsula displacing IBERIANS. The CARTHAGINIANS under Hannibal defeated the Carpetani in 220–219 B.C.E. The ROMANS captured their capital in 197 B.C.E. and named it Toletum. In the Roman provincial system later established, the Carpetani homeland was part of Tarraconensis.

Carpatho-Rusyns See RUSYNS.

Carpi (Carps; Karps; Capes; Carpians)

The Carpi were probably a tribe of THRACIANS, a subgroup of the DACIANS, although some scholars classify them as SLAVS. They lived in the Carpathian Mountains (probably named after them) in present-day Romania to the north of the Roman province of Dacia, and hence their designation, along with the COSTOBOCII, as the free Dacians. Some of them also lived to the east in present-day Moldova. They carried out a number of attacks on the ROMANS. In 273 C.E., allied with the GOTHs and SARMATIANS, they crossed the Danube for attacks on the Roman province of Moesia (parts of present-day Serbia and Bulgaria). It is thought that they were absorbed by other groups subsequently.

Carthaginians (Phoenicians; Poeni; Puni)

Carthaginians were inhabitants of the ancient city-state of Carthage, situated on a peninsula in the Bay of Tunis in present-day Tunisia on the north coast of Africa. PHOENICIANS,

assumed to be out of present-day Lebanon in Asia, founded the city, but the Carthaginians as a people are discussed separately in historical texts.

ORIGINS

Legend holds that a queen by the name of Dido founded Carthage, but it is thought to have been established by Phoenicians from Tyre (Sur) in Asia as a trading post perhaps as early as the late ninth century B.C.E. (although archaeological evidence only exists from the last quarter of the eighth century B.C.E.). The city had two harbors, connected by a canal; a walled fortress overlooked the harbors from a hill. The name Carthage is from the Latin Carthago or Cartago, derived from the Phoenician word Kart-hadasht, for “new city.” The Romans called its inhabitants Poeni, from Phoenikes (or Phoenicians), from which the adjective Punic is derived.

LANGUAGE

The Carthaginians spoke a dialect referred to as Punic, or Pun. It was related to Phoenician, the Semitic language of Carthage’s founders, but influenced by Berber, the Hamitic language of the Berbers of North Africa.

HISTORY

The colony of Carthage evolved into a city-state under an aristocracy of nobles and

wealthy merchants. Through conquest and trade it became influential throughout the Mediterranean region. By the sixth century B.C.E. Carthaginians had subjugated the Libyan tribes and earlier Phoenician colonies and controlled the coast of North Africa from the western extent of Egypt to the Atlantic Ocean.

Carthaginian Activity in Europe

The Carthaginians, following the earlier Phoenician tradition, were a seagoing people and were active in commerce in the Mediterranean region. In the sixth century B.C.E. Carthage gained control of Malta and Sardinia (part of present-day Italy), which had formerly been Phoenician and then Greek colonies.

The Carthaginians had trade contacts beyond the Mediterranean region, however, reached by sailing through the Strait of Gibraltar into the Atlantic Ocean. In about 450 B.C.E. Himilco, perhaps the brother of Hanno, who had earlier explored part of Africa’s west coast, visited Atlantic coastal areas to the north, as far as present-day Brittany in France and the British Isles, although there is no archaeological evidence to indicate such travels. It is thought they used this route to trade for tin.

Starting in 409 B.C.E. the Carthaginians waged war with the GREEKS over Sicily, gaining a foothold in the west; the eastern boundary of Carthaginian power was the Halycus (modern Platani) River. Yet attempts to control the entire island led to a series of defeats over the centuries.

In the third century B.C.E. the ROMANS challenged Carthage’s control of the western Mediterranean in a series of three wars known as the Punic Wars (after the Roman name for the Phoenicians, Poeni). In 241 B.C.E. at the end of the First Punic War (264–241 B.C.E.) the Carthaginian general Hamilcar Barca was forced to make peace with the Romans, after a naval defeat by the Roman consul Gaius Lutatius Catulus, and to give up holdings in Sicily.

In 237 B.C.E. Hamilcar Barca led an invasion of the Iberian Peninsula, fighting IBERIANS and CELTIBERIANS. His son-in-law, Hasdrubal, and his son, Hannibal, completed the conquest, occupying present-day southeastern Spain. Hasdrubal founded the city of Carthago Nova (New Carthage; modern Cartagena) in 227 B.C.E.

In the Second Punic War (218–201 B.C.E.) Hannibal, with a full baggage train and ele-

phants, marched eastward along the Mediterranean's north coast from Spain and crossed the Alps in a journey into Italy, where he had success against Roman forces. The Carthaginian victory in the Battle of Cannae in 216 B.C.E. was one of the worst defeats in Roman history. The city of Rome held against his forces, however, and Roman victories elsewhere led to Hannibal's recall to Africa in 203 B.C.E. In 202 B.C.E. at Zama, northwest of Carthage, he was defeated by a Roman army under Scipio Africanus (Scipio the Elder), which led to loss of territory in Spain.

The End of Carthage

In 146 B.C.E. at the end of the Third Punic War (149–146 B.C.E.), the Romans under Scipio Aemilianus Africanus Numantinus (Scipio the Younger) sacked and burned Carthage. A new city, founded by the Romans in 29 B.C.E., became a center of Roman administration. The

Germanic VANDALS under Gaiseric, along with the SUEBI and ALANS, invaded Africa from Spain and in 439 C.E. occupied Carthage, making it their capital. In 533 C.E. it was taken by the BYZANTINES. In the late seventh century C.E. with Arab expansion westward, Carthage again came under attack and was destroyed in 698. The site, under Arab control, was continuously inhabited over the centuries and is presently a suburb of Tunis.

CULTURE (see also PHOENICIANS)

Carthage, as a center of trade, became a melting pot of people and ideas, especially influenced by Greece and Egypt.

Economy

The Carthaginian economy was built around trade. Among the Carthaginian products were purple dye, African grain, fruits, nuts, wine,

Carthaginians used coins such as this one from the late fifth century B.C.E. (Drawing by Patti Erway)

slaves, exotic animals, ivory, lumber, pottery, glassware, jewelry, beds, and bedding. They bartered these goods for tin, silver, and gold.

Government and Society

Carthage was ruled by a king, a council of elders known as the Gerousia, and two *suffetes*, or magistrates. The *suffetes* held office on the basis of merit and wielded much of the power. The wealthy merchant families also had a great deal of influence.

Military Practices

The Carthaginians controlled the shipping lanes, protecting their monopoly through a powerful navy. Some of their galley ships were quadriremes and quinqueremes, with four or five tiers of oars on each side, designed for ramming ships. They also used foreign mercenaries, especially Iberians, Celtiberians, and GAULS. They minted gold coins to pay for their armies.

Religion

Baal-hammon (Amon), the chief deity, and Tanit (Tinith), probably his consort, and the equivalent of the Phoenician goddess Astarte, thought to represent the Sun and the Moon, respectively, were worshipped by the Carthaginians, along with other minor gods. Baal-hammon and Tanit supposedly fertilized the soil and provided renewal. Versions of the Greek gods Demeter and Persephone and the Roman goddess Juno also were worshipped by Carthaginians.

The Carthaginians, as did other Phoenicians, carried on the tradition of far-reaching sea travel and commerce. Carthaginian merchants were so common in foreign lands that they were even satirized in Greek theater. In competition with the militaristic Romans, however, the Carthaginians also concerned themselves with conquest and, maintaining a presence in Europe for part of their history, becoming an early obstacle to Roman expansion. The historic struggle with the Carthaginians further fueled the Roman trajectory toward empire.

Carvetii

The Carvetii are classified as a Celtic tribe, perhaps a branch of the BRIGANTES. They lived in Britain in the present-day county of Cumbria in northwestern England at least by the first century B.C.E. and are discussed as CELTS or BRITONS. Luguvalium on the site of present-day Carlisle became a *civitas* capital during the occupation by ROMANS.

Cashubians *See* KASHUBES.

Cassi

The Cassi are classified as a Celtic tribe. They lived in Britain and are discussed as CELTS or BRITONS. According to Julius Caesar they were allies of the TRINOVANTES and surrendered to the ROMANS in 54 B.C.E., along with the ANCALITES, BIBROCI, CENIMAGNI, and SEGONTIACI. Cassivellaunus, who led the resistance of the CATUVELLAUNI against the Romans, may have been of the Cassi, perhaps a subgroup of the Catuvellauni.

Catalanians (Catalans; people of Catalonia)

The name Catalanians refers to people now or formerly living in the historical region or autonomous community of Catalonia, situated in present-day northeastern Spain. Over the centuries the IBERIANS, PHOENICIANS, GREEKS, CARTHAGINIANS, ROMANS, and VISIGOTHS all had a presence there. Catalan (or Barcelona) was established as an independent county of the FRANKS by the ninth century C.E. and eventually extended its territories beyond the Pyrenees. It united with Aragon in 1137, and, since the 13th century, Catalonia has alternately gained and lost autonomy from Spanish rule. Since

1978 it has been an autonomous community within Spain, with the Catalán language (a Romance language distinct from Spanish) officially used (see SPANISH: NATIONALITY). There are also Catalán speakers in Andorra (see ANDORRANS: NATIONALITY), who maintain a cultural identity as Catalanians.

Catalauni (Catalaunes)

The Catalauni are classified as a Celtic tribe. They lived in Gaul around present-day Châlons-sur-Marne in northern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Catti See CHATTI.

Caturiges

The Caturiges are classified as a Celtic tribe. They lived in Gaul, in the Valley of the Durance in the western Alps in present-day southeastern France and are discussed as CELTS or GAULS. Along with the CEUTRONES and GRAIOCELLI, they attempted unsuccessfully to obstruct the ROMANS under Julius Caesar in the Alps in 58 B.C.E.

Catuvellauni

The Catuvellauni are classified as a Celtic tribe. They lived in Britain in the present-day county of Hertfordshire in southern England and are discussed as CELTS or as BRITONS. With the ATREBATES and TRINOVANTES, they were one of the three most powerful tribal kingdoms in Britain in the first centuries B.C.E. and C.E.

The Catuvellauni leader Cassivellaunus (perhaps of the CASSI) resisted the ROMANS under Julius Caesar in 54 B.C.E. After their defeat they established trade contacts and competed to control the imports of Roman goods.

In 10 C.E. the territories of the Catuvellauni and the Trinovantes were united by the Catuvellaunian king Cunobelin (Cymbeline). In 42 C.E. his sons, Caractacus (Caradoc) and Togodumnus, inherited his kingdom and moved against the pro-Roman Atrebates (One theory of the rationale for the Roman invasion of Britain in 43 C.E. was that the Atrebates appealed to Rome for help against the Catuvellauni.) Afterward Caractacus and allies in Wales among the ORDOVICES and SILURES resisted Roman occupation. He eventually sought refuge among the BRIGANTES under Queen Cartimandua in 51 C.E., but she turned him over to the Romans.

Verulamium on the site of present-day St. Albans became a *civitas* capital during the Roman occupation lasting until 410 C.E. Londinium on the site of present-day London, another Catuvellauni town, eventually became the capital in Roman Britain. They were both attacked in the revolt led by Queen Boudicca (Boadicea) of the ICENI. A tribe known as Catuvellauni, probably related ancestrally, inhabited part of Gaul near the SENONES and would thus be discussed as GAULS.

Caucasians (Caucasic peoples)

The Caucasus Mountains are cited by many geographers as part of the boundary between Europe and Asia. In discussions of ancient history this natural barrier, much as the Ural Mountains to the north do, stands between different cultures and traditions on its opposite sides. In modern times this barrier also has geographic significance because the North Caucasus is the southern extent of European Russia.

Nevertheless, in understanding the flow of peoples and history, the mountains are an arbitrary boundary, emphasizing, once again, how Europe and Asia are not in fact two separate entities but are one Eurasia, with peoples of central Eurasia, in terms of culture, language, and even physical characteristics, blending elements of both Europe and Asia. The entire Caucasus region—both Ciscaucasia in the north (North Caucasus) and Transcaucasia in the south (South Caucasus)—was settled by related peoples and was conquered in the 18th–19th centuries by Russia. Moreover, in the 20th century the South Caucasus territories—Armenia, Azerbaijan, and Georgia—were, as were the territories to the north, part of the Soviet Union (USSR) as the Transcaucasian Federation, officially the Transcaucasian Soviet Federated Socialist Republic. That is to say, the peoples of the South Caucasus share ethnicity, culture, and history with the peoples of the North Caucasus.

The term *Caucasians* (from the Latinized form of the Greek *Kaukasos*, possibly derived from the Hittite *Kaz-Kaz*, their name for a tribe on the Black Sea) is sometimes applied to all the people of the Caucasus (not to be confused with the term's more general usage for an entire race, first applied in 1775 under the supposition that the people of the region were typical of the white race). But this book uses the term for peoples of the Caucasic language family. Other peoples of the Caucasus are classified as

Indo-Iranian (*see* OSSETS), Turkic (*see* TURKICS), and Semitic. A number of Caucasian peoples with separate entries in this book, although presently part of the Russian Federation (*see* RUSSIANS: NATIONALITY), have preserved their identities as distinct ethnolinguistic groups.

ORIGINS

Caucasic peoples, on the basis of archaeological continuity for the last 8,000 years or more, are considered indigenous to the Caucasus and are probably descended from Neolithic peoples living there, among the early workers in bronze. They occupied their present territories longer than any other European language group, with the possible exception of the

BASQUES. The Caucasian root language is comparable in age to Indo-European. Moreover the distribution of loanwords from ancient Semitic-speaking peoples of Mesopotamia to the south confirms a long-term Caucasian presence in the region. The divergent dialects indicate that Caucasians have lived near one another peaceably as distinct communities for millennia. Peoples speaking Indo-Iranian languages perhaps reached the region by the second millennium B.C.E., and Turkic peoples in the early Middle Ages. Many Caucasian individuals became multilingual. The languages were traditionally not written, and Caucasians over the centuries adopted alphabets of other peoples to keep records.

LANGUAGE

The Caucasus is known for the great number and diversity of its languages and dialects. The first-century C.E. Roman scholar Pliny the Elder wrote that the ROMANS conducted business in the region with the help of 80 interpreters, many of them for the multitudinous Caucasian dialects. The Caucasus was called Jabal al-Asine for “mountain of languages” by Arab geographers. The two branches of Caucasian, a non-Indo-European family, are sometimes grouped as North Caucasian and South Caucasian (or Kartvelian). North Caucasian, the branch spoken by European peoples, is subdivided by some linguists as North-Central, North-East, and North-West. Caucasian languages have a wealth of consonants

HISTORY**The Ancient Caucasus**

Each of the many Caucasian tribes has its distinct traditions and history, but, as a group, the peoples are part of the general history of the Caucasus and the successive migrations and invasions by other peoples. The stretch of land between the Black Sea and Caspian Sea became a trade route between the peoples of southwest Asia, such as from Mesopotamia to the south, and the steppe peoples in eastern Europe and central Asia. Among the earliest invaders known to establish a presence in the Caucasus were the SCYTHIANS, who arrived in the region from central Asia by the eighth century B.C.E. Caucasians built fortified towers in the mountains to defend against them. In the fourth century B.C.E. the SARMATIANS migrated westward and began competing with the Scythians, mainly to the north of the Caucasus. Numerous peoples competed over the South Caucasus in

ancient times, among them Medes and Persians in the sixth century B.C.E.

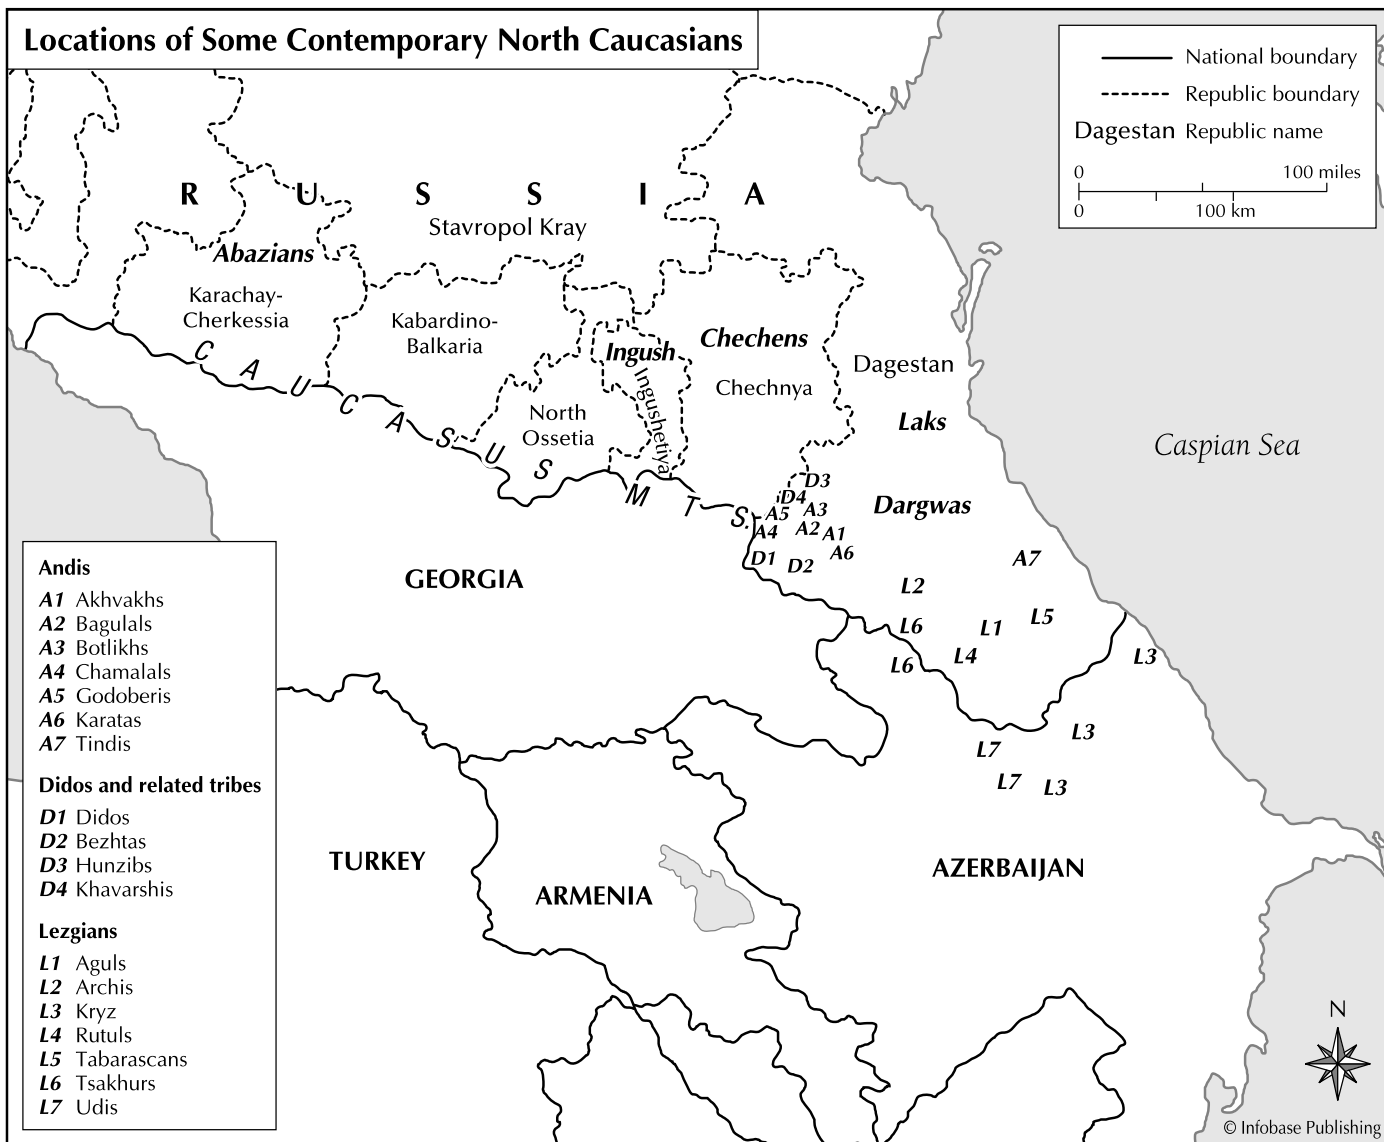

The GREEKS, also in the sixth century B.C.E., extended their trade near the South Caucasus by way of the Black Sea. Colchis, a land bordering the Black Sea in the South Caucasus, was colonized by Greek inhabitants out of Miletos in western Asia Minor. The region became part of Greek mythology: Zeus reportedly chained Prometheus to a Caucasus mountaintop as punishment for siding with humankind against the gods; Jason and his Argonauts sought the Golden Fleece in Colchis. And Medea, a sorceress who helped the Greek Jason steal the Golden Fleece, was the daughter of the king of Colchis.

MACEDONIANS and Greeks under Alexander the Great captured territory south of the mountains in 330 B.C.E. By the second century B.C.E. the Parthians, perhaps descendants of the Scythians, had established an empire out of

present-day northeastern Iran stretching near the South Caucasus. The Romans also held territory as far to the northeast as the Caucasus region; the Roman province of Cappadocia, established in 17 B.C.E., extended along the southeast coast of the Black Sea as far as Trapezus (modern Trabzon, Turkey), and traders ventured into the actual Caucasus by both land and sea.

Later Invaders

The ALANS, an Iranian people, assumed to be descendants of the Scythian-Sarmatians, are mentioned in Roman texts as living north of the Caucasus Mountains in the first century C.E. The next great wave of outsiders to reach the region were the HUNS, who lived along the Volga River, which feeds the Caspian Sea, also as early as the first century C.E. They pushed westward to the Black Sea by the fourth century.

In the South Caucasus in the third–seventh centuries, the Persians under the rule of the Sassanians were dominant, but other peoples, such as the Armenians, competed with them. In the sixth century a confederation of **TURKS** known as **Goktuks** built an empire that extended from Mongolia to the Black Sea. **AVARS** are known to have been in the Caucasus region by the mid-sixth century before they pushed on west and created a khanate in central Europe. In the seventh to eighth centuries Arab Muslims became the dominant power to the south. **KHAZARS** held territory from the steppes southward to Transcaucasia, that is, lands south of the Caucasus Mountains in Asia. Arabs meanwhile expanded northward out of Arabia, spreading the Islamic religion. The Khazars resisted, but by the mid-seventh century the Arabs seized territory in the North Caucasus region. The Khazars succeeded in driving them back into Transcaucasia in 685 but were themselves forced out of Transcaucasia by the 720s. The **BYZANTINES** out of Constantinople, from the fifth to the seventh century, held territory in the South Caucasus.

From the 11th to the 13th century the Caucasians were flanked by the Seljuk Turks to the south. The Alans still held lands in the North Caucasus, but the Turkic **KIPCHAKS** to their north were more powerful. In the 13th century the **MONGOLS** invaded from eastern Asia, and the Caucasus Mountains eventually became the dividing line between two khanates, the Kipchak khanate (or Khanate of the Golden Horde) to the north and the Ilkhanate to the south. Both of these khanates consisted of numerous Turkic peoples, some of whom became known—some sharing bloodlines with Mongols—as **TATARS**. In the late 14th century after the Mongol Empire had weakened, a Turkic ruler by the name of Tamerlane (Timur), from Samarkand in the region of Turkestan (part of present-day Uzbekistan in Asia), created an empire extending as far east as the territory between the Caspian and Black Seas, including the Caucasus. The Ottoman Turks were the next great power in the territory south of the Caucasus, and they dominated the region for subsequent centuries.

With the breakup of the Mongol Empire in 1382 some people of the Caucasus—some among whom in the north were known as **CIRCASSIANS**—regained their independence. Most of them by this time were Muslims. Many of the Caucasians of present-day Georgia (formerly the Kingdom of Georgia), where Christianity had been introduced in the fourth century, were Christians.

Through these centuries of occupation by other peoples many of the Caucasians managed to maintain their traditional lifeways by remaining in the high country of the Caucasus Mountains.

Russia and Caucasians

Much of the later history of the Caucasians, while the Ottoman Turkey and Persia competed for territory in the south, involves expansion of the Russian **SLAVS** out of the north. Russia became one of the players in the region in the 16th century, as they expanded eastward, although a concerted effort to occupy the region did not take place until the reign of Peter the Great in 1672–1725. Much of the 18th and 19th centuries was taken up with the Russo-Turkish Wars and involved the entire Black Sea region. The Crimean Tatars were among the Turkic enemies of Russia. Many of the early forces the Russians sent to the Caucasus were **COSSACKS** of Slavic ancestry. (In fact, all capitals of the North Caucasian Russian republics were founded as Cossack fortifications.) By 1785 the North Caucasus had been designated a Russian province.

During much of the 19th century, starting in 1817, the Russians and Caucasians, as well as other peoples of the region, continued to battle over the Caucasus. The Ottoman Turks gave up their claim to the Caucasus in 1829. Russian settlement was encouraged, and the influx of settlers in the North Caucasus led to organized rebellion, such as that in Dagestan in 1834 led by Shāmil, said to be of Avar ancestry. His forces were defeated in 1858. With the last pockets of resistance defeated in 1864, many of their villages purposely destroyed, and Russian administrative control established, an estimated 400,000 people of the region—Caucasians and others—emigrated, both forcibly and by choice, many of them to Turkey.

After the Russian Revolution of 1917 the new Soviet government attempted to reorganize the Caucasus political structure (as it would time and again over the decades). During the Russian Civil War of 1918–20 between the Whites (anti-Communists) and Reds (Bolsheviks) Cossacks of the North Caucasus participated in the White Voluntary Army and established a Cossack Republic. In 1921 with Bolshevik victory some 70,000 Cossacks were deported to Siberia. Bolshevism was centered in the cities, with Caucasian mountain villages able to maintain traditional lifestyle. Meanwhile the movements of separatism and pan-Islamism grew among the indigenous population. From

the late 1920s the Soviet government promoted a policy of Russification among the various Caucasian peoples, discouraging nationalism and repressing Islam.

During World War II in 1942 Nazi forces of Germany launched an offensive to capture or neutralize the oil resources of the Caucasus; the next year the Soviets managed to drive them from the region. In 1943–44 during World War II Joseph Stalin accused Muslim peoples of the region of collaborating with Germany and ordered their deportation to Soviet Asia, especially Kazakhstan; it is estimated that one-quarter to one-half of the migrants died in transit. In 1956–57 the émigrés were “rehabilitated” and the next year they were allowed to return to the Caucasus, although many stayed in their new homes.

Since the collapse of the Soviet Union in 1991, the republics of the North Caucasus have been part of the Russian Federation. Armenia, Azerbaijan, and Georgia in Transcaucasia have become independent nations, however. The CHECHENS in the north unsuccessfully fought a war of independence in 1994–96, with additional sporadic fighting from 1999 to the present.

European Caucasian Tribes

European Caucasian tribes include the ABAZIANS; the ANDIS and tribes related linguistically to them; the DIDOS and related tribes; the LEZGIANS and related tribes; the related Chechens and INGUSH; the related DARGWAS and LAKS; the UBYKS; and the various groups known historically as CIRCASSIANS. These larger classifications consisted of and still consist of many tribes with their own dialects and traditions, many of them now recognized as official ethnic groups in the Russian Federation (and others maintaining traditions even without official status). In Dagestan alone there are 19 official ethnic groups (both Caucasian speaking and non-Caucasian speaking).

In the South Caucasus (Asia) Caspian-speaking peoples include the Georgians and Kartvelians, the latter subdivided into the Imeritians, Lazes, Mingrelians, and Svanetians.

CULTURE

Economy

The majority of Caucasian peoples have traditionally supported themselves through the raising of livestock—sheep, goats, oxen, cattle, and horses—in the highlands and farming, especially of grains, in the lowlands. Terracing has allowed for some farming in the rugged high-

A Caucasian peasant of the late 19th century smokes his pipe. (*Library of Congress, Prints and Photographs Division [LC-USZ62-106016]*)

lands. Hunting and fishing have also provided sustenance. The Caucasus, a crossroads between Europe and Asia and offering ports on both the Black Sea and Caspian Sea, has been a center of trade throughout history. Mountain peoples sometimes descended from their villages to trade with lowland peoples. The discovery of oil in modern times and other industrialization have led to new sources of revenue.

Government and Society

Traditional Caucasian social structure is based on tribal (or village), clan, and family groupings. Among many groups communities are headed by a village elder and assistant village elders, elected by the village assembly; village judges and the local cleric settle disputes regulated by two codes of law, customary law (known to some groups as *adat*) and Islamic law (*shariah*). The Muslim cleric (*qadi*) administers justice according to the Muslim code of *shariah*. Clans are patriarchal, with respected elders leading them, but generally nonhierarchical and egalitarian, although clan members show respect for clan elders. Some of the ancient tribal names have endured as names of clan groupings. Even in modern urban life, clan relationships are still important among many groups, who can trace their ancestry back to highland villages and clan towers. At times of warfare various tribes sometimes united under a common leader. Some

tribes founded military organizations, with men taking part in regular battle drills.

Dwellings and Architecture

In the highlands of the Caucasus villages typically consist of stone houses clustered together. Others have more isolated homes, separated by mountain paths. Some villages consist of individual homesteads surrounded by fences. In addition to stone, wood and wattle covered with clay are used. House types vary considerably. Some groups favor single-storied buildings, others multistoried ones. The Caucasians built fortified towers (sometimes called clan towers)—massive stone structures—in ancient times for defensive purposes.

Clothing

Caucasian women have traditionally worn *chukhtas* (hooded garments). Others have worn *burkas* (garments covering the entire body with holes for the eyes, typically worn by many Muslim women). A more modern style of dress consists of scarves or woolen shawls tied around the head.

Art

Some Caucasians became known for elaborately designed woven rugs, others for stone or wood carving.

Religion

Animism was once an important part of Caucasian religion. Ancient cults were associated with thunder, fertility rites, and sacred groves, among other beliefs and practices. Islam began spreading to the region with the Arab invasions of the seventh to eighth century. Between the ninth and 14th centuries two rival religions competed in the region: Islam and Christianity. Islam prevailed, and the majority of Caucasians are Sunni Muslims, except in Georgia, where Christianity is the majority religion. Some Jews and other minority sects are also present.

A prime characteristic of the region known as the Caucasus is its diversity. Geographically it has mountain ranges, plateaus, foothills, plains, rivers, and lakes, with forests, grasslands, marshes, and dry steppes. It has myriad peoples—more than 50 recognized groups living there today and many more throughout history. They speak numerous languages, more languages and dialects than in any region of comparable size.

This diversity of peoples and cultures has flourished over the centuries despite the external pressure of invading peoples and concerted attempts at imposing new ways of life.

Cauci (Kauki)

The Cauci are classified as a Celtic tribe. They lived in the present-day counties of Carlow, Kilkenny, and Wicklow in eastern Ireland at least by the first century C.E. and are discussed as CELTS or IRISH.

Cavares

The Cavares are classified as a Celtic tribe. They lived in Gaul around present-day Avignon in southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Celtae (Galli)

The name Celtae is the Latin version of the name CELTS (itself derived from the Greek Keltoi). In the first century B.C.E. the name, based on classifications by Julius Caesar, was applied specifically by the ROMANS to those GAULS living in Gallia Celtica (or Gallia Lugdunensis), a central region of Gaul mainly in present-day France between the Loire and the Seine. The Romans called them Celtae to distinguish them from the BELGAE of Gallia Belgica to the north and the AQUITANI of Gallia Aquitania to the south. In Roman usage at the time the names Celtae and Galli were interchangeable.

Celtiberians (Celt-Iberians; Celtiberi; Celtiberes; Ibero-Celts)

The Celtiberians were those CELTS living on the Iberian Peninsula. Because of their contact with native IBERIANS, they are classified as culturally distinct from other Celts of the central European Hallstatt/La Tène zone, from Britain across France and Germany to Poland. The term Celtiberia is sometimes used specifically for a region in the north-central part of present-

day Spain between the Tagus (Tajo) and Ebro Rivers, where the Celtic presence and influence were strongest. But it is also used for all those tribes in the western two-thirds of the peninsula exposed to Celtic influence to any degree.

ORIGINS

The various Celtic-speaking peoples were the descendants of the tribes of the Bell Beaker and other Bronze Age cultures that before that of

the peoples of the Neolithic cultures that developed after the introduction of farming practices to Europe. It is thought that during the Iron Age by about 600 B.C.E. Celtic peoples had settled on the Iberian Peninsula, or Hispania, as the ROMANS called it, after they had migrated across the Pyrenees from the north. They met and assimilated with a local culture dating to the Late Bronze Age. The fifth-century Greek historian Herodotus places them there by 500 B.C.E. Their mention by Herodotus, who identifies them as the same people as those living north of the Danube River in central Europe, is the earliest extant written record of Celts anywhere. The name Celtiberi is Roman. Inscriptions in the Iberian and Latin alphabets of the Celto-Iberian language constitute the most extensive body of epigraphical Celtic material earlier than the medieval Irish literature. Contacts with the Iberians in eastern and southern Spain, who traded extensively with PHOENICIANS, GREEKS, CARTHAGINIANS, and Romans, gave the Celtiberians much stimulus from those cultures.

The north-central highland region of Iberia, which would become Celtiberia, shared in the Urnfield phenomenon of other proto-Celtic regions in Europe, in which cremation and deposition of ashes in urns buried in cemeteries replaced inhumation. This practice was also taken up by the Iberians in the northeast. The people engaged in pastoral farming, mostly of sheep and goats. The culture in general seems to date from the Late Bronze Age/Iron Age transition. Study of place-names attests to the presence of what can be called a “proto-Celtic” language quite different from Celto-Iberian, its archaism evident in the preservation of an initial

p for many words (not to be confused with *p*-Celtic languages, a later development). Elements of this culture—alternative burial rites, ritual sites, and deity names—continued after the emergence of the Celtiberian culture as a sort of substratum that was slowly disappearing. Affinities between Celtiberians and Iberians seem to be based on elements of this older substratum, which they all held in common.

Invasion theories, as elsewhere in lands on the Celtic periphery, have been advanced for the origin of the Celtiberian culture. They explain the available archaeological evidence less well than a process of cultural assimilation and evolution set in motion by both local conditions and the arrival of some by ethnically Celtic groups, probably mostly elites rather than whole peoples.

LANGUAGE

The Celtiberians spoke a branch of the Celtic Continental Celtic languages, known as Celto-Iberian, or Hispano-Celtic; the other two Continental branches are Gaulish, spoken in Gaul, and Lepontic, spoken in northern Italy. Celto-Iberian is actually a *q*-Celtic language, making it closer in origin to the Gaelic branch of the Insular Celtic languages of the British Isles, spoken in Ireland and Scotland, than to *p*-Celtic Gaulish. The ancient annals of Ireland speak of invasions of tribes from Spain, and this similarity of language may suggest some sort of contact between the two peoples possibly brought about in part through trade. On the other hand Celto-Iberian may have been, as was Irish Gaelic, a language closer to Common Celtic, the ancestor of all the Celtic languages—the relative isolation of the Celtiberians, as did that of the Irish, prevented them from participating in the evolution to *p*-Celtic elsewhere. Some *p*-Celtic peoples did migrate there, however. The Celtiberian language absorbed many features from the local non-Indo-European languages of the Iberians.

HISTORY

The heart of the Celtic region was on the hill country and mesetas (plateaus) in present-day north-central Spain between the Tagus (Tajo) and Ebro Rivers. Tribes there included the AREVACI, BELLI, BERONES, LOBETANI, LUSONES, OLCADES, PALENDONES, TITTI, and TURBOLETAS. The Arevaci eventually dominated the region. Surrounding tribes included the CANTABRI, GALLI (also the Roman name for GAULS), and TURMOGI to the north and the VACCAEI and VETTONES to the west. The tribes even farther west, some of them in present-day Portugal—among them the ASTURES and LUSITANI—also adopted some Celtic

This stone relief shows a Celtiberian warrior carrying a Celtic shield and an Iberian sword. (Drawing by Patti Erway)

traits (although the Lusitani are generally discussed as Iberian). The *CELTICI* and *GALLAECI*, also to the west, were probably more predominantly Celtic in culture, as indicated by their names' resemblance to the names Celtic and Gallic. There were dozens of other tribes who could be classified as Celtiberians in Celtiberia proper as well as surrounding areas.

The tribes in the eastern and southern parts of the peninsula, among them the *BASTETANI*, *TARTASSIANS*, and *VASCONES*, kept their pre-Celtic languages and way of life. Those Iberians living along the coast had the earliest regular contacts with the rest of the Mediterranean world, especially Phoenicians and Greeks, who had trading settlements there.

Carthaginians in Spain

In 237 B.C.E. the Carthaginians, Phoenicians out of Carthage in North Africa, invaded the Iberian Peninsula and occupied the region south of the Guadalquivir River. They extended their influence farther to the north through alliances with Celtiberian chieftains. Celtiberians, renowned as warriors, were hired as mercenaries by the Carthaginians. They participated under Hannibal in his attack in 219–218 B.C.E. on the Roman-allied city of Saguntum (modern Sagunto), precipitating the Second Punic War, and were with him in his march eastward along the Mediterranean's north coast, where he defeated Gallic tribes (Gauls); across the Alps; and into Italy. The defeat of the Carthaginians by the Romans in 201 B.C.E. in the Second Punic War led to their loss of Spain in addition to some island possessions.

Roman Inroads

After the war with the Carthaginians the Romans established a greater presence in Spain, at first along the entire Mediterranean coast. In 197 B.C.E. the Romans created two provinces—*Hispania Citerior* (Hither or Near Spain) and *Hispania Ulterior* (Farther or Far Spain)—as well as a bureaucracy to rule them. Over the next two centuries they would meet with great resistance from the indigenous tribes.

The Lusitani living to the west in present-day Portugal, perhaps partly Celtic, mounted a number of organized revolts against the Romans, in 195–190, 154–150, and 147–139 B.C.E. In the meantime the Romans waged war in Celtiberia proper, clearing the Ebro Valley of Celtiberian forces in 143 B.C.E. Ten years later Roman legions under Scipio Aemilianus Africanus Numantinus (Scipio the Younger), after a 16-month siege, destroyed Numantia, the stronghold of the Arevaci on the Douro River.

Celtiberian resistance continued, however. In 80 B.C.E. the Roman expatriate Quintus Sertorius, who had been sent to govern Hither Spain, led a campaign against other Roman factions and sought the support of Iberians and Celtiberians. He was defeated by Pompey in 73 B.C.E., whereupon he was executed. The Lusitani were defeated once and for all by troops under Julius Caesar in 61 B.C.E., three years before his first campaigns in Gaul.

Some Celtiberians and Iberians, as did the Gauls, served in Roman armies and thus were caught up in the power struggles among various factions. In 45 B.C.E., the year before he was assassinated, Caesar defeated Pompey's sons at Munda in southern Spain. The tribes in the northwest of the Iberian Peninsula continued to resist the Roman presence, however—in particular the Astures, Cantabri, and Gallaecai, who in 26 began attacking settlements. The Celtiberians suffered final defeat by Marcus Vipsanius Agrippa in 19 B.C.E., after which all the tribes were pacified.

In 13 B.C.E. as part of the provincial system of the Roman Empire the Iberian Peninsula was divided into the provinces *Tarraconensis*, *Lusitania*, and *Baetica*. In 260 C.E. peoples in Gaul, Spain, and Britain became part of an independent Gallic empire, governed by Marcus Cassianus Latinius Postumus. But in 273 C.E. the emperor Aurelian defeated the rebels.

Germanic Invasions

The Carthaginians and Romans were not the only invaders of the Iberian Peninsula. In the late second century Germanic-speaking tribes—the *CIMBRI* and *TEUTONES*—crossed the Pyrenees after a victory over Roman forces in southern Gaul in 105 B.C.E., but they were repelled by Celtiberians by 102 B.C.E.

In later centuries other *GERMANICS* invaded the peninsula and wrested control from the Romans. The *VANDALS* and the *SUEBI* occupied Spain in 411 C.E.; the *VISIGOTHS* seized lands in southwestern Gaul and Spain in 412–414, driving the Vandals into Africa.

In the fifth century the Celtic language died out. By that time the Celtiberian way of life had also passed away.

CULTURE (see also CELTS)

Economy

The Celtiberians, as had other Celts, had agricultural and herding economies. The exchange of goods through trade was also important, although the Celtiberians, living inland, were not a direct part of the extensive Mediterranean

trading activity. Yet they traded with the Iberian peoples living to their east, some of whom maintained port cities. The resemblance of the Celtiberian language to Irish Gaelic may imply some sort of contact between the two regions; Irish copper and gold had been traded to southern Spain since the Early Bronze Age as part of the Bell Beaker trading system but, as in the Iron Age, northern Iberia was not part of this. Celtiberian chieftains may have benefited from the Carthaginian trading empire through their alliances with Carthaginians in the third century B.C.E. and thus had some contact with Ireland.

Government and Society

As did Celts in other parts of Europe, Celtiberians lived in small settlements, but they maintained tribal connections and specific territories. The exact social and political organization of village as compared to tribe is not known. Some groups—a number of allied villages—certainly in times of war were ruled by chieftains, but life within the villages themselves is thought to have been communal and egalitarian.

The local conditions that fostered the Celtiberian culture, with its social hierarchy and fortified settlements, included the harsh geographical conditions in central Iberia. Seasonal movement of flocks to avoid the dryness of the mesetas in summer and the cold of the high mountains in winter, led to population increase but also to social stratification as the holders of the high summer pastures were enriched. The seasonal movement of flocks also seems to have caused conflicts, leading to the development of a warrior class to protect the flocks from raiders and enforce their passage. The common occurrence in inscriptions of the word *ambatus*, meaning “client,” suggests a system of tenantry and overlordship. The artifacts called *tesserae*, small bronze inscribed tablets sometimes in the shape of clasped hands, used as tokens of recognition and of hospitality agreements, give a sense of the character of the Celtiberian culture, one of wide-ranging travel over large territories with its concomitant insecurities and conflicts.

The Celtiberians adopted innovations from the Iberians, such as the use of currency and an alphabet and the planning of towns on orthogonal (four-way) axes, which ultimately derived from Mediterranean civilization. These elements were introduced to them earlier, by the sixth century B.C.E., than they were in other Celtic areas and not, as happened with the Gauls, in the context of invasion.

Finds such as funeral stelae and laws inscribed on bronze tablets begin to show a strong Roman influence in Celtiberia after the second century B.C.E. The Celtiberians began to build large *oppida* (towns) to accommodate mass movements of people from the countryside. Other signs of social evolution include the disappearance of weapons from burials and the advent of urban magistrates. With the increasing Roman influence Celtiberian society became more stratified.

Dwellings and Architecture

Celtiberian architecture resembled that of Celts in other parts of Europe. Roundhouses were the norm, resembling those of the British Isles rather than of Gaul. The earliest Celtic inhabitants of the Iberian Peninsula lived in fortified hilltop settlements, the typical Celtic hill forts. By the third century B.C.E. their compounds—known as *castros*—became increasingly urbanized with orderly street plans, a process that occurred in Celtic *oppida* to the north as well. Chevaux-de-frise fortification (sharp stones or other objects set upright in masonry) was sometimes used, a sign that the horse was important in war.

During the last pre-Roman phase the Celtiberians were building monumental architecture with great columns derived from the Iberians, as well as Greco-Roman-style villas.

Military Practices

Historical texts relate that the Celtiberians were both hospitable and fond of war. They had a tradition of duels between champions, and of the *devotio*, according to which a warrior dedicated his life to his chief.

Among other peoples Celtiberian warriors enjoyed a reputation as the finest mercenary infantry of their time. As did their Iberian neighbors they became known as accomplished cavalymen, riding the local breed of horse known as Lusitano.

Technology and Art

The Celtiberians became master metalworkers, crafting utilitarian objects, such as horse bits, daggers, and shield fittings, as well as ornamental ones, such as the neck rings known as torcs (torques), brooches, and bangles. They also produced wheel-made pottery and stone sculptures. Although they were influenced by the pre-Celtic Hallstatt and La Tène cultures, their art shows Iberian and also Tartessian influences. A Celtiberian invention, a two-edged sword, was adopted by the Romans. The

“antenna-sword,” with dual knobs on the pomel suggesting antennae, is typical of regions in Celtic Europe that retained the Urnfield cremation burial rite into the Iron Age. The short sword also used by Celtiberians was probably of Mediterranean origin. They used a Tartessian-style fibula with a spring-loaded pin.

The geometric decoration and the use of terra-cotta for their painted pottery show Tartessian influence; the urns used for burial have an S-shaped profile similar to those used in central Europe. In general, proximity to advanced Mediterranean cultures caused the Celtiberians to adopt new technologies earlier than Celts elsewhere. For example, they began using the potter’s wheel by the fourth century B.C.E.

Despite Iberian and Mediterranean influences, Celtiberian art, at least until the Roman invasions, retained a profoundly Celtic aesthetic and feeling.

Literature

The Celtiberians developed a script, partly syllabic and partly alphabetic, from the local Iberian scripts, but only a small number of Celtiberian inscriptions dating from between the sixth and first centuries B.C.E. have been found. They followed the Iberian practice of making large bronze tablets with sacred or legal significance, the former typically used by the Druids for religious purposes. One of these tablets, found at Saragossa and dating from the early first century B.C.E., has the longest Celtic text to survive from antiquity. Another bronze tablet using the Latin alphabet mentions aqueducts and seems to refer to complex social concepts such as that of public property and to institutions intended to mediate between ethnic groups. With the advent of the Romans, the Celtiberian script was gradually replaced by the Latin alphabet.

At least one well-known Roman writer acknowledged his Celtiberian ancestry. The first-century Roman poet known as Martial, born in Spain in the Celtiberian town of Bilbilis, wrote that he was descended from Celts and Iberians both. Other classical authors born in the provinces, even if they had a native strain in their background, did not acknowledge it. But men such as the first-centuries B.C.E. and C.E. Seneca the Elder (Lucius Annaeus) and the more famous Seneca the Younger, born in Corduba (modern Cordova), an Iberian town in southern Spain on the Guadalquivir, perhaps were at least influenced by the native culture around them.

Religion

The Celtiberians, as did other Celts, had Druids living among them. Cremation burials were more prevalent among the Celtiberians than La Tène-style inhumations. There were many local variants in the style of cemeteries; urns in some places were buried under tumuli (mounds) and in others set up in rows accompanied by stelae (upright stones carved with figures in relief).

The Celtic god Lugh or Lugus, apparently in multiple form, was worshipped in Celtiberia, as attested by an inscription found in Uxma, Spain. “L. L. Urico donated this, sacred to the Lugoves, to the guild of shoemakers.” Lugh was connected with crafts and shoemaking in the insular literature of Ireland and Wales. The Matres, the trio of goddesses worshipped in Gaul, had their cult in Celtiberia as well. Other deities known from inscriptions have names with the prefixes Bandu-, Nabia-, and Reve-sometimes attached to a non-Indo-European name; these probably originated with the indigenous people of north-central Iberia whose culture was gradually subsumed by that of the Celtiberians.

The problem of classifying Celtiberians calls up the issue of ethnicity versus cultural influence. There is no way to know the degree of Celtic ancestry among the ancient tribes of the Iberian Peninsula, because the degree of intermarriage among migrating and native peoples is not known. Calling a group Celtiberian as opposed to Iberian thus becomes primarily a cultural matter or sometimes a political one, depending on alliances among tribes. The concept of “peoples” throughout prehistoric and historic times is a fluid one, and the labels we place on them become a matter of convenience.

Celtici

The Celtici are classified as a Celtic tribe. They lived in present-day southern Portugal and southwestern Spain near the non-Celtic TARTESSIANS at least by the first century B.C.E.; they are discussed as CELTS or CELTIBERIANS. Their name indicates that they are classified as a Celtic people, although they were far from the region in north-central Spain that came to be designated as Celtiberia proper.

Celts (Celtae; Kelts; Keltoi; Kelten; Celtic peoples)

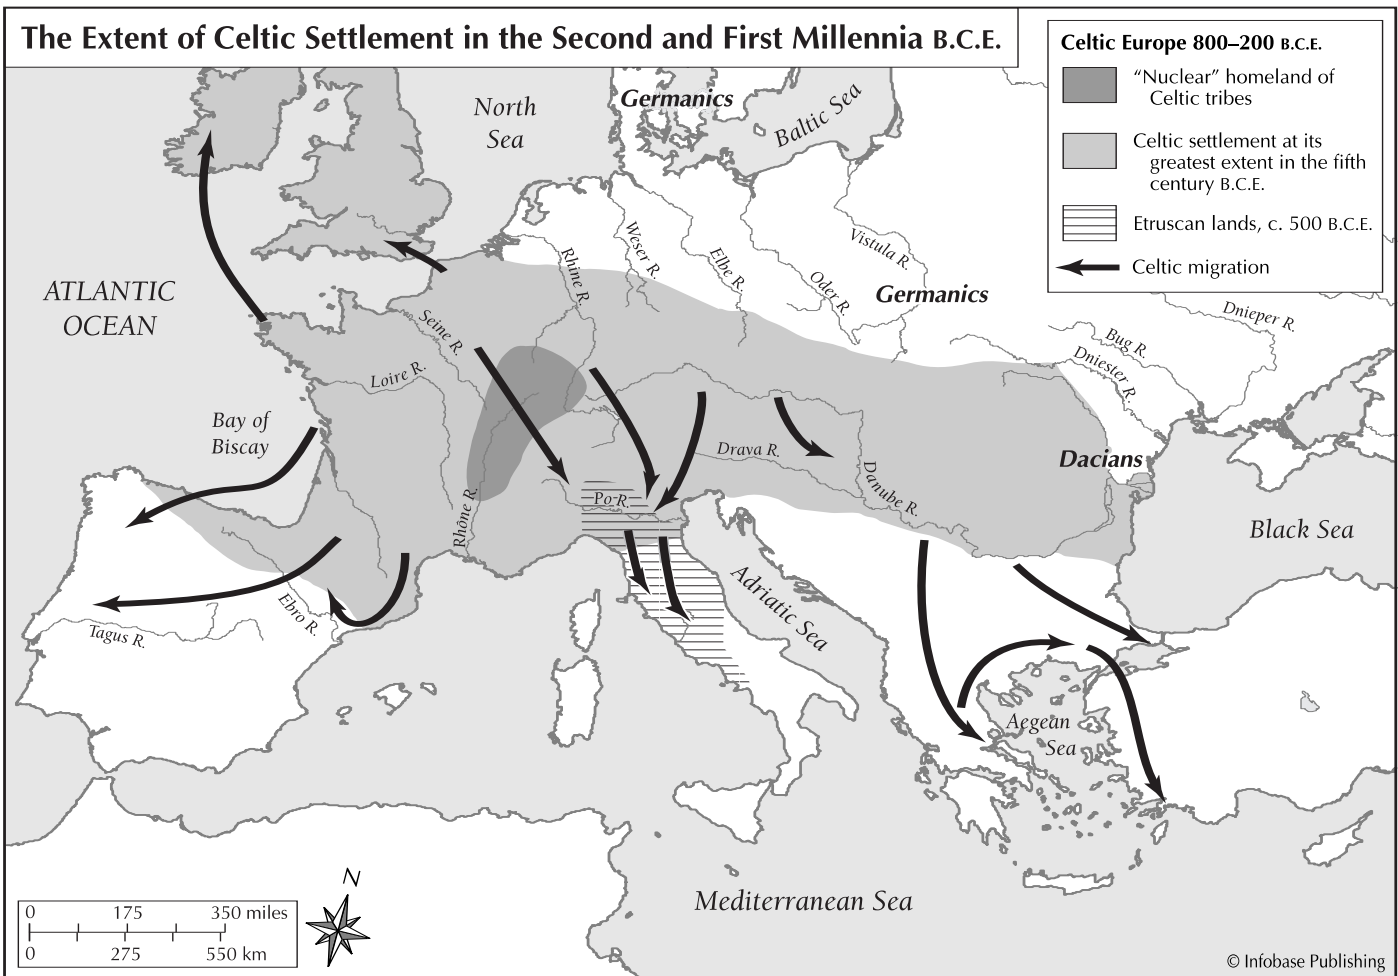

Celts, in its modern usage, is an encompassing term referring to all Celtic-speaking peoples. Celtic peoples occupied many parts of Europe over several millennia and are known by a variety of names. Many of the Celtic tribes on the mainland are discussed, also collectively, as GAULS. Celtic tribes on the British Isles are known generally as BRITONS, CORNISH, IRISH, MANX, WELSH, or SCOTS. Those in Brittany in western France are the BRETONS. Those on the Iberian Peninsula are known as CELTIBERIANS.

The ancient GREEKS first used the name Keltoi in the sixth century B.C.E. to describe people living to the north of their colony of Massilia (modern-day Marseille in southern France), although it is not known what group used this name, if any at all. It was reported by the ROMANS, who used the name Gauls to describe the northern tribes, that some among them referred to themselves collectively by the name CELTAE and one tribe used the name CELTICI.

The group name Celts can be thought of as parallel to that of the ancient GERMANICS, that is, the many different European peoples speaking Germanic languages, known by an array of other names. Perhaps it would be less confusing if the terms were always presented as “Celtic peoples” and “Germanic peoples” to indicate that these are general terms based on language and not on tribal or political organization.

ORIGINS

The identity of the Celts has been a cause of great debate among scholars. The current view, based on archaeological and linguistic evidence

as well as classical texts, is that people in Iron Age Europe and Britain spoke related languages and shared certain cultural traditions, such as the use of a common art style, usually called La Tène. The proposition that there was a single Celtic race is generally discounted in favor of a

pan-Celtic culture. Yet scholars still debate over the extent and pervasiveness of that culture. The difficulty of defining the Celts as a people lies in the very different nature of the various sources of evidence about them: archaeology, linguistics, and written accounts by contemporaries.

This bronze figure from western Austria was probably sculpted by a Celtic people. (Drawing by Patti Erway)

The Celts are the first northern European people to be recognized and described by Mediterranean civilization. The archaeological record tends to provide a long view of cultural change and differentiation—archaeologists paint with a broad brush compared to historians. The picture of European prehistory shows long continuities and very slow evolutionary change; this is no less true for the Celtic Iron Age than for earlier periods. To archaeologists the Iron Age shows as much continuity with previous eras as difference. The tribes who were called *Keltoi* by the Greeks had a culture not so different from that of the Bronze Age Bell Beaker culture that dominated Europe during the second millennium B.C.E. With the emergence of written history about “barbarian” Europe, the time scale speeds up dramatically, and the dwellers in Iron Age roundhouses step onto the stage of world history as actors with distinct names, costumes, and traits. The challenge in studying and classifying these people is to strike a balance between the

impression of marked differences among peoples in different eras and regions that ancient writers give and the picture of broad cultural commonalities given by archaeology.

Archaeology provides concrete evidence that the Celts were the people living in the part of Europe occupied by modern-day Poland, Austria, Czech Republic, Slovakia, Switzerland, Germany, northern Spain, France, and the British Isles during the Iron Age. Earlier theories that the Celts overran Europe from a variously located homeland to the east are now widely discounted. The Celts were the descendants of the tribes of the Bell Beaker and other Bronze Age cultures and before that of the peoples of the Neolithic cultures that developed after the introduction of farming practices to Europe.

During the Late Bronze Age several important cultural phenomena that may have coincided with the emergence of a distinctive “Celtic” culture appeared. One of these was the almost universal shift from burial to cremation of the dead and the burial of their ashes in urns, which gives the period the name *Urnfield*. A marked trend toward fortification began around 1100 B.C.E., with hilltop forts or timber stockades on lower ground being built over a wide region. In some areas burials were more elaborate and ostentatious than ever before and included large amounts of grave goods, many of them from far away, evidence of wide-ranging trade networks. One of the richest burial grounds has been found at Hallstatt in the Austrian Alps, where salt was mined on a large scale. Changes, too, were occurring during this time in settlement and subsistence patterns. In all, this period saw a series of revolutions in most aspects of life.

LANGUAGE

Celtic languages were descended from the postulated proto-Indo-European language, the ancestor of nearly all modern European languages.

The Celtic languages were the product of the process of *language drift* whereby languages diverge from one another at a more or less steady rate when population groups of speakers are separated from one another. The different branches of the Celtic language group slowly evolved from proto-Indo-European in situ in the different regions mentioned. During the Iron Age differentiation between languages in these regions had not reached a point at which their essential family relationship had disappeared. The Germanic languages of peoples living during the latter Iron Age in the north European

plain, who were to displace the Celts, developed in the same way.

The different Celtic languages, including those currently known in England, Scotland, Ireland, and the Brittany peninsula of north-western France as well as those that must have been spoken in other Celtic lands, now lost, evolved from a common ancestor, called by linguists Common Celtic. Common Celtic is divided into Continental Celtic on the mainland and Insular Celtic on the British Isles. It is theorized that Common Celtic diverged from Indo-European in central temperate Europe about the same time as Italic and Germanic languages developed on the Italian peninsula and the northern European plain, respectively.

Continental Celtic includes Gaulish (Gaulish; Gallic), Celto-Iberian (or Hispano-Celtic), and Lepontic, all now extinct. Insular Celtic includes the Brythonic branch, including Breton, Welsh, and the now-extinct Cornish, and the Gaelic (or Goidelic) branch, which includes Irish, Scottish, and the near-extinct Manx.

The earliest Celtic writing is found in ogham inscriptions from the fourth century C.E., a form of writing in which letters are represented by groups of strokes and notches, which appears on stone monuments.

HISTORY

Celts in the Iron Age: Contact with Greeks

The earliest historical mention of the Keltoi dates from the sixth–fifth century B.C.E. by Greek geographer Hecataeus of Miletus. His writings survive only in fragments, but he is considered a main source of the fifth-century B.C.E. historian Herodotus, who also mentions the Keltoi. Yet it is likely that the Celtic tribes the Greeks encountered in the early sixth century B.C.E. had been in their territories and speaking Celtic languages for a long time, as early as the Late Bronze Age (1300–800 B.C.E.) or even earlier. Cultural trends that began after 1300 B.C.E. still largely prevailed eight centuries later.

In the eighth century B.C.E. the city-states of the Greeks were beginning to coalesce; urban growth was accompanied by rapid population growth that the farmlands on the Greek mainland could not sustain. Overpopulation and the need for raw materials led to emigration and trading ventures on a large scale both eastward to the corn lands of the Pontic steppe south of the Black Sea and westward to metal-rich Etruria on the Italian Peninsula. Intensive trade with the latter region was under way by at least 770

B.C.E., and Greeks established trading emporia around this time on the island of Ischia in the northern part of the Bay of Naples. Greek traders steadily extended trade routes westward, in the land-hugging style of navigation of the time, which, for example, followed the coast around the Italian boot and then along the south coast of present-day France. In 600 B.C.E. the Greeks founded Massalia (present-day Marseille) near the mouth of the Rhône River. The Rhône became the highway north to the lands of tribes of the Hallstatt culture, the earliest culture definitely associated with the Celts.

Competition with the CARTHAGINIANS of northern Africa for trade with mineral-rich Tartessos on the Iberian Peninsula forced the Greeks to focus their energies northward, and during the sixth century Massilia developed rapidly for the purpose of controlling both the Rhône valley leading north and the route through the Carcassonne Gap and along the Garonne and Gironde Rivers to Celtic tribes and the rich sources of tin to the north and west.

Contact with Greek civilization had a profound effect on the societies with whom they traded. Products of Greek artistic genius such as finely crafted metalware, painted amphorae, and other pottery dazzled the northerners and were avidly sought. Possession of such exotic goods exalted the status of chieftains, and goods of lesser quality were passed on to retainers in cycles of gift exchange. Emulation by local craftsmen stimulated them to develop the distinctive Hallstatt and later La Tène craft styles. And tribes immediately adjacent to the Greek trading areas, controlling the flow of goods farther inland, grew immensely rich. Commodities associated with wine drinking were especially favored in the Hallstatt region; great numbers of wine-filled amphorae were carried to the north as wine replaced mead and beer in drinking rituals.

The leading households of the west Hallstatt zone in southern France competed for trading access to the Greeks, as shown in the relative richness of burials over time in different regions. Trade varied also because of the activities of the Greeks' competitors, the ETRUSCANS. The Greeks tightened their control over the Rhône trade route in part as a result of conflict during the sixth century with the Etruscans. Yet by the fifth century B.C.E. the Etruscans had found trade routes bypassing the Rhône, which led through Alpine passes to the Rhine-Moselle region, where high-quality iron ore was available, such as in the Hunsrück-Eifel region.

The tribes in the Rhine-Moselle region had already begun to develop a society of elites, possibly because of their involvement in providing slaves to the Hallstatt elite for trade with the Greeks. Now with direct contact to the Mediterranean luxury trade, they in their turn became rich. Etruscan influence on the tribes here is shown in their adoption of the Etruscan-style two-wheeled chariot and in the flowering of the richly inventive La Tène art style. The waxing of fortunes in this region coincided with the waning of the west Hallstatt system, whether this came about through direct aggression from the La Tène tribes, internal instability, or a diminution in the flow of Mediterranean goods is unclear. After 450 B.C.E. the Greek and Etruscan trading networks were under increasing stress from the growing power of expansionist Rome until, by the end of the fifth century, they had been completely disrupted by continual warfare in the western Mediterranean. The collapse of the west Hallstatt trading system may have been a consequence of this disruption or of an instability inherent in the custom of gift exchange, as aspiring leaders among the warrior class required war to win spoils for followers. Thus raiding of neighbors was endemic, and warfare was an essential part of the social system.

The absence of luxury items from Greece may have been part of the stimulus for the development of the La Tène style in the Rhine-Moselle region, as native craftsmen strove to fill the vacuum. For a time La Tène craftsmen managed to create enough prestige goods to maintain social equilibrium despite the loss of the Mediterranean trade. However, a rapid population increase, documented in the growth of the number of cemeteries during the fifth century B.C.E., greatly exacerbated matters. Together these factors resulted in what has been called a major system collapse, which led to a period of large-scale migrations.

That population increase caused the migrations was also documented by classical writers; the Roman Pompeius Trogus of the late first century B.C.E. said that the Gauls (the term the Romans used for all Celtic tribes, which has also been applied to those who inhabited a specific region known as Gaul) had outgrown their region and sent 300,000 men away to seek new lands. According to the Roman historian Livy (of the first centuries B.C.E. and C.E.), King Ambigatus of the BITURIGES, a powerful Gallic tribe, possibly as early as the sixth century B.C.E., in order to rid his kingdom of the throng of unruly warriors and their families, chose two

young kinsmen, Bellovesus and Segovesus, to lead a mass migration, one group to go east to the Danube River and the other to Italy. Livy's account may indicate another cause for the migration: the consolidation of power in fewer hands, leading chieftains to wish to rid their kingdoms of the constant raiding by younger members of the warrior class, for whom military exploits were the means to prove themselves. This tension between forces inherently at odds would be seen again and again in the succeeding centuries, for example, among the Germanic tribes who helped bring about the fall of the Roman Empire, and among the VIKINGS, who raided throughout Europe, and among the SLAVS, who slowly gained territory.

The significant decrease in cemeteries in the Rhine-Moselle region strongly suggests that these initial mass migrations emanated from there.

The Celtic Invasion of Greece

Evidence from cemeteries provides evidence of where the migrating groups went: southward down the Po River valley into Italy and eastward along the Danube into present-day Hungary and on to Transylvania in present-day Romania. The archaeological record and the writings of classical historians agree about the movements of tribes from the Rhine-Moselle region to the east: They traveled along the Danube into Transdanubia (eastern Hungary) in the late fifth and early fourth centuries B.C.E., founding substantial settlements near the Carpathian Mountains and Transylvanian Alps in Romania. In the latter part of the fourth century B.C.E. they launched raids from Transdanubia southward into Illyria (east Adriatic coast) and between 300 and 280 B.C.E. into present-day Bulgaria. In 335 B.C.E. Alexander the Great of the MACEDONIANS received delegations of Celts living near the Adriatic. In 279 B.C.E. Celts migrated to Macedonia; they consisted of three groups, one of which eventually moved into Serbia, another to Thrace; the third, led by a chieftain of the GALATOI called Brennus, passed beyond Thrace and through the Pass of Thermopylae and penetrated deep into Greece as far as Delphi, probably attracted by tales of the great wealth that adorned Apollo's shrine. This campaign failed because of severe winter weather, and the Celts fell back to Macedonia; many joined other Celtic groups in the Danube basin.

The combined groups became known as the SCORDISCI, whose major *oppidum* (town) was Singidunum, on the site of present-day Belgrade in Yugoslavia. Three tribes, the

TECTOSAGES, TOLISTOBOGII, and TROCMI., moved into Anatolia (Asia Minor), where they created widespread havoc. By 276 B.C.E. they had settled in parts of Phrygia but continued raiding and pillaging until finally quelled by Attalus I of Pergamum, a Greek kingdom in western Asia Minor, in about 230 B.C.E. They were called the GALATOI or Galatians. In the name *Galatoi* are echoes both of Galli and of Keltoi, implying an ancient connection.

Perhaps as a result of this restless movement of Celtic tribes, of which the only extant historical record concerns the migrations into Italy, Greece, and Asia Minor from about 450 to 200 B.C.E., the culture across a broad swathe of Europe, from France to northern Italy to Poland and Transylvania, remained remarkably uniform. There was even an outpost of Celtic culture on the Iberian Peninsula, where Celtic tribes had migrated perhaps by the sixth century B.C.E.; they are classified as Celtiberians. The La Tène style is found in artifacts throughout this region, spread perhaps in part through migration of whole tribes, but also in part by trade. Warrior burials from this period are found throughout the La Tène zone, attesting to the continued importance of warfare; by the end, however, dense settlements of farmsteads and villages, with signs of increasing craft specialization, point to the emergence of greater social stability and the ascendancy of the arts of peace rather than of war.

Celts and the Roman Empire

The shock wave of the La Tène systems collapse, which sent one group of tribesmen to Italy, ultimately set them in conflict with the greatest power of the day, the Roman Republic. The region in Italy settled by the Gauls in the first wave of migration during the fourth century B.C.E. was called Cisalpine Gaul (that is, Gaul on this side of the Alps), as opposed to Transalpine Gaul (Gaul across the Alps). Cisalpine Gaul was divided into Cispadane Gaul (Gaul on this side the Po) and Transpadane Gaul (Gaul across the Po). Transalpine Gaul (modern France and the Rhineland) was subdued by the Roman general Julius Caesar in the first century B.C.E., and most of Britain was under Roman rule in the first century C.E. In the same period the Celts of central Europe became dominated by Germanic-speaking peoples. In the latter centuries of the Roman Empire, Germanic tribes placed increasing pressure on Roman Gaul and Britain, eventually overrunning large parts of both provinces.

Celts of the Atlantic Coastal Zone

Western coastal Europe differed to some extent from this pan-European Celtic culture. Groups of Gauls in western France, for example, in Aquitania (in the southwest) and Armorica (modern Brittany in the northwest), preserved their own distinct culture and when imitating La Tène elements adapted them to suit local taste. The same is true for the Britons of Britain. There are exceptions to this; vehicle burials in Yorkshire, for example, show close similarities with those in the Seine valley. The Yorkshire tribe were called PARISI; the similarity of the name with that of a tribe in the Seine valley strongly suggesting a tribal migration. BELGAE from Gaul had settled in southeastern Britain by the first century B.C.E.

Germanic Europe beyond the La Tène Zone

As for Europe north of a line drawn from the mouth of the Rhine eastward to the Sudetan Mountains and on to the Carpathian Mountains, the people continued to live the “longhouse lives” (referring to the Neolithic building style) their ancestors had practiced since farming arrived there in the Neolithic Age, untouched by events to the south. In their isolation they were slowly evolving the language family ancestral to the Germanic languages of today.

Modern Celts

Except for isolated pockets in areas of the British Isles and France, which once were on the far fringes of the Celtic world, the pan-Celtic culture was swept away by forces set in motion by the Roman Empire and its collapse. In medieval times and to the present the Celtic tradition and languages have survived in Brittany (in western France), Wales, Cornwall, the Isle of Man, the Scottish Highlands, and Ireland, where they are identified as Bretons, Welsh, Cornish, Manx, Scots, and Irish.

CULTURE

Economy

Early Farming Practices After 1300 B.C.E. and the probable emergence of Celtic culture farming practices maintained continuity with the past in that a variety of crops were grown. New crops added to this mix changed the character of farming in several ways. In the past different varieties of wheat and barley dominated grain crops, accompanied by legumes such as lentils and peas. But now millet and rye began to be grown throughout Europe; oil-bearing plants such as flax and poppy began to be important,

along with broad or Celtic beans. Common characteristics of these newcomers are their easy and prolific growth and their ability to flourish in harsh climate conditions. Millet is able to withstand drought and has a short growing span; in historic times millet was known as the crop of the poor, to be used not only in unleavened bread but also in porridges and fermented drinks. Millet became important in central and northern Europe during the Early Iron Age. Celtic beans, nitrogen fixers that improve soil fertility, can grow in a variety of conditions, including cool, moist weather. The oil-bearing plants have a high protein content, making them very nutritious, and they have a delicious taste, as the name of one of them, gold-of-pleasure, attests. Seeds of this plant were sprinkled on a loaf of bread found at the Early Iron Age site of Aggtelek in Hungary.

Not only the crops changed, but field systems did as well. Although the majority of fields in central Europe were cultivated by the beginning of the Bronze Age, their layout changed significantly in a number of regions after 1300 B.C.E. Previously field systems had consisted of many small fields workable by single families. Now long dykes were driven through this mosaic, creating much larger subdivisions of the countryside, which amounted in size to large ranches or estates. This phenomenon is found in Britain particularly; in Wessex the numerous hill forts are clearly related to these greatly enlarged systems of fields and linear boundaries. Hill forts contained large granaries; whether the grain stored in these was used to enrich single chieftains or to supply whole tribes in times of famine is unclear.

During this period large wild as well as domestic animals continued to be exploited, including wild cattle called aurochs and very large wild pigs. Red deer and a wide range of small mammals, as well as birds and fish, were important. Among domestic animals cattle and pigs were most important in Celtic regions; large numbers of cattle were herded in groups sorted as to age and sex. In Hallstatt Poland pigs predominated. Bees would have been kept, although evidence for this practice is scant. After 1300 B.C.E. horses took on a new importance, as evidenced by the appearance of ornate bronze and iron horse trappings in burials over a wide region of eastern Europe.

Iron Age Farming Cattle were used by Celts of the Iron Age mostly to work as draft animals and to supply milk; the primary meat animal was the pig. Milk and milk products and fresh and salt-

ed pork were the mainstays of the Celtic diet, along with porridge made of barley bran; breads from emmer wheat, spelt, oats, and rye; and legumes. Flax was grown for linen and linseed oil. Poppies were also grown; whether they were used to obtain opium is unknown.

Investigation of the large *oppida* (fortified settlements) that developed toward the end of the Celtic era has shown that, despite their large size, they were not true cities. Instead they were enclosed villages in which much of the acreage was given over to farm fields. Almost all of the food eaten in the *oppida* was produced there, and there are few signs of “urban” eating habits involving exotic imported foods such as spices or fruits such as figs that could be grown only in the south. The only foodstuff imported—and that in large quantities—was wine.

In general, Iron Age Celtic farming had changed little from that of the Bronze Age, either in crops or in animals. All of the Celtic domestic breeds were ancient, primitive forms little changed from those of the Neolithic, demonstrating a low level of animal husbandry in terms of attempts to improve breeds. Celtic cattle were the smallest in the history of cattle evolution, with a slender build, short horns, and narrow skull. Roman cattle were about six inches taller. Celtic pigs were similarly small and primitive. Surprisingly, considering the high regard Celts had for the horse, they were not skillful horse breeders. Celtic horses were much too small to ride and were used instead to pull chariots or carts. When Celtic chieftains wanted larger horses, they imported them from the SCYTHIANS in the steppe regions of eastern Europe, as indicated by eastern horse trappings found in burials. The Scythians also introduced chickens to Europe, and the Celts were most responsible for their spread, although they did not keep them in large numbers. They may have kept geese and ducks; their domestication is hard to determine archaeologically, since domestics differ little from wild breeds in skeletal structure.

In contrast to diets in the Bronze Age, wild animals were largely absent from those of Iron Age Celts in some regions—whether because of the shrinkage of forests and overhunting, or because of religious taboos, is not known. Of all their domestic animals, including the dog, only horses were apparently never eaten by the Celts.

Trade By the Late Bronze Age, although the quantity of goods traded was not great, thriving, long-range trading contacts across the putative Celtic regions of Europe were well established.

Trade at this time was completely intertwined with social relations; centralized market economies using coinage as a “socially neutral” medium of exchange, which allowed complete strangers to do business with one another, existed only in the cities of the Near East. In the Celtic regions goods moved through a continuous series of face-to-face gift exchanges or barter. Despite the essentially local nature of such exchanges, goods moved over long distances, as documented in recoveries from shipwrecks. A shipwreck off the coast of Turkey from this period revealed swords made in the style of smiths on the Atlantic coast as far north as Britain, as well as goods from a wide range of localities. The distribution of particular styles of metalworking over a wide area also demonstrates long-range contacts; for example, a sword type called Rössen has been found from Britain to Czechoslovakia.

An extremely important commodity new to trade at this time was salt from the Austrian Alps, mined and made in evaporation pools at Hallstatt and present-day Hallein (also in the Austrian Alps). Burials in cemeteries in the area from the Late Bronze and Early Iron Ages contain valuable objects from both north and south of the Alps, suggesting both the extent of the salt trade and the wealth it generated. One large cemetery near Hallstatt contained 2,000 burials. Salt mining began around 1000 B.C.E.; after 750 B.C.E. the amount being mined increased significantly. More than 3,000 square feet of galleries, which would have provided 2 million cubic meters of salt, were dug.

Some glass beads found in Europe were made of glass of a composition similar to that of glass made in the Near East; the Ulu Burun shipwreck off the coast of Turkey, dated to around 1300 B.C.E., carried raw glass ingots from the Near East, possibly evidence that such glass could have found its way to Europe via the Greeks. Amber was traded in large quantities from northern Europe to Mycenaean Greece.

In the first century B.C.E. trade flourished at Hengistbury Head in Dorset in Britain. Quantities of wine amphorae from the mainland and metal ores from Devon and Cornwall found at Hengistbury suggest that heavy cargoes were unloaded there; evidence for large numbers of cattle, together with signs of butchery and leather dressing, suggest that return cargoes may frequently have consisted largely of dry animal hides. The Greek geographer Strabo of the first centuries B.C.E. and C.E. includes hides in his list of British exports; according to Caesar, the VENETHI used those

hides to make sails for their ships, among other products.

Government and Society

Bronze Age Warrior Ideology The pan-European Iron Age Celtic culture with its warrior class is thought to have descended from a warrior class already present in the Bronze Age. This emerged not in one place but in parallel all over Celtic Europe, sparked by the spread of what is called the Bell Beaker ideology around 2500 B.C.E.

This movement of ideas and, possibly, of people may be linked to the transformation known from archaeological evidence to have occurred at this time over large areas of Europe. Values and practices dating to the adoption of farming at the beginning of the Neolithic Age were replaced with new values held by an elite warrior class that emerged at this time, known from burials containing finely wrought bronze weapons, armor, and other prestige items. The common theme throughout those elements that distinguish the Celtic cultural complex—from the hill forts to the exquisitely wrought artifacts of the La Tène style—may have had its distant beginnings in this Early Bronze Age ideology based around the values of individuality and aggression. For people at this time the possession of valuable goods, whether cattle or objects of precious metals infused with the magic art of the smith, are proofs of bravery and the favor of the gods.

Political Power of Priests What may distinguish the Celtic warrior ideology from the very similar ideologies of later peoples, such as the Germanics, is another set of values held by a class of Celtic society equal in importance to the warrior class: that of the priestly order called the Druids. The signal importance for the Celts of the Druids, who in a real sense seem to have outranked any other social class and were the equals of kings, may be the most distinguishing feature of the Celts when compared to other warrior societies in Europe. The building of Stonehenge in Britain could have come about through a compromise between bearers of the Bell Beaker Culture, the first people in Europe who followed an individualistic warrior lifestyle, and people for whom the great communal rituals held in henge monuments, which had emerged earlier during the Neolithic Age, remained important. The distant ancestors of the Druids may have been priestly elites who directed the building of the great Neolithic monuments such as the stone circle and giant henge

at Avebury, the stone alignments of Carnac in Brittany in France, Maes Howe stone mound in Orkney, the Callanish stone circle in Scotland, and New Grange in Ireland.

The values of the Druids, the importance of learning and the arts and of communality among a people as a whole as a counterweight to the sometimes destructive individualism of warriors, devotion to the gods, the sacredness of the land, equality of women (who could become Druids) and the importance of goddesses, may have been a continuation of values of Neolithic times before warfare had assumed its later importance.

The Romans took the Druids' political power very seriously. The emperors Augustus, Tiberius, and Claudius of the first centuries B.C.E. and C.E. all issued edicts to curb Druidic activity, which suggest its continuing strength. Suetonius Paullinus deliberately attacked the British Druidic stronghold on the island of Anglesey off the Welsh coast in 60 C.E. as a means of quelling British resistance to Roman rule. The Romans believed that Druids used their prophetic powers to incite rebellion against Roman order.

A World of Farmers The archaeological evidence suggests that farmers made up the overwhelming majority of the population. The splendid weaponry and other accoutrements found in warriors' graves has fostered a picture of Celtic society in which warriors and chieftains had more prominence than they did in reality. The common image of a Celtic warrior society led by a chief or king may reflect an exception rather than the rule. Reassessment of evidence from the fortified hilltop settlements known as hill forts suggests they were often used as much for display or symbol as for defense. At the same time new studies contradict the idea that hill forts were typically the residences of chieftains since clear evidence of an aristocracy is hard to find. Instead the evidence points to a more communal and a relatively egalitarian society of small, competitive farming families in many areas of Iron Age Europe.

Gift Exchange The exceptions to this egalitarian state were found among tribes living near the borders of the Greco-Roman world or having access to Mediterranean trade goods, for whom the gift-exchange cycles seem to have led to greater social differentiation. More successful traders gathered ever more followers, exerting ever greater influence the richer they

became and ever greater control of military power and trade.

Differentiation The Iron Age differed considerably across Europe. Although there were contacts and shared cultural elements, the differences in all aspects of life between neighboring areas are as evident as the similarities. One region might bury its dead in graves with grave goods, for instance, whereas in the next burials are absent. Areas differed as to whether they had hill forts and settlements enclosed by substantial earthworks or open settlements. Clearly groups had a great deal of contact with one another; it is probable that trade and marriages among different groups were common. But it must have been important for tribes to mark out their particular differences and their sense of their own uniqueness.

Class System According to various classical authors and the ancient Irish Brehon Law, tribes were divided into three classes: kings, of which there were different ranks; warrior aristocracy; and freemen farmers. In Ireland there were local kings ruling tribes, regional kings ruling provinces, and the High King of all of Ireland. The Druids, the priestly caste, were recruited from families of the warrior class but ranked higher. Caesar distinguished between men of religion and learning, warriors, and commoners. As in other Indo-European systems, the family was patriarchal.

Drinking and Feasting The inclusion of feasting equipment—drinking horns, a cauldron, and alcohol—in princely tombs provides clear evidence for the importance of feasting in Celtic Europe. Every undisturbed, elite burial found on the mainland from the late Hallstatt and early La Tène periods contains feasting and drinking equipment. In addition classical sources and the insular literature of Ireland and Wales provide abundant testimony that the ability to give mighty feasts with bountiful alcoholic drink was a key part of a leader's claim to rule.

Since the Corded Ware period in the Late Neolithic, ceramic vessel sets, probably used to consume beer or mead, had appeared mainly in male burials. By the Bronze Age drinking vessels were being made of sheet metal, primarily bronze or gold. However, the importance of feasting in Celtic society increased greatly in the late Hallstatt period, soon after the foundation of the Greek colony of Massilia. Afterward wine in amphorae was traded north and east along major river systems together with metal and ceramic drinking vessels from the Greek world.

The rarity of wine and a chieftain's display of impressive imported goods added to the impact of his feasts on his followers. Classical authors emphasize the value of wine to northerners, adding that the lower classes drank wheaten beer prepared with honey.

Classical texts suggest that the layout of feasters, a chieftain, and his retinue sitting in a circle around a central hearth or fireplace had an almost ritual social significance. The alcoholic beverage circulated among them in a common cup with the chieftain taking the first draft, then sending it along among his followers, an act symbolic of his generosity. The sharing of the common cup may also have symbolized a common bond among the chieftain and his followers. Alcohol helped reduce social distance, suspicion, and rivalries. On the other hand several authors point to the seating arrangements as reflecting a hierarchy within the retinue, as those closest to the leader of the group received the largest quantity of liquor and the choicest cut of meat, both symbolic of favored status. Music was very probably a part of these feasts, with bards celebrating the warriors' deeds and those of their ancestors. Classical texts report that Celtic feasting involved bragging competitions that frequently led to brawls, even death.

The literature of medieval Ireland gives many details of feasts; literature among the Celts of later times was rooted in part in the storytelling that was an integral part of feasting. Vessels made of bronze, gold, wood, horn, and pottery are described in the Irish literature, and these correspond to archaeological finds from the Early Iron Age on the mainland and in the British Isles. The social symbolism of drinking is reflected in the connection between the Irish words *laith* (liquor) and *flaith* (sovereignty or lordship): *laith* flowing in abundance from the fount of *flaith*. Drinking horns, which were among the finds at Halstatt Burials, are frequently referred to in Irish poetry as symbols of authority and kingship, and as late as the 15th century a 300-year-old drinking horn was cited by the Kavanagh family as the basis for their claim to the kingship of Leinster.

The connection between the right to rule and the ability to host a feast at which alcoholic beverages are distributed is a continuing theme in Irish and Welsh literature. In the Irish *Baile in Scail*, for example, Conn and his followers are taken before a seated girl wearing a gold crown, with a silver vat in front of her and a vessel of gold and a gold cup. The girl is the personification of Ireland, and whomever she offers the ale of sovereignty will become king in a symbolic

wedding ritual. The girl gives a cup of red ale to Conn, then disappears, leaving behind the drinking equipment as a symbol of his authority.

Military Practices

On the whole the people of the Urnfield world lived according to the ceaseless round of the seasons of the agricultural year; this peaceful rhythm must have been punctuated from time to time by warfare, judging by the numbers of weapons from this period that have survived in graves and other deposits. Conflict was on a small scale, with raiding parties that engaged the enemy warriors in single combat, rather than large massed armies. Warriors used swords, daggers, spears, and arrows. Although only metal armor has survived, it was probably used only for display or for intimidation of opponents, perhaps in an attempt to make them believe they were confronting men of bronze; bronze armor offered no protection against sword blows and leather or wood would have been much more effective. A number of bronze shields have been found in northwestern Europe, especially on the British Isles.

The sword, first developed in the Middle Bronze Age in the eastern Alpine area, was central to the warrior's panoply, judging by the rapid evolution of different forms, indicating a kind of Bronze Age arms race to maintain technical superiority. Swords that have been found show signs of wear and repeated sharpening, attesting to their importance to their owners. A prevalent sword type was a long slashing sword called the "carp's tongue" from the shape of its tang. In Britain the first true swords were imported from the Rhineland from about 950 B.C.E. Although certain sword types were used across Europe, they were modified into differing regional styles. The construction of swords shows that although some were obviously functional, others must have been used only for display.

The Urnfield period saw the beginning of widespread building of protective ramparts and ditches around settlements, often on hills but also on lower ground. Forts at first had timber ramparts; they were later reinforced by wooden frames faced with stone and filled with rubble, and sloping revetment banks. The distribution of such forts in southwestern Germany was very even, with forts every 10 to 15 kilometers (six to 10 miles), apparently serving a thinly distributed population, again suggesting the small scale of military operations and the relative lack of social differentiation. Such forts usually seem to have had only a short lifetime before being destroyed.

Celts wore this type of helmet in the late first century B.C.E. (Drawing by Patti Erway)

The use of horses to pull chariots increased steadily through this period and into the Iron Age, as shown by the numbers of metal bits and cheek pieces found. After 800 B.C.E. many graves began to contain horse-riding equipment, coinciding in time with a westward movement of peoples, recorded by Herodotus, from the steppe lands to the east, whose horses were large enough to be ridden.

During the Early Iron Age chariots became heavier and, except in Britain, began to decline in use in favor of mounted cavalry. Warriors on foot used short thrusting spears and javelins for throwing. With iron, armor came into practical use, at least among the elite.

The Celts of the Iron Age seem to have made use of a kind of psychological warfare; Roman writers attest that they often fought naked in the ancient warrior style, perhaps to convince the enemy that they were as invulnerable as gods or that they were such formidable warriors they had no need for shields or armor. They would make terrifying sounds by blowing large trumpets, called carnexes, which had beast-shaped mouths, and they would roar as if they were wild beasts. Caesar mentions that Gallic warriors painted themselves with a blue dye called woad to make themselves look more terrifying. Bards often accompanied the warriors, inciting them to battle and hurling imprecations of savage satire against the opponents. The Celts believed the bards could call up magic mists to confuse the enemy.

The Purpose of War Our modern ideas that war should be waged solely for political or national purposes and that the resort to war represents a failure of diplomacy would have been very foreign to men of the European Bronze and Iron Ages. The relative inefficiency of their weaponry ensured that the casualty rate in their wars was never high. Men went to war for intangible purposes, such as to prove their prowess and win fame, so that tales would be told of their deeds after their deaths, as well as to gain territory or spoils. There may even have been a spiritual component to war, similar to the belief of the Vikings that only death in battle ensured that one would attain Valhalla. In risking their lives Bronze and Iron Age warriors throughout Europe may have been offering themselves in sacrifice to the gods; in the exhilaration of overcoming fear, they may have experienced a kind of ecstatic communion with the divine. Elaborate decoration of arms and armor may have been analogous to the decoration of temples and sacred vessels used in religious ritual. It

is even possible that the Urnfield religious revolution with its changed attitude toward the material body resulted from the emergence of warfare as an integral part of society. The experience of battle could have furnished its seminal spiritual experience.

Dwellings and Architecture

Hill Forts The rich trade of the sixth century B.C.E. coincided with the appearance of hilltop settlements called hill forts, such as Mont Lassois in Burgundy, France, and the Heuneburg in southern Germany. Some Hallstatt chiefs emulated the Greeks even to the extent of building Mediterranean-style mud brick walls as defensive structures, completely inappropriate for the rainy north. A characteristic architectural phenomenon of Late Bronze Age and Iron Age Celtic Europe, hill forts began to appear around 1100 B.C.E. and were built in a zone of temperate Europe from Wales and southern Britain, through northern France, southern Belgium, central Germany, to the present-day Czech Republic, Slovakia, and Poland. Their numbers increased considerably during the sixth and fifth centuries B.C.E. The style of these settlements was broadly similar throughout this zone, so that forts in Slovakia resemble those in Wales.

A rampart along the edge of the hilltop site enclosed circular or rectangular timber houses; metal-reinforced roads connected dwellings and grain storage buildings. In Biskupin, a hill fort in Poland, houses were arranged tightly together in 13 parallel rows, multiple houses sharing a single gable roof, along timber corduroy roads adjoined to a ring road along the rampart. There were 105 houses in the complex, suggesting a possible population of 400–500. Although the orderly layout implies a controlling power of some kind, there is no other evidence of social differentiation in, for example, house size. The use of hill forts peaked in the sixth and fifth centuries, and many were abandoned by the fourth century.

Scholars disagree over the purpose of hill forts and the degree to which they were used for defensive purposes. The mud brick ramparts of Hallstatt versions argue against defense as their primary purpose as they must have been regularly eroded away by rain and in need of refurbishing. Despite broad similarities, hill forts differ from region to region. In Britain, for example, they seem to have the character of farming villages. Later in the Celtic period, especially under Roman influence, some hill forts evolved into *oppida*, fortified towns more municipal in nature than military.

The Roundhouse A common Iron Age building style was the roundhouse. The exact construction of roundhouses is hard to determine because most of the building materials were natural, such as timber and reed. Organic materials like these do not survive for long unless they are protected in some way, such as in very dry, very cold, or waterlogged conditions. Out in the open and exposed to the elements, natural organic materials used in roundhouse construction rarely survive the test of time.

Archaeological excavation has revealed evidence for the foundations of roundhouses such as postholes, stake holes, wall gullies, and stone wall foundations. The remains of hearths have also been found, and occasionally drains, drainage trenches, and drip gullies (formed by rain water dripping off the end of roof eaves and falling on exposed ground). Daub sometimes becomes fire-hardened similarly to pottery. Occasionally archaeologists find packed clay or daub floors within the interiors of the roundhouse wall foundations.

Iron Age roundhouses, as well as farms and hill forts, faced east or southeast in the direction of the morning Sun. In some cases roundhouses were built so that their doors faced the location where the Sun rose on the winter solstice. Many apparent rubbish pits on further analysis display an organization in their deposition that points to ritual. Some of this rubbish includes complete animal and human carcasses and bits of carcasses, possibly the result of sacrifice. But even broken potsherds, old tools, and worn-out quern (hand mill) stones were sometimes placed in special parts of a farm, together with other objects, sometimes even according to a particular order.

Clothing

The male clothing of the Celts in its basic elements was probably broadly similar to that of men throughout temperate and northern Europe, even in those areas, such as lands of the Germanics, outside the Celtic sphere. It consisted of trousers, shirt, leather shoes, and a covering cloak, the ancestor of European dress that prevailed after the influence of the Mediterranean world had waned with the fall of the Roman Empire. Trousers, called *bracae*, particularly distinguished Celtic dress from that of Greeks and Romans. To the Greeks wearing trousers was a sure sign of barbarity, as sure as having a moustache, beard, or long hair (in this betraying their insularity and Greek chauvinism, for the highly civilized Persians wore all of these).

Women wore a sleeved under-tunic covered by a chiton, a rectangular cloth similar to a poncho with an opening for the head and neck, which was belted at the waist; over all they would wear a cloak like that of the men if the weather were cold. For both men and women, the brooches (also called fibulae) used to secure their cloaks were often prized ornaments and were made in a variety of intricate shapes, usually of bronze, but also of precious metals. The shapes of brooches were the subject of fashionable preference, which differed from place to place and changed constantly throughout the Celtic period.

Until the Roman conquest the wool used for clothing was from sheep whose fleece was very coarse; fine wool sheep were introduced to Europe by the Romans. Thus wool was mostly used for making cloaks. Diodorus Siculus, a first-century B.C.E. Greek historian living in Sicily, writes that the cloaks had striped or checkered designs, with the stripes close together. This could describe Scottish tartan patterns, which combine broad bands of different colors running perpendicular to one another to form squares of color with thinner stripes of contrasting color setting off the squares. Swatches of fabric were preserved in the Hallstatt salt mines; some of these resemble tweeds still made today in Celtic areas such as the Scottish islands of the Outer Hebrides. Others show a tartanlike combination of parallel thin stripes running perpendicular to broader bands. Wool was commonly woven into twill.

Linen was also widely used and woven into cloth. It was the fabric of choice in Celtic Germany, Austria, Czechoslovakia, and Hungary; in La Tène France and Switzerland twilled wool was preferred.

Diodorus called the Celts' clothing "astounding," and besides their *bracae*, what impressed him were the bright colors of their shirts and the embroidery with which they were embellished. Remnants of linen cloth found in the present-day Czech Republic and Slovakia were stitched with red, gold, and silk thread. Embroidery was done with a simple stem stitch; meanders and swastikas were common motifs.

Diodorus mentions that the Celts bleached their hair blond by washing it in lime and combing it back from their forehead, rather like a horse's mane. (To Romans this shaggy hair made Celts look like woodland spirits, perhaps the satyrs of myth and legend.) Some were clean-shaven, but men of high rank shaved their cheeks, leaving a moustache that grew over the mouth and trapped particles of food.

An important ornament type was the torc (torque), a metal neck ring made of metal wires twisted together so as to resemble a rope or cord, with an opening in the front with molded terminals welded to the ring ends. Torcs may have been worn only by the nobility, particularly during the La Tène period; astonishingly elaborate and heavy gold, silver, and bronze torcs have been recovered from burials. Some torcs almost appear unwearable, as though they were used more as symbols of status. The Gallic warriors who overran Italy and Greece during the fourth and third centuries B.C.E. went into battle naked (as did the Iron Age Celts), some of them wearing only a torc. Deities are shown wearing torcs; a famous example is the horned god on the Gundestrup Cauldron (a huge silver cauldron found near Gundestrup, Denmark, thought to document Celtic religious iconography), who also holds a torc in his right hand, a large snake in his left. Torcs thus had some religious significance as well. Some scholars speculate that the rope appearance of the torc refers to a noose or garotte, the terminals like knots, used to dispatch a sacrificial victim. The wearing of torcs by warriors may have been a sign that in going into battle they were devoting themselves to or putting their fates into the hands of a god—perhaps Esus, who received his sacrifices through having them strangled or their throats cut.

Transportation

The Bronze Age The long-range trade evident already in the Late Bronze Age implies efficient means of transportation among Celtic peoples. Little is known about Bronze Age ships and boats to the north of Mediterranean regions, but the trade routes along major rivers such as the Rhône, the Rhine, and the Danube show that water transport was important. A model boat found in Wales from this period is somewhat bowl-shaped; much later, in the early medieval period, the Irish made long sea voyages in a type of bowl-shaped boat made of hides called a curragh or coracle. This is the kind of boat St. Brendan reportedly utilized in the sixth century C.E., when he went on a long sea journey as a pilgrimage. It is possible that the Irish, who of all Celtic peoples had experienced the least influence and interference from other more dominant cultures, were at this time continuing a boat-building tradition of their Celtic ancestors even as far back as the Bronze Age. Curraghs made of wood are still used today by Irish fishermen.

More is known about land travel from this time because of the survival of timber or brushwood tracks laid down in marshy areas, which

have been preserved in peat or under water. In the Somerset Levels in England a major phase of track-building took place around 1200 B.C.E., possibly a result of climate change that caused higher rainfall and flooding. Such tracks consisted of brushwood pegged in place, supplemented by wooden planks in wetter areas. In dry areas the location of important sites gives an idea of routes.

Evidence of Celtic vehicles includes depictions and models, and bronze fittings, wheels, and whole wagons found in burials. Great ceremonial wagons and wheeled urns were used in ritual processions; farmers used slow-moving wagons with solid wooden wheels—similar to those of the Neolithic—drawn by oxen or horses.

The Iron Age Archaeological evidence shows that trading vessels that plied the English Channel in the late first millennium B.C.E. had high sides and flat bottoms; they relied on heavy cargoes or ballast to give them stability. Ships arriving at Hengistbury Head in Dorset, for example, carried heavy wine amphorae, but on their return journey to the Continent they carried only light-weight cattle hides and thus needed ballast. A number of “quarry hollows” and “scoops” were discovered on the north shore of the defended promontory at Hengistbury, dug to obtain gravel for ballast. The hollows and scoops were found close to the old shoreline, where the flat-bottomed boats were no doubt beached or berthed to facilitate unloading and reloading.

Other Technologies

The Late Bronze Age Industrial Revolution One of the revolutions after 1300 B.C.E. was an explosion in metalworking activity among the Celts both quantitatively and qualitatively. Enormous hoards of metal objects from this period displaying a great increase in the skill of smiths have been unearthed. Multiple-piece rather than the simpler two-piece molds of earlier times were now used to form molten metal, allowing a greater variety of shapes. Sheet-metal working began during this period, and bronze armor was made—cuirasses, greaves, helmets, and shields, shaped and elaborately embossed with hammers of various sizes. Such armor was useless for actual defense; demonstrations have indicated that it can easily be penetrated by blows from a bronze sword. Its main purpose, then, must have been decorative and/or ritualistic. The lost-wax method became important; in this method wax was shaped into

the desired form and encased in clay, which was fired in a kiln, causing the wax to melt away, leaving a mold without seams. The ease with which wax could be worked enabled smiths to create much finer and more subtle forms with more intricate detailing than ever before.

These new techniques both enabled and inspired smiths to endow even the most utilitarian objects, such as axe heads, cauldrons, rivets, and buckles, with beautiful decoration and form. These efforts probably derived less from aesthetics of the sort that inspires modern fine craftspeople than from a sense of the magical and spiritual quality of metal, which has been transformed from rough ore, through the magic agency of fire, into something completely different. Greek myths such as that of Prometheus, who created humankind out of clay, and others concerning men made of bronze may suggest the attitude of early bronze workers elsewhere in Europe. The implication is that in transforming natural materials into pottery and metal, smiths emulated the creative acts of the gods. Such attitudes, remembered dimly about their own past by Greeks of the classical period, may well have been held as well by other Europeans during the Bronze Age in Europe. In using their utmost skill to beautify their creations, smiths may have been expressing their sense of divine emulation. The burial of huge quantities of metal objects, possibly as offerings to the gods, may derive from similar attitudes.

The great increase in the volume of bronze made implies a well-established, long-range trading network because the sources of copper were widely dispersed (Ireland, the Alps, Carpathians, and Balkans), as were the probable sources of tin (Cornwall, Brittany, and parts of what are present-day Germany, Slovakia, Czech Republic, Spain, and Italy). The presence of copper in Ireland and of tin in Cornwall, Brittany, and Spain may have made these areas on the periphery of Celtic Europe closer to the sphere of Celtic cultural influence.

Glassmaking began during the Early Bronze Age, although not in great volume, since it required a much higher firing temperature than did bronze. Glass was made mostly in the form of beads for decoration; in Switzerland so-called eye beads and beads with twists of different colors were made. Glass-making spread quickly throughout Europe; such rapid technology transfer demonstrates the interconnectedness of Europe at this time under the probable Celtic cultural hegemony.

The Iron Age The transition to the Iron Age was slow and incremental, although iron was far more readily available than the copper and tin needed for bronze; iron is found throughout most of Europe. The melting point of iron is only slightly higher than that of copper, and bronze-working techniques were used at first in working iron. Recent research suggests that iron did not directly replace bronze at the end of the Bronze Age but rather took over the roles of flint, which had continued in use during the Bronze Age because of its superior hardness and cutting ability.

Coal came into use in the Iron Age in coal regions such as Britain. Large quantities of coal fragments, many of them burned or charred, have been found in the defensive ditches of an enclosed Late Iron Age settlement at Port Seton near present-day Edinburgh, Scotland.

Art

Evolving Styles As with other aspects of Iron Age Celtic culture the roots of Celtic art can be traced back to the Urnfield period of the Bronze Age. The rich burials of the Hallstatt culture at the beginning of the Iron Age provide many examples of Celtic art that have affinities to art of the Bronze Age. Under the influence of Mediterranean styles, but maintaining their autonomy, artisans of the Rhine-Moselle region created the La Tène style, which became the first pan-European art style, influential across a wide region. La Tène style is evident in the making of many objects, such as weapons, vessels, and jewelry, in bronze, gold, and occasionally silver.

The Celts decorated even the most mundane of objects with beautiful art. Tools that were used for everything from war to cooking presented opportunities for carving or metalwork. The art of the Celts was inseparable from their religion; it embodied a sense that forces unseen underlay every activity and imbued every object in the material world. The intricate swirls and spirals so characteristic of Celtic art may have been intended to evoke in the viewer and user of decorated objects a sense of harmony with the spiritual realm that so permeated the material.

Stylized plant motifs and fantastic animals, derived from the Scythians and other steppe peoples, are characteristic of Celtic art; the human figure plays a secondary role. Celtic art was full of elliptical and opposing curves, spirals, and chevrons, also derived from steppe art. These elements were combined in dynamic yet symmetrical geometric patterns in relief, engraved, or in red, yellow, blue, and green

enamel on shields, swords, sheaths, helmets, bowls, and jewelry. They also appeared on painted pottery: cinerary urns, food vessels, incense bowls, and drinking cups.

Fine examples of Hallstatt period Celtic art from a tomb at Hochdorf in Germany, show continuities with art from Urnfield times. It contained the princely burial of a man wearing a great gold torc, bracelet, shoe and belt coverings, and a conical birchbark hat that is thought to be an emblem or symbol of high status. The torc (torque) and bracelet are stamped with lines of bosses reminiscent of bosses on cups from Urnfield times, although far more intricate and varied in shape. The torc has a pattern of tiny stylized horsemen. A shallow gold cup has Urnfield-like bosses around its rim.

A tomb in Hallein contained flagons whose decoration is typical of the later La Tène style. A later La Tène sandstone statue of a warrior found at Glauberg, Germany, has teardrop shapes on each side of his head although upside down; they seem to be sprouting out of his head. This is called by archaeologists a Blattkrone, "leaf crown," and is thought to symbolize divine status. Heads with Blattkronen adorn a four-sided pillar from Pfalzfeld in Germany as well as other figures from the period.

Celtic Linear Art An important type of pottery developed in Roman Britain, called Glastonbury Ware, illustrates a fundamental difference between Celtic and Greco-Roman art. The focus of the latter was on the spatial, creating a sense of volume and mass, of three dimensions, even in reliefs or two-dimensional painting. Greco-Roman art is basically sculptural, whereas Celtic art is linear, more like drawing. Thus Roman artisans, when making reliefs on their pottery, carved dies in the desired shapes, much as they would have carved out a marble sculpture. The British artisan used a funnel to extrude a line of wet clay somewhat in the way he might have used a brush to apply paint. The curves of his lines and their rhythms were most important. Thus, in scenes showing running hares or dogs, their elongated bodies are paralleled by curving lines above and below; the shapes of the bodies themselves are hardly more subtle than thickened lines. The sense of speed derives at least as much from the lines as from the bodies, which, one feels, would have had equal impact if they were two- rather than three-dimensional.

The essential difference between Celtic and Greco-Roman art is well illustrated by the Hochdorf cauldron, which has reposing lions along its rim. Two of the lions are of Greek man-

ufacture; the third is Celtic, probably made by a Celtic artisan to replace a missing Greek lion. Compared to that of the Greek lions, the shape of the Celtic lion is clumsy, a mere barrel body topped by a head whose muzzle is a simple funnel, with little attempt to model the lion's cheeks, chin, and nose. The mane is suggested by incised lines rather than the fully sculpted curls on the Greek lions. However, the lines of the tail curling into a circle and of the crouching haunches are much more skillful and charged with potential energy.

Celtic Christian Art The final efflorescence of Celtic art occurred in Christian Ireland and in Irish monasteries in Scotland after the fifth century C.E. The Irish incorporated new elements from the Romans and from the ANGLO-SAXONS in their illuminated manuscripts such as *The Book of Kells* and their metalwork. The Irish adapted the Pictish tradition of large carved standing stone cross slabs to create the three-dimensional high Irish cross.

Music

Material evidence for the practice of music among the Celts is scanty. Few musical instruments or depictions of them have been found earlier than the first centuries C.E., when Mediterranean instruments were introduced in Celtic lands under Roman influence. This may mean no more than the lack of material evidence of Celtic poetry, both media being transmitted orally. It is nearly certain that Druidic poetry had a musical element in the same way that the Homeric poetic tradition did. In traditional societies all over the world, music and poetry have been and are inseparable. That the Celts had a keen understanding of the psychological impact of music is shown by their use of carnyxes, their great war trumpets shaped like roaring beasts, to terrify their enemies.

Among the few sources of evidence on early Celtic music are the Venetic bronze situlae found in present-day Slovenia. These are large decorated bucket-shaped vessels that depict scenes of festivity and apparent ritual. Although some situlae have been found in areas associated with the Illyrian-speaking Veneti, other similar ones come from the eastern Hallstatt zone, demonstrating considerable cultural commonality between Hallstatt and Venetic peoples. Dating to about 700 B.C.E. the situlae show a number of different forms of instruments. The four-stringed lyre (similar to the lyre of contemporary Homeric Greece) predominates in these scenes, played standing in processions and to

accompany dancers and played seated to entertain feasters. The other most common instrument is the syrinx, or panpipes, usually with five pipes (suggesting the use of a pentatonic scale). Panpipes are thought to be of eastern European rather than of Mediterranean origin. Another type of instrument resembles the Greek *aulos*, a vibrating reed flute typically with two pipes.

Contemporary pots in the western Hallstatt zone in southern Germany and France show mostly female dancers not accompanied by instruments; they dance with their arms raised. At the Hallstatt site itself several actual instruments have been found, including a set of simple end-blown bone pipes, a single pottery globular flute from the cemetery, and a cow's horn with carefully cut mouthpiece discovered in a salt mine. Far more complex than these are the nine-tubed panpipes cut from sheep or goat bone found in what seems to have been the grave of a priest or religious person of some kind in the cemetery of Przeczyce near Katowice in southern Poland. Here we have a possible connection of Druids and music.

The late Hallstatt chiefs who participated in trade with the Mediterranean world adopted the musical aspects of feasting of Greeks and Etruscans along with the accoutrements of wine-drinking. Artifacts depict dancers at feasts; in some cases these are sword dances, appropriate for the warlike Celts. An Etruscan ceremonial rattle of iron with bronze jangle plates has been found in a princely Hallstatt grave.

From near Budapest comes a tiny bronze figurine of the late Hallstatt period, possibly a mount from a bronze vessel or cult model, of a man playing the double pipes, or *aulos*, one of the few evidences of music from the central Celtic region. Indeed the most abundant evidence of instruments among the Celts comes from the periphery of the Celtic world and shows clear influences from other cultures. Very little evidence of musical instruments has been found in the period from about the fifth century B.C.E., the time of the collapse of the Hallstatt economic system, to the first century B.C.E., when Celts in Gaul and then Britain came into contact with Romans. Some researchers have thought this evidence that Celts were essentially unmusical. It seems more likely that their musical practice consisted mostly of song and dance. Again, the importance of poetry among them makes it nearly certain that music was of great importance as well.

A few bone pipes with pentatonic tuning have been found dating from this period in Britain, as also a bronze coin showing a centaur

playing an *aulos*-like set of pipes. Much more numerous evidence has been found for the great war trumpets called *carnyxes*. These were nearly man-high trumpets with mouths fashioned to look like beasts; they were held vertically with the snarling beast mouth forward. As in the case of other instruments, few *carnyxes* or depictions of them have been found in the central La Tène region. A second-century B.C.E. frieze on a temple in Pergamon shows Galatian Celts in battle blowing *carnyxes*; other examples come from Roman Gaul; and the Gundestrup Cauldron (a great silver-gilt cauldron, found at Gundestrup in Jutland but probably made in Thrace for eastern Celts and dating probably from the very late second century B.C.E.) shows boar-headed *carnyxes*. Several actual instruments have been found in Britain, including one with a boar's head that had a moveable tongue made of wood that had been preserved in the peat bog where it was found.

In Ireland an indigenous type of metal horn with a curving stock had begun to be made in the Bronze Age; it is thought to have been an imitation in metal of animal horn instruments. Such horns continued to be made in the Iron Age. Another bronze horn was found in the lake deposit of Llyn Cerrig Bach on the Isle of Anglesey, the ancient Druid stronghold of Mona, clear evidence of the use of such instruments in ritual. They can play only a few notes but the tone of modern reproductions suggests an evocative quality that must have been impressive when used in religious rites.

Celtic coinage in Gaul and Britain, which mostly dates from during the period of Roman contact, has many depictions of instruments, including of lyre-players. There is textual evidence that *Maponus*, a god of people north of Hadrian's Wall in Britain, was identified with lyre-playing *Apollo*. The existence of a lyre-playing Celtic god is further attested by a figurine found in Gaul wearing a torque with large buffer terminals, sign of high or divine status, and clasping before him a seven-stringed lyre. *Diodorus Siculus*, writing in the first century B.C.E., speaks of *bardoi*, bards, singing to the accompaniment of a stringed instrument. Although this comes from a time when Celts were again coming into contact with the Greco-Roman world, since religious practice is inherently conservative in nature, it seems unlikely that the use of instruments in worship would have been taken up in Druidic circles so quickly. (The conflation of Celtic with Roman gods happened only over time and mostly after the conquest.) Rather, they may well have been

using lyres for a very long time, as attested by Hecataeus of the sixth–fifth century B.C.E. A piece of a possible lyre dated to the third century B.C.E. was found below the rampart of a hill fort in north Wales. Irish early medieval texts such as the Ulster Cycle mention stringed instruments.

On the other hand the assymetric harp so associated with the Celts of the British Isles came into use only in the ninth century C.E. Regarding the vibrating reed instrument most associated with Celts in both Britain and Brittany, the bagpipes, there is no evidence of their use before the Middle Ages.

Literature

Insular Literature A central part of the training of Druids involved memorizing and composing poetry. They learned great numbers of verses by heart, and some studied for as long as 19 years; they thought it wrong to commit their learning to writing, as this might dilute its potency, but used the Greek alphabet for other purposes. In Celtic literature poets were able to perform magical acts through their recitations, for instance, calling up magic mists to provide cover for the war bands they accompanied, or reciting savage satires that rendered enemy warriors helpless. Some scholars believe that occult religious knowledge was hidden, in riddling fashion, in a number of important Welsh poems, as for example, “The Battle of the Trees” and “The Song of Amergin.”

After the Welsh and Irish adopted Christianity along with the literary traditions of the Greco-Roman world, in addition to compiling their ancient tales, writers made new compositions, such as the Welsh *Y Gododdin* (The Gododdin) and the Irish *Lebor na hUidre* (The book of the dun cow), which successfully integrated old and new influences.

A discernibly “Celtic” spirit and atmosphere have continued to pervade the literatures of Ireland and Wales to the present, as evinced by poets such as Ireland’s William Butler Yeats and Seamus Heaney and Wales’s Dylan Thomas, with mystical life at the center of their work.

Religion

The Urnfield Revolution Archaeology gives us the first glimpse of Celtic religious practices from ancient times. The widespread change in burial practice after 1300 from inhumation to cremation and the burial of ashes in urns in well-defined cemeteries seem likely to have resulted from a seminal change in spiritual beliefs. Although cremation had been prac-

This golden votive offering was made by a Celtic craftsman. (Drawing by Patti Erway)

ticed before this and inhumation continued in some places afterward—indicating that local and personal preference continued—the “Urnfield” phenomenon constituted a genuine revolution. Urns were covered with small and sometimes very large mounds and sometimes accompanied by rich grave goods; however, as a rule Urnfield graves tended to be poorly furnished. The change to cremation may reflect a change in attitude toward the material body: that no longer was the body needed for the continuance of the spirit in a life after death. Likewise grave goods for use in the afterlife may no longer have been deemed necessary. A sense of the spirit as an unseen agency or force more akin to mental and emotional processes than to the visible body, escaping from the body by being transformed by holy fire into smoke rising toward heaven, may lie behind the Urnfield revolution. In keeping with such an attitude, memory, aided by commemorations of the dead in song and story, may have been considered a more fitting tribute than physical monuments.

Spiritual Symbols and Cult Places in the Late Bronze Age The bird was an important symbol during the Late Bronze Age, represented in figurines of clay and bronze and in decorative motifs on wagons and cauldrons. Water birds draw or are associated with boats and even

wagons and chariots. The many depictions of these creatures of the air suggest a new focus on a spiritual realm in the sky in addition to that of the underworld beneath the soil.

People during this period continued the practice of ritual deposits underground, however, including hoards of metal objects, pottery, and human and animal bone, possibly from sacrificial victims. Deposits were made within fortifications and at cult sites of earlier times; Bronze Age pottery was deposited in the holes that encircle Stonehenge, built 1,000 years earlier. It is probable that open-air sites such as sacred groves and hilltops were used for ritual activities, as documented for Iron Age Celts by Greek and Roman writers.

The Druids A significant aspect of Celtic spiritual life was the presence among them of the Druids, a priestly class of enormous importance both for religion and for social life. After the Roman and then the Germanic takeover of much of Celtic Europe around the start of the first millennium C.E. the importance of the Druids is perhaps most clearly seen in Britain, where, according to Caesar, the Gauls sent their sons for their religious training. The relative isolation of Britain and of Ireland may have allowed the survival there of values antedating the aggressive individualism of the Bronze Age warrior ideal, and closer to the older Neolithic values of community and a sense of identity growing out of allegiance to the group and to the land. The rites of communal worship and communal labor on megalithic monuments and vast earthworks may in part have given the religious observances of the Britons their particular prestige and mystique to the rest of the Celtic world. But they may only have been preserving a socioreligious ideology once common throughout Celtic Europe.

Much is mysterious about the Druids because they never revealed their doctrine and practices in writing, perhaps because to do so would have been an impiety. Fragments only of these matters were known to the Greeks and Romans who wrote about them. Even the meaning of the name *Druid* is not known with certainty. Pliny the Elder in his *Natural History* speculates that because of their reverence for the oak, the name *druidae* may derive from the Greek name for the oak—*drus*. Another suggestion by modern scholars is that *druid* is derived from the proto-Indo-European word **wid*, denoting wisdom (as in English *wit* and *wisdom*, which have that root), with *dru* an intensive, so that *dru* + **wid* meant “very wise.” Yet another theory combines *drus* meaning “oak” with **wid*

to give “oak wisdom”—a form of esoteric knowledge gained during rituals involving the oak. Some scholars, ancient and modern, have noted the resemblance of *druid* to *dryadae*, the Latin for the oak nymphs of Greek myth, female spirits who haunted oak trees.

A word related to *druid* is *Drunemeton* recorded by the Greek Strabo, writing in the first century B.C.E., as the place of judgment of the Galatians of Asia Minor, an offshoot of the Galatoi. The second part, *-nemeton*, would be cognate with the Old Irish *Nemed*, denoting a sanctuary or a consecrated place. *Drunemeton*, then, would mean either “very holy sanctuary” or “oak sanctuary.” The use of specially consecrated sanctuaries for judgment and other functions was evidently a pan-Celtic practice, given the wide dispersal of place-names containing *nemet*. Strabo emphasized the legal activities that took place there, but in archaic societies, judicial, political, and religious functions are not at all distinguished in a modern sense. The root of *nemet* and *nemeton* in Old Irish is *nem*, “heaven.”

Druids as Judges Caesar describes the Druids as having a judicial function equal to their religious one. They presided over all disputes and adjudged guilt in murder. The source of their power was their ability to forbid anyone who flouted their decisions to attend religious rites and sacrifices. Caesar described this as a heavy punishment among the Celts, tantamount to shunning by the whole of society.

In general, because of the prestige accorded the Druids, according to Caesar, and the benefits they enjoyed, including exemption from military service and any tributes or taxes, many wanted to join their order, and many parents sent their children to study with them. The course of study included the memorization of many verses, probably numbering in the thousands. It is likely that law codes were embodied in many of these verses, a practice that continued in Wales into the Middle Ages as preserved in the *Triads of Wales*, a collection of verses denoting transgressions and their penalties.

Druidic Rites Among the many matters of obscurity concerning the Druids is what their rituals were. Roman writers mention horrific sacrifices, one involving a Roman general fighting the Boii who had allied themselves with Hannibal during the Second Punic War. The general was captured and beheaded, his skull then gilded for use in sacred rites as a libation and drinking cup. This may be no more than

Roman prejudice against a tribe who had aided Hannibal, but then again may not.

A rite described by Pliny has been more generally accepted by scholars and is the only detailed description of a druidic ritual. It concerns mistletoe, a parasitic plant that grows on trees but only very rarely on the oak. Thus, when a mistletoe plant was discovered growing on an oak tree, the Druids carried out a very special rite to gather it. They had a feast under the tree to which they took two white bulls. A Druid in a white vestment would lop the mistletoe with a golden pruning hook, while others caught it below in a white cloth. The bulls were then sacrificed, perhaps in recompense to the god for the gift of the sacred plant. The mistletoe was highly prized, says Pliny, as a means of giving fertility to cattle and as an antidote for poisons; the Gauls called the mistletoe “the healer of all things.” The word for mistletoe in Irish today means “allheal” or “panacea.” Aside from this descriptive term, there is no actual name for mistletoe in Irish; the only other possibility is *Druialus*, “Druid’s plant,” another description rather than a name. Just as the Druids never described in writing or described their cultic practices to outsiders, the actual name of this sacred plant may have been taboo, withheld from any outside the Druidic order who might weaken its potency or draw down evil by carelessly speaking its name.

Education of Druids Among the Celts religion and cultural products such as poetry were closely interlinked. A central part of the training of Druids involved memorizing and composing poetry. They learned great numbers of verses by heart, and some studied for as long as 19 years; they thought it wrong to commit their learning to writing, as this might dilute its potency. In Celtic literature poets were able to perform magical acts through their recitations, for instance, calling up magic mists to provide cover for the war bands they accompanied, or by reciting savage satires that rendered enemy warriors helpless.

Excommunication by the Druids A striking aspect of Caesar’s account of Celtic religion, given in his *Commentarii de bello Gallico* (Commentary on the Gallic War, 52–51 B.C.E.), and that of other Romans is the attention to its special importance for the Celts. They were reportedly given to religion, and banishment from participation in religious ritual, which was occasionally meted out to wrongdoers by the Druids, was considered the gravest of punishments. That this importance of religion to the

Celts was remarkable to Romans, whose own society was closely bound up in religious ritual, is in itself eloquent testimony on Celtic spirituality. It is clear that for the Celts the interpenetration of the secular and sacred realms, of the material and the spiritual, was complete. It seems that every aspect of their life related to an organic unity of the here and the hereafter, the natural and supernatural, in which each was the continuation and completion of the other, and there was constant communication between them.

Evidence about Celtic Religion The usual difficulty in studying the Celts caused by the incomplete and varying evidence about them is compounded with respect to their religion because they seem to have considered it impious to commit any of their belief to writing, even when they had begun to use Latin and ogham script under Roman influence. Only after the Irish and Welsh converted to Christianity did scholar monks among them begin to commit their mythological narratives to writing, centuries after paganism had ceased. The obvious shortcoming of deriving evidence of pagan beliefs from Christian scholars, whose basic attitude was one of condemnation, is counterbalanced by the close links between the Celtic Christian Church and Druidic beliefs and practices. Scholarship and the preservation of religious narrative were central to Druidic practices; a large part of the education of Druids consisted of committing their mythology to memory. In a sense the Irish monks in particular were simply carrying on this enterprise in a different medium, the written word. Striking archaisms of style and content in their writings give a sense of the monks’ fidelity to their ancient sources.

There are two other main sources of information on Celtic religion. There are contemporary written accounts of Celtic religion by Greco-Roman writers; they, however, observed Celtic religious practices only at the end of the Celtic Iron Age, and under circumstances of turmoil and dramatic cultural change. There is also a large body of iconographic evidence and of inscriptions on monuments. The Celts left many religious monuments and artifacts, but in the absence of contemporary information on their liturgy and belief system from the Celts themselves, such monuments and icons are hard to interpret. Moreover, most inscriptions date from the Roman era.

Yet this piecemeal body of evidence, when taken together, exhibits a number of consistencies among the different sources, which must

constitute a core of authentic information. For example, the second–first-century B.C.E. Greek philosopher Poseidonius and others describe three classes in Gaul involved in sacred ritual and learning: Druids, bards, and a group called in Gaulish *vatis* (seers). This division corresponds to the medieval Irish literature that also tells of Druids, bards, and *filidh*, or seers. In general the sacredness of “threeness,” of the triad, is supported both by iconography, for example, the many sculptures in Gaul showing a triad of women called in inscriptions the Matrones, “the mothers,” and the importance of the concept in Irish and Welsh literature.

Perhaps even more fundamental is the Celts’ belief in the sacredness of the land and of nature in general. It is possible to discern in the evidence that the Celts divided the natural world into three spiritual realms: earth, water, and air or sky—the latter sometimes represented by fire. Evidence includes the water rituals of the Bronze Age, which continued into Celtic times; earth burials of both the human dead and metal hoards, and the use of hilltop sites for ritual. The chief god in the Irish pantheon was the Dagda, a sky god, whose mother was Danu or Dana, an Earth goddess who also seems to have been a deity of rivers, especially the Danube (in German, Donau). The Gauls had a mother goddess called Madron whose sacred river was the Marne.

The Celtic attitude toward the land is indicated by an important branch of learning among the Irish, called *dindshencas*, “the lore of famous places,” by which mythical narratives were furnished to account for place-names. In Ireland place-names numbered in the hundreds and were given to all sorts of sites: hill and mountain tops, clearings and fields, rocks, fords, confluences, rivers, and springs. A striking example is the twin hills near Killarney now known as the Paps; in Gaelic they were called the breasts of Anu, the mother of the last race of gods to live on Earth, the Tuatha de Danaan. At least two of the early Irish festival sites, Carmun and Tailtiu, were the reputed burial places of goddesses associated with the fertility of the Earth. In Gaul, too, deity names were given to such sites. In both Gaul and Ireland named places proliferated along tribal boundaries but also in the territorial centers, a reflection of the Celtic sense of the land as redolent with deity.

The sacredness of the land is underscored by the coronation ritual of Irish kings, which consisted of a sacred marriage between the new ruler and a woman—possibly a priestess, or else the king’s consort-to-be—who represented the

Earth goddess. A Gallic god mentioned by the first-century C.E. Roman writer Lucan was Teutates, the god of the tribe; presumably as the god’s mortal representative the Irish sacred king married the representative of the goddess. That such unions were meant to ensure the land’s fertility may be the symbolic meaning of the many tales concerning widowed hags, blighted and decrepit as a winter landscape, who are restored to radiant youth and springtime beauty by the act of intercourse with a virile hero.

The Problem of Celtic Gods Perhaps the most dramatic contradiction among the various sources on Celtic religion concerns their gods—their names, numbers, and functions. Caesar’s *Commentarii de bello Gallico* gives the names of five important gods among the Gauls, some of whom have clear counterparts elsewhere in the Celtic world, while others are hard to relate to other evidence. Caesar’s main source aside from firsthand experience is thought to be Poseidonius, whose work on the Celts of Gaul was also used by the first-century B.C.E. Greek historian Timagenes. Including also Diodorus Siculus and Strabo, this trio constitute what is called the Poseidonius school.

Caesar mentions five deities, giving them only the names of Roman gods with whom he identifies them. Mercury, the most important Celtic god, had the greatest number of images made; he was the inventor of all arts, the guide and protector of travelers and tradesmen, and in general the patron of commerce. Many images of Mercury have in fact been found in Roman Gaul; moreover, he seems to have a clear counterpart in the insular literature: the Irish Lugh (in Welsh, Lleu), who is commonly described as “skilled in many arts together.” The fact that the capital of Roman Gaul was Lugudunum (Lyon) and that many other towns seem to have derived their names from Lugh, including Liegnitz in Silesia, Leiden in Holland, and Carlisle (Luguvallum) in Britain, brings the identification full circle. Lugh has been identified with the sculptures of a deity wearing a Blattkrone, “leaf crown,” possibly of mistletoe leaves, which first appeared around 500 B.C.E., when La Tène chieftains were enriching themselves through trade with the Greeks and Etruscans. The later statues of Mercury usually showed him bearing a moneybag (ostensibly to pay the boatman ferrying souls across the River Styx, for Mercury was the conveyor of souls to Hades, the land of the dead in Greco-Roman myth).

For the other gods Caesar mentions, however—Apollo, Mars, Jupiter, and Minerva—

identification with evidence from other sources becomes problematical. Inscriptions mentioning Minerva are found throughout Roman Gaul and Britain; the dedication of a temple in Bath (Aquae Sulis) in Britain to Sul-Minerva identifies her with the goddess Sulis of the medicinal springs there. The Celtic word for *eye* was *sul*, perhaps a reference to the use of medicinal springs to cure eye ailments, but also to her role as patroness of learning and goddess of divine wisdom: Sul the All-Seeing One. She, as did Minerva, oversaw the teaching of crafts. However, Caesar said that healing was the province of Apollo.

The greatest problem with Caesar's clear-cut and simple scheme is that it stands in contrast with the teeming abundance of deities mentioned in Irish and Welsh literature and in inscriptions. This has led some scholars to conclude that the Celts had no universal gods and that all of them were local and particular to each tribe. However, again correspondences in inscriptions, depictions, and the insular literature are not wanting (as in the case of Lugh), and the proliferation of names probably came about through local tribes' giving their own names to pan-Celtic deities, who nevertheless had the same attributes all over the Celtic world. Sulis, for example, had an Irish counterpart in Brighid, daughter of the chief god, Dagda, who was also concerned with healing, craftsmanship, and poetry. Brighid may have had a counterpart among the BRIGANTES of northern Britain, whose goddess was called (in the Latinized version of her name) Brigantia, "exalted one."

The state religion of Rome, fundamentally urban and national in nature, with its highly organized pantheon and yearly cycle of festivals, represents religion at a later stage of development than that of the tribal Celts. The Romans used their religion as a unifying agency to bind together peoples all over the Empire—to Romanize them. The Protean religion of the Celts seems to have emphasized individualism—individual reinterpretations of pan-Celtic gods and beliefs (similar to local reinterpretations of the La Tène art style). The disjunct between Caesar's account and Irish and Welsh myth derives from this fundamental difference in religious attitude.

The whole tenor of the Celtic worldview as seen in the insular literature defies the neat classifications of Romans. A common theme of Irish and Welsh myth is that its characters frequently change from one form into another. The Irish "Song of Amergin," for example, consists of a long series of statements beginning with "I am."

The narrator describes the changes he has undergone, from being a wind, to being a wave, a ray of sunshine, a hawk on a cliff, the greenest of plants, a boar, a salmon, and many others, ending, "I can shift my shape like a god." A Welsh story tells of a character called little Gwion, who changes his shape in his efforts to escape the angry goddess Cerridwen, each shift followed by one of hers. He becomes a fish, whereupon she becomes an otter and hunts him; he becomes a mouse and she a cat, and so on. The strong impression the mythology creates is of a world of fluid change and eternal becoming in which appearances are deceiving and categories unimportant.

It was precisely the gods' ability to assume different forms or multiple forms that made them objects of worship to the Celts. An inscription in Spain to Lugh or Lugus refers to him in the plural—the Lugoves, and the Matrones probably represent a divine mother in triplicate. Names of goddesses in particular proliferate—Rosmerta, Nantosvelta, Damona, Sirona, and Nemetona, among many others. A goddess whom the king figuratively weds may have been conceived of as the mother of the people, of the tribe, as well as of the land. The Welsh goddess Branwen, for example, has been described as one of the great ancestor goddesses of Britain; the Irish triad of Eriu, Fodla, and Banbha are considered the ancestor goddesses of Ireland. The consort Maia, also called Rosmerta (the provider), accompanies "Mercury"—or more probably Lugus—on many Gaulish monuments and is also a fertility goddess.

The character of Celtic goddesses was by no means entirely benign, and some of them presided over warfare. Such were Buanann ("The Lasting One") and Scathach ("The Shadowy One") and the triad of Morrighan ("The Phantom Queen"), Bodhbh Chatha ("The Carrion Crow") and Nemhain ("Frenzy"), who would incite warriors on the battlefield but also confuse and ensnare them to their deaths. The Gallic equivalent of Bodhbh Chatha is Cathubodua, known from an inscription in Haute-Savoie in France. The Iceni queen Boudicca of the British Isles led warriors to battle and invoked the goddess Andraste. Another important epiphany of the goddess was as a horse, called Epona, "The Divine Horse" or "Horse Goddess," whose name is preserved in hundreds of inscriptions. She was connected to the fertility of the land and of nature, and was another form of goddess as mother of the realm, judging by the coronation ritual of some Irish

kings, which consisted of the king miming being born to a mare. The Irish horse goddess was Macha, who gave her name to Ard Macha, “Height of Macha,” an important pagan sanctuary that later became the center of Christian worship in Ireland. Her Welsh equivalent was probably Rhiannon, “Divine Queen.”

In general the importance of goddesses to the Celts, together with the fact that women could join the priestly class, strongly differentiates Celtic religion from others in contemporary Europe—those of the Greeks and Romans, as well as the Germanics, whose goddesses are clearly subservient to the gods. This, together with marked similarities between a number of Celtic myths and stories in the Vedas of India, for example, the myths of the Irish queen Medhbh and the Indian Mahdavi, has led many scholars to conclude that Celtic religion arose out of and preserved a substratum of belief and ideology once common to the speakers of the original Indo-European language, who spread throughout Europe and India sometime during the Neolithic Age. Moreover many religious terms in Celtic languages derive from proto-Indo-European, attesting to the conservative nature of Celtic religion.

The earliest appearance in what would later be Iron Age Celtic Europe of a clear warrior ideology was that of the Bronze Age Bell Beaker Culture. There is suggestive evidence that Bell Beaker warriors engaged in some sort of compromise with people holding to the older Neolithic values of worship of nature and the land, perhaps embodied by a goddess, which they expressed by building great earthworks and stone monuments and holding rites of communal worship there. Stonehenge and other great stone circles in the British Isles may well be a monument to this compromise, since Beaker warriors probably took part in their building. Although we may never know what deities in particular were worshipped at Stonehenge in the Bronze Age, goddesses or a single goddess of the Earth were probably among them. And the religion of Iron Age Celts may have preserved some aspects of this cult along with other aspects of Bronze Age spirituality, which, among Greeks and Romans, had been greatly modified by the latter half of the first millennium B.C.E.

Some of the earliest written evidence on Celtic religion is from the sixth–fifth-century B.C.E. Greek geographer Hecataeus of Miletus, of whose writings only fragments remain. He gave an account of people worshipping in a round temple. He is quoted at length by Diodorus Siculus on the religion of a people called the

Hyperboreans (referring to the fact that they lived “at the back of the North Wind,” called Boreas by Greeks). Hecataeus writes that according to tradition Latona, Apollo’s mother, was born on an island the size of Sicily opposite the coast of Celtic Gaul, and that people there venerated Apollo more than any other god, worshipping him with continual song and harping in a sacred grove and in a round temple. This temple has been thought to be Stonehenge, although there are other candidates, including the Callanish stone circle in Scotland. The Hyperboreans had had contacts with the Greeks “from remote periods,” Hecataeus writes, and were particularly attached to the Delians, inhabitants of the Aegean island of Delos, which was a center of Apollo’s worship in Greece.

Apollo-Maponus A strong candidate for the Celtic Apollo of Hecataeus is Maponus, “The Divine Son,” who was especially worshipped in northern Britain, as attested by inscriptions of Roman times. In Gaul his sacred sites were located near healing springs, so that he may be identified with the god Caesar calls Apollo, “who drives away disease.” Maponus is indeed equated at least once with Apollo Citharoedus, “the Harper.”

According to Hecataeus Apollo visited Britain once every 19 years, “in which period the stars complete their revolutions,” and because of this the Greeks distinguish the cycle of 19 years by the name of “the great year.” The 19-year cycle is the period required for the lunar and solar calendars to return to synchrony. As noted earlier, Caesar informs us that a period of 19 years was the statutory study period for any acolyte wanting to train for the Druidic priesthood. The reference to continual harping and hymn singing accords with the importance of poetry and music in Druidic training and practice. Because of the Greeks’ trading links with northwestern Europe, it is not impossible that Hecataeus received his information from firsthand accounts by traders or other travelers. Greek travelers to Britain would have given the name of their god Apollo to a British god who had characteristics similar to Apollo’s; the fact that this god’s season began with the spring equinox, as Hecataeus mentions, suggests he was a Sun god, as was Apollo. He must also have shared Apollo’s patronage of music, healing, and prophesy. It may not have been solely, or even principally, desire for plunder that led the Celts who overran Greece in the fourth century to make their way to Apollo’s principal shrine at Delphi.

Contrast between Celtic and Greek Religion In general Apollo figures in Greek myth as a god who took over the attributes of an earlier great goddess; for example, he assumed patronage of the shrine at Delphi by killing the goddess's sacred python. This story has been thought to document the shift in Greek religious belief to a strongly patriarchal system, with the mother goddess no longer the equal partner of the father god, Zeus. (Thus Hecataeus's account emphasizes Apollo's worship, saying nothing about that of Apollo's mother, Latona.) The situation was otherwise with the Celts, who held to attitudes they once shared with the Greeks of "remote periods" in the past. (For the Romans, too, Apollo was the god of healing, which for the Celts continued to be the province of the goddess Sulis/Brighid.)

Maponus receives little mention in medieval Irish and Welsh literature; for the Welsh he was Mabon, son of Modron—or Matrona, the divine mother. However, inscriptions attest to his importance; he figures prominently in the Celtic paradigm of the triad of father god, mother goddess, and divine son: Teyrnnon (Divine Lord), Modron, and Mabon. This triad appears in Irish myth as the Dagda (among other names), Boand or Boann, goddess of the river Boyne (as Modron was of the Marne in France), and Mac ind Og, "The Young Son" (also called Oengus). They dwelt in Bruigh na Bóinne, the great Neolithic passage grave now called Newgrange. Mac ind Og tricked his father into ceding him possession of Bruigh na Bóinne by wordplay, which places him in the tradition of the Divine Son as trickster (like Mercury).

Cosmology and the Cult of the Sacred Center

The "sacred geography" of Ireland provides a glimpse into the cosmology of the Celts as a whole. In a scheme that has analogues in many of the world's cultures, including those of India and China, the five provinces of Ireland mapped out an earthly microcosm of the lineaments of the immortal world. The four provinces of Ulster, Leinster, Munster, and Connacht represented the cardinal points of the compass, and Midhe (middle), not territorially separate from the others, was located in the center. The royal coronation site of Tara, where the high kings of Ireland were crowned, stood within Midhe, and the structures there were probably intended to reflect the universe in microcosm. There was a Gallic analogue to Tara for, according to Caesar, the Druids of Gaul would meet at a holy site in the territory of the CARNUTES, which was believed to be the center of all Gaul. The crux of

the Celtic cosmology, then, seems to have been the concept of the multiplicity of the world transcended and unified within a sacred center, like the "jewel in the heart" of the many-petaled lotus of Tibetan Buddhism.

Iron Age Human Sacrifice Greco-Roman writers of the first century B.C.E. to the second century C.E., including Caesar, Strabo, Lucan, and Tacitus, state that the Celts engaged in human sacrifice. A variety of methods, they say, were used, including drowning, burning, hanging, stabbing, shooting with arrows, throat cutting, and tearing to pieces. Women, men, prisoners, children, and even priests were among the victims. Many modern scholars think that Roman writers, whose compatriots were engaged in conquering the Celts, exaggerated and distorted their accounts, as commonly happens when the conquerors write about the conquered. Much archaeological evidence exists, however, that strongly suggests sacrifice. This evidence is from the whole span of the Iron Age from the seventh century B.C.E. to the first century C.E., and in Britain for some time after the Roman conquest.

Individual finds on their own cannot be interpreted as proving human sacrifice, since a body showing signs of violent injury could have suffered murder or execution, and the injuries could have been inflicted after death. But certain aspects of the context in which bodies are found can point to sacrifice. Bodies buried in pairs, such as a man and a woman, who clearly died at the same time, suggest the Indian practice of *sut-tee*, in which wives were sacrificed to accompany husbands. (Such a practice has been documented for the Vikings of Russia by eyewitness account.) An example is the Early Iron Age Hallstatt D royal tomb at Hohmichele on the Upper Danube. It included two large burial chambers, each of which had contained two bodies of high-ranking people. There were also low-status secondary graves within the mound. These could have been retainers or dependents of a noble sacrificed so that they could continue to serve him or her in the next world.

Bodies were sometimes placed in disused grain storage pits. A number of these have been found at Danebury hill fort in Britain. Such deposits appear to have occurred from the seventh to first century B.C.E. and to have been done on average once every six years. The limbs of these bodies had sometimes been bound together; some were weighted down with large flint or chalk blocks. All of these factors seem to point to a ritual component of their deaths, perhaps including sacrifice. The purpose of such sacri-

fices could have been propitiation of deities of fertility.

Stronger evidence of sacrifice is that of bodies that show signs of struggle. At Curragh in county Kildare, Ireland, signs of writhing and struggle exhibited by a woman's skeleton suggest she was buried alive. Other such bodies have been found.

Of the many burials in streams and bogs a number were almost certainly sacrifices. Some, for example, from La Tène (which means the shallows) and Cornaux in Switzerland were weighted down with heavy timbers in the shallows of a lake. Lindow II, a young man who was deposited in a marsh in Cheshire, England, in the first century C.E., was apparently killed ritually, underscored by the importance of the number 3 involved: in the means of killing him (head blows, strangling, and throat cutting) and in the details (three head blows from an ax, and three knots on the cord that strangled him).

Ceremonial aspects of many of these bog deaths include the fact that victims were buried naked and that they had eaten special food just before their death. Lindow II had some bits of blackened cake or bannock in his esophagus. This finding recalls a custom among boys in remote Scottish villages that persisted almost to the present. On May 1, called in some parts of the Celtic world the feast of Beltane, boys would go out to the moors, kindle a bonfire, and divide a cake into pieces, one for each boy. One of the pieces was blackened with charcoal and all were placed into a hat. Each boy, blindfolded, drew a piece of cake from the hat; whoever chose the blackened piece was called the "devoted" one, that is, dedicated or made over for sacrifice, which he mimed by jumping three times through the bonfire. The cake Lindow II had eaten, in addition to barley and wheat, contained mistletoe pollen, suggesting the season of his death, since mistletoe pollinates in March or April.

The numbers of possible or probable sacrifices found as a proportion of all burials suggest that sacrifice was not common but rather unusual and special; this indeed conforms to the written accounts. Sacrifice was possibly performed at critical times: for example, to avert famine and epidemics or to commemorate the death of a leader or defeat in battle. Lindow II was sacrificed around the time of the Roman invasion, in itself a crisis serious enough to elicit an extraordinary response.

Seasonal Festivals Much of what is known about the seasonal festivals of the Celts is taken

from insular sources. In Ireland the year was divided into two periods of six months by the feasts of Beltane (May 1) and Samhain (Samain; November 1), and each of these periods was equally divided by the feasts of Imbolc (February 1) and Lughnasadh (August 1). Samhain seems originally to have meant "summer," but by the early Irish period it had come to mark summer's end. Beltane is also called Cetsamain (First Samhain). Imbolc, sometimes called Oímelc (sheep milk), inaugurated the lambing season and was particularly associated with the goddess Brighid. Beltane (Fire of Bel) was the summer festival, and there is a tradition that on that day the Druids drove cattle between two fires as a protection against disease. For the festival of Lughnasadh (Festival of Lugh), into recent times, in one of the rituals people pretended to be working at different tasks: weaving, spinning, or plowing. Early commentators gave this a Christian interpretation: The people were miming work that they had done unlawfully on the Sabbath. However, the miming may once have been in honor of many-skilled Lugh.

Esus and Other Celtic Gods Three other important gods of the Celts mentioned in classical literature were Taranis, the god of thunder; Esus, the god of the underworld; and Teutates, the god of the tribe. According to Lucan each required a specific type of sacrifice. For Taranis, as thunder and lightning god, fire was the method of death and prisoners of war were burned alive in giant wicker cages in his honor; alternately, his victims were dispatched by a blow to the head, another way of symbolizing the lightning bolt. The victims of Esus were either hanged from sacred trees, stabbed to death, or killed by both means. Teutates received his sacrifices in sacred wells and pools. The threefold means of killing Lindow II may have meant that victims were offered to all three gods. His head blows would have been a sacrifice to Taranis. His strangling and throat cutting, in this interpretation these two means conflated into one, could have been to Esus. And his deposition in the marsh could have given him to Teutates.

Esus's name meant "lord" or "master." That his victims were sacrificed by hanging from trees suggests he may have been a tree or vegetative god. A relief in the cathedral of Nôtre-Dame de Paris portrays him as a bent woodman cutting a branch from a willow tree. This and a related relief from Trier, in Germany, both called Tarvos Trigaranus (The Bull of the Three Cranes), associate him with the sacred bull and his accompanying cranes or egrets.

Esus is sometimes paired with a horned or antlered god named Cernunnos, known by name only from a single inscription, as a sort of alter ego who ruled one-half of the year; Cernunnos ruled autumn and winter and Esus, spring and summer. Thus the bull in the relief at Trier would be Cernunnos and the cranes, whose migratory return heralded the spring, would be Esus. The Gundestrup Cauldron depicts an antlered god who may have been Cernunnos. Sitting cross-legged in a posture that resembles the Tantric lotus position, the god holds in one hand a snake (commonly a symbol both of renascence since snakes are “reborn” after shedding their skins, and of spring since snakes emerge from underground in the spring) and in the other a torc (torque). He also wears a torc, the twisted cord appearance of which could symbolize Esus’s garotte.

Zoomorphic Deities The many animals on the Gundestrup Cauldron imply that Cernunnos was a form of the Hindu god Shiva in the guise of Pasupati, Lord of Beasts. In general there is much animal imagery in Celto-Roman iconography, representing the deities in combinations of animal and human forms, again attesting to the Celtic fascination with shape shifting. Another prominent zoomorphic deity type is the divine bull, the Donn Cuailnge (Brown Bull of Cooley), which has a central role in the great Irish hero tale “Táin Bó Cuailnge” (The Cattle Raid of Cooley) and recalls the *Tarvos Trigaranus* reliefs from the cathedral at Trier in Germany and at Nôtre-Dame de Paris. Other animals that figure particularly prominently in association with the pantheon in Celto-Roman art as well as in insular literature are boars, dogs, bears, and horses.

Celtic Christianity Under the auspices of the Roman Empire, for which Christianity had become the state religion, the Christian faith was well established in Celtic Britain by the fourth century C.E. At the same time St. Patrick, a Romano-Briton who had been captured in an Irish raid and spent years of his boyhood as a slave in Ireland, returned there to convert the Irish after he won his freedom. He spearheaded the foundation of a new church in Ireland, which then became the center of Celtic Christianity. Patrick particularly targeted the Druids as key to converting the Irish people as a whole.

By the early seventh century though the church had succeeded in reducing the Druids to irrelevancy, their influence continued to be felt in the Irish Catholic church, particularly in its devotion to learning. The Irish monks did much to preserve a knowledge of ancient

Roman literature in early medieval Europe. The distinctive organization of the Irish church, based on monasticism in which bishops were subordinate to the abbots of monasteries, may well have been based on the sacred colleges of the Druids. The *filidh*, although Caesar calls their mainland equivalents seers, carried on the Druidic traditional learning and were able to maintain many of their activities unchecked, retaining a considerable part of their pre-Christian tradition, social status, and privilege. *Cormac’s Glossary* (c. 900) recounts that St. Patrick banished those rituals of the *filidh* that involved offerings to demons, and it seems probable that the church took particular pains to stamp out animal sacrifice. What survived of ancient ritual practice tended to be related to *filidhecht*, the traditional repertoire of the *filidh*, or to the central institution of sacral kingship. Although the concept of the sacred marriage of the king with the goddess of sovereignty that constituted the core of the royal inauguration seems to have been purged from actual practice at an early date, it remained alive for many centuries in the literary tradition.

In 1991 the president of the European Union’s Commission on Culture, at the opening of an exhibition on the Celts in Venice, announced that being Celtic was the common bond that drew together all the nations of Europe, in effect saying, “We are all Celts.” This statement was received in some quarters with less than enthusiasm or even worse. Commentators in the United Kingdom, particularly in Northern Ireland, no doubt under the influence of the highly charged political atmosphere there, equated it with Nazi assertions of racial supremacy and nationalist pride. Clearly the commissioner intended just the opposite: that Celtic identity could be a unifying concept replacing the nationalism that, since the emergence of nation-states in the late Middle Ages, has repeatedly torn Europe apart and in the 20th century put the world on the brink of nuclear annihilation.

That a culture that had largely disappeared before the end of the first millennium C.E. could retain enough vitality 1,000 years later to cause controversy is remarkable even though many of its modern manifestations, particularly in popular art and music, are in great measure modern constructs that say more about us than about the ancient Celts. What we can discern of Celtic culture shows it to have been a unifying—although by no means always peaceful—force over much

of Europe for centuries. The spiritual and artistic aspects of Celtic culture can be compared in this to the Christian Church, to Renaissance art, baroque and classical music, and even modern science—that is, it transcended national or ethnic boundaries.

Less a distinct “people” than a socioeconomic and spiritual order, Celtic culture arose and flourished in a Europe that had yet to know civilization fully. (The often-lamented Celtic lack of writing, which forever places aspects of their culture beyond our understanding, was nevertheless of their essence as an oral culture.) Moreover the Celtic culture was the culmination of the earliest warrior-elite culture in Europe—that of the Germanic peoples was later. Our continued fascination with Celtic culture lies in its embodiment of tribal, precivilized Europe. The fragments of it that remain put us in direct touch with a vanished world.

Cenimagni

The Cenimagni are classified as a Celtic tribe. They lived in Britain and are discussed as CELTS or BRITONS. According to Julius Caesar they were allies of the TRINOVANTES and surrendered to the ROMANS in 54 B.C.E., along with the ANCALITES, BIBROCI, CASSI, and SEGONTIACI. It has been assumed the Cenimagni were actually the same as the ICENI.

Cenomani (Aulerici Cenomani)

The Cenomani are classified as a Celtic tribe. They lived in Gaul around present-day Le Mans in northwestern France and are discussed as CELTS or GAULS. A Celtic tribe with the same name, thought to be a branch of the same people, lived in present-day northeastern Italy in the early centuries B.C.E., neighbors of the BOII and SENONES and allies of the ROMANS. They defected from the alliance in 200 B.C.E., siding with the CARTHAGINIANS, but made peace with the Romans three years later. Suindinum on the site of Le Mans became a *civitas* capital in Roman Gaul; Le Mans takes its name from the tribal name.

Ceretani

The Ceretani are classified as a Celtic tribe. They lived in Gaul near the Mediterranean around present-day Céret in present-day southwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Céret takes its name from the tribal name.

Ceutrones (Ceatrones)

The Ceutrones are classified as a Celtic tribe. They lived in Gaul in the Alps in the district of Tarentaise in eastern France and are discussed as CELTS or GAULS. Along with the CATURIGES and GRAIOCELI they attempted unsuccessfully to obstruct the ROMANS under Julius Caesar in the Alps in 58 B.C.E. Another group by the same name were a subgroup or allies of the NERVII. They lived in present-day Belgium.

Chamavi (Chamavians; Camavi)

The Chamavi are classified as a Germanic tribe. In the first century C.E. they lived north of the Rhine and southeast of the Zuider Zee in present-day northeastern Netherlands and northwestern Germany. By the third century they had become allied with other GERMANICS—the AMSIVARII, BRUCTERI, CHATTUARI, and TUBANTES—as FRANKS.

Chatti (Catti; Chatten; Cattans)

The Chatti are classified as a Germanic tribe. In the first century C.E. they lived near the Weser River in present-day Belgium to the Main River region in present-day western Germany. They typically allied themselves with other GERMANICS against the ROMANS; a Roman legion under Didius Julianus, posted at Mogontiacum (modern Mainz), campaigned against them in the second century C.E. By 162 C.E. the Chatti were raiding across the Rhine and attempted to settle there until being repelled by the Romans in the Marcomannic Wars (see MARCOMANNI). Some of them may have joined the BATAVI early in their history, possibly when the Batavi settled on an island formerly held by them. In the third century or later they merged with the FRANKS. The CHATTUARI were perhaps the same people or a subtribe.

Chattuarii

The Chattuarii are classified as a Germanic tribe (possibly the same tribe as the CHATTI). They lived east of the Rhine in present-day western Germany. By the third century C.E. they had become allied with other GERMANICS—the AMSIVARII, BRUCTERI, CHAMAVI, and TUBANTES—as FRANKS.

Chauci (Chaucians; Chaukes; Cauci; Chanci)

The Chauci are classified as a Germanic tribe. By the end of the first century B.C.E. they lived on

the shore of the North Sea in present-day northwestern Germany west of the Elbe estuary. They supported Arminius of the CHERUSCI in his alliance of GERMANICS against Rome in 9 C.E. By the latter part of the second century they were known to carry out raids along the Atlantic coast of present-day France. By the end of the third century they had merged with the SAXONS, living to their east.

Chazars See KHAZARS.

Chechens (Czechens; Nokhchi; Noxchuo; Akki)

The Chechens are a Caucasian-speaking people, living for the most part in the north-central republic of Chechnya (or Chechenia; or Chechen Republic) in the North Caucasus of southwestern Russia (see also CAUCASIANS; RUSSIANS: NATIONALITY). Chechens also live in neighboring Ingushetiya, Dagestan, and other parts of the Russian Federation—Ukraine; Kazakhstan; and Kyrgyzstan. Chechen is a Russian name derived from the name of the first conquered settlement. The Chechens in Dagestan go by the name of Akki.

ORIGINS

Caucasian-speaking peoples are considered indigenous to the Caucasus. Peoples maintaining tribal identity as Chechens are believed to have inhabited the north slope of the Caucasus Mountains since the second millennium B.C.E.

LANGUAGE

The Chechens' North Caucasian language is classified as part of the North-Central (Nakh) branch and related to the languages of the INGUSH and the Bats of the nation of Georgia to the south in Asia. The Cyrillic alphabet is used in the written form. Most Chechens also speak Russian.

HISTORY

In ancient times the Chechens lived in both the highlands and plains but built fortified watchtowers in the mountains to guard against attacks by nomads from the Eurasian steppes, the SCYTHIANS among the earliest in the eighth century B.C.E. Other peoples to establish a presence in the region and at various times rule the Chechens and other Caucasians of the North Caucasus were the ALANS, HUNS, AVARS, TURKS, and MONGOLS.

In the 18th century Russians—with predominantly SLAVS in power—competed with the Ottoman Turks and Persians over the entire Caucasus. The Chechens—Islamic by that time—resisted the Russian presence, whereas the Christian OSSETS, descendants of the ALANS, generally supported it. In 1785 a freedom fighter known as Sheik Mansur established a movement to resist Russian intervention that still exists today.

In the 19th century a war was fought between Caucasians and Russians for control of the region. In 1834 Chechens joined forces with rebels from Dagestan led by Shāmil, said to be of Avar ancestry, and resisted Russians until 1858, when Chechnya became part of the Russian Empire. In 1865 some 40,000 Chechens were expelled from their homeland and settled in Turkey. In 1893 oil was discovered near Grozny, the capital of Chechnya, which had been founded as a Russian fort during the Russian conquest of the Caucasus. This discovery led to a growth in Russian settlement.

In 1918–20 during the Russian Civil War years the Chechens rebelled under Sheik Uzun Haji against the Whites (the anti-Communist forces) still controlling the region. After their defeat of the Whites, the Reds, or Bolsheviks, occupied the Caucasus. In 1922 the Chechen Autonomous oblast was established. In 1936 the Soviets merged the Chechens with the Ingush in the Checheno-Ingushetiya Republic and began a program of collectivization. The Chechens continued to resist, and new fighting erupted in 1940. In 1944 during World War II Joseph Stalin accused the Chechens and other people in the region of collaborating with Germany and ordered their deportation to Soviet Asia, especially Kazakhstan. Checheno-Ingushetiya was abolished. The Chechens and Ingush were allowed to return to their homeland in 1956–57, and the joint republic was reestablished.

After the breakup of the Soviet Union (USSR) in 1991, the Ingush and Chechens founded their own republics, at which time the Chechens declared their independence from the Russian Federation. (The Chechens call their land Ichkeria.) General Dzhokhar Dudayev, a retired bomber pilot, was elected president. In 1994 Russian troops invaded Chechnya (or Chechenya). Bitter fighting lasted for two years. Dudayev was killed in a Russian rocket attack. Fighting between Russian and Chechen forces again occurred in 1999–2000, and Chechen resistance to the Russian military presence has continued to this day.

Chechens time line

C.E.

- 1785** Resistance movement against Russians founded.
- 1858** Chechnya becomes part of Russian Empire.

- 1944** Chechen diaspora to central Asia
- 1991** Chechnya declares independence.
- 1994–96** Warfare between Chechens and Russians
- 1999–2000** Renewed fighting between Chechens and Russians, with Chechen resistance continuing to the present.

CULTURE

Economy

The Chechens traditionally raised livestock in the highlands and farmed in the lowlands. They carried on trade with neighboring tribes.

Government and Society

Traditional Chechen society is based on *taip* (clan formations) and the family. Most Chechens can trace their family and clan back to a particular mountain village. Social structure is nonhierarchical and egalitarian, with clans differing in size but not in prestige. Clan structure is patriarchal. Each clan is headed by a respected elder. Leaders of the Chechens as a whole have come into being primarily for military purposes in response to an external threat.

Literature

The Chechen poetic tradition includes epic and lyric songs. Songs continue to be composed in traditional forms. Humor plays a large part in content. Russian conventions, such as rhyme, are also used. Traditional prose makes much use of humor (as does conversation in modern everyday life). Modern Chechen literature includes standard European genres.

Religion

Some Chechens were first converted from their pagan religion to Christianity in the fourth century, when Georgian missionaries were active among them. But the majority adopted Islam from the 16th to the 19th century. Many are part of Sufi brotherhoods.

Chechen history since the 18th century can be summarized as one long struggle toward independence from the Russians.

Cherusci (Cheruscii; Cherisci)

The Cherusci are classified as a Germanic tribe. During the first century B.C.E. and first century C.E. they lived along the Weser River near present-day Hanover in western Germany; their principal town was Veubingen. They were early allies of the ROMANS.

The Cherusci warlord Arminius is famous as a leader of an alliance of GERMANICS (*see* sidebar “Arminius” under Germanics) against Rome. He led the Cherusci, CHAUCI, and MARCI in a rebellion against Romans under Publius Quinctilius Varus, defeating three legions over the course of three days in 9 C.E. at Teutoburger Wald (Teutoburg Forest). Arminius's victory forced back the Roman frontier from the Elbe River to the Rhine—after which the Romans built a line of fortifications, called the Limes Germanicus, or simply the *limes*, from the Rhine to the Danube. Arminius also successfully led a force against the MARCOMANNI in 17 C.E.

The Cherusci later became allies of the Romans. In the second century they were gradually absorbed by neighboring tribes, especially the LOMBARDS.

Chorvati (Khorvaty)

The Chorvati, considered a Slavic-speaking tribe, may have lived northeast of Bohemia; other evidence, however, places them among the other SLAVS of Kievan RUS. There is debate as to whether these Chorvati lived in the region

between southern Poland and southwestern Ukraine or on the southeastern borders of the Rus state. The latter is generally favored in recent studies. Some scholars speculate that references to a group ancestral to the CROATS, called the White Croats (also known as Belocroati or Bielo-Chorvats), may have been to the Chorvati. Medieval Russian sources state that the Chorvati were attacked in 992 C.E. by Prince Vladimir of Kiev; their name disappears from sources after this time. It is unclear what relationship these Chorvati may have had with Croats in southern and western Slavic lands.

Chuds *See* VEPS; VOTES.

Chuvash (Chuvashes)

The Chuvash are a Turkic-speaking people, living mostly in Chuvashia (Chuvashiya; the Chuvash Republic), an autonomous republic in western Russia. Their unique Altaic or Turkic dialect is related to that of the BULGARS, who migrated to the region in the fourth century C.E. The Chuvash claim descent from them, although other peoples, in addition to TURKICS, may be ancestral to them, in particular the FINNICS.

The Chuvash were under the rule of the MONGOLS in the 13th century, and that of the Russians by the mid-16th century (*see* RUSSIANS: NATIONALITY). Chuvashia was organized as an autonomous area in 1920 and became an autonomous republic in 1925.

Since 1991 Chuvashia has been a republic within the Russian Federation. Situated in the Volga basin and crossed by the Lower Sura River, it is farm country, and the Chuvash grow a variety of crops and keep livestock. Unlike the majority of other Turkic-speaking peoples in Russia, who are Islamic, most Chuvash practice Russian Orthodox Christianity.

Ciberni *See* SUGAMBRI.

Cimbri (Chimbri)

The Cimbri are generally believed to have been a tribe of GERMANICS. Their ancestral homeland was north of the TEUTONES on the Jutland Peninsula in present-day Denmark. In the late second century B.C.E. the two tribes departed from their ancestral homeland and traveled through much of western Europe, becoming the first known Germanic peoples to invade territory held by the ROMANS.

language:

Altaic (Turkic)

ORIGINS

Jutland was known to the Romans as Chersonesus Cimbrica, or the Cimbric Peninsula. Despite their Scandinavian homeland, which indicates a connection to other Germanic-speaking peoples around them, the Cimbri were in fact CELTS, according to some scholars. The Greek philosopher Poseidonius of the second-first century B.C.E. indeed classified them as well as the Teutones as Celts. But the Greek geographer Strabo of the first centuries B.C.E. and C.E., interpreting Poseidonius's work, said that they were Germanics who migrated across the Rhine. In general the Romans labored under considerable confusion when trying to identify and classify those "barbarians" who lived in northern, central, and eastern Europe beyond the bounds of their empire. The Romans who lived in Gaul reportedly called them *Germani*, meaning either "genuine" or "people of pure descent," to indicate that they were the original or real Celts. They may have seen the Cimbri as Celts in the sense that their society and culture were in many ways quite similar to those of the Celts, particularly in having a prominent warrior class. The Germanics across the Rhine, including the Cimbri, were "genuine" and "original" in the sense that their societies had felt as yet little of that influence of the Greco-Roman world that had altered Celtic societies so greatly. Strabo does mention physical differences between Germanics and Celts, the latter being taller and having yellower hair.

HISTORY

Starting in about 120 B.C.E. the Cimbri and Teutones migrated from Jutland. It has been theorized that a cataclysmic Atlantic high tide destroyed their coastal villages, leading to their departure. Most are thought to have headed southward. They moved first through Moravia and Hungary to the middle Danube, where they attacked the Celtic SCORDISCI. One group of Cimbri may have migrated from Jutland along the coast of the Baltic Sea into present-day Poland.

In 113 B.C.E. the Cimbri and Teutones invaded the territory of the Celtic TAURISCI, allies of the Romans, south of present-day Vienna, Austria, in the province of Noricum, and defeated a Roman army sent to defend the Taurisci. The migrants proceeded westward, gaining allies from among both Germanic and Celtic peoples. Although their defeat of the Roman army left Italy defenseless before them, causing fear and panic in Rome, for unknown reasons

they continued westward and looped through Gaul. An alliance of Celtic BELGAE in northern Gaul repelled them, but they generally were unimpeded as they moved southward again, through the province of Gallia Transalpina, destroying town after town and again inflicting disastrous defeats on Roman armies sent against them in 109, 107, and 105 B.C.E. The continuing migration took some of them across the Pyrenees onto the Iberian Peninsula.

By 102 B.C.E. those tribal members who had been in Spain returned to join tribal members in a two-pronged invasion of Italy—the first such Germanic invasion—most of the Teutones along the coastal route, and the Cimbri reaching the Po River valley in northern Italy by way of the Alps. Because of the new Germanic threat the Roman consul Gaius Marius reformed the Roman army, taking soldiers from among the landless citizens, including the growing urban proletariat. He defeated the Teutones at present-day Aix-en-Provence in southeastern France in 102 B.C.E., and the Cimbri near Vercellae (modern Vercelli) in present-day northwestern Italy in 101 B.C.E. It is said that when the outcome of the battle was clear, Cimbri women killed their children and themselves. Marius was viewed as the savior of Rome.

So deep was Roman fear of the northern barbarians, of whom the Cimbri were but the latest representatives whom they had faced, that Roman society embarked on a process of greater militarization than ever before, and when in the next century Julius Caesar was determined to conquer Gaul, he had only to play on this fear in the Senate to have his way. The Cimbri and their allies therefore contributed greatly to the impetus that led to the creation of the Roman Empire.

According to the writings of Julius Caesar the ADUATUCI of Belgium claimed to be descendants of the Cimbri and the Teutones, although they are generally classified among Celtic-speaking peoples.

CULTURE (see also GERMANICS)

The hypothesized cultural characteristics of Germanic tribes are based largely on works of

Roman writers. Archaeology can be invaluable in revealing a people's culture through the material remains they leave behind, but tribes such as the Cimbri, constantly on the move by the time they attracted the attention of ancient writers, left little of themselves in any one place. Even though they were said to have originated in northern Jutland, there is no way to know how long they had been there or whether their original homeland lay elsewhere. Thus it is not certain that archaeological finds in Jutland are indeed from the Cimbri.

Roman writers described the Cimbri as hordes of warlike men carrying swords and spears and with animal totems on their helmets, accompanied by blonde women and children whose hair was like that of old men—that is, white blond, as the hair of Danish children is today. They were typically described as ferocious.

In 5 C.E., when Tiberius sailed with a fleet to Jutland, his men came upon the ruins of large fortifications. They assumed these must have been built by the Cimbri, reputed to have been from this country. Ruins the Romans found later in the former La Tène region of the Rhineland were ascribed to the departed Cimbri but were actually those of Celtic hill forts.

Military Practices

The Cimbri were known for using trained dogs in battles. Their swords were poor and easily bent so that the Cimbri warriors often had to stamp them back into shape. Cimbri women reportedly took part in war by attacking their men to prevent them from retreating and, when this failed, killing their own children and themselves to prevent being captured.

Religion

Use of Omens A puzzle about the Cimbri and Teutones is why, after they had repeatedly demolished Roman armies, they did not fall upon a defenseless Rome but instead moved off. It is possible that they did so because of omens from their gods warning them away. Seeresses would gaze into the steaming blood of a sacrificed youth perhaps in silver cauldrons such as the one found in Gundestrup in Denmark seeking omens. Dice throwing and observing the flight of birds or listening to their cries were other means of receiving divine messages.

Bull Cult According to Roman accounts, the Cimbri had an important bull cult. This may have dated to the Bronze Age, when helmets with bull horns were made. Although the

Gundestrup Cauldron was probably made in the territory of the Celtic SCORDISCI (near Belgrade in present-day Serbia) by a Thracian silversmith using Celtic motifs, it may have been taken to Jutland by a Cimbric warrior with the prominent figure of a bull with which it was adorned.

The history of the Cimbri and Teutones with regard to the Romans represents a foreshadowing of events over the next centuries: Germanic tribes battled the Romans throughout Europe, and Roman generals gained power through key victories. The powerful unleashing of societal and cultural forces during and after the Roman period threw together cultural groups throughout Eurasia, groups that had for centuries and millennia remained mostly isolated and unchanging in their territories. The new interaction is revealed in the history of a single artifact: the Gundestrup Cauldron, named for the Danish town in former Cimbric territory near which it was found. Considered a key piece of evidence for Celtic religious belief, it was probably made in the first half of the second century B.C.E. by a Thracian (see THRACIANS), judging by its style. Some of its images are Celtic (see CELTS); others are Greek (see GREEKS), Scythian (see SCYTHIANS), Iranian, and Indian; others can be traced as far away as Siberia and China. And it is thought likely that this enormous silver cauldron was carried, after a raiding foray somewhere in the south, back to his homeland by a Cimbric warrior, to be hurled into a bog as tribute to the gods for his victories.

Cimmerians (Cymmerians)

The Cimmerians possess one of the earliest identifiable names of any people in eastern Europe. Although little is known about them, it is known that they lived for a time north of the Black Sea before migrating to Asia Minor. Their name is thought to be derived from Gimirru, the Assyrian name for them, which means “people traveling back and forth.”

ORIGINS

The Cimmerians are mentioned in Homeric texts, probably written in the ninth century B.C.E. Yet not until the eighth century did they become an identifiable people. It is not known where they originated, but their homeland in Europe was in present-day southern Ukraine extending into southwestern Russia. They may have been related to the THRACIANS.

CIMMERIANS

location:

Ukraine; southwestern Russia

time period:

Ninth to sixth century B.C.E.

ancestry:

Probably Thracian or Iranian

language:

Cimmerian (probably Thraco-Illyrian or Iranian)

LANGUAGE

The language of the Cimmerians is not known. It is assumed they were Thracian, speaking a Thraco-Illyrian language, or Indo-Iranian, possibly speaking an Iranian dialect related to other steppe peoples of their period.

HISTORY

Probably about 720 B.C.E. the Cimmerians were driven out of Europe across the Caucasus Mountains into Asia. It is generally believed that they led an attack on the kingdom of Urartu (or Van) ruled by King Rusa in present-day Armenia in about 714 B.C.E. After being defeated by the Assyrians under Sargon II, they headed westward into Asia Minor, where in 696–695 B.C.E. they conquered the Phrygians led by King Midas, who reportedly committed suicide after defeat. In 652 B.C.E. the Cimmerians also conquered the Lydians of the city of Sardis in Lydia. During the next decade the Cimmerians raided towns of the AEOLIANS and IONIANS, Greeks who had settled in western Asia Minor.

After 640 B.C.E. the Cimmerians under Lygdamis led two campaigns against the Assyrians but were defeated. The Lydians, led by Alyattes, defeated them in about 610 B.C.E., and the Cimmerians disappeared from the historical record. Survivors possibly settled in Cappadocia in present-day north-central Turkey, as suggested by the Armenian name for the region, Gamir.

In the meantime some Cimmerians possibly migrated westward to the Hungarian Plain and survived there until the end of the sixth century.

CULTURE

Although no definitive connection has been made, the Cimmerians are associated with a number of archaeological sites and early steppe cultures. It is assumed they originally lived a nomadic life similar to that of other steppe peoples. In addition to horses they probably traveled with domesticated cows, sheep, and goats. They probably fought as mounted archers as other steppe peoples of western Asia and eastern Europe did. When settled in their European homeland north of the Black Sea, they adopted a partly sedentary agricultural existence, supplementing their economy through trading and raiding.

Circassians (Zyukhoy)

The Circassians are a collection of tribes of CAUCASIANS, living in the northwestern Caucasus region in southwestern Russia (see RUSSIANS: NATIONALITY). The two main groups of Circassians are the Adyghians (Kiakhs or Lower Circassians), who live mostly in the republics of Adygea and Karachay-Cherkessia in Russia, and the Kabardians (Upper Circassians), who live mostly in the republic of Kabardino-Balkaria to the east. The Adyghians, since the 1930s and the Soviet period, are further subdivided into Adyghians proper and Cherkess. Circassia is the historic name for the entire region. Many Circassians live in the plain immediately to the north of the mountains, others live in the piedmont, and the rest in the high mountains. Circassian communities also exist in Turkey, Syria, Jordan, Iraq, and Iran.

ORIGINS

Caucasic-speaking peoples are considered indigenous to the Caucasus. The Circassians are thought to be descended from a group of Caucasian tribes along the Kuban River who called themselves Adygey and who have possibly maintained tribal identity since the second millennium B.C.E.

LANGUAGE

The Circassians spoke dialects of the North-West (Abkhazo-Adygheian) branch of North Caucasian, related to dialects of the ABAZIANS, Abkhazians (of Asia), and UBYKS. Their two principal dialects are Kiakh and Kabardian.

CIRCASSIANS**location:**

Northwestern Caucasus Mountains in southwestern Russia

time period:

Second millennium B.C.E. to present

ancestry:

Caucasian

language:

Caucasic

HISTORY

The Circassians had early contacts with the GREEKS, who did not hold territory in Circassia but who established colonies to the south and traded along the coast of the Black Sea as early as the sixth century B.C.E. The ROMANS also later secured territory to the south of the Ubyks. Invading peoples who controlled or wielded influence in Circassia in the Middle Ages were the KHAZARS and MONGOLS. After the breakup of the Mongol Empire in 1382 the TATARS and Turks (see TURKICS) became dominant in the region. In 1785 the North Caucasus was designated a Russian province.

During the Shāmil Rebellion of 1834 against Russian rule in Dagestan, led by Shāmil, said to be descended from the AVARS, most Circassians remained neutral. In 1864 during a period of contesting the region with the Turks in the last of the Russo-Turkish Wars the Russians defeated the Circassians, after which many were expelled or chose to relocate, mostly to Turkey. During the period when the Caucasus was under the dominion of the Soviet Union (USSR), the various ethnic groups were reorganized in the 1930s along with political boundaries. The Adyghians are the titular people of Adygea; the Cherkess share Karachay-Cherkessia with the Turkic KARACHAY; and the Kabardians share Kabardino-Balkaria with the Turkic BALKARS. There are also large Circassian groups in Turkey, Jordan, and Syria.

CULTURE (see also CAUCASIANS)

The Circassians traditionally have practiced herding of livestock, farming, and fruit growing. Hunting and fishing help provide sustenance.

The Circassians formerly practiced an animist religion. They were Christianized in the sixth century but adopted Islam in the 17th cen-

tury when under the rule of the Ottoman Empire of the Turks.

The name *Circassians* has been mistakenly used for all peoples of the North Caucasus.

Cocosates (Cocossates)

The Cocosates are classified as a Celtic tribe. They lived in Gaul between present-day Dax and Bordeaux in southwestern France and are discussed as CELTS or GAULS. They surrendered to the ROMANS under Julius Caesar with the fall of Aquitania in 56 B.C.E.

Coenicenses

The Coenicenses are classified as a Celtic tribe. They lived in Gaul near the Lower Rhone in present-day southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Conderates

The Conderates are classified as a Celtic tribe. They lived in Gaul around present-day Condrieu in southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Condrieu takes its name from the tribal name.

Condrusi

The Condrusi are classified as a combined Celtic-Germanic tribe. They lived in Gaul along the Meuse River in present-day eastern Belgium at least by the first century B.C.E. The EBURONES and PAEMANI, also thought to consist of both CELTS and GERMANICS, were their neighbors. All three tribes are sometimes grouped among the BELGAE according to Caesar, for instance, a subdivision of GAULS.

Conсорanni (Conсорanis)

The Conсорanni are classified as a Celtic tribe. At least by the first century B.C.E. they lived in Gaul in the northern Pyrenees, around present-day St. Lizzier in southwestern France. They are discussed as CELTS or GAULS.

Circassians time line**C.E.**

sixth century Christianity reaches Circassians.

17th century Circassians convert to Islam.

1834 Most Circassians remain neutral in Shāmil Rebellion against Russians.

1864 Many Circassians emigrate to Turkey after defeat by Russians.

1930s Reshuffling of Circassian identities by Soviet authorities

Convenae

The Convenae are classified as a Celtic tribe. They lived in Gaul in the northern Pyrenees around present-day St-Bertrand-de-Comminges in southwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. They were allies of the BIGERRIONES. Lugdunum Convenarum on the site of St-Bertrand-de-Comminges became a *civitas* capital in Roman Gaul.

Corieltauvi See CORITANI.

Coriondi (Coriundi; Koriondi)

The Coriondi are classified as a Celtic tribe. They lived in the present-day counties of Kildare and Tipperary and perhaps part of the county of Carlow in southeastern Ireland, having possibly migrated there from Britain later than did other Celtic peoples at least by the early centuries C.E. They are discussed as CELTS or IRISH. The CORIONOTOTAE of present-day northeastern England were probably ancestrally related to them.

Corionototae

The Corionototae are classified as a Celtic tribe. They lived in Britain in the Tyne valley of present-day northern England at least by the first century B.C.E. and are discussed as CELTS or BRITONS. They were possibly a subgroup of the BRIGANTES and related ancestrally to the CORIONDI of southern Ireland.

Coriosolites (Curisolites; Curiosolitae; Coriosolli)

The Coriosolites are classified as a Celtic tribe. They lived in Gaul around present-day Corseul in western France and are discussed as CELTS or GAULS. The ROMANS referred to them along with other tribes as Armoricans, that is, tribes living between the Seine and Loire on or near the Atlantic Ocean in the region of Armorica (roughly present-day Brittany and eastern Normandy). This area was occupied by forces under Julius Caesar in 55 B.C.E. Fanum Martis on the site of Corseul became a *civitas* capital in Roman Gaul; Corseul takes its name from the tribal name.

Coritani (Corieltauvi)

The Coritani are classified as a Celtic tribe. They lived in Britain and are discussed as CELTS or

BRITONS. They appear to have been a confederation of smaller tribes. They lived in present-day Lincolnshire, Leicestershire, Nottinghamshire, Derbyshire, and Northamptonshire. The Coritani issued coins before the arrival of the ROMANS in the first century C.E. Ratae Coritanorum on the site of present-day Leicester became a *civitas* capital during the Roman occupation.

Cornish (Cornishmen; people of Cornwall)

The Cornish are the people of Cornwall, part of a peninsula about 75 miles long in extreme southwestern England. They are mostly descended from CELTS and are grouped among BRITONS. The peninsula ends at the cape of Land's End, the farthest southwestern point in Britain. The Scilly Islands, an archipelago of the Cornish peninsula, have been culturally part of Cornwall from early times.

ORIGINS

Cornwall was called by the Greek historian Diodorus Siculus *Belerion*, meaning “shining land.” The final syllable of the name Cornwall is from the Old English *walh*, derived from the Anglo-Saxon *wealas*, “foreigner,” applied also to people of Wales. The first syllable seems to point to a connection of Cornwall with the CORNOVII of Wales, also defined as WELSH. Members of the Cornovii are known to have joined the Roman army as auxiliaries and a Cornovian cohort was stationed for a time on Hadrian's Wall. It is possible that some were also stationed in Cornwall and remained there after the ROMANS departed. On the other hand the word *cornu*, meaning “horn” in Brythonic, could refer to the horn shape of the Cornwall peninsula and thus could have been the derivation of the tribal name of people there, suggesting that a branch of the Cornovii tribe lived in the region. The Cornovii in Wales could have been originally from Cornwall, possibly during the Iron Age, when there was movement of tribes through Celtic Europe and Britain. Cornwall was referred to in written sources as Cornubia by the eighth century C.E.

In common with other Britons people in Cornwall were strongly influenced by the pan-European Celtic culture, influences that date to the Bronze Age. The presence in Cornwall of tin, a rare metal in Europe, which was essential for the making of bronze, guaranteed that people

there were part of the prehistoric Bronze Age trade network probably pioneered by people of the Bell Beaker culture. The traders exchanged bronze tools and gold ornaments with the Cornish for minerals.

The remains of Cornish Bronze Age villages can still be seen on Bodmin Moor and the West Penwith Uplands. Excavations have shown that people at this time were well organized, living in villages and practicing farming and metalworking.

The situation of Cornwall, a narrow peninsula jutting far to the west of most of Britain, has tended to isolate it from many trends in Britain. Cornish tin was shipped probably directly to Brittany from Cornwall, with the result that the Cornish had closer ties with people there than with other inhabitants of Britain. Cornish tin mines were known to the GREEKS and the CARTHAGINIANS.

In the Iron Age Cornwall was part of the territory of the DUMNONII, who also inhabited present-day Devon.

LANGUAGE

The now-extinct native language of the Cornish is from the Brythonic branch of Celtic; both Welsh and Cornish evolved from a western dialect of Brythonic spoken in the rest of Britain. The last speaker of Cornish, according to her tombstone, was a woman named Dorothy Pentreath, who died in 1777 in the town of Mousehole, just eight miles from Land's End. Cornish is related to Breton, spoken by the BRETONS of Brittany, among whose ancestors were people from Cornwall who emigrated during the fifth and sixth centuries after the Romans left Britain. Efforts are currently under way to revive the Cornish language, with some modest success so far.

HISTORY**Possible Early Visitors**

The Roman writer Rufus Festus Avianus gives an account of a place named Oestrymnon with bays and isles and tin and lead and a trading people who built boats of skins and leather. It is thought to be Cornwall and the account may have been based on information from a voyage of CARTHAGINIANS led by Himilco in the mid-fifth century B.C.E. The Greek navigator Pytheas described visiting a region in Britain that is assumed to be Cornwall in the fourth century.

Roman Occupation

In 55–60 C.E. the Romans built a fort at Isca Dumnoniorum (modern Exeter), the *civitas* capital of the Dumnonii, on the river Exe in Devonshire. The wild moors of Dartmoor, Exmoor, and Bodmin Moor prevented the Romans from trying to incorporate much of Cornish territory into their villa system. As always Cornish tin most interested them. Very few Roman remains are known west of Exeter. Two substantial Roman buildings and a salt works are located near Bawdrip far inland, and an account in *Geographia* by the first–second-century Alexandrian writer Ptolemy mentions a town of the Dumnonii called Tamaris on the river Tamara, presumably the Tamar, which flows through both Cornwall and Devon and at whose mouth is the present-day city of Plymouth. Ptolemy's knowledge of Tamaris implies that the Romans made some use of the town, probably as a port. Located on the south-western edge of Bodmin Moor in Cornwall, the Roman fort at Nanstallon overlooks the river Camel from the south. The fort is both the most southerly and farthest western of all Roman mil-

itary works in Britain, and there are two tin mines near Nanstallon, the only Roman tin mines known in Britain.

Around 75 C.E. work on Isca Dumnoniorum's forum and basilica had begun on the site of the former fortress, and by the late second century the town walls were built, 10 feet thick and 20 feet high, enclosing the same area as had the earlier fortress. Isca Dumnoniorum was in decline by the late fourth century. Soon afterward in 410 the Romans officially ended their occupation of Britain.

Anglo-Saxon Inroads

From the sixth to the eighth century the ANGLI-SAXONS pressed westward, attempting to annex territory from the Dumnonii. Dumnonian resistance kept them at bay, and the tribal capital of Exeter, the former Isca Dumnoniorum, held out until 710.

In subsequent encounters with the Dumnonii the Anglo-Saxons were mainly victorious, except in 722, when Roderic, king of the Britons in Wales and Cornwall, repelled Adelred, king of Wessex.

The Wessex Anglo-Saxons finally annexed Cornwall in the ninth century in the course of confronting the VIKINGS, who had begun raiding in their territory in North Devon and Somerset in 836. The Wessex king Ecgberht fought them at the Battle of Carhampton but was forced to withdraw. Two years later the threat to Wessex became even more serious when the Dumnonii joined forces with the Vikings. Ecgberht defeated the combined armies at Hingston Down in 838. According to early annals the last independent king of Dumnonia died by drowning in 875.

Cornish resistance continued for decades, however, and Exeter was retaken. In 927 Athelstan of Wessex expelled the Cornish forces from Exeter and in 936 fixed the east bank of the Tamar River as the boundary between Anglo-Saxon Wessex and Celtic Cornwall.

Advent of the Normans

Devon and Cornwall served as a staging area for Anglo-Saxon resistance against the initial successful campaign of the NORMANS under William the Conqueror in 1066. In 1068 the sons of the defeated Anglo-Saxon king Harold II raided the southwest coast of Britain. After they were defeated by William's local commanders, William created an earldom for Cornwall, whose ruler, Robert of Mortain, swore fealty and undertook to guard the threatened frontiers and maintain internal security in return for land.

Later Centuries

In 1201 King John of England granted to the Cornish a charter for a regulatory body called the stannaries (*see also* Government and Society). In the 14th century Cornwall was given the status of a duchy, over which, by convention, the eldest son of the reigning king of England ruled as duke.

Michael Joseph An Gof was joint leader with Thomas Flamank of the Cornish rebellion of 1497, caused by the imposition of taxes by Henry VII to pay for a war against the SCOTS. The additional taxes were imposed at a time when the foundation of the Cornish economy, tin production, was in decline. Another grievance was that the council of the duke of Cornwall had sought to impose new regulations on the tin trade, angering the Cornishmen, who resented this interference in the workings of the stannaries. They ignored these regulations and as a result the king confiscated the stannary charters and suspended the stannary government, thus inflaming the population even further against the English. A popular army that at its largest numbered 15,000 began a march to London, hoping to gain recruits from other regions along the way. When this did not transpire, morale among the Cornish began to fall, causing desertions. Arriving at London, the depleted body of about 8,000 men, haphazardly armed and untrained, met a large English army of more than 25,000. In the ensuing fight 200 Cornish were killed and their leaders captured. On Tuesday, June 27, Michael Joseph An Gof and Thomas Flamank were taken from the Tower of London, where they had been tortured, to Tyburn, where they were hanged, drawn, and quartered.

During the English Civil War in the 17th century Cornwall was a stronghold of royalist forces. It was the surrender of Pendennis Castle by its commander to the parliamentary forces that brought the civil war to an end in 1646.

During the War of 1812 between the United States and Britain a prison near Princetown on Dartmoor was used to house American prisoners of war. The harsh conditions led the prisoners to stage an uprising, called the Dartmoor Rebellion, during which many Americans were killed or wounded.

CULTURE (*see also* BRITONS; CELTS)

Economy

Farming The proximity of Cornwall to the warm Gulf Stream gives its southwest coastal

region a subtropical climate. The river valleys are highly productive; the uplands support sheep and cattle pastures. The moors of Cornwall and Devon are inhospitable and unsuited to agriculture.

Carn Brea Iron Age Hill Fort The large hill fort Carn Brea, perhaps dating to the early first century C.E., provides an example of early economic activity in Cornwall. Occupying a prominent granite ridge, its formidable ramparts were faced with large stone slabs. Several hut circles have been traced in the fort's interior. Excavation of storage pits has revealed tin and copper ore caches, and one even contained a hoard of gold coins of the CANTIACI tribe in Kent. Evidently the community was focused on trade in the natural metal resources in the area, which may have been exploited for millennia. On the other hand the site of the hill fort was first occupied in the late Neolithic Age before mining began, around 3190–2687 B.C.E. (a time frame based on radiocarbon dating).

Expansion of the Tin Trade under the Romans The Roman villa at Magor Farm, Illogan, near Redruth is the only one known in Cornwall and is the only substantial Romano-British building in the entire peninsula west of Isca Dumnoniorum, the *civitas* capital of the Dumnonii tribe, almost 90 Roman miles by road from Illogan. Its location near tin mines makes it likely to have been an administrative center for the substantial trade in tin from Cornwall during the later Romano-British period. The Romans in search of greater quantities of tin opened mines in the hills to the east of Trevelgue Head near Newquay.

Government and Society

Until the Middle Ages the Cornish had a tribal society similar to that of other Britons.

Starting in 1201 24 members or “stannators” were elected to a stannary parliament, which was led by a speaker chosen from among the stannators and by an officer appointed by the duke of Cornwall or the Crown, who was lord warden of the stannaries. The stannary parliaments had no regular term but were assembled from time to time at the determination of the lord warden as needed, in order to revise old laws or to enact new ones.

The stannary courts held jurisdiction over tin mining and production (the name *stannary* derives from the Latin *stannum*, tin). They operated according to a body of customary law that must have had very ancient roots, in that tin mining in Cornwall dates from the Bronze Age.

In medieval Cornwall Cornish tin miners and smelters were exempt from the authority of any other court than the stannaries, except in cases involving land or homicide. Stannary laws concerned such matters as the percentage of their yield that tin workers had to pay the owner of the land they worked, called toll-tin, and matters of land ownership and usage.

The last Cornish stannary parliament was held at Truro in 1752. In the mid-19th century the various local stannary courts were consolidated.

Dwellings and Architecture

Cornwall is known today for its many well-preserved Neolithic and later stone constructions, particularly on the high granitic plateau of Dartmoor, where lack of farmland or other resources has deterred subsequent settlement and destruction of prehistoric sites. The Grey Wethers, a stone circle reputed to have been used by Druids and partly reconstructed during the 19th-century revival of interest in prehistory, is among the most famous.

Roman Era A form of dwelling unique to Cornwall was first built on Land's End during the Roman era. Called the courtyard house, it consisted of several small stone roundhouses arranged around a courtyard. They were constructed singly and also in villages. The best-known courtyard villages are at Chysauster and Carn Euny; that in Carn Euny represents the final phase of occupation of the site. One courtyard house is known in the Scilly Islands. Such houses ceased to be built after the first part of the first millennium C.E.

Settlement Patterns To a degree not found elsewhere in Britain the settlement patterns and location of farmsteads in Cornwall in the medieval period and beyond changed very little from what they were in the Iron Age. Archaeological surveys of the number and distribution of “rounds” (enclosed prehistoric farmsteads with a single ditch and bank) find a significant percentage of them adjacent to medieval settlements, suggesting that the medieval houses were built on top of prehistoric ones. Hamlets and churches were built within Iron Age earth enclosures that in some cases can still be seen; fogous, stone-lined underground chambers, have been found near farms still active today. More rarely sites exist that have been continuously occupied since the Bronze Age. In general the basic farmland/heathland zones appear to date back into the second millennium B.C.E. The most significant change over

time has been the increase in enclosure of heathland, while use of arable farmland has remained unchanged, suggesting that already by the Iron Age at least people in Cornwall had arrived at an optimal use of their land and an environmental equilibrium sustainable for centuries.

Of more than 5,000 medieval settlements identified in Cornwall, archaeologists estimate that about 2,500 were built on top of Iron Age settlements. When the approximately 1,000 prehistoric settlements that were abandoned are taken into account, the number of settlements in Late Iron Age Cornwall approaches that of medieval times. Many of the prehistoric rounds had at least three roundhouses. If it is estimated that most of the 3,500 rounds were home to about 30 people, the Iron Age population of Cornwall was more than 100,000, close to the number of Cornish in 1801 C.E. (before the population increases of the Industrial Revolution had begun). Thus the environmental “steady state” mentioned was matched and made possible by population stability.

Other Technologies

Pottery A particular type of large ceramic funerary urn, known as Trevisker Ware, had its origins in Cornwall but was traded all over southern England and northern France in the Bronze Age.

Cornish Tin Mining Cornish tin was mostly obtained by “streaming,” that is, collecting nuggets of almost chemically pure tin from the sandy beds of streams. To prepare the tin the Cornish became highly skilled at smelting.

Tin Mining in the 18th Century The mines of Cornwall, along with those elsewhere in Britain, attracted a number of 18th-century inventors, including the Scot James Watt, who hoped to use his improved steam engine to aid in mining operations. A Cornishman named John Edyvean invented the inclined plane system, to reduce the necessity for locks along canals used to transport ore. The world’s first steam-powered rock-boring machine was built by a Cornish firm in 1812. Mining operations expanded in Cornwall after the Cornishman Richard Trevithick’s invention of a high-pressure steam-powered engine in 1796. Trevithick, one of the pioneers of steam locomotion and considered by many to be its real inventor, constructed the first passenger-carrying steam engine, known locally as the “puffing devil,” at Penydaren in 1801. In 1829 the Cornishman Goldsworthy Gurney made the first long-distance journey in a steam-powered vehicle from

Bath to London at an average speed of 15 miles per hour.

Literature

At least by the 15th century monks began to write literature in the Cornish language, mostly on religious and biblical themes. Cornish literature was influenced by Breton and by English literature. The earliest known work is *The Passion of Our Lord, or Mount Calgary*, which treats its subject in a poeticized manner. The *Ordinalia*, a trilogy of mystery plays, is perhaps the masterpiece of the literature. The plays may have been performed annually as part of the festival of Corpus Christi, which inspired mystery cycles elsewhere in Britain. Many references in the plays to the locality of the Collegiate Church of Glasney in Penryn suggest they were written there. For centuries Glasney was one of the most important religious centers in the southwest of Britain, with an influence that stretched to Exeter, the royal court, and Canterbury, the ecclesiastical center of England.

Religion

Burial Practices During the Neolithic and Bronze Ages people in Cornwall made monumental stone mortuary buildings of the type found along the Atlantic seaboard of Europe from Scotland, Ireland, and Brittany to Spain. Local Cornish variants include entrance graves and mound-covered stone passageways, in Cornwall and the Scilly Isles; portal dolmens, large vertical stones holding up a horizontal stone dolmen, in Cornwall and West Wales; and Cotswold-Severn cairns on each side of the Bristol Channel.

Merry Maidens, the name of a Bronze Age stone circle near Penzance, is suggestive of the process of Christianization in Cornwall. The legend concerning the circle is that the stones were originally maidens who, because they danced on Sunday, were turned to stone. Two large standing stones (one fallen) to the northeast of the Merry Maidens are called the Pipers, who had provided music for the illicit dancing.

Conversion to Christianity An important missionary to the Cornish was St. Petroc in the sixth century. Petroc went first from Ireland to Padstow and then to Bodmin, founding monasteries at both places. The church of St. Petroc in Bodmin, built in the 15th century, contains an elaborately carved Norman font and the 12th-century ivory casket said to have held the bones of Petroc. Bodmin was once noted for its holy wells; one of these can still be found in the

churchyard of St. Petroc's Church bearing the date 1700. The well water is thought to be a cure for eye troubles.

In the seventh century the Synod of Whitby reestablished England as an ecclesiastical province of Rome, with its formal structure of dioceses and parishes. Yet the Celtic Church in Cornwall was not party to the decision and the Cornish Church retained the monastery as its model.

While the Protestant Reformation was winning many converts in the rest of Britain, the Cornish remained loyal to the Roman Catholic Church. In 1549 thousands of Cornishmen marched to defend the Roman Catholic service. Protestantism entered Cornwall in the 18th century in the form of the Wesleyan movement, and Cornwall has remained a predominantly Methodist area since.

The Cornish were one of the Celtic peoples of the British Isles who, because of their relative isolation on the Cornish peninsula far to the southwest of most of Britain, maintained their Celtic language and identity for centuries after the rest of Europe was dominated by Germanic peoples. The Cornish, who for most of the Celtic period were on the far periphery of the Celtic world, helped to preserve the Celtic culture, so much of which has been lost. At the same time the importance of mining in Cornwall led to the invention and development there of devices important to the progress of the Industrial Revolution, including the inclined plane and steam-powered transportation.

Cornovii

The Cornovii are classified as a Celtic tribe. They lived in Britain in present-day western England and northeastern Wales at least by the first century B.C.E. and are discussed as CELTS, BRITONS, or WELSH. They possibly have an ancestral connection to the CORNISH. Viroconium on the site of present-day Wroxeter became a *civitas* capital during the occupation by the ROMANS.

Another probably nonrelated group of the same name, who can be classified as CALEDONIANS, SCOTS, or PICTS, lived in present-day northern Scotland.

Cossacks (Kazaks)

The Cossacks are a peasant people of mixed descent, especially from among the SLAVS and TURKICS, who have inhabited over the course of their history parts of eastern Europe, especially present-day Russia (see RUSSIANS: NATIONALITY). They mainly inhabited steppe country extending from the region north of the Black Sea and the Caucasus Mountains and the Caspian Sea eastward to the Altai Mountains in Siberia in Asia. The term *Cossack* is derived from the Turkish word *kazak*, for “free person” or “adventurer.”

ORIGINS

The formation of Cossacks is traced to the 14th and 15th centuries C.E. Originally the term referred to semi-independent groups, many of them made up of TATARS, which formed in the Dnieper River region of eastern Europe. The term was applied by the end of the 15th century to runaway serfs—many of them Slavs, including Russians, Ukrainians, and Poles—who settled in self-governing military communities along the Dnieper and Don Rivers.

LANGUAGE

The Cossacks spoke a variety of Slavic languages, depending on their origins and homelands, including Russian, Polish, and Ukrainian.

HISTORY

In the 15th century the first Cossack military units were organized in Ukraine, then part of the unified Polish-Lithuanian state, in an attempt to fend off attacks by Tatars. The Cossacks formed independent, self-governing military communes along the river valleys of the steppe, in Russia as well. By the 16th century six principal Cossack settlements had been established: the Dnieper on the Dnieper River, Don on the Don River, Greben in Caucasia, Volga on the Volga River, Yaik on the Ural River, and Zaporozhian west of the Dnieper. That century the Russian czarist government—mostly SLAVS in power—began to extend its control to frontier regions and forced military service on Cossack males, age 18 to 50. Cossacks were organized for the most part as cavalry units, and some among them rose to leadership roles.

Cossacks helped in the wars against the Tatars in the Crimea and in the Caucasus in the 16th century. All capitals of the Russian republics eventually established by the Russians in the northern Caucasus were founded as Cossack fortifications. Many Cossacks stayed in the region. In 1581–82 a Cossack by the name of Yermak Timofeyevich led a force eastward across the Ural Mountains and conquered the Tatars at Sibir (from which the name Siberia is derived). His activity marked the beginning of Russian expansion eastward into Asia, much of which was carried out by Cossack units. Cossacks also played a part in opening up Russian Asia as fur traders and pioneers.

Because of growing threats to their remaining autonomy the Cossacks revolted more than once. In about 1649 Zaporozhian Cossacks under Bohdan Khmelnytsky rebelled against Polish rule. In 1670–71 under Stenka Razi, and again in 1773–74 under Yemelyan Ivanovich Pugachov, the Cossacks, supported by non-Cossack peasant groups, revolted against Russian czarist rule, with most of the rebel activity in the lower Volga valley. Both times they were defeated and both times their leaders were executed. Yet the Cossacks, valued for their military prowess, became a privileged military class. In the 19th century and early 20th century they were used by the czarist government to quell a number of uprisings.

By the early 20th century there were 11 principal Cossack communities: Amur, Astrakhan, Don, Kuban, Orenburg, Siberia, Semirechensk, Terek, Transbaikalia, Ural, and Ussuri. In the Bolshevik Revolution of 1917 the Cossacks refused to aid the government. In the subsequent Civil War of 1918–20 they opposed the Red Army.

Under the Soviet system the Cossacks lost their special status in the military. They also lost much of their wealth and were forced to relocate and farm collectively. In World War II (1941–45) Cossack cavalry divisions were formed to fight the invading Germans.

In recent times the Cossacks have experienced newfound unity and influence as well as a cultural revival, especially the Don and Kuban Cossacks, as the communities along those rivers are known. In 1990 a number of Cossack associations were founded, in the Russian south as well as in northern cities. In 1992, the year after the dissolution of the Soviet Union, a Russian governmental decree granted the Cossacks the status of an ethnic group.

1992 Russian government gives Cossacks status as ethnic group.

CULTURE

Economy

Many of the Cossack communities supported themselves through wheat growing and stock raising.

Government and Society

Cossack villagers, as did other Russian peasant communities of the period, owned land in common. They were governed by assemblies, presided over by elected elders known as *atamans*. One elder, the *hetman*, oversaw several communities, especially in times of war. An 1869 law allowed officers and civil servants to own land as personal property, altering traditional cohesiveness.

Military Practices

Cossacks were organized into military units, particularly cavalry. They earned a reputation for bravery and skilled horsemanship. The short double-edged sword typically carried by

Cossack soldiers sit astride their horses in the late 19th century. (Library of Congress, Prints and Photographs Division [LC-USZ62-no reproduction #])

Cossacks, called a *quama*, according to their tradition evolved from the short sword of Roman legionnaires.

Although a European people by origin, the Cossacks contributed to Russian history mainly as soldiers/explorers, fur traders, and pioneers in Siberia.

Costobocii (Costoboci)

The Costoboci were probably a tribe of THRACIANS, a subgroup of the DACIANS, some scholars classify them as SARMATIANS. They lived east of the Carpathian Mountains in present-day Romania to the north of the Roman province of Dacia; hence their designation, along with the CARPI, as free Dacians. Neighbors included the Sarmatian ROXOLANI and Germanic BASTARNAE. In 167 C.E. the Costobocii attacked Roman forces in Dacia, then south of the Danube in Macedonia and Greece. Scholars think that they were later absorbed by other groups.

Courons See CURONIANS.

Creones

The Creones are classified as a Celtic tribe. They lived in Britain in present-day western Scotland at least by the first century B.C.E. and are discussed as CELTS, CALEDONIANS, or SCOTS. It is possible that they were PICTS and not Celtic speaking, however.

Crivichi See KRIVICHIANs.

Croats (Croatians; Hrvati)

The ancient Croats were a tribe or tribes of Southern SLAVS who began settling on the Balkan Peninsula by the seventh century C.E.

ORIGINS

There is not as yet a consensus concerning the location of the original homeland of the Croats. A mid-10th-century account by Constantine Porphyrogenitus (the Byzantine emperor Constantine VII), one of whose informants lived in the region of Dalmatia (Adriatic coastal parts of modern Montenegro, Bosnia and Herzegovina, and Croatia), writes that Croats and SERBS settled there in the reign of Heraclius in the first half of the seventh century; Heraclius invited them there, provided they convert to Christianity, as allies against the AVARS. There are several problems with Constantine's account, however. A settlement of Croats and Serbs at this time would antedate any known Slavic archaeological remains in the Balkans (some sites and material, including that of the "Old Croat Culture" in Hungary, which initially were given early dates, have been reexamined and found to be not earlier than the mid-seventh century). Given the scarcity of any signs at all of the Slavs in the Balkans in this century, however, the early settlement by Croats and Serbs is not at all impossible.

Some of the material in this text has features that make it appear more like a legend than a straightforward account, with elements characteristic of Slavic folktales, such as the tale of the five Croat brothers, and there are duplications suggesting it may have been simply a compilation of earlier material—different versions of the same story, as in many medieval annals and histories, which often are collections of oral traditions—with no attempt at verification. Second versions of the story are given both for the Croats and for the Serbs, and they are similar. Both emphasize that the Croats and Serbs settled in the Balkans at the behest of the emperor; this material may be from a Byzantine source, who emphasized that the emperor had given the Croats and Serbs the land so as to establish promoting imperial claims of suzerainty over them, a political motivation that casts some doubt on the veracity of the account. Each story also locates the homelands of the Croats and Serbs in, respectively, "White Croatia" and "White Serbia," both located near Bavaria on the border of the kingdom of the FRANKS, giving rise to the name White Croats (also recorded as Belocroati or Bielo-Chorvats).

Other documents also refer to this homeland of the Croats, but they date from the ninth and 10th centuries and also—puzzlingly—the early fifth century, and the sources who mention it are graphically distant. One is the 10th-century Arab geographer Ibn Rusteh, another

the fourth–fifth-century Iberian scholar Orosius, whose account of the matter is known only from a translation by Alfred the Great, and who was writing at a time 100 years before the Slavs are thought to have emerged as a distinct ethnic group; therefore it is highly improbable that he could have been referring to a Slavic people. It is also possible that Orosius was Ibn Rusteh's source, because Iberia was under Muslim rule. Thus it is difficult to know how much this account can be trusted. If Croats entered the Balkans from near Bavaria, their sojourn there must have been brief, because Slavic expansion westward from the Lower Danube region into southern Austria toward Bavaria had only begun in the sixth century. It is possible that Croats and Serbs were initially part of this movement up the Danube tributaries leading into the eastern Alpine region but then for unknown reasons broke away and headed southward into the Balkans. The movements of early Slavic groups are too little understood either to rule this out or to provide evidence for it.

The account may be referring to a tribal group called the *CHORVATI*, who apparently lived in the northeast of the region of Bohemia (and were sometimes associated with the “White Croats”); other evidence places the Chorvati in the region of the Kievan *RUS*. There is debate as to whether these Chorvati lived in the region between southern Poland and southwest Ukraine, or on the southeast borders of the *Rus* state. Possibly the Croats or Chorvati in these different areas had once been a united tribe that split. This phenomenon of tribes in different areas having the same name occurs with other Slavs—for example, the name *Polane* appears both in Poland and near Kiev. It may be that Slavs had common names or ways of naming tribes, analogous to the proliferation of certain modern family names such as Smith or Jones, most of them not actually related.

Some linguistic theories postulate that the name Croat is actually of Iranian Sarmatian origin and was later adopted by Slavs. However, this hypothesis has little convincing evidence to support it.

LANGUAGE

The Croatian dialect is part of the South Slavic branch of the Slavic language family, which includes Bulgarian, Serbo-Croatian (with separate Serbian and Croatian dialects), Macedonian, Slovenian, Bosnian, and Montenegrin. The last two were recently claimed by their national groups to be separate languages. All Slavic languages are similar enough that speak-

ers of different languages can at least roughly understand one another. Thus the question of whether different Slavic tongues are fully separate languages or only dialects is often contentious and difficult to answer.

HISTORY

Migrations

At least by the seventh century, if not somewhat earlier, Croats were settling in the western Balkans, especially in Dalmatia, including the Dinaric Alps on the Adriatic side of the Balkans and in Pannonia (including parts of modern Hungary extending south and west into Serbia, Croatia, Slovenia, and Austria) to the northeast. Dalmatia, where Slavs had begun raiding in about 550, had been the last surviving Western Roman province and was currently part of the Eastern Empire; by the time of the arrival of the Croats a significant number of the Romanized multiethnic population remained there. Over time as rapprochement between the Croats and the *DALMATIANS* (mostly *ILLYRIANS*) took place, the latter's culture had a strong effect on the Croats, perhaps greater than in any other Slavic territory. Slavs and *Avars* increasingly penetrated this area after the fall of Sirmium gave them access to the western Balkans, from the 570s to the 590s destroying towns and settlements all the way to the coast.

Influences

Croats, as did other Southern Slavs, continued to be much affected by the *BYZANTINES*, since the whole region remained in the Byzantine sphere of influence even during periods when territories there had been wrested from direct imperial control by various invaders—*Avars* and *BULGARS*. The Croat territory's westerly position exposed them to influences from Western powers—Italy and the Frankish kingdom—but the wealthy coastal towns of Dalmatia, which continued to have Byzantine cultural and political

affinities, remained extremely influential on the Croats as well. Western influences included the Latin alphabet and the Roman Catholic Church.

Reorganization

In the eighth century Croatian territory was organized into seven provinces. It bordered on the province of Ostmark, part of the Frankish territory. Croats managed to stave off threats of annexation by Charlemagne, and in about 876–879 several Croatian provinces united to form a state, which comprised Croatian lands on the Adriatic coast and an inland province in Pannonia called Slovenia. The most important early ruler was Tomislav, who gained power sometime from 910 to 914. In 924 or 925 he was crowned by a papal legate, thus gaining church sanction for his reign. Civil unrest followed his death in 928, however, weakening central authority. The territory that included part of modern Bosnia broke away from Croatia. Croatia was annexed by Hungary in 1102.

Enduring Identity

Croatian territory continued to be part of Hungary and later the Austro-Hungarian Empire until the latter's collapse in 1918. At this time Croatia became part of the newly formed Kingdom of the Serbs, Croats, and Slovenes, later named Yugoslavia for "south Slavs." Croatia declared its independence from the former Yugoslavia in 1991 and gained international recognition the next year.

Large movements of Croats from elsewhere in the Balkans into Croatia took place in the late 20th century, making its ethnic makeup more than 90 percent Croat (see CROATS: NATIONALITY). People who consider themselves Croats also live in a number of the modern states in the Balkans and neighboring regions in addition to Croatia. In order of Croatian population size, these are Bosnia and Herzegovina, Serbia and Montenegro, Hungary, Austria, Slovenia, Slovakia, and Moravia in the Czech Republic.

CULTURE (see also SLAVS)

Art

A distinctive metalworking style that appeared in the 10th century was named Bialobrdó, after a site in Croatia. The style crystallized in part because of the settlement in the Carpathian basin (modern Hungary and neighboring Slovenia), of the MAGYARS, a steppe people, who combined their own styles with Croatian influences, as well as influences of the Avars and MORAVIANS. Characteristic Bialobrdó jewelry

included pieces made of plaited wire, sheetwork pendants, snake-headed bracelets, and S-shaped temple rings (used to ornament headbands). The style spread throughout Hungary, Slovakia, and part of Transylvania. Some of the elements of this style are still used in folk costumes.

Religion

According to their folk belief the Croats, like other Southern Slavs, were sometimes visited by demons or spirits called *vila*, beautiful naked warrior maidens armed with bows and arrows. The *vila* danced on mountaintops as supposedly witches and the Valkyries did in Germanic lands. As late as the 13th century men left offerings for the *vila*, who lived in springs and caves and under trees and stones.

A divisive factor between the Croats and the Serbs to their east has been their religious affiliations: The Croats are Roman Catholic and the Serbs adhere to the Eastern Orthodox creed and liturgy.

The Croats, although they came under the rule of various powers, maintained their language and their sense of themselves as a distinct nationality to the present.

Croats: nationality (Croats; Hrvati; people of Croatia)

GEOGRAPHY

Croatia is bounded in the northeast by Hungary, and in the northwest by Slovenia. Bosnia and Herzegovina lie to the east and south, Serbia and Montenegro lie to the east. The Adriatic Sea defines the nation's western limits. Croatia's area is 21,829 square miles.

The fertile Pannonian and para-Pannonian plains of the north and northeast are lush agricultural regions. The Sava and Drava, two principal rivers, provide water for the plains and eventually drain into the Danube River in the east. Zagorje Hills, a valley north of Zagreb, separates the two rivers. The Dinaric Alps lie in the south and west of Croatia, where the country's highest peak, Mount Troglav (6,276 feet), is found. The Karst, a limestone plateau, is also

found in this region. Croatia's coastline includes the Istrian Peninsula, which stretches into the Adriatic Sea, and the Dalmatian coast, to the Gulf of Kotor. More than 1,000 islands and inlets are scattered along the coastline.

INCEPTION AS A NATION

The first dukedom of Croatia was formed—consisting mostly of CROATS but other SLAVS as well—in 879 C.E., recognized as independent by Pope John VIII. Tomislav became the first king of Croatia in 925, having expanded its borders to include the duchies of Pannonia and Dalmatia and at times parts of Bosnia. By 1102 Croatia signed the “Pacta Conventa,” establishing a personal union with the Hungarian monarchy. In 1527 Croatia accepted the Hapsburgs as their monarchs and continued to exist as part of the Hapsburg Empire in exchange for common defense and a basic retention of existing privileges.

The Austro-Hungarian monarchy was formed in 1867, replacing the Hapsburg dynasty. Croatia proper and Slovenia remained under Hungarian jurisdiction while other regions such as Dalmatia were passed to Austrian administration.

At the end of World War I (1914–18) Austria-Hungary was dissolved. Croatia then joined the independent Kingdom of Serbs, Croats, and Slovenes, later united as Yugoslavia. Yugoslavia endured until its dismantling during World War II. Croatia took advantage of the German invasion of 1941 to declare its independence and expand its borders to include a large portion of Bosnia and Herzegovina. Germany continued to occupy Croatia throughout the war. Its independence was short lived; in 1945 after the war Croatia became one of the six republics of a reconstituted Communist Yugoslavia. The breakup of Soviet power and the general destabilization of the Eastern bloc allowed Croatia and Slovenia to secede and declare independence in 1991 and gain international recognition the next year.

CULTURAL IDENTITY

The distinctive cultural identity of the Croats with respect to other Southern Slavs has historically derived from their greater ties with Western Europe. They are largely part of the Roman Catholic world, as opposed to that of the Eastern Orthodox Church, to which most Slavs belong, and the Croatian state strongly supports the church. As part of the former Yugoslavia Croats escaped the Russification that held sway

through much of Communist Europe and have been able to retain a sense of their own nationality. The divide between Croats and other Slavs came to a tragic head with the Croatian and Bosnian civil wars, as ethnic Croats and ethnic SERBS in Croatia and Bosnia engaged in bloody reprisals called “ethnic cleansing” against one another.

The strong Croatian nationalism derives from the fact that through much of their history Croats have been ruled by foreigners, from the MAGYARS to the Ottoman Turks (see TURKICS) and the Austrian Hapsburg dynasty. Through much of this period although not independent, Croats have enjoyed a certain degree of autonomy, which has allowed them to preserve their cultural identity. On the other hand ethnic Croats have been separated in different states with the redrawing of the map of the Balkans after various conflicts, a matter that has created in Croats a passionate desire for their own independent state. Under the Hapsburgs in the 19th century ethnic Serbs were settled in Croatian territory as privileged soldier-farmers; in some areas they became the majority of the population, a matter that rankled Croats, who formed the poorer and less educated segment of society. Serbs have tended to denigrate Croats because of this status and because of their perceived failures (in Serb eyes) in maintaining their Slavic identity in religion, choosing Roman Catholicism over Eastern Orthodoxy, and through cooperation with Hungary, with its Magyar element, and with the Austrian Hapsburgs. Serbs and other Slavs have pointed to the Croats' involvement in the suppression by Austria of the Hungarian

- 1915** Croatia invades Armenia.
- 1917** Serbs, Croats, and Slovenes sign Pact of Corfu declaring principles of unity among southern Slavs.
- 1918** Kingdom of Serbs, Croats, and Slovenes is established, ruled by Serbian Karageorgevic dynasty.
- 1919** Writer Miroslav Krleža founds leftist review *Plamen*.
- 1929** Alexander I, ruler of Kingdom of Serbs, Croats, and Slovenes, changes name to Yugoslavia in attempt to impose national unity on Croats and other non-Serbia minorities.
- 1941** Independent State of Croatia is formed, including most of Bosnia and western Serbia; during World War II Ante Pavelić leads a fascist government under Nazi Germany.
- 1945** World War II ends; Croatia joins six other constituent republics under Yugoslav socialist federation ruled for 35 years by Josip Broz (Tito).
- 1961** Dušan Vukotić's film *Substitute/Ersatz* made at Zagreb Animation Studio becomes first non-U.S. animated film to win Academy Award for best animated short film.
- 1970s** Ethnic tensions between Croats and Serbs lead to riots and violence; Tito's government cracks down on Croats.
- 1991** Croatia declares independence; Croatian Serbs, assisted by Yugoslav army, drive out Croats from Krajina and eastern Croatia.
- 1992** Four protected areas are formed, separating Croats and Serbs; Croatia supports Bosnian Croats against Bosnian Serbs in civil war in Bosnia-Herzegovina.
- 1995** Dayton Peace Accords end war in Bosnia-Herzegovina; Croatian forces retake territories lost in 1991, causing Serbs to flee to Bosnia and Serbia.
- 1996** Croatia joins Council of Europe.
- 1998** Croatia regains control over eastern region of Slavonia.

rebellion during the Revolution of 1848 (which the Croats had hoped would win them their independence) as a sign of pandering to rule by Germans, even more hated by Slavs than the Magyars.

Croats, less fiercely nationalistic than Serbs, have a culture in which many elements are blended. Their cuisine still reflects Hungarian and Austrian influences (for example, the Zagreb veal cutlet, perhaps inspired by the Wiener schnitzel of Vienna); Italian and Mediterranean influences are strong as well. Folk music along the Dalmatian coast has affinities to Italian folk music, and the *kolo* circle dance is in the circle dance tradition of the Mediterranean, while folk music elsewhere in the country maintains a Slavic tradition.

Cumans (Kumans; Qumans; Kun; Polovtski; Polovtsky; Polovetsy; Polovtsians; Kipchaks)

The Cumans, or Polovtski, consisted of the western tribes of TURKICS in the tribal confederation of the nomadic KIPCHAKS, living in western Asia and eastern Europe from the Aral Sea to the Black Sea by the 11th century C.E. (The name Cumans is used both as a synonym and as a designation of a subgroup of Kipchaks.) The Cumans expanded into central Europe by the 12th century. After MONGOLS invaded Europe in the 13th century some Cumans migrated into Hungary. BYZANTINES called them Cumans; SLAVS called them Polovtsi, and MAGYARS referred to them as Kuns. Cuman means “pale” or “sallow” in varying languages.

ORIGINS

The ancestors of the Cumans, as with other Kipchaks, are thought to have lived in western

This late-19th-century photograph shows the facade of the cathedral at Šibenik, Croatia, formerly Dalmatia. (*Library of Congress, Prints and Photographs Division [LC-USZ62-109393]*)

Siberia by the ninth century and to have migrated into Europe by the 11th century.

LANGUAGE

The Cumans spoke the now-extinct Cuman (Kuman) dialect of the Northwestern (Kipchak; Ogur) branch of the Turkic language. A number of dictionaries exist from the Middle Ages, including the late-13th-century *Codex Cumanicus*, with words presented in Kipchak, Latin, and Persian.

HISTORY

The Cumans carried out raids in present-day Romania by the late 11th century, defeating the PECHENECS, also Turkic speaking, in 1064 and absorbing survivors into their tribes. In 1090–91 some Cumans were allied with the Byzantines against the Pechenegs. By the 12th century the Cumans controlled territory in present-day Moldova and the regions of Transylvania and Walachia in present-day Romania, whence they carried out raids south of the Danube River. In the first half of the 13th century Mongols invaded Cuman lands. Some Cumans sought asylum among the RUS in present-day Ukraine, others among the BULGARS in present-day Bulgaria, and among the Magyars in present-day Hungary. Others

Cuman (Turkic)

became subjects of the Mongols in what became known as the Kipchak khanate.

In 1221–25 the Teutonic Knights, a military and religious order that had been active in the Christian Crusades to the Near East, campaigned on behalf of King Andrew II of Hungary against the Cumans. In 1227 the Cuman prince Barc and 15,000 of his people were baptized as Christians. King Béla IV of Hungary assumed the title “king of Cumania,” and two years later granted asylum to the Cuman prince Kuthen and his followers, who had earlier tried to organize a Slavic resistance to the Mongols. But he was murdered as a potential threat to Magyar interests. The Cumans left Hungary during the Mongol invasion of 1240–41, but Béla resettled them there in 1245. The wife of Stephen V, Béla’s son, was a Cuman princess. Their son László (Ladislav) was known as the Cuman and, during his reign in 1272–90 the Cumans played an important role in Hungarian affairs.

The Cumans, known for their fighting skills, served as mercenaries for a number of armies in the region, including the Byzantines and the crusaders out of western Europe.

CULTURE (see TURKICS)

The experience of ranging through the vast and empty steppe lands seems to have affected the cultures of all nomadic steppe peoples along similar lines. The Cumans were no exception. The Byzantines, in grouping the various steppe peoples who attacked them, including the Cumans, together as the SCYTHIANS, a name given by the Greek historian Herodotus to a people of his own time (fifth century B.C.E.), may have been guilty of oversimplification in equating diverse cultures from different places and times. Yet there is more than a little truth to this view. The looseness and freedom of steppe culture, the constant travel over long distances to find decent grazing in a harsh climate, the propensity for raiding, the autonomy of individuals (though males only), the formation of tribes and hordes, and the lack of codified law were all

common characteristics of the Scythians, SARMATIANS, HUNS, AVARS, Cumans, and other Turkics.

The Cumans, as did other nomadic steppe peoples, swept into Europe as conquerors and controlled territory for a time. Although they were not the founders of a permanent state, they played an important role for centuries in relation to other peoples.

Curonians (Cours; Courans; Courones; Cori; Curi; Curlandrs; Kurs; Kurons; Kursa; Kursi; Kurshi; Kurzemians; Kurlanders; Kershes)

The Curonians, a tribe of BALTS, lived in the region known as Courland, situated along the Baltic Sea and the southwest shore of the Gulf of Riga in present-day western Latvia. They had extensive contacts with VIKINGS across the Baltic Sea in Scandinavia at least by the ninth century. Along with the LETTS, SELONIANS, SEMIGALLIANS, and assimilated Finnic-speaking peoples (such as from among the ESTHS, LIVS, and VOTES), they are among those peoples considered ancestral to contemporary Latvians (see LATVIANS: NATIONALITY).

ORIGINS

By about 2000–1500 B.C.E. pre-Baltic peoples, probably Indo-European-speaking, inhabited the region; the Curonians and other tribes would emerge in the region by the ninth century C.E. The name of the Curonians occurs in historical sources earlier—as the Latin Cori in 853 C.E.—than the names of the other tribes in the region. *Kur* in Latvian means “mound” or “hill” and is possibly related etymologically.

LANGUAGE

Some scholars consider the now-extinct Curonian to have been a transitional language between Eastern and Western Baltic. The Curonian language still existed at the end of the 16th century, but Curonians already used it less often than the Latvian language.

Cumans time line**C.E.**

11th century Kipchaks settle lands north of Black Sea; western tribes become known as Cumans.

12th century Cumans settle in Romania.

1220s Mongols arrive on Cuman territory.

1245 Cumans settle permanently in Hungary.

HISTORY

Curonians and Vikings

The Curonians traded with the peoples of Scandinavia directly across the Baltic Sea, but trading parties were frequently attacked and robbed on both sides. In about the ninth century the Vikings of present-day Sweden and Denmark invaded Courland. A reason for the hostilities was retribution against the successful attacks on Swedish and Danish towns; another reason was the struggle for control of the river mouths and usable ports from which traders could penetrate the continent and trade with the Mediterranean region. The Balts would continue to offer fierce opposition to the Vikings for centuries.

In 840, according to the Danish historian Saxo Grammaticus (who wrote in the 13th century), the Viking leader Ragnar Lodbrok organized a raid on the Curonians and Sambians, a subgroup of BORUSSIANS. In 853 the Vikings again attacked the Curonians and lost to a united army of five Curonian tribes. The Vikings attacked again, capturing Seeburg (modern Grobina in Latvia) and Auole (near modern Skuodas in Lithuania).

Conflicts continued over the centuries. In 1161 the Danes captured Palanga Castle in Courland. In 1170 Curonians and Esths attacked Oland Island in Sweden.

Curonians and Crusaders

In 1202 the German prelate Albert von Buxhoevden founded the military and religious order Brothers of the Sword, uniting and controlling the various military factions. In 1210 Curonian ships were able to defeat German ships in Irbe channel and kill more than 30 crusaders. They then attacked Riga, but the city's defenses held out.

Over the next years the order subdued the various Baltic and Finnic peoples in the region. In 1230 the Curonian king Lamikis, pressured by the Danes, LITHUANIANS, and POLES, and in order to avoid rule by Brothers of the Sword, agreed to become a vassal of the pope. The Brothers of the Sword (who merged with the Teutonic Knights) refused to honor this arrangement, and by 1269 had subjugated the Curonians, making Courland their domain. In 1561 the Teutonic Knights dissolved their order and combine Courland and Semigallia into the duchy of Courland, which became a Polish fief.

CULTURE (see also BALTS)

Economy

Early Curonians were farmers and herders, who also gathered berries and mushrooms, kept bees,

and hunted small game. Because the main trade road from the Scandinavian region to Byzantium passed through Courland, a rich trading culture developed. An important export was amber, found in large quantities on the coasts of the Baltic Sea.

Government and Society

Curonians organized their territory in regions and built heavily fortified castles. Before the medieval period Curonians, as did most ancient Balts, had a relatively egalitarian society. Communal meetings would be held periodically, presided over by a council of elders. Medieval Curonians organized their territory in regions and built heavily fortified castles. They adopted the practice, widespread over northern Europe, of organizing their fighting men into military orders.

Music

Curonians performed *daino*, song cycles, believing that nature will reveal itself if the song is sung correctly and the dance rhythms evoke the right vibrations. A common practice among traditional tribal cultures, it was a means by which humans could interact with nature and thus ensure the well-being of the tribe.

Religion

The Curonians were known for their prophets, who supposedly could foretell the future, and peoples of other cultures traveled to them for consultation.

In 1075 the German historian Adam of Bremen described the Curonians as "the most cruel

Cycladites (Cycladians; people of the Cyclades)

The Cycladites were an Early Bronze Age people living on some of the approximately 220 islands and islets of the Cyclades island group to the east of the Greek mainland in the southern Aegean Sea, an arm of the Mediterranean. They flourished in the late fourth millennium and third millennium B.C.E. and had contacts with the MINOANS of Crete living to their south on the island of Crete as well as coastal peoples on the Greek mainland and in the western Mediterranean, including Asia Minor. They are discussed with the Minoans of the Middle Bronze Age and the MYCENAEANS on the Greek mainland of the Late Bronze Age as Aegean civilizations distinct from the later Hellenic civilization of the ancient GREEKS.

ORIGINS

The origins of the Cycladites are not known. The earliest inhabitants of the islands were Neolithic peoples, who, as indicated by the oldest site found on the island of Saliagos, migrated there by 5000 B.C.E., probably from Asia Minor. The Cyclades—extending from Andros in the north to Thera in the south—along with the Dodecanese Islands to the east—formed a natural bridge between Asia and Europe and perhaps were visited by many peoples. Cycladites also founded settlements on the coastal Greek mainland and Crete. The name Cyclades for the island group is derived from the Greek *Kyklos*, meaning “circle,” which was used to describe those islands forming a rough circle around the sacred island of Delos.

LANGUAGE

Nothing is known of the Cycladites’ language other than place-names. Perhaps, like Minoan, it was related to the ancient languages of Asian peoples, such as Semitic.

HISTORY

The Cycladites passed through many cultural phases over the long span associated with them, and distinct periods can be classified on the basis of archaeological evidence. Three main phases of Bronze Age Cycladic civilization are defined: the first, Early Cycladic I, a formative period, from about 3300 to 2800 B.C.E. on the

islands of Amorgos, Antiparos, Melos, Naxos, Paros, and Thera; the second, Early Cycladic II, the height of Cycladic culture, from about 2800 to 2300 B.C.E., on Amorgos, Naxos, Syros, Thera, and perhaps Melos; and the third, Early Cycladic III, declining culture and the start of Minoan influence, from about 2300 to 2000 B.C.E., on Melos, Paros, and Thera. The Grotta-Pelos culture, as determined by artifacts found at excavations, relates to the first period; the Keros-Syros culture, to the second; and the Phylakopi culture to the third.

The Cycladites originally lived in unfortified settlements in coastal areas. In later stages because of pirates they moved to the interior of islands and situated their settlements in defensible sites and built walls and towers. When the Minoans became dominant in the western Mediterranean, the Cycladites again moved to coastal regions. There is evidence of a new movement of people who may have displaced some of the indigenous Cycladites and related coastal peoples on the Greek mainland toward the end of the third millennium B.C.E.

CULTURE

Economy

Cycladites hunted and fished in addition to farming. Major crops were grains, grapes, and olives. Livestock included sheep, goats, and pigs. Cycladites also depended on trade with other peoples for some of their goods.

Precursors of Long Distance Trade In the early Greek Bronze Age (c. 3200–c. 3000 B.C.E.), long-distance trade began in earnest, starting in the island group of the Cyclades, which, located between the Greek mainland and Asia Minor, acted as a series of “stepping stones” between the two. The first galley ships capable of long sea voyages were developed in the Cyclades, and Cycladite traders used them both to export their own commodities, metals and marble, to Asia Minor and Greece, and to transship goods between those two regions. Bronze metallurgy came first to the Cyclades and then to mainland Greece from the Near East by the latter fourth millennium B.C.E., and the scarcity value of bronze, whose component metals, tin and copper, were seldom found in any one region but had to be brought together through trade, caused those involved in bronze making and trading to become rich to a degree not known before in Europe. The lucrative bronze trade, and trade in other exotic materials desired by the new elites, soon became exploited by both seagoing and land-bound raiders, as attested by

language:

Possibly Semitic

the large numbers of bronze weapons that have been found dating back to the third millennium B.C.E. in the Cyclades and in Greece.

Dwellings and Architecture

Cycladic houses were made of stones and mud and plaster on interior walls, with roofs of reeds and branches. They were built without a hearth, possibly because of firewood shortages on the small islands. A house at Lerna (the so-called House of Tiles) on the eastern mainland, also from the Early Bronze Age, was built on a grander scale with two stories and an upstairs balcony. Among the excavated ruins were found small baked clay tiles apparently from a sloping roof, some of the earliest roof tiles known to have existed.

Transportation

Skilled mariners, the Cycladites used galley ships—probably without a deck and with a double bank of oars—to travel throughout the western Mediterranean. Ships had a low bow and a high stern post.

Other Technologies

The Cycladites were proficient in stonework, metallurgy, and ceramics. They quarried stone and mined ores. The island of Kithnos was a major source of copper ore, and silver and lead were mined on Siphnos; tin was probably imported from Troy on Asia Minor and from other locations. Tools and weapons, including arrow points, were crafted from both obsidian and bronze. Gold and silver were used to make jewelry, and marble to make vases and sculptures. The stone vases were hollowed out by boring with an abrasive such as emery or sand. Pottery—including vases, flasks (*aryballoi*), and cooking vessels—was shaped without a potter's wheel.

Art

Cycladic pottery had both impressed and incised designs. Abstract designs were angled and curved with spirals and concentric circles. Pottery was also decorated with flowers, human forms, legendary beings, and animals, including goats, birds, and dolphins.

Frescoes show scenes of daily life; men hunting and boxing; girls picking flowers, often crocuses; and spectators observing ships at sea. Among the animals depicted are blue monkeys, which seems to have some religious significance.

The most famous Cycladic works of art are small figurines, predominantly of the islands'

white marble but also crafted from bone, ivory, seashells, and metal. The vast majority are only several inches tall, but some as large as four feet tall have been found. They are mostly female. Some have folded arms; others play instruments—harps or double pipes. Some reveal traces of paint, often around the hair and eyes. Whether they represented legendary beings is not known, and their purpose remains a mystery, although they are often found in graves. Such sculptures are rare in Bronze Age civilizations.

Religion: Burials

The Cycladites buried their dead individually or sometimes in pairs in small stone-lined graves. Bodies were placed lying on one side. The cemeteries, generally near the settlements, sometimes were surrounded by a wall. Stone platforms sometimes built near the cemeteries may have been used for burial rituals. Objects, such as figurines, jewelry, and daggers, were placed in the graves.

The religion of people on some of the Cyclades seems to have been influenced by Minoan belief—or at least arose from a substratum perhaps common to many Aegean peoples. Horns of consecration and snakes are part of the iconography found on Thera, for example.

This idol from the Cycladites was found in Amorgos and dates to about 2500–1100 B.C.E. (Drawing by Patti Erway)

The mild climate of the Cyclades Islands encouraged settlement, but their small size and limited resources made it difficult for the Cycladites to compete with the expanding Bronze Age cultures on Crete and mainland Greece. Middle Bronze Age civilization, as it developed among the Minoans, drew on Cycladic influences, however.

Cypriots: nationality (people of Cyprus)

GEOGRAPHY

Cyprus lies in the Mediterranean Sea, west of Syria and south of Turkey. Although defined as part of Europe, the island is closer to Asia. The total area is 3,572 square miles. Cyprus narrows in the east near the Syrian coast, forming the Karpas Peninsula. The interior of the island consists of flat plains, called Messaoria. Parallel to the northern coastline lies the Kyrenia range, and to the south lie the Troödos Mountains, where the highest peak, Mount Olympus measuring 6,401 feet, is found. Cyprus has two salt-water lakes, few freshwater lakes, and no rivers.

INCEPTION AS A NATION

Cyprus was ruled by many different peoples in ancient times, among them the GREEKS and ROMANS. While subjects of BYZANTINES, Cyprus was raided by Arabs many times from the seventh to 10th century C.E. It was captured by the English king Richard I (the Lionhearted) during the Crusades in 1191 and sold the next year to French interests. In 1489 it was acquired by the VENETIANS. The Ottoman Turks (see TURKICS) gained control in 1571. When the Turks lost the Russo-Turkish Wars (1877–78) Cyprus fell under British administration. It became a British colony in 1925 and was proclaimed an independent republic in 1960. The largely Greek population has close ties with Greece (see GREEKS: NATIONALITY). In 1975 after Turkey had invaded the year before and claimed the northern part of the island, the Turkish Federated State of Cyprus was established (see TURKS: NATIONALITY). In 1985 the Turkish population proclaimed the Turkish Republic of Northern Cyprus; only Turkey gave it international recognition, however.

CULTURAL IDENTITY

The nature of the modern Greek-Cypriot identity has involved a struggle between two opposing points of view: Greek-Cypriot nationalism, which emphasizes Cyprus's ties with Greece, and Cypriotism, an ideology that pledges support to the political independence of the island. With the advent of British colonialism in 1878 Greek-Cypriot nationalism, in the form of the demand for union (*enosis*) with Greece, began to be transformed into a mass movement. In reaction there gradually arose an opposing Turkish-

Cypriot nationalism, calling for the partition (*taksim*) of Cyprus along ethnic lines. The balance of power between the two political viewpoints was dramatically realigned after the Turkish invasion of Cyprus in 1974. A decline of nationalist ideology occurred in the post-1974 years because nationalism was seen as at least partly responsible for the invasion. For the first time since Cyprus's independence from Britain in 1960, the Cypriot flag began to be publicly displayed on a large scale and to replace, or at least be placed beside, the Greek flag. The events of 1974 increased the psychological distance between the Greek Cypriots and the mainland Greeks. The coup that led to the Turkish invasion was designed and executed by Greeks and their associates on the island. Thus the *kalamarades* (pen pushers), as the mainland Greeks are commonly called in Cyprus, were blamed for the Turkish invasion of 1974.

All of these events caused Cypriotism to rise in favor. The official Greek-Cypriot leadership espoused a policy of rapprochement with the Turkish Cypriots, stressing that the Turkish Cypriots were not the enemy and that the two communities could again live together as they had in the past. Cypriotism refers to the idea that Cyprus has its own genuine character and thus must be viewed as an entity that is independent of the motherlands of the two main communities of the island, that is, Greece and Turkey, instead of as two communities that are merely extensions of the motherlands. In this way Cypriotes are seen as having some common ground.

With the victory of Andreas Papandreou's socialist Panhellenic Socialist Movement (PASOK) in the Greek parliamentary elections of 1981, Greek nationalism in Cyprus again moved to the fore. Papandreou rose to power on an explicitly nationalist anti-West agenda, promising to make the Greeks the true masters of their country. For the Greek Cypriots this was a new Greece, different from the Greece that had "betrayed" its own child; it was a Greece with which the Greek Cypriots could again proudly identify even without *enosis*. What Greek-Cypriot nationalists aspire to now is not union with Greece but the reaffirmation of Greek identity in the context of an independent polity that is tied to Greek culture and is in some way politically anchored to the Greek state.

The argument between nationalists and Cypriotists has taken place in varying interpretations of history amounting to the "invention" of tradition by the two sides. The ideological

About 85 percent of the population are Greek Orthodox; religious minorities include Muslims, Maronites, and Armenian Apostolic.

earlier inhabitants:

Minoans; Mycenaeans; Greeks; Phoenicians; Assyrians, Persians, Ptolemaics (Hellenic dynasty in Egypt); Romans; Byzantines; Venetians; Turks

demographics:

About 85 percent of the population are Greek; about 12 percent are Turkish.

clash focuses on key events from the recent history of Cyprus, such as the coup of 1974. Many other issues and turning points in Cypriot history, however, often become objects of ideological contest—from the legacy of the pre-Greek Cypriot past more than three millennia ago or the Phoenician influence to the relations between the island's Greeks and the Turks during Ottoman rule. Both camps claim to possess the “true” history and accuse the other of the distortion of history.

Czechs (Tcheques; Cechove; Češi; Bohemians)

The ancient Czechs were a tribe or tribes of Western SLAVS, centered in the present-day western Czech Republic near the SLOVAKS. They are considered ancestral to modern Czechs now living in the Czech Republic and neighboring countries (see CZECHS: NATIONALITY). The ancient tribal name was Cechove or Češi.

ORIGINS

It is thought that the Slavic ancestors of the Czechs settled along the Upper Elbe River in the region known as Bohemia by the mid- to late sixth century C.E., having migrated there from the original Slavic homeland north of the Carpathian Mountains. They are associated with Slavic peoples referred to by ancient writers as VENEDI. Czech tradition maintains that, subjugated by the AVARS, Czechs freed themselves under the leadership of Samo in the seventh century.

The earliest material evidence of Slavic settlement in the region known in the Middle Ages as Bohemia (from the Celtic tribal name BOII; see BOHEMIANS), which comprises roughly the western two-thirds of the present-day Czech Republic, dates from the mid- to late sixth century. Our knowledge of Slavs in this region is derived mostly from archaeological finds, pottery, house types, and other artifacts. The material culture characteristic of Bohemia at this time had affinities with that in contemporary Poland, whereas in its early stages the Czech language was similar to South Slavic languages; thus the question of where Slavs there

originated—present-day Poland, the Danube valley to the south, or elsewhere, possibly present-day Ukraine or Moldova—is difficult to answer, and no consensus has as yet been reached. The earliest Slavic pottery in Bohemia is found in a dense cluster of sites in the west, where some GERMANICS continued to live for a time. As elsewhere in Slavdom these early Slavs had a very simple culture, living in small, square, sunken-floored huts and making pottery that by the standards of the time elsewhere in Europe was no more than crude.

The most well known early Bohemian Slavic culture is called the Prague culture, which is now dated to the second half of the sixth century. Prague sites are found in the same region as earlier Slavic sites in western Bohemia and along the Elbe River downstream from Prague in a region in present-day eastern Germany. There a Germanic tribal culture seems to have collapsed or been dispersed in the sixth century (possibly because of eastward pressures emanating, in the 530s, from the FRANKS of western Germany and France). Prague culture artifacts replaced the earlier Germanic material, which is not found in Prague contexts as Slavs seem to have moved

on to land along the Elbe that had previously been cleared, although pollen evidence shows that in some places the forest had begun to regenerate. This suggests that Germanic peoples had abandoned these regions some time before Slavs arrived. The appearance of the Prague culture coincides with the disappearance of Germanic cultural markers both in Bohemia itself and in adjacent areas of eastern Germany (called by Slavic scholars Polabia after a now-extinct Slavic language that was spoken there until the 19th century), either because Germanic peoples left the area, because they had adopted Slavic culture, or because of a combination of factors. (The differences of Prague culture material from that of earlier Slavs in the area could have come about through contributions from Germanic peoples who had joined the Slavs, although this is speculative.)

The Prague culture in Bohemia continued through the seventh century and in some areas into the eighth. In southern Polabia a distinct culture evolved from the Prague culture, marked

by a pottery type called Rüssen, after the site where it was first found, and its adherence to flat cemeteries at a time when in surrounding areas barrow (mound) burials had become common. Rüssen pottery making continued in the area into the early 10th century. Some of the earliest barrow burials north of the Danube region were made in Bohemia and to the east in Moldova.

In the eighth and ninth centuries as elsewhere in Slavdom in Bohemia numbers of strongholds were built, evidence of a greater organization—and probably stratification—of society, and of unrest.

LANGUAGE

The Czech language, formerly called Bohemian, is part of the West Slavic branch, which includes Polish and Slovak as well as a number of other less widespread languages.

HISTORY**Early Tribes**

By the early ninth century a number of tribes had emerged in the densely populated and fertile Bohemian basin, bounded by mountains or uplands on the north, east and south. The basin itself was (and is) formed and watered by the tributaries of the Elbe, fed by the surrounding highlands. The geography of the area fostered a sociocultural cohesion that would help in the establishment of the Bohemian state. In the northwest were the Lučane and Lemuzi; the Czechs (known in early sources as Cechove or Češi) were in the center near the future site of Prague on the Moldau; in the northeast were a group called CHORVATI, or CROATS, the Pšovians lived on the Elbe between the Croats and Czechs; the DULEBIANS lived along the upper Moldau in the south.

The greater organization of society in Bohemia than elsewhere in Slavdom, aside from the building of strongholds, was also evident in the formation of a union or confederacy of tribes centered on the valley of the Moldau in the Bohemian basin. Among the tribes involved were the Czechs, Croats, Dulebians, Lemuzi, Lučane, and Zličane. The rise in numbers of strongholds built at this time was dramatic.

Competing States

The wealth of Bohemia attracted the interest of powerful states to the east and west. The MORAVIANS to the east had formed a state in the late eighth century; to the west lay the Carolingian Empire of the FRANKS. The *Royal Frankish Annals* (a year-by-year accounting of

events) for the year 805 tells of the campaign against a tribal ruler called Lecho (or Becho), led by emperor Charlemagne's son, Karl. It reports that Karl's forces "ravaged the land from one end to the other," killing Lecho (described as a chief rather than duke or king). The next year another invasion force, consisting of troops from Bavaria, Allemania (a region in present-day Alsace and Switzerland), and Burgundy (in present-day France), again lay waste to the land, "the army returning without serious losses," indicating the superiority of the Frankish military and the perils Bohemians faced.

Instability in the Frankish kingdom after the death of Charlemagne in 814 may have caused a lull in Frankish pressure on Bohemia, but the Treaty of Verdun in 843 stabilized Frankish leadership, and Louis II (Louis the German), who received the eastern territories of Charlemagne's empire closest to Bohemia, turned his attention to the wealthy Bohemian basin. In the 840s and 850s Louis's forces conducted raids on Bohemia. Hoping to gain protection from these raids 14 nobles and local rulers went to the church authorities of Regensburg in Bavaria in 845 offering to become Christian; they recanted a year later after realizing their conversion did not halt German incursions.

Moravia—known as Greater Moravia because of its expansion—annexed Bohemian territory in the 880s and fostered the rise of the Czech Premyslid dynasty, who would become the core leaders of the Bohemian state. Premyslid power was fostered by the wealth of their territory, centered on fertile farmlands of the confluence of the Moldau (Vltava) with the Elbe and other tributaries. These important waterways made the area a crossroads of trade, another source of wealth.

The semilegendary princess (sometimes called a queen) Libussa and her husband, the peasant Premysl, founded the Premyslid dynasty in the late eighth or early ninth century. In the ninth century the Premyslid ruler Borivoj married Ludmila, a princess of the Polabian Slavs, and under her influence became Christian; he was baptized at the court of Moravia by St. Methodius in about 884. This action caused a revolt by Bohemian pagans from which Borivoj fled to Moravia; the revolt was suppressed with the help of Moravians, drawing greater Moravian influences into Bohemia. Borivoj made Prague his capital, building there a church dedicated to St. Mary, and continued, with Moravian help, to subju-

gate the weaker tribes of Bohemia and consolidate his power.

Possibly in reaction to the arrival of the MAGYARS in the region in 895, all of the Bohemian princes traveled to Regensburg to ally themselves with East Francia, and Prague became part of the Regensburg diocese. Moravian influence in Bohemia was thus balanced by that of Bavaria, which promoted the interests of the Slavník family, a rival of the Premyslids. As an example of this balance—although the church in Prague, the center of religious life in Bohemia, looked to Regensburg for leadership, Moravian priests who fled the Magyars were able to practice the Slavic rites of the Eastern Orthodox Church. The Bohemian princes acknowledged Premyslid primacy, but under the overlordship of Bavaria.

Meanwhile the Premyslids augmented Bohemia's natural defenses, its wall of mountains, by building an ingenious system of strongholds that formed a circle around Prague, itself heavily fortified. In this way the Bohemians avoided the fate of Great Moravia, which collapsed as a political entity by 907. By the 10th century Bohemia had become one of the most highly developed regions of Europe.

Outside the Premyslid realms around Prague the practice of paganism continued, and Vratislav, son of Borivoj, married a pagan from Polabia, Drahomir. When Vratislav died after his brief reign from 915 to 921, his Christian mother, Ludmila, assumed guardianship of his son and her grandson, Wenceslas (Vaclav), over the objections of his pagan wife, making sure he had a Christian upbringing. (According to legend, Drahomir had Ludmila murdered; whatever the truth, Ludmila later was made a saint, as was Wenceslas, considered the patron saint of Bohemia.) Religious tensions—between factions of pagans, Slavic-rite Christians, and Roman Catholic Christians whose allegiance was to Regensburg—hampered the power of the Premyslids, and Drahomir exploited Slavic Christians' frustration at Wenceslas's inability to break with Regensburg to promote the interests of her younger son, Boleslav I, who reigned in 935–972 (a Christian, however). In 935 Boleslav had his brother murdered and usurped his throne.

In about 936 Boleslav apparently sent forces into northern Moravia and beyond into present-day southern Poland, taking Kraków and then the nearby territories of the LEDZIANIANS, from there expanding far to the east. Strongholds that have been excavated in

the region of Silesia (southwestern Poland) and farther east bear a strong resemblance to contemporary Bohemian ones. Part of the attraction of these territories lay in the important trade routes that crossed them, leading to the Baltic. They were annexed by the Polish state in 988–990.

Although Boleslav wished to gain independence from the Bavarian overlordship, he was forced by the German emperor Otto I in 950 to acknowledge Bavarian hegemony over Bohemia; he honored this commitment by aiding German attempts to annex Polabia in 955. German support for the rival Bohemian leader Slavnik, whose son was a pupil of the bishop of Magdeburg, an important see founded by Otto, began at this time. Boleslav perhaps sought to counter this when he gave his daughter in marriage to the Polish prince on condition that he accept Christianity. This alliance was broken in the reign in 972–999 of Boleslav's son, Boleslav II, with the Polish annexation of Silesia.

The Prague diocese was founded at this time, its second bishop Slavnik's son, Wojciech, who had studied with Adalbert of Magdeburg (and who took the name Adalbert for himself, thus underscoring his German connections). The Slavnikovice family, whose seat was at Libice, east of Prague, continued to be powerful rivals of the Premyslids. Boleslav II in 995 seized the opportunity presented when Adalbert went to Rome to take Libice and slaughter nearly all of the Slavnikovice family.

In 988–990 the expanding Polish state took advantage of internal dissension in Bohemia to annex lands in Moravia and in much of Bohemia. Polish rule soon collapsed, however, and Moravia was retaken by Bohemia in 1019 and henceforth remained attached to the Bohemian state. Bohemian forces raided Polish territory in 1034 and reclaimed the body of the now-canonized Wojciech/Adalbert (who had been martyred while preaching to the BORUSSIANS in 997). Soon after Bohemia became fragmented among its feuding nobles. The Premyslid prince Vratislav II was the first to obtain the title of king of Bohemia as a non-hereditary privilege. In 1198 Otakar I was named the hereditary king of Bohemia.

13th to 17th Centuries

By the 13th century Bohemia, which had maintained its allegiance to the German empire, now called the Holy Roman Empire, had become one of the most important provinces in the empire. In 1212 the emperor Frederick II made Bohemia a largely independent kingdom

within the empire. The primacy of Bohemia's cities as centers of trade attracted immigration by many German traders and craftsmen, furthering Bohemia's prosperity and cultural importance.

In 1310 John of Luxembourg married Elizabeth, sister of the Bohemian king, Wenceslas III. John was chosen to be the king of Bohemia to stem the political chaos that followed Wenceslas's death. John's son, Charles IV, succeeded him as king in 1346 and then, helped by the papacy, which was concerned to extend its political influence in the empire, was elected Holy Roman Emperor in 1355. Now the center of the empire Prague grew into a major center of learning and culture in Europe. Charles undertook extensive building programs and in 1348 founded Charles University, the first university in central Europe.

A precursor of the Protestant Reformation took place in Bohemia in the 15th century under the leadership of Jan Hus, who was burned at the stake for heresy in 1415; his execution precipitated a period of conflict between Hussites and Catholics, culminating in the Hussite Wars of 1420–34. In 1458 the Bohemians elected as king a follower of Huss, Jiří of Poděbrady, who was thus the first Protestant king in Europe. By the end of the century a large proportion of the Bohemian nobility had embraced Hus's teachings.

In 1526, when the Bohemian throne became vacant, Ferdinand I of the Hapsburg dynasty was made king of Bohemia (and Hungary). Both because of the Hapsburgs' German culture and because of their staunch support of Roman Catholicism, the Bohemian Czech nobility strongly opposed Ferdinand, culminating in a large-scale revolt in 1618, sparked when members of the Protestant Czech nobility threw several papal officials from a window in Prague (an event known as the Defenestration of Prague). The Protestant Czech nobility deposed Ferdinand and offered the throne of Bohemia to Frederick V, a Protestant German prince. The Protestant nobility across Germany quickly aligned themselves with Frederick, while Catholic Germany backed Ferdinand, who became Holy Roman Emperor (Ferdinand II) in 1619. The conflict soon escalated into the Thirty Years' War, involving most of the great European powers, which devastated Bohemia (and much of Germany).

In 1620 the Bohemian army was defeated at the Battle of White Mountain. Many Czech nobles were killed or sent into exile, and

Catholicism, along with German culture and language, was imposed on those who remained. Oppressive taxation and absentee landownership reduced the Czechs, except a few nobles who were favored by the Hapsburgs, to poverty. Imposed Germanization by Hapsburg rulers continued into the 18th century, even by the otherwise-enlightened Emperor Joseph II. Joseph had begun a widespread policy of freeing serfs throughout the empire, instituted numerous liberal reforms of law and government, and extended partial freedom of worship. However, Czechs saw as tyranny his policy of instituting German as the official language throughout the empire—based as it was on Enlightenment principles of fostering learning and mutual understanding between peoples and doing away with the irrational parochialism of local customs and cultures rooted in the medieval past.

Enduring Identity

Czechs participated in the rise of interest in ethnic nationalism that swept over much of Europe in the 19th century, part of the reaction to Enlightenment principles that had led to the romantic movement. A nationalist political movement arose, but independence awaited the dissolution of the Austro-Hungarian Empire after World War I (1914–18). In 1918 the largely Czech Bohemia became the core of the state of Czechoslovakia (which included Slovakia—see SLOVAKS: NATIONALITY), which in 1993, became two nations, the Czech Republic and Slovakia. The overwhelming majority of people who consider themselves Czechs live in the Czech Republic, small numbers of Czechs live elsewhere in central Europe. These countries, in order of Czech population size, are Slovakia, Austria, Croatia, Ukraine, Romania, and Poland.

CULTURE (see also SLAVS)

Economy

Trade The major rivers of Bohemia, especially the Moldau and Elbe running to the Baltic, gave it a favored position for trade by a variety of European peoples. A Jewish traveler named Ibrahim ibn Yaqub journeyed to Bohemia in about 965 and observed and wrote an account of the trading enterprise here. He mentions that Prague was built of stone and chalk “and is the richest in trade of all these lands.” He notes the wealth of agricultural products available for cheap prices—flour, barley, wheat, poultry, and horses. Fine leather goods were made in

Prague, saddles, bridles, and “flimsy leather bucklers [shields] that are used in those parts.” Ibrahim describes a curious product: “light fine kerchiefs like nets, embroidered with crescents, which are of no use for anything” (except perhaps vanity, to set off the beauty of the weaver). Such kerchiefs were packed in jars and used for currency, 10 kerchiefs worth a penny, to buy everything from slaves and horses to gold and silver.

Government and Society

Bohemian Stronghold Organization The Bohemian state developed as its organizational basis a system of strongholds surrounding Prague, the seat of the ruling family; the commanders of the strongholds owed allegiance to the rulers. This arrangement became the basic form of sociopolitical organization throughout western Slavdom. Their strongholds were large, ranging in size from 20 to 40 hectares, with inhabited outer enclosures; some of the inhabitants were craft workers.

Rivalry between Royalty and Nobility The Premyslids contended with other noble families in addition to the Slavnikovice; the situation in Bohemia was similar to that in many countries across Europe at this time, as centralizing and fragmenting tendencies played themselves out among leading families struggling to become royal and lesser nobles attempting to preserve their independence. In the 10th and 11th centuries archaeological evidence shows, many strongholds in Bohemia were destroyed and replaced by others built nearby. This evidence may document the usurpation by central authority of the old tribal nobility, both enabled and symbolized by the erection of new fortifications commanded by officials of the state.

Religion

Burials The characteristic burial rite of the Prague culture was in small cremation cemeteries with buried urns unmarked by mounds or barrows. In the seventh century in Bohemia barrow graves began to be made, with mounds enclosed by horizontal wood revetting (facing), rectangular in form, at their base. Cremated remains were deposited on top of the mounds. The impetus for this change in burial rite is unknown; it may have originated in territories to the south, where Slavs were heavily influenced by the culture of the AVARS, a warrior society from the steppe lands of Eurasia. The Avars themselves did not make barrow graves,

but their warrior elite culture emphasized the fame and glory of the individual warrior. Some among the Slavs seem to have adopted this ideology, marking their status by wearing ornaments made of luxury materials such as silver and gold. Another way they strove to achieve a more lasting fame was to erect burial mounds to commemorate fallen warriors.

Christianity Christianization of Bohemia began when its ruler Borivoj converted in 884, adopting the Slavic rites of the Eastern Orthodox Church. However, Bohemia's proximity to the Roman Catholic Frankish and later German kingdoms drew Christians here into the sphere of the Western church, in part because the Bohemian princes, chafing under Moravian dominance in their country, sought a counterweight with the Franks. Their alliance with East Francia in 895 put Prague in the diocese of Regensburg in Bavaria. Moravians practicing the Slavic rite who fled to Bohemia from the Magyars were allowed their form of worship, but during the 10th century the Bavarian mission became increasingly influential until the Slavic rite fell into disuse.

For centuries strong German influence in Bohemia and Catholicism went hand in hand, and the Bohemian nobility's resentments against the former contributed to the growth among them of enthusiasm for the anti-Catholic teachings of the Bohemian preacher Jan Hus, one of the earliest church reformers, whose work anticipated the Protestant Reformation. Hus also gained great popular support, expressed in riots in Prague when he was excommunicated in 1410 and then executed in 1415. Attempts by the Bohemian monarchy (by this time closely associated with the Holy Roman Empire) to root out Hus's followers (Hussites) led to armed rebellion. Repeated invasions by imperial troops were repelled by Bohemian Hussite forces until a compromise was reached. By this time the Hussites had developed rival factions along class lines, the nobility (the Utraquists) reacting against the more radical faction composed of peasants and villagers (Taborites); the former accepted compromise with the empire. In the end in spite of their military successes the Hussites achieved few of their reforms, and the Taborite peasants who had wanted to continue fighting were in many ways worse off than before. The Hussite wars had important social implications, however, because the urban bourgeoisie of German descent had been driven out of the country

during the fighting, giving new scope to the Bohemian Czech middle class and a greater sense of Czech nationality.

Remnants of the Hussites joined in the 1450s to form the Bohemian Brethren, which later would evolve into the Moravian Church.

Because of its geographical position Bohemia throughout its history has been on the front line of the great cultural divide between Slavic-speaking and Germanic-speaking Europe. Within Bohemia the Czech dialect, precursor of the modern Czech language, began developing after the eighth century as the Czech tribe emerged. From the ninth century, as the ruling dynasty, who were Czechs, consolidated their power, the Czech dialect grew to be the language of all Bohemians. Bohemian culture for centuries was strongly influenced by German culture and by a cosmopolitanism fostered both by trade and by Bohemia's importance within the multinational Holy Roman Empire. Yet the Czech identity of Bohemians was never forgotten and, at present, is more dominant in the Czech Republic than it has been for some 800 years. The notable cosmopolitanism of Czechs today is now fostered from within, rather than imposed from without.

Czechs: nationality (people of the Czech Republic)

GEOGRAPHY

The Czech Republic is surrounded by Slovakia to the east, Poland to the north, Germany to the west, and Austria to the south. The republic is divided into the regions of Bohemia, Moravia, and Czech Silesia. Czech Silesia is separated from Moravia by the Sudetes Mountains in the north, where Sněžka, the highest peak, measuring 5,259 feet, is found. Along the western border with Germany lie the Bohemian Forest (Böhmerwald) and Šumava Mountains. The Bohemian plateau lies in the west. The Bohemian-Moravian Highlands and low plains of the Bohemian Basin occupy cen-

tral Czech Republic. A portion of the Carpathian Mountains are in the southwest along the Slovakian border. Principal rivers include the Elbe (known locally as the Lake), Vltava, Ohře, and Morava, which supplies a fertile agricultural valley. The republic's area is 30,450 square miles.

INCEPTION AS A NATION

The SLAVS moved into the present-day Czech Republic at least from the early sixth century C.E. A merchant by the name of Samo of the FRANKS formed the Slavic state of Bohemia around 623 C.E. as a defense against the AVARS. In the late eighth century the Slavic state of Moravia was formed. By the 880s it came to encompass Bohemia, Slovakia, southern

Poland, and western Hungary, hence the name Great Moravia. By 907 the MORAVIANS were defeated by the MAGYARS. The dynasty of the Premyslids united the tribes of CZECHS in Bohemia, and expanded territory under the supervision of the Holy Roman Empire.

By 1212 Holy Roman Emperor Frederick II organized an autonomous Bohemian state within the Holy Roman Empire. Bohemia expanded in 1335 to include part of Silesia.

Jogaila (Wladyslaw II), king of Lithuania and Poland, ruled Bohemia in the 15th century. The Austrian Hapsburg Ferdinand I ruled Hungary and Bohemia in 1526. At the end of the Thirty Years' War (1618–48) throughout much of Europe, a period of increasing Germanization, occurred in Bohemia. In

Czech, a West Slavic subgroup of the Slavic language, is the official language; Slovak is also spoken.

religion:

About 40 percent of the population are Roman Catholic; about an equal percentage are recognized as atheist; Protestants and Eastern Orthodox Christians make up the remaining.

earlier inhabitants:

Celts; Thracians; Marcomanni; Quadi; Heruli; Sciri; Slavs (Czechs; Slovaks; etc.); Franks; Magyars; Mongols

demographics:

About 82 percent of the population are Czech; about 13 percent are Moravian; other minorities include Slovaks, Poles, Germans, Silesians, Roma, and Hungarians.

Czechs: nationality time line**C.E.**

ninth century Bohemia is part of Great Moravia.

after 863 Missionaries Cyril and Methodius translate religious works from Greek into Old Church Slavonic, starting tradition of Czech literature.

c. 907 Moravia dissolves after invasion of Magyars.

950 Bohemia is forced by German emperor Otto I to acknowledge Carolingian hegemony.

1278 Bohemia is under Hapsburg rule.

1355 Charles IV of Bohemia becomes Holy Roman Emperor.

1415 Reformist religious leader Jan Hus is burned at stake for questioning pope's authority.

1579–93 Czech Protestant Kralice Bible is published and serves as literary model of classical Czech language.

1618 Thirty Years' War begins when Czech Protestant nobles revolt against Catholic Hapsburg dynasty, sparked by defenestration of Prague.

1620 Hapsburgs defeat Protestant rebels and rule Bohemia.

1648 Thirty Years' War ends with the Peace of Westphalia, starting a period of Germanization.

1749 Separate chancellery at Prague is no longer allowed by Hapsburgs.

1781 National Library is founded in Prague.

1790s Josef Dobrovský codifies revived Czech literary language.

1818 National Museum is founded in Prague.

1826 Systematic study of Slavic languages by Pavel Josef Šafárik is published.

1835–39 Josef Jungmann produces Czech-German dictionary, modernizing Czech vocabulary.

1836 Publication of lyrical epic poem, *Máj* by Karel Hynek Mácha; name of poem is used for national school of writers of 1860s, *Máj* group, including poet, novelist, and journalist Jan Neruda who uses newspaper essay as educational and political tool.

1848 Slavic congress assembled at Prague in the Revolutions of 1848 but opposition is defeated by Hapsburgs the next year.

1867 Bohemia became part of the Austro-Hungarian monarchy.

At the end of World War I (1918) Austria-Hungary disbanded; Czechs and SLOVAKS united in the independent state of Czechoslovakia. Bohemia, Moravia, part of Silesia, Slovakia, and later Ruthenia were all part of Czechoslovakia.

By the terms of the Munich Agreement of 1938, Czechoslovakia ceded Sudetenland to Germany; Hungary and Poland later divided parts of Czechoslovakia. Threatened by Hungary and Poland, Slovakia separated from the country, declaring a short-lived independence. During World War II (1939–45) Nazi Germany occupied Bohemia and Moravia, forming a protectorate. At the end of the war Czechoslovakia's republic was reestablished,

aided by the Soviet Union (USSR), which then annexed Ruthenia. In 1948 Czechoslovakia came under Communist rule. In 1992, after the dissolution of the Soviet Union, Czech and Slovak leaders agreed on partitioning Czechoslovakia into two independent states, the Czech Republic and Slovakia, which took effect January 1, 1993.

CULTURAL IDENTITY

The Czechs, on the western edge of Slavdom, have an ancient tradition of opposing domination of their culture by outsiders, a tradition that may have strengthened Czech resistance to rule by the Russian-dominated Soviet Union in the 20th century. Although the Czechs experienced foreign rule since they became part of

- 1984** Poet Jaroslav Seifert wins Nobel Prize in literature.
- 1989** Communist rule ends in Czechoslovakia; Václav Havel, a playwright who took part in anti-Communist protests, is elected president.
- 1990** Country is renamed Czech and Slovak Federative Republic.
- 1993** Czech Republic and Slovakia become independent nations.
- 1999** Czech Republic joins North Atlantic Treaty Organization (NATO).
- 2004** Czech Republic joins European Union (EU).

the Germanic Holy Roman Empire in the early Middle Ages, their cultural identity continued to be strong. This enduring identity was helped by the fact that the Czech Bohemian state grew into an important entity, a largely independent kingdom within the empire. The success of Bohemia's cities as centers of trade caused many German traders and craftsmen to migrate there, furthering Bohemia's prosperity and cultural importance.

The Czech language has among the oldest literary traditions of all Slavic tongues, beginning soon after the missionary brothers, Cyril and Methodius, devised an alphabet for Old Church Slavonic in the ninth century. The earliest preserved texts in the Czech language, mainly hymns, were written in the late 13th

century at the courts of the Premyslid kings of Bohemia. From that time a vibrant literature in the Czech language flourished. During the medieval period Prague was at the forefront of European intellectual life, and the Bohemian king Charles IV founded Charles University, the first university in central Europe, in 1348.

The Czechs have been in the forefront of Slavic resistance against Germanic dominance, a position of which they have been conscious from the earliest times. Christianity had reached the Slavs of Moravia from the west under the political aegis of the FRANKS. Rostislav, prince of Great Moravia, invited Cyril and Methodius to his kingdom to counter Frankish influence.

Imposed Germanization reached a crescendo under Hapsburg rule in the 18th century. The Holy Roman Emperor Joseph II instituted German as the official language. His actions became a flashpoint for Czechs and made them all the more determined to promote the Czech language.

Bohemian patriotism began to revive in reaction to the centralizing tendencies of the Hapsburg government. These trends, along with currents of the romantic movement, such as a fascination with nationalistic and ethnic roots, spurred a Czech national literary revival in the first half of the 19th century. At the same time social and economic developments were helping to create a new middle-class audience for Czech literature.

Yet Czechs have not been content with a literature simply in reaction to foreign dominance. In the latter 19th century literary life crystallized around two movements, one stressing the need to Europeanize Czech literature, the other looking to the strength of native traditions and themes. In music too, nationalistic themes became important. Bedřich Smetana based much of his music on Czech folk songs and dances. Antonín Leopold Dvořák, a master of the symphony and chamber music, was also known for incorporating Czech folk music into his works.

In the 20th and 21st centuries Czech writers such as Karel Čapek and Jaroslav Hašek

have been able to make the experience of being Czech a means of confronting issues central to modern life. Their works, typically set in the collapsing Austro-Hungarian Empire, remain widely read in many languages and relevant to the present day. Franz Kafka, although writing in German, made the police state of the Hapsburg Empire a metaphor for the alienation of modern society.

It is perhaps a fitting testimony to the importance of culture, not only for defining Czech nationhood conceptually but for guiding its course through history, that the first president of Czechoslovakia after the collapse of its communist government and then of the Czech Republic was the playwright Václav Havel.

D

Dacians (Daci; Daceans; Geto-Dacians)

The Dacians were a people of present-day Romania, a subgroup of THRACIANS, who had significant contacts with the ROMANS from the mid-second century B.C.E. to the late third century C.E. Dacia, as defined in ancient times, was bounded on the north by the Carpathian Mountains, on the northeast by the Dniester River, on the west by the Tisza, and on the east and south by the Danube River.

ORIGINS

The Dacians were closely related to the GETAE, an earlier Indo-European people in the region; they may simply have been the same people at different points in history. Getae is a name used for them by the GREEKS, and Daci a Roman name. The two Thracian peoples, Getae and Dacians, are sometimes discussed together as Geto-Dacian. The name of their homeland, Dacia, became the name of a Roman province, and the name Dacians was used to designate peoples of varying ancestry in the region. The CARPI and COSTOBOCII are generally considered Dacian subtribes.

LANGUAGE

The Dacian language is thought to have been related to Thracian, spoken by people of Thrace (roughly present-day central and southern Bulgaria, European Turkey, and

northeastern Greece). Some scholars believe that the Dacian language is related to that spoken by the ancient Phrygians, a people of Asia Minor, as well as by modern Armenians. With Roman colonization some Dacian dialects became somewhat Latinized.

HISTORY

The earliest literary accounts of Dacians date to the first half of the second century B.C.E., when they were successfully preventing the BASTARNAE, a Germanic tribe, from moving into the Carpathian Mountains. In the 170s B.C.E. their territorial control was said to be increasing; this new influence is generally assumed to imply an expansion from their original homeland, in the plain of Walachia north of the Lower Danube, into Transylvania, where they would have had contact with long established

105–106 Second Dacian Wars between Dacians and Romans

107 Roman province of Dacia is created.

256 Romans evacuate most of Dacia.

communities of CELTS, absorbing them into the expanding Dacian state.

The Dacians and Romans met in battle in 112, 109, and 75 B.C.E. By about 60 B.C.E. the Dacian leader Burebistas united various tribes in the region into a powerful kingdom. Among Burebistas's conquests were the Celtic BOII, SCORDISCI, and TAURISCI living to the west. The Roman general Julius Caesar was preparing a major campaign against the Dacians before his assassination in 44 B.C.E. The Dacians continued raids on Roman-held lands during the reign of the Roman emperor Augustus, from 27 B.C.E. to 14 C.E. Though he claimed them as a tributary people they remained unconquered. They swept into Moesia (parts of present-day Serbia and Bulgaria) in 69 C.E. but were driven back by Roman legions. In 85–89 C.E. during the reign of Domitian the Dacians and Romans fought a series of inconclusive battles. The Romans claimed overlordship of the Dacians but paid them tribute to prevent further raids.

In 101–102 and 105–106 C.E. the Dacians under Decebalus fought against the Romans under Emperor Trajan in what are known as the First and Second Dacian Wars. Decebalus committed suicide upon his defeat. The Romans drove survivors northward and seized

enormous wealth from the Dacians. Trajan established numerous colonies and in 107 C.E. created the province of Dacia, the last province established in the Roman Empire. The Romans built roads and oversaw the operation of Dacian gold, silver, and iron mines. Dacia also provided grain to the empire.

In 129 C.E. under Emperor Hadrian the province was divided into Dacia Superior in the north (roughly the region of Transylvania) and Dacia Inferior (extending south to the region of Walachia between the Transylvanian Alps and the Danube). In the mid-second century C.E. Emperor Antoninus Pius divided the region into three provinces, the Tres Daciae (Dacia Porolissensis, Dacia Apulensis, and Dacia Malvensis). By that time with merchants traveling to Dacia from numerous regions the region had become a melting pot.

By the second century C.E. Germanic peoples had entered Dacia, such as the Asding VANDALS in 171, granted permission by the Romans to do so. The GOTHs, who reached the Black Sea by about 217, also grew in strength to the east. In the 250s they invaded, driving the Romans out of most parts of Dacia by 256. In the 270s. Emperor Aurelian officially evacuated Dacia and moved the Roman colonies south of

the Danube to the province of Moesia. Yet some of the Roman population may have remained. In any case trade between the empire and Dacia continued, and Romans continued to have contacts with peoples they considered Dacians into the sixth century.

CULTURE (*see also* THRACIANS)

Economy

The plain of Transylvania, north of the Danube, provided fertile farmland for the Dacians, who intensively exploited the iron, gold, and silver of the Carpathians north of the plain. As the Dacian state grew in power, religious ideology came to play an important role in the agricultural economy in terms of what was grown. King Burebistas had all vineyards dug up, as, in a development not well understood, the Dacian religion now demanded abstinence. Grain was transported to the highland, where the religious center was located, and stored in pits. Gold and silver were also stored there in enormous amounts.

Control of Trade Routes Burebistas's move westward to annex territory of the Boii apparently was motivated by a desire to acquire control over an important north-south trade route on which amber from the Baltic was a major commodity. At the same time he attacked and partly destroyed colonies on the Black Sea that had arisen as a consequence of trade between the Dacian region and Sarmatia, a circumstance hard to understand, as previously the trade with this area had carried valuable commodities to Dacia to be traded to the west, such as cattle, slaves, and grain. It may be that Burebistas desired more control over the Black Sea trade.

Coin hoards show the trade route the Dacians used westward to the Roman/western Mediterranean world: through the middle Danube region, which the Dacians had wrested from the Celtic Scordisci, to colonies on the Dalmatian coast across the Adriatic from Rome. Coins from these colonies have been found in Dacian territory, as have large amounts of Roman denarii. Dacians made copies of Roman coinage for use within their state. (This has been a matter of some controversy, as some Romanian numismatists, especially while Romania was under Soviet domination and they sought to emphasize Romanian nationality, have insisted that all or most of the coins found in Dacian territory were made there, regardless of whether they are closely similar to Roman coinage and seem to be genuine Roman coins, or of an inferior quality suggesting they

are copies probably made outside the aegis of Dacian royalty.)

Aside from coins the Dacians appear not to have imported any durable goods such as metalware or pottery but to have exported their own fine silverware and pottery. They seem to have acted as middlemen for foreign luxury goods but, perhaps for ideological reasons, kept none for themselves.

Government and Society

From the second century B.C.E. Dacian kings engaged in expansion of territory into a powerful state. The Dacian state was unusual in that it was nonliterate, at least at first, and that it did not have cities in the usual sense. However, their upland center did have a well-organized system of droveways called *plaiuri* that linked a high density of fortresses around Sarmizegethusa to open settlements and terraces with single dwellings. It may be that this complex functioned as a city. Interpretation of Dacian society from building remains is made difficult by Roman destruction; the Roman claim to have found a treasure hoard near Sarmizegethusa that contained an enormous amount of gold and silver suggests central control of the wealth coming to Dacia.

By the 80s B.C.E. the focus of Dacian power lay in Transylvania. King Burebistas held power in partnership with a religious leader named Deceneus, according to the sixth-century C.E. Gothic writer Jordanes (who used Greek writings as his source), a coupling of secular and spiritual power that was a feature of a number of central European groups, including Celts and GERMANICS. The SCYTHIANS, whose influence was still felt in the Lower Danube–Black Sea region, had also been ruled by a priest-king pairing. The spiritual center of the Dacian state was the circular sanctuary of Sarmizegethusa, thought to mirror in microcosm the circular ramparts of the Carpathians.

Under Burebistas's leadership a number of disparate tribes were welded to form a single powerful state covering roughly the present area of Romania. After some 20 years of consolidation Burebistas was in a strong position, able to command, according to the Greek historian Strabo of the first centuries B.C.E. and C.E., 200,000 warriors. After Burebistas's death the Dacian state broke into a number of smaller polities.

Dacian Isolationism The elaborate defensive layout of the complex of Sarmizegethusa in its remote mountain setting with its surrounding settlements, protected by a series of strategically

placed forts, gives a sense of Dacian society as isolationist and inward looking; of a people focused on religious worship, possibly in a seasonal round of festivals and observances, judging by the layout of the central sanctuary with its pillars representing the Dacian calendar. The fact that after the Romans under Trajan finally penetrated and destroyed this isolation the population left en masse is more evidence for this insularity and inward focus. Some scholars have hypothesized that the very vastness of the steppe and the ease of movement there, which constantly put different peoples in contact, fostered an intense need of individuals for ethnic identification both with their own group and against all others. The Dacians, perhaps inheriting this penchant from their Thracian forebears, may have found a group identity in life and ceremony carried out in their mountain sanctuary. When the Romans entered, the sort of Romanization that so many peoples in the Roman Empire embraced was for the Dacians unthinkable.

Military Practices

The Roman emperor Trajan celebrated his victory over the Dacians by erecting a column profusely carved with scenes from his war. The illustrations provide good evidence of Dacian military practices, dress, and other matters. Dacian soldiers are shown with relatively short hair (although not as short as the Romans') and trimmed beards (not the uncut manes and beards of such barbarians as Germanics, who sometimes drew up their long hair into top knots), evincing a certain level of civilization. They wear long trousers, showing the antecedents of Dacian culture in the horse-riding steppe world of first the Scythians and then the SARMATIANS. Although Trajan's column shows Dacian cavalry, most soldiers are on foot.

Dacian weapons included the short recurved bow of the steppes and a heavy curved sword, called a *falx* or *falas* (plural, *falces*), wielded with both hands. They used the latter to amputate arms and legs of the enemy. To counter this, Roman soldiers were equipped with arm and leg armor. One scene on Trajan's column shows Dacians wielding a ram-headed battering ram against a Roman fortress. They carried large oval-shaped shields of wood or hide edged with metal or iron plated. These were decorated with images that either proclaimed lineage or warded off evil.

Their religion, which promised immortality, caused the Dacians to be fanatical warriors, heedless of death.

Art

The Dacians created an art style in which the influences of Scythians and the Greeks can be seen. Their craftsmen were highly skilled in gold and silver working and in pottery making. Pottery was white with red decorations in floral, geometric, and stylized animal motifs. Similar decorations were worked in metal, especially the figure of a horse, which was common on Dacian coins.

Religion

Archaeologists have discovered what is probably a sacred precinct built on an artificial terrace high in the Orastie Mountains in Romania and have tentatively identified it with the Dacian sacred center named by ancient writers, Sarmizegethusa. The central feature of this precinct is an open area containing several concentric stone circles, the stones of different shapes. This is surrounded by a network of fortresses and temples. Features of the circular area seem to exhibit astronomical/calendrical alignments; if that interpretation is accurate, judging by the numbers of pillars, the Dacian calendar had 12 months, each of 30 days with five six-day weeks in each month.

The circular stone arrangement could in part have been symbolic of the arc of the Carpathians, offering a haven from the vastness of the steppes to the east. This vastness awakened in many societies in and around the steppe a need for a secure ethnic group with its own ideology and behavior clearly marking ethnicity. Dacian abstinence from drink and the vegetarianism of the inner core of the priestly class could have played this role.

The social order of the Dacian state was not based on kinship, but on centralized economic and religious power. The Greek writer Criton in his *Getica* says that Dacian kings deployed cunning and magic to overawe their subjects, whether wielded by them or by a priestly class of Dacians called *kapnobatai*, "smoke walkers." This name suggests they may have used cannabis, much grown in Thrace, to induce sacred trance states during which they communed with the gods (as did the shamans of northern Eurasia). They were celibate and ate no meat.

The God Salmoxis It is possible that Dacian religion had been influenced by the earlier Thracian worship of Salmoxis, a god who promised immortality to humans. (Herodotus, the Greek historian of the fifth century B.C.E., tells of

Salmoxis, a follower of the sixth-century B.C.E. mystic philosopher Pythagoras who traveled to Thrace and taught the Thracians the Pythagorean doctrine, which included the transmigration of souls into multiple lives.) Buddhist ideas could also have informed Dacian religion, and Judaism had reached the Bosporan kingdom of the Crimea by this time. The Dionysiac cult, which seems to have arisen in Greece through some kind of cross-fertilization of ideas with Thrace, could have reached Dacia in its evolved form, Orphism, which also promised immortality. Thracians of earlier centuries had also had hilltop sanctuaries. The Dacian priestly class may have emulated the Druids of the Celts.

No individual burials from the period of Dacian power have been found; rather, bodies were cremated, leaving bones to be buried in communal, barrel-shaped grave pits. This interment style is similar to Persian Zoroastrian practice.

The Dacian religion, as was that of the Celtic Druids, was powerful enough that when the Romans conquered Dacia, they razed all its temples to the ground.

Modern Romanians are a mix of many different peoples (see ROMANIANS: NATIONALITY). On the basis of the Romanian language (a Romance language related to Latin), some Romanians claim that the VLACHS of the region of Walachia are direct descendants of Daco-Romans.

Dál Fiatach (Darini; Darnii)

The Dál Fiatach are classified as a Celtic tribe. They lived in northeastern Ireland (present-day Northern Ireland) at least by the first century C.E. and are discussed as CELTS or IRISH. Scholars assumed they were the same people cited by the second-century C.E. Alexandrian geographer Ptolemy as the Darini.

Dalmatians (people of Dalmatia)

The name Dalmatians has been used in various historical writings to refer to the people living in Dalmatia, the coastal region of the Adriatic, extending across present-day Bosnia and Herzegovina, Serbia and Montenegro, and Croatia. Dalmatia, inhabited by the ILLYRIANS, was occupied by MACEDONIANS in the mid-fourth century B.C.E., and by ROMANS late in the first century B.C.E. In the fifth century C.E. GERMANICS under Odoacer of the SCIRI conquered the region but soon lost it to the BYZANTINES. SLAVS settled the area in the seventh century. Dalmatia was then alternately controlled by Croatian, Hungarian, Serbian, Austrian, and Italian dynasties. It was included in independent Croatia in 1991 (see CROATS: NATIONALITY).

Dál Riata (Dalriada; Dal Reti; Redoii)

The Dál Riata are classified as a Celtic tribe. They lived in northeastern Ireland (present-day Northern Ireland) and later southwestern Scotland, where they founded the kingdom of Dalriada by the fourth century C.E. Their ancestors are said to have been descended from a legendary line of Irish kings. Some among them are thought to have been of the ROBODI. They are discussed as CELTS, IRISH, or SCOTS.

Damnonii (Damnoni; Damnonians)

The Damnonii are classified as a Celtic tribe. They lived in Britain around present-day Glasgow in central Scotland; they are discussed as CELTS, or BRITONS, or SCOTS. They were defeated by the ROMANS under Gnaeus Julius Agricola in the 80s C.E. They probably had no connection to the DUMNONII of present-day southwestern England. By the sixth century descendants in the original homeland were part of a kingdom known as Strathclyde.

- 1914–18** Denmark is neutral throughout World War I.
- 1914–31** Isak Dinesen (Karen Blixen) resides on coffee plantation in Kenya; her novel based on her experiences, *Out of Africa*, is published in 1937.
- 1917** Poet Karl Adolph Gjellerup and novelist Henrik Pontoppidan win Nobel Prize in literature.
- 1918** Iceland is granted sovereignty.
- 1920** Northern part of Schleswig is awarded to Denmark by plebiscite.
- 1922** Nils Henrik David Bohr wins Nobel Prize in physics.
- 1928** *La Passion de Jeanne d'Arc (The Passion of Joan of Arc)*, a film directed by Carl Theodor Dreyer, gains international acclaim.
- 1940** Nazi Germany occupies Denmark during World War II although Denmark declares neutrality.
- 1944** Novelist and poet Johannes Vilhelm Jensen wins Nobel Prize in literature.
- 1945** World War II ends; Denmark joins United Nations (UN).
- 1949** Denmark joins North Atlantic Treaty Organization (NATO).
- 1973** Denmark joins European Community (EC).
- 1993** Denmark becomes one of original 12 members of European Union (EU).

Faeroe Islands. Olaf's mother, Margaret, united Norway, Denmark, and Sweden as the Union of Kalmar. Sweden won its independence in 1523, dismantling the Union of Kalmar. Denmark colonized Greenland in the 18th century.

During the Napoleonic Wars (1799–1815) the Danish navy was defeated, forcing the Danes to side with Napoleon. By the Peace of Kiel in 1814 Denmark ceded Norway to Sweden, and Helgoland to Great Britain. Then Denmark won Pomerania, which it later traded to Russia for Lauenburg. In 1849 a new constitution declared Denmark a constitutional monarchy.

In 1920 the northern part of Schleswig was awarded to Denmark by plebiscite. Iceland declared complete independence from Denmark in 1918; Denmark granted Greenland home rule in 1979.

CULTURAL IDENTITY

The geography of Denmark has played an important role in shaping Danish cultural identity. The Jutland Peninsula, except for a narrow portion, and nearby islands are set apart by sea from the European mainland. The proximity of its north coasts to Scandinavia

This photograph shows Danes in a courtyard in Nyborg, Denmark, in the late 19th or early 20th century. (*Library of Congress, Prints and Photographs Division [LC-USZ62-105975]*)

has given Denmark a decidedly Nordic character. Its language is a Nordic one. An important part of its economic life is based on seafaring—fishing, trade, and, during the age of Vikings, piracy.

In prehistoric times the people of what is now northern Danish territory, as did those in Sweden and Norway, experienced a lag in receiving cultural innovations—such as farming and metallurgy—as compared with the rest of Europe. And yet in the historic period Denmark's southern regions readily adopted innovations received from abroad. Danes, then, have long experienced sufficient isolation to create their own distinctive identity, a mix of Nordic and mainland Germanic elements, while absorbing other cultural influences. Somehow Danes have found a way to take in foreign influences without being overwhelmed by them, to be adaptable and at the same time stubbornly themselves. Moreover, they have been able to create cultural products that are distinctively Danish but of sufficient quality that they are

desirable to other peoples. A prime example of this is modern Danish furniture.

The great importance in modern Danish history of the “common” people—ordinary farmers and fishermen—has given Danes a populist outlook and a distrust for large institutions and for elites. The crucial role of Danish farmers in transforming Danish agriculture from wheat to dairy and pork farming, which in turn transformed Denmark from a poor to a prosperous country, has fostered their sense of pride and self-sufficiency. The folk high schools (for rural young people from 18 to 25 years of age), which began to be established in the mid-19th century, have had the same effect and have helped foster populist initiatives such as the agricultural cooperative movement. The populist outlook in Denmark caused the country to be in the forefront, in comparison to other countries in Europe, of electoral reforms, granting suffrage to the lower classes and to women in 1914–15.

Nonetheless the Danes' sense of hard-won, tenacious, and proud cultural identity has begun

to cause significant problems for Denmark in a Europe in which the old equation of ethnic identity and nationhood is no longer viable. The country's present difficulties in dealing with the "New Danes"—the many immigrants from abroad—were foreshadowed when after World War II Denmark refused to annex the former Danish territory of South Schleswig because it had a large German refugee population. Having abjured what would have been a valuable learning experience in integrating a population whose culture was not very different from their own, the Danes now must deal with the large numbers of immigrants, constituting about 4.5 percent of the population, from Morocco, Somalia, sub-Saharan Africa, Turkey, the Arab world, and the Far East, widely different from Danes in race and religion.

Dani

Dani is the Latin form of the term Danes. From the fifth century C.E. the Dani were mentioned as a people living first in present-day southern Sweden and on the island of Sjaelland, part of present-day Denmark (where Copenhagen is located), and, by the eighth century, the Jutland Peninsula, mainland Denmark. Their ancestry is not known with certainty, although they are assumed to be GERMANICS. Different Germanic tribes had lived in the region over the centuries, such as the ANGLES, CIMBRI, GOTHs, HERULI, JUTES, SAXONS, and TEUTONES. The VIKINGS who raided lands to the south included peoples from this region and were generally referred to as Danes on the British Isles.

Dardani (Dardanians)

According to ancient sources, the Dardani—variously grouped but probably ILLYRIANS—

lived west of present-day Belgrade in present-day Serbia and Montenegro in the third century B.C.E., their homeland in the ancient region of Thrace (and possibly there since the eighth century B.C.E.). They joined forces with the CELTS in 281 B.C.E., when the GREEKS refused to negotiate with GALATOI invading Macedon under Bolgius. That year these forces defeated and killed Ptolemy Keraunos, considered to be the first Greek leader to die at the hands of the Celts.

Dargwas (Darguas; Dargins)

The Dargwas are various Caucasian-speaking tribes—that is, CAUCASIANS—living for the most part in the northern Caucasus Mountains of central Dagestan, a republic in southwestern Russia, as well as in Stavropol Kray and the republic of Kalmykiya to the north. Their dialects are classified as part of the North-East (Dagestanian) branch of North Caucasian and are closely related to the dialects of the LAKS. The written form is based on the Akusha dialect and uses the Cyrillic alphabet. Among the subgroups of the Dargwas are the Akushas (the majority group), Khurkils (Urakhs), and Tsudakhars. The Kaytaks (Kaidaks) and Kubachis, although with varying traditions, have been classified among them.

Like other Caucasians, the Dargwas are considered indigenous to the region, perhaps maintaining tribal identity since the second millennium B.C.E. Over the centuries the Dargwas have been influenced by the many invading peoples from both Europe and Asia. Their economic life has been organized around trading, as well as herding and farming. They have maintained traditional extended family structures, as well as a village assembly and council of elders. They are primarily Muslims; Islam was introduced in the region by Arabs in the eighth–ninth centuries, although it did not become the majority religion until the 15th century; animist influences persist.

In 1991 Dagestan, consisting of 19 different ethnic groups, became a republic within Russia and subsequently a member of the Russian Federation.

(Dagestanian) Caucasic

northwestern Scotland at least by the first century C.E. and are discussed as CELTS, CALEDONIANS, or SCOTS. It is possible that they were PICTS and not Celtic speaking, however.

Deceangli

The Deceangli are classified as a Celtic tribe. They lived in Britain in present-day northern Wales and are further discussed as CELTS, BRITONS, or WELSH. In the late 40s C.E. the ROMANS under Publius Ostorius Scapula, the governor of Britain, marched against them. Tribal members probably made the island of Mona (Anglesey), a stronghold from which to resist the Romans until defeat by Suetonius Paulinus in 61 C.E.

Deciates

The Deciates are classified as a Celtic tribe. They lived in Gaul in the western Alps around present-day Antibes in southwestern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Demetae

The Demetae are classified as a Celtic tribe. They lived in Britain in present-day southwestern Wales and discussed as CELTS, BRITONS, or WELSH. Unlike the DECEANGLI, GANGANI, ORDOVICES, SILURES, and other tribes of Wales, the Demetae apparently did not resist occupation by the ROMANS in the first century C.E. Maridunum, on the site of present-day modern Carmarthen, became a *civitas* capital during the Roman occupation. They survived longer as a tribal entity than did Britons.

Derevlianians *See* DREVLANS.

Diablintes (Aulerci Diablintes)

The Diablintes are classified as a Celtic tribe. They lived in Gaul around present-day Jublains in northwestern France, probably between Le Mans and Bayeux, at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Didos (Didoi; Tsunti)

The Didos are various Caucasian-speaking tribes, living for the most part in the northern Caucasus Mountains of western Dagestan, a republic in southwestern Russia. Their dialects are part of the North-East (Dagestani) branch of North Caucasian and related to the

dialects of the neighboring ANDIS. A related language known as Avarish is used for writing (*see* AVARS). In addition to the Didos proper, Bezhtas other peoples grouped in their linguistic family are Bezhtas, Hinukhs, Hunzibs (Honzals), Kapuchis, and Khvarshis, each tribe with its own traditions.

As are other CAUCASIANS, the Didos are considered indigenous to the region, perhaps maintaining tribal identity since the second millennium B.C.E. Over the centuries they have been influenced by the many invading peoples in their homeland from both Europe and Asia but have maintained many of their traditional lifeways. Most Didos live in villages along the upper reaches of the Andi-Koisu and Avar-Koisu Rivers; some also live in the lowlands.

In addition to the traditional raising of livestock, especially sheep, oxen, horses, and goats, terracing has allowed for some farming in the rugged highlands, where wheat and rye are among the main crops. The majority of Didos are Muslims; Islam was introduced into the region in the eighth–ninth centuries. Animist influences persist, however. For part of their history some among the Didos also practiced Christianity. Traditional Dido society is regulated by two codes of law, customary law (*adat*) and Islamic law (*shariah*), the latter of which is administered by a Muslim cleric (*qadi*). A council of elders (*dzhamat*) directed the village assembly (*rukken*).

In 1991 Dagestan, consisting of 19 different ethnic groups, became a republic within Russia and subsequently a member of the Russian Federation.

See also RUSSIANS: NATIONALITY.

Dobunni

The Dobunni are classified as a Celtic tribe. They lived in Britain in the present-day county of Gloucestershire in central England and are discussed as CELTS or BRITONS. They issued coins sometime before the occupation by the ROMANS in the first century C.E. and reportedly established peaceful relations. Their tribe seems to have been divided into a northern and a southern faction. Corinium on the site of present-day Cirencester became a *civitas* capital during the Roman occupation.

Dorians (Doricians; Doric Greeks)

The Dorians are one of the four ethnic groups into which the ancient GREEKS, or Hellenes, divided themselves in historical times; the others, the ACHAEANS, AEOLIANS, and IONIANS. The

Dorians settled mainly on the Peloponnese Peninsula, on Crete and other islands, and on southern Asia Minor. The Spartans of the city-state Sparta traced their origins to Dorian tribes. A dialect of Greek and an order of Greek architecture take the name Doric from the Dorians.

ORIGINS

Before the classical period the term Dorian was primarily a linguistic designation for people speaking the Doric dialect of Greek. Thus it is extremely difficult to identify Dorians from prehistoric times before written records, which could be used to identify a people's name and language, were kept. It is known that after the Greek Dark Ages by about the eighth century B.C.E. Doric speakers were living on the Peloponnese in much of the territory that had been held by MYCENAEANS, Bronze Age Greeks who had built the first great Greek civilization (c. 15th century to c. 1200 B.C.E.). It is thus plausible that Doric speakers displaced the Mycenaeans, whose civilization collapsed with great suddenness in about 1200 B.C.E. Earlier material remains are mute: Skeletons, artifacts, and buildings, are the only remnants of the inhabitants of what would become Dorian territory. Therefore the existence of a Dorian ethnicity increasingly becomes a matter of speculation.

Nineteenth and early-20th-century scholars believed that waves of Bronze Age invaders entered Greece as early as the third millennium B.C.E. They identified one group of these invaders as being Dorian. However, this identification rests on very uncertain ground. It seems clear that many groups and cultural influences entered Greece from abroad as early as the Copper Age or even earlier. The first Indo-European speakers may have arrived (probably in small bands rather than waves of invaders) as early as the fourth millennium B.C.E. Throughout the Bronze Age Greece was in touch with a wider world through trade and small-scale movements of peoples, but again there is no positive evidence of the existence of Dorians. Writing first emerged in Greece with the Mycenaeans. From this period evidence for the dialects of later Greeks might be found; however, the Greek spoken by the Mycenaeans is similar only to the dialect called Arcado-Cypriot spoken in later times on Cyprus and in the remote mountain region of Arcadia.

There is evidence that warrior groups from the Danube region north of Greece

played some role in the demise of Mycenaean civilization, although their contribution was probably not decisive: only one of a number of factors involved. The fact that speakers of Arcado-Cypriot after the Dark Ages lived only on the margins of the Greek world, while Doric, Ionic, and Aeolic speakers dominated the Greek mainland, may imply that the ancestors of the latter three groups were among the warriors from the north who had arrived in Greece around 1200 B.C.E., probably taking part in the civil wars and raiding that were devastating the region and later settling lands abandoned by the fleeing Mycenaean elites.

It is possible that the Doric dialect or a precursor of Doric was introduced to regions suffering from the economic distress and depopulation of the Mycenaean systems collapse by newcomers accustomed to a simpler way of life independent of long-distance trade and the agricultural central planning engaged in by the Mycenaeans. Able to support themselves with subsistence farming and simple craft goods, Doric speakers could have taken advantage of the depopulated landscape. Doric together with the lifeways of its speakers could have been adopted by the local peasantry of the Peloponnese who had been left to their own devices by the collapse of Mycenaean authority. The extent to which these newcomers resembled or can be identified with Doric speakers of post-Dark Ages Greece is unknown.

The fact that Doric speakers were ruling Crete by the end of the Dark Ages may indicate that their ancestors took part in the raiding of the SEA PEOPLES, warrior groups of unknown eth-

nicity who attacked Egypt and probably other territories in the eastern Mediterranean region around the time of the Mycenaean collapse.

The political situation at the time historians first classified their ancestors has to be taken into consideration. The term the Greek Dark Ages refers to the period from about 1200 to 750 B.C.E., beginning with the collapse of Mycenaean civilization and lasting to what is called the Archaic Period. Because no written records were kept during this time, later Greeks—Athenians, Spartans and others—had little idea of their own early history. The Dark Ages lifted first in Asia Minor, where it is presumed that many mainland Greeks had fled the devastation of their homelands. Mainland Greek records of early contact with these Asian Greeks refer to them simply as Achaeans or Ionians.

In the *Iliad*, presumably written by Homer in the ninth or eighth century B.C.E., a small number of Greeks from a region called Doris in north-central Greece between Mount Parnassus and Mount Oeta are mentioned as Dorians, but they are not presented as an ethnic division. Yet, by about the eighth century, probably when the mainland poet Hesiod created a genealogy of the Greek settlers of Asia Minor in his *Theogony*, the Greeks there had separated into three communities, geographically and culturally distinct, from south to north, Dorians, Aeolians, and Ionians. A location on the Carian Peninsula of southern Asia Minor was known as Doris.

The Greeks of Asia Minor traced their origins to the mainland, it is thought, to validate their identity as Greeks in the face of pressure from the east, from peoples such as the Lydians and Persians. The three communities on Asia Minor grew powerful and vibrant, establishing colonies throughout the Mediterranean. Through the Archaic period, however, under threats from invading peoples the Greeks of Asia Minor began a slow decline, while a Greek renaissance began on the mainland and flowered into classical Greece.

In turn the Greeks of the mainland identified themselves with one or another of these ethnic divisions in Asia Minor and for political reasons fashioned complicated myths of their origins to fill in the darkness of their history. Since Sparta's rise in the sixth century B.C.E. the Spartans claimed Dorian descent. The interpretation of Dorians as austere and savage warriors may be due to their association with Sparta, or Sparta may have identified its own nature with a preexisting view of the Dorians. From the

fifth century B.C.E. the Spartans' principal antagonists, the Athenians, identified themselves with the Ionians, in order to distinguish themselves ethnically and culturally, because the Ionians of Asia Minor were regarded as more refined than the Dorians.

This ethnic posturing for political gain was temporarily interrupted by the Persian Wars of 500–449 B.C.E., since all the Greeks recognized their inherent similarities and banded together against what they considered barbarian invasions. The ancient ethnic groupings became largely irrelevant with the ascent of Alexander the Great of the MACEDONIANS in the fourth century B.C.E. and his unification of mainland Greece and founding of a Hellenic empire.

Origin Myth

The myth of Dorian origins, in addition being presented in the work of Hesiod, is found in the poetry of Tyrtaeus of the seventh century B.C.E., who composed to serve the Spartans, and in that of Pindar of the sixth–fifth century B.C.E. These early works identify the Spartans as descendants of one Dorus, a son of Hellen, ancestor of all the Greeks. Hellen was son of the pious Deucalion and Pyrrha, the only survivors of a flood sent by Zeus to destroy wicked humankind. Hellen was granted all of Greece, which his sons, Dorus, Xouthus (father of Ion and Achaeus, the supposed progenitors of the Ionians and Achaeans), and Aeolus (progenitor of the Aeolians), inherited. Dorus took as his inheritance the area called Doris.

According to the mythic writings under the leadership of Dorus or under Aegimius, a later king, the Dorians conquered the entire region of Doris, expelling the DRYOPES. Because of aid from Heracles in battling off invading LAPITHES, King Aegimius adopted Heracles' son, Hyllus, as his own. The Dorians of the Peloponnese grouped themselves into three clans, the Hylleis, Dymanes, and Pamphyloi, named from Hyllus and from Aegimius's two other sons, Dymas and Pamphylus. The adoption of Hyllus involved the Dorians in attempts by the Heraclidae to recover the Peloponnese from the Mycenaean king, Eurystheus. This version of events legitimized the invasion of the Dorians, in that they were returning the region to its rightful heirs. It also explains one of the key characteristics of religion in Dorian areas, which was the worship of Heracles.

This myth served several purposes. First it legitimized the Dorians, especially those of Sparta, as rightful rulers in the Peloponnese. It

also connected the Dorians to the other Greeks and explained the existence of a place named Doris in north-central Greece, which was no longer inhabited by Dorians.

LANGUAGE

The Dorians are identified with Doric, one of the main dialects of ancient Greek, but whether they spoke the language when they migrated or whether they took it up after settling among the remnants of the existing Greeks is not certain. Although most of the Greeks of the Peloponnese as of the sixth century B.C.E. spoke a language called Doric, including the Spartans who have been identified with the Dorian ethnic stock, there is no direct evidence to tie Doric Greek to the Dorians. The Dorians of Asia Minor spoke Aeolic in historical times, as did the Greeks of mainland Doris. Doric largely faded by the fifth century B.C.E., replaced in common speech by the Ionian and Attic dialects.

HISTORY

The early history of the Dorians is more that of an idea and a name than of a people. Historians from ancient times until the present, in treating the Dorians as an ethnic group, have tried to reconcile all the claims for Dorian kinship with mythical accounts, such as that of Hesiod's *Theocracy*.

The Greek Dark Ages

The Greek historian Thucydides dated the Dorian invasion about 80 years after the Trojan War described in the *Iliad*; the traditional date of the end of the war is 1200 B.C.E., although this time frame is impossible to verify. This was at the start of what is known as the Greek Dark Ages, when writing was lost, bureaucracy crumbled, commerce disappeared, the building of large temples and public works ceased, and decoration was reduced to geometric designs. The Dorians perhaps displaced other peoples or, as recent archaeological evidence indicates, filled the vacuum left by the Mycenaean collapse. In Sparta the Dorians of the Spartan city-state eventually enslaved a large part of the population of the surrounding region and subjected neighboring cities and towns to their hegemony. Dorians migrated to the Aegean islands of Crete, the Dodecanese and Sporades Islands, and Rhodes off the coast of Asia Minor, and from there to the southwest coast of Asia Minor. Rhodes and parts of Crete traced their descent to Dorians from Argos; Cnidus traced

its descent from Argos and Sparta; other Dorian cities in Asia traced themselves to Epidaurus.

In Asia Minor the Dorian city-states of Cos, Cnidus, and Halicarnassus formed a confederacy with three city-states in Rhodes and called it the Hexapolis. On the Greek mainland various Greek ethnic and linguistic groups organized themselves into independent city-states. Most peoples of the Peloponnese, including those of Sparta, Corinth, Aegina, Argos, and Megara, identified themselves as Dorian, speaking the Doric dialect, except the inhabitants of Arcadia, a relatively inaccessible region where Arcado-Cypriot was spoken, and the region of Attica, including the city of Athens, where Ionic was spoken. The Ionians may have been another group of northern warriors who took advantage of the demise of Mycenaean authority and the depopulation that resulted from the events at the end of the 13th century.

The Rise of City-States

Evidence from Argos, a formerly Mycenaean-era city that would later become a powerful Dorian stronghold, illustrates the process by which Doric-speakers settled and rose to dominance in the Peloponnese. Although most of the region surrounding Argos (called the Argolid) seems to have been deserted for centuries after the Mycenaean collapse, there is evidence of continuity of settlement at Argos itself, although on a much lesser scale than in Mycenaean times. The city probably had shrunk to mere village size. At some point during the Dark Ages Doric speakers came to power in the Argolid; this is known because by the time of the post-Dark Age Archaic period, there was an important Dorian city on the site of Mycenaean Argos. It is thought that the first Dorians to take hold in the Argolid numbered no more than in the hundreds, with their leader having the status of a village chief, but by the Archaic period Dorian Argos dominated not only the Argolid but most of the Peloponnese (until the rise of Dorian Sparta).

The Dorian Argives are thought to have developed the cult of Apollo and to worship the Olympian goddess Athena. But they also had cult places at sites where the Mycenaean goddess Hera (Era) had been worshipped and, in the late eighth century B.C.E., they built for Hera a temple that was the first post-Dark Age construction to approach in scale the "Cyclopean" building projects of the Mycenaeans. They placed this Heraion (temple to Hera) at a site, Prosymna, where Mycenaean Hera had probably

been worshipped, showing a desire to associate themselves with her divinity.

The timing of this construction is interesting because it was contemporary with the crystallization of the Homeric epics in which the patriarchal dominance of Olympian Zeus over all the gods and particularly Hera is firmly established. Hera is portrayed by Homer in a most unflattering light, alternately seething with bitter rage against Zeus and the Trojans, ignominiously dominated by Zeus, and presented by the poet in an ironic, almost humorous way that functions to provide comic relief from the tensions of the story. This triumph of patriarchy has long been cited as having been brought by the Dorians. Thus the building of the Heraeum by the Dorian Argives gives evidence of a more complex process than this.

Sparta and Corinth rose to prominence in the seventh century B.C.E. Before 500 B.C.E. Sparta founded the Peloponnesian League, a confederacy of allies, including Corinth. Historical records indicate that from the eighth to the sixth century B.C.E. Dorian city-states established colonies in Tarentum in southern Italy and on the south coast of Sicily, from Syracuse in the west to Selinus in the east. The Dorians also founded settlements in Africa (at Cyrene) and on the Black Sea coast. Of the Dorian city-states Corinth, a maritime power, was the most active colonizer.

CULTURE (see also GREEKS)

Because of their association with Sparta and with the Greek Dark Ages the Dorians were regarded as warlike and austere, but the fifth-century B.C.E. Ionian historian Herodotus viewed the Dorian simply as the ordinary uneducated Greek. The supposed Dorians of the Peloponnese spoke Doric, tended to worship the mythological figure Heracles (Hercules to the ROMANS), and divided themselves into three clans, the Hylleis, Dymanes, and Pamphyloi. The Dorians of Asia Minor were more influenced by their Greek neighbors to the north and spoke Aeolic but generally also divided themselves into the three tribes; followed a standardized traditional calendar, with the Hyacinthia and Carneia as the principal festivals; and worshipped the god Apollo as well as Heracles.

Dwellings and Architecture

The Greeks of the Peloponnese after the collapse of the Mycenaean civilization slowly redeveloped large-scale construction, probably beginning with sun-dried bricks and wood,

later replaced by stone. The oldest temple existing in what is called the Doric style is the massive Temple of Hera at Olympia, or Heraeum, constructed with wood on a limestone foundation in about 600 B.C.E. The wood was later replaced with the stone that we find now. Aside from the hulking size, what distinguishes the Doric style are the temples' Doric pillars (which are different from the later Ionic and Corinthian styles). Each pillar is constructed of a heavy column without a base, which, slightly convex, tapers toward the capital, a square stone sitting atop a tapered disk.

Other Technologies

The Dorians are by tradition associated with the beginning of the Iron Age in Greece and the technology of iron smelting. The development of iron smelting and hard iron weapons associated with the Dorian invaders was attributed by the ancients to the downfall of the Bronze Age civilization of the Mycenaeans or Achaeans—the Greeks of the Trojan War—and to the rise of the Greek Dark Ages. Yet archaeology has shown that the raiders from the north had bronze, not iron weapons. It is more probable that iron working developed in Greece after the loss of the Mycenaean trade network that had supplied tin and copper needed for bronze from afar—the tin from as far away as Cornwall in Britain. The technique for iron working itself probably was introduced from the Near East.

Literature

The Doric dialect is found in the sixth–fifth-century B.C.E. lyric poetry of Pindar and in the third-century B.C.E. pastoral poems of Theocritus and survived in the choral sections of classical Greek tragedy, which are traced to the oldest forms of Greek drama.

◆

The study of the Dorians, as is the case with all the ancestors of the ancient Greeks, is a prime example of how myth, linguistics, and archaeology all play a part in historical studies and how, in attempting to classify peoples, it is important to keep sources of information with their relative strengths and weaknesses in mind.

Dregovichians (Dregovichi; Dregoviches)

The Dregovichians are classified as a tribe of Eastern SLAVS, living along the Berezina and Pripyat Rivers in present-day southern Belarus probably by the early sixth century C.E. Probably in the eighth century they established a principality centered around Turov and held territory northeastward toward the Dnieper River.

In the second half of the ninth century with other Slavic peoples they came under the suzerainty of the RUS of the Kievan Rus principality, paying tribute to them and serving under their princes in military campaigns, including the attack by Oleg on the BYZANTINES of Constantinople (modern Istanbul) in 907.

With other Slavic tribes in the region—DREVLANS, KRIVICHANS, POLOCHANANS, and RADIMICHANS—the Dregovichians are considered ancestral to modern Belarusians (see BELARUSIANS: NATIONALITY).

Drevlyans (Drevlyane; Drevliane; Drevlians; Drevlane; Derevlians; Derevlianians; Derevlane; Vervians)

The Drevlyans were a tribal confederation of Eastern SLAVS, living to the northwest of Kiev and south of the Pripyat River in present-day northern Ukraine and southern Belarus probably by the early sixth century C.E. Their name means “people of the forest.”

In the second half of the ninth century with other Slavic peoples the Drevlyans were under the suzerainty of the RUS of the Kievan Rus principality, paying tribute to them and serving under their princes in military campaigns, including the attack by Oleg on the BYZANTINES of Constantinople (modern Istanbul) in 907.

In 945 a party of Drevlyans, angered by the unfair collection of tribute by the Rus prince Igor, killed him. His wife, Olga, who served as regent for their son, Svyatoslav, exacted revenge. According to legend she accepted a marriage proposal from Prince Mal of the Drevlyan. Olga told Mal that she would only go to him if he sent his nobles and lords to accompany her. When the lords arrived, they were offered a steam bath, during which the bathhouse was locked and burned down. Also,

according to legend, she demanded three pigeons and three sparrows from each Drevlyan family as a sign of reconciliation. On release the birds returned to Drevlyan houses, identifying them for her soldiers. In any case the Rus were said to have burned Iskorosten to the ground, and Olga reorganized the system of tributes and promoted Christianity among the Drevlyans and other Slavic tribute tribes, for which she was canonized by the Catholic Church.

With other Slavic tribes in the region—DREGOVICHANS, KRIVICHANS, POLOCHANANS, and RADIMICHANS—the Drevlyans are considered ancestral to modern Belarusians (see BELARUSIANS: NATIONALITY).

Duklianes

The Duklianes were a tribe of Southern SLAVS whose territory was near the abandoned Roman town of Dioclea near modern Montenegro. At the turn of the 10th and 11th centuries C.E. they joined with a tribe to their west, the Travunianie, to form a state called Duklianie, which comprised present-day Montenegro and parts of present-day southern Bosnia and Herzegovina. Duklianie was conquered in turns by the SERBS, the BYZANTINES, the western BULGARS, and the Byzantines again, before it finally achieved independence in the mid-11th century. Much of the region later became the kingdom of Montenegro (see MONTENEGRINS; SERBS: NATIONALITY).

Dulebians (Dulebi; Duleby; Dulebs; Doulebes; Doudelebi)

The Dulebians were a tribe of Eastern SLAVS, who lived northeast of the Carpathian Mountains between the Dniester River and Western Bug and Southern Bug Rivers in present-day western Ukraine probably by the early sixth century C.E.

The Dulebians competed with the AVARS in the late sixth to early seventh centuries. A tribal federation formed among them consisted in part of Slavs formerly known as ANTES. Some scholars consider the ULICHANS a branch tribe of the Dulebians.

In the second half of the ninth century with other Slavic peoples the Dulebians fell under the suzerainty of the RUS of the Kievan Rus principality, paying tribute to them and serving under their princes in military campaigns, including the attack by Oleg on the BYZANTINES of Constantinople (modern Istanbul) in 907.

language:

Brythonic (Celtic)

The Slavic-speaking groups that later became known as **PODILIANS**, living in the region of Podilia, and the **VOLHNYIANS**, living in Volhynia, are thought to be partly descended from the Dulebians.

Dumnonii (Dumnoni; Domnainn)

The Dumnonii are classified as a Celtic tribe. They lived in Britain in the former counties of Cornwall and Devon in present-day southwestern England at least by the first century B.C.E. and are discussed as **BRITONS** or **CELTS**.

The Dumnonii apparently did not resist the **ROMANS** in the first century C.E. *Isca Dumnoniorum* on the site of present-day Exeter was a *civitas* capital during the Roman occupation.

Dumnonii, known as Domnainn, probably the same people, also lived in Ireland at some point in the centuries B.C.E. Tribal members went to live on the north coast of Brittany in present-day France in the fifth century C.E., in an area that became known as Domnonee. The Dumnonii probably had no connection to the **DAMNONII** of present-day central Scotland.

By the sixth century Dumnoii descendants were part of a British kingdom in the original homeland known as Dumnonia. Modern-day descendants are referred to as **CORNISH**.

Durocasses (Durocassi)

The Durocasses are classified as a Celtic tribe. They lived in Gaul around present-day Dreux, west of Paris, in northern France at least by the first century B.C.E. and are discussed as **CELTS** or **GAULS**. Dreux takes its name from the tribal name.

Durotriges

The Durotriges are classified as a Celtic tribe. They lived in Britain in the present-day county of Dorset and southern parts of Somerset and Wiltshire in southern England and are discussed as **CELTS** or **BRITONS**. They are thought to have been a confederation of smaller tribal groups. They resisted the **ROMANS**, but Vespasian, a general for the emperor Claudius I in the 40s C.E., destroyed 20 of their hill forts and subdued them. Durnovaria, on the site of present-day Dorchester, became a *civitas* capital during the Roman occupation; Lindinis, on the site of present-day Ilchester, later became the capital of a second Durotrigean *civitas*.

Dutch: nationality (Hollanders; people of the Netherlands)**GEOGRAPHY**

The North Sea flanks the Netherlands to the north and west; Germany borders the Netherlands to the east; Belgium lies to the south. The Netherlands is part of the Benelux countries with Belgium and Luxembourg. The mainland has an area of 16,003 square miles. Nearly half of the country's landmass is below sea level, mostly in the west. Canals, rivers, and clay- and peat-soiled lands mark the terrain. Agricultural lowlands are found to the east and south. The foothills of the Ardennes lie in the southern Limburg province, where Vaalserberg (1,053 feet), the highest peak, is found. Dunes make up the northern and southern coastlines. Eroded dunes formed the West Frisian Islands and the tidal sea Waddenzee. Many of the sea arms are being drained and reclaimed, land known as *polders*. The principal rivers include the Rhine and its tributaries (the Waal, the Nederrijn, the Maas, and the Schelde).

INCEPTION AS A NATION

GAULS and **GERMANICS**, in particular the **BATAVI**, **FRISIANS**, and **FRANKS**, once inhabited the region that became the Netherlands. It was also occu-

pied by the ROMANS. During the ninth and 10th centuries C.E. Scandinavian raids within the Netherlands forced unification among local defenses. This led to the gradual formation of powerful Dutch city-states. In 1555 the region including the present-day Netherlands fell under Spanish rule. The large Calvinist population organized revolts against Catholic Spain, and in 1579 the provinces of Holland, Zeeland, Utrecht, Gelderland, Overijssel, Friesland, and Groningen banded together to form the Union of Utrecht, declaring their independence in 1581. Intermittent wars with Spain continued until the end of the Thirty Years' War in 1648; the Peace of Westphalia officially recognized the independence of the United Provinces and passed the regions of North Brabant, with Breda, and part of Limburg, with Maastricht, to the United Provinces.

The country prospered throughout the 1600s, adding large colonial and trading territories to its control. In the 18th century the United Provinces engaged in a series of wars with Britain and France. The country lost several colonies under the Treaty of Paris in 1783, end-

ing the American Revolution. During the Napoleonic wars (1795–1813) France occupied the entire region; Napoleon established the Kingdom of Holland in 1806. After Napoleon I Bonaparte's defeat France took control of the kingdom until the Congress of Vienna in 1814 reestablished the Netherlands as an independent nation. It consisted of the former United Provinces and present-day Belgium. Belgium seceded in 1830.

After German occupation of the Netherlands during World War II (1940–45) the nation reinstated its former government. Throughout the latter part of the 20th century the Netherlands relinquished and ceded colonies, notably including Netherlands Antilles and Aruba as equal members of the kingdom, hence forming the present-day Netherlands.

CULTURAL IDENTITY

The Dutch have long had a reputation for tolerance and for an open society that has attracted freethinkers, humanists, liberals, and those seeking religious freedom. The Dutch writer Desiderius Erasmus was a powerful proponent

Dutch: nationality time line**C.E.**

- 870** Netherlands unites under East Frankish kingdom.
- 925** Netherlands is part of Holy Roman Empire.
- 1300–1400** Low Countries (Netherlands, Belgium, and Luxembourg) are united by French dukes of Burgundy.
- 1477** Low Countries join Hapsburg Empire when Mary of Burgundy marries Maximilian I of Hapsburg family.
- 1516** Charles, king of Low Countries, becomes Charles I, king of Spain.
Hiëronymus Bosch is mentioned as *Insignis pictor* (distinguished painter) in official records at time of his death.
- 1524–26** Desiderius Erasmus disputes with Martin Luther over extent of Protestant Reformation.
- 1555** Philip II, son of Charles, controls Low Countries; persecution of Protestants persists.
- 1566** Dutch begin to rebel; southern Catholic provinces support Spanish rule; northern Protestants revolt.
- 1568** William I, prince of Orange, revolts against Spanish government.
- 1579** United Provinces, including Holland, Zeeland, Utrecht, Gelderland, Groningen, Friesland, and Overijssel, form Union of Utrecht.
- 1581** Protestant provinces of Low Countries declare independence; independence is not recognized by Spain.
- 1602** Dutch East India Company is formed.
- 1624** Dutch West India Company is formed.
- 1630–54** Dutch control Brazil; acquire Netherlands Antilles and Aruba.
- 1631** Rembrandt settles in Amsterdam as portrait painter and teacher.
- 1644** Frans Hals becomes dean of painters' guild.
- 1648** Spain recognizes Netherlands' independence after years of Spanish-Dutch conflict.
- 1652–74** Netherlands battles against England in naval wars; Netherlands wins Suriname; England wins New Netherland.
- 1653** Johannes Vermeer is admitted to painters' guild.
- 1659** *Systema Saturnium* by astronomer Christiaan Huygens is published, in which he records discoveries of moon of Saturn and true shape of Saturn's rings.
- 1677** Philosopher Baruch Spinoza's *Ethica Ordine Geometrico Demonstrata*, or *Ethics*, is published posthumously.
- 1689** William III marries Mary II of England; in what becomes known in England as Glorious Revolution, William deposes James II of England without bloodshed and assumes English

of humanism in the 16th century. In the 17th century Holland's atmosphere of open inquiry induced the French philosopher and mathematician René Descartes and the English philosopher John Locke to live there. The fact that Holland was a republic and had had a long history of participation in governance by the merchant class tended to foster an atmosphere of discourse in which reason and objectivity—essential qualities for successful business endeavor—were highly regarded. Although the

Dutch Reformed Church was the state religion, the Dutch government had a policy of de facto toleration of other faiths as long as their practitioners did not attract public notice of their worship—not the degree of religious freedom expected today, but a very liberal policy for the time.

Today the Dutch take great pride in their cultural heritage. Support for the arts is not limited to preserving and appreciating works of the past, however. The government is heavily

Crown; Louis XIV of France attacks Netherlands in hope of annexing territory, leading to more than 20 years of war.

1701–14 Netherlands continues struggle with France in War of Spanish Succession.

1774 Naturalist Antoni van Leeuwenhoek begins studies of microorganisms with microscopes he has built.

1780 Great Britain starts naval war with Netherlands, motivated by American-Dutch allegiance during American Revolution.

1784 Great Britain defeats Dutch.

1795–1813 During Napoleonic Wars France occupies Netherlands.

1798 Royal Library (Dutch national library) is founded in the Hague.

1806 Batavian Republic becomes Kingdom of Holland.

1810 Napoleon I Bonaparte makes Kingdom of Holland part of France.

1815 Netherlands unites with Belgium and Luxembourg to form independent kingdom.

1830 Belgium establishes independence from Netherlands.

1885 First issue of review *De Nieuwe Gids* (The new guide), created by Willem Kloos and other writers, begins Dutch literary revival.

1886 Painter Vincent van Gogh moves to Paris.

1888 Concertgebouw, concert hall in Amsterdam, is completed, and Concertgebouw orchestra is founded.

1914–18 During World War I Netherlands remains neutral.

1917 Painter Piet Mondrian and other artists found De Stijl art review; Stijl group develops theories of “neoplasticism” involving reduction of paintings to primary colors, noncolors, and straight lines.

1922 Women win right to vote.

1939–45 During World War II Nazi Germany occupies Netherlands; Dutch government flees to London.

1945 Netherlands becomes part of United Nations (UN).

1949 Indonesia, former Dutch colony, wins independence.

1957 Netherlands joins European Economic Community (EEC), which evolves into European Community (EC).

1962 Indonesia gains control of Netherlands New Guinea.

1975 Suriname, former Dutch colony, becomes independent nation.

1986 Aruba gains independence from Netherlands Antilles; both become equal members of Kingdom of the Netherlands.

1993 Netherlands becomes one of original 12 members of European Union (EU).

involved in subsidizing artists working today in various media. Moreover, the Dutch tradition of free expression lives on in the care with which the government refrains from involving itself directly in control of cultural enterprises.

The Netherlands continued to be a mecca for people seeking freedom of action and expression into the 20th century. Members of the United States counterculture flocked there in the 1960s and 1970s, in large part because of the Netherlands’ liberal drug policy. The gov-

ernment effectively decriminalized marijuana use in 1976, and it is available for purchase in small quantities by adults in licensed coffee shops. Meanwhile the country is still among the most tolerant concerning freedom of expression of all kinds and attracts people with radical or progressive politics from all over the world.

The Netherlands, with so much of its land artificially made and maintained with dykes and canals, is very densely populated. For this

reason it has long been necessary for the Dutch to find ways of working together for the mutual benefit of all and to develop social institutions that can minimize tensions among different groups in Dutch society, especially the different religions. One such institutional organization that was important until the 1960s is the *pillar* (group) system. There were three basic *pillars*, Protestant, Roman Catholic, and nonsectarian or public. In education, politics, the communications media, medicine, the trade unions, and other segments of Dutch life each *pillar* had its own institutions; for example, schools belonged to one of the three *pillars*. Most Dutch, then, went to school or hospital, read newspapers, and met in other social organizations with others of their religious or nonsectarian group. With increasing liberalization of religious doctrine after the 1960s the division between religious and pub-

lic pillars lessened greatly and in many cases these joined, while some institutions ceased to be part of any *pillar*. Thus the *pillars* nowadays have much less significance in the life of individual Dutch.

E

Eblani (Blanii; Ebdani)

The Eblani are classified as a Celtic tribe. They lived in the present-day counties of Dublin and Meath in eastern Ireland at least by the first century C.E. and are discussed as CELTS or IRISH. The city of Dublin was formerly known as Eblana.

Eburones (Eburonii; Ebourones; Eberones)

The Eburones are classified as a Celtic tribe, although they probably had GERMANICS among them as well. They lived in Gaul west of the Rhine in present-day northeastern Belgium and southeastern Netherlands. Discussed as CELTS or GAULS, they were among the tribes Julius Caesar considered BELGAE. According to some Roman sources the Eburones had the largest and strongest rebel army in all of Gaul, some 60,000 men. After they had attacked the ROMANS under their leader Ambiorix in 54 B.C.E., they were practically exterminated by troops under Caesar the next year.

Eburovices (Ebuovici; Aulerci Eburovices; Eburatici)

The Eburovices are classified as a Celtic tribe. They lived in Gaul around present-day Evreux in northern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. Evreux takes its name from the tribal name.

Eceni *See* ICENI.

Eduens *See* AEDUI.

Eleuteti (Eleutheri)

The Eleuteti are classified as a Celtic tribe. They lived in Gaul along the Aveyron River in present-day southern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. They were perhaps a subgroup of the CADURCI.

Elusates

The Elusates are classified as a Celtic tribe. They lived in Gaul around present-day Eauze in southwestern France and are discussed as CELTS or GAULS. They surrendered to the ROMANS under Julius Caesar with the fall of Aquitania in 56 B.C.E. Elusa on the site of Eauze became a *civitas* capital in Roman Gaul; Eauze takes its name from the tribal name.

Elymi (Elimi)

The Elymi are one of three indigenous populations of Sicily whom the GREEKS encountered as they colonized the island during the Archaic period (starting about 700 B.C.E.). Archaeologists disagree on whether the Elymi are distinct from or closely related to the other two Sicilian peoples, the SICANI and SICULI. The Elymi inhabited the northwestern corner

424 Elymi alliance with Athens

397 Elymi attacked by Greeks of Syracuse

307 Greeks sack Segesta.

of Sicily in present-day Italy sometime in the second millennium B.C.E.

ORIGINS

Ancient historians identified the Elymi as descendants of the Trojans of Asia Minor. Modern theories suggest they may be the descendants of LIGURIANS, who crossed the Tyrrhenian Sea to Sicily from the Italian Peninsula during the Bronze Age. Others suggest the Elymi ancestors include both indigenous and intruding populations. Archaeological and linguistic evidence remains inconclusive on the origins and identity of these people, who inhabited independent cities.

LANGUAGE

Only minuscule fragments of the Elymi language remain, from a Greek inscription of the fifth century B.C.E., but not enough to determine whether the Elymi were an Indo-European-speaking people or not.

HISTORY

Segesta was the most important Elymi city during historical times. After 700 B.C.E. the Greeks established the colony of Selinus on Sicily's south coast, and the CARTHAGINIANS established Motua in the northwest. From 580 B.C.E. the Elymi at Segesta were engaged in boundary disputes with the Greeks of Selinus. Toward the end of the sixth century B.C.E. the Carthaginians conquered the Elymi city of Erice. In the mid-fifth century B.C.E. the Elymi entered into dealings with Athenians and they formed an alliance with them in 424 B.C.E. during the Greek civil wars.

After the defeat of Athens the Elymi joined into an alliance with the Carthaginians, in which the Carthaginians took over most of the authority. Segesta was besieged in 397 B.C.E. by

Dionysius the Elder, the powerful tyrant of the Greek city-state of Syracuse on Sicily, but was finally rescued by a Carthaginian force. Then in 307 B.C.E. the Greek general Agathocles sacked Segesta, killing 10,000 of the Elymi.

After the Punic Wars of the Carthaginians and ROMANS of the third and second centuries B.C.E. the Elymi were swallowed into the expanding territory of Rome and Latinized.

CULTURE

Little is known of Elymi culture other than that they were highly influenced in art and culture by the Greeks and Carthaginians, and later by the Romans.

The location of the island of Sicily in the central Mediterranean has attracted settlement by many different peoples. The most ancient known inhabitants—the Elymi, Sicani, and Siculi, who themselves probably migrated there from elsewhere—were caught up in the wars for their homeland between major Mediterranean powers.

English (Engle; Anglo-Normans; people of England)

England is a region in the southern part of the island of Great Britain in the British Isles. Scotland and Wales are the two other regions. The peoples of all three regions—the English, SCOTS, and WELSH—have distinct traditions, as do the peoples of the island of Ireland to the west, the IRISH. The administrative divisions of England—Scotland, Wales, and Northern Ireland—make up the present-day nation of the United Kingdom, or officially the United Kingdom of Great Britain and Northern Ireland (see BRITISH: NATIONALITY).

ORIGINS

The defeat of the ANGLO-SAXONS by the NORMANS in 1066 created the conditions for the emergence of the English in the modern sense of the word. Previously the term English had referred solely to Anglo-Saxons (Angli later transformed to Old English to Engle, which evolved into Engla-land and eventually English). But as the Norman ruling families in Britain, called by modern scholars Anglo-Normans, focused more of their energies on their lands and political ambitions there than in France, a new tradition emerged.

ENGLISH**location:**

English

LANGUAGE

The Old English language evolved into the strongly French influenced Middle English, which evolved into modern English.

HISTORY

Norman Consolidation

Armed Anglo-Saxon resistance to the Normans was at first local in response to local issues, such as misrule by officials and Norman landholders. Long accustomed to taking their cue from the Old English Crown, the *thegns* (thanes) lacked a leader to rally around. Only in 1069 did an organized rebellion occur, led by the Northumbrians, who had long resented rule from the south and had previously rebelled in 1065 and 1066 against Harold, the last Anglo-Saxon king of England. With assistance from Scotland and Denmark Northumbrians marched against the castle at Durham, massacring its garrison, then laying siege to York. Soon earls and other local leaders all over the north of England were up in arms. The response of William the Conqueror, king of England, was brutal. Building numerous simple castles of mounded earth and timber, which could be erected within as little as six days, to serve as hubs for lightning raids by his mounted knights, he quickly gained control of the territory and then proceeded with a scorched-earth campaign of destruction so complete, people were reduced to eating cats and dogs, and the area was a useless wasteland for decades thereafter.

William and later Anglo-Norman monarchs also sought to project their power beyond their own borders. Wales, Scotland, and Ireland nevertheless remained largely independent. Scotland was a united kingdom; the various smaller kingdoms of Wales and Ireland over time generated a series of powerful leaders who tried to unite their country under their rule.

Norman Rivals

The Norman cohesion that William had managed to achieve collapsed on his death, as he divided Normandy and England between two of his sons, who soon were at war with one another. Only their younger brother, Henry I, who gained the English throne after his brother was killed while hunting, was able to consolidate his hold on England as his father had. The fact that when his daughter Matilda succeeded him as monarch in 1135 a powerful faction of Anglo-Norman barons immediately revolted against her illustrates the continued precariousness of the Anglo-Norman monar-

chy. Henry's nephew Stephen of Blois headed the revolt, which in part was driven by mainland politics because Matilda had married Geoffrey of the powerful house of Anjou (whose members were called Angevins) in France, great rivals of the dukes of Normandy. Three years after Stephen seized the throne, he was attacked by Geoffrey, and a long, devastating, and inconclusive civil war ensued, neither side able decisively to defeat the other. Other barons not primarily involved in the Matilda-Stephen rivalry took advantage of the political vacuum caused by Stephen's distraction with the war to plunder weaker lords, and general lawlessness gripped the land. Even after Matilda abandoned her claims to the throne in 1148, Geoffrey, now duke of Normandy, mounted a new invasion led by his son Henry in 1153. When Stephen's son and heir Eustace IV died the same year, Stephen agreed to reunite the Anglo-Norman kingdom by naming

- 1707** England and Scotland are formally united, forming Great Britain.
- 1801** Ireland is formally united with Great Britain.

Henry as his successor. Stephen died the following year.

Henry II and Thomas Becket

Henry II's reputation has been clouded by the murder, possibly at his command or possibly by mistake, in 1170 of Thomas Becket, the archbishop of Canterbury. Becket had been Henry's chancellor, the most powerful commoner in the land, and had applied his considerable talents on Henry's behalf with much success. Thus, when the see of Canterbury became vacant, Henry thought Becket as archbishop would prove a powerful ally in his struggle for dominance with church leaders. Whether because he had a spiritual awakening or because his ambitions now centered on the church, the formerly worldly and irreligious Becket turned against Henry and opposed his plans as vigorously as he had once promoted them. His opposition to Henry's coronation of his son particularly infuriated the king and led to Henry's famous outburst, "Will no one rid me of this turbulent priest?" Four of his barons interpreted him literally and carried out his presumed wishes, by murdering Becket in Canterbury Cathedral. Whether Henry had simply been carried away by rage, never intending his order to be executed, or whether he had feigned rage to cast this very doubt on his intentions and avoid culpability in the affair, has been the subject of speculation for centuries. But the rivalry of Henry and Becket—of a king and a minister of common descent—formed a paradigm of English and later British political life that continued to be a living reality up to the 20th century.

Henry II's later years had been dominated by intrigue surrounding his domains in Normandy, Anjou, and Aquitaine. England and large areas of France (almost half its landmass) remained under the joint rule of Richard and John, but the ambitions of the powerful French monarchy made the situation increasingly untenable under them and succeeding rulers, and by the 13th century the French lands were lost to the English Crown.

Edward I, Wales, and Scotland

In the 13th century Edward I made decisive moves toward the annexation of Wales, seizing control of Welsh territory that Llywelyn ap Gruffudd, among the most powerful leaders in Welsh history, had managed to dominate, partly because of the weakness of Henry III. After a massive invasion in 1276 Edward defeated Llywelyn, dismembered his kingdom of

Gwynedd, and asserted his lordship over the Marcher lords. In 1301 he vested authority for Wales in his eldest son, beginning the tradition that the heir apparent to the English throne be given the title of prince of Wales.

During the same period Edward attempted to assert his overlordship in Scotland, deposing the reigning king and after an invasion removing the coronation Stone of Scone to England. His initiative would be resisted by Scots for years thereafter. Edward introduced England into the network of international finance by inviting Italian bankers to London. In return for their loans he granted them the revenues from a tax on wool, Britain's principal export at this time, which the Italians collected directly.

Peasants' Revolt

The Peasants' Revolt of 1381 was the first mass uprising by commoners in English history. Profound socioeconomic shifts caused by the devastation of the bubonic plague, or Black Death, which had ravaged England 30 years before, had increased the power of laborers, who were able to demand higher wages. The immediate cause of the revolt was the imposition of a poll tax on every man in England. Despite its name the revolt was led by small property holders called yeomen, who were becoming an important social force as more and more peasants were able to accumulate wealth. One of the leaders of the revolt was John Ball, an itinerant preacher who was inspired by the ideas of John Wycliffe, a reformist cleric who rejected church hierarchy and insisted that the Bible was the only true religious authority. (The epidemic known as the Black Death had had a disproportionate effect on the clergy. The loss of so many people led to recruitment into the church of men without the traditional education of clerics. In many cases these recruits had differing outlooks on religion and challenged the church's organization and assumptions in parallel with the forces in society at large.) Wycliffe had preached that the pope and higher clergy were no more certain of salvation than the lowliest peasant. Ball took this egalitarianism a step further, comparing the relationship to serfdom.

The effects of societal changes were also felt in Parliament at this time. In the so-called Good Parliament of 1376 the first challenges to royal power from outside the aristocracy occurred as opposition to increasing taxes by Edward III, led not by the barons but the "commons" in Parliament.

End of the Hundred Years War

After decades of conflict the English under Henry V finally achieved a decisive victory over the French at the Battle of Agincourt in 1415. Henry capitalized on this victory by capturing Rouen in Normandy in 1419 and with it the whole province. His premature death in 1422 meant the end of English ambitions to annex the whole of France, however, as various factions aspired to the English Crown. This distraction of resources for the English allowed the French to regain the territories Henry V had won, and English forces were finally driven out of France in 1453. The Hundred Years' War was over.

Tudor Dynasty

The struggle for power in England erupted into a bloody civil war for 30 years, 1455 to 1485, known as the Wars of the Roses. The conflict was brought to an end by Henry Tudor, who as Henry VII founded the Tudor dynasty.

Henry did much to reorganize the King's Council, appointing new councilors and calling regular meetings. With his support his minister Thomas Cromwell further organized subcommittees and made of the Privy Council an important body similar to the present-day Cabinet. Under Henry and subsequent Tudor monarchs Parliament's role as controlling the power of the purse became entrenched, and Henry regularly called Parliament into session to help enact legislation.

Henry VIII and the Church of England

In 1534 Parliament, under immense political pressure and intimidation, by the Act of Supremacy acknowledged Henry VIII as head of church and state and declared the Catholic religion, with its ritual and teachings, null and void. Henry wanted separation from the Catholic Church because he had failed to obtain papal approval for his desired divorce from his wife, Catherine of Aragon. Meanwhile because of England's Continental trading links Protestant ideas had arrived soon after the German Martin Luther's declaration against the church in 1516, and from 1526 German-printed vernacular versions of the Bible, produced by William Tynedale, were circulating extensively. As a result Henry's withdrawal of England from the Catholic fold met with approval by many (although by no means everyone). His decision to dissolve all monasteries in England led to massive uprisings in 1536 and 1537, in part because of the monasteries' importance in local economies, but also

because of their continuing significant spiritual role in people's lives. During the 1550s the Act of Uniformity, which imposed the First Book of Common Prayer on English worshippers, was opposed in southwestern England by rioting.

After centuries of tug-of-war between English monarchs and the landed nobility, under Henry VIII much of governmental power became centralized in the monarchy. Parliament, however, in part made up of members of the nobility, continued to have the power of the purse, that is, control of finances, in that it alone had the right to enact new taxes, and the failure of Tudor monarchs to implement a financial system under which they could raise funds for their wars gave Parliament a certain measure of control over them. Henry's power over Parliament lay not in law but in his political acumen, and Parliaments in ensuing centuries under weaker kings would further curb royal power.

Under the Tudors the power of the English monarchy over Wales and Ireland increased significantly. In 1536 Parliament under Henry's pressure incorporated Wales into England. English law was imposed on Wales and English was made its official language. The two were known thereafter as England. Five years later the same body proclaimed Henry "king of Ireland."

Bloody Mary

After Henry's death and the premature death of his son and successor, Edward VI, Henry's daughter Mary, an avowed Catholic, was aided by anti-Protestant sentiment in her bid for the Crown against Edward's chosen Protestant heir. Mary's repressive regime, during which hundreds of Protestants were burned at the stake, earning her the nickname Bloody Mary, further deepened the divide between Catholics and Protestants, the roots of which lay in her father's forcible establishment of the Church of England. Catholic-Protestant rivalries—and later those between radical Puritans and "High Church" conservatives—fomented tension and violence for years thereafter. Mary further strengthened her reestablishment of the Catholic Church in England by marrying Philip II of Spain, who was in the forefront of the Counter-Reformation, the goal of which was to eradicate Protestantism from Europe.

Elizabeth I

Protestantism Among the first initiatives of Elizabeth I, who gained power after Mary's

death in 1558, was to restore Protestantism in a form that would not unduly antagonize Catholics. Worship was to be in English rather than Latin, and a modified Book of Common Prayer was put in use. However, some aspects of Catholic worship, such as the use of candles, crucifixes, and clerical robes, were retained. The more extreme Protestants, called Puritans, condemned this system, but their influence was kept at bay throughout Elizabeth's reign as an uneasy accommodation between radicals of both sides was preserved, one however, punctuated from time to time with Catholic conspiracies to depose or assassinate Elizabeth.

Mary, Queen of Scots, and the Counter-Reformation

In 1567 Mary, Queen of Scots, who had been deposed by her own people, sought refuge with Elizabeth. Recognizing the threat that Mary posed, since she was a Catholic who might become a rallying point for Catholics bent on deposing Elizabeth, Elizabeth's ministers immediately imprisoned her. Even so she became the focus of conspiracies that eventually led to her execution in 1587. In reaction the

pope called on Philip of Spain to invade England, and accordingly Philip created his Armada, which sailed the next year.

Mary's execution was only the final factor in Philip's decision to invade. Troops from England, Scotland, and Ireland had been fighting Philip's forces in the Netherlands since 1584, aiding the Protestant Dutch who were engaged in a rebellion against Spanish rule. Elizabeth had formed an alliance with the Dutch and had also closed her eyes to the activities of English privateers, notable among them Sir Francis Drake, who for years had been conducting a de facto naval war against the Spaniards in their own waters, raiding their treasure fleets from the Americas. The execution of Mary of Scotland finally prompted Philip to action and in 1588 a massive force of 130 ships, among them some of the largest ships of the day, and 19,000 troops sailed from Lisbon to Calais. Superior seamanship and naval tactics by the English, together with storms, forced the Armada out of British waters, although prevailing winds forced them to take an escape route north around Scotland and down the west coast of Ireland. Many Spanish ships were wrecked on these coasts along the way, and hundreds of Spanish seamen landed and were sheltered by Scots and Irish.

Plantation in Ireland under Elizabeth

Under Elizabeth English involvement in Ireland continued to increase, although slowly at first. Elizabeth's interest in Ireland focused most on the possibility that Catholic Spain and France would use Catholic Ireland as a staging area for invasion and insurgency. Elizabeth's government, having little stomach for conquest of Ireland, tried an approach of moderation, in 1569–70 establishing in Connaught and Munster regional councils (or presidencies) aimed at counterbalancing the power of the chieftains, in order to convince the Irish of the benefits of English rule. Some of these became successful, self-financing bodies that allowed a measure of local self-government to commoners. Yet attempts at colonization fell victim to the ambitions of Elizabethan soldiers such as Humphrey Gilbert and Walter Raleigh, who modeled themselves on Spanish conquistadors in the New World and employed measures of utmost ruthlessness and brutality to seize lands from the Irish. The help given to Spanish seamen by Irish people apparently bore out Elizabeth's worst fears, especially when Irish chiefs repelled an English army attempting to

slaughter all Spaniards in Ulster. This defeat led to confiscation of lands and “plantation” or colonization in Ulster. In 1590 Elizabeth’s lord deputy in Ireland broke up the ruling family in Monaghan, the MacMahons. Further attempts at plantation led to nine years of rebellion, during which much of Ulster was laid waste, and the destruction of cattle and crops caused widespread famine.

Unification of English and Scottish Crowns

The ascension of James VI of Scotland to the English throne as James I in 1603 can be cited as the beginning of the move toward modern-day Great Britain, part of the United Kingdom. However, England and Scotland retained separate Parliaments under the united Crown. The familiar flag of Great Britain was created at this time by superimposing the red cross of St. George, patron saint of England, upon the X-shaped white cross of St. Andrew, patron saint of Scotland.

Great Britain

Increasingly after this period the political history of the English was intertwined with that of the Scottish, Welsh, and Irish. Great Britain was created when in 1707 the Scots gave up their separate parliament and sent representatives to the English Parliament. Nearly a century later in 1801 Great Britain and Ireland were formally united, with Irish representation in the British Parliament. The red saltire (X-shaped cross) of St. Patrick was added to the flag of Great Britain. With the Government of Ireland Act in 1920 Ireland with the exception of six Protestant counties in the north was granted independence as the Irish Free State. The northern counties became Northern Ireland, part of the United Kingdom of Great Britain, the latter consisting of England, Scotland, and Wales. At the end of the 20th century the different nations of the British archipelago, who had maintained remarkably distinct cultures and identities, gained their independence from the United Kingdom and the British Parliament. In 1997 the people of both Wales and Scotland voted to create their own legislative bodies, and in 1999 the Good Friday peace accords ended direct British rule in Northern Ireland.

CULTURE

Government and Society

Anglo-Saxon England was probably the most highly organized state in Europe in the 11th

century. The government had evolved beyond the relatively simple Germanic system based on personal loyalties, by which greater lords granted or “loaned” land to lesser lords in return for military service. Alfred the Great in the ninth century had resolved a common problem with this system—the fact that over time for various reasons landholders began to consider their lands their own, not loaned, and resisted making compensation in terms of military service. Alfred’s solution was to subject lands themselves to direct royal taxation in both money and service, in effect bypassing the web of aristocratic interrelationships. Great landowners were expected to contribute armed *thegns* (thanes) to the king’s military campaigns, the number based on the size of their estates and calculated according to an exact and unambiguous formula. *Thegns* in turn contributed a calculated number of their own retainers. The shire system furnished the means by which the king, through royal officials called shire reeves (later sheriffs), had far more direct control over local lords than Norman dukes had ever achieved.

In contrast Norman dukes assembled armies by means of personal and family loyalties. Moreover Norman lords expected a share in the spoils of war, in the old Germanic way, a practice that had been greatly curtailed in England, for two reasons: The expansionist pressure exerted by kings’ rewarding followers new lands gained in wars of conquest could not continue forever on an island with no new lands to conquer. And the continual threat of the VIKINGS, even more dangerous than the Normans, had brought about the emergence of the kings of Wessex as national leaders of all Old English, who joined in a common cause.

Thus William the Conqueror, who had struggled throughout his reign as duke to control his barons in Normandy, now found at his command the methods of Anglo-Saxon kingly control: and the use of writs, courts, and sheriffs became the instruments of dominance for him and for Anglo-Norman kings thereafter, making them the most powerful rulers in Britain.

Merging of Anglo-Saxons and Normans into English Numerically the Normans who took over present-day England in the 11th century were few—between about 10,000 and 20,000, a majority of whom were probably common soldiers—ruling over a country of about 1 million. Several hundred Norman barons replaced around 4,000 Anglo-Saxon earls, but the whole

structure of royal government remained fundamentally Anglo-Saxon for centuries. Elements of the former Anglo-Saxon government that the Normans retained included the king's council, the royal seal and writing office, the shire system and the sheriffs, and the twofold royal revenue system consisting of the produce of royal estates and a direct tax levied by the Crown on the landowning class.

Moreover the Anglo-Saxon and Norman societies were not fundamentally different, both arising from a Germanic substrate. Both were warrior societies moving toward greater stability under the influence of strong leaders. The two had had ties for many years. The mother of King Edward the Confessor was a Norman, and Edward spent years living in Normandy; when he ascended the English throne, he took many Norman friends to his court. And it was characteristic of Normans to adapt quickly and adopt new cultural traits (they had ceased speaking their native Danish a generation after settling in Normandy in northern France). Thus the English culture and language can be thought of as basically Anglo-Saxon with a strong admixture of Norman qualities.

There is conflicting evidence as to how long the Normans had been in England when they merged with the Anglo-Saxons (or Old English, as some scholars call them). Some of the writings of the 12th century speak of "the English" as a single people; others distinguish continuing Norman traits. The Norman aristocracy are known to have lived apart from Anglo-Saxons. It is difficult to tell how many commoners from Normandy, such as merchants, craftsmen, or laborers, followed their lords to England, and to what extent such roles were filled by Anglo-Saxons, making the Norman rulers a small minority in their new land. Some second-generation Normans, it is known, could no longer speak French. It may have been only the highest aristocracy among the Normans, many of whom still had lands and extensive connections in France, who resisted speaking English for centuries.

Sweeping Changes in Anglo-Saxon Society under Normans For the Anglo-Saxon *ceorls* (churls), free small landholders called *villeins* by the Normans, the situation under the Normans may not have changed drastically immediately after the Norman Conquest, although over time they would be subject to the same trends—at a greatly accelerated pace—already under way; that is, losing their lands and becoming tenants cum serfs, called

cottars. But Anglo-Saxons of a higher station were immediately dispossessed. There were approximately 1,400 officeholders called tenants-in-chief in Anglo-Saxon England; of these only two were still in office by 1086. There were exceptions, especially among English prelates who had recognized William as Edward the Confessor's anointed successor. William confirmed many in their positions, as well as some English earls. Of the several thousand lesser *thegns* (freemen and free-women) below them, some still held their family lands in 1086 but often owed service to a Norman overlord.

The great castles and churches built in England by the Normans in the 11th and 12th centuries probably served a psychological as well as a practical function, a demonstration of Norman power intended to awe the Anglo-Saxons. The many castles built across England shortly after the conquest as well as much contemporary testimony give evidence of the brute force the Normans used to subdue the Old English. The Anglo-Saxon culture was much older, richer, and more evolved than the Norman, which had only emerged several centuries before under the influence of the FRANKS of present-day France. The heavy-handed use of force as well as cultural "apartheid" may actually be signs of the Normans' sense of cultural inferiority to the Old English, the people who had produced Alfred the Great, the Venerable Bede, and *Beowulf*.

Magna Carta Aside from repeated attempts to regain French territory by successive monarchs, during the medieval period the focus of the English Crown was mostly on domestic matters, most notably the struggle between the monarchy and the barons to delineate their respective powers. An important milestone in this process, although its full implications did not immediately come into play, was the drawing up in 1215 of Magna Carta, the Great Charter between John and his barons, which for the first time set down in written law limits to the powers of the monarchy. Among its provisions it guaranteed the rights of the church, and it included 25 chapters detailing provisions designed to curb the king's exploitation of the tax system and other financial privileges.

During the 13th and 14th centuries considerable constitutional changes were instituted, including the creation of Parliament (derived from the French *parler*, to speak), a body of advisers to the king elected from among the local nobility, at first two knights from each shire. Contemporary compilation of

English law in the 13th century shows that it had become distinctively different from both canon (ecclesiastical) and Roman law. One of the most important concepts recognized by this time was that “the king is under the law because the law makes him king,” according to Henry de Bracton in his *Laws and Customs of England*, a crucial turning point away from the situation in England (and Europe in general) for centuries after the demise of the Roman Empire, particularly under the Anglo-Saxons, for whom royal power derived directly from military power.

Excesses and misgovernment by Henry III provoked Parliament to meet at Oxford in 1258 and draw up a provisional constitution to control the king. England was declared to be a “commune” made up of representative institutions. There were to be an elected council, three meetings of Parliament every year, and elected officials. Henry III was compelled to swear to the provisions, but by 1261 he had obtained release from his oath from the pope. Yet an important precedent had been set, and the relationship between Crown and Parliament would be developed for centuries to come.

Poor Laws In Elizabeth’s reign the problem of poverty in Britain had become severe. The shrinkage of arable land and shorter growing seasons caused by the Little Ice Age had led to greater importance of fishing and of trade in the overall economy during the 15th century, and this in turn led to a movement of people from the countryside to the cities. Overpopulation was held in check for a time by recurrences of the plague and by wars, and higher wages paid to laborers after the Peasants’ Revolt brought about a higher standard of living. Over time, however, this fostered a higher birth and lower death rate, and by the 16th century the population began to grow dramatically. Because of the Little Ice Age economic resources derived from agriculture, still of vital importance to the economy, could not keep pace with the population growth. At the same time many landowners were ejecting tenant farmers from their land in order to raise sheep for the lucrative wool trade. Henry VIII’s devaluation of the currency intensified price inflation. Increasing numbers of people were unable to support themselves, and the destitute flocked to the cities in great numbers. Elizabeth’s ministers feared the consequences of having large numbers of the poor and desperate concentrated in the cities with no option except to beg, steal, or do worse.

In 1563 the government enacted the first in a series of provisions that came to be called the Poor Laws, for the first time acknowledging that care for the poor was the responsibility not solely of individual benefactors or of church authorities, but of citizens as a whole through the central government. This idea was underscored by the introduction of a poor law tax in 1572. Some of the Poor Laws aimed to curb begging and robbery with harsh penalties; others required local municipalities to provide work and oversee the needs of the poor. In cities “houses of correction” were established in which vagrants, while incarcerated, were given work with the idea that this would “cure” them of their ways so that they could be reintegrated into society.

Dwellings and Architecture

Perhaps the most characteristically “English” architecture, after the English had established an identity out of their varying ancestry and cultural influences, was that of the 18th-century Georgian style, in which, following classical models, architects arrived at a harmonious resolution of opposites. Based on the Roman Palladian style (a perhaps conscious derivation of a nation that was coming to see itself in Roman terms as it embarked on the creation of an even greater empire than that of the ROMANS), Georgian style was used both for domestic architecture, such as Somerset House in London, and for planned sections in cities, such as the Adelphi section of London, the Royal Crescent of Bath, and the Customs House and surrounding buildings in Dublin. It is thus preeminently a social rather than religious style.

Art

As in past ages English visual artists after Anglo-Norman times to the present have received strong influences from Europe. The illuminated manuscript painters of medieval England worked in mainstream European traditions and were also influenced by Celtic styles from Ireland and Scotland. English painters of the 16th and 17th centuries learned Renaissance styles and techniques of portrait painting, together with a humanistic worldview, as well as the baroque style from Flemish painters (see FLEMINGS). From the 18th century on English painters began to carve out their own particular styles and became less imitative of foreign models, absorbing influences and making them their own.

Literature

Rise of the English Language Although the English have excelled in all the arts, they have shown a particular genius for literature. The cause of this may in part be the English language with its huge vocabulary gained through its mixed origins in the Germanic Old English and Latin-derived French, thus combining the two main branches of most Western European languages. Modern English further developed, through the melding of Old English and French, and many Old and Middle English dialects, into a common or standard language of commerce, of the law, and of politics as well as of scholarship and literature. English, then, is in part an urban “melting pot” language of great flexibility and range, which readily absorbs new words and elements but also is capable of clarity and conciseness of expression.

The 14th century was a watershed for the English language as for so much else. In part because of the loss of clerks educated in French in 1362 Parliament passed a statute decreeing that all pleas should be heard in English. The new opportunities opening up to the English-speaking lower classes fostered greater pride and confidence than they ever had before, one result of which was the emergence of a vibrant vernacular literature, led by William Langland and by Geoffrey Chaucer, who wrote the *Canterbury Tales* of 1387. During the 14th and 15th centuries, possibly because of the rise of English patriotism during the Hundred Years’ War with France, even among the aristocracy English replaced French as the language of daily use.

Robin Hood The dynamic process of sorting out the differing roles and powers in England involving the king, the barons, the minor aristocracy, and the common people is illustrated in the story of Robin Hood. By the 14th century ballads concerning Robin Hood were so common that in the earliest known written reference to Robin by name, found in *The Vision of Piers Plowman*, written by William Langland in 1377, the character of a drunken chaplain laments that he knows the rhymes of Robin Hood better than he knows his prayers. The “King’s deer,” whose slaying propelled Robin, possibly a member of the minor aristocracy, into a life of outlawry, is a powerful symbol of royal prerogatives, and the outlaw bands that Robin joined and led represented forces in English society at odds with the status quo. The poor for whom Robin provided by stealing

from the rich were probably predominantly descended from dispossessed Anglo-Saxons. The many characters in the Robin Hood tales—peasants, yeomen, foresters, craftsmen, friars, the sheriff of Nottingham and kings John and Richard—together with Robin’s change in status from nobleman to outlaw give a sense of a society in flux, one also in which people in many stations of society and walks of life mingle. The immense popularity of the Robin Hood ballads and plays in medieval England attests to the importance to English people of Robin’s egalitarian creed of “robbing the rich to feed the poor,” even at a time when society was highly stratified.

Nature Themes One of the hallmarks of English writers has been their preoccupation with nature—nature in general, but also the particular character of nature in England observed with that almost obsessive absorption shared by people of other island nations, such as Ireland and Japan. No other English writer made the natural world more essential to his created world of characters and narrative than William Shakespeare. Shakespeare used a philosophical system of his time called the doctrine of humors, which gives his plays a sense of universality but also of being set in an organically coherent natural world of their own. In this doctrine the whole of nature was governed by the interactions of essences called “humors” or temperaments, which were influenced by the planets. Each individual was influenced most by one of these temperaments—mercurial, saturnine, jovial (from Jove, or Jupiter)—although subject to the others to a lesser degree as well. Another basic premise of the doctrine of humors was that they connected human beings to nature; the planets affecting the individual could also affect the natural world at large; humanity was a microcosm of the macrocosmic universe. A cardinal point about this doctrine was that health depended upon the maintenance of an equilibrium among all the humors, and that imbalance was what led to illness. Virtually all of Shakespeare’s plays begin with a situation of disequilibrium—for instance, as in *Hamlet*, “times are out of joint”—that by the end has been resolved, either in joyful harmony or, a shocking loss, when suddenly all the main actors are killed and we are stunned into silence. Part of the greatness of Shakespeare is the way his plays unfold with the organic motion of natural processes.

The theme of nature as the fount of poetry runs through the work of many English poets,

Shakespeare performs before Queen Elizabeth I and her court. (Library of Congress, Prints and Photographs Division [LC-USZ62-116194])

from Chaucer's *Canterbury Tales*, which opens with an evocation of the springtide as the potent force that sends people on pilgrimage, to later works. English writers over the ages, such as the essayist Izaak Walton of the 17th century and the naturalist Gilbert White of the 18th century, have expressed the English love of the countryside and its pastimes. The 19th-century writers Robert Surtees, George Eliot, and Thomas Hardy in their novels on society and human relations have nature as a theme. In Eliot's *The Mill on the Floss* the river Floss is practically one of the characters, providing the livelihood of the miller's family but also, by flooding, generating the novel's dramatic denouement.

War and Adventure Discussion of English letters must include writing on war, with notable examples throughout history, from the 15th-century carol *Deo Gracias Anglia* celebrating Henry V's victory at Agincourt, as does also Shakespeare's play *Henry V*, to "The Charge of the Light Brigade" in 1855 by Alfred Lord Tennyson and Wilfred Owen's poems on World

War I. The Arthurian legend, rooted in the Celtic past, formed the basis for many works on war and adventure, such as *Sir Gawain and the Green Knight* (late 1300s, author unknown) and Sir Thomas Mallory's *La Morte d'Arthur* of the 15th century.

Writings on Society Geoffrey Chaucer's *Canterbury Tales* and others of his works are 14th-century examples of English writing on society, as is William Langland's *Piers Plowman*. With the influence on English letters of the European intellectual movement called Renaissance humanism in the 16th century, derived from ancient Greek models, most notably Plato, which preferred rational discourse over the medieval reliance on received wisdom, writers began a more incisive observation and discussion of English society and politics than ever before. Chief among these was Sir Thomas More, who in *Utopia* (1516) questions assumptions underlying English society by describing a distant land organized according to rational principles rather than superstition.

Religion

Although Roman Britain had been Christian, with the coming of the Anglo-Saxons, Christianity disappeared in much of what would later be England. At the time Anglo-Saxon kingdoms were emerging in the sixth century, missionaries were sent to England by Pope Gregory the Great. Despite initial successes, the Gregorian mission to the Anglo-Saxons had no lasting impact, however. Rather, the Irish missionary centers of Iona and Lindisfarne in Scotland were the driving force behind the conversion of the Anglo-Saxons. By the 680s all of the Anglo-Saxon kingdoms had been converted, at least nominally, and their kings began to enforce Christianity by law. After the seventh century the Catholic Church in England was vigorous and secure enough to send missionaries to pagans in Germanic Europe.

After the Norman Conquest Norman prelates took control of and reorganized the Anglo-Saxon Church. The Normans were great champions of the church and of religious orthodoxy. Their fervor for Christianity was not without a certain pagan outlook, and they expected their patronage of the church to gain them both spiritual and temporal support for their worldly political aims. This attitude underlay perhaps the darkest chapter in the history of the early medieval church in England: the murder in 1170 of Thomas Becket, the archbishop of Canterbury, by barons of King Henry II.

In the 14th century almost certainly in part because of the devastation caused by the Black Death (the bubonic plague), which had decimated the clergy as they fulfilled their duty of giving last rites to the dying, new ideas prefiguring Protestantism began to appear among clerics who replaced them. Most prominently among these was John Wycliffe, a reformist cleric who rejected church hierarchy and insisted that the Bible is the only true religious authority.

A century later because of England's Continental trading links Protestant ideas arrived soon after the German Martin Luther's declaration against the church in 1516, and from 1526 German-printed vernacular versions of the Bible, produced by William Tynedale, were circulating extensively. Against this backdrop King Henry VIII withdrew the English Church from allegiance to the pope in Rome, declaring himself head of the church. Monasteries were dissolved and new liturgy was instituted; both initiatives were met at first with violent opposi-

tion among the common people. Although many in England had responded favorably to Protestant ideas, Henry's abrupt and forcible imposition of change polarized opinion between Protestants and Catholics; this divide was deepened considerably in the brutally repressive reign of Henry's daughter, Mary I, a Catholic, known as Bloody Mary for her executions of Protestants. This schism has led to violence and war in England and elsewhere in the British Isles up to the present day in the Catholic-Protestant controversies in Northern Ireland, where many English Protestants settled during the forcible "plantations" of the Elizabethan period and later. Ironically later English monarchs, most notably the Stuarts, sought to return England to Catholicism, initiatives that led to the English Civil War and strengthened the English Parliament, which was dominated by Protestants. The polarization led to the rise of extreme Protestant sects, most prominently the Calvinist-influenced Puritanism.

Perhaps in rejection of such extremes and also of sectarian violence, new Protestant sects continued to be born in England in succeeding centuries. In the 1640s there arose the so-called Quakers, or the Society of Friends; they were and are pacifists who reject the need for clergy to intercede with the divine, believing each individual is a potential vessel for God's light. In the 18th century Methodism rejected the Calvinist doctrine of predestination (that the individual is foreordained by God for salvation or damnation, whatever his or her acts during life). In general the Church of England, or the Anglican Church, the national church of England, beginning with efforts by Elizabeth I, has steered a course between extremes, preserving much Catholic liturgy, while over time responding to new movements such as Methodism as well.

English culture has taken shape around the absorption and reinterpretation of foreign elements—Celtic, Roman, Anglo-Saxon, Norman French, Italian, German. The following characteristics relate to what it means to be "English": a combination of insularity and cosmopolitanism brought about by the status of the English as islanders whose land at the same time was large enough to support a nation that could rise to world importance; the sense among the English of being at once part of and apart from Europe as a whole; their language, blended of a

Germanic and a Latin tongue, which has allowed them to feel a kinship with the two main poles of European culture; their social egalitarianism, which to this day has not eradicated class consciousness (illustrated, for example, by contradictory attitudes of condemnation and loyalty toward the English royal family); their love of nature, which only deepened as they became the most urbanized people in the world; and their pragmatic, down-to-earth character, which nevertheless has produced art and philosophy of the most high-flown idealism.

Enotri (Enotrians; Oenotri; Oenotrians)

According to ancient sources, the Enotri occupied territory along rivers in the region of Lucania (modern Basilicata) in present-day southern Italy, as well as a great part of northern Bruttium (modern Calabria and part of Campania), by the eighth century B.C.E. Their homeland was known as Oenotria in ancient times, associated with the mythical king Enotro or Oenotro, who according to legend led his people to the Italian Peninsula from the Greek Peninsula in the second millennium B.C.E. during the Bronze Age. He was supposedly succeeded by Italo, who established law for his people. Their language affiliations are unknown. Many of their neighbors were ITALICS.

The Enotri had a tribal society based on family ties, with an agricultural economy. Known as “growers of the grapevine,” they also manufactured artifacts of bronze. At the beginning of the seventh century B.C.E. after the GREEKS had founded colonies on the Ionian Sea and the ETRUSCANS had developed the interior of Campania, the Enotri acted as middlemen between the two peoples and thrived until the fall of the Greek city of Sybaris, a center of trade, and the emergence of the LUCANI in the region.

Some Enotri eventually migrated to Sicily it is believed, intermingling with the local population there, either the SICULI or SICANI, perhaps in the fourth century B.C.E., when the Lucani were thriving, or perhaps after 298 B.C.E., when the Lucani formed an alliance with the ROMANS.

Epidi (Epidii)

The Epidi are classified as a Celtic tribe. They lived in Britain on the Kintyre peninsula in present-day southwestern Scotland and are discussed as CELTS, CALEDONIANS, or SCOTS. They are from Ireland. Other tribal members are thought to have settled in northeastern Ireland, where they mixed with the local population, becoming known as ROBODGI. The Scottish Epidi were defeated by the ROMANS under Gnaeus Julius Agricola in the 80s C.E.

Equi See AEQUI.

Eravisci

The Eravisci are classified as a Celtic tribe. They lived on the Danube River around present-day Budapest in Hungary. It is possible that they moved into the region from the north, breaking off from other CELTS, in the first century C.E.

Ernaigh (Ernagh; Ernaei; Erdini)

The Ernaigh are classified as a Celtic tribe. They lived in northwestern Ireland (the present-day countries of Cavan and Leitrim in the Republic of Ireland and the county of Fermanagh in Northern Ireland) at least by the first century C.E. They are discussed as CELTS or IRISH.

Ernici See HERNICI.

Eruli See HERULI.

Finno-Ugrian**language:**
Balto-Finnic (Finnic)**Essues**

The Essues are classified as a Celtic tribe. They lived in Gaul in the present-day Argentan region of northwestern France near the OSISMI at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Esths (Estes; Esthonians; Estonians)

The Esths were a Finnic-speaking tribe, living in present-day Estonia. They are classified as Baltic (or Western) Finnic, a subgroup of FINNO-UGRIANS, as distinct from the Volga (or Eastern) Finnic. The Esths are among the ancestors of modern Estonians (see ESTONIANS: NATIONALITY). To the south were the LIVS, also Finnic speaking, and the LETTS, a Baltic-speaking people.

ORIGINS

The ancestral Finnic are thought to have reached the Baltic region by 3000 B.C.E. Perhaps as early as the first century C.E. they had formed loosely organized states. The AESTII, a people mentioned by the Roman historian Tacitus in the first century C.E., although probably Baltic speaking, may be the source of their name. Or *Esths* is possibly derived from the Baltic root meaning “Speckled.” Another possible source is a Germanic term for “east.”

LANGUAGE

The Estonian language is in the Balto-Finnic group of Finnic in the Finno-Ugric language family and is closely related to Finnish. It has two main dialects: a northern dialect, used in most of Estonia and the basis of the modern literary language, and a southern dialect spoken south of Tartu. The earliest writings in Estonian date from the 16th century.

HISTORY

Those Esths living along the coast by the ninth century were at risk from attacks by VIKINGS and other raiders during the early Middle Ages, they too launched maritime raids on other peoples, crossing the Baltic in longboats. Inland Esths felt pressure from the RUS, who expanded from the east. In 1030 Yaroslav I founded Tartu among them southwest of Lake Peipus in eastern Estonia. Yet the Esths generally maintained their independence until soon after the arrival of the first Catholic missionaries.

Father Meinhard arrived in the region in the 1160s, practicing among the LIVS. In 1198 Pope Innocent III sanctioned the first Baltic crusade. Bishop Albert von Buxhoevden of Bremen arrived in 1199 and founded Riga to the south in present-day Latvia in 1201. The next year he founded the military and religious order Brothers of the Sword to Christianize Baltic lands. The Brothers of the Sword pacified the Livs by 1207, thereby creating a new tax base for the Catholic Church and making soldiers for the conquest of the remaining tribes. Esths as well as Baltic-speaking LETTS moved onto what had been Liv territory. In 1214 the Brothers of the Sword defeated the Letts. The Esths turned to Russia for support against German expansion. Albert joined with Denmark in a final push for domination. The Danes attacked the Esths in the north, and the Germans in the south. By 1219 the mainland Esths had been conquered. Valdemar II of the Danes built Reval castle (at modern Tallinn) on the Gulf of Finland in 1219. The last remaining Esth stronghold, on the island of Saaremaa northwest of Riga in the Baltic Sea, held out for eight more years until 1227.

In 1237 the Brothers of the Sword united with the Teutonic Knights, who held lands among the Balts to the south in present-day northern Poland; they became known as the Livonian Order to Teutonic Knights. In 1282 Riga joined the Hanseatic League of northern Germany, a collection of merchants in the Baltic region, and assumed a central role in east-west trade and control of trade with local tribes.

In 1346 the Danes sold their territorial holdings to the order. The Esths remained under the rule of the knights and the Hanseatic merchants until the order's dissolution in 1561. At that time the nobility of northern Estonia, including Revel, submitted to the protection of the Swedish Crown; Poland retained southern Estonia, including Tartu. By 1645 Sweden ruled all of Estonia. In the 1670–80s Sweden introduced reforms, reducing privileges of the nobili-

ty over the Esths and Livs. In 1721 Sweden ceded Estonia to Russia by the Peace of Nystadt, at which time the Russian emperor Peter the Great restored the former privileges of the nobility. Estonian history henceforth is tied to that of Russia until independence in 1991.

CULTURE (see also FINNO-UGRIANS)

The Esths consisted of agrarian as well as fishing, hunting, and gathering peoples. The sea and inland waterways as well as the woodlands provided valuable resources. Even before the arrival of outsiders and the establishment of the Hanseatic League the Esths were part of a trade network involving many Baltic peoples.

Many peoples played a part in the history of Estonia. But because the Esths were the dominant ancient tribe in Estonia, their identity evolved into that of the Estonians.

Estonians: nationality (Estes; Esths; people of Estonia)

GEOGRAPHY

Estonia borders Russia to the east and Latvia to the south; the Gulf of Finland forms the coastline in the north and the Baltic Sea and the Gulf of Riga lie to the west. The Gulf of Riga is separated from the Baltic Sea by Saaremaa and Hiiumaa, the two largest islands of the 1,500 that are part of the country. Estonia, along with Lithuania and Latvia, is part of the Baltic states. Estonia's entire area is 17,462 square miles. Plains and some southern hills make up most of Estonia's terrain. Forests cover about 50 percent of the land, and wetlands constitute another 20 percent. Lake Peipus in the east and Võrtsjärv in the south are the two largest lakes. Principal rivers include the Pärnu, the Narva (forming the Russian border), and the Emajõgi.

INCEPTION AS A NATION

Starting in the 13th century C.E. the ESTHS and LIVS suffered occupation by invading Danes and Germans. By 1346 Denmark had ceded territories to the Livonian Order of the Teutonic Knights, who possessed the Southern Territories or Livonia. Knights and merchants still occupied the region in the 17th century, when northern Estonia fell under Swedish control, and Poland annexed southern Estonia. Sweden controlled all of Estonia by 1645. The Peace of Nystadt passed Estonia from Swedish hands to Russian in 1721.

During the Russian Revolution of 1917 Estonia declared itself an independent demo-

cratic republic. The Treaty of Tartu in 1920 established a peace between the Bolsheviks and Estonia; Estonia was free of Russian rule. By the following year Western powers recognized the new republic.

During World War II (1939–45) Soviet troops occupied Estonia, Latvia, and Lithuania; Estonia became the Estonian Soviet Socialist Republic, part of the Soviet Union (USSR). The Soviet Union broke up in 1991, enabling Estonia and the other Baltic states to declare independence. Russia and Estonia continued to dispute over territory, but this conflict was resolved in 1999 in a border treaty, reaffirming the Russian-Estonian frontier.

CULTURAL IDENTITY

A driving force behind the emergence of a modern Estonian cultural identity has been the relations of Estonians to foreign occupying powers. The first of these were Danes, whose state was more politically cohesive than the loose tribal associations of Estonians, and then the Germans, whose Hanseatic League developed trading centers along the Estonian coast. The the Germans, who were more "advanced" than Estonians in terms of trends current in the rest of Europe, dominated the country for centuries. Thus modern Estonians have developed their cultural identity in an atmosphere of struggle to remain independent and distinct.

Estonians have balanced a focus on their native culture, with its Finnic elements, and a desire to be "European" as against domination by Slavic Eastern Europe, particularly Russia. Estonian appreciation of European culture may derive from the country's position on the Baltic Sea, which introduced influences from abroad, giving Estonians the international, cosmopolitan outlook of SCANDINAVIANS and other peoples along the Baltic Sea. After World War II more than half of Estonia's writers went into exile to escape Soviet Russian hegemony, a circumstance that had a profound effect on Estonian cultural identity, perhaps arousing a conviction that under Soviet rule the only way to be Estonian was to live where one could express oneself freely. In Estonia little poetry appeared under Stalin's Socialist Realism, but new poets, adopting Western styles, appeared in the 1960s. Prose writing was equally influenced by movements current in Europe.

Centuries of German dominance have had their impact in Estonia. Early written Estonian is strongly Germanic, and the first known book in Estonian is a translation of the Lutheran catechism (1535). Lutheranism is still the majority

- 1227** German crusaders from Riga invade Estonia.
- 1346** Danes sell northern Estonia to German Teutonic Order as result of native rebellions.
- 1400** Tallinn emerges as important center for commerce and culture.
- 1535** Lutheran catechism is translated into Estonian.
- 1558** Sweden seizes northern Estonia.
- 1629** Sweden controls all of Estonia, expelling Russians.
- 1686** New Testament is translated into southern Estonian.
- 1715** New Testament is translated into northern Estonian.
- 1721** Russia conquers Estonia.
- 1739** Anton Thor Helle combines two Estonian dialects based on northern Estonian in translation of Bible.
- 1816** Serfdom is abolished.
- 1822** Kristjan Jaak Peterson dies at age 21 after having begun Estonian literary tradition through his poems.
- 1838** Friedrich Reinhold Kreutzwald founds Estonian Learned Society to collect Estonian narrative folksongs, published as *Kalevipoeg* (Son of Kalev) in 1857–61.
- 1842** Estonian History Museum is founded in Tallinn.
- 1843** First Estonian novel, *Luige Laus* by Juhan Sommer, is published.
- 1870** Poet and playwright Lydia Koidula helps found Vanemuine Theatre in Tartu, beginning tradition of Estonian theatrical art.
- 1909** National Museum is founded in Tartu.
- 1918** Estonia proclaims independence from Russia and Germany. National Library is founded in Tallinn.
- 1926–33** *Tõde ja õigus* (Truth and justice), five-volume novel by Anton Hansen Tammsaare, is published.
- 1928** Art Museum of Estonia is founded in Tallinn.
- 1939–45** During World War II Estonia is incorporated into Soviet Union (USSR), then occupied by Nazi Germany.
- 1944** Estonia is again annexed by Soviet Union.
- 1991** Estonia declares independence from Soviet Union.
- 1994** Estonia joins Partnership for Peace.
- 2004** Estonia joins North Atlantic Treaty Organization (NATO) and European Union (EU).

religion. Only by the 19th century did Estonians gain a full appreciation of their Finnic heritage, with the publication of the *Kalevipoeg* (1857–61; literally the son of Kalevi [or Kalev], translated as *An Ancient Estonian Tale*) by Friedrich Reinhold Kreutzwald, probably inspired by the compilation of Finnish epic poetry in the

Kalevala (see FINNS: NATIONALITY). Like that work the *Kalevipoeg* is partly based on authentic tradition, incorporating hundreds of Estonian legends and folk tales, and in part is a creation of its compiler. It inspired the Romantic nationalistic movement soon to emerge.

An important Estonian literary tradition is lyric poetry. Though this genre includes variants of Finnish epic themes, it is more lyrical than Finnish folk poetry. More than a million pages of folk poems of several ethnic groups are preserved in the national archives at Tartu. As in Finnish folk poetry the standard meter of Estonian poetry is the trochaic four-foot line, with assonance, alliteration, repetition, and parallelism as important organizing principles. Folk songs are central to Estonian self-identity, as seen in the independence movement of the late 1980s, which was known as the Singing Revolution because Estonians gathered in huge song festivals singing previously banned songs.

Estonians benefited from their geographic position as the country became the Soviet Union's commercial outlet to the West. This status gave Estonians the highest per capita income in the Soviet Union, a high level of education, and frequent contact with Western institutions. When Estonians regained independence in 1991, they built quickly on these advantages to institute a free-market economy. The balancing act that the Estonians maintained for centuries between Eastern and Western Europe is greatly advantageous to them, now that Europe has made determined efforts to abandon the power politics of the past, giving small countries their rights to self-determination within the wider European Union.

Esuvii (Esubii; Sessuvi; Aulerci Sesuvi)

The Esuvii are classified as a Celtic tribe. They lived in Gaul around present-day Sées in northwestern France and are discussed as CELTS or GAULS. They were allies of the UNELLI. The BAIOCASSES and VIDUCASSES were possibly subgroups of the Esuvii. The Saii may also have been a subgroup or an alternate name. The ROMANS under Julius Caesar wintered among them in 54 B.C.E. Sagii on the site of Sées became a *civitas* capital in Roman Gaul.

Etruscans (Etruschi; Rasenna; Tusci; Tyrrhenians)

The Etruscans were a people who spoke an apparently non-Indo-European language living along the west coast of the Italian Peninsula on the coastal plain west of the Apennines in the second and first millennia B.C.E.

ORIGINS

There is a persistent and often-repeated idea that the Etruscans were a people whose society and origins are shrouded in mystery. Their apparently non-Indo-European language is often said to be indecipherable and their elaborate cities of the dead give them an aura of otherworldliness. Their culture was so alien to that of other peoples of Italy, it is claimed, that they must have immigrated there from elsewhere. This idea was long given credence because of the assertion by the fifth-century B.C.E. Greek philosopher Herodotus, that they originated in the country of Lydia in Asia Minor.

An aura of mystery surrounds the Etruscans probably, in large part, because, although they did adopt writing from the GREEKS in about 700 B.C.E., for largely unknown reasons they did not develop a literature, and most of the great number of surviving writings in the Etruscan language are simple memorials to the dead, giving their names, names of relatives, ages at death, and little more. This lack of material, not any inherent opacity of the language, has hampered a full decipherment of their language. As a result, unlike that of the Greeks and ROMANS, Etruscan civilization is a largely silent one, speaking to us primarily through the medium of their rich figural art.

A continuity of cultural development has shown conclusively that the earliest Etruscans were the makers of what is called the Villanova culture (named for one of its sites near modern Bologna), which had been established in the future Etruria (Tuscany) at least by about 1200

B.C.E., and probably long before. It is now recognized that Etruscan culture evolved directly from that of the VILLANOVANS, and that the Etruscans' cities, including Veii, Tarquinia, Vulci, and Cerveteri, were located on the sites of earlier Villanovan villages.

LANGUAGE

Unlike the later arrivals on the Italian Peninsula, the ITALICS, the Etruscans spoke a non-Indo-European language that may have had its origins with the first farmers in their region in the sixth millennium B.C.E. Most of the surviving writings in the Etruscan language are funerary inscriptions. This paucity of examples of their language has prevented its full decipherment.

HISTORY**A Trading Society**

By the time Greeks and PHOENICIANS arrived in the western Mediterranean in the eighth century B.C.E., they found a flourishing Etruscan trade network throughout what the Greeks called the Tyrrhenian (Greek for Etruscan) Sea and reaching as far as Sardinia. The Etruscans

had formed a loose confederation of states in the area north of Rome by about 750 B.C.E.

Over the course of the eighth century B.C.E. the Etruscans expanded their trade routes and settlements southward, controlling the rich Campanian plain and trading with the Greeks at their emporium of Cumae, established in about 725 B.C.E. The Etruscans built their own trading centers along the coast, such as Pontecagnano. At this time the towns of Latium, among them Rome with its important position on the Tiber, few under Etruscan control and Etruscan influence spread inland, for example, to Umbria, where some evidence for urban settlement has

been found. Inscriptions have been found there of the local dialect in Etruscan script (for example, the Iguvine tablets, a set of religious tracks, discovered in 1444 C.E. in the town of Gubbio). The Etruscans established cities on the important hilltop sites in the region.

Greek emigrants began settling in southern Italy in such numbers that it became known as Magna Graecia (Greater Greece). One among many reasons for emigration is provided by the story of an aristocrat named Demaratus, who is recorded as fleeing from tyranny in Corinth in the middle of the sixth century B.C.E. and setting up a business in Etruria. Many immigrated

to areas under Etruscan control. At Gravisca, the port of Tarquinia, a Greek sanctuary was established and offerings to Apollo, Hera, and Demeter survive. One example is an anchor with a dedication to Apollo from one Sostratus, perhaps a merchant captain or sailor. A number of pots found in Etruria are inscribed with the Greek letters *SOS*, very possibly the initials of a wealthy Greek merchant mentioned by Herodotus as trading in the late sixth century B.C.E.

Persian pressure on Greeks in the mid-sixth century B.C.E. propelled waves of refugees to Italy, especially from colonies on Asia Minor; Phocaeans, Greeks from Phocis, were the most numerous. The Phocaeans created a colony at Alalia in western Corsica that was particularly threatening to Etruscan interests. In 540 B.C.E. the Etruscans, with some Phoenician support, defeated the Phocaeans at sea and forced the abandonment of the settlement. The Phocaean Greeks tightened their control over the trade route up the Rhône River in southern France, which they had established to avoid the CARTHAGINIANS (Phoenicians who had established the city of Carthage and made it a springboard for further colonization), in part because of conflict with the Etruscans. But by the fifth century B.C.E. the Etruscans had found trade routes bypassing the Rhône, which led through Alpine passes to the Rhine-Moselle region, where high-quality iron ore was available, such as in the Hunsrück-Eifel region.

The tribes in the Rhine-Moselle region had already begun to develop a warrior society, possibly because of their involvement in providing slaves to the Hallstatt elite to their south in southeastern France and southern Germany for trade with the Greeks. Now with direct contact to the Mediterranean luxury trade, they in their turn became rich. Etruscan influence on the tribes here is shown by their adoption of the Etruscan-style two-wheeled chariot, the numerous Etruscan amphorae found here, and the flowering of the richly inventive La Tène art style.

The Carthaginian Factor

During the same period the Carthaginians had consolidated their position on Sardinia and on the west coast of Sicily and gradually forced the Etruscans off the sea. The Etruscans were now also under pressure from the Greek city-states in Sicily. An expedition against the Greek city of Cumae, led by Etruscans with native mercenaries in about 525 B.C.E., failed, and in 474 B.C.E. Hiero I of Syracuse defeated an Etruscan

fleet off Cumae. The Etruscan presence in Campania was eliminated in the fifth century B.C.E. by the SAMNITES, a mountain people who now began raiding into the plains. In the face of this truncation of their trade network the Etruscans focused their energies on the Po River valley and trade routes through the Apennines. Here they founded the precursors of the modern cities of Ravenna, Rimini, and Bologna. One of the most successful trading cities was Spina on the Po delta, built on piles with bridges and canals between the buildings.

Carthaginian dominance in the Tyrrhenian Sea caused the decline of the coastal cities of Etruria. Inland cities, including Clusium, Fiesole, Cortona, Volsinii (Orvieto), and Veii, continued to thrive, however, largely because of their flourishing agriculture, fostered by large irrigation schemes in the fifth century B.C.E. These cities belonged to a religious confederation of 12 city-states that held an annual meeting at a shrine to the goddess Voltumna, but there does not seem to have been any political unity among them—none of them aided Veii when the city was attacked by Rome in the fifth and early fourth centuries B.C.E.

Decline of the Etruscans

After 450 B.C.E. the Greek and Etruscan trading networks were under increasing stress from the growing power of expansionist Rome until, by the end of the fifth century B.C.E., they had been completely disrupted by continual warfare in the western Mediterranean.

Meanwhile the disruption of trade had a dramatic effect on the Celtic La Tène tribes, which, together with population growth and some internal social instability whose cause can only be guessed at, led to an outburst of mass migrations both toward Greece and into Italy along the routes that had carried the coveted goods of the Mediterranean world. The raids of Celtic tribes on northern Italy and the Po region in the fourth century B.C.E. caused further serious economic losses to the Etruscans. There is some evidence that Celts and Etruscans intermarried, however.

The decline of the Etruscans opened a power vacuum in Italy that was exploited by many different peoples. In the north the CELTS occupying the Po valley raided farther down into the peninsula, easily driving through Etruscan opposition with a momentum that quickly propelled them all the way to the gates of Rome itself in 390 (or 387) B.C.E. The Celts laid waste much of the region around Rome, which held out for seven months until the

Celts moved off. Raiding continued throughout the Italian Peninsula for 60 years. Many different mountain peoples also began to plunder the plains. They may have been driven by population pressures, but many had also acquired military skills from service as mercenaries and so had developed the confidence to attack the wealthy Greek and Etruscan cities of the lowlands. Almost every Greek city of southwest Italy was overrun by the fifth century B.C.E.

The power vacuum caused by Etruscan decline, leading to the disruptions in Italy of the fifth and fourth centuries B.C.E., not only galvanized Rome to expand the military for own self-defense, but also catapulted the city to leadership of the whole of Italy and then beyond. The Etruscan cities of central Italy fell into terminal decline and were eventually defeated and destroyed by Rome in the third century B.C.E.

CULTURE

Economy

Etruscan Wealth through Trade The rise of Etruscan society was fostered by several natural benefits of their territory. It lay along the west coast of the Italian Peninsula on the coastal plain west of the Apennines. This was the best farmland in the region, with fertile volcanic soil and, because it is not in the rain shadow of the mountains, adequate precipitation; between the rivers Tiber and Arno are found some of the richest mineral deposits in the central Mediterranean. The coast is indented and so provides a safe haven for seafarers. From the eighth century B.C.E. Greeks and Phoenicians in particular were trading inland for minerals. As their suppliers the Etruscans grew rich. They also established trade routes north through the Alps to the Celts along the Rhine and Moselle Rivers, trading wine and other goods for iron.

The Etruscan socioeconomy had undergone an important realignment from 1200 B.C.E., with a greater emphasis on stock rearing, particularly of sheep, goats, and pigs, and a rise in population; by 900 B.C.E. settlements had been established on the plateaus of tufa (a soft volcanic rock) common in the region.

Greek Imports The appetite of Etruscan society for Greek pottery was so great that Greek potters, the so-called Perizoma Group of late sixth-century Athens, adapted their wares for the Etruscan market.

Government and Society

Early Etruscans Early Etruscan society appears to have been a tribal one closer to that

of the Celts than of contemporary Greeks, for whom the city was the focus of one's identity. This structure is suggested by the Etruscan custom of naming, which was similar to that of the Romans, with an individual's name, called in Latin the *praenomen*, linked with that of his clan or tribe, the *nomen*. (Among Greeks the individual's name was linked with the name of his or her city.) Thus the Etruscans had not as yet developed a truly urban culture, possibly the reason they did not use writing, a primarily urban phenomenon, until late in their history under Greek influence.

Evolution away from Tribal Past Intertribal rivalry changed over time as the Etruscans prospered. War became more serious as the stakes grew higher and as competition for control of trade in the area intensified. This development is seen in the greater fortification of the plateau sites that may have begun as early as 700 B.C.E., built with tufa blocks. (Cerveteri is an example.) The building of massive fortified walls reached its peak in the fifth and fourth centuries B.C.E., when the Etruscan cities were being threatened by both Romans and Celts.

Greek Influences The Etruscans received important influences from the Greeks as soon as large-scale trade with them began. They adopted the Greek alphabet in about 700 B.C.E.; writing seems to have been used as a sign of elite status. Tomb paintings demonstrate Etruscan adoption of the Greek banquet, with the difference that Etruscan wives took part, rather than the *hetairai*, prostitutes, of the Greeks. Another favorite occupation of Etruscan nobles depicted in tomb paintings was hunting.

Military Practices

Warfare between tribes had a large element of ceremony (as may well have been the case with the Celts, too, until they began their migrations). Local chieftains fought one another on horseback as in a joust, backed by lightly armed retainers. Thus war was mostly an individual affair, in which elite warriors fought as much for personal glory as for plunder and gain. It has been suggested that the Roman triumph of republican and imperial times, the highly stylized public celebration given for a victorious general, was adopted from the Etruscans, because it is a somewhat archaic holdover in emphasizing the general's personal achievement, instead of his service to the state, a more characteristic Roman attitude. Some ancient sources mention Etruscan kings, sitting in state, wearing a gold crown and a richly

embroidered tunic, sitting on an ivory throne, and bearing an eagle-shaped scepter. It would be a mistake to think of such trappings and celebrations as primarily intended to assert a leader's authority, as in an urban-based civilization. Rather, in tribal societies, a leader's wealth, derived from victory in war, was a sign of the gods' favor for the tribe as a whole. Tribal leaders acted as intercessors between the gods and their people, and their success in the risky business of war depended on the help of the gods, who tipped the balance in the king's favor (as in Homer, who was writing not about Greeks of later times but of the tribal societies of the remote past). Victory in war probably was seen as foretelling bountiful harvests, health, and general prosperity for the tribe.

Dwellings and Architecture

The typical dwelling of Etruscans was adopted by Romans. The entrance of the one-story house was a narrow vestibule that opened out into the atrium, an open-roofed area with a pool underneath to receive rainwater. An altar to the household gods and the seat of the head of the household (who performed the rituals at the altar on behalf of his family) stood opposite the vestibule, and thus was the first sight to greet the visitor. Beyond the altar was the master bedroom in earlier times; later this became a public room where the master of the house received visitors. Bedrooms lined the sides of the atrium.

Technology and Art

Inspired by Greek pottery and other wares, Etruscans experimented with new material and techniques. In the seventh century they developed *bucchero*, a shiny black pottery, which became highly desired in coastal Gaul (France) and Iberia (Spain). They also invented terracotta while attempting to replicate metal relief work in clay. Terra-cotta was used at first for the decoration of temples. The large-scale migration of Greeks to southern Italy stimulated trade, manufacturing, and craft skills in working gold, silver, and ivory.

Other Etruscan art forms include sculpture in clay and metal, and fresco tomb paintings. Etruscans clearly were influenced by Greeks and cultures of the eastern Mediterranean, and their art was extremely influential on that of the Romans.

Religion

Funerary Art The many banqueting scenes in Etruscan funerary painting are thought to have more significance than merely portraying a

favorite pastime of the living. They may have been meant to show a ritual, sacramental meal consumed by the living on behalf of the dead, as in many customs that have survived to the present of setting a place at the table for departed ancestors on certain occasions, such as the Catholic holy day All Souls' Day. They perhaps expressed the hope that the departed would indeed join in those feasts in parallel with living relatives. The demons and other symbols of the underworld that begin to appear in paintings in the fourth century B.C.E. lend credence to this hypothesis; however, they may also be signs of social and psychological stressors on the Etruscans as the threat of Roman power loomed large at this time.

Painted Greek pottery became very popular as burial offerings, so much so that some 80 percent of surviving Greek pottery was found in Etruscan tombs. Setting aside such unlikely theories as that Etruscans buried Greek pottery with their dead (instead of gold and silver vessels that they kept for their own use) because it was cheap and abundant, it may have been the mythic themes depicted on the pottery to which Etruscans responded. Pottery showing the exploits of Heracles (Hercules) was very common in tombs; the fact that he was a mortal who became immortal may have offered comfort to mourners. In general the theme of many Greek (and probably also Etruscan) myths involved heroes who through their deeds attained immortality, at least in the form of everlasting fame. (The Greek hero Achilles, who traded glory for length of days, is the exemplar.)

Cities of the Dead Beginning around 500 B.C.E. the citizens of several Etruscan cities ceased to bury their dead in separate tombs, but instead created literal underground cities of the dead, with tombs arranged in streets, each one with a facade in the shape of a house carved in the tufa. Family tombs are surrounded by more modest burial places for what might have been servants or retainers. Such cities are found at Cerveteri and Orvieto. This more egalitarian arrangement probably reflects actual changes in Etruscan society, as urban life featured an increasingly prominent merchant and craftsman class, and the old warrior elite became less completely dominant. But it also gives a heightened sense that for the Etruscans, the world of the living was paralleled by an unseen world of the dead. Was the living world considered to be a mere reflection of this alternate spiritual world? With the lack of an Etruscan literature, such matters may remain the subject of speculation alone.

This bronze statue of an Etruscan warrior dates to about 300 B.C.E.

(Drawing by Patti Erway)

Role of Augurs The importance for the Etruscans of augurs, priests schooled in divining the will of the gods by reading omens, such as the flight of birds or lightning bolts, suggests that their religion, as did that of the Italic tribes of Italy, grew out of a belief in spirits (called by the Italics *numina*) who dwelled in rivers and trees, groves, fields and buildings. Belief in a multitude of spirits surrounding humankind on every hand, which each person encountered by day or night, waking or sleeping, may have given rise to efforts to contact the spirits both to learn their will and to gain their knowledge of the unseen, including the future. Augurs were consulted for everyday matters as well as at moments of crisis or war.

Augurs made their divinations from within a sacral space, usually on high ground. By about 600 B.C.E. the Etruscans began building temples adjacent to this sacred space (called by Romans the *templum*, the origin of the word *temple*), with very high podia (the bases on which temples were built). Augurs may have stood on the edge of a temple's podium, the better to gain contact with the flying spirits. The Roman temple to Jupiter, Juno, and Minerva on the Capitoline Hill begun in the late sixth century when an Etruscan "king" still ruled Rome was modeled on Etruscan temples. The Romans used the Etruscan rules of divination, the *disciplina*, which they took care to preserve unaltered.

Etruscan Gods Etruscans of historical times had developed a pantheon of gods, many adopted from other peoples, especially the Greeks. (Two-thirds of the Greek Olympian gods have an Etruscan equivalent.) In many cases they gave Greek or other names to their own deities. They equated the Phoenician goddess Astarte with their own Uni, whose Greek equivalent was Hera and who was the forerunner of the Roman Juno.

The "exotic" culture of the Etruscans, so different from what we think we know about the ancient Mediterranean world, hints at a diversity of that world that scholars and archaeologists have only begun to discover in recent decades. What we thought we knew about the ancient world for centuries derived from a very fragmented and limited source: the ancient texts that survived some 2,000 years of often tumultuous history and dramatic cultural change. Only a small fraction of the written legacy of antiquity has survived. For example, there are

only 1,865 Roman manuscripts in existence that date from before Charlemagne (ninth century C.E.) of the FRANKS; the rest of the extant Roman literature consists of what scribes in the ninth century saw fit to copy; a number of the most important works are known from only a single copy. And because the overwhelming majority of the known literature was created by writers who worked within the dominant Greco-Roman culture, the picture that emerges from the texts alone has a considerable degree of uniformity. It is this uniformity which makes the culture of the Etruscans in contrast seem so strange. The field of classical studies in the 20th century opened wide many new doors to knowledge about the ancient world that are creating a new picture of antiquity as a period of sometimes bewildering cultural complexity and diversity, beginning with the archaeological discoveries of civilizations of the MINOANS and MYCENAEANS. Against this new backdrop the uniqueness of Etruscan culture can be seen as typical of the Mediterranean world, in which cultures in contact with Africa, the Near East, and Europe each blended them into a particular amalgam unique to itself.

F

Faliscans (Falisci; Falerians)

The Faliscans, a tribe of ITALICS, inhabited a horseshoe-shaped territory in northern parts of the region of ancient Latium (part of modern Lazio) between the ROMANS and LATINS in the south and the ETRUSCANS to the northeast. Their culture was highly influenced by their Etruscan neighbors, and their chief city, Falerii (modern Civita Castellana), was part of the 12-city Etruscan League during historical times. Most of our knowledge of the Faliscans is derived from Roman historians of the early republic, who paint a picture of them as a fierce and warlike race. The Faliscans made a number of truces with the Romans but reportedly broke them all.

ORIGINS

Sometime in the eighth century B.C.E. the Faliscan people evolved out of an Iron Age culture archaeologists called Villanovan (see VILLANOVANS), which was spread widely over central and north-central Italy. They became influenced by other Italics in the region.

LANGUAGE

The Faliscans spoke an Italic language, similar to the Latin of their Roman neighbors (and perhaps derived from Latin rather than a language that formed parallel to it). In the seventh century B.C.E. they began to write using the Etruscan alphabet.

HISTORY

The Faliscans' territory stretched in a horseshoe, bordered on the west by the Cimini Mountains and the impenetrable Cimina forest. To the southwest were the Sabatine Mountains, and south, the Campanian territories, Rome, and Mt. Siratte. The northern part of the territory was bounded by the Tiber River, which separated the Faliscans from Etruria and the Etruscans. Several important cities, including their capital, Falerii, were located on the Treja River, which ran from south to north through Falerian territory, a tributary of the Tiber, which provided water and transportation.

By 437 B.C.E. in the face of the expansion of Roman ambition the chief city of the Faliscans, Falerii, had joined with the Etruscan League. After the Etruscan city Veii fell to the Romans in 397 B.C.E., the Faliscans reaffirmed their commitment to the Etruscans in 394 B.C.E. Beginning in 357 B.C.E. the frequency of incursions by Romans into Faliscan territory and of Faliscans into Roman territory escalated. The two were at continual war; because neither side won decisively, in 351 B.C.E. they signed a truce.

It was not long before the two sides were fighting again, intermittently. During the Second Samnite War beginning in 326 B.C.E. the Faliscans allied themselves with the Romans against the SAMNITES and their allies, including the Etruscans. In 312 B.C.E., however, the Faliscans sided with the Romans in a decisive battle against the Etruscans at Sutri.

Faliscans time line

B.C.E.

eighth century	Evidence of Faliscan culture, as distinct from Etruscan, appears in small area between southern Etruria and Roman territory in Latium.
seventh century	Faliscans, while speaking an Italic language, adopt Etruscan written alphabet.
437	Falerii, capital of Faliscans, joins Veii and other Etruscan cities in alliance opposing Roman expansion.
394	Faliscans reaffirm alliance with Etruscans after fall of Veii to Romans.
357–351	Incursions of Romans and Faliscans into respective territories leads to heavy fighting.
351	Romans and Faliscans, equally matched militarily, sign truce, followed by long period of intermittent peace and fighting.
312	Faliscans side with Romans against Etruscans.
241	At start of First Punic War between Rome and Carthage Faliscans rebel; Romans overrun Falerii.

They later decided to oppose the Romans. The Romans mounted a huge army and marched on Falerii, where the Faliscans, in light of the Romans' power, sued for peace. The Romans then levied a heavy tribute on them.

In 241 B.C.E. the First Punic War broke out between the two dominant powers of that time in Mediterranean trade, the Romans and CARTHAGINIANS. The Faliscans, possibly angered by the heavy tribute, took the opportunity to rebel against the Romans. This time the Romans defeated the Faliscans in every encounter, finally marching on Falerii, and after six days of siege, they leveled the city that sat on the heights of a cliff. Reports say that 15,000 Falerians were killed. Later Falerii was rebuilt on the plain as a Roman city. Faliscan culture and language were swallowed up by Rome.

CULTURE (see also ITALICS)

Economy

The Faliscans were an agricultural people who depended heavily on trade.

Government and Society

Faliscan cities were built atop high cliffs that dotted Faliscan territory. Each city was an independent entity, but periodically representatives from each city would gather in Falerii, the chief city of the Faliscans, to make laws.

Art

Faliscan pottery shows Etruscan influence, which in turn was influenced by the GREEKS of

the eastern Mediterranean. But it is also distinctive. The pottery is characterized by ornate twisted handles, capped by the heads of animals, with forms and painted decoration extravagantly combined.

Religion

The religion of the Faliscans is known primarily from inscriptions, votive offerings, and writings from classical times. Its importance lies in expressiveness and technical acuity of temple decorations unearthed. The Faliscans' relation to the Romans is reinforced by their worship of Mercury, Minerva, and Apollo, but their highest reverence was reserved for another important Roman deity, Juno Quirites. The first-century B.C.E. Roman poet Virgil describes a sacred grotto in a cave on Mt. Soracte used by the Faliscans for religious rites. At the foot of the mountain was a sacred spring, called Lucus Feroniae, dedicated to Feronia, the protector of the animals, who was worshipped by the Faliscans, as well as by Etruscans, LATINS, and SABINES, demonstrating the cultural overlaps among the early peoples of Italy.

Burial Practices Faliscan burial practices were very similar to those of the Etruscans. Between the eighth and seventh centuries B.C.E. Faliscan burials were accompanied by displays of opulence. Warriors were buried with their arms, armor, chariots, harnesses, and the trappings of daily life, from shaving equipment to vases for banqueting. Women were buried with their weaving tools.

The Faliscans, being ethnically different from their northern and more widespread neighbors the Etruscans, adopted many of their customs. Both are among the distinctive peoples of the Italian Peninsula whose culture disappeared after their conquest by Rome. Until the advent of modern archaeology many peoples of Italy were known solely through Roman descriptions of them. Roman writings on the people they fought and overcame are not all intrinsically inaccurate but do reflect Roman biases, and as a whole the Roman literature on the peoples of Italy does not fully reflect the cultural variety of the region. (The Roman habit of interpreting foreign gods in terms of their own pantheon is an example of their Romanizing tendencies.) Archaeology has increasingly revealed the rich and varied mosaic that was the cultural landscape of ancient Italy.

Finno-Ugrians (Finno-Ugrics; Finnic; Finnish; Finns; Finno-Ugric peoples)

The name Finno-Ugrians (or Finno-Ugrics) refers to peoples in north-central and eastern Europe (as well as some groups in Asia) who speak languages of the Finno-Ugrian language family. The term is thus primarily a linguistic designation, and speakers of Finno-Ugric languages have widely diverse ethnic origins and live in scattered enclaves throughout a vast region. They are also sometimes grouped under the name Finnic, with the Ugrians, or Ugrics, omitted, or as FINNS.

The name Finns, however, is better used for a specific tribal group or for the Finns of present-day Finland (see FINNS: NATIONALITY). Among the Finno-Ugrians are the SAAMI (also known as Lapps or Laplanders) in present-day northern Finland, Sweden, and Norway, and in northwestern Russia and the Khanti (or Ostyaks) in northwestern Siberia. There are also the Baltic Finno-Ugrians (or Balto-Finno-Ugrians or Western Finno-Ugrians), including the ESTHS, INGRIANS, IZHORIANS, KARELIANS, KVENS, LIVS, TORNEDALIANS, and VOTES. The Volga Finno-Ugrians (or Eastern Finno-Ugrians) include the MARI, MERYA, MORDVINS, and MUROMA. The Permian Finno-Ugrians (or Finno-Permians) include the KOMI and UDMURTS. The MESHCHERA are classified by some scholars as Volga Finno-Ugrians and by others as Permics. The MAGYARS, later to be called Hungarians (see

1207 Brothers of the Sword pacify Livs.

1219 Brothers of the Sword pacify Esths.

HUNGARIANS: NATIONALITY), also spoke a Finno-Ugric language.

ORIGINS

As in the case of so many language groups, studies of the Finno-Ugrians have long been entangled in intellectual, ideological, and political struggles, since the late 18th century. On the one hand, the sciences being used to identify and study ethnic and language groups, such as linguistics, ethnology, and archaeology, were still new and developing. On the other, nationalistic movements for independence being born in a number of the countries where Finno-Ugric languages were spoken, such as Hungary, Finland, and Estonia (*see* ESTONIANS: NATIONALITY), strongly influenced ideas about them. Activists in these countries, longing to escape Russian domination, sought to stress their ethnic uniqueness and distinctness from Russia, while some Russian scholars welcomed the contribution of many varied races, including Finno-Ugrians, to the formation of the Russian people, in a sort of “melting pot.”

In the 19th and earlier 20th centuries as linguistics developed and became more detailed and complex, its practitioners succumbed to a narrowing of focus and elaborated theories almost devoid of input from archaeology, ethnology, or physical anthropology. Finno-Ugrian specialists studied the evolution of this group without considering the history of neighboring peoples, such as the SLAVS, or other peoples who may have inhabited the woodland zone of western Siberia and eastern Europe, claiming that Finno-Ugrians were the sole, original inhabitants of this region, a notion long since overturned by archaeology.

Finnish researchers sought a Finno-Ugrian culture that was universal among all Finno-

Ugrian speakers, from the Saami to Hungarians to Estonians to the Khanti, while ignoring the considerable evidence that Finno-Ugrian and eastern Slavic peoples have long had many elements in common. Instead, they and Estonian scholars looked to peoples to the west in Europe for congeners.

A special problem with understanding Finno-Ugrian ethnogenesis is the fact that Finno-Ugrian languages are spoken by such a bewildering variety of peoples. That a language group can be shared by the Saami, some of whom live to this day a hunter-gatherer lifeway in remote sub-Arctic regions, and Hungarians in the center of temperate eastern Europe, whose culture has long been among the richest and most sophisticated in Europe, is indeed hard to comprehend. A partial solution to this conundrum must be sought in the location of the ancestors of the Finno-Ugrians near the circum-polar region of the great Eurasian continent at what became a crossroads of cultures and influences probably soon after the end of the last Ice Age. From that time until well into the Common Era, a period during which important groups of Finno-Ugrians had moved south to central Eurasia, peoples across the region experienced both evolutionary changes and sometimes tumultuous and sudden shifts of socioeconomic and historical forces brought to bear on them by peoples from east, west, and south—many of them causing population dislocation and dispersal to the regions where Finno-Ugrian languages are spoken today. Perhaps the greater conundrum of the Finno-Ugrians is how they were able to retain their languages through all of these shifts and dislocations.

Place of Origin of Proto-Finno-Ugric

The original Finno-Ugric language developed somewhere in the northern forest belt of western Siberia and northeastern Europe. Anthropological study of skulls found in this region increasingly makes clear that already by the fourth millennium B.C.E. people there were racially mixed, with ancestors from both Europe and Asia. People from southeast and southwest had probably begun to migrate to northern Eurasia as soon as the ice sheets receded, at first seasonally following herds of caribou and reindeer, then sometime after 7000 B.C.E. more permanently as the climate moderated and the forests grew deep. Asians most probably migrated from central Asia via the Ural Mountain region, and Europeans from the Baltic coast. The apparent kinship of the Uralic languages (of which Finno-Ugric is a sub-

group) with the Altaic group from the Altai Mountains in Asia supports this penetration of Asians to the Ural region, as do the Uralic languages spoken east of the Urals in Asia. The different peoples of the northern forest belt probably spoke related languages at least from Mesolithic times (if not even earlier), ranging from those with a more European character (Finnic) in the west to those with a more Asian character (Uralian) in the east. The fact that peoples in what would be the Finno-Ugrian region had from the beginning such a diverse ancestry, the result of part of their homeland's being so near "the top of the world"—the circumpolar region where all the continents of Earth are close—is perhaps a partial explanation of their great diversity in later times.

The Uralic language ancestral to the Finno-Ugric language could have emerged as a result of this meeting and intermingling in the north of peoples from Asia and Europe in the Mesolithic Age or earlier. The original language could have been a lingua franca made up of elements from east and west used when different language speakers met.

There are several possibilities for the origin of the Finno-Ugric language family, no one of which has been proved. One theory that has been favored by scholars holds that the crystallization of proto-Finno-Ugric (the ancestral language of all Finno-Ugric languages) came about with the adoption of farming in the region sometime in the fourth millennium B.C.E., possibly through a mechanism whereby the dialect of the group that first began to practice agriculture was adopted by other groups along with the technological innovation. Since all languages in the wider region were related, the adoption of one of the dialects by speakers of other dialects would not have been difficult. There is a strong possibility that for many peoples the earliest adoption of farming was intertwined with religious belief, as agricultural practices were undertaken more as a form of religious ritual than as a primary subsistence means. If this was true in the northern forest zone, the first people in the region to adopt farming would have enjoyed great prestige, possibly sufficient to influence other groups to adopt their language along with the strange new practice of controlling the growth of crops and the breeding of animals. Whatever the timing and means by which the Finno-Ugric language first emerged, the Finno-Ugric speakers probably are descended from Mesolithic or Neolithic peoples indigenous since the last Ice Age to Russia and western Siberia.

Most anthropologists believe that the country around the Oka, the bend of the Volga, and the Kama (the Oka and the Kama are tributaries of the Volga River) was occupied by Finno-Ugrians before Indo-European-speaking peoples arrived, and that their early home extended from the headwaters of the Dnieper and western Dvina Rivers to the western slope of the Ural Mountains. Today only the Mari and Mordvins remain in this region. If the ancestral Finno-Ugric language emerged as farming was adopted, it may have happened at that location.

This territory differed from the important steppe zone to its south, along which contacts and influences between Europe and the Near and Far East traveled for millennia, in being more forested and therefore more isolated from cultural trends elsewhere. It was probably just one enclave in the vast northern forest zone that existed in the territories of present-day Russia, including Siberia and Finland and extending to the northwest into most of Scandinavia. From about 4500 to 3500 B.C.E. a sub-Neolithic subsistence economy in which foraging remained important continued in this vast region when, to the southwest in the North European Plain, a fully Neolithic way of life had been adopted, and, to the south in the Pontic Steppe, copper working had been adopted from the Balkans and domestication of the horse had been achieved.

In the Baltic region, including Karelia (in northwestern Russia) and Finland, the adoption of pottery making in about the sixth millennium B.C.E. shows contacts with the Finno-Ugrian region. It is in a style called Comb or Combed Ware, from its impressed comblike decorations, which derive from a ceramic tradition of the Upper Volga region, probably via the Lake Ladoga region. It is possible, although there is no direct evidence for it, that the arrival of Combed Ware was accompanied by adoption of a Finno-Ugric language. Some archaeologists have seen this development as eventually leading to the emergence of the Saami. Some have seen affinities of Combed Ware with pottery made throughout the circumpolar region, including the northern forest zone of North America, possibly evidence of the existence of an interconnected cultural province of boreal, nonagricultural peoples encircling the Arctic region.

Role of the Corded Ware Complex in the Spread of Finno-Ugric Languages

In the fourth and third millennia B.C.E. most of the southern part of the northern forest zone

(not including present-day Finland and Scandinavia) had contact with a momentous change emanating from central Europe associated with what is known as the Corded Ware culture, from the cord impressions used to decorate pottery. Corded Ware users, still following a Neolithic lifestyle, were now spreading that lifestyle by engaging in pastoralism (consisting mostly of cattle grazing) and longer-distance trade than had ever been known before. Travel using the innovation (from the Near East) of wheeled carts, and domestication of horses adopted from the Pontic Steppe, gave Corded Ware users contact with different peoples on an unprecedented scale. The impact of this shift on hitherto isolated societies is symbolized by two elements of material culture that were found in burials: a more or less standardized set of drinking vessels, and the substitution of the forester's axes of the past by heavy stone battle-axes. The drinking vessels to hold alcoholic beverages were possibly used in hospitality rituals intended to avert the need to use the battle-axes.

An emerging theory postulates that the proto-Indo-European language ancestral to the Indo-European language family was born out of the nexus of these new wide-ranging contacts in central Europe, perhaps as a *lingua franca* or trade language to allow communication among strangers, perhaps as they engaged in ritual drinking and feasting. If so, the spread of the Corded Ware cultural complex could have been accompanied by the spread of proto-Indo-European.

From about 3500 B.C.E. the Corded Ware culture was quickly adopted over a wide region, including present-day Russia and southern parts of the northern forest zone, perhaps by about 3000 B.C.E. This cultural dissemination is not thought to have been by force, through invasion or migration of peoples, but rather through the movement of ideas, as people eagerly adopted horse domestication and copper implements on learning about them from far-ranging herders or traders. Perhaps the fact that Finno-Ugric speakers adopted these innovations but not the proto-Indo-European language, for reasons still unknown, is negative evidence that the Corded Ware complex was spread through emulation rather than by force. A Corded Ware way of life may have been adopted in Finno-Ugric regions by people still living a sub-Neolithic, foraging way of life, for whom the mobility of herding would have come naturally. For the forebears of the reindeer-herding Saami, for example, the shift

from following wild herds to capturing and domesticating reindeer may not have been great.

A possible mechanism for the spread of Finno-Ugric beyond its original homeland is the new mobility characteristic of the Corded Ware way of life. Corded Ware arrived in Finland by around 3000–2800 B.C.E. The one-quarter of the Finns' genetic stock that is Siberian may have been contributed by Finno-Ugrians following the mobile Corded Ware way of life. Again the Corded Ware culture seems to have spread not through invasion or large-scale migration, but through the attractiveness of its elements, which were quickly adopted by some groups. (Corded Ware was actually slow to replace Combed Ware in Finland.) The arrival of the Corded Ware way of life in Finland may not have had a major impact on Finnish racial makeup but could have led to a shift there to a new language, in this case Finno-Ugric, as elsewhere in Europe Corded Ware may have been responsible for the spread of Indo-European. Finno-Ugric may have permeated the northern forest zone in the same way. If, on the other hand, a form of Finno-Ugric had already arrived in Finland, the Corded Ware lifestyle could have spurred the development of the Balto-Finnic branch of Finno-Ugric.

The Finns and Saami may have begun diverging into distinct cultures as coastal groups began to adopt a Corded Ware way of life, while those in the interior continued to practice the foraging existence of the past. This divergence would help to explain why the languages of the two groups occupy separate branches of the Finno-Ugric language family.

Bronze Age

The Finno-Ugric territory remained isolated from trends to their south and west in the Early Bronze Age, from 2500 to about 1800 B.C.E. lacking bronze and maintaining a Corded Ware lifestyle and culture. Bronze making entered the steppe region to the south of the forest zone from the Caucasus Mountain region (with its proximity to the urbanizing Near East) by about 2500 B.C.E., and on from there to the metal-rich Carpathian Mountain region in central Europe. During this period Carpathian bronze industries steadily increased their productivity and technical skill, exporting huge numbers of metal objects to the steppe zone in return for horses. By the end of the third millennium B.C.E. steppe peoples had transferred knowledge of metalworking to people in the copper-rich southern Ural Mountains. From

there knowledge of metalworking and other steppe influences probably filtered through to much of the forest belt, by 1800 B.C.E. giving rise to the Abashevo culture located between the Don and the Volga Rivers, which by now was probably a Finno-Ugrian region. This culture had wealthy elites, who may have gained their wealth through raiding the rich trade routes reaching from the Urals across Abashevo territory to the east-west steppe zone, traversed by a trade network that extended from Carpathian and Caucasus bronze industries to the Pontic Steppe and on to the borders of Mongolia and even northern China. Thus although the Finno-Ugrian region continued to be a relative backwater largely bypassed by the major socioeconomic forces of the time, it was not out of touch entirely.

Burials of the Abashevo culture show the moderate wealth of their elites, and their links with the steppe-dwelling makers of multiple relief band pottery and timber graves who lived in the steppe zone to the south. A burial located in the Tzna basin (the area between the Don and the Oka in central Russia) had grave goods that included bronze daggers and a spearhead, richly decorated bone cheek pieces for horse bridles, and flint arrowheads. Multiple burials were collectively enclosed beneath a mound. The assemblage has many analogies in Don-Volga Abashevo culture sites and in some synchronous sites in the steppe and forest-steppe areas of eastern Russia and the southern Urals.

Meanwhile there is evidence of migration of peoples to the northern forest zone from the Volga-Oka confluence region in south-central Siberian Russia from the third to the second millennium B.C.E.; because their skull types point to an origin north of the Black Sea, it is likely that they spoke an Indo-European language. Place-names that still exist in the Volga-Oka region are of Indo-European origin, in a language possibly related to Scythian (see SCYTHIANS); people there, nevertheless, spoke a Finno-Ugrian tongue. Later in the Bronze and Iron Ages peoples of an eastern Mediterranean skull shape also moved north to the Finno-Ugrian region, while migration from beyond the Urals introduced more Asian peoples to the region as well.

Three basic anthropological types are recognized in the Finno-Ugrian region in prehistoric times, identified by analysis of skulls: (1) a transitional group in which Asian (Mongoloid) and European (Europoid) characteristics are commingled, who lived in the Volga-Kama region (with scattered communi-

ties in the eastern Baltic along the Gulf of Finland); (2) a clearly European group with northern characteristics to the south and west of the first, from the Baltic coast to the middle Volga; and (3) peoples with eastern Mediterranean traits south of the Volga-Oka region. The first of these is often called the Uralic type; peoples of this type include the Khanty (Ostyaks), Mansi (Voguls), Udmurts, Mari, and isolated groups of the Mordvins and Komi. The Saami are a subtype of this group. The second group, the White Sea-Baltic, includes Estonians and Finns and is found today in speakers of non-Finno-Ugric languages, such as Lithuanians, Poles, and White Russians. A name recently proposed for the third group, which probably is made up of peoples from the Pontic Black Sea region and from the eastern Mediterranean, is Atlanto-Black Sea, as some of its people have traits that seem to derive from the western Atlantic region of Europe, perhaps introduced to the eastern Mediterranean by migrants. The Black Sea component of this group shares features with non-Finno-Ugric speakers, such as Russians and TATARS of the Volga region, as well as peoples from the Balkans such as the BULGARS and the Caucasus. One subtype of this complex is well represented among Hungarians. It is also seen in some Slavic and Germanic speakers.

LANGUAGE

Finno-Ugric languages, along with Ugric (or Ugrian) languages, are part of the Finno-Ugric branch of the Uralic language family. The Uralic family is considered by some linguists to be part of an even larger group, the Uralic-Altai language family, named for the European Ural and the Asian Altaic Mountains. Important common linguistic characteristics of the two and a small vocabulary of shared words, including personal pronouns, kinship terms—*mother* and *father*, for example—and names of plants and animals, further support the idea that they share a common ancestor, perhaps originating in the central Asian Altai range. This grouping is not accepted by all linguists, however. The Uralic group is thought to have emerged in the Ural Mountains. The other branch of the Uralic group is Samoyedic, the first Uralic subfamily to separate from Uralic, spoken by the NENETS and various Arctic and sub-Arctic Asian peoples.

The Finno-Ugric subfamily includes the Balto-Finno-Ugric, Permic, Saami, and Volgaic groupings. The Ugric subfamily includes the Hungarian language of the Magyars. The linguistic and cultural similarities among the

various Finno-Ugric peoples suggest that one great tribe splintered into various smaller groups, who then migrated to different areas. Although Finno-Ugric peoples may have started with the same language base, there are only a few tribes who are linguistically compatible enough for communication.

The original homeland of the Finno-Ugric languages is believed by some linguists to have been the region extending from the headwaters of the Dnieper and the western Dvina to the western slope of the Ural Mountains, about 5,000 years ago. There is evidence that before the immigration of Slavic-speaking tribes in their present territory in central and eastern Europe in about the sixth century C.E. Finno-Ugrians inhabited the whole territory from the Urals to the Baltic Sea.

Most linguists believe that unlike most of the languages spoken in Europe, Uralic languages are not part of the Indo-European family of languages. Some researchers now believe, however, in an alternative theory, that early Finno-Ugric was one of the two elements that blended to form basic Indo-European. They maintain that some among them mingled with Caucasian-speaking peoples (*see* CAUCASIANS) to produce Indo-European.

Evidence is wanting, however, as to direct contact between Caucasian peoples and Finno-Ugrians, and such a connection is unlikely because the two did not inhabit neighboring territories; rather, the vast steppe region lay between the two. (There is much evidence of relations between Caucasians and steppe peoples in the late Neolithic, the period when Proto-Indo-European most likely emerged.) If the complex Caucasian societies on the periphery of the urban Near East had had substantial contacts with Finno-Ugrians, a more likely outcome would have been the absorption of the latter into the more advanced Caucasian culture and even the disappearance of their language.

It is difficult to see how the language of such remote, isolated, and primitive societies as lived in the Finno-Ugrian homeland could have had the very large impact over a wide region of more developed societies to the south and west where the Indo-European language is known to have been influential. The most common way primitive societies historically have been able to impose their culture and language on more advanced ones is through large population movements, displacing indigenous languages in other territories either by forcible

invasion or (as in the case of the Slavs in the mid-first millennium C.E.) by exploitation of a power vacuum left by the collapse or migration of a previous warrior elite society. However, there is no trace of evidence of such a scenario for Finno-Ugrians, either in the most likely time frame for the emergence of Indo-European—that is, the fourth to the third millennia B.C.E.—or at any other time. On the other hand, another possible mechanism for language spread in the relevant period is clear in the archaeological record: the rapid spread over the territories concerned of the distinctly new and different cultural complex called Corded Ware. This eventuality, which has been characterized as among the most momentous that occurred in prehistoric Europe, furnishes a more likely mechanism for widespread language change.

Variations of Finno-Ugric are the official languages in Finland, Estonia, and Hungary. Pockets of Finno-Ugric speech are found elsewhere in European and Asian Russia.

HISTORY

Ancient Accounts

In the fifth century B.C.E. the Greek historian Herodotus wrote of peoples presumed to be Finno-Ugrians as “long possessed of the soil.” Some of the tribes described by him have been claimed as Finno-Ugrian, mostly based on their probable location to the far northeast of the Greek world. Herodotus mentions the Issedones and Arimaspians and says that beyond these lived the Hyperboreans, who worshipped Apollo. (He distinguishes the Hyperboreans from the others as being peaceful.) His authority for this information, however, is a very uncertain one. He learned of this region from a tale concerning one Aristeus of Proconessus (an island in the Propontis), who may have lived in the sixth or seventh century B.C.E. It was said that Aristeus died suddenly one day, but when his relatives came to take his body for burial it had disappeared. Seven years later Aristeus came back to his city and told of having been possessed by Apollo; in this possession he traveled to lands approaching the territory of the Hyperboreans, finally coming to these Apollo-worshippers themselves. Confusingly, Herodotus later qualifies this by saying Aristeus had learned about the Hyperboreans from the Issedones. In the end, Herodotus says, no one knows for sure about these lands, and he was unable to interview anyone who had actually been there.

Some details of Aristeus's account are plausible and may well have derived from travelers' and traders' tales, for Proconessus, in the approaches to the Black Sea, was a natural stopping point for ships. He describes a lofty chain of mountains where gold, guarded by griffins, is to be found. These could well be the mineral-rich Urals, and the abundant gold from burials by Scythians at this time could have come from there. There is a curious lapse in Aristeus's story, however, for nowhere does he mention the other principal feature of the Finno-Ugrian homeland besides the Urals: the mighty Volga. Surely any traveler who had actually been to the region would have remarked on this great river. It seems likely that the travelers and traders passing through Proconessus from whom the Greek Aristeus could have derived information mostly traversed the Black Sea and, Greek-like, did not stray far from their ships, let alone journey across the steppes to the far north.

Aristeus says that the Issedones were being expelled from their territory by the Arimaspians, the Scythians from theirs by the Issedones, and that the CIMMERIANS, who live on the southern sea (i.e., the Black Sea), abandoned their territory under pressure from the Scythians. This movement of peoples, too, is plausible, for it accords with the ripple affect that for millennia fanned out across the steppe region as disturbance among peoples in one region affected their neighbors. As mentioned above, both possible Scythian place-names and skull types found in the Volga-Oka region have affinities with the area north of the Black Sea.

Early Contacts and Migrations

The Finno-Ugrians extended at one point in their history from the Gulf of Livonia to the Ural Mountains, and from the Arctic coastline to the Black Sea. By the fourth century B.C.E. the Finno-Ugrians were in contact with the Scythians, who lived west of the Don, and with the SARMATIANS, who occupied the plains to the east of it.

In the late centuries B.C.E. the Finno-Ugrians migrated westward to the east shore of the Baltic Sea, where they occupied the country north of the Western Dvina and the northern half of Courland, territory that included most of present-day Latvia and Estonia. Later some of them crossed the Gulf of Finland and settled near present-day Turku (Abo) and in the Kokemaki and Kyrö valleys of present-day Finland. The Finno-Ugrians absorbed the indigenous Iron Age population.

The Roman historian Tacitus wrote about people under the name Fenni as early as 98 C.E. His description of them as having no horses, houses, or weapons and dressing in skins fits the Saami of the time rather than people in southern Finland. On the other hand, Tacitus wrote that the Fenni had no religion, an assertion that was certainly not true of the Saami, then or at any other time. His description may have reflected Roman prejudice against barbarians living far from Rome on the edge of the world. For ROMANS such people were closer to animals than to civilized man. In *Geographia*, a work written in 127–147 C.E., Ptolemy used the name Finnoi.

Later Contacts and Migrations

In the first century C.E. the HUNS entered the Volga country and remained along its lower and middle course, having an impact on some of the Finno-Ugric groups. In the fifth century the BULGARS, who had settled on the Lower Volga and Kama, had contacts with and influence on the Komi, Mari, Mordvins, Udmurts, and the Finno-Ugric-speaking Magyars.

In about 700 the Finno-Ugrians reached the present-day region of Karelia in northwestern Russia.

From the eighth century VIKINGS from Sweden made strikes by sea eastward into Finno-Ugrian territory, primarily using the river systems. In the ninth century the Slavs also expanded from settlements in the Ukraine northeast up tributaries of the Dnieper River into Finno-Ugric lands.

The ancient territory of the AVARS in the Lower Danube region and the Carpathian basin was occupied at the end of the ninth century by the Magyars or Hungarians. The Magyars were politically organized by an aristocracy of TURKICS. Arab geographers of the medieval period distinguish two Magyar groups, one of which remained in the Ural Mountains, where the Vogul still live today, while the other emigrated first to "Levedia" north of the Sea of Azov and later to "Atelkuzu," the plain surrounded by the Lower Dnieper, the Carpathians, the Seret, the Danube delta, and the Black Sea. At this time the same Arab geographers (and also Constantine VII Porphyrogenitus of the 10th century) speak of the "Majghari" as Turks, no doubt because both groups of these Finno-Ugrians had been organized by Bulgars: those of the Urals by the Bulgars of Kama, those of Atelkuzu by the Onoghundur or Onogur, who in the ninth century occupied the southeastern region of the

Carpathians. The name Hungarians, to denote the Magyars, may have originated from these Onogur, who mingled with them in the second half of the ninth century. Other sources link these Finno-Ugrian Magyars with another Turkic tribe, the Kabars, who are associated with the KHAZARS and who are believed to have given the Magyars their royal family, the Arpads. The presence of an Onogur or Kabar Turkic aristocracy among the Magyars would explain the protocol of the BYZANTINES by which, in the exchange of ambassadors under Constantine VII, Magyar chiefs were always referred to as “Princes of the Turks.”

In the 10th century some Finno-Ugrians occupied, with the Khazars, the shores of the Sea of Azov and of the Caspian Sea.

By the 12th century the Baltic-speaking LETTS had reached the region known as Livonia (part of present-day Latvia and Estonia) and absorbed some of the more southerly Finno-Ugrians or pushed them northward.

In the late 12th and early 13th centuries German military and religious orders launched crusades to the Baltic region. In 1202 the invaders founded the city of Riga on the Gulf of Riga in Latvia, and the next year they established the Brothers of the Sword to Christianize the peoples. The Livs were the first to be pacified, in 1207. In 1214 the Letts fell, after which the Esths turned to Russia for support against German expansion. The Esths themselves were vanquished in 1219. In 1237 the Brothers of the Sword united with the Teutonic Knights, becoming known as the Livonian Order of Teutonic Knights. During the next century some Finno-Ugrians, migrating northward, reached Sweden. Kingdoms and nations would form over the next centuries.

Meanwhile the Saami continued to live a nomadic lifestyle in extreme northern Scandinavia, Finland, and western Russia.

CULTURE

Economy

Economic subsistence among Finno-Ugrians has followed the same developmental trends as among other Europeans but in a later time frame because of their location in the far north. Skilled in hunting and fishing, they followed a foraging way of life for millennia after agriculture had been adopted in the rest of Europe. An important feature in some areas was stream and river fishing, in which great seasonal runs of species such as salmon fostered a sedentary existence in which people lived in large villages

focused on the prolific source of food. Elsewhere, such as in Karelia and Finland, sealing played the same role.

Later as Finno-Ugrians moved into new territories, considerable regional differences in economy developed. The pastoral economy typical of the Corded Ware culture that entered Finno-Ugria from about 3500 B.C.E. caused the people in forest steppe regions south of the northern zone to take up cattle rearing. This activity has long been important to Estonians south of Finland, and Udmurts and Cheremis in the southeast. In northern lands among the Finns, Karelians, and Komi, hunting to supply furs for trading to both western and southeastern Europe maintained its importance into the modern era, long after they had adopted agriculture. The amber trade generated foreign goods and wealth for coastal Finno-Ugrians from the Bronze Age until well into the Common Era. The fur and amber trade in Finland expanded greatly as traders from Sweden and Denmark pioneered trade routes southward through the Russian interior, first to Baghdad in present-day Iraq and then to the Byzantine Empire in the eastern Mediterranean region. During this period people in Finland began to bury their deceased in graveyards with abundant grave goods. Finnish culture spread inland to Tavastia and Ostrobothnia, through trade and settlement. Estonians, too, benefited from the trade networks fostered by the Vikings, and in the medieval period by the German Hanseatic League.

Fishing continued to be a mainstay; in the medieval period the periodical fasting from meat required by the Christian Church across Europe increased the importance of the cod and herring fisheries. It is thought that ancestral Finno-Ugrians from central Russia took knowledge of cereal agriculture northwestward with them to Karelia and Finland. In the early centuries C.E. Baltic Finno-Ugrians (Western Finno-Ugrians) became active in the east-west trade. Early extensive trade relations lasted until the decline of the Roman Empire and the wide-ranging migrations of the Germanics.

Government and Society

The great difference of Finno-Ugriaic languages from the Indo-European ones that predominate in Europe, as well as the location of most Finno-Ugriaic speakers in territories on the periphery of that continent, have isolated them to some extent from social and cultural trends elsewhere. Their political organization remained tribal until well into the Middle

Ages. As a result, Finno-Ugric speakers were dominated by outside powers—principally Sweden and Russia, but also Germany—in the early medieval period before they had a chance to form states of their own. Christianity, in the Middle Ages a civilizing force, was introduced late and by force as part of political annexation. Finno-Ugrians in areas under Russian rule remained almost totally separated from the outside world. In the southern parts of Karelia and Ingria the Karelian, Vote, and Ingrian populations were bound to the land as serfs of Russian-speaking masters. The cultural isolation of the Ingrians and Votes was exacerbated by their living in an area that was a mosaic of peoples speaking different languages. The Estonians were also bound to the land as serfs but in a feudal system handed down from the period of German rule and harsher than that of the Russians. Educational opportunities and the right to travel were for most speakers of these languages almost nonexistent until the 19th century and then only in restricted circumstances.

Art

Finno-Ugrians in the forest steppe zone were greatly influenced by Scythian steppe art. This spread toward the forest region of the Upper Volga, influencing the Finno-Ugrian Ananino culture near Kazan (c. 600–200 B.C.E.). A rich burial ground discovered there has yielded, in addition to the bronze spiked axes and daggers commonly found, some objects with animal motifs in which the animals' bodies are curled up; these have Scythian affinities, though executed here in a somewhat simplified form. The Scythian animal style was only partially adopted at Ananino, and the decoration continued to be based on geometric patterns. But depictions of animals have been common among a number of Finno-Ugric peoples to the present. Among Saami in coastal areas the most prevalent images were of the reindeer, small mammals, or fish; in the deep forest the most popular image was the elk. On the other hand, the geometric style continues among Udmurt women, who are renowned for their weaving and embroidery, with geometrical ornamentation using the traditional Udmurtian colors of red, black, and white.

Music

The Mari have two musical instruments unique to their culture. One is a many-stringed zither called the *kusle*, the other a *shyuvr* bagpipe.

Their musical traditions include song lyrics that mention the Volga and reflect a love of nature, especially of the forest and the rainbow.

The Udmurts had no written language but a strong oral tradition that has saved many myths, legends, and fairy tales. Much of Udmurtian folklore, history, and daily life is preserved in song, and the Udmurts are known for their singing ability.

Literature

The Kalevala Speakers of Finno-Ugric languages in the northeast Baltic region share a distinct poetic tradition with common themes, motifs, and forms, called the Finnish oral tradition or Kalevala-meter poetry, after the most famous work of the tradition, the *Kalevala*. Many examples of this tradition have been recorded in writing in five of the seven closely related Finno-Ugric languages in the region: Finnish, Karelian, Estonian, Ingrian, and Vote. The similarities of these works suggest that the tradition dates to a time before these languages differentiated from a common ancestor, probably the Finno-Ugrian dialect taken to the region in prehistoric times. There is no clear agreement among students of this poetry as to when and where this happened. The consensus of opinion among them points to an area on the southern side of the Gulf of Finland at least 2,500 years ago. On the other hand, it is possible that the Finno-Ugric ancestor of these languages arrived in the region—or began to filter in—much earlier, by about 3000–2800 B.C.E., so that the Kalevala tradition could be much older. Poetry in this style continued to be composed well into the Common Era, used to promote Christianity and even for political propaganda.

Poetry of the Kalevala tradition has lines in tetrameter consisting of two metrical feet each beginning with a strong or stressed syllable followed by two feet each beginning with an unstressed or weak syllable; a caesura (pause) is placed in the middle of the line between the second and third feet, that is, after the “strong” feet and before the “weak” ones. Alliteration is important in this poetry, abetted by the fact that Finno-Ugric languages have relatively few consonants—Finnish has only 13.

The *Kalevala* was first compiled in literary form by the Finn Elias Lönnrot. In 1827 he traveled from western Finland as far as eastern Karelia collecting folk songs, which he published the next year in Helsinki under the title *Kantele* (Harp). Common themes running through many of these songs gave him the idea

of uniting them into larger units. His first such compilation consisted of tales about the hero Lemminkäinen. In subsequent years as a result of further researches in Karelia, Lönnrot compiled songs into an epic cycle usually referred to as the *Old Kalevala*. In 1849 he published a greatly expanded version comprising 22,795 lines and 50 songs. When referring to the Finnish epic, commentators mean this *New Kalevala*; the *Old Kalevala* is primarily of historical interest.

The *Kalevala's* form is entirely Lönnrot's invention. The main material of the work consists of about 30 different epic songs, tales of adventure and great deeds, each of them in numerous variants. In addition, he used lyric songs, charms (incantations), wedding songs, laments, and proverbs. About one-fifth of the whole epic is made up of charms, such as one used to cure Väinämöinen's knee wound and another chanted by a female character to drive oxen.

Religion

Finno-Ugrian peoples of the northern forest zone had an animistic religion in which all things, especially animals and plants, were imbued with spirit. Animals—especially waterfowl—were deified. The Mordvins of the Volga region preserve this animistic religion; they have rituals of Sun worship, called Shkay. The Moon, trees, water, thunder, and frost are still considered integral to religious belief. The pagan religion of the Veps celebrated animals, such as the bear and the pike (fish).

Ancestor Worship Some Finno-Ugric peoples have beliefs that may have originated in ancestor worship. Many Mordvins still believe that dead family members return briefly on the 40th day after death. Some venerated their dead by representing them as polycephalic (multiple-headed) and holding communal banquets in their honor. There was a belief that after death one's spirit is turned into trees. Women were absorbed into fir, pine, and aspen; men turned into oak, maple, and ash.

Many omens were observed during Votic funerals. If the horse pulling the casket started walking with his left leg, the next person to die would be a woman. Living men never put their left sock or shoe on first, as that sequence was reserved for when dressing the dead for burial. The condition of the body in the coffin was a sign of how soon the next death could be expected. A stiff body meant it would be a while until the next burial unless the sleigh or horse cart toppled over upon returning from

the graveyard, in which case another death was predicted to follow soon. A copper coin thrown into the grave would help the dead person gain a better place in the next world. There was also a custom not to remove anything from cemeteries; even the berries growing there belonged either to the dead or to the god's birds.

At home the places that the dead body had touched were washed with soap and a rag, which was subsequently destroyed. All objects that had touched the corpse were thrown into a fire or into water. Yet there were good omens associated with having a corpse in the house. Anyone who had a cyst on the arm or leg had only to touch the same spot on a dead body, after which he or she could hope to recover.

Many Finno-Ugrians had or have spoken charms for healing. Omens govern much of their behavior, such as in the building of their homes. These are signs of a belief in an unseen spirit world that surrounds and influences all human actions and must be taken into account during all activities.

Shamanism It is believed that before Finno-Ugrians spread to other regions from their northern homeland, they practiced shamanism, depending on a priestlike man or woman of special powers that allowed him or her to communicate with the spirit world. Shamanism has occurred throughout the circumpolar region, including Siberia and North America. The shaman uses special techniques to transcend the limits of time-bound, space-bound mortality and enter the spirit world through a soul flight. Shamans used deprivation of food, sleep, shelter, and companionship, and sometimes intoxicants, drugs or drink, to attain a trance state. The shamans' visions transport them into the surrounding invisible world of the dead, and they speak their language. Through this they master the natural living world.

The famous Paleolithic painting in the cave at Lascaux, France, showing a recumbent human figure, it has been argued, is a depiction of a shaman in a trance, possible evidence of the great antiquity of such practices and their relation to a tundra existence lived by peoples all over ice-free Europe during the last Ice Age, which continued afterward in the circumpolar region. The shaman, while in a trance, is thought to have died temporarily. During the absence of its spirit the shaman's abandoned body must be protected by members of the tribe so that the soul will have a living form to reenter. Many feats of endurance of cold and pain that have been reported from Siberia and

elsewhere in the circumpolar region are thought to be related to such techniques of ecstasy.

The Saami still have shamans among them. The shaman mediates between humans and the spirit world. In times of trouble people turn to this central figure in the society. To connect with the other worlds, he enters a trance through what is commonly referred to as *joika*, a type of singing without words that attempts to capture the essence of nature. The term *joika* actually applies to only one of several modes of singing; the other modes, *lavlu/laavloevuelie*, have words and narratives. Drums accompany the singing and chanting, as do the bullroarer and the flute. Through the music a soul travels with the help of protective spirits, typically a totemistic animal. Men's rites focus on the hunt and control of wind and weather; women's rites center on home and family. The Veps had a type of shaman called a *noid*, who bore a staff made of alder to preside over weddings and other rites.

The geographical location of Finno-Ugrians in the far north both brought into being their unique blend of European and Asian genetic and cultural traits and, for those who remained there, engendered an isolation that protected their culture from usurpation by more dominant peoples with more advanced societies. Even most of those tribes who moved southward to the Volga region and westward to Baltic lands occupied peripheral areas, the forest steppe of central Eurasia and, in the case of the Saami, the boreal forests of northern Scandinavia. Even after Volga Finno-Ugrians were taken over by Russia, they shared in the great insularity and isolation from the outside world of that nation. Unlike other tribal peoples such as the CELTS and GERMANICS, who were utterly transformed by contact with Greco-Roman civilization, Finno-Ugrians preserve to a remarkable degree a tribal, pre-Christian outlook that once was common over the entire European continent.

Finns (Fenni)

The name Finns, originally Fenni, as used by the ROMANS, is used variously. It is sometimes applied to all Finnic-speaking peoples, a branch of the language family of Finno-Ugrians (see FINNO-UGRIANS). As such it is sometimes used for particular groupings of Finnic-speaking peoples, such as the Baltic Finnic or Finns (or Eastern Finnic), that is, all the Finnic-speaking people living near the Baltic Sea in present-day Finland, Russia, and Estonia, sometimes called Western Finnic; and the Volga Finnic or Finns, that is, all the Finnic-speaking people living along the Volga River in Russia or its tributaries, sometimes called Eastern Finnic. The name Finns also appears as part of the name of those Finnic-speaking peoples—the Ingrian Finns—who migrated from present-day Finland and settled in the region of Ingria in present-day

northwestern Russia and maintained a political identity and cultural tradition apart from that of other Finnic peoples there (see *INGRIANS*). Similarly the *ESTHS* of present-day Estonia are sometimes called the Estonian Finns, and the *LIVS*, the Livonian Finns. The name Finns is of course also applied to the peoples who have lived or live in the territory comprising what is now the modern nation of Finland, including ancient tribal people, as well as those of the historic region or modern nation of Finland (see *FINNS: NATIONALITY*).

Among the tribal peoples who settled Finland, classified by dialectal differences as well as by geography, are the *Suomalaiset* (*Suomaläiset*; *Suomea*) in the southwest, the *Tavasts* (*Tavastians*; *Hämäläiset*; *Hame*; *Hemes*; *Iames*) in the interior southern and western lake district, and the *KARELIANS* (*Carelians*; *Karjalaiset*) to the north and east, also including lands in the region of Karelia, now a republic in the Russian Federation. Other Finnic tribes are a mixture of these main groups. The *Savolaiset*, or people of Savolax, are a linguistic mixture of *Tavasts* and *Karelians*. The *Kainulaiset* or *KVENS* on the Gulf of Bothnia in present-day Finland and Sweden, as well as in present-day Norway to the north, can be considered a subgroup of the *Karelians*.

The *Suomalaiset*, in addition to being known as southwestern Finns because they inhabited southwestern Finland (*Varsinais-Suomi*, now the province of Turku ja Pori), are sometimes called the Finns proper because they were the first Finnish people known to the neighboring Swedes. The Finnish name for Finland, *Suomi*, is derived from their tribal name. The *Tavasts* are thought to be the first Finnic people to reach Finland from Estonia, but this idea has not been proved archaeologically.

The *SAAMI* (*Lapps*; *Laplanders*) of Lapland (consisting of Finland, the Scandinavian peninsula of Sweden and Norway, and the Kola Peninsula of Russia) are also a Finnic-speaking people but are culturally and to some extent physically distinct from the Finns of Finland. It is uncertain whether or not they were indigenous inhabitants of Lapland who had lived in their homeland for millennia, possibly from as early as 9000–8000 B.C.E., adopting the Finnic language in the first millennium B.C.E. Some anthropologists have seen affinities in the physical type of some among the *Saami* with Asian peoples in the eastern Ural Mountain region where European and Asian peoples had probably been meeting and mingling since the end of the last Ice Age. Similarities between

Finno-Ugric languages and those of the Asian Uralic language group may document such interactions. Some *Saami* ancestors may have thus migrated to Finland. Although in Finland they are generally discussed as separate from other Finnic peoples, in Norway because of their Finnic language they are sometimes called Finns.

ORIGINS

The first people to inhabit Finland were Neolithic peoples (of the *Kiukainen* culture), who are assumed to have settled there after the northward retreat of the glaciers. A Karelian folk epic, the *Kalevala*, tells of a mythical land, *Pohjola*, against which the *Kalevala* people, identified with the Finns, struggled and triumphed.

Finnics are thought to have departed their ancestral homeland in the Volga River basin and eventually reached the north coast of the Gulf of Finland. Theories vary widely as to the time of this event; the earliest is generally given as 3500 B.C.E. At some point too, Finnic peoples crossed to Finland and displaced or absorbed pre-Finnic peoples. It is thought that at least some among the Finnic peoples of the Baltic area were organized in loosely federated small states by the first century C.E. By the ninth century the *Karelians* settled the shores of the White Sea, the northern extent of their territory.

Other peoples intermingled with the Finns over the centuries, especially *GERMANICS*. From the first through the fourth century C.E., an apparently thriving seafaring culture spread throughout the region from as far west as the Jutland Peninsula (present-day Denmark), including the Elbe and Vistula estuaries. During this period people in Finland began to bury deceased in graveyards with abundant grave goods. The culture spread inland to *Tavastia* and *Ostrobothnia* through trade and settlement.

LANGUAGE

The Finns' language is in the Balto-Finnic group of Finnic in the Finno-Ugric language family and is closely related to Estonian. Dialects vary considerably; some of them have elements of both Estonian and Germanic.

HISTORY

From the ninth century the ancient Finns, loosely organized into states, were contending with coastal raids by *VIKINGS*. The Finns themselves tended to colonize inland, following

rivers, although they too carried out raids beyond Finland's shores. The Kainulaiset became known as raiders in the Middle Ages. The Rus ruled the southern part of Karelia from the late ninth century. In the next century the Eastern Orthodox Christian Church extended its influence to Finnic peoples of Novgorod (*see* RUS), Karelia, and Tavastia. In the mid-12th century the Swedes invaded Finland. In the 1230s the Catholic Church, in conjunction with the Germanic military and religious order Brothers of the Sword, active to the south among the Balts in present-day Latvia, established a presence in Tavastia.

For much of the century Sweden and Russia fought a border dispute over Finnish lands, with Karelia as the battlefield. In 1323 the Russian-Swedish border divided the Karelian territory, but continuing conflict became part of state policy on both sides. Centuries later, in 1617, the Peace Treaty of Stolbovo finally produced relative stability in Karelia but also the migration of many Karelian peoples to Russia to escape feudal taxes and the Lutheranism of the Swedes. Russia supported the emigration from Swedish lands and freed the Karelians temporarily from taxes.

Åland, an archipelago and now a province of Finland, was known to have been colonized by Germanics out of Sweden, who traded with peoples inhabiting Finland's coast in the Gulf of Bothnia and Gulf of Finland from Ostrobothnia in the north to Hanko in the south. The Swedes also made inroads on the mainland. A revolt by the Tavasts was suppressed in the mid-17th century by the Swedish noble Birger Jarl, who encouraged crusades against the pagan Finns and colonization of Finnish lands along the Gulf of Finland as far west as Vipiurii (Viborg) in Russia (formerly part of Finland). He also captured Karelia.

In 1721 by the Peace of Nystad, Sweden ceded Karelia (and Estonia) to Russia and, after defeat in a war in 1808–09, the rest of Finland.

CULTURE (*see also* FINNO-UGRIANS)

The livelihood of the Finns varied significantly depending on geography: The southwestern Suomalaiset were more likely to be agrarian, and the inland Tavasts and Karelians more likely to subsist on hunting. Fish from oceans, lakes, and rivers were also a valued resource. Finns living near the coast or up accessible rivers were more like to engage in trading. Evidence of Arabic silver coins in Finland indi-

cates that the Finns, as did the Vikings, prospered from Eastern trade.

The ancient Finns were actually a number of different tribal groups, about which little is known. In the Middle Ages they coalesced into a people with a distinct identity, eventually becoming a modern nation.

Finns: nationality (Finnish; people of Finland)

GEOGRAPHY

Finland is bordered by Norway to the north, Sweden to the northwest, and Russia to the east. The Gulf of Bothnia makes up the western boundary and the Gulf of Finland is along the south coast. Åland, situated in the Baltic Sea, is an archipelago of about 6,500 islands belonging to Finland. Finland's total area is 130,559 square miles, which includes more than 60,000 lakes, the largest of which are Saimaa, Inarijärvi, and Päijänne. Many canals and rivers (principally the Kemijoki and the Oulujoki) connect the lakes and rivers within Finland's vast interior plateau. The landscape is mostly forests and woodland; only about 10 percent of the land (mostly along the coast) is used for agriculture. Northern Finland is known as Lapland (Saamiland), part of it is north of the Arctic Circle. Its terrain is marked by barren hills and some mountains. Finland's highest peak, Haltiatunturi (4,357 feet), is located near the Norwegian border.

INCEPTION AS A NATION

Christian crusaders traversed present-day Finland in the 12th century, attempting to convert tribal FINNS. By the 1170s Sweden had invaded and settled the land. In the early 13th century the pope reaffirmed Swedish holdings in Finland, especially the eastern and northern territories. Birger Jarl of Sweden centralized Finland when forming Tavastia in 1249 as a defense against invading Russia. After Russian attacks a treaty of 1323 divided Karelia between Sweden and Novgorod.

Finland, a suzerainty of Sweden, was united with Norway, Denmark, and Sweden under the Union of Kalmar in 1397. It became a duchy of Sweden after a war with Russia in 1555–57. For the next quarter of a century Finland was one of the battlegrounds in the

Finns: nationality time line**C.E.**

- 1150** Swedish crusaders invade southwestern Finland.
- 1238–49** Birger Jarl, earl of Sweden, leads second Crusade into province of Tavastia.
- 1293** Third crusade into eastern Finland divides Catholic west from Orthodox east.
- 1323** Finnish territory is divided between Sweden and Novgorod.
- 1397** Queen Margaret I unites Denmark, Sweden, and Norway, known as Union of Kalmar, under one monarch.
- 1523** Gustav I Vasa is king of Sweden, terminating Kalmar Union.
- 1548** Bishop of Åbo (Turku) Michael Agricola publishes New Testament in Finnish, which establishes Åbo dialect as basis of written Finnish.
- 1617** Peace of Stolbova designates Sweden supreme ruler of Baltic Sea, controls Gulf of Finland.
- 1640** Academy of Åbo is founded; in 1827 it is moved to Helsinki, becoming University of Helsinki; its library serves as national library.
- 1700–21** During Great Northern War Russia gains power in Finland.
- 1721** Russia wins southeastern Finland from Sweden under Treaty of Nystad (Uusikaupunki).
- 1808–09** In Finnish War Russia, supported by Napoleon I Bonaparte, defeats Sweden; Finland becomes autonomous grand duchy of Russia.
- 1812** Helsinki becomes capital of Finland.
- 1835** Elias Lönnrot publishes *Kalevala*, collection of folk songs and sayings of ancient Finland; he expands it in 1849.
- 1848** Johan Ludvig Runeberg writes poem “Vårt Land” in Swedish (known as “Maame” in Finnish); later, to music of Fredrik Pacius, it becomes national anthem of Finland.
- 1870** First Finnish novel, *Seitsemän veljestä* (Seven brothers) by Aleksis Stenvall (Aleksis Kivi), is published.
- 1872** Kaarlo Bergbom founds Finnish National Theater.

conflict between Sweden and Russia. The Peace of Stolbova in 1617 ended war with Russia and extended Finnish boundaries eastward into Ingria. Throughout the 18th century conflict with Russia resulted in a loss of Finnish territory, notably during the Great Northern War (1700–21) when Russia acquired the province of Vyborg.

Russia, under a treaty with Napoleon I Bonaparte, attacked Finland, declaring it a Grand Duchy of Russia in 1809. By the Peace of Hamina Sweden officially gave Finland and Åland (archipelago) to Russia. In 1811 Finland regained the Karelian region and the province of Vyborg, territory previously ceded to Russia. Finland’s capital was moved from Turku to Helsinki the next year.

During the Russian Revolution of 1917 a newly elected parliament proclaimed Finland an independent republic. By an armistice of 1944 signed between Russia and Finland, Finland ceded the Petsamo region and leased

the Porkkala Peninsula, which it did not reclaim until 1995.

CULTURAL IDENTITY

A driving force behind the emergence of a modern Finnish cultural identity has been the relations of Finns—those peoples descended from tribal FINNO-UGRIANS—to foreign occupying powers. The first of these was Sweden. Swedes and Finns have had close relations at least since the Swedish VIKINGS began trading Finnish products—importantly furs—southward through Russian territory in the sixth century C.E. Swedes, more “advanced” than Finns in terms of trends in western Europe, have usually dominated the latter, actually annexing Finnish territory in the 12th century. Thus modern Finns have developed their cultural identity in an atmosphere of struggle to remain independent and distinct.

In 1640 Sweden established the Turku (or Åbo) Academy in Finland with the purpose of

- 1882** Martin Wegelius founds Helsinki Music Institute (now Sibelius Academy); Robert Kajanus founds Helsinki Orchestra Society (now Helsinki Philharmonic Orchestra).
- 1899** Russian Czar Nicholas II implements February Manifesto, opposing Finnish constitution. Jean Sibelius composes symphony *Finlandia*, inspired by nature and Finnish folktales; it is later banned by czarist authorities for its pro-Finnish themes.
- 1906** Finland declares national parliament; women are granted right to vote.
- 1917** During Russian Revolution Finland declares its independence.
- 1918** Civil war breaks out between Bolsheviks of southern Finland or Red Guards, and right-wing government of western Finland or White Guards; White Guards, supported by German troops, prevail.
- 1919** Finland becomes republic.
- 1920** Finland and Soviet Union (USSR) sign Peace of Tartu; Finland gains Petsamo area. Finland joins League of Nations.
- 1932** Finland and Soviet Union sign nonaggression pact.
- 1939** World War II begins; Winter War begins when Soviet Red Army invades Finland. Novelist and short story writer Frans Eemil Sillanpää wins Nobel Prize in literature.
- 1940** Winter War ends; under Peace of Moscow Finland cedes southeastern provinces to Soviet Union.
- 1944** As a result of Finnish and Soviet Union conflict along southern border agreement is signed in Moscow, restoring frontier of 1940; Soviet Union annexes Petsamo area.
- 1944–45** War begins in Lapland; Finland and Soviet Union sign Friendship Treaty.
- 1955** Finland joins United Nations (UN) and Nordic Council.
- 1992** Soviet Union nullifies Friendship Treaty.
- 1993** National Museum of Finland is founded in Helsinki; Finnish National Opera House, home of Finnish National Opera and Finnish National Ballet, is inaugurated in Helsinki.
- 1995** Finland joins European Union (EU).
- 2000** New constitution is adopted.

drawing Finns into mainstream European culture. The assumption by the Swedish government that acquainting Finns with advanced cultural trends from wider Europe, filtered to them through a Swedish lens, would attach Finland even more closely to the Swedish Crown proved unfounded, as the intellectual tools Finns gained in the academy actually helped them promote a sense of cultural identity distinct from that of Swedes. Prior to this time most educated Finns spoke Swedish, which was the language of government and culture. But with the founding of the academy translations of important documents, such as law codes, into Finnish began. A rudimentary Latin-Swedish-Finnish dictionary was published in 1678. At the same time Finnish material, such as descriptions of ancient Finnish religion, began to be translated into Latin, making them available to scholars in other countries. One work included a Finnish folk song about the bear that became the first spec-

imen of Finnish folk poetry known abroad. These efforts were the forerunners of the compilation in the 19th century by Elias Lönnrot of oral Finnish epic poetry into the *Kalevala*.

Russia's annexation of Finland from Sweden in 1809 at first opened the way to a resurgence of Finnish culture and language. The high point of this was the compilation of the *Kalevala*, whose great international literary importance has made Finnish oral poetic tradition central to Finnish cultural identity. The relative isolation of the Finnic peoples, living "on top of the world" in the arctic circumpolar region, has been partly responsible for the preservation of their oral poetry. Peasants would sing this poetry to the accompaniment of the *kantele*, an instrument similar to a zither. The *Kalevala* was hailed as Finland's national epic almost as soon as it appeared in 1835.

Later in the 19th century, however, Russia undertook efforts at "Russifying" Finland and imposing the Russian language. Finnish

resistance marshalled international aid because of the fame of the *Kalevala*. The Finnish Pavilion at the Paris World's Fair in 1900 assembled all the forces of the arts into a joint manifestation of Finland's cultural identity, and the intelligentsia of Western Europe protested against Russian oppression.

The state of Finland established in 1917 did not comprise all Finnic speakers; a number of them living in Sweden and Norway and speaking what are usually considered dialects of the standard Finnish spoken in Finland—the TORNE DALIANS and KVENS—believe that their languages are different enough from standard Finnish to be considered official minority languages and in recent decades have been campaigning to have them recognized as such. The Tornedalians have published much of their literature, including teaching materials for schools, fiction, newspaper articles, and translation of parts of the Bible, in what they call Meänkieli (our language) in order to underscore its relationship with Tornedalian identity.

As is the case with many speakers of minority languages in Nordic countries, language has become a central component in the cultural identity of Finnic speakers outside Finland, aided by the fact that Finnish is not a Nordic or even an Indo-European language. There are many speakers of Finnish in Sweden (as well as Swedish speakers in Finland), the result of age-old movements back and forth, especially between northern Sweden and Finland, and they have become increasingly language conscious. There are a number of groups who moved from what is now Finland to Sweden. They include Middle Sweden's "Forest Finns," who have lived in Stockholm since the late Middle Ages, and the so-called Sweden Finns (or Swedish Finns), who moved to Sweden in the 20th century. All have lived under heavy pressure to assimilate, which has made preserving their language and culture difficult.

Finnish in Sweden has traditionally been stigmatized, its speakers assumed to be of low status. This attitude has gradually changed as many Sweden Finns learned to speak Swedish without an accent; in addition, they differ little in appearance from Swedes. Sweden Finns now can be found at every level of society, not just in blue-collar work. They have been able to preserve their own language because of the bilingualism movement in Sweden, which aims to give schoolchildren classes in both their native language (home language classes) and Swedish.

Traditional folk music sung and danced to the *kantele* continues to be popular in Finland. *Pelimannimusiikki* is a style of dance music. A school of Finnish symphonic music developed in the latter 19th century, its basic language and structure derived from German music, its thematic material from Finnish folk songs. The most celebrated exponent of this school was Jan Sibelius, whose stirring and majestic tone poem *Finlandia* is one of the most admired and beloved works of the international symphonic repertoire.

Finns continue to be fascinated by the shamanistic spiritual tradition of their ancestors. Shamanistic elements have long played an important role in poetry and song; a significant portion of the *Kalevala* consists of "charms"—incantations intended to gain aid for the singer from the spirit world. Many modern Finnish musicians derive inspiration from shamanistic drumming tradition, and other artists, playwrights, filmmakers, visual artists, use shamanic themes. The shaman as the seeker, who will go to great lengths and brave dangers to discover truth unmediated by language or other cultural filters, is an attractive figure to many modern Finns.

Flemings (Flemish; people of Flanders)

The Flemings are a Germanic-speaking people who inhabit primarily northern and western

Belgium; the nation is divided along ethnolinguistic lines. The French-speaking WALLOONS live to their south and east in Belgium. The Flemings make up about two-thirds of Belgium's population (see BELGIANS: NATIONALITY). Flemings are also found in northern France. The term Flemings, or Flemish (from the Middle Dutch *Vlaming* akin to Middle Dutch *Vlandes* for Flanders, possibly meaning lowland or flooded land), has also been used for inhabitants of varying ethnicity from the historic region of Flanders.

ORIGINS

Present-day Belgium was originally inhabited by GAULS, among them the BELGAE. In the first century B.C.E. the ROMANS occupied the region. Over the next centuries the Romanized Celtic peoples competed with the GERMANICS, such as SAXONS and FRISIANS, who migrated into Roman Gaul from across the Rhine. In the third century the FRANKS, a loosely organized assortment of war bands and traders east of the Rhine border who had been trading with the Romans probably since the first century C.E., began to impinge on the area west of the Rhine in Belgium. The Romans enlisted some of them for protection. The Franks were successful as Roman allies, receiving grants of territory in the region in recompense. Frankish settlements in southern Belgium were situated around the town of Tournai. (Archaeology has found evidence of Franks living alongside Roman villas, in all probability to act as guards.) After the collapse of Roman power in Gaul, the Franks came together under the rule of Childeric I, whose son Clovis I extended Frankish rule over much of today's France and Belgium in the sixth century. Both Germanic and Celtic influence continued in Belgium, leading to the formation of the groups defined as Flemings and Walloons.

LANGUAGE

Peoples who settled the north in present-day Netherlands and Belgium were largely Germanic speaking; those who settled to the south in Belgium and present-day France adopted the language of the Romanized Gauls, which evolved into Walloon, related to French. The Germanic language spoken by the Flemings is the same, except for dialectal variations, as Netherlandic (or Dutch), spoken by the people of the Netherlands. The written versions of Flemish and Netherlandic are also the same. Many of Belgium's citizens are bilingual

or trilingual, speaking Flemish in addition to French and/or Walloon.

HISTORY

Flanders

The name Flanders, from the same root word as the names Flemings and Flemish, was originally applied to a historic principality, which comprised the present-day provinces of East and West Flanders in Belgium, the southern portion of Zeeland Province in the Netherlands, and the Nord Département in France. It is also used for the Flemish-speaking region of Belgium—the provinces of Antwerpen, East Flanders, West Flanders, and northern Brabant—also sometimes called the Flemish Region. This region is bordered on the west by the North Sea and France, on the north and east by the Netherlands, and on the south by the region of Wallonia.

In about 862 Baldwin I, son-in-law of the Carolingian Frankish emperor Charles the Bald (later Charles II, Holy Roman Emperor), became the first count of Flanders. The counts of Flanders effectively united the various Germanic-speaking and Romance-speaking peoples under their rule. Because of its North Sea coast Flanders was at risk from attacks by VIKINGS in the ninth and 10th centuries, but Frankish-based armies managed to repel incursions, unlike in the region of Normandy to the south, where Vikings became known as NORMANS. By the 10th century Flanders became a center of the wool and silk industries. By the 11th century Flanders, because of its commercial success, had risen to a prominent position in western European affairs. By

the 13th century the Flemish cloth industry was the foremost in Europe.

Various European powers, including France, the Holy Roman Empire, Burgundy, Spain, Austria, and the Netherlands, played a part in the history of the region over the subsequent centuries, with shifting sovereignty and borders and various military occupations. Part of it was incorporated into the Spanish Netherlands in 1584, after other territory had been given to France. Louis XIV of France annexed other portions in 1668. The original Flanders disappeared as a political entity during the French Revolution and Napoleonic period, 1795–1814, when incorporated into the French Empire. The modern nations of the region took a form close to their present shape in the 19th century, after Belgium's revolt from the Netherlands in 1830 and its recognition as an independent kingdom in 1831 and 1839 treaties. The title *Count of Flanders* is still used for princes of the Belgian royal family.

Flemish Movement

On becoming citizens of Belgium, the Flemings, although greater in number, had less political power than did the Walloons. In the 19th century a Flemish movement seeking political equality as well as preservation of language and culture arose. From the 1830s the Flemish scholar and poet Jan Frans Willems helped revive the Flemish literary language. Guido Gezelle, a Roman Catholic priest and poet, also championed the Flemish cause in *Rijmsnoer* (Necklace of rhymes; 1897) and other works. By the end of the century government and courts in Flemish areas utilized Flemish in official proceedings. In 1898 Flemish was made Belgium's second official language. In the 1930s Flemish became the language of instruction at the University of Ghent and in all primary and secondary schools located in Flemish areas. In 1932 the military established a Flemish military academy and separate Flemish units. With inequality between Belgium's Flemish and Walloons a continuing issue, in 1993 a constitutional revision made Belgium a federalist state with three separate and autonomous regions: Flanders, Wallonia, and Brussels. All public signs and government publications in Flanders are in Flemish. The nation's capital was given official bilingual status.

CULTURE

Economy

The textiles industry, foremost in Europe by the 13th century, has been central to the econ-

omy of the Flemings. Some among them became renowned as intricate weavers of exquisite tapestries and found work internationally, for instance, at Beauvais in northern France starting in the 17th century. The location of Flanders also made it central to European trade. Bruges connected to North Sea towns by canals, Antwerp on the Schelde, and Ghent at the confluence of the Schelde and Leie Rivers (as well as several canals) all became important trade centers.

Government and Society

Although historic Flanders as of the 12th century had a centralized judicial system, many of its towns operated with a considerable measure of independence, granted numerous privileges and liberties by sovereign or feudal overlords.

Art

The Flemish tradition in art, in combination with the Dutch tradition, is one of the strongest in all of Europe; many of its masters, especially in the 15th–17th centuries, became renowned throughout Europe. Among some of the most notable are Hubert van Eyck and his brother, Jan van Eyck, of the 15th century, founders of the Flemish school of painting; Rogier van der Weyden of the 15th century; Pieter Bruegel of the 16th century and his sons and grandsons; Peter Paul Rubens of the 16th–17th century; and Sir Anthony van Dyck of the 17th century. The greatest patron of Flemish art was the Catholic Church.

Jan van Eyck was the first painter in Europe to fully exploit the possibilities of the new medium of oil paint; for a time he was even credited with its invention. With it he was able to capture the visible world in greater detail and more vivid color than had ever been seen before. Jan and his brother Hugo used their mastery of this medium to create a distinctive Flemish school of painting (also called the Northern Renaissance), characterized by acute observation of nature, the use of symbolism in no way at odds with the great realism of their paintings, depiction of spatial depth and landscape backgrounds, and delicate precision of brushwork.

The paintings of peasant life by Pieter Breughel and others of his family have a lusty and rugged humor; in "The Peasant Dance" heavy-footed men and women tread out a ponderous but energetic dance to the music of a piper whose cheeks balloon out in his efforts to make his instrument heard above the uproar of a table of drunks just behind him.

Rogier van der Weyden was the most renowned painter of his time and was patronized by various European courts. His work was known for its realistic clarity and strong colors.

Peter Paul Rubens, although born in Germany, spent most of his life in Antwerp. Called by 19th-century French painter Eugène Delacroix the Homer of painting, he specialized in cycles of paintings on narratives of epic proportions, including a life of Achilles. Other cycles are scenes from Ovid's *Metamorphoses*, and stories from the Old Testament. Rubens also made two large series of paintings to glorify rulers: the Marie de' Médicis cycle in Paris, and the Apotheosis of James I for the Banqueting Hall of Whitehall Palace in London. Rather than focusing on psychological depth, he chose to depict extreme, climactic moments using a brushwork technique supercharged with energy.

Sir Anthony van Dyke, a pupil of Rubens, painted with an Apollonian elegance and restraint in strong contrast with Rubens's Dionysian exuberance. His style appealed greatly to the British, and he became court painter to King Charles I in 1632 (his name anglicized to Sir Anthony). His portrait of Charles and others of his court helped to create the atmosphere they sought of refinement and of royal power so absolute it needed no outward trapping of crown, ermine, and orb. Charles is shown in plain though rich hunting dress, just dismounted from his horse. Van Dyke has been credited with helping to create for the British aristocracy their own image of themselves.

Religion

The majority of Flemings are Roman Catholic, as are the Walloons.

Although modern Flanders no longer has the political, economic, and cultural clout of the historic Flanders, the modern Flemish movement has ensured a continuation of the Flemish identity.

Franks (Franci; Franchi; Ripuarian Franks; Salian Franks; Franci ripuarii; Franci salii)

The Franks emerged from the early centuries C.E. as the most powerful and influential of the GERMANICS. They created a medieval empire, founded in 800 C.E. and extending throughout much of western Europe—including present-day France, Belgium, Netherlands, Luxembourg, Germany west of the Elbe, Austria, Switzerland, and northern and central Italy—and they laid the political foundation for what evolved into the modern-day nations of France and Germany.

ORIGINS

Gregory of Tours, a sixth-century Frankish prelate and a bishop at Tours in present-day France, wrote in *Historia Francorum*, a history of the Merovingian kingdom, that the Franks originally lived in the Roman province of Pannonia (modern Hungary and surrounding areas), but the accuracy of this assertion is uncertain. Pannonia is where the confederacy of GOTHs emerged, and Franks may have wanted to identify themselves with Gothic greatness by claiming the same origins. Modern scholars believe

that those peoples who were known to history as the Franks were originally a loose coalition of war bands from the Rhine region, whose members were from a number of tribes, including the AMSIVARII, BRUCTERI, CHAMAVI, CHATTUARI, SALII, TUBANTI, USIPETES, and other small groups.

The Franks are first mentioned in sources after 250 C.E. and probably came to the notice of the ROMANS in the third century C.E. as signs of the weakening Roman grip on the Rhine border tempted war bands to try forays into imperial territory. The name Franks means “free,” or possibly “brave” or “hardy.” The tribes’ central political cohesiveness seems to have been rather less than that of the ALAMANNI until later, and they had a much closer relationship with Romans as well: Frankish groups settled under Roman authority west of the lower Rhine in the

late third century. Franks were also sea raiders on the rich North Sea coastal trade, and they possibly contributed to a disruption of this trade serious enough to become a factor in the systems crisis fueling the mass migrations of the time. Some among them are known to have traveled through Gaul and the Iberian Peninsula into North Africa in 257–258 C.E. The Salii, and other Germanic peoples living near them along the Lower Rhine, became known as the Salian (salty) Franks. Others along the middle course of the Rhine became known in the eighth century as the Ripuarian (river) Franks. Other Frankish settlements were located in the Meuse and Moselle valleys and in southern Belgium, centered in the Roman town of Tournai. Later Frankish groups settled the area around Rheims.

HISTORY

Early Contacts with Romans

The peoples who became known as Franks lived close to the Roman imperial border on the Rhine. Such close proximity meant they were heavily influenced by Rome, at first largely peacefully—there is no mention in sources of friction with tribes in their area until the third century. Probably they traded with Romans, because they were in the frontier zone east of the Rhine where market economies were beginning to emerge in the first and second centuries. Their elites were probably enlisted as clients of Rome through rich gifts symbolic of alliance with Rome, similar to the medals given to Native American tribal leaders by European authorities in the colonial period. Centuries later Childeric I, father of Clovis, was buried with a type of brooch worn by Roman officers, which indicates that Franks still treasured emblems of their allegiance to Rome. Many Franks probably joined the Roman military. By the mid-third century C.E., however, possibly because of Rome's increasing state of beleaguerment due to Germanic incursions, Franks seem to have engaged in sporadic raids and uprisings. In retaliation they were brutally crushed by the Romans, their leaders thrown to wild animals in the circus.

In 358 the ROMANS under the emperor Julian defeated the Salian Franks, granting them more land in the Netherlands and Belgium, as well as *foederati* (federates) status. The Ripuarian Franks soon afterward spread westward from the Rhine toward the Moselle River in present-day northeastern France. The Salians encroached on the traditional territory of the THURINGI along the lower Rhine.

This treatment pacified the Salian Franks, who remained largely loyal to Rome for more than a century. Indeed, the Franks' sense of their own Frankish identity, as opposed to their tribal identities as Bructeri, Chamavi, Salii, or the like, became closely intertwined with their sense of being staunch defenders of Rome.

Many Franks served as generals in the Roman army. During the fourth century Frankish commanders dominated leadership of the Roman army of the West, becoming increasingly independent of imperial authority and engaging in the game that was being played by Roman generals throughout the West of involving themselves in politics, either by making and breaking emperors or in declaring themselves emperor. One such was Claudius Silvanus, overall commander in Gaul in the mid-fourth century, who after declaring

himself emperor was murdered by his own troops in 356. Some commanders even served as Roman consuls and had close relationships with members of the Romano-Gallic senatorial aristocracy. A young rhetorician in the imperial capital in Milan, the future Saint Augustine, wrote the official oration of congratulation and praise on the consulship of one Bauto, a pagan Frank from across the Rhine. In 406 the Franks, as allies of the Romans, battled the incursions of other Germanic peoples, such as the VANDALS, into Gaul. On the other hand the Salian chieftain, Chlodio, led uprisings against Rome in 428 and in the 450s, all of which were crushed. It illustrates how fragmented the Franks were at this time that in 451 other Frankish warriors from among the Salians and Ripuarians helped the Romans battle the HUNS, while some Ripuarians supported Hunnic forces. With Roman power in Gaul weakening in the ensuing years the Franks expanded southward into Gaul and attacked Gallo-Roman settlements.

During the fifth century the "tribal swarm" of Franks (as they have been called) became dominated by one lineage of leaders from among the Salians, related to Chlodio, whose son may have been that Merovich whose name would be given to the Merovingian dynasty. The dominant leader of this kindred group was Childeric I, the last Frankish commander who fully considered himself an "imperial German" in the service of Rome. He fought under Roman command against the VISIGOTHS in 463 and 469.

By this time "Roman" authority in Gaul chiefly consisted of the power wielded by a variety of army commanders, both Germanic and Roman. In 461 the Roman general Aegidius, under whom Childeric had fought the Visigoths, severed relations with imperial authorities in Rome, who were in increasing disarray, because he opposed the current administration; henceforth he relied solely on his army to maintain his authority. His son, Syagrius, assumed his position on his death; Gregory of Tours later reported that Syagrius had been elected *rex Romanorum*, "king of the Romans," in no sense a Roman office, but rather a Germanic understanding of what a powerful Roman general was. Childeric, too, had some kind of a disagreement, the details of which are not known, and withdrew from Gaul to Frankish territory. The royal splendor of his tomb, which contained a signet ring with the inscription *Childirici regis* "of King Childeric," shows he had suffered no loss of power, and

This is a 16th-century representation of Clovis I, king of the Franks. (*Library of Congress, Prints and Photographs Division [LC-USZ61-1435]*)

some historians have argued that he received direct subsidies from the BYZANTINES in Constantinople (modern Istanbul). The differ-

Clovis I: Unifier of the Franks

Clovis (or Chlodwig), born in about 466 C.E., was the first Frankish ruler of the Merovingian dynasty. His father, Childeric I, was king of the Salian Franks and fought under Roman command against the Visigoths. To the Romans, as attested in a letter to him from the Gallo-Roman bishop of Rheims, Clovis was administrator of the military sector called *Belgica Secunda*. The bishop of Rheims advised him to maintain the ways of his forefathers, remain pure and honest, and always honor his bishops. He did this as long as it was politically sound to do so. When in 485 the death of the powerful Visigothic king Euric created a power vacuum in Gaul, Clovis made his move to expand his power.

Clovis defeated Syagrius of northern Gaul (the last Roman governor of Gaul) and conquered the Alamanni. According to legend while in battle against the Alamanni he had a spiritual revelation and was assisted in battle by the Christian God. His pious Christian wife, Clotilda, niece of Gundobad of the Burgundii, supposedly helped direct him toward Christianity. At some point during this time on Christmas Day of the year 496, 497, or possibly even 506, Clovis was baptized as a Roman Catholic along with some 3,000 of his soldiers. His decision to be baptized was almost certainly strongly influenced by his pending showdown with the Visigoths; on becoming Roman Catholic rather than Arian Christian as were the Visigoths, he won the immediate support of Roman bishops in the Visigoths' territory, an invaluable political advantage. By 507 he had defeated the Visigoths, killing Alaric II.

Clovis's kingdom was the basis of the state that evolved into the French monarchy. On his death in 511 his empire was divided among his four sons, Theodoric I, Clodomir, Childebert I, and Clotaire I.

ence between the nature of Childeric's political power and that of Aegidius, therefore, was not great, and Roman society was becoming increasingly indistinguishable from Germanic society. Childeric maintained friendly relations with the Visigoths—his sister was married to one of their kings—with Aegidius and Syagrius and, although he was pagan, with Gallo-Roman bishops.

Clovis I

In 482 Childeric's son, Clovis I (see sidebar), succeeded him as leader of the Salian Franks and maintained his father's policy of supporting the remains of Roman authority in Gaul until the death of the powerful Visigothic king Euric two years later. Clovis's first step on the way to challenging the Visigoths occurred in 486, when he defeated Syagrius near his stronghold of Soissons; later he murdered him while he was in captivity. This feat can be described as replacing a Germanized Roman *rex* by a Romanized barbarian one. Clovis took over the whole governing apparatus of the kingdom of Soissons, including what remained of the Roman provincial bureaucracy there. The Gallo-Roman senatorial aristocracy seems to have accepted his takeover as legitimate.

Clovis established as his domain most of northern Gaul, along the way subduing other power blocs held by Celtic and Germanic leaders in a series of wars whose details are not known with certainty. He may have fought BURGUNDII, Thuringi, and various tribes of GAULS. In 496 or 497 Clovis defeated the Alamanni at Tolbiacum (modern Zülpich, Germany), attaching their kingdom to his own. About this time Clovis converted to Christianity.

In 507 Clovis established his court at Paris. That same year he defeated the Visigoths at Vouillé, northwest of present-day Poitiers. Before his death he united the Salian and Ripuarian factions and founded the Merovingian (from the sea) dynasty. His kingdom eventually included most of Gaul north to south from the North Sea to the Pyrenees and east to west from the Atlantic Ocean to the Main River. Upon his death his kingdom was divided among his four sons.

The Expanding Merovingian Empire

The Merovingian dynasty took its name from a Frankish leader called Merovich (sometimes Latinized as Meroveus or Merovius), who may have been an important leader in the mid-fifth

century, or alternatively a legendary, possibly semidivine tribal ancestor. In 531 Chlotar I, one son of Clovis, defeated the Thuringi at the Battle of Scheidungen and married their princess, Radegunda. The Franks and the SAXONS divided the Thuringian homeland. In 534 Chlotar gained control of the kingdom of the Burgundii.

The practice of partitioning and repartitioning Frankish kingdoms among surviving sons, which hindered efforts at unification, led to shifting boundaries of kingdoms, duchies, and counties. Under the Merovingians the main kingdoms were Neustria in the west, Austrasia in the east, and Burgundy in the south (see BURGUNDIANS); warfare among the kingdoms was common. Chlotar II again established rule over all the Frankish holdings in 613. Upon his death, however, the empire was again fragmented.

Dagobert I was the most powerful and successful Merovingian monarch. Succeeding to the throne of Austrasia, he was able to annex both the regions of Bourgogne and Aquitaine during his short reign. Devoutly religious, he had the Saint Denis Basilica in Paris built.

The Carolingians

The Franks utilized what was known as the office of *major domus*, mayor of the palace, in their kingdoms. In Austrasia one family, the Carolingians, whose name is taken from the most powerful of them, the eighth- and ninth-century Emperor Charlemagne, filled the position for more than a century and in many cases were more powerful than the kings. In 687 Pépin II defeated the armies of Neustria and Burgundy, setting himself up as the *major domus* of a united Frankish kingdom.

Pépin's illegitimate son, Charles Martel, whose surname, meaning "the hammer," referred to his military success, further extended Carolingian power with campaigns against Chilperic II of Neustria, whom he later propped up to legitimize his own hold on power. Because of repeated incursions by the MOORS northward from the Iberian Peninsula Charles Martel mobilized an army. In 732 he defeated the Moors in a battle at a location between Poitiers and Tours, ending the Moorish threat to lands north of the Pyrenees. He also campaigned in Burgundy and against the FRISIANS and SAXONS. In 751 his son, Pépin III (Pépin the Short), deposed Childeric III, the last of the Merovingians. He also campaigned against the LOMBARDS on behalf of Pope Zacharias and Pope Stephen II.

Charlemagne: "King Father of Europe" ❦❦❦

Charlemagne (or Carolus Magnus in Latin, which translates as Charles the Great) built a powerful European kingdom. He was born in 742 C.E., the eldest son of Pépin III the Short and grandson of Charles Martel. As a child, along with his brother Carloman, he accompanied his father not only on battlefields but also in political and religious events that prepared him as eventual heir to the throne. On Pépin's death in 768, his kingdom was divided between his two sons. When Carloman died in 771, Charlemagne became king of all the Franks and, after assuring the pope of continued support, began a campaign of conquest that created the Frankish Empire, uniting much of western and central Europe under one sovereign. Soon thereafter he was anointed emperor of the West, a position that evolved to Holy Roman Emperor.

Charlemagne was more than a brilliant political leader and strategist. He was a reformist who built on the existing system of seigniorialism, in which kings gave tracts of land to nobles in exchange for support. He also appointed counts (the head of a district called a county) and margraves (the count of a border province). To gain the support of tribal leaders, he granted lands known as fiefs. He codified and compiled tribal laws and integrated them in his legislative system. He standardized weights and measures and circulated the *denarius*, the first silver coin since the late Roman Empire (which featured his portrait). He established religious schools and libraries and encouraged the development of a handwriting style known as Carolingian minuscule, from which the modern printed alphabet evolved. Cultural developments during his reign are known as the Carolingian Renaissance. A poet of his court dubbed him *rex pater Europae*, "king father of Europe." He in fact became the ideal of a Christian monarch for centuries.

After Charlemagne's death his son, Louis I the Pious, succeeded him. Frankish territories were eventually divided up among Charlemagne's grandsons, Charles II, Lothair I, and Louis II.

The anointing of Pépin legitimized the monarchy of an elected king rather than one by descent.

Charlemagne

During the reign from 768 to 814 of Charlemagne (see sidebar), the son of Pépin III, the Frankish Empire reached its greatest extent. As had his father, Charlemagne sought legitimacy from the papacy; in 773–774 he defeated the Lombards, who were attempting to annex papal lands. With the blessing of Pope Adrian I he assumed the iron crown of the Lombard kings of Italy. In 778 he invaded Muslim Spain, eventually capturing Barcelona from the Moors and establishing control over territory beyond the Pyrenees.

From 772 until 804 Charlemagne waged brutal campaigns against the Saxons of Saxony, again with the church's blessing because the Saxons were pagans. His actions against the Saxons took the form of forced conversions, wholesale massacres, and transportation of thousands of Saxons to the interior of the Frankish kingdom. Charlemagne effectively

crushed the AVARS, who controlled much of central Europe at the time, from the Elbe to the Dnieper. He destroyed the “Avar Ring”—their military fortifications—in 791 and defeated their armies in 805. He also defeated various Slavic peoples, including the CARANTANIANS and SLOVENES. To protect the borders of the conquered territory, Charlemagne established marks, or marches, frontier borders defended by Frankish armies.

In the meantime Charlemagne involved himself in Roman church politics, traveling to Rome in 800 to aid the beleaguered Pope Leo III. This time he used his political rather than military strength to insist that Leo be given a trial in court in which to answer charges of misconduct made by his enemies. After Leo was cleared of wrongdoing, he crowned Charlemagne emperor on Christmas Day, 800. This event was later claimed as the birth of the Holy Roman Empire, a political concept that, assuming different forms over time, continued to have at least a notional reality for more than a thousand years. Recognition of the Western Roman Empire’s legitimacy by the Byzantines was long in coming. Only through a combination of force and diplomacy was Charlemagne able to persuade Michael I, the Byzantine emperor, to acknowledge him as emperor of the West in 812. Pope Leo’s successor, Stephen IV, crowned Charlemagne’s son, Louis I, thus establishing the papal claim to the right to consecrate the emperor.

Charlemagne’s ambition was to create a rebirth of Roman civilization, and he threw his energies into making his court at Aachen a center of culture and learning. In this endeavor he enlisted the aid of the Anglo-Saxon cleric and scholar Alcuin, who had been educated by a disciple of the Venerable Bede. The curriculum developed at Aachen formed the basis of education for medieval western Europe for centuries.

Charlemagne’s empire stretched from an area in northern Spain, over the Pyrenees and almost all of present-day France (excluding Brittany, which was never conquered by the Franks) eastward to most of present-day Germany, including northern Italy and today’s Austria. Later in the Middle Ages it furnished the ideal from which European monarchs derived inspiration; it developed a semimythical aura, and writers modeled King Arthur’s court on Charlemagne’s. The modern concept of a unified Europe owes much more to Charlemagne’s empire than to the Roman Empire—unsurprisingly, since for the first

time in history, under Charlemagne, the political, economic, and cultural center of Europe had decisively shifted north of the Alps, with the Mediterranean world forever having lost its primacy.

The empire remained united under Charlemagne’s son, Louis, but on his death was divided among his three sons under the Treaty of Verdun of 843 into regions that prefigured modern-day Germany, France, the Netherlands, and Italy. Louis II received the eastern portion (later Germany); Charles II became king of the western portion (later France); Lothair I received the central portion (Low Countries, Lorraine, Alsace, Burgundy, Provence, and most of Italy) and retained the imperial title. The Frankish realm was reorganized again in 870 by the Treaty of Mersen.

In partitioning the realm among sons, the Carolingians followed the example of the Merovingians—indeed, it was only because Charlemagne’s brother, Carloman, retired to a monastery and soon died that Charlemagne had his chance to unify the Frankish territories. This practice was rooted in the Germanic past, in the days when the political basis of society was that unstable entity the tribe; when ethnogenesis, the formation of new tribes, was constant; when tribal leaders and the mass of free warriors engaged in a continual contest for dominance; when new leaders could emerge at any time through success in war, splitting away to form their own tribes; and when overall war leaders, elected only in times of emergency, were the exception rather than the rule. But the circumstances in the early Middle Ages—the devastating inroads on the economy of central and western Europe made by VIKINGS, SLAVS, MAGYARS, and others—also kept the socioeconomy localized and gave rise to the feudal system, with much of the defense against raiders devolving on local lords. This situation made partitioning large territories into smaller kingdoms a practical necessity for centuries.

Viking Raids and the Establishment of Normandy

The last years of Charlemagne’s reign saw the beginnings of contacts with Vikings from Denmark and Norway in the forms of both trading in silver from the Abbasid Empire in present-day Iraq and raiding, from about 799. Charlemagne began construction of a fleet to counter these raiders, but his successors overlooked the threat and so were unprepared for the much larger-scale onslaught of raiding by the middle of the next century, possibly caused

by the interruption of the silver trade that followed on political turmoil among the Abbasids.

By about 900 these Vikings had secured a permanent foothold on Frankish soil in the valley of the Lower Seine River and their raids had almost crippled the Frankish economy and fabric of society. In 911 the Frankish king Charles III made the Treaty of St. Clair-sur-Epte with a Norwegian named Rollo, who had emerged as a significant personality among the Vikings, ceding him the land around the mouth of the Seine and what is now the city of Rouen. From this foothold Rollo and his successors established the Duchy of Normandy and eventually were known as NORMANS.

CULTURE (*see also* GERMANICS)

Economy

Agriculture, the basis of the economy in Frankish lands, continued to follow the late Roman model. Most land was held by a few extremely wealthy individuals; the vast majority of the population, slave or free, barely eked out a subsistence existence and were subject to famine. Overtaxation in the last years of the empire had forced abandonment of much land when farmers were unable to raise enough produce to pay taxes. There was a serious shortage of agricultural labor. At the same time Roman devices such as the mechanical harvester used in Gaul in Pliny's time (first century C.E.) and water mills, which made farming less labor intensive, were no longer used and iron tools were extremely scarce.

Cereal production ceased to depend on wheat, dominant in Roman times, in favor of the hardier darker grains, such as barley. Wine cultivation actually increased, in part because it was essential for religious ritual; moreover, the enthusiasm of the Frankish aristocracy for wine led them to revive the ancient Roman practice of diverting increasingly more land from subsistence farming to viticulture.

Government and Society

Franks and Romans The Franks' relationship with the Romans was among the earliest and closest of all Germanic groups. The nature of the takeover by the Franks of Roman Gaul illustrates the extreme oversimplification of the picture of the Roman Empire's crumbling before barbarian hordes, for after the third century Frankish groups were invited by Romans to settle near large villa estates for the Romans' protection. Archaeology reveals a continuity of

settlement in many such cases, with a gradual disappearance of Roman elements, probably brought about as the villa economy died away. Frankish features replaced them as more and more members of formerly mobile, roving Frankish war bands were attracted to settle near the old Roman centers. By medieval times many of these settlements had evolved into villages centered around churches.

Frankish leaders especially embraced Roman culture to a great degree, moving in the highest and most cultivated of Roman circles and receiving extensive education, which allowed them to converse with ease with the likes of Bishop Ambrose of Milan and with men of letters. Their paganism did not constitute a barrier, since many in the Romano-Gallic senatorial aristocracy, nominally Christian, preserved a pagan outlook themselves.

According to historical sources the Franks had taken over much of the Rhineland, the Meuse and Moselle valleys, and large areas of Belgium by the middle of the fifth century. Little archaeological evidence of a Frankish presence by this date has been found, however. The reason may be that the Frankish "takeover" at first took place under the guise of the Roman reorganization of the border defenses, in which native militias under their own commanders were given most of the responsibility for their own areas. As Roman central authority began to wither away, such militias, in Frankish areas composed mostly of their own warrior bands or *comitati*, increasingly went their own way, becoming autonomous polities. The point at which their military control ceased to represent the empire and became a straightforward takeover may be indistinguishable. By the second half of the fifth century clearly Frankish cemeteries were being established, with pagan Germanic grave goods marking a break from late Roman culture. These probably indicate that newcomers from the un-Romanized Frankish homelands east of the Rhine were joining their brethren in Gaul. This process seems to have been slow, spreading out from enclaves already established.

Royal Burials The strongest archaeological evidence for the society of the Franks is derived from their royal and elite graves. The first royal Frankish grave found was also the earliest, that of Childeric, the father of Clovis, which was found at Tournai in 1653. Childeric's tomb contained grave goods of great splendor: a treasury of gold, silver, and garnet, including a brocaded cloak sewn with 300 gold bees, and a

kind of brooch worn by late Roman officers. In all it attests to Frankish dominance and power and to the continuing allure of Rome.

With Clovis's conversion to Christianity, Frankish kings were buried in or near churches, but for centuries they and other aristocrats followed the pagan practice of burial with weapons and rich grave goods in a decidedly non-Christian manner. A six-year-old boy, for example, buried under the site of the later cathedral at Cologne, had the full panoply of a Frankish warrior in miniature. Some nobles were buried in nonecclesiastic cemeteries.

Lex Salica (Salic Law) The *lex salica*, or customary law of the Salian Franks, was first compiled under Clovis sometime between 508 and 511; aside from the law of the Visigoths, it was the earliest written Germanic law code. Entitled the *Pactus legis Salicae*, it had influence throughout the Merovingian and Carolingian dynasties and continued to be important to the Holy Roman Empire. Although it had its roots in Germanic customary law, it was strongly influenced by Roman legal and political ideas. Its prologue tells that it was first decreed by four military commanders to deal with feuding among the Franks that was disrupting society. The territories these four were said to control seem to correspond with Roman military sectors; their authority to issue a law code probably derived from their status as Roman officers, not Germanic chieftains. The Salic Law code was thus thoroughly imbued with a Roman outlook. The very idea of a top-down law code made static by being written was foreign to the much more fluid Germanic concept of folkright, consisting as it did of tradition that, however ancient, was always interpreted in the present moment by councils of freemen.

Office of Major Domus The office of *major domus* (chief man of the hall), or mayor of the Palace, among the Franks had its roots in both their loose early organization and late adoption of kingship; it also reflected the fact that until the migration period kingship was known among Germanic peoples only in the form of the *thiudans*, a sacred king who was not necessarily a war or political leader. Absolute rule by a single individual, such as was wielded by Roman emperors, seems to have sat uneasily on the Germanic mind, more accustomed to councils of leaders and assemblies of free warriors. The idea that a king ruled with the assistance and support of his nobles was more natural. As a result even

after Clovis welded the Franks into a united kingdom, the office of mayor continued to be powerful.

A corollary to the king's need for supporters was that in principle at least they had the right to decide on the king's fitness for office. Doubt is cast on the strength of this principle in practice, however, by the fact that for all of Charles Martel's clear primacy and great successes as war leader, he was unable to attain to the kingship, and only after his son, Pépin, gained the support of the papacy was he able to depose the last Merovingian king and win the Crown. But the strong influence of powerful nobles on the monarchy, together with the ancient Germanic tradition of electing war leaders, continued after the establishment of the Holy Roman Empire in the hereditary office of elector, held by certain German princes who elected the king of Germany (who then would be crowned emperor by the pope). Until the 12th century, however, the electors simply confirmed the hereditary succession.

Military Practices

Charles Martel's victory over the Moors was the debut of feudal cavalry, revolutionizing warfare in Europe. His troops probably rode Percherons, among the largest of horse breeds. Martel pioneered the practice of providing horses to his troops, as well as estates for their support, which they retained as long as they served him. As the system of mounted troops supplied by kings with lands for their support was adopted elsewhere in Europe in reaction to the mobility of the mounted Muslims and Magyars, and of the Vikings in their ships, the feudal system arose.

Religion

Clovis's conversion to Christianity is shrouded in obscurity. It is not certain what religious beliefs he held beforehand. Gregory of Tours writes that previously he worshipped the Roman gods Saturn, Jupiter, Mars, and Mercury; given the extent to which Franks had been Romanized, this is possibly true. He may also have worshipped Celtic gods as well as Germanic ones such as Woden or Odin; his second son was named after the god Ingvi-Frey. Clovis's family had a sort of tutelary deity, part man, part sea beast, and part bull, who may have been conflated with the legendary founder of his line, Merovich, eponymous ancestor of the Merovingians. It is even possible that he had begun to practice Arian Christianity for political reasons.

As to his concept of Christianity, Clovis probably saw Christ in much the same terms as his Germanic ancestors saw Woden—a powerful, victory-conferring deity. There is a strong parallel in the story of his conversion with that of the emperor Constantine two hundred years earlier. At a difficult juncture in his campaign against the Alamanni, he vowed to be baptized in return for victory. The baptism of a reported 3,000 of his warriors underscores the military nature of the conversion.

Furthermore, at this time profession of Christianity, whether Arian or Roman, had a strong political component. Indeed, one of the main reasons for its importance derived from its adoption as the official religion of the Roman Empire. By this time the office of bishop had become highly important politically. Bishops were usually drawn from among the Gallo-Roman aristocracy, and they administered what remained of the Roman public sphere (much reduced from having been starved of revenue by the wealthy senatorial class), the affairs of the *civitates*—the cities and their environs. By becoming Roman Catholic, Clovis gained the support of the bishops and their aristocratic Gallo-Roman constituents. His Franks, too, could now enter a closer relationship with the rest of Gallo-Roman society, which would lead in time to a true fusion of the two peoples to a degree Germanics had not experienced.

Saint Martin of Tours, whose homeland in the fourth century was Pannonia (named by Gregory of Tours as the original homeland of the Franks themselves, possibly no more than a legend), was the chief religious patron of the Franks.

Of all the Germanic peoples impinging on the Roman Empire during the early centuries C.E., trying in their different ways to come to terms with Rome—either through simple pillaging and looting or taking part in the glory and tradition of the Roman military or of Roman culture—as tribes or confederacies becoming Rome's allies—the Franks had the most enduring success in incorporating Roman values into their society without losing their own identity as Germanics. They succeeded in achieving a true fusion of Roman and Germanic elements. Furthermore, it was the Franks under Clovis and afterward who moved the western European political and cultural center of gravity for the first time in history north of the Alps.

From the partitions of the Frankish Empire emerged the kingdom of the West Franks, which became France, and the kingdom of the East Franks, which became Germany. Both France and the region of Franconia in Germany derived their name from the Franks.

- 751** Pépin the Short becomes first Frankish king of Carolingian dynasty.
- 771** Charlemagne expands empire from Pyrenees to Elbe River.
- 843** Treaty of Verdun divides kingdom held by Louis I among his three sons, Charlemagne's grandsons.
- 911** Normandy is founded.
- 1066** Normans conquer England; duchy of Normandy is united with England.
- 1206** Capetian dynasty dominates Europe; Philip II rules Normandy, Maine, Touraine, Anjou, Poitou, Auvergne, and Brittany.
- 1309–77** Avignon is seat of Papacy.
- 1328** Valois dynasty replaces Capetians.
- 1337–1453** France defeats England in Hundred Years' War.
- 1420** Treaty of Troyes recognizes claim by Henry V of England to French throne.
- 1429** Joan of Arc leads French force in relief of Orléans under siege by the English.
- 1461** Louis XI becomes king; Valois-Burgundian alliance collapses.
- 1481** Provence and Var become part of French kingdom.
- 1532** Brittany falls under Valois control.
- 1532–34** *Pantagruel* and *Gargantua*, satirical novels by François Rabelais, are published.
- c. 1553** Pierre de Ronsard and six other poets form group known as Pléiade (name taken from third-century B.C.E. Alexandrian group known as Pleiad), to encourage writing in French.
- 1559** Treaty of Cateau-Cambrésis ends war with Spain; France gains Calais and three bishoprics in Lorraine.
- 1572** Protestant leaders are killed in Massacre of Saint Bartholomew's Day.
- 1595** First complete edition of Michel Eyquem de Montaigne's *Essais (Essays)* is published three years after his death.
- 1598** Henry IV issues the Edict of Nantes, granting considerable freedom to French Protestants.
- 1618–48** Thirty Years' War involves German Protestant princes with France, Sweden, England, and Denmark against Hapsburgs and Catholic princes of Holy Roman Empire. Peace of Westphalia recognizes French acquisitions in Alsace, Artois, Picardy, Lorraine, and Roussillon.
- 1637** *Discours de la méthode* by René Descartes is published, considered foundation of modern philosophical method.
Le Cid, play by Pierre Corneille, wins acclaim in Paris.
- 1648** Fronde rebellion erupts in Paris.
- 1658** Molière's theater company gains patronage of duc d'Orléans.
- 1667** *Andromaque*, play by Jean Racine, is performed at Hôtel de Bourgogne, rival theater company to that of Molière.
- 1668–94** Satirical *Fables* by Jean de la Fontaine is published.
- 1672–78** Louis XIV attacks Netherlands.
- 1678** Marie-Madeleine de La Fayette's *La Princesse de Clèves*, considered first French psychological novel, is published.
- 1685** Louis XIV revokes Edict of Nantes.
- 1701–14** In War of the Spanish Succession France becomes involved in dynastic struggle for throne of Spain; in 1714 Treaty of Utrecht recognizes Philip V as heir to Spanish throne.
- 1733–35** After War of Polish Succession France acquires provinces of Bar and Lorraine.

- 1734** Voltaire's *Lettres philosophiques* (Philosophical letters; also known as *Letters Concerning the English Nation*), are banned in France.
- 1740** Naturalist George-Louis Leclerc, comte de Buffon is appointed *intendant* (keeper) at Jardin du Roi (King's Garden) in Paris.
- 1747** Denis Diderot becomes editor of *Encyclopédie*, published in 28 volumes in 1751–72.
- 1748** Treaty of Aix-la-Chapelle ends War of Austrian Succession.
- 1756–63** In Seven Years' War France and England struggle for overseas empire.
- 1789** Storming of Bastille begins French Revolution.
Traité élémentaire de chimie (Treatise on chemical elements) by chemist Antoine-Laurent Lavoisier is published.
- 1792** National Convention votes to abolish monarchy and establish republic.
- 1793** Louis XVI is executed. Louvre opens as public museum in Paris.
- 1795** New constitution, which establishes two-chambered legislature, is introduced.
Bibliothèque du Roi (Royal Library) and Bibliothèque de France (Library of France) merge as Bibliothèque Nationale (National Library).
- 1799** Napoleon Bonaparte forms Consulate.
- 1804** Napoleon I declares himself emperor, establishing First Empire.
Jacques-Louis David is appointed court painter by Napoleon.
- 1809** *Philosophie zoologique* (Zoological philosophy) by naturalist Jean-Baptiste-Pierre-Antoine de Monet de Lamarck is published.
- 1814** Pierre Guérin becomes professor at École des Beaux-Arts (School of Fine Arts) in Paris; he later teaches painting to Eugène Delacroix and Théodore Géricault.
- 1815** Napoleon is defeated at Battle of Waterloo.
- 1830** After Revolution of 1830 new regime, July Monarchy, takes power.
Louis-Hector Berlioz's *Symphonie fantastique* (Fantastic Symphony) is performed in Paris.
- 1831** *Le rouge et le noir* (*The Red and the Black*), novel by Stendhal, is published.
- 1841** Writer Victor Hugo is elected to Académie française.
- 1842** First novels of Honoré de Balzac's 47-volume series, *La Comédie humaine* (*The Human Comedy*), are published.
- 1848** July Monarchy is overthrown; new republic is declared; Parisian workers revolt in June Days of 1848.
- 1852** Louis Napoleon declares himself Napoleon III.
- 1857** Charles-Pierre Baudelaire's book of verse, *Fleurs du mal* (*Flowers of Evil*), is published and is condemned for obscenity and blasphemy; Gustave Flaubert's novel *Madame Bovary* is also condemned.
- 1870–71** Prussia and France dispute over Spanish throne in Franco-Prussian War with Germany victorious; new provisional government establishes Third Republic.
- 1871** Commune of Paris is formed.
- 1873** Arthur Rimbaud's poem *Une Saison en Enfer* (*A Season in Hell*) helps define Symbolist movement.
- 1874–86** Eight impressionist exhibitions occur, showing works of such painters as Édouard Manet, Claude Monet, Camille Pissarro, Alfred Sisley, Pierre-Auguste Renoir, Paul Cézanne, and Edgar Degas.
- 1875** New constitution is enacted under Third Republic.
- 1877** Auguste Rodin exhibits his sculpture at Paris Salon.

(continues)

French: nationality time line (continued)

- 1888–95** Chemist and microbiologist Louis Pasteur is director of Institut Pasteur in Paris where he conducts studies, leading to germ theory of disease, process of pasteurization, and vaccines for several diseases, including rabies.
- 1889** Eiffel Tower is completed in Paris.
- 1891** Post-impressionist painter Paul Gauguin sets up studio in Tahiti.
- 1894** Claude Debussy bases symphony on Stéphanie Mallarmé's 1876 poem "L'Après-midi d'un faune" ("The Afternoon of a Fawn").
- 1896** Composer Gabriel-Urbain Fauré becomes professor at Paris Conservatoire de Musique (Paris Conservatory of Music); Maurice Ravel later becomes one of his students.
- 1898** Writer Émile Zola writes letter in defense of Alfred Dreyfus, Jewish army officer later proven to be falsely accused of treason by anti-Semitic elements in military.
- 1901** Poet René François Armand (pseudonym, Sully Prudhomme) wins Nobel Prize for literature.
- 1904** Entente Cordiale is negotiated between France and Britain.
Painter Toulouse-Lautrec dies at age 37; poet Frédéric Mistral wins Nobel Prize for literature.
- 1913–12** Marcel Proust's 16-volume series of novels, *À la recherche du temps perdu* (*Remembrance of Things Past* or *In Search of Lost Time*), with exhaustive psychological analysis of characters, is published.
- 1914** Germany invades France, beginning World War; it lasts until 1918.
- 1915** Novelist Romain Rolland wins Nobel Prize in literature.
- 1917** Poet and playwright Guillaume Apollinaire coins term surrealism; in 1924 poet, essayist, and critic André Breton writes *Manifeste du surréalisme* (*Manifesto of surrealism*).
- 1919** By Treaty of Versailles France regains Alsace-Lorraine territory.
- 1921** Poet and novelist Jacques Anatole Thibault (pseudonym, Anatole France) wins Nobel Prize in literature.
- 1925** Locarno Pact of 1925 reaffirms France-German border.
- 1927** Philosopher Henri Bergson wins Nobel Prize in literature.

Pyrenees, Jura, and Vosge—mostly run along the interior borders of France. The highest point is Mont Blanc in the Alps at 15,781 feet near the Italian border. The Massif Central and Auvergne Mountains are located in the southeast-central region. The major rivers of France include the Loire, Garonne, Seine, and Rhône.

INCEPTION AS A NATION

The FRANKS occupied lands once the homeland of the GAULS and occupied by the ROMANS. In the late eighth century C.E. Charlemagne of the Franks, united "Francia," which eventually extended from the Pyrenees in present-day northern Spain and southern France to the Elbe River in present-day Germany. The Treaty of Verdun in 843 divided the Carolingian Empire among the sons of Louis I: Lothair I received the central kingdom, Louis II received the territory east of the Rhine, and Charles II won the western kingdom, the territory known today as modern France.

By 1206 the Capetian dynasty had expanded the French domain over Normandy, Maine, Touraine, Anjou, Poitou, Auvergne, and Brittany. During the reign of Louis IX (1226–70) France secured Guyenne and Normandy and annexed Provence and Var. The Thirty Years' War was resolved in 1648 under the Peace of Westphalia. This treaty and the Treaty of the Pyrenees with Spain granted France Alsace, Artois, Picardy, Lorraine, and Roussillon. In the Treaty of Utrecht, which ended the War of the Spanish Succession in 1713, France gained the eastern province of Franche-Comté. An earlier treaty confirmed acquisition of Alsace and Strasbourg.

After the French Revolution (1789–99) France's government dealt with transitional leadership. It experienced five republics, empires (such as the consulates of Napoleon I Bonaparte and Napoleon III), and a succession of regimes, including the Bourbon family and July Monarchy. The Third Republic in 1875

- 1935** Popular Front is established when Communist Party allies with Socialists and Radicals.
- 1937–39** Films by Jean Renoir (Pierre-Auguste Renoir's son), *La Grande Illusion* (*The Grand Illusion*), *La Bête humaine* (*The Human Beast*), and *La Règle du jeu* (*Rules of the Game*), influence generation of filmmakers.
- 1937** Novelist Roger Martin Du Gard wins Nobel Prize in literature.
- 1939–45** During World War II Nazi Germany occupies northern France.
- 1946** Cannes Film Festival is founded.
- 1946–58** Fourth Republic is established.
- 1947** Novelist André Paul Guillaume Gide wins Nobel Prize in literature.
- 1951** Magazine *Cahiers du cinéma* (Notes on the cinema) is first published, promoting *auteur* (author) theory of filmmaking and *nouvelle vague* (New Wave) in film; François Truffaut, Jean-Luc Godard, and others who write for it later become successful directors.
- 1952** Novelist François Mauriac wins Nobel Prize in literature.
- 1957** France joins European Economic Community (EEC), which evolves into European Community (EC).
- 1958** New constitution establishes Fifth Republic; Charles de Gaulle becomes president.
- 1960** Poet Alexis Léger (pseudonym, Saint-John Perse) wins Nobel Prize in literature.
- 1962** France grants independence to Algeria.
- 1964** Novelist Jean-Paul Sartre wins but refuses Nobel Prize in literature.
- 1974** Novelist Albert Camus wins Nobel Prize in literature.
- 1981** Socialist François Mitterrand is elected president.

- 1993** France becomes one of original 12 members of European Union (EU).
- 1994** Channel Tunnel between France and United Kingdom is officially opened.

established the system of republican democracy that prevails today.

CULTURAL IDENTITY

As in many cultures, but perhaps to a more marked degree than in some, the native language is a primary distinguishing feature of French cultural identity. If French culture and society in the early Middle Ages achieved the most complete fusion between Romano-Celtic and Germanic elements of any European country, the French language allowed this fusion, as its precursor, the Latin-derived *lingua vulgaris*, was adopted first by the Celtic Gauls after the Roman conquest of Gaul, then by the Germanic Franks, who ruled much of France after the fall of the Roman Empire. The shared language helped to create a French culture that embraced elements of three different ancient peoples, CELTS, ROMANS, and GERMANICS (including the VISIGOTHS, BURGUNDII, and NORMANS. At the same time the dominance of Paris in French culture

and society caused the French spoken in the Parisian region to become dominant in France as a whole, replacing, for example, the *langue d'oc*, the Provençal language spoken in Provence and most of the south of France well into the Middle Ages. The importance of language to the French, both in terms of literature and learning and as a centralizing factor in French society, is underscored by the foundation in the 17th century of L'Académie Française (the French Academy) for the specific purpose of standardizing French usage.

The town-versus-country and capital-versus-provinces split had been foreshadowed in Roman Gaul. The great similarity of the *lingua vulgaris* to the native language of the Gauls greatly facilitated its adoption, as nobles especially evolved a Gallo-Roman culture; however, it was mostly Gauls in towns and cities who spoke it, and for centuries people in the countryside retained their native language. This situation was mirrored in the early modern era as

In this 1833 painting Joan of Arc rides triumphantly through a town. (*Library of Congress, Prints and Photographs Division [LC-USZ62-72045]*)

BASQUES, BRETONS, and CATALANIANS experienced increasing pressure to adopt French.

The fusion between Gallic and Roman culture was succeeded by the adoption of Gallo-Roman culture by the Franks, which took place earlier and was more complete than was the case for any other Germanic tribe. This meant both that a distinct national character—a sense of

“Frenchness”—emerged earlier in France than elsewhere after the fall of the Roman Empire, and that France became more advanced politically. By the reign of Charlemagne France had an empire that in scope approached that of the Romans. Charlemagne saw to it that his court became a center of learning, and scholars from all over Europe traveled there. Thus France

enjoyed a sort of cultural and political head start over the rest of Europe that continued for centuries. Although Charlemagne's empire included much of present-day Germany, he had acquired most of this territory by conquest of the still largely divided Germanic peoples there, and the cultural center of gravity of the Carolingians remained present-day France, with Paris as major city and later capital.

Even today there is a noticeable focus on Frenchness among the French. At the same time, a self-conscious preoccupation with culture in all its forms—dress, manners, and style, as well as with high art and philosophy—is a defining trait. If the French have a particular sense of style, of being *au courant* or *chic* as opposed to the *gaucherie* of Germans or British, it may be the result of the long centuries, from the Middle Ages to well into the 19th century, during which France was the most admired and imitated European country in terms of manners, dress, and cuisine as well as in high culture and learning.

Modern French identity—at least as seen by many French—exists amid an emphatic challenge from external “others,” the non-French nations, partners and enemies, against whom the French assert their distinct existence. Part of this tendency is a reaction to France's loss of international political power in the 20th century and the shrinkage of its cultural hegemony, as English has replaced French as the most important international language.

Much of French culture is not primarily individualistic or mystic—Jean-Jacques Rousseau

notwithstanding—but rather social in nature. Some of its best expression has occurred in the midst of social groups in which ideas flow freely. This trend has been seen repeatedly throughout history—the courts of Charlemagne, Francis I, and Louis XIV; the salons of the 17th and 18th centuries; schools of thinkers such as the 18th-century *philosophes* who brought forth the French Enlightenment and the existentialists and deconstructionists of the 20th century; and artistic groups such as the impressionists, cubists, and dadaists.

Frentani

The Frentani are generally classified among the ITALICS, although they may have originally been Illyrian speaking. They lived in the region of present-day Molise in present-day southeastern Italy, perhaps after breaking off from ILLYRIANS of the Balkan Peninsula and migrating to the east coast of the Italian Peninsula before the sixth century B.C.E. and the Roman period. They eventually spread inland to the region that the ROMANS called Samnium (modern Abruzzi and part of Campania) and were eventual allies of the SAMNITES living to their east. The Frentani spoke Oscan, an Italic language, in the historic period.

According to the Roman historian Livy of the first centuries B.C.E. and C.E. the Frentani capital, Frentum, was captured by the Romans in 305 or 304 B.C.E. during the Second Samnite War of 322–304 B.C.E. That another Frentani city, Larinum, became Romanized by 200 B.C.E. is indicated by coins found there, originally in Oscan, then in Latin. Some among the Frentani joined an alliance against Rome in the Social War of 90–88 B.C.E.

Frisians (Frisii)

The Frisians are a people who live for the most part between the Lower Rhine and the Ems River along the North Sea coast in present-day northern Netherlands and northwestern Germany and on the adjacent Frisian Islands. Friesland (or Vriesland) is currently a province in the northern Netherlands. The region of East Friesland (Ostfriesland), now part of the state of Lower Saxony in Germany, includes the East Frisian Islands (see DUTCH: NATIONALITY; GERMANS: NATIONALITY).

ORIGINS

The Frisians were originally a tribal people of GERMANICS in the region, referred to as the Frisii by the ROMANS. Their name is possibly from the Germanic Freisias related to Indo-European root *prei-*, “to love” (which also led to the name of the Germanic goddess of love, Freya, suggesting Frisians worshipped her). As a coastal people, they took part in wide-ranging trading networks from very early times, and their culture received influences from other parts of the Atlantic trade zone, which stretched from the western Mediterranean and Iberian Peninsula along coastal present-day France and the Atlantic coasts of the British Isles to their northern neighbors on the Jutland Peninsula. The land of the Frisians was part of the Atlantic megalith building zone, and from around 3500 B.C.E. dolmens, assemblages of huge boulders propped up against one another, began to be built, simultaneously with the introduction of farming. Such structures, which were built in areas where incoming farmers met dense populations of Mesolithic peoples exploiting the rich marine resources along the coasts, are thought to have been built in communal rituals aimed at reconciling and uniting groups practicing very different lifeways. The Frisians of the Iron Age were less warlike than the inland SAXONS, and their energies were directed far more toward trade and fishing. However, the Frisians were known as sea raiders, as well.

LANGUAGE

Frisian is part of the West Germanic language group. It is a Low German language closely related to English. It has survived among inhabitants of the Dutch province of Friesland and in parts of northwestern Germany.

HISTORY

The Roman incursions into northwestern Europe had a profound effect on all of the Germanic tribes there, including the Frisians. Their military operations in the region, culminating in the establishment of the Rhine frontier, and their development of large-scale trading enterprises transformed societies here. In 476 C.E. the Romans established treaty relations with the Frisians as a means of stabilizing the frontier, and a kingdom of Frisia was eventually established. The Roman historian Tacitus of the first–second century in his *Germania* mentioned the Frisians as among the tribes he grouped together as the INGVAEONES. Trade with Romans, notably in the slaves so

necessary to the Roman economy, fostered the beginnings of a true market economy among Frisians, and trading towns grew. For a period after the collapse of the Roman Empire in the fifth century the homeland of the Frisians was occupied by the ANGLES, JUTES, and SAXONS. Some Frisians invaded and settled in the British Isles along with the other northwestern Germanic tribes; the Angles, Jutes, Saxons, and Frisians became known collectively as ANGLO-SAXONS. After this migration the Frisians who remained in their homeland continued to have close relations with their relatives across the North Sea, particularly in East Anglia.

Frisians in the Middle Ages

The Carolingian FRANKS under Charlemagne conquered Frisia in 785. Before the conquest many pagan Frisians fled to what is today north Friesland—formerly the territory of the Angles who had migrated to Britain—and remained unconverted. They engaged in trade with East Anglia in England, especially with the trading town of Ipswich, among the largest towns in Anglo-Saxon England. Numerous pottery finds that have been made in Ipswich date to the seventh and eighth centuries, bearing impressed pagan motifs, even though East Anglia was officially Christian. Thus Ipswich was supplying pagan wares to the Frisians and may itself have been a pocket of paganism in Christian East Anglia. In general Frisians and East Anglians, some of the latter perhaps of Frisian descent, must have engaged for centuries in cross-cultural contacts that may never be known in detail. (The Frisian language is closer to English than to Dutch.) The Anglo-Saxon Saint Willibrord, aided by Saint Boniface, was apostle to the Frisians in the eighth century and with the backing of the Frankish king Pippin II established a bishopric at Utrecht.

During and after the Middle Ages the territory of Friesland passed into and out of the control of a number of northern kingdoms and states, including those of the counts of Holland and the duchies of Burgundy and of Saxony. Throughout this time, however, the Frisians stubbornly maintained their autonomy as a people and retained their own unique language. At the end of the 15th century Friesland was given to the duchy of Saxony by the Holy Roman Emperor. Because the duke of Saxony was unable to establish his authority over Friesland, it reverted to the empire, and the Hapsburg emperor Charles V reduced the province by force in 1523. Later in the 16th century Frisians took part in Dutch resistance

1748 Friesland joins United Provinces of the Netherlands.

against the Spanish Hapsburg regime (which was using the Netherlands as a staging area for war against England). Friesland joined the United Provinces of the Netherlands in 1748.

Enduring Identity

Modern Friesland is an important dairy and cattle-rearing region. The marshlands of the past have been transformed with canals and artificial lakes.

Part of the old Frisian territory is in present-day Germany, but the people there still speak the Low German Frisian language and maintain ties with Frisians in the Netherlands. There are also descendants of Frisians living on the coast of the Jutland Peninsula and nearby islands.

CULTURE (see also GERMANICS)

Economy

During the Middle Ages cattle and sheep rearing were the most important means of support, supplemented by fishing, trading, and shipping. A cattle breed, the Frisian, still exists. A wool industry emerged through the manufacture of a coarse woolen cloth with a shaggy nap on one side, traded in large quantities to the ENGLISH, who called it *frieze*. Because relatively little land was safe from flooding, imports of grain were important.

Government and Society: *Lex Frisionum*

The customary laws of the Frisians were written in 790 as the *Lex Frisionum* under the auspices of Charlemagne, who was compiling such bodies of law from the peoples he conquered in order to take local law into account in his effort

FRIULIANS**location:**

Northeastern Italy

time period:

Second century B.C.E. to present

ancestry:

language:

Friulian (Rhaeto-Romanic)

at promulgating a consistent law code for his empire. In common with other Germanic law codes that of the Frisians was based on a system of monetary fines to be paid for transgressions, which gave rise to the concept of *wergild*, “man price,” the amount of a fine based on status.

During the Middle Ages Frisians were able to resist incorporation in the feudal and manorial systems that dominated much of Europe, possibly because the challenges of farming their region made the land unattractive to lords who were seeking agricultural wealth. Frisian farmers retained the status of free peasants largely governing themselves according to the principle of *folkright*, the collective will of the people as embodied in rules and laws that had been established over time, interpreted by local assemblies.

Dwellings and Architecture

Because their low-lying homeland was subject to frequent flooding, the Frisians constructed *terpen*, earthen mounds, on which to build their homes. *Terpen* functioned as small villages, and some of the larger of them had their own churches. Typically a *terp* with a church would have some 100 inhabitants—12 farms and four houses of craftsmen. *Terps* without churches would have had little more than three farms.

Of the many small Germanic tribes who have appeared in history the Frisians have been

among the most tenacious in maintaining their identity as a distinct people. Their language has played a large part in this, but their territory, for so long marginal, as much sea as land, which required tenacity of its inhabitants but also spared them from encroachment, must also have fostered their stout autonomy and stubborn maintenance of their own folkright.

Friulians

The Friulians are people of modern-day Italy, most of whom live in the Friuli-Venezia Giulia region in the northeast, centered around the city of Udine. They are classified on the basis of their shared language known as Friulian, a Rhaeto-Romanic dialect of the Romance branch of Italic languages, probably related to Ladin, also spoken in Italy (see LADINS), and Romansch, spoken in Switzerland. There are presently about 700,000 Italians who speak Friulian, recognized as an official language by the Italian government since 1937.

CELTS, among them the RAETI, occupied the region as early as the second century B.C.E., whence the name for the language, but because numerous other peoples lived there over the centuries, among them the ETRUSCANS, ILLYRIANS, ROMANS, and GERMANICS, determining ancestry is hard. Although Friulian is classified with Ladin and Romansch, it is closer to Italian.

See also ITALIANS: NATIONALITY.

G

Gaballi (Gabali; Gaballes; Gabeli)

The Gaballi are classified as a Celtic tribe. They lived in Gaul around present-day Javois in southern France at least by the first century B.C.E. and are discussed as CELTS or GAULS. They were allies of the ARVERNI.

Gaels *See* CELTS; IRISH; SCOTS.

Gaesati (Gaesatae)

The Gaesati are classified as a Celtic tribe. They lived in the Alps and Rhône valley and joined other CELTS, the BOII and INSUBRES, against the ROMANS in 225 B.C.E. KNOWN as fearless fighters, they were hired by other tribes to fight as mercenaries.

Gagauz (Gagauzs; Gagauzi; Gagauzians)

The Gagauz are a Turkic-speaking people, living in the region known as Gagauzia in southern Moldova. They are thought to be descended from peoples known as TORKS—TURKICS considered part of the Oguz Turkic branch—who settled in central Europe in the 11th century C.E.

In 1994 the Gagauz were granted limited autonomy, with the right to secede in the event Moldova merged with Romania. Living on the Bugeac plain, they are primarily agricultural and among the few Christian Turkic groups.

See also MOLDOVANS: NATIONALITY.

Galatians *See* GALATOI.

Galatoi (Galatai; Galatae; Galatians; Galats)

In the fourth century B.C.E. a number of allied tribes of CELTS first settled in the Danube Basin and displaced ILLYRIANS and other peoples of the region. According to ancient Greek sources at the start of the third century B.C.E. some tribes pushed farther southward in the ancient regions of Thrace and Macedon on the Balkan Peninsula. Bolgius was one of their leaders. By 279 B.C.E. the Galatoi had migrated deep into Greece, probably as far as Delphi, under leaders, perhaps legendary, by the names of Brennus and Achichorios. They eventually were repelled.

After the invasion into Greece had failed, varying tribes or factions settled in different areas. Some became mercenaries for the MACEDONIANS; others under Achichorios founded the kingdom of Tylis in Thrace among the SCYTHIANS; still others settled on the site of present-day Belgrade, Yugoslavia. There they were known as SCORDISCI, one of the powerful groups in the region; those small numbers who managed to stay in Greece—and any others who migrated there over the centuries—adopted the Greek language and were called Gallograeci (“Gallic Greeks”) by Greek-speaking inhabitants. Some tribes among the Celts—the TECTOSAGES, TOLISTOBOGII, and TROCMI, origi-

nally from southern France, under Leonorios and Lutorios—were invited by Greeks living in northern Phrygia in Asia Minor in present-day Turkey to relocate there as allies and mercenaries. After traveling there, however, the Galatoi tribes remained independent and created their own kingdom, Galatia, its inhabitants referred to as Galatians in many texts. (These were the Galatians reportedly addressed by St. Paul in his “Letter to Galatians.”)

In about 230 B.C.E. the Galatians were defeated by Attalus I of Pergamum, a Greek kingdom in western Asia Minor, who, however, failed to dislodge them. The ROMANS defeated them again in 189 B.C.E., but Galatia did not become a client kingdom of Rome until 64 B.C.E. and part of the empire until 25 B.C.E. The Galatians retained their Celtic identity at least until the fourth century C.E.

Galicians (Gallaecians; people of Galicia)

The name Galicians refers to people living in the region and ancient kingdom of Galicia, or Gallaecia, situated in present-day northwestern Spain. It is an autonomous region, which includes the provinces of La Coruña, Lugo, Orense, and Pontevedra. An independent kingdom under the SUEBI in the fifth and sixth centuries C.E., it was later under the rule of the VISIGOTHS. The MOORS invaded in the eighth century, but a kingdom, Asturias, founded by the Pelayo, a Visigoth, held out against them. In the ninth century Galicia became part of the kingdom of León, which evolved into that of León and Castile (*see* SPANISH: NATIONALITY). Another historic region known as Galicia (also Galicja or Galitsiya), formerly ruled by Poland and Austria, is situated north of the Carpathian Mountains in present-day Ukraine.

Gallaeci

The Gallaeci are classified as a Celtic tribe. They lived in present-day northwestern Spain. Their name indicates that they were CELTS, although they lived far from the region in north-central Spain designated as Celtiberia proper (*see* CELTIBERIANS). They resisted the ROMANS along with the ASTURES and CANTABRI but were finally defeated in 19 B.C.E. The region of Gallaecia consisting of the present-day Spanish provinces of La Coruña, Lugo, Orense, and Pontevedra took its name from the tribe. It was an independent kingdom under the Germanic SUEBI in the fifth and sixth centuries C.E.

Gallaecians *See* GALICIANS.

Galli

The Galli are classified as a Celtic tribe. They lived south of the Pyrenees in present-day northern Spain; they thus can be discussed as CELTS or CELTIBERIANS. Their territory was occupied by the ROMANS by 19 B.C.E. The name Gallia is also the Latin form for the region known as Gaul, whose tribes are considered GAULS.

Gangani (Ganagani; Siol Gangain)

The Gangani are classified as a Celtic tribe. They lived in Britain on the Lleyn Peninsula in present-day northwestern Wales at least by the first century C.E. and are discussed as CELTS, BRITONS, or WELSH. A group of the same name, known in Gaelic as Siol Gangain, lived in the present-day county of Clare and the southern part of the county of Galway in western Ireland.

Garites

The Garites are classified as a Celtic tribe. They lived in Gaul around present-day Gariés in southwestern France and are discussed as CELTS or GAULS. They surrendered to the ROMANS under Julius Caesar with the fall of Aquitania in 56 B.C.E.

Garumni

The Garumni are classified as a Celtic tribe. They lived in Gaul along the upper Garonne River in present-day southwestern France and are discussed as CELTS or GAULS. They surrendered to the ROMANS under Julius Caesar with the fall of Aquitania in 56 B.C.E.

Gauls (Galli; Galatoi; Keltoi; Celtae; Gallic Celts)

The Gauls are a subgroup of Celtic-speaking peoples or CELTS. Numerous Gaulish (Gallic) tribes lived in a region known as Gaul, as defined by the ROMANS. (The Latin version is Gallia; the French is Gaule.) The Gauls were the Celts with whom the ROMANS had the most contact over the centuries: those who lived in present-day France, Belgium, Switzerland, the Netherlands, western Germany, and northern Italy. Mainland peoples not discussed as Gauls are the Celtic tribes living on the Iberian Peninsula (the Celtiberians) and those living in other regions of central and eastern Europe as well as Asia Minor. Celtic peoples on the British Isles are discussed as BRITONS, IRISH, and SCOTS.

ORIGINS

The Gauls—and the other various Celtic-speaking peoples—were the descendants of the tribes of the Bell Beaker and other Bronze Age cultures and before that of the peoples of the Neolithic cultures that developed after the introduction of farming practices to Europe. The Hallstatt culture and the La Tène art style became important developments for those peoples who are grouped together as Celts.

LANGUAGE

The Gauls spoke dialects of Gaulish (Gallic), one of the branches of Continental Celtic (the others are Lepontic and Celto-Iberian). The other Celtic language family is known as Insular Celtic, dialects spoken on the British Isles. Gaulish is known primarily from references to tribes, places, and individuals in the writings of the ancient GREEKS and Romans. Only a few inscriptions have been found. The great majority of evidence for Continental Celtic consists of the names of persons, tribes, and places recorded by Greek and Latin writers. Only in Gaul and in northern Italy are inscriptions found, and their interpretation is in most cases doubtful. The longest inscription is the Coligny calendar, preserved on two bronze tablets found in 1897 at Bourg in eastern France, a lunar calendar.

Continental Celtic seems to have been very similar to Latin, so much so that when sending confidential messages during wartime Roman officers would write in Greek so that if their letters fell into the hands of Gallic warriors, they would be illegible. The similarity between Latin and Continental Celtic may have contributed to the latter's disappearance, because it would have been so easy for Gauls to learn Latin and to use it when writing. Latin may even have served as a lingua franca among different Gallic tribes in territories far apart whose regional dialects made it hard to understand one another. Latin was in all probability the language of the marketplace, law, government, and the wealthy, while Gaulish continued to be spoken only in backward rural areas.

The Coligny calendar is a lunar calendar with months of 29 days; the lunar time reckoning of the Gauls is mentioned by Julius Caesar in his writings. Given the nature of the evidence, knowledge of these languages is confined largely to the sound system and a small part of the vocabulary, and no certain conclusions can be reached as to their historical development or the differences between them.

HISTORY

Gallic Incursions into Italy

Although the Roman historian Livy of the first-centuries B.C.E. and C.E. reported a migration that occurred as early as 600 B.C.E. is suspect, there is evidence of some movement of prehistoric Hallstatt groups—peoples ancestral to the Celts—through Alpine passes to the Lombard lake district in the sixth and fifth centuries B.C.E.; typical Hallstatt burials have been found there. But the main thrust southward was at the end of the fifth century B.C.E. as successive waves of Celts arrived, each bypassing the territories of their brethren to move ever farther south. Tribes named in accounts include the INSUBRES, who conquered the territory around Milan; the CENOMANI, who entered Brescia and Verona; the LEPONTI around Lake Maggiore, and the LIBICI and SALUVII. The BOII and LINGONES passed on, moving south of the Po. Among the last to arrive, the SENONES went to Umbria and the Adriatic coastal zone.

Whole families accompanied this movement and settled to farm the rich Po valley; the second-century B.C.E. Greek historian Polybius, who lived in Rome, describes fertile fields growing wheat, barley, millet, and vines, through which pigs roamed. Large numbers of small cemeteries from this time document a population scattered thinly across the countryside. There continued to be warrior burials as

in the homeland, in some cases the accoutrements including Etruscan body armor, an innovation, as Celts typically fought naked.

For a time the Apennine Mountains served as a barrier to further movement. Meanwhile to the south of the Apennines the Romans were engaged in acquiring the territories of the ETRUSCANS. No sooner had their annexation been completed, however, than Gallic war bands appeared, having burst through the Apennine barrier. These tribesmen are thought to have originated in the Rhine-Moselle region in present-day eastern France and western Germany. They overran the former Etruscan

cities with an impetus that quickly moved them all the way to the gates of Rome itself in 390 (or 387) B.C.E.

The Gauls laid waste much of the region around Rome, which held out for seven months until the Gauls moved off. Raiding continued throughout the Italian Peninsula for 60 years, during which many Gauls became employed as mercenaries for various local tyrants. By the 330s B.C.E. the raids had largely ceased; in 332–331 B.C.E. the Romans concluded a treaty with the Senones.

During the third century B.C.E. the Romans regained territory to the north all the way to

the Po River valley. A description by Polybius of a major battle during these campaigns, at Telamon in 225 B.C.E., gives a sense of the primal clash of cultures represented by the two sides. Part of the shock cast by the Gallic warriors resulted from their fighting without armor and entirely naked, as though they were invulnerable, in one account appearing to be “insane gods.” The Gauls also showed a keen appreciation of the psychology of fear in their use of sound—innumerable horns, called *carnexes*, fashioned with fierce animal heads at their mouths, and trumpets accompanied the roars of the warriors—and in their theatrical threatening gestures. Had the Romans been able to understand the Gauls’ language, no doubt they would have been further impressed by the imprecations hurled at them by the poets who always accompanied Gallic warriors to battle, improvising satiric verses to discomfit and confuse the enemy. The Gauls fought with improvisatory flamboyance—war to them was as much an art as anything else. The Roman fighting spirit, on the other hand, depended upon organization, discipline, training, and *esprit de corps*.

In the end, however, Roman discipline won out and large territories settled by the Gauls were annexed. The Gauls were not all ousted from these territories. One tribe, the Boii, returned north through the Alps and settled finally in Bohemia in the present-day Czech Republic, which takes its name from them.

Impetus for the Roman Conquest of Gaul

The early successes of the Gauls in Italy and the terror felt by the populace of Rome on beholding the Gaulish warriors at their gates are part of the impetus for the Roman conquest of Gallic France: The need to extend the *Pax Romana* as far as possible into barbarian territories so as to prevent another such invasion. Other developments in Italy were also involved in the Roman drive for empire to the west and north. The Roman social hierarchy maintained itself through military adventures. The almost constant warfare over time depopulated the Italian countryside as small farmers and laborers were drafted into the army; even those whose service had ended often moved to the cities, disinclined to resume a rural existence. As a result land was increasingly in the hands of large estate holders, who depended on slave labor. Land was a major focus of investment among the aristocracy, who poured the spoils of their wars into developing their estates until

much of Italy became planted as vineyards. The amount of wine produced was far more than the domestic market could absorb, so that Roman wine merchants looked to the Gauls, whose passion for wine was legendary. As a result the constant need for new military horizons, the growing population of increasingly restive war veterans in Italy who wanted land on which to settle, and the need of merchants for stable markets in barbarian regions all created incentives for Roman expeditions in several directions, including toward the coastal strip of present-day southern France.

Early Roman Gaul

The Romans originally defined Gaul as consisting of two main divisions: *Gallia Cisalpina*, “Gaul this side of the Alps” (in present-day northern Italy), and *Gallia Transalpina*, “Gaul across the Alps.”

Gallia Cisalpina, or Cisalpine Gaul, in present-day northern Italy, was also called *Gallia Citerior*, or Near or Hither Gaul, to distinguish it from *Gallia Ulterior*, or Far or Farther Gaul. During the third century B.C.E. the Romans wrested control of *Gallia Cisalpina* from the Gallic tribesmen who had earlier invaded the northern area of the Italian Peninsula. The Romans established colonies in the various Gallic towns. In the first century B.C.E. the region was subdivided into *Gallia Cispadana* (“Gaul this side of the Padana, or Po River”) and *Gallia Transpadana* (“Gaul across the Po River”).

Gallia Transalpina, or Transalpine Gaul, was defined as practically all of France and Belgium and parts of the Netherlands, Germany, and Switzerland. (It later became known as *Gallia Celtica*, *Gallia Proper*, or *Gaule*.)

The First Roman Colony

By 121 B.C.E. Rome ruled the southern part of Transalpine Gaul. Originally called *Provincia Romana* (from which is derived the modern name Provence), it comprised a strip some 100 miles wide from the eastern Pyrenees on the present Spanish-French border northeastward along the northern Mediterranean and up the Rhône valley nearly to Lyon. The importance of this region to the Romans was twofold. It furnished the main route of their armies to Iberia (present-day Spain), which during the second century B.C.E. was a major focus of Roman ambitions because of its wealth of gold, silver, and agricultural products. It also became an increasingly important market both for Roman

wine and for manufactured products such as pottery. The Romans founded what is thought to be its first colony of Narbo Martius (present-day Narbonne) in southern France on the coast in 118 B.C.E. This region would later become known as Gallia Narbonensis.

Germanic Invasion

After 120 B.C.E. an alliance with the AEDUI against the ALLOBROGES and the ARVERNI gave the Romans control of the Rhône River valley. The Gallic tribes in the rest of Transalpine Gaul—that is, the territory from the Rhine River and the Alps westward to the Atlantic Ocean—now faced the threats of the GERMANS pressing from the east westward toward and across the Rhine, and of the Romans from the south. The Germanic CIMBRI invaded Bohemia, the land of the Boii, and Noricum, a Celtic kingdom in the eastern Alps (not thought of as part of Gaul), and in 118 B.C.E. defeated a Roman army sent to Noricum. Joined by another Germanic tribe, the TEUTONES, the Cimbri continued their raids, pushing into Italy, where they were defeated by the Roman armies in 102 and 101 B.C.E.

The Campaigns of Julius Caesar

The Roman general Julius Caesar conquered Transalpine Gaul and eventually pushed on to the British Isles, where he spent two seasons campaigning against the Britons. In his political efforts to gain permission from the Roman senate to lead an army into Gaul Caesar was helped by the abiding trauma in the Roman psyche caused by the Gallic invasions of the fourth century B.C.E. The Romans perceived the continuing Gallic threat and growing Germanic threat and voted Caesar all the powers he needed to carry out his campaigns in what became known as the Gallic Wars.

The migration of the Celtic HELVETHI westward into the territory of the Arverni from Switzerland prompted Caesar's first military campaigns northward in 58 B.C.E. He drove them back to their homeland. Some Celtic tribes, such as the Aedui, appealed for his help in defeating the attacking SEQUANI and their allies, the Germanic SUEBI under Ariovistus.

Instead of helping the Aedui, Caesar kept his legions in Gaul, campaigning against the tribes of northern Gaul—whom he called the BELGAE—in 57 B.C.E. The next year he moved against the tribes in Armorica (modern Brittany in western France) and Aquitania in southwestern France, securing the region in 55 B.C.E. Caesar led his troops across the Rhine in that

year and for 18 days made war on the Germanic SUGAMBRI, TENCTERI, and USIPETES. He then led two legions across the English Channel and landed at Dover, but high tides and storms as well as raiding Britons forced him back to the mainland, where he suppressed a revolt of the Belgae. In 54 B.C.E. he mounted a second assault on the British Isles with five legions and advanced as far as the Thames. Another Gallic revolt forced his return to Gaul. In 53 B.C.E. he battled tribes living near the Rhine, including the MENAPII and NERVII. In 52 B.C.E. he suppressed a Gallic revolt of the Arverni and allied tribes led by Vercingetorix (see sidebar, p. 291). Gaul was pacified by the end of 50 B.C.E. In 49 B.C.E. Caesar conferred Roman citizenship on the inhabitants of Gallia Cisalpina.

Caesar's campaigns devastated Gallic society; he treated rebellion and resistance with extreme ruthlessness. The elders of one tribe, the VENETI, were all executed and the rest of the population sold into slavery. His soldiers decimated an army of Nervii reported to number 60,000 men in Belgica, leaving only some 500 alive; their Council of 600 was reduced to three. Caesar did show leniency toward the surviving women, children, and elders, who had fled to the forests, allowing them to return to their settlements and giving orders to neighboring tribes to leave them in peace. After vanquishing the ADUATUCI in an assault that reportedly killed 4,000, Caesar sold what is estimated at 53,000 survivors into slavery. He encouraged the wholesale slaughter by his soldiers of the CARNUTES because they had killed the Roman traders living with them; of a supposed 40,000 men, women, and children, only 800 survived. No doubt as a result of those losses there was little Gallic resistance for many years.

Later Years

Emperor Tiberius was obliged to suppress a rebellion of the nobles in 21 C.E., but the assimilation of the Gallic aristocracy was secured when the emperor Claudius I made them eligible for seats in the Roman senate and appointed them to governing posts in Gaul. The first Gauls to serve in the Roman senate were from the Aedui tribe.

Over the next two centuries there were a number of revolts in Gaul. Because of increasing Germanic incursions, the Romans had limes—a type of fortification—built from the Middle Rhine to the Upper Danube. Germanic invaders breached this line during the reign of the emperor Marcus Aurelius in 161–180 C.E.

Some of the Roman legions stationed along the Rhine revolted after 192 C.E. Further instability was caused by an economic recession, which raised prices in the region. In 260 peoples in Gaul, Spain, and Britain became part of an independent Gallic empire, governed by Marcus Cassianius Latinus Postumus from Trier (or Trèves, named after the *TREVERI*) on the Moselle River in present-day Germany. In 273 Emperor Aurelian reclaimed Gaul for Rome. Yet Germanic tribes remained a threat, reaching as far as Spain. Emperor Diocletian, who ruled in 284–305, and his successors attempted to reorganize the administration and revitalize the defense of Gaul, but in the fourth century more and more Germanic tribes were making inroads. By the fifth century the *VISIGOTHS* ruled Aquitania, the *FRANKS* ruled Belgica, and the *BURGUNDII* ruled the Rhine region. By the early sixth century the Romans had no presence in Gaul. In 486 the Frankish king Clovis I captured the last Roman outposts in Gaul.

CULTURE (see also CELTS)

Economy

The Gauls were as powerfully affected by trade with the Romans as their Celtic ancestors, the Hallstatt and La Tène tribes, had been by trade with the Greeks and Etruscans in the sixth and fifth centuries B.C.E. The Roman trade was on a much larger scale numerically than that of the Greeks and Etruscans had been. Fleets of merchant ships sailed up river routes deep into the interior of Gaul and along the Atlantic seaways to Brittany and southern Britain during the first century B.C.E. At such ports as Tolosa (Toulouse) and Chalon-sur-Saône wine was decanted from amphorae into barrels or skins for safe transport farther inland; enormous numbers of discarded and smashed amphorae were dumped into rivers. Roman merchants took up residence in Gallic *oppida* (towns). The Aude-Garonne River route was important because it led to the Atlantic sea routes.

After the Roman conquest trading routes by sea with their inherent dangers fell into disuse, replaced by the well-maintained roads of the Romans. Trading patterns changed markedly at this time.

Government and Society

Gaul Reorganized Caesar wrote a detailed account of the country and its inhabitants, distinguishing regions according to their native inhabitants, whom he classified north to south as *Belgae*, *CELTAE* (or *Galli*), and *AQUITANI*.

Vercingetorix: Visionary of a United Gaul

Vercingetorix, an Arverni nobleman, is the most famous of all the Gauls. His name in Gaulish means “overking” (*ver-rix*) of “warriors” (*cingetos*). His name has also been transcribed from Gaulish as Fearcuincedorigh. Vercingetorix’s name indicates he led warriors of many different tribes in battle—as many as 30, including Arverni neighbors in the Loire country and from other parts of Gaul as well. In this way he was able to counter Julius Caesar’s strategy of divide and conquer the tribes. His uncle, worried about Roman retribution, expelled him from the Arverni town of Gergovia on the Gergovie plateau, but Vercingetorix raised support from other young warriors and returned, proclaiming himself chief of his tribe.

By 53 B.C.E. the Roman legions had pacified Gaul except for scattered resistance. The first action in the general Gallic revolt was small, the killing of several Roman merchants at Cenabum (modern Orléans) in 53 B.C.E. Vercingetorix, who used cavalry as well as foot soldiers, led raids in Provincia Romana in southern France late that year. To prevent the Romans from living off the land, Vercingetorix had Gallic towns and fields burned. He also was masterful in using natural fortifications to defend against pursuing armies. Caesar’s forces drove the Gauls out of the province, then crossed the Cévennes in January 52 B.C.E. and attacked Arverni towns. They laid siege to Gergovia on the plateau of Gergovie. The powerful Aedui had at first refrained from supporting the revolt of the Arverni, their traditional enemies, but joined in time to force abandonment of the siege.

A Roman victory on the Vingeanne River forced the rebels to retreat northward to Alesia, a town of the Mandubii, to the northwest of present-day Dijon. Caesar mounted a siege. After the failure of a Gallic relief force to break through Caesar’s doughnut-shaped fortification—an outer defensive perimeter of 14 miles to defend against Gallic reinforcements and an inner wall of 11 miles protecting siege weapons to attack Alesia—the rebels, although outnumbering the Romans six to one, suffered staggering losses and surrendered in October 52 B.C.E.

After being held as a prisoner in the Tullianum at Rome for five years, Vercingetorix, the Gallic freedom fighter who had had a vision of a united Gaul, was publicly beheaded in 46 B.C.E. as a part of Caesar’s victory celebrations.

Emperor Augustus reorganized Gaul on the basis of his classifications, establishing new provinces in 27 B.C.E.: *Narbonensis* (or *Gallia Narbonensis*, the “old province”) in the south, under the direct rule of the Roman senate; *Aquitania* (*Gallia Aquitania*), extending from the Pyrenees to the Loire; *Lugdunensis* (or *Gallia Celtica*), a central region mainly between the Loire and the Seine; and *Belgica* (or *Gallia Belgica*) in the northeast. *Aquitania*, *Lugdunensis*, and *Belgica* were referred to collectively as *Tres Gallia* (Three Gauls) or *Gallia Comata*, (long-haired Gaul) and were administered from *Lugdunum* (now Lyon), the capital of *Lugdunensis*.

There were numerous tribes in the region, Germanic in addition to Celtic (or tribes of an ethnic mix). Some of the Celtic peoples in this region have been mentioned. The Romans founded colonies (*coloniae*) of Roman citizens.

Gauls living in northern France crafted this bronze plaque in the first century C.E. (Drawing by Patty Erway)

These were organized into *civitates* (singular, *civitas*), self-governed regions based largely on tribal territories. Each *civitas* had a capital, often at the location of a Gallic *oppidum* (town), although new towns were sometimes established.

As trade with the Romans increased, even before the Roman conquest of Gaul changes were occurring in Gallic society. The importance of kingship decreased in favor of municipal authority. Gallic tribes formed senates in Roman style. Magistrates of the tribal *oppida* wielded ever more power; according to Caesar among the Aedui the chief magistrate, Vergobretos, ruled for years although his was an annual appointment; he was prevented from founding a dynasty by rules that prohibited any member of his family from taking office during his lifetime and prevented him from leading Celtic-style raids abroad by the requirement that he not leave tribal territory while he held office. It is possible that these political innovations had been fostered by the Romans, for it was in their interest that the Gauls settle down and find gratification in wealth from trade rather than in proving their warrior prowess in raids.

Dwellings and Architecture

In common with the rest of Celtic Europe the Gauls began to establish large defended settlements called *oppida* (singular, *oppidum*)—the word Caesar used—during the mid-second century B.C.E. Much larger than the hill forts of the past *oppida* had orderly street grids. Many of the houses in Gaul were rectangular, as opposed to the circular dwellings, roundhouses, found on the British Isles.

Military Practices

The importance of the *oppida* in Gallic society actually aided Caesar in his conquest, for laying siege to such defended strongholds was a particular strength of the Roman armies, and once these centers of tribal power were taken, further resistance became minimal. This situation stands in sharp contrast to that of the Germanic tribes that the Romans would face in later years, whose settlements were thinly dispersed, and whose armies retreated into the forests. And the martial energies of the Gauls, which earlier in their history more than matched that of the Germans, had all been subsumed into peaceful pursuits.

Other Technologies

The Gauls produced a wide range of crafts, including pottery, glass beads, and bracelets

and other iron work, produced in industrial-scale quantities. Coins were minted as well.

Religion

In general the Gauls shared many gods and religious practices with Celts in other regions of the Celtic world, such as the British Isles. The fact that the Druids oversaw judicial matters as well as religious underscores how little separation there was between sacred and secular life among Celts. Part of their influence over political affairs lay in their role as prophets and seers.

The primary source of information for the Celtic gods of Gaul is the passage in Caesar's *Commentarii de bello Gallico* (*The Gallic War*) in which he lists five of them and their functions: Mercury, Jupiter, Mars, Apollo, and Minerva. Yet he uses the names of equivalent Roman gods rather than Gallic native names. Mercury is the most important Gallic god according to Caesar, his interpretation verified by the great number of images and inscriptions relating to Mercury. He is the inventor of the arts and the patron of travelers and of merchants; Jupiter rules the realm of the gods; Mars directs war; Apollo repels disease; and Minerva oversees handicrafts. It is possible that in addition to these gods the Gauls had particular local gods, although various deity names might be alternate names of principal deities. In this regard the Gallic god Taranis, a thunder god, has been associated with Jupiter; Teutates, with Mars and Mercury both; Belatucadrus, with Mars; Grannos with Apollo; and Sul with Minerva.

Many Gallic monuments show a pairing of male deity and female consort, possibly symbolic of the coupling of the protector god of the tribe or nation with the fertility mother goddess. It is difficult to distinguish between individual goddesses and mother goddesses, Matres or Matronae, who figure so prominently in Celtic iconography; they are symbolic of fertility and the seasonal cycle of nature. The Mothers usually appear as a triad (and sometimes pentad) of seated and smiling young women, wearing long robes and holding baskets of fruit on their laps, but there are many variations on this theme. At Arles in Provence near Marseilles (formerly Massalia) a large Roman cemetery, called Alyscamps, contains tombstones with reliefs of the Matres. A festival still held in the spring at Arles, possibly inspired by an earlier festival in honor of the Matres, is called The three Maries of the Sea, in which statues of the Virgin Mary, Mary

Cleophas, and Mary Magdalene are carried out to sea in a boat to bless the waters for the start of the navigational season.

Literature

The greatest of all Roman poets, Virgil of the first century B.C.E., whose family were farmers, may well have been of Gallic descent; his work owes little to Celtic literary tradition, however, being fully informed by Greco-Roman models and traditions. Possibly a trace of Gallic culture may be detected in his *Georgics*, a poetic treatise on farming that shows a keen appreciation of the natural world and of the farmer's joy in the bounty of the harvest. His earlier *Eclogues*, on the other hand, a set of pastoral poems, are firmly in the Greek tradition. Other "Roman" writers born in the territory of Gallia Cisalpina include the poets Gaius Valerius Catullus, also of the first century B.C.E.; the historian Livy of the first centuries B.C.E. and C.E.; and the statesmen and writers Pliny the Elder of the first century C.E. and Pliny the Younger of the first–second century C.E. It is not known whether their ancestry was Gallic, however. These writers, as Virgil did, worked in the classical Roman literary tradition.

Although the Romans had won political control over Gaul, following their usual procedure, they did not try to impose Roman culture; rather a new Gallo-Roman culture developed on its own, more through Gallic emulation of the Romans than by imposition. A strong Roman influence on the Gallic tribes, brought about by trade, had long predated the conquest. The Romans strengthened this influence by building towns and roads throughout Gaul, financed by taxing the old Gallic landowning class. The Gallic *oppida* with their municipal authorities were well on the way to becoming true urban centers by the end of the Roman period. The villa system became an important component of the economy and society of Gaul and in some regions laid the groundwork for the feudal estates of the Middle Ages. A landed aristocracy grew up, part Gallic, part Roman, employing the laborers who made up the principal part of the population. At the same time the Romans promoted the development of a middle class of merchants, tradesmen, and government bureaucrats. Moreover, as mentioned, Roman religion became intertwined with Celtic religion as different Celtic gods were identified with gods of the Roman pantheon. Gallo-

Roman religious centers in some cases later became the loci of Christian churches. For example, the town of Lugdunum, present-day Lyon, which took its name from the Celtic god Lugh, became the first Christian center in Gaul in the second century C.E. Arles, the site of a large Celtic cemetery, was another. Both towns had bishoprics by the second and the third centuries C.E., respectively. The Latin language survived in Gaul by evolving into French. Perhaps the most important contribution of the Gauls to the preservation of Roman culture was the survival among them of the Latin language as it evolved into French.

Geiduni

The Geiduni are classified as a Celtic tribe. They lived in Gaul, their location unknown, at least by the first century B.C.E. and are discussed as CELTS or GAULS. They were a subgroup or allies of the NERVII.

Gepids (Gepidae; Gepidi)

The Gepids are a tribe of GERMANICS living at varying times in parts of present-day Poland, Romania, and Hungary. Their history was especially tied to that of the GOTHs and HUNS and, as was the case with other Germanics of the early centuries C.E., to that of the ROMANS.

ORIGINS

The Gepids may have been among those Germanic tribes who in the first century C.E. migrated south and eastward out of Scandinavia. The sixth-century historian Jordanes reported that when the Goths departed

GEPIDS

location:

Baltic coast of Poland; Carpathian Mountains in Romania; Danube River in Romania; Tisza River in Hungary; around Belgrade in Serbia

time period:

First to sixth century C.E.

ancestry:

first century Gepids migrate from southern Scandinavia and settle along Lower Vistula River in Poland.

c. 268 Gepids allied with Goths and other tribes in attack on Romans.

third century Gepids settle in Carpathian region east of Tisza River.

fourth century Gepids settle along Danube River.

451 After defeat by Huns Gepids join them in invasion of Gaul.

455 Gepids and other Germanics defeat Huns in Roman province of Pannonia; granted new territory there by Romans.

471 Gepids gain territory in Serbia and Montenegro.

488 Ostrogoths defeat Gepids.

567 Lombards, with complicity of Avars and Byzantines, defeat Gepids.

Scandinavia in the first century C.E. and headed for Poland, one of three ships was delayed, and those in the other two ships dubbed them *gepanta* for “loiterers” or “sluggards.” The story may be apocryphal because an ancestral relationship between the Goths and Gepids has never been proved. Moreover, scholars date the arrival of Germanic peoples in the region to as early as the sixth to fourth century B.C.E. In any case it has been theorized that in the first century C.E. the Gepids settled on the island of Spesis at the mouth of the Vistula River before migrating southward. Archaeological evidence confirms that Germanics lived in the region of present-day Gdansk by the mid-second century C.E. The Germanic groups who would form the Gothic confederacy migrated to the Black Sea region sometime after that, at which time the Gepids, if they had not been before, became a distinct group.

LANGUAGE

The Gepids spoke an East Germanic dialect.

HISTORY

The story of Jordanes about the “sluggish” Gepids may have been invented to explain the name given them by their rivals, the Goths, who began contesting with the Gepids for dominance as soon as the former had established themselves in the Black Sea region. *Gepanta* could have been an insult hurled at the Gepids by Gothic warriors. The tribal grouping that became known as the Gepids may have emerged for the express purpose of opposing the Goths. They could have been a splinter group of warriors resisting the domi-

nance of the Gothic ruling class. Later for a time they would be absorbed—although without losing their identity—into the Gothic coalition in a process similar to that which occurred among many Germanic peoples. Other such confederations included the ALAMANNI and MARCOMANNI.

In about 260 the Gepids caused the westward migration of their neighbors in present-day Poland, the BURGUNDII. The Gepids’ activities were part of an intense series of attacks by many other tribes that were occurring all along the Roman Rhine-Danube frontier, both against other Germanic tribes and against the Roman Empire. In 268 (or 290) the Gepids were part of a coalition organized by Goths to exact revenge on the Romans under Emperor Claudius II for an earlier defeat. Probably during that period the Gepids settled east of the Tisza River, the eastern boundary of the Roman province of Dacia (roughly modern Romania). Some sources indicate that during the reign of Probus in 272–282 the Gepids were settled by the Romans as *coloni* (colonists) along both the Rhine in Germany and the Danube. It is known that by the fourth century some Gepids held territory as far south as the Danube River.

The Hunnic Period

The Huns, nomadic steppe people out of Asia, invaded Gepid territory in the 370s; along with the OSTROGOTHS—a branch of Goths living to their east and north—the Gepids fell under Hunnic suzerainty. Of all the Germanic peoples the Gepids became the favored allies of the Huns, and their chieftain Ardaric was a principal adviser of Attila, a position that seems to have caused resentment among members of the Ostrogothic aristocracy. In 451 Ardaric led Gepid warriors in support of Attila against the Romans under Flavius Aetius at the Battle of the Catalaunian Fields south of modern Châlons-sur-Marne in present-day France. After Attila’s death in 453, however, Ardaric led a coalition of Germanic tribes, including Ostrogoths, HERULI, RUGII, SCIRI, and SUEBI, against Attila’s sons. In 455 they defeated the Huns in the Battle of Nedao, probably along a tributary of the Sava River in the Roman province of Pannonia (roughly modern Hungary). For the Gepids’ central part in the destruction of the Hunnic Empire the Romans granted them all of present-day Hungary east of the Danube as a new homeland. From there in 471 they spread southward into present-day Serbia and

Montenegro, capturing Sirmium (modern Mitrovica).

Rivals of the Ostrogoths

In the ensuing years the Gepids and Ostrogoths became caught up in a power struggle, with the more powerful Ostrogoths under Theodoric generally prevailing. In 488 the Gepids attempted to block the Ostrogoths' route southward in their invasion of Italy. Some of the most desperate fighting took place at the Ulca River near Cybaleae. The Gepids, whose rear wagons were full of recently harvested grain, made a stand along the river, whose muddy bottom made fording while fighting virtually impossible. The Ostrogoths were close to starvation and pressed on. Finally when Theodoric found a ford of solid ground, he personally led his men across and through the Gepid ranks to the loaded wagons. Theodoric's forces went on to defeat the Gepids at Sirmium near present-day Seremska on the Sava River. After the Ostrogoths had moved on through, however, the Gepids recaptured the region, including Singiduum (modern Belgrade). They again made Sirmium their capital. Some among the Gepids, however, accompanied the Ostrogoths into Italy.

During Theodoric's reign over the Western Roman Empire the Gepids remained a constant threat, and he sent armies against them. But his main forces were preoccupied with the BYZANTINES of the Eastern Roman Empire, who also held territory in the Balkans, and, as a result of being part of a double threat to the Ostrogoths, the Gepids endured.

The Gepids who had accompanied the Ostrogoths to Italy became important defenders of Ostrogothic interests; from 523 to 526 under Theodoric's orders they manned the Gallic frontier.

Rivals of the Lombards

The arrival of the LOMBARDS in the region led to the eventual downfall of the Gepids. In 547 the Byzantine emperor Justinian I granted the Lombards permission to settle in the provinces of Pannonia and Noricum (roughly modern eastern Austria) as *foederati* (federates, or auxiliary troops). At first the Gepids managed to use diplomacy to stay at peace with them, and a number of royal intermarriages took place. Through 567 there were a series of five wars between the two peoples. The Byzantines and Lombards were united against the Gepids, who encouraged raids by surviving Huns and SLAVS along the Danube against their enemies. The

Byzantines in turn encouraged attacks on the Gepids by the AVARS, now situated to the east of Gepid holdings. In 567 the Lombards under Alboin defeated the Gepids under Kunimund in a battle somewhere between the Danube and the Tisza, after which the Avars under Baian swept into Pannonia.

Alboin later founded the Lombard kingdom in northern Italy. Legend has it that the daughter of Kunimund, Rosamund, was forced to marry Alboin and drink from the skull of her slain father. In revenge she arranged the murder of Alboin by Himalchus, who aspired to the throne. But in 573 Rosamund and Himalchus were themselves poisoned for their act.

In the ensuing years the Gepids ultimately lost their political identity; the survivors were absorbed into the Lombard or Avar population.

CULTURE (see also GERMANICS)

The Gepids are hard to distinguish culturally from the Goths, in particular the Ostrogoths, with whom much of their history was intertwined. It was mostly their elites who observed the distinction, based on rivalries between Gepid and Gothic noble families. These rivalries were greatly exacerbated during the Hunnic period; the favoritism the Huns showed toward the Gepid aristocracy caused bitter enmity toward them among the leading Ostrogothic families. Even after the Gepids under Ardaric began leading the fight against the Huns, the Ostrogoths for a time resisted joining them, so deep was their mistrust.

Some idea of Gepid art can be formed from a richly furnished Gepid burial of the mid-fifth century found at Apahida in present-day Romania. It included lavishly decorated horse gear, bridle and saddle decorated with roundels and eagle motifs.

Many Gepid artifacts have been found in Italy. The eagle motif was used for buckles by them and by Ostrogoths. The evolution of fibula styles shows the interplay between Gepid and Ostrogothic artisans.

In the fifth or sixth century the Gepids adopted Arian Christianity from the Goths.

The Gepids, as had many of the Germanics of the early centuries C.E., had a history of tribal movement and shifting alliances. They can be considered the right hand of the Huns as well as their ultimate nemesis.

Germanics (Germans; Teutons; Germanic peoples)

The name Germanics, synonymous with ancient Germans or Teutons in other texts, applies to all those ancient European peoples speaking a Germanic language throughout history, known by a variety of names. Some among the Germanic peoples—the FRANKS and groups they absorbed such as the ALAMANNI—were critical in the founding of the nation of Germany (see GERMANS: NATIONALITY), but Germanic peoples also played a role in the history of every part of Europe: the ANGLO-SAXONS in Britain; the VIKINGS in Scandinavia; the

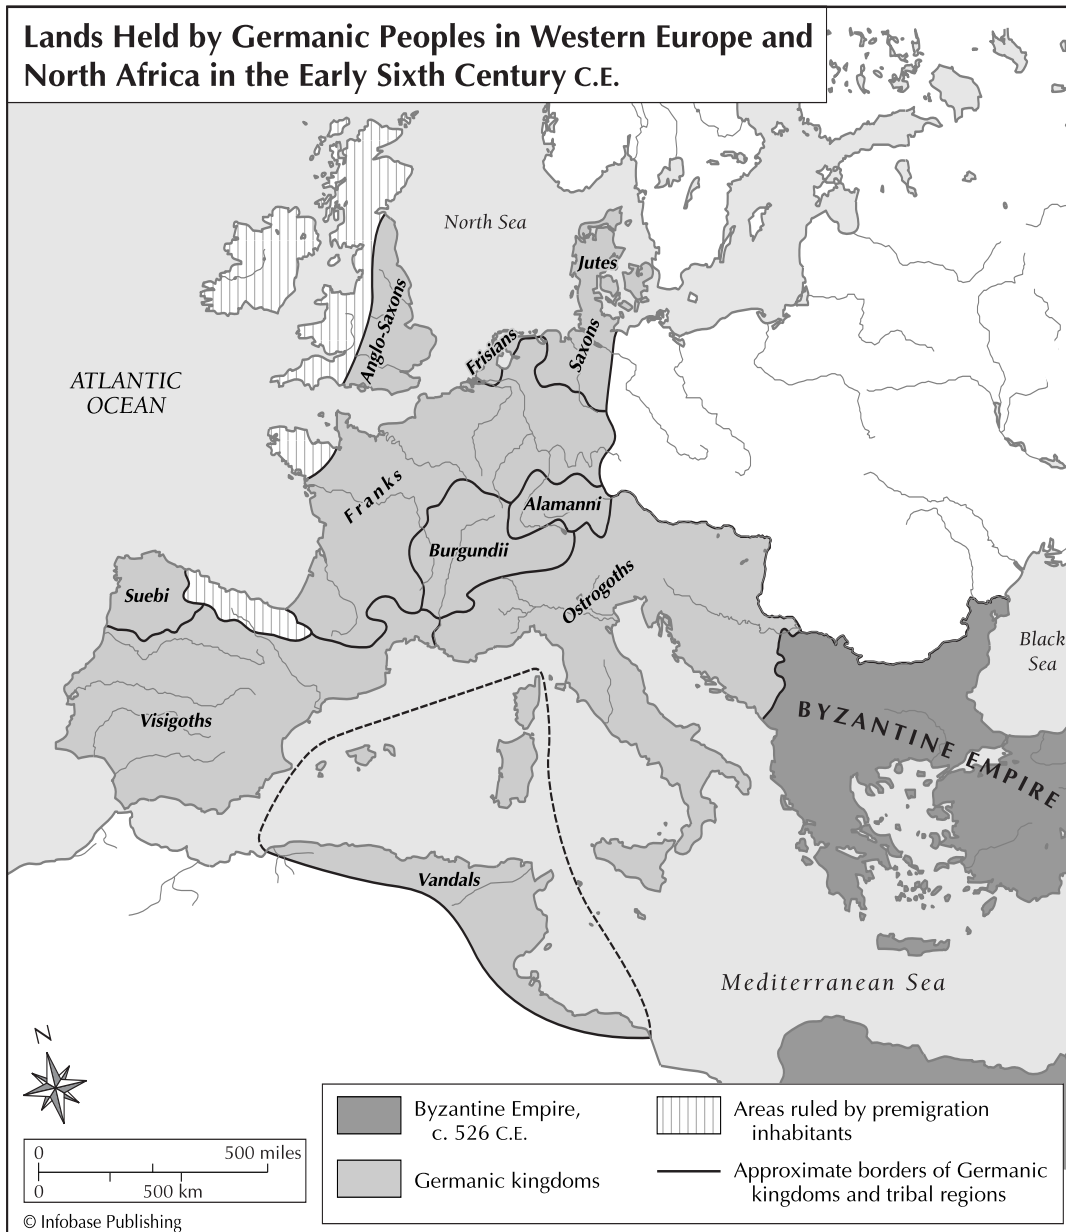

NORMANS, BURGUNDII, and Franks in France; the RUS in Russia and Ukraine; the VANDALS and VISIGOTHS in Spain; and the OSTROGOTHS and LOMBARDS in Italy, to name the most obvious examples. Many more German tribes were spread throughout the Continent.

The Latin *germanus*, “brotherly” or “of pure descent,” is derived from the root *germen*, for “bud” or “shoot.” Strabo believed that the name related to people east of Rhine as being genuine, that is, originals or progenitors of the Celts. The alternate name Deutsch or Dutch is derived from the proto-Germanic *theudisko-z* “of the people” (*theudā* is “people” or “nation”).

ORIGINS

Society in the northernmost regions of Europe—the north European plain and present-day Denmark and southern Sweden, which

Raids by Germanic Tribes on the Roman Empire in the Third Century C.E.

in the Iron Age would be the homeland of the Germanic peoples—was remarkably stable from the Neolithic Age when farming began in 4500 B.C.E. until the early centuries C.E. It consisted largely of a village economy lacking much social differentiation until about the latter second millennium B.C.E., when warrior elites began to emerge. They experienced the series of climatic and socioeconomic changes that moved through Europe after the end of the last Ice Age later than peoples farther south and east. Both the lag time in climate change in their region and their distance from the Near Eastern “cradle of civilization” meant that innovations such as farming and metalworking would occur centuries later among them than

in other regions. Bronze metallurgy, for example, had become important in present-day northern Germany only after about 2000 B.C.E.; during the ensuing centuries the Unetice culture of northern Germany began to bury massive hoards of bronze objects.

Typically when the northerners finally adopted such innovations, they did so more quickly than did people farther south. The Neolithic Corded Ware culture lasted among people in Denmark well into the second millennium B.C.E. and bronze making became important there only by about 1800 B.C.E., but by 1300 B.C.E. they had developed a distinctive style of bronze working and were using chariots. In a few centuries they had changed from a

Germanics time line**B.C.E.**

- 113** Roman army meets Germanic warriors from a confederacy of tribes from Jutland led by Cimbri and Teutones, near present-day Vienna, Austria, in Celtic kingdom of Noricum and is annihilated by them; Germanics continue west into Gaul and then south onto Iberian Peninsula.
- 102 and 101** Gaius Marius defeats Teutones at present-day Aix-en-Provence in southeastern France, and Cimbri near Vercellae (modern Vercelli) in northwestern Italy.
- 71** Ariovistus, leader of Suebi, with his warriors crosses Rhine into Gaul, defeating Celtic Aedui and overrunning a large territory.
- 59** Julius Caesar, after defeating Celtic Helvetii, drives back Suebi, then begins conquest of whole of Gaul, including Germanic tribes in Low Countries.
- 55** Caesar crosses Rhine over bridge near present-day Cologne.
- 12–7** Under orders from Emperor Augustus annual campaigns establish Roman control over the area east of Rhine to Elbe.

C.E.

- 4–5** Augustus again sponsors annual campaigns east of Rhine.
- 9** Arminius, leader of Cherusci, annihilates three Roman legions at Teutoburger Wald (Teutoburg Forest).
- 10–16** Romans attempt to regain lost territory; Emperor Tiberius, deciding that region is ungovernable, withdraws legions to Rhine.
- 162** Chatti attempt to migrate south into Roman territory.
- 167** Massive movement of Marcomanni, Quadi, and Iazyges begins; they reach head of Adriatic Sea.
- 166–180** Marcomannic Wars; Romans reestablish Middle Danube frontier.
- 213** Tribal confederacy called Alamanni driven out of Upper Germany by Emperor Caracalla.
- 238** Confederacy of tribes called Goths begin raids in Lower Danube region.
- 250** Group of war bands east of the Rhine, called collectively Franks, first mentioned in sources.
- 251** King Cniva of Goths leads his warriors to great victory over Roman army at Abrittus, where they kill Roman emperor Decius.
- 257** Goths invade Greece.
- 260** Alamannic incursions help bring about abandonment of Roman frontier system along the Rhine and Danube Rivers.
- 275** Alamanni, Goths, and Vandals overrun part of Roman province of Dacia, defeating Sarmatians.
- 290** Goths separate into two groups that later evolve into Ostrogoths and Visigoths.
- 332** Goths sign formal treaty with Romans under which they agree to stay out of Greece.
- 370s** Steppe nomads known as Huns invade territory of Ostrogoths and Visigoths, overrunning them; Fritigern, Visigothic leader, adopts Arian Christianity.
- 376** Large numbers of Goths plead with Roman authorities for permission to cross Danube in order to escape Huns.
- 378** Because of desperate conditions in Visigoths' new lands in Balkans they break out and under Fritigern confront a Roman army at Adrianople, which they crush, killing Emperor Valens.
- 400** Anglo-Saxon settler groups begin migrating to Gaul and Britain, in small groups with no overall cohesiveness.
- 406–407** Vandals, Suebi, Burgundii, and Alans cross frozen Rhine.
- 410** Visigoths under Alaric take city of Rome.

relatively simple, Neolithic subsistence society that had lasted for millennia to one engaged in sophisticated technology, in long-distance

trade in prestige materials, with the social stratification that usually accompanies such trade. In all, this process had taken twice as

- 416** Visigoths given territory in Aquitaine in Gaul and soon expand into northern Spain.
- 420s** Vandals, repelled from Gaul by Visigoths, move into Spain, attacking settlements.
- 428** Vandals cross to Africa.
- 440** Vandals mount an invasion of Sicily.
- 451** Visigoths form the core of army in battle that halts Hunnic invasion of Gaul; King Theodoric I is killed.
- 455** Vandal forces again ravage Spain and Italy and sack city of Rome.
- mid-fifth century** Frankish groups control much of Rhineland, Belgian plain, and Meuse and Moselle regions.
- 476** Roman Empire in the West officially dissolved when boy-emperor Romulus deposed by Odoacer, commander of German mercenaries in Italy.
- 488** Ostrogoths enter Italy, defeat and slay Odoacer, and set up Ostrogothic kingdom.
- 507** Defeat of the Visigothic army by King Clovis I of Franks; Visigoths lose control of territories north of the Pyrenees; Toledo becomes their capital.
- sixth century** Clovis establishes Merovingian dynasty.
- 533** Byzantines topple Vandal regime.
- 552** Byzantines gain control of Italy from Ostrogoths.
- 568** Lombards enter Italy, taking control of most of territory north of Po River.
- 580s** Lombards resist Byzantine-Frankish alliance.
- sixth–seventh century** Anglo-Saxons begin to establish kingdoms in southeastern Britain, thereafter expanding northward and westward.
- 605** Byzantines cede Lombards large territory in northern part of Italian Peninsula.
- eighth century** Frankish war leader Charles Martel wins victories against Moors invading from Spain, making him secular leader of Christendom in West.
- 751** Charles Martel's son, Pippin, deposes Childeric III, last Merovingian king, establishing Carolingian dynasty.
- 772–804** Frankish king Charlemagne wages brutal campaigns against Saxons of Saxony.
- 773** Charlemagne defeats Lombards and, with blessing of Pope Adrian I, assumes iron crown of Lombard kings of Italy.
- 778** Charlemagne invades Muslim Spain, eventually capturing Barcelona and establishing control over territory beyond Pyrenees.
- 800** Pope Leo III crowns Charlemagne emperor of Rome, event later claimed as birth of Holy Roman Empire
- 840** On Louis I's death empire is divided among his three sons, Charlemagne's grandsons; under Treaty of Verdun in 843 regions are created prefiguring modern-day Germany, France, Netherlands, and Italy.
- late eighth–10th centuries** Era of great Viking raids, last period of Germanic expansion
- 899** Death of Arnulf, last Carolingian Frank to hold imperial title
- c. 900** Vikings secure permanent foothold on Frankish soil in Lower Seine region.
- 911** Frankish king Charles III the Simple makes treaty Norwegian Viking Rollo, ceding him land around the mouth of Seine and city of Rouen, which become the nucleus of Normandy.
- 962** Otto I of Germany crowned emperor by Pope John XII.

long in regions farther south. After a short Bronze Age, moreover, iron making quickly overtook bronze making and had a more profound effect on society, because iron was much more abundant and had more practical uses. It quickly contributed to population growth,

because iron implements greatly facilitated agriculture, both land clearance and plowing. And the impact of the ROMANS in the first centuries C.E. on societies still changing and adjusting to the growing importance of war and ever greater social stratification was significant, greatly increasing the pace of change among Germanic peoples. Such relatively rapid socioeconomic changes could have contributed to social and psychological stress that the people of the north experienced in ways that can only be guessed. It is even possible that these changes fostered a deep sense of instability, leading to the fatalism that is such a feature of early Germanic literature and mythology.

LANGUAGE

The assumption that all Germanic languages have a common ancestor is based on the finding that the further back in time they are traced the more closely they resemble one another. Linguists postulate that a proto-Germanic language had become distinct from other Indo-European languages sometime before 500 B.C.E. Archaeological evidence of the isolation of peoples in ancestral Germanic lands from those elsewhere in Europe suggests that proto-Germanic could have emerged as early as the Late Neolithic or Early Bronze Age.

Three Germanic language groups had emerged by the fourth century C.E.: East Germanic, North Germanic, and West Germanic. The East Germanic group included such now-dead languages as Burgundian, Gothic, and Vandalic and is now itself extinct.

The North Germanic languages, all descended from Old Norse, include Danish, Faeroese, Icelandic, Norwegian, and Swedish. They are spoken by about 20 million people, chiefly in Denmark, the Faeroe Islands, Iceland, Norway, and Sweden.

The West Germanic languages are English, Frisian, Dutch, Afrikaans, German, and Yiddish and are spoken as a primary language by about 450 million people throughout the world. West Germanic languages that died out included Old Franconian, Old High German, and Old English (or Anglo-Saxon), from which Dutch, German, and English, respectively, developed.

At least by the seventh century C.E., when written records of Germanic languages first appeared, all of them demonstrated a fundamental sound shift—a change or difference in consonants used in words that otherwise are similar to words in other Indo-European lan-

guages. Grimm's Law, named after its discoverer, Jakob Grimm, postulates that in Germanic languages the sounds *p*, *d*, *t*, and *k* at some point changed from their usage in other ancient Indo-European languages such as Latin, Classical Greek, and Sanskrit—becoming *f*, *t*, *th*, and *h*, as in Latin *pater*, becoming the English *father* and German *vater*; Latin *dent*, English *tooth*; and Latin *cornu*, English *horn*.

Grimm's Law further recognizes that sometime during the eighth century a second shift occurred in dialects of High German, so called because its speakers lived in the up-river regions, the uplands near the headwaters of the important German rivers such as the Rhine and Elbe. In them, as compared to Low German dialects downriver, *d* became *t*, and *t* became *ss* or *z*, as in the German *Brot*, compared to the English *bread*, and Dutch *brood*; German *Fuss*, but English *foot*, and Dutch *voet*; and German *zehn*, but English *ten*, and Dutch *tien*.

HISTORY

Studying the Germanics

As in the case of the CELTS the sources available for creating a picture of the Germanics vary greatly in viewpoint and in application. Linguistics, for example, can demonstrate social cohesion, because language is its very basis. Too often, however, language has been taken to mark ethnicity, whereas history has shown repeatedly that it often does not. The widespread adoption of Latin throughout the Roman Empire by peoples of many different ethnicities and the transformation of Norse-speaking Vikings in a single generation into French-speaking Normans (later into English speakers) are just two examples.

Archaeology can likewise show cultural connections and, through skeletal and now sometimes deoxyribonucleic acid (DNA) analysis, genealogical ones as well. But the archaeological brush is not nearly fine enough to delineate the picture of how in detail people actually lived their lives, the multifarious complexities and contingencies of personal and social histories. For that we must rely on the precious but potentially misleading written reports of contemporary witnesses; in the case of the Germanics such witnesses are mostly Roman. Contemporary reports are so seductive because it is natural simply to accept and believe the word of others, especially the written word. It is the first step on the road to wisdom—albeit a melancholy one—to understand the caveats we must place upon the validity of knowledge transmitted to us through the

spoken or written word, to recognize the limits of human objectivity.

For this reason when making use of Roman sources it is crucial to understand the mental and philosophical framework with which the Romans viewed the “barbarians” to their north—Celts, Germanics, SLAVS, FINNO-UGRIANS, BALTS, and others. In the first place their framework was basically the same as that of the GREEKS in judging all peoples as belonging somewhere on a continuum from high to low, the highest state of humanity that of “civilization”—the social and cultural world of the typical Mediterranean city state or polis. Each degree of societal differentiation from this ideal represented a falling away in the direction of barbarity and ultimately toward the state of brute beasts. This differentiation had a spatial aspect: the farther away from Rome a people or society were, the more “barbaric.” Such thinking is strikingly illustrated in the writings of the Roman historian Tacitus of the first and second century C.E. After describing peoples of increasing remoteness and decreasing civilization, he writes of the most remote of all: the Fenni, living on the edge of the known world, who have no horses, arms, or dwellings; dress in skins; and have no religion. Beyond them are no more humans but rather creatures called the Hellusii and Oxiones with the bodies and limbs of animals.

Thus, for Romans, the peoples beyond the Celts, who were in the process of being brought up to a state of civilization, had as much or more in common with animals than with Romans themselves. Romans assumed that because these peoples had no written laws, their society must be run according to senseless customs and they must succumb to every conceivable vice.

The second salient characteristic of Roman writers and philosophers was their passion for order, organization, and classification. Although they considered the prime characteristic of northerners to be barbarity, they eagerly seized on those differences among them that could be discerned for purposes of classification. It may well be that the work of organizing the threatening foreigners into comprehensible groups and tribes with known leaders, customs, and places of origin was important to the Romans psychologically.

Archaeological study during the 20th century to some extent confirmed the Romans’ first insight, much modified from its pejorative terms, that the peoples beyond the pale of the Roman Empire indeed had much in common.

In economy, material culture, and apparent social organization the Germanic peoples show little sign of differentiation into the manifold tribal groupings mentioned by Romans; indeed they are hard to differentiate from Celts. It is apparent that of the Germanic peoples the Romans knew little and understood less.

This fact should be particularly underscored in the case of the Germanic peoples because the Roman viewpoint has had amazing longevity, considering its limitations, continuing to influence historians, especially in the English-speaking world, to the present. In Germany the 19th-century romantic fascination with ethnicity led to philosophical speculations about the unconscious wellsprings of race wisdom that impel each people toward its ultimate destiny, that of the Germanics prefigured in the supposed communal societies of their tribal past and the Germanics’ quasi-religious devotion to freedom. Such ideas informed the efforts of ideologues of the National Socialist (Nazi) Party in the 1930s to legitimize the Third Reich as descending from the tribal society described in Tacitus’s *Germania*. The disasters inflicted on the world by this regime confirmed many in the rest of Europe and in America in the belief that modern German “frightfulness,” as it has been called in Britain, is the same quality witnessed by the ancient Romans, an inborn aspect of Germanics as characteristic as the qualities claimed for them by the Nazis.

In light of insights from modern archaeology and ethnology, such a belief has to be rejected as without foundation. Moreover the qualities of the Germanics, whatever they may have been, have no more relevance to modern Germany than to other nations—such as Britain and France—that emerged as states under Germanic leadership and many of whose people have considerable Germanic ancestry.

Germanics and Romans: Initial Contacts

The long isolation of the Germanic peoples came to a dramatic end with the extension of the Roman Empire northward into Gaul (roughly present-day France and Belgium) and Britain in the first centuries B.C.E. and C.E. Both Roman military activity along the Rhine—first incursions into German territory to the east and then the establishment of the Rhine frontier—and Roman trading activities had as profound an effect on Germanic peoples as the Greeks and ETRUSCANS had had on the Celts of central and western Europe during the mid-first millennium B.C.E.

The first contact between the Roman and Germanic peoples was a disastrous one from a Roman perspective. In 113 B.C.E. somewhere south of present-day Vienna, Austria, in the Celtic kingdom of Noricum a Roman army met a horde of Germanic warriors, a confederacy of tribes from the Jutland Peninsula (comprising present-day Denmark and the German state of Schleswig-Holstein), led by two groups labeled by Romans the CIMBRI and TEUTONES, and was annihilated by them.

It is an indication of how chary we must be in accepting the Romans' names for barbarians that the second-first-century B.C.E. Greek philosopher Poseidonius classified them as Celts. Indeed the term *barbarian* itself had no ethnic meaning; it was a legal or political category referring to all people who lived outside the Roman Empire. But the Greek geographer Strabo in interpreting Poseidonius's work identified these warriors as Germanics from across the Rhine. They differed from the Celts of the left bank, he wrote, only in that they were wilder and taller, and had yellower hair. The Romans who lived in Gaul, he says, called them Germani because they wanted to indicate that they were the true Celts, *Germani* meaning in their language "genuine" in the sense of original. The Romans, then, considered them the "germ," or the progenitors of the Celts. Only because they were said to have originated in Jutland can we identify them as Germanic.

The Romans, in fact, did not distinguish the peoples living on the north European Plain—who probably spoke Germanic languages—from Celtic speakers in central temperate Europe east of the Rhine and Finnic speakers in the northeast. To the Romans the languages of all the barbarians were more like animal cries than human speech. All were labeled collectively, Germani.

The Cimbri, Teutones, and the others had left Jutland in 120 B.C.E. for reasons not known with certainty (according to one theory, their coastal lands had been flooded). Overpopulation, such as that which probably had caused the Celtic migrations less than 300 years earlier, is a strong likelihood. They had moved first through present-day Moravia and Hungary to the Middle Danube where they had attacked the Celtic SCORDISCI. In 113 B.C.E. they moved from there westward to Noricum, but, after destroying the Roman army, leaving Italy defenseless before them, for unknown reasons they continued westward into Gaul (roughly modern France and Gaul) and then southward into present-day Spain. In subsequent years they

conducted raids into Gallia Transalpina, again inflicting disastrous defeats on Roman armies sent against them in 109, 107, and 105 B.C.E.

Germanic Threat against Rome Leads to Militarization and Empire

The presence of these terrible warriors on the threshold of present-day Italy naturally revived memories of the Celtic incursions of the past, and Roman citizens voted to give military commanders anything they needed to meet the threat. So deep was Roman fear of the northern barbarians that Roman society embarked on a process of greater militarization than ever before, and when in the next century Julius Caesar became determined to conquer Gaul, he had only to play on this fear to have his way. In the immediate term the Roman consul Gaius Marius completely reformed the Roman military, transforming it from a loose militia into a highly disciplined professional army manned by landless citizens, including the growing urban proletariat. He defeated the Teutones at Aquae Sextiae (modern Aix-en-Provence) in southeastern France in 102 B.C.E., and the Cimbri near Vercellae (modern Vercelli) in northwestern Italy in 101 B.C.E.

Forty years later Germanic tribes east of the Rhine were again, as a result of some internal disequilibrium whose cause can only be guessed, threatening peoples to their south and west. In 71 B.C.E. Ariovistus, leader of the SUEBI, with his warriors crossed the Rhine into Gaul, defeating the Celtic AEDUI and overrunning a large territory in Gaul. Rome's first response was to negotiate with Ariovistus, making him an ally in 60 B.C.E. to secure Roman trade routes through Gaul. However, Caesar, in part to further his personal political ambitions, in 59 B.C.E. argued in the senate that Rome could not afford to have Germanics so close to Italy, with only Celtic tribes holding them off. Rome must take control of Celtic Gaul or be overrun by Germanics. He was given a five-year command, which was afterward extended, in Cisalpine Gaul. After defeating the Celtic HELVETII the next year, he turned to the Suebi and drove them back as well, before turning his attention to subduing the whole of Gaul. He focused much of his effort on the tribes in the northern periphery from Brittany to the Rhine, among them Germanic tribes in the Low Countries. He was so successful that in 55 B.C.E. he crossed the Rhine over a bridge he had had constructed near present-day Cologne and the next year crossed the English Channel, engaging in promising but inconclusive attacks

on British tribes before returning to Gaul. Both excursions were probably more symbolic than practical, intended to impress the northerners with Roman might.

The Rhine and the Elbe as the Bounds of Empire

To the Romans with their penchant for neat classification the Rhine served as an ethnic divide between Germanics and Celts. However, in Caesar's time the peoples on both sides of the Rhine were ethnically mixed and probably had interacted for centuries through trade, intermarriage, and tribal movements. When after 55 B.C.E. the Romans engaged in establishing and maintaining the imperial frontier along the Rhine, they produced the very situation they had earlier thought to exist. Now when Germanic tribes from the north reached the Rhine frontier, unable to go any farther, they displaced more mixed peoples along the east bank, forcing them to cross into Roman Gaul. In this way the territory east of the Rhine became more Germanic than ever before.

After the political chaos and civil war in Rome that followed Caesar's assassination had been stemmed in 27 B.C.E., and the new order established by Augustus had taken hold a decade later, the emperor decided that the empire's frontier should be pushed beyond the Rhine farther east to the Elbe.

Rome's military capabilities had found an ideal object in Gaul, with its permanent *oppida* (towns) ripe for picking and its population that had begun to reject the old warrior ideal of the past; the Germanics were a far different matter. Among them the warrior ideal was still at its height; they had no permanent centers whose capture would critically disrupt their society and economy, and they had the still-vast forests where they could hide if necessary.

Even so, annual campaigns from 12 to 7 B.C.E. and in 4 to 5 C.E. had established Roman control over the area sufficient to allow armies to be withdrawn to quell a rebellion elsewhere in the empire. Soon afterward in an event of great significance for the future Arminius (see sidebar), a member of the German elite who had served as a cavalry officer in the Roman army, was elected war leader of a confederacy of Germanic tribes. His experience in the Roman military may well have helped him to victory; in 9 C.E. he annihilated three Roman legions in the depths of the Teutoburger Wald (Teutoburg Forest) near present-day Warstein

in north-central Germany. Roman campaigns from 10 to 16 C.E. were unsuccessful in regaining the lost territory; afterward Emperor Tiberius, deciding that the region was ungovernable, withdrew his armies to the Rhine.

The success of the Germanics in forcing the withdrawal of the Romans, by whom they had earlier been suppressed, suggests both that they had learned how to fight the Romans more successfully and that their military organization was becoming more effective, probably through imitating to some degree the top-down Roman style of discipline, instead of relying solely on the élan and ferocity of the mass of individual German warriors. The subsequent career of Arminius seems to bear out this inference. Although he had been elected by his tribe, the *CHERUSCI*, as war leader, he tried to retain this office permanently and even make himself king. This ambition violated Germanic tradition, however. The older generation resisted him, led by his father-in-law and uncle; conflict broke out and, according to Tacitus, he was undone by the treachery of his family.

Arminius: "Liberator of Germania" ❦❦❦

Born in about 18 B.C.E., Arminius (also known as Armin or Hermann or Herman Siegfried) was the son of Sigimer, a Cherusci tribal leader. He may have been educated in Rome or he may have learned Latin in army camps. In any case he is known to have served in the Roman army from 1 to 6 B.C.E. somewhere in the Roman Empire. Because of his service he was granted Roman citizenship.

On returning home, probably after the death of his father, he witnessed the oppression of his people by the occupying Roman forces under Publius Quinctilius Varus. Arminius, now acting as a Drighthen (warlord), led a rebellion against Rome. His followers, warriors of the Cherusci as well as neighboring Marci and Chauici tribes, annihilated three Roman legions over the course of three days in 9 C.E. at Teutoburger Wald (known in English as Teutoburg Forest). Varus, disgraced by the defeat, committed suicide.

Arminius also repelled a Roman force under Germanicus Caesar in 16 C.E. and defeated the Marcomanni, a Germanic tribe led by Marobodus in 17 C.E. Arminius, who dreamed of uniting the German tribes against Rome, was betrayed in 19 C.E. and killed by tribal members, including a nephew, who established a Cherusci kingdom under Roman protection.

Arminius's wife was Thusnelda. According to some sources she was the daughter of the rival pro-Roman Cherusci leader Segestes, who handed her over to Germanicus Caesar. Segestes later had to flee his tribesmen, taking refuge among the Romans. Thusnelda supposedly delivered Arminius's baby, Thumelicus, in captivity. Thumelicus grew up to be a gladiator in Rome.

Because Arminius's victory forced the Roman frontier back from the Elbe River to the Rhine, thus effectively countering Roman expansion, he has been referred to as the "liberator of Germania." He also has been associated with the Siegfried of early medieval German mythology, a folk hero in several Germanic epics, who slays the dragon Fafnir.

Effects of Roman Trade on Germanic Tribes: Frontier Zone East of the Rhine

Instead of attempting to annex Germanic territory, the Romans now turned to other means of coexisting with the tribes beyond the Rhine. As they had earlier with the Celts, they began extensive trading with Germanics along the Rhine, particularly in slaves and in leather goods, often opening relations by offering their elites luxury goods and coinage. This process soon awakened in some German aristocrats fervent aspirations to become Roman, a status that could be achieved vicariously by “fostering” their sons in the emperor’s household. Many a German youth in this way became more “Roman” in manners than the Romans themselves. Many Germanics joined the Roman army, a means that promoted Romanization in German society. Members of certain tribes, such as the HERMUNDURI, were allowed to cross the Rhine on trading trips, during which they moved freely without being guarded says Tacitus.

Yet Roman ways were not universally accepted by Germanics; the Suebi, for example, were known for their abhorrence of wine, one of the principal Roman exports, believing that it made men effeminate and weak. Cultural influences between Romans and Germanics did not run only one way. Many Roman traders traveled into German territory and lived there so long that they forgot their own country, according to a contemporary report by Germanics at the court of the MARCOMANNI in 18 C.E.

Indirect Roman Influences on Germanics in the Interior: Rich Burial and Warrior Zones

Farther into Germanic territory Roman influence was less direct. Instead of large supplies of coins, which were affecting the economy of the frontier zone in a fundamental way by bringing about a market economy, smaller amounts of luxury goods reached members of the nobility alone. This in turn fueled a more archaic gift-exchange or prestige-goods economy strongly reminiscent of that practiced by Celtic West Hallstatt chiefs in the sixth and fifth centuries B.C.E., and by aristocrats in eastern Britain and Belgica in the first centuries B.C.E. and C.E., judging by the rich burials that have been found there.

Farther east still the traditional warrior societies maintained their way of life relatively unchanged. The main effect of the Roman Empire on them probably derived from their participation in the greatly increased slave

trade; it may well have been they who in their raids and small-scale wars procured slaves to trade to middlemen in the rich burial zone to the west. Some burials in this area contain gold or silver fibulae, in all probability payments for slaves. Although the taking of slaves had long been a feature of Germanic warfare, the Roman slave trade may have been an incentive for significantly more raiding than had occurred in the past.

This process seems to have increased the social instability inherent in warrior societies. By the second century C.E. this instability coupled with population growth may have contributed to the migrations that began to pressure the tribes along the Rhine frontier. The tribal groupings called by Romans the Burgundii and Vandals apparently were from the warrior zone deep in the Germanic interior.

Reawakening of Germanic Unrest in the Second Century C.E.

The first evidence that the equilibrium that had held for a century and a half was beginning to disintegrate occurred in 162 C.E., when the CHATTI, a frontier tribe, attempted to migrate south into Roman territory. Their migration had probably been set in motion by events in the interior, a supposition strengthened by the fact that a few years later the Marcomanni centered on the Main River, moved southward and crossed the Danube into transdanubian Hungary. The Marcomanni had been within the zone of rich burials, whose wealth, long eyed with envy by tribes in the warrior zone, may finally have proved their undoing. In 167 C.E. an even more massive movement of Marcomanni, QUADI, and IAZYGES (a Sarmatian people) began. They reached the head of the Adriatic Sea and laid siege to Aquileia.

The Marcomannic Wars and the Emergence of Aggressive Tribal Confederacies

From 166 to 180 C.E. the Romans responded to these pressures in a series of what have been called the Marcomannic Wars, although the Quadi and SARMATIANS were also major players in them. At the end of these conflicts the Romans had reestablished the Middle Danube frontier for the time being.

Probably in reaction to the Marcomannic Wars and conflicts along the Rhine frontier, many among the Germanic tribes underwent a sociopolitical transformation. By the next century a new phenomenon had appeared among the Germanics: large, aggressive confederacies of tribes led by permanent war-leaders-cum-

kings. The first of these mentioned in historical sources were the Alamanni, driven out of Upper Germany by the Roman emperor Caracalla in 213 C.E. The name Alamanni meant “all men” or “everyone,” a characterization that indicates that Germanic society was transcending the simple tribalism of the past. Their territory lay between the Upper Elbe and the Rhine, formerly the land of the Suebi and SEMNONES. The Alamannic confederacy had staying power, and 20 years later they again broke through the Rhine border and wreaked havoc in the frontier provinces. Their incursions led to the abandonment of the Roman frontier system along the Rhine and Danube Rivers in 260 C.E.

The Franks east of the Rhine were another such tribal grouping, first mentioned in sources after 250 C.E., which probably emerged early in the third century C.E., as signs of the weakening Roman grip on the Rhine border tempted war bands to try forays into imperial territory. Their central political cohesiveness seems to have been rather less than that of the Alamanni until later, and they had a much closer relationship with Romans as well—Frankish groups were settled under Roman authority west of the Lower Rhine in the late third century. Franks were also sea raiders on the rich North Sea coastal trade, and their disruption of this trade perhaps was a factor in the systems crisis fueling the mass migrations of the time. A series of Frankish graves between the Rhine and the Seine in Gaul dating to the late fourth century were richly furnished with fine weaponry and other elite goods, many of them produced east of the Rhine. These included female burials, a sign that kin groups were part of this trans-Rhenish settlement of Germanic Franks. Frankish warriors may have been marshaled to protect Roman estates in the region from their fellow Germanics, as evidenced by a Germanic settlement that has been found in the Meuse River valley close to a Roman villa; many other such sites have been found.

Tensions in the interior of Germania affected Germanic tribes in the east as well, and in the second century C.E. war bands from there, among them members of the tribe called the Gutones, moved to their east into the Black Sea coastal region, where they met and mingled with nomadic steppe peoples and populations gathered around the Greek and Roman cities along the Black Sea. German war bands entered into alliances with the various groups, who became increasingly unified under the command of a single overall war leader or king. The

king became the focus of a system or network of personal loyalties that fanned out from him to greater, then lesser chieftains on down to individual free warriors. The peoples of this confederacy were called by the Romans the GOTHs, a name possibly derived from Gutones, perhaps an ancestral tribe. The great heterogeneity of the members of this congeries of war bands, tribes, and other groupings required that all accept a single leader whose significance transcended ethnicity. In this the king of the Goths was to some extent a barbarian version of the emperor of Rome. (A legend of the Goths maintained that they began their migrations southward after a group of foreign nobles reached Goth territory from the far south and either took control of or influenced the leaders of the tribe—possibly a folk memory of the emergence of this rank of king so foreign to Germanics—and it is possible that the Goths adopted kingship on the advice of expatriate Romans.)

The Goths first made themselves known to the Romans in 238 C.E. and thereafter, carrying out raids in the Lower Danube region. In 251 C.E. the Gothic king Cniva led his warriors to a great victory over a Roman army at Abrittus in the Balkans, where they killed the Roman emperor, Decius. His successor was forced to pay them huge sums in bribes. Later they moved into Asia Minor, attacking coastal cities from fleets, and invaded Greece in 257 C.E. After they were forced out of Greece, their invasions ceased, probably because the Romans began trying to negotiate with them, a process that culminated in a formal treaty in 332 C.E. Among its provisions the Goths were to receive annual payments; in return they would supply men for the Roman military and promised to stay out of Greece.

Germanics as Tribal Federates and Soldiers of Rome

From the third century C.E. the Romans increasingly dealt with Germanic tribes as they did the Goths, making them *foederati* (federates) and recruiting many of them into the Roman army. By the late fourth century Germanics constituted most of the Roman military. Such service provided an outlet for their warlike ardor, gave them wealth and status among their own people, and opened to them a new world: the world of Greco-Roman civilization. It has to be remembered that for many Germanics, the Roman Empire was not simply a treasure house to be looted and brought down but a longed-for state of society.

Eventually the Roman military included so many Germanics that the word *barbarus* became a synonym for “soldier”; the imperial military budget was called the *ficus barbarus*, and a colloquial expression for enlisting in the army was “going off with the barbarians.”

The mobile army created by the emperor Constantine was largely manned by barbarians, mostly Germanics, and their service was not limited to the rank and file. Not surprisingly members of the tribal confederacies, with their greater organization than that of the more primitive Germanic tribes, tended to rise to positions of command. Members of the Alamanni in the first half of the fourth century and later Franks and others attained high-ranking positions. The Frank Silvanus was high military commander of Gaul in the 350s. He, as did many Roman generals of the period, proclaimed himself emperor, only to be murdered by his own soldiers.

Visigoths and Ostrogoths Succumb to the Huns

The federate status accorded the Goths of the Lower Danube region created an uneasy equilibrium in their relations with the empire. By now they were known as Visigoths—as distinct from the Goths in the East, called Ostrogoths—and had achieved internally a fair degree of societal stability until the sudden and violent arrival in the 370s of steppe nomads known to the Greco-Roman world as HUNS. What the Germanics earlier had done to the nearly civilized Celts, the Huns now did to the Ostrogoths and Visigoths, themselves some way along the road to being Romanized, overrunning them with devastating speed and subjecting them to harsh domination. In 376 large numbers of Goths requested from Roman authorities permission to cross the Danube in order to escape the Huns. The northern Balkans, where they were allowed to settle, were a far cry from the productive lands near the Black Sea they had left. Conditions in the Balkans were so desperate that after two years the Visigoths had a violent confrontation with a Roman army at Adrianople, whom they crushed, killing the emperor Valens.

Fritigern, a Visigothic leader at this time, adopted Christianity, possibly a political move to gain support from the Romans; Christianity was then the official religion of the Roman Empire. As it turned out, the religious doctrine that he accepted, Arian Christianity, still being debated by church leaders at this time, ulti-

mately was decreed a heresy. The Arian faith of the Visigoths would later stand in the way of their rapprochement with Romans in Gaul and Spain when they migrated there in the fifth and sixth centuries.

The City of Rome Falls to the Visigoths

A treaty in 382, under which they were given lands within the Roman Empire itself, did little to alleviate the plight of the Visigoths, since the new territory likewise proved inadequate, and they began to raid northern Italy under their leader Alaric. Alaric achieved a victory that, symbolically at least, forecast doom for the Roman Empire when he took control of the city of Rome itself in 410. The great Christian leader St. Jerome reportedly wept in his cell in Bethlehem when he heard the news. As it happened, little was changed by Alaric's feat; he was more interested in the wealth of Africa and immediately began preparations to mount an invasion there. In the midst of these he suddenly died. His successor Ataulf, through diplomacy, gained Roman permission to march into Gaul and establish control over a viable territory in Aquitaine, from which the Visigoths soon expanded into northern Spain. The fact that they were still willing to abide by a treaty with Rome, after what must have seemed to them repeated betrayals by Roman authorities in failing for so long to provide for their welfare, may attest to the continuing allure of Rome for Germanic peoples of that time.

Migrations of North Sea Coast Germanics

Germanic peoples living along the North Sea coast—FRISIANS of the present-day northern Netherlands and Germany, SAXONS of the Lower Elbe and Weser region, the ANGLES of Schleswig, and the JUTES of present-day Denmark—were variously affected by the nearby Roman presence. The Frisians were closest to the imperial frontier and accordingly entered into direct trade with Romans, developing a market economy, while the Saxons, Angles, and Jutes were in the rich burial zone farther east; their elites, who may have acted as middlemen in the slave trade between Romans and tribes of inner Germania, were buried in richly furnished graves. Warriors from among all these tribes had probably raided ships plying the lucrative trade route along the coast from the first years of the Roman Empire in the north and in Gaul itself and Britain. Only by about 400 did settler groups begin migrating to Gaul and Britain, possibly because rising sea levels

were making areas of their homelands uninhabitable at the same time as their populations were increasing; for many years they did so only in a piecemeal fashion, in small groups with no overall cohesiveness. They differed in this from groups such as the Alemanni and Visigoths. Centralization of power occurred only after enough of them had arrived in the new lands to form groups large enough to spark resistance to their infiltrations by people in Gaul and Britain, necessitating a tighter military organization. The name most mentioned in contemporary writings is that of the Saxons, but this may indicate only that all people from this general area were given the name, because of the uncertain ethnography of Romans. The large-scale abandonment of cemeteries in some areas in the mid-fifth century and the beginning of others elsewhere around 500 indicate important movements and realignments of populations.

Peoples from this region who migrated to Britain, usually called collectively Anglo-Saxons, began to establish kingdoms in south-eastern Britain by the sixth century and thereafter expanded northward and westward. In the same period the continental Saxons established kingdoms, which lasted some two hundred years, until they were subjugated by the Frankish king Charlemagne in the late eighth century. Charlemagne also conquered the Frisians.

Germanic Tribes Breach the Rhine Frontier

The rise of Visigothic power coincided with the collapse of Roman authority in Gaul in the middle of the fifth century. The final period of dissolution of Roman power there began in the winter of 406–407, when warriors of the Vandals, Suebi, Burgundii, and the Sarmatian ALANS crossed the frozen Rhine looking for lands to settle and wealth to plunder.

The Visigoths forced the Vandals and Alans out of Gaul, but the Burgundii, under their strong king, seized a large area of eastern Gaul and later attempted to expand into Belgica. They too were contained by Roman military leaders (who by this time constituted the only meaningful Roman authority left in Gaul) and suffered diminution of their power through a devastating defeat by Huns; they were accorded federate status in 443 and fought against the Huns in 451. But the shocks of the fifth century in Gaul itself—the attempted assumption of control of the empire by Constantius, a usurper from Britain, who tried to make his capital at Arles,

as well as campaigns in Italy by the Huns and others—strained Roman power in Gaul to the breaking point in succeeding decades.

The Alamanni, who had settled in the Black Forest and Upper Danube region in the fourth century and soon began exerting pressure on eastern Gaul and the Upper Rhine, were also part of the great invasion of 406–407. They were repelled from Gaul by the Franks and moved into the northern Alps and Bavaria. In the sixth century their territory was absorbed into the empire of the Frankish king Charles Martel.

Collapse of the Western Roman Empire

Pressures from without joined with a sharply contracting economy within to bring about the collapse of the Western Empire. The West suffered from a trade imbalance with the Eastern Empire to the point that in some districts a money economy was abandoned for a barter system. The villa system had long been in decline, with falling productivity, and the taxes needed to fund the military, on which Roman society depended more with every passing year, bled the economy dry.

Ordinary citizens bore the brunt of the tax burden, while great landowners of senatorial rank, because of their imperial connections and private military means, found ways of avoiding paying taxes. Such individuals had little allegiance to the empire; for them being Roman meant cultivating an elite cultural tradition and preserving the privileges of their class. Such senators were perfectly willing to have barbarian soldiers and kings protect their privileges. Thus a Gallo-Roman at the Burgundii court in the mid-fifth century mocked a holy man there who had long been predicting the ruin of the empire by asking why his predictions had not come true. Of the great shocks and momentous events of the time, even the dissolution of Roman authority in Gaul, the wealthy senator, who had not been personally affected, remained sublimely ignorant.

In 476 the Roman Empire in the West was officially dissolved when the boy-emperor Romulus was deposed by Odoacer, commander of German mercenaries in Italy. The BYZANTINES of the Eastern Roman Empire would henceforth carry on the Roman tradition.

Vandals in Spain and Africa

In the meantime, expelled from Gaul, the Vandals and Alans moved into Spain and engaged in the long spree of brigandage that caused the name Vandal to become a byword

for destructiveness. Having run through the available wealth in Spain, the Vandals crossed to Africa in 428 and by 440 were in such complete control there that they were able to mount an invasion of Sicily. Rome's only option was to offer them the status of federates, which caused them to withdraw to Africa. Their rule there was truly worthy of barbarians, as we think of the term, and mainly consisted of ruthless plundering and confiscation of Roman lands. In 455 Vandal forces again ravaged Spain and Italy and sacked the city of Rome. Such devastation of lands and peoples could not continue forever, and in 533 the BYZANTINES were able to topple the improvident Vandal regime in a few months.

Visigoths in Gaul and Spain

Little is known about the history of the long reign of the Visigoths' first king in Aquitaine, Theodoric I. This very fact may be a testimony to the stability he achieved, "history," as recorded, so often consisting of violent events. The main such event of his reign was the participation of the Visigoths in 451 in the battle that halted the Hunnic advance in Gaul. The Visigoths formed the core of the army that faced the Huns, and Theodoric lost his life in the conflict.

After Theodoric's death the Visigoths experienced increasing pressure from the Franks, and the center of their power began to shift southward into Spain. As the result of a defeat by Franks in 507 the Visigoths lost control of their territories north of the Pyrenees and Toledo became their capital. Soon afterward they controlled most of the Iberian Peninsula, and the kingdom they established there survived until the Arab invasion of 711. Visigothic Spain was notable for its unification of Germanic and Roman elements and in terms of material culture was hardly "Gothic" or Germanic at all. The vitality of the intellectual life there is attested by the career of the scholar Isidore of Seville of the sixth–seventh century, who preserved a remarkably Roman outlook for his time.

Ostrogoths in Italy

The Ostrogoths, who had taken northern Italy from Odoacer in 488, achieved a considerable degree of fusion between Germanic and Roman cultural and political traditions, mostly because of the breadth of vision of their king, Theodoric, the greatest Germanic ruler in the West, who preserved Roman administrative organization and appointed Romans to high

posts in his court, at the same time employing Germanic traditions for his military. However, after his death in 526 the Ostrogothic hold in Italy weakened and they were unable to withstand Byzantine efforts to annex the former heart of the Roman Empire in the West. By 552 the Byzantines had gained control of Italy; shortly thereafter they lost much of their territory to the Germanic Lombards.

Franks after the Demise of the Roman Empire

By the middle of the fifth century according to historical sources Frankish groups had gained control of much of the Rhineland, the Belgian plain, and the Meuse and Moselle regions. Yet large numbers of cemeteries with clearly Frankish grave goods date only from later in the century, when Frankish power had finally been centralized under the leadership of King Clovis I and expanded until it reached from the Rhine to the Loire. Clovis campaigned against the THURINGI and Alamanni east of the Rhine and the Burgundii in eastern Gaul; he defeated the Visigoths in 507. The Franks controlled Gaul and part of Germany for centuries thereafter.

Clovis, who founded the Merovingian dynasty, made his capital at Paris, and his conquests in Gaul delineated in large part what would become the kingdom of France. His marriage to the Burgundian princess Clothilde, who was an orthodox Roman Catholic, not an Arian, immediately won him the support of the Catholic Church in Gaul, and that of the bishops in Visigothic territory helped him greatly. He united all of the various Frankish groups under him, partly by assassinating their leaders. His heirs extended their power into part of Italy and claimed suzerainty over southeastern England.

The nature of the takeover by the Franks of Roman Gaul illustrates how oversimplified is the picture of the Roman Empire's crumbling before barbarian hordes, for, as noted, after the third century Frankish groups were invited by Romans to settle near large villa estates for the latter's protection. Archaeology reveals a continuity of settlement in many such cases, with a rather gradual disappearance of Roman elements, probably the result of the fading of the villa economy, in favor of Frankish elements as more and more members of formerly mobile roving Frankish war bands were attracted to settle near the old Roman centers. By medieval times many of these settlements had evolved into villages centered on churches.

Lombards in Italy

The final invasion of Roman Italy by Germanics, which swept away almost all vestiges of imperial Rome, was carried out in the sixth century by Lombards. Living along the Middle and Lower Elbe, the Lombards arrived late in the migration process; in 547 they moved southward to Pannonia (roughly modern Hungary) southwest of Noricum. Later in the sixth century they were forced out of Pannonia by the AVARS to their east, a nomadic people who with Slavic tribes were ravaging Greece and the Balkans. The Lombards had served in Roman military forces as mercenaries, and this experience had taught them how to deploy their military power more effectively. When they entered Italy in 568, they swiftly took control of most of the territory north of the Po River and were able to resist a Byzantine-Frankish alliance in the 580s. In 605 the Byzantines ceded them a large territory in the northern part of the peninsula; much of the south was dominated by semi-independent duchies; the Byzantines had preserved for the Roman Empire only Rome and Ravenna, with a precariously held corridor connecting them, and coastal enclaves.

Unlike the Goths the Lombards, perhaps unimpressed by the battered cities that were all that now remained of Rome's former glory, made no attempt to become Romanized or to enlist Romans in their polity. Their elite warriors took over lands and estates from their Roman owners and engaged in the "vandalism" bemoaned by Pope Gregory the Great, who called them "unspeakable" for burning churches. (That the cities had become largely depopulated by now had as much to do with the collapse of the Roman economic system as the actions of the Lombards.)

The Carolingians

Frankish dominance in northern France and Germany reached its zenith under the Carolingians, named for Carolus Magnus or Charlemagne. They gained power from the Merovingians, who had failed to provide vigorous leaders for decades, in the seventh century, first as court bureaucrats administering the royal estates. Their first great leader was Charles Martel (Charles the Hammer), whose victories against the Arab Muslims invading from Spain in the eighth century made him the secular leader of Christendom in the West. He pushed the Arabs back over the Pyrenees into Spain. However, he was unable in law or

Frankish custom to claim the title of king. In 751 his son, Pépin III, by cooperating with St. Boniface in his sweeping reforms of the Frankish church and by courting Pope Zacharias, gained the latter's approval for deposing Childeric III, the last Merovingian king. In this he maintained the Frankish tradition, begun by Clovis, of seeking church sanction for political aims; whether or not this was cynical manipulation, it gained for the Carolingians a mantle of legitimacy of a kind that would retain vital importance in all Germanic kingdoms for centuries to come. Both Pippin and his son, Charlemagne, received the title of *patrician of the Romans*, showing the continuing importance of the idea of the Roman Empire, long after the reality had crumbled to nothing.

As had his father, Charlemagne sought legitimacy from the papacy in 773 by defeating the Lombards who were attempting to annex papal lands. With the blessing of Pope Adrian I he assumed the iron crown of the Lombard kings of Italy. In 778 he invaded Muslim Spain and eventually captured Barcelona and established control over territory beyond the Pyrenees.

From 772 until 804 Charlemagne waged brutal campaigns against the Saxons of Saxony, again with the church's blessing because the Saxons were pagans. His conversion of the Saxons took the form of force, wholesale massacres, and transportation of thousands of Saxons to the interior of the Frankish kingdom.

Charlemagne involved himself in Roman church politics, traveling to Rome in 800 to aid the beleaguered Pope Leo III. This time he used his political rather than military strength to insist that Leo be given a trial in court in which to answer charges of misconduct made by his enemies. After Leo was cleared of wrongdoing, he crowned Charlemagne emperor, on Christmas Day 800, the event that was later claimed as the birth of the Holy Roman Empire, a political concept that, assuming different forms over time, had at least a notional reality for more than a thousand years. Recognition of Charlemagne's imperial legitimacy by the Byzantines was long in coming. Only through a combination of force and diplomacy was Charlemagne able to persuade Michael I, the Byzantine emperor, to acknowledge him as emperor of the West in 812. Leo's successor, Stephen IV, crowned Charlemagne's son, Louis I (Louis the Pious), thus establishing

the papal claim to the right to consecrate the emperor.

Charlemagne's ambition was to bring about a rebirth of Roman civilization, and he threw his energies into making his court at Aachen a center of culture and learning. In this endeavor he enlisted the aid of the English cleric and scholar Alcuin, who had been educated by a disciple of the Venerable Bede. The curriculum developed at Aachen formed the basis of education for medieval Western Europe for centuries.

The empire remained united under Louis I but on his death was divided among his three sons under the Treaty of Verdun into regions that prefigured modern-day Germany, France, the Netherlands, and Italy. Louis II (Louis the German) received the eastern portion (later Germany); Charles II (Charles the Bald) became king of the western portion (later France); Lothair I received the central portion (Low Countries, Lorraine, Alsace, Burgundy, Provence, and most of Italy) and retained the imperial title.

Last of the Germanic Invasions: The Viking Age

During the period of Roman hegemony in northern Europe, southern Sweden with its large Baltic islands received influences only from the Eastern Roman Empire, mostly in the form of gold that was being paid as subsidies to barbarians along its borders. This stream of gold flowed north through gift-exchange networks, finally being traded to people in Sweden in exchange for iron and finely wrought metalwork, among many other trade goods. Previously people here may have acted as middlemen in the slave trade with Romans in the West. The wealth that entered the region fostered the development of large trading towns, powerful ruling dynasties, among the earliest that of the SVEAR. These dynasties, who had virtually no knowledge of the Greco-Roman world (and who were little known to that world as well), began to emerge as early as the middle of the first millennium C.E. Free of direct Roman influence, societies here developed toward greater organization and centralization of power independently for their own reasons.

As with other Germanic peoples, among the Vikings there were competing and opposing tendencies toward consolidation of power in the hands of a few and the continuing freedom of action of individual warriors. Perhaps because of their northerly position population

pressures did not arise among SCANDINAVIANS until the second half of the first millennium C.E. The beginning of a long warming trend called the Medieval Warm Period at about that time may have added overpopulation to societal stressors. Moreover in the late eighth and early ninth centuries Scandinavians experienced for the first time the direct influence of a first-class power in the form of the Frankish Carolingian Empire. In all probability these broad trends, set alight by specific events that may never be known in detail, fueled the great Viking raids of the late eighth to the 10th centuries, the last period of Germanic expansion.

The ships of the Vikings (a contemporary term for *pirate*) gave their raiding a scope beyond the dreams of earlier barbarian groups. From Spain, Gaul, Ireland, and Britain in the west to Slavic and Finnic lands in the east, no land with a coastline escaped Viking attention. They reached even unto Byzantium. Viking groups, called by contemporaries in what is now Russia the RUS, established a trading network from northern Slavic and Finnic lands to the Byzantine Empire, which laid the foundations for the Russian state. When the Viking Norse began voyages of migration, their reach was more fantastic still, to the far northern island groups of the North Atlantic, Iceland, Greenland off North America, and finally (as has been firmly established by archaeology) to the North American mainland in Newfoundland.

The Normans

The last years of Charlemagne's reign saw the beginnings of contacts with Norsemen from Denmark and Norway. By the late eighth century Norse silver traders had established posts in Frisia near the borders of the empire, dealing in silver from the Abbasid Empire in present-day Iraq. As so often among the Norse trading activities went hand in hand with raiding, and as early as 799 small numbers of Norse Vikings were taking advantage of the rich trade routes along the North Sea coast. Charlemagne began construction of a fleet to counter these raiders, but his successors neglected this work and so were unprepared for the much larger-scale onslaught of raiding that began by the middle of the next century, possibly caused by the interruption of the silver trade that followed political turmoil among the Abbasids.

By about 900 these Vikings had secured a permanent foothold on Frankish soil in the valley of the Lower Seine River and their raids had almost crippled the Frankish economy and fab-

ric of society. In 911 the Frankish king Charles III the Simple made the Treaty of St. Clair-sur-Epte with a Norwegian named Rollo, who had emerged as a significant personality among the Vikings, ceding him the land around the mouth of the Seine and what is now the city of Rouen. From this foothold Rollo and his successors established the duchy of Normandy. Normans then expanded their power far beyond Normandy, conquering Anglo-Saxon England and other parts of the British Isles, as well as Italy and Sicily.

The Holy Roman Empire

The division of the Carolingian Empire among the sons of Louis I in no way eclipsed the importance of the Roman Empire as a concept. Indeed its Carolingian proponents claimed that the supposed official end of the Roman Empire in 476 was merely a suspension. For centuries thereafter many Roman institutions, especially the church, endured under Germanic kings, and Romans played important roles in government and politics. The Roman church in the person of the pope had anointed a Roman emperor; therefore, there must be an empire. Arnulf was the last Carolingian to hold the imperial title (he died in 899), but a number of claimants to the empire in Italy and France kept the idea alive until 962, when Otto I of Germany (see sidebar) was crowned emperor by Pope John XII. Otto had partly reunified the Carolingian Empire by putting Italy, Burgundy, and Lotharingia under his rule. The term *Holy Roman Empire* only came into use some centuries after Otto's reign. From this time German kings took the title of king of Rome, in this asserting their right to the imperial throne and implying that they were in effect emperors-designate until they should be crowned by the pope, an expectation that was not always realized.

The creation (or re-creation) of the Holy Roman Empire took place in the context of a convergence of forces that tended to cause central authority on the Roman model to fly apart. Among these were the devastating inroads on the economy of central and western Europe made by the Vikings, Slavs, and MAGYARS, forcing the socioeconomy to remain localized, based on the manorial system, itself based on the relationship between tenant farmers and landowners. Feudalism, the political-military version of the manorial system, was also based on personal face-to-face relations between a vassal and overlord and tended to militate against the more abstract concept of a divinely

Otto I: First Holy Roman Emperor

Otto, born in 912 C.E., succeeded his father, German king Henry I, in 936. In the process begun by Henry, Otto sought to expand and unite Germany through limiting the power of the nobility and seeking alliances with foreign rulers and church prelates. In 939 he suppressed a revolt involving his brother Henry and granted duchies to faithful followers. He warred against, then reached an agreement with King Louis IV of France. In 951 Otto aided Adelaide, the widowed queen of Lombardy, by defeating Berengar II; he then married her, assuming the title "king of the Lombards." In 953 he defeated a ducal rebellion led by his son, Ludolf, and in 955, the Magyars at Lechfeld. Part of Otto's policy—known as the "Ottonian church system of the Reich"—was nurturing his relationship with the Roman Catholic Church. He was aided in his efforts by his brother, Saint Bruno, his chief adviser, archbishop of Cologne, and duke of Lotharingia (modern Lorraine).

In 962 Pope John XII crowned Otto as Roman emperor, a rank similar to that of "emperor of the West" first held by Charlemagne of the Franks. Pope John, threatened by Otto's growing power, negotiated with his enemies, and Otto deposed him in favor of Leo VIII. Otto, referred to as Otto the Great, died in 973. His reign, during which German culture flourished, is known as the Ottonian Renaissance. The political entity that some centuries later became known as the Holy Roman Empire endured until 1806.

appointed emperor. The increasing importance and power of local lords in their duchies made even kingship tenuous and dependent upon the personal abilities of kings, who resorted to iron-fisted tactics to control their vassals. For all their dreams of restoring the empire, Germanic rulers of the early Middle Ages had not yet found a way to contain the instability inherent in societies in which the warrior was the ideal.

Into Modern Times

A century after the Carolingian Empire was divided among Charlemagne's three grandsons into kingdoms that would form the basis of Germany, France, the Netherlands, and Italy, the German kingdom emerged as the greatest power in the west of Europe under Otto I. His father Henry I, duke of Saxony, although designated as overall ruler of the duchies of Franconia, Swabia, and Bavaria, called collectively East Francia, had had to resort to political maneuvering to gain the recognition of the other German dukes. The practice in which German dukes and princes elected the king had begun after the last Carolingian ruler of East Francia, Louis III the Child, died in 911. Conrad I, duke of Franconia, who was elected, eventually designated his own successor in Henry. But because of this usurpation of the dukes' right to elect the king, Henry had to grant them important concessions to gain their support.

These concessions, including Crown lands and the right to appoint bishops in their own territories, in later German history would form the basis for strong resistance by dukes to royal power. By the end of his reign Henry had rescinded these concessions and had become undisputed ruler in Germany as a result of his success in thwarting the double threat of the Magyars in the east and the Danes in the north. The German dukes and others, including the king of Bohemia, joined Henry to form a united front against the invaders.

But Henry's reign prefigured much of subsequent German history, which would be characterized by a violent oscillation between periods of consolidation of central royal or imperial power and periods of fragmentation of that power into the hands of German dukes and other lesser princes. This process may have had its roots in the ancient Germanic practice of electing overall leaders only temporarily in times of unrest, most recently reflected in the Frankish kingdom, with the unification achieved by rulers such as Clovis and Charlemagne followed by partition of the realm among sons, and the importance of the king's supporting nobles. These oscillations prevented the establishment in Germany of the kind of highly developed central monarchical power that came to the fore in France and England. In the near term Otto was able to build upon his father's work to cement further the unity of the German kingdom, taking advantage of conflicts in France to establish his power over Lotharingia (later Lorraine) and partly reunifying the Carolingian Empire by drawing Italy and Burgundy under his rule. In 962 he was crowned Carolingian emperor by the pope. Otto's crowning would later be claimed as the birth of the Holy Roman Empire and the title of the rulers would become "Holy Roman Emperor." His success solidified the German state as a concept and a reality for several centuries, but it was not to last, and in many periods of German history political power lay with small temporal and ecclesiastical principalities, some of whose rulers or bishops served as imperial electors (whose identity shifted over time), and free cities. Emperors often used the latter as counterweights to the power of the dukes. Germany's flourishing trade centers joined into leagues, such as the Hanseatic and Swabian Leagues, for mutual support.

In the 16th century the writings and reforms of Martin Luther began a wholesale attack on the spiritual supremacy of the Roman

Catholic Church. The rise of Protestantism further fragmented Germany, as many powerful German princes became Protestant in spite of the opposition of the emperor, and the divide between them and Catholic polities deepened. Competition between Catholic and Protestant principalities led to the Thirty Years' War in which other European powers—Sweden and France on the one hand, and Spain on the other—pursued their own agendas in aiding the Protestant and Catholic sides. Spain wished the Holy Roman Empire (now held by the Hapsburg dynasty and firmly entrenched in Catholic Austria as well as Spain) to maintain its power to further the Counter-Reformation, while France's Cardinal Richelieu was concerned to limit Hapsburg power in Germany to afford more international scope for France. Thus he financed the military efforts of Sweden, champion of Lutheranism. The war was fought on German soil, causing widespread devastation and loss of population. Under the Peace of Westphalia, which ended the war, effective rule by the Holy Roman Emperor over the German states was ended, and the states were confirmed in their sovereignty, some of them being named as electors. The recognition of the independence of the German states, which included Bavaria, the Rhenish Palatinate, and Brandenburg (and the Netherlands), laid the legal foundations of the modern European state system. Provisions of the treaty that sought to limit further religious wars were largely successful.

For some two centuries after the Peace of Westphalia the prospect of a centralized German state seemed unlikely. The political organization of Germany consisted of a loose confederation of bishoprics and principalities of various sizes under the no more than notional rule of the Holy Roman Emperor.

CULTURE

Economy

The Rise of Pastoralism and the Warrior Ideal in the Corded Ware Culture Evidence of the earliest beginnings of the cattle-rearing lifestyles of the Germanic peoples may perhaps be seen in the elaborate cattle burials of the Globular Amphora culture between the Elbe and the Vistula Rivers in central Europe between about 4000 to 3000 B.C.E. This culture shows little sign of social stratification or gender difference in its burials, and the joint burials of humans and their animals—in some cases cattle were buried alone—may indicate a

view of the cattle less as possessions to be kept simply for their food value than as beings to be honored almost as much as humans. In many early societies the dead were buried so as to join their ancestors (who were later to evolve into gods), a means of communion and communication with them to gain their aid in the affairs of this world.

The view of cattle as a form of wealth began to emerge after 3000 B.C.E. Centuries of forest clearance in the forested region just south of the north European plain, which made possible the herding of cattle over longer distances than ever before, coincided with the arrival of ox-drawn wheeled vehicles and the light plow from the Near East and, from the steppe region north of the Black Sea, of the domesticated horse. These powerful innovations may have been borne into the ancient tell regions of the Balkans and north into eastern Hungary in about 3500 by the Pit Grave, also called Kurgan people, from the round mounds or *kurgans* with which they covered their graves; these contained the first elite burials known in Europe. On the other hand there is evidence that people from the Balkans and the Hungarian plain were changing their way of life from the sedentarism of the past, centered on the tells, to a more mobile one that put them in contact with the Kurgan people to their east, from whom they learned of the innovations. In any case there is no evidence of an invasion of Hungary and the Balkans by Kurgan people as once was thought. Kurgan men were buried with an assortment of goods, sometimes including wagon wheels and even whole wagons, pairs of cattle, and pottery in shapes influenced by silver wine-drinking vessels from Anatolia in Asia Minor. The impact of the Kurgan culture—or more important, the technological advances they were associated with—spread through central Europe, far beyond their actual territory. The Globular Amphora culture which, as in the case of cultures in the Balkans and Hungary, had been spreading eastward as new lands suitable for grazing were carved out, seems to have come in contact with the Kurgan people, judging by their adoption of a twisted-cord ornamentation for their pottery (which probably symbolized the horse, mastered by humans with ropes), although they did not adopt the kurgan grave.

The full implications of these developments—larger scale of cultivation made possible by the plow and the greater mobility made possible by wheeled vehicles, horses, and an increasingly open landscape, which allowed people, most of them men, an unprecedented

diversity of contacts—did not emerge for some 500 years, but at the end of that time their arrival was sudden and swift.

The new ideology born around 3000 B.C.E., made possible by the pastoral lifestyle and symbolized by a characteristic assortment of grave goods, has been called the Corded Ware culture, from the full flowering of the twisted-cord ornamentation of pottery first used in central Europe centuries earlier. More important, instead of communal graves and, in some regions, the large megalithic graves or grave mounds typical in the past, Corded Ware men were buried individually under conspicuous mounds like those of the Kurgan culture. The finely made stone battle-axes that replaced the forester's axes of the past, and the set of drinking vessels, including goblets shaped like the silver wine cups used in the Aegean area, tell of the advent of a much different world. Greater mobility and contact with strangers made necessary the battle-axes for protection or aggression and the drinking implements for forging bonds both within the group and without. Men of the Globular Amphora culture and others in central-north Europe, venturing ever farther afield as the landscape opened, slowly loosening their ties to the tribal centers with their communal rites celebrating allegiance to place, seem to have gained an ever greater sense of individuality (also distinction from women). That it was a hard-won individuality, with dangers faced and overcome, was cause for celebration with funeral rites and burial of the implements symbolic of a warrior's courage and prowess, and of his bonds with his fellows.

The new emphasis on individuality seems to have been accompanied by a greater importance of personal possessions, as the basis of the economy shifted from the land, probably held in common by the whole community, to cattle. In the past cattle too had probably been communal possessions, but the new mobility may have altered this system. This cultural pattern may have emerged first in Jutland, where the earliest finds were made (although this concept is not universally accepted); its adherents at first lived among the indigenous megalith-building Funnel-Necked Beaker culture, which gradually gave way before the new ideology. Another view has this new culture emanating from the east as another impulse from the steppe cultures, whether introduced by invaders or simply adopted as a lifestyle for which inhabitants of formerly forested regions were now ready.

Whether spread as a movement of peoples or of ideas, the Corded Ware complex may

have been accompanied by the proto-Indo-European language that is ancestral to most modern European languages. However, the one-to-one equation of a specific language with a discrete people or culture group, carried along with them as they migrated, may be too simple, given the very different ways in which people in different areas reacted to and/or adopted elements of the Corded Ware complex. One theory is that proto-Indo-European emerged as a kind of “trade language” or *lingua franca* necessitated by the new wider range of contacts of groups.

Corded Ware spread very quickly through central Germany and the north European plain, to the Rhineland and on to Switzerland, north over much of southern Scandinavia, and eastward through the Baltic regions toward Moscow, resulting in a new cultural uniformity over a vast region. The very speed with which cultures over such a wide area adopted the Corded Ware lifestyle makes pinpointing its place of origin difficult, given the uncertainties of dating. Evidence of violence attests to the disruptions that accompanied this transformation in some places. Especially in the north and north coastal regions there is evidence that the Corded Ware lifestyle was adopted by foraging groups who until now had led a Mesolithic way of life. This lifestyle would have particularly fitted them for the even greater mobility now made possible by the horse and the ox-drawn wagon.

The Corded Ware culture had several distinct variants; they were located in its west-central, eastern, and northern areas, showing that even though its basic characteristics had quickly been adopted over a wide region, local cultures remained quite isolated from one another. It may have been during and after the Corded Ware period that Indo-European slowly diverged into Celtic languages in the west-central area, Baltic and precursors to the later Slavic languages in the northeast, and Germanic languages in the north.

It is important not to exaggerate the degree of change Corded Ware represented. The contrast the Corded Ware culture made with previous cultures is its most notable characteristic, and when the Corded Ware users are compared to the complex societies on the periphery of the urban Near East world system their distinctness from their predecessors appears less striking. All were rustic societies with little more than subsistence economies. Even the Corded Ware graves, stressing individuality as they do, still were located in communal burial

grounds, indicating a continued strong sense of place and community, and women and children were buried in them as well as men. Differentiation in burial rites, although present, was not great between old and young and between the sexes. Even the stone battle-axes may have been used more as symbols than as actual implements. In Jutland many Corded Ware graves are located near the passage graves and dolmens of the earlier Funnel-Necked Beaker culture.

Widening Trade Contacts and Warrior Elites

Only with the advent of the Bronze Age Bell Beaker culture around 2800 B.C.E. did true warrior elites arise. The characteristic bell-shaped beakers buried with their owners' remains, finery, and weapons seem to have emerged as a local variant of Corded Ware in the Lower Rhine delta, spreading from there by Atlantic seaways along northwestern coastal Europe to Britain and to southern Iberia and Sicily. Whether this means the whole Beaker ideology began there or was introduced there from elsewhere, possibly Iberia, adopting and spreading the beaker style throughout the Atlantic zone, is still unresolved.

People in Denmark adopted the typical Beaker dagger long before metallurgy had arrived there by making highly skilled imitations in flint. The Beaker warrior lifestyle there and in the North European plain was more like a continuation of the Corded Ware culture, since these regions were still beyond the reach of the trade networks that were spreading copper, gold, and then bronze with other elite goods through the Atlantic trade zones.

By the Late Bronze Age the isolation of these regions had ended and gold and bronze entered central and north Germany from the Carpathian Mountains and Ireland in large amounts, probably fueling gift-exchange networks and fostering social differentiation through both greater possession of gold by elites and their use of the metal to exhibit status. The Unetice culture, characterized by the great skill and sophistication of its metalwork, began at this time in central Germany.

Around 1800 B.C.E. goods from the burgeoning Carpathian metal industry reached Scandinavia, in exchange for amber and probably other perishable materials lost to the archaeological record. Social differentiation now became more marked as elite items such as finely crafted swords, spearheads and, at least by 1300, chariots were possessed by powerful local chiefs. In northwestern Germany

and in Jutland tumulus graves were first built at this time, probably under the influence of the west-central European Tumulus culture (located in what would later be Celtic lands), which was now competing with the Carpathian bronze makers for trade with the north. Through this region of Germany passed amber from Jutland to be traded both south and west. Amber from here has been found in Greece in an early royal grave of the MYCENAEANS. Local bronze industries flourished, developing distinctive styles and techniques. The greatly increased trade of the Bronze Age fostered the evolution of canoes for coastal and river travel into vessels worthy to be called ships. But trade links with the Mediterranean remained too rare and sporadic for much influence from there such as would be felt in the north in the Iron Age.

Economic Revolutions of the Urnfield Period In the latter Bronze Age after 1300 B.C.E. societies in northern Germany and Jutland experienced many of the same dramatic changes in what would later be Celtic lands. What has been called the Industrial Revolution of the Late Bronze Age, with an explosion of bronze working in both quality and quantity, also took place in the north. The change to cremation and burial of ashes in urns did as well, although varied in the north by putting cremated remains in grave pits large enough for an inhumation, in boat-shaped stone settings, or under small or large mounds, some with stone corbel-vaulted chambers reminiscent of the megalithic tombs of Neolithic times. A few of these were richly furnished with grave goods. The Neolithic assortment of grains began to be supplemented by rye and millet, more easily grown in adverse climatic circumstances than other crops, and oil-bearing plants such as flax. Field systems were much more extensive than earlier, and cattle raising had grown to large proportions. The building of fortifications on hilltops or stockades on lower ground became more common. Weaponry of all kinds was abundant, with a continuing proliferation of types—the sword had now come into prominence, as also the bow—and forms attesting to a Bronze Age arms race to maintain weapon superiority. The greater amount of amber found in the Mediterranean from this time indicates that long-distance trade had become more regular.

Iron Age In the Iron Age the Germanic culture contemporary with the Celtic Hallstatt and later La Tène cultures—and in some ways virtually indistinguishable from them—has been

called by archaeologists the Jastorfkultur (Jastorf culture). As with many of their Celtic neighbors, the socioeconomy of Jastorf societies emphasized cattle rearing. An important distinction of the Germanic peoples from the Celts was a greater mastery of ironworking. They differed from the Celts in preserving the simpler village socioeconomy of the past while the Celts were engaged in building hill forts (distinguished from the small hilltop fortifications of Germanic peoples by being, in effect, large, organized farming plantations) and later the townlike *oppida*, with all the greater social stratification and more complex organization of people and resources this implied. In contrast throughout the first millennium B.C.E. until its very end the Germanic peoples remained isolated from the often-disruptive effects of the consumer markets and luxury trade that had come into being farther south as a result of contact with the Greco-Roman world.

Trade with Romans After the Roman wars of conquest were largely over and the empire's borders had become relatively fixed, the Romans turned to trade with barbarians outside the empire to supply the large number of slaves needed to maintain the Roman economy. Probably as a result of trade in slaves and also in iron and leather a prestige-goods economy began to flourish in Denmark and the northern European plain, as attested by rich burials from the first century C.E. Archaeologists have distinguished concentric zones of differing burial types, affected by their distance from the Roman frontier. Most of Denmark and the northern European plain lay within the zone of rich burials where those who prospered by trade with the Romans lived. Beyond this to the north in Sweden, east along the Baltic coast, and in eastern Germanic lands was a zone of warrior burials that contained fewer prestige items. The warriors of this zone may have provided captive slaves to the “middlemen” along the frontier with Rome. The presence of such wealth there as well as the smaller amounts of gold and silver that the warrior societies of the hinterlands were able to obtain must have provided a continual irritant and incentive for raiding.

A profound influence on Germanic society were Roman coins, at first desired most for their metal and design (most coveted were coins bearing the image of a two-horse chariot). By the second century C.E. Germanics along the Rhine preferred silver to gold coins,

evidence that coinage was being used in a true market economy, rather than in gift exchanges or barter. Evidence of greatly increased production of trade goods in this region, especially along the North Sea coast in the Netherlands and Denmark, and the emergence of locally specialized production of goods such as leather, fine metalwork, iron, and glass attest to the sea change that took place in the economy of the Germanic tribes here.

While tribes such as the Hermunduri were allowed to trade west of the Rhine, Roman traders penetrated deep into the German hinterland. A Roman aristocrat in the reign of Nero explored Germany and the Baltic region in search of beasts for the Roman Circus. While there he acquired large amounts of amber at trading ports that he called *commercias*.

Farming Animal husbandry was the dominant form of agriculture practiced by Germanic peoples, with cattle the primary animals, used for meat, milk, and pulling of plows and wagons. Germanics also kept pigs, sheep, and goats. Horses were relatively rare. All of the Germanic breeds had long been reared in isolation from breeds in other regions, with the result that they were very small; cattle were often barely a meter high at the shoulder, and horses only a meter and a half.

As was the case with the Celts, Germanic peoples did little hunting for food, and fishing played a minor role in subsistence. Barley was the most important grain crop, used for making beer as well as food. Einkorn and emmer wheat, grains of the earliest Neolithic Age, continued in use, joined by oats, millet, and rye. Flax was grown for its oil and its fibers, used to make linen. Beans and peas were grown, and wild plants included celery, spinach, lettuce, radishes, and brassicas. Woad provided a blue dye. Germanics were on the whole successful farmers but were not immune from famine caused by occasional poor growing seasons or unusually severe winters, especially in eastern regions.

The Manorial System In the early Middle Ages the main source of wealth for the German-descended nobility throughout Europe was agriculture. Taxation of free peasants in return for protection in time of war took the form of both forced labor and agricultural produce; both were due to the lord from hereditary serfs. Some of the serfs were descended from free peasants who, in times of bad harvests, had been unable to pay taxes and were reduced to servitude. Subjection of peasants to serfdom

took place at a great rate in the 11th century as the nobility sought to increase their wealth, taxing peasants beyond their ability to pay. At the same time a process of expansion of available agricultural land was occurring; the forced labor of peasants on this enterprise also forced many into serfdom as their own farms suffered. In some cases the serfs themselves initiated land clearance to pay their rents. Fields carved out of the forest were more fertile than those that had long been under cultivation; they were filled with decomposed organic matter and fertilized by the ash from fires used to clear away the tops of felled trees.

Improvements in agricultural techniques, such as the use of horses for plowing, the use of iron tools, and the rotation of crops, generated increased harvests in the 11th century, leading to rapid population growth. By the 12th century overpopulation began to be a problem.

Serfs were inherited by each new lord of a manor and had few legal rights. A lord's demands on his serfs were based on his own discretion and could vary greatly from region to region, even from one manor to another. Rent on lands used by peasants was paid in kind—agricultural produce—or in money, and a direct tax was collected for military protection by the lord and his knights. The lord's economic control extended to every aspect of the life of his subjects, including free peasants. They had to pay for the use of the mill, press, forge, and washhouse on the manor. They were unable to bake their bread except in the lord's ovens. He could sell products such as wine at the best price before serfs could sell theirs. He received a percentage on sales at fairs and markets in his territory. He could also set up toll-booths and charge for use of roads in his manor. When serfs married outside the manor, they had to pay a tax. They also paid a tax on funerals. The lord also exercised justice. He imposed fines for petty crimes and disobedience; for serious crimes he could expel the serf from the manor, punish him physically, or even have him executed.

Government and Society

Differing Cultural Groupings Material evidence gathered by archaeologists suggests that the peoples in Germanic lands were divided into four broad groups sharing somewhat distinct cultural affinities. These were the Elbe Germanic tribes who lived between the Elbe and Oder Rivers; the Rhine-Weser Germanics, who were closer to Celtic Gaul and probably

were of mixed Germanic and Celtic descent; Germanic tribes along the North Sea coast; and the groups in Denmark and Scandinavia.

End of the First Millennium B.C.E. The picture Julius Caesar gives of Germanic society before they had had much Roman contact is in agreement with the archaeological record in showing a society with a relatively limited degree of social stratification. He writes that land was held by each tribe and allotted in turn to individual clans or kinship groups in a yearly redistribution system expressly aimed at preventing wealth from accumulating in any one clan. That agriculture had not developed much beyond a subsistence level is indicated by the subsistence village-based economy uncovered by archaeologists. The means of status lay not in economic activity but in warfare (which remained, however, on the level of raiding). Power lay with a warrior elite who gained status through success in raiding by which they obtained booty to distribute to their retainers. Excavations of villages show a great variety in the number of cattle different individuals owned (based on the number of stalls in houses); this could range from 10 or 12 cattle to more than 30. The better-endowed households gained their wealth not through careful husbandry (which was on a primitive level among Germanics at this time) but through cattle raids. Individual warriors could rise to prominence through acts of bravery and success in raiding, both of which attracted followers. Successful warriors who became chiefs would periodically sit in tribal councils to determine and announce raiding forays, and young untried warriors would proclaim there and then their willingness to take part. The only compulsion to fight was the fear of shame and derision from their fellow tribesmen should they fail to honor their vow to join in the raid.

Social Strata Germanic peoples kept slaves, usually prisoners of war, who lived in their own houses and worked as farmers but were required to provide certain amounts of food-stuffs, cattle, and textiles to their masters, making them more like serfs than Roman slaves.

German society was highly patriarchal; fathers had absolute authority over the family, which could include more than one wife.

Clan and Tribe Individual households consisting of single families were integrated into a larger unit called the Sippe, or clan. The patriarchal aspect of society was modified somewhat in the case of the clan in that it was

bilateral, including families of matrilineal as well as patrilineal descent. Clans probably consisted of no more than about 50 households. Each clan preserved within itself what was known as the “peace” under which violence between members constituted a crime for which no compensation or atonement could be made. Incest was taboo within the clan and certain property rights were observed. With regard to the world outside the clan, clan members were bound to support each other when any was the victim of violence and to fight on each other’s behalf when a blood feud had been declared.

The clan unit was essentially unstable because breaches of the peace, the basic defining principle of the clan, or failure to honor the obligation of mutual help could lead to a clan’s being split between the nearest kin of both violator and victim. And because clan membership was bilateral, marriages could lead to the absorption of smaller clans into larger ones. Tribes were essentially groupings of clans, bound by shared histories, traditions, and institutions. As such commonalities inevitably changed through time, so did tribes, splitting apart, expanding and absorbing new groups, or being themselves absorbed into larger groups. It has been said that the tribe was more process than stable structure; ethnogenesis, the birth of new tribal groupings, was constant. And under the contingencies of historical forces at certain times the process of ethnogenesis was accelerated. Clearly one such time was the migration period, when Germanic tribes were being impacted by powerful forces, among them overpopulation, the Romans, and migrating groups from the east, such as the Huns.

The Germanic tribe, more than any other aspect of Germanic culture, has been viewed uncritically through the filter of Greek and Roman ideas. Both Greeks and Romans themselves had tribal identities that, much modified over time, were continuously remembered through most of the Greco-Roman era. However, Greek and Roman tribes had long left behind the sort of dynamic ethnogenesis the Germanics were undergoing and were far more stable units than the Germanic tribes. This system probably accounts for the fact that few of the tribes mentioned by Romans can be discerned in the archaeological record, because they had only a fleeting existence.

Most Greek and Roman tribal groups preserved the tradition that the founder of each tribe was one of the gods—Zeus, Poseidon, Mars, or another. Tacitus wrote that the

Germanic peoples believed they were descended from the god Tuisto, through his son, Mannus, a concept that Tacitus, as a Roman, must have found familiar. Because of his relatively limited contact with Germanics, he may have been recording the tradition of a single tribe, or of the tribes of a single region, rather than of all Germanic peoples. It is highly unlikely that at this time speakers of Germanic languages considered themselves a whole, distinct people with a common ancestor. But Tacitus's information has been interpreted by some modern scholars to mean that Germanic peoples had a concept of a shared biological, genealogical origin peculiar to them and that their belief in this common ancestor was the same as modern ideas of ethnic or racial purity of blood that informed the eugenics movement of the 20th century.

Ethnology has shown that virtually all tribal peoples, all over the world and in all times, have believed that tribal identity was based on kinship and a common, often divine ancestor. Such beliefs are no more particular to Germanics than to any other group. And it is entirely anachronistic to ascribe the concept of "purity of blood"—or of race—that was partly although mistakenly based on the discoveries of genetic science—to Germanics, particularly since their tribes were based at least as much on shared cultural traditions as on kinship. In fact the very idea that tribal members shared a divine common ancestry located in the distant past probably tended to downplay actual family relationships in the present as an important factor of tribal identity.

Even language may not have been decisive in establishing tribal identity. More important were clothing and hairstyles, ornamentation, types of weapon, religious cult, and a shared oral history. These factors also distinguished social standing within the tribe.

The Tribal Peace As in the case of the clan the tribe preserved within itself the "peace" that made cooperative efforts possible. The English word *friend* is very close to the modern German for peace: *Frieden*. Tribal members were, in effect, friends observing a mutual peace. It is interesting that Tacitus mentions a Germanic goddess called Nerthus under whose aegis, from time to time, a universal peace was declared and observed with joyous rituals. Tacitus also calls Nerthus "Mother Earth"; it is possible, given the emphasis on peace within the tribe, that a goddess such as Nerthus was claimed by Germanic tribes of prehistoric times

as founding ancestress, perhaps alongside a god such as Tuisto, who, as did the Celtic god of the tribe, Teutates, wedded the goddess of Earth to ensure the land's fertility. (Among Celts an important triad of deities were Teyrnon, "Divine Lord"; his consort, Modron, the Mother Goddess; and their son, Maponus, whose name is similar to that of Mannus.) In this as in many other matters the distance of Germanic peoples from Celtic ones seems based more on the contingencies of these peoples' histories than on anything more fundamental.

The peace of the tribe, unlike that of the clan, did not consist of an absolute prohibition against violence between tribal members, but rather an attempt to control violence. Revenge and feud were the norm in clan interrelations, but tribal law set rules for the ways feuds were to be carried out and limited such violence to certain times and places. Intertribal violence was forbidden during religious festivals, tribal assemblies, and tribal military actions. The punishment for violating these proscriptions could be severe: either execution or banishment from the tribe, which rendered the outlaw liable to be killed by any tribal member without fear of revenge.

The tribal council of all free warriors, called the Thing, would meet from time to time to reinforce tribal solidarity, deal with serious lawbreakers, and determine the time and place for raids. It was here that young, untested warriors would announce their desire to go to war with the tribe. Such councils varied widely in their organization across Germanic territory and over time; in general, as noted elsewhere, such councils became more and more dominated by elites.

Types of Kingship As in the case of the Irish and probably other Celtic peoples, some pre-migration Germanic tribes had a type of sacred king called the *thiudans*, dedicated to the god Tiwaz as the Celtic kings were dedicated to Teutates. He was the symbol and protector of social stability, the intercessor for the people with the gods in matters such as the fertility of the land and the safety of the tribe. Such a king seems to have been chosen from among that clan or family with whom tribal traditions were most closely associated. Again his role varied: in some tribes mostly religious, in others military. Often he would preside at tribal councils as the one above all divisions and narrow loyalties to whom all could appeal for fair judgment.

Early Germanic peoples probably also shared with Celtic peoples the custom of hav-

ing several grades of kingship—in addition to the tribal *thiudans* there could be provincial and high kings. Before the emergence of the Merovingian dynasty, the Franks seem to have had a number of tribal kings. Early Latin documents among the Anglo-Saxons mention offices of unknown standing, such as *subreguli*, *principes*, or *duces regii*, which may be tribal kings or, alternately, war leaders. (Tacitus calls the war leader *dux*, or *duke*.) Some Anglo-Saxon kings claimed the rank of *bretwealda*, or “ruler of Britain,” which, as among Irish kings claiming to be *ardri* or overking, was probably more a reflection of desire than of reality. Bede mentions that the Saxons on the mainland elected overall war leaders or high kings only in times of emergency. The failure of Arminius of the Cherusci to claim permanent rule over his people after he had succeeded in driving the Romans back over the Rhine is an example. As mentioned, permanent war leaders or overall kings only began to emerge among Germanic groups such as the Goths during the period of migration and conflict with the Roman Empire.

From about 350 C.E. the Gothic bishop Ulfilas and others under his leadership translated the Bible into the Gothic language. The Gothic words used for political and military institutions in this translation provide an invaluable means of understanding Germanic political life. The translation shows that the word *thiudans* had become disconnected from any political meaning for the Goths themselves. *Thiudans* was used instead to denote the Roman emperor, but more important the deity of the Gospels: the Lord God the Father and Christ, King of the Jews. Thereafter throughout the Germanic world *thiudans* was used primarily in this way (with the exception that in the Anglo-Saxon poem *Beowulf* the mythical hero-king is celebrated as *theoden*, lord). For worldly kings biblical Gothic uses a Celtic term: *reiks* (compare the Irish *ri*). Theodoric the Great was called a *thiuda-reiks*, denoting his exceptional status.

The Comitatus Another form of tribal grouping independent of clan or tribal structure was the warrior band, called the *comitatus* by Tacitus and *Gefolgschaft* by modern German scholars. These were warrior societies formed around the nucleus of a successful war leader, one whose good fortune in war signaled the favor of the gods and whose skills promised his followers much glory and plunder. Such war bands, though they might participate in tribal

wars, fought for the good of the whole people, stood outside tribal military lines of command, and frequently went out on raids purely for their own benefit. These bands were a highly destabilizing influence on the already unstable tribal structure and would cause the disintegration of tribes as bands that had grown too powerful would leave to form their own tribes.

In fact the ethos and outlook of the *comitatus* came increasingly to the fore during the migration period as war began to dominate some Germanic tribes almost wholly. The concept of society as wholly focused on a permanent war leader informed the large tribal confederacies such as the Alamanni and the Goths. Such confederacies were in effect *comitatus*, or war bands writ large. In the case of the Franks war bands maintained their independence until Clovis was able to unite all of them under his rule.

Feasting As did Celts, Germanics used feasting and drinking bouts to strengthen tribal bonds, and this practice, again as among the Celts, was a double-edged sword, for feasts were just as likely to end in violence as in harmony. Many a blood feud must have begun in one of these heroic feasts. But they provided a forum within which the deeds of warriors were celebrated by bards called skalds, and a chieftain's generosity in giving bounteous food and drink was an important way of attracting his followers' loyalty. It would have been at the feast after battle that a chieftain would reward his bravest warriors with rich gifts from among the spoils. The Anglo-Saxon poem “The Wanderer” gives a sense of how central feasting was to the lives of Germanics, as the poet laments his exile from the feasting hall of his lord as his greatest loss when leaving his homeland and tribe. The afterlife of warriors in the god Odin's hall, Valhalla, represented the ideal.

Legal System Violence and wealth—whether obtained in war, by trading, or through agriculture—were fundamental to the system of “governance” obtaining among all barbarian tribes, the Germanic tribes included. The basic purpose of the legal system, the law codes and the status of individuals before the law, was to mediate conflict among tribal members and determine the punishment of wrongdoers, consisting of either payment as compensation by the wrongdoer to the victim or the declaration of blood feud against the wrongdoer so that the victim's clan members could legally lay hands on him to obtain justice or even kill him. So fundamental was wealth to barbarian society

that each individual had his or her “man price”: the worth of his oath in a court of law and the amount of compensation due him or his kin by a wrongdoer. The man prices among a number of tribes are known in monetary terms, mostly because the law codes were written only after these societies had adopted coinage. Earlier the man price had probably consisted of so many cattle or such a weight in gold. Man prices known from early sources included 200 *solidi* for a free Frank and 200 shillings for a free Anglo-Saxon. (The man price for women was always considerably less.) The man price was also, of course, highly stratified; an aristocrat’s worth before the court—his oath as well as the indemnity owed him or his kin by a wrongdoer—was three or more times higher than that of a commoner.

The guilt or innocence of an accused malefactor was determined in assemblies of various kinds on the clan or tribal level, later in courts. Fundamental to this determination was the belief that the divine, pagan or later Christian, played a direct role in the unfolding of the truth. Therefore every act during a trial was scrutinized with the greatest care for clues to the divine will. The burden of proof was on the accused, and his manner in declaring his guilt or innocence carried great weight. If his statement was clear and given with assurance and no slips of the tongue, coughing, or hesitation, his statement was assumed to be true. His rank and reputation were taken into account as well. If he was a commoner and his accuser a noble, he was almost certain to be found guilty.

In a case in which accuser and defendant were of equal rank and the statements of both were equally persuasive, so that the court was unable to decide the truth, the trial by ordeal was invoked. There were many forms, depending on the severity of the crime, some of them horrific, including having the accused hold his hand in a fire, carry a piece of red-hot iron, or pick up a stone from the bottom of a steaming cauldron. Burns that healed cleanly in a few days were taken as a sign of innocence. In a trial by water the bound defendant was thrown into a lake or stream; if he floated, it was assumed that he was being rejected by the pure nature of water and hence was guilty. Trial by combat could directly involve accuser and accused, or one or both could choose a substitute.

Era of Germanic Raids and Migrations: Second Century C.E. and Later Although premigration Germanic society was continually changing—tribes forming, breaking up, re-forming; tribes

absorbing and being absorbed by other tribes—the level of instability and violence continued to be moderate enough to maintain an equilibrium, with economic activity sufficiently undisrupted to keep everything going. This state of affairs had lasted for centuries. During the first centuries B.C.E. and C.E. neighboring Celtic and Slavic societies (those who had remained relatively uninfluenced by the Greco-Roman world) were maintaining a similar equilibrium in roughly the same way. Contact with Rome would cause increasing unrest.

At the time of the Germanic raids while the main basis for the economy was farming and trade was becoming increasingly important, most tribes had a political organization in which warfare now played a more central role. Power was more concentrated in the hands of a few as the successful leaders of *comitatus* attracted more and more followers. A crucial difference from Germanic society, as Caesar had observed it a century and a half earlier, appears in the account of the Roman historian Tacitus: Land now was distributed according to social status, and the clan or kinship group decreased in importance as allegiance to war leaders grew. Formerly elected in times of emergency, some war leaders now held permanent power. Yet because of this very fact the tendency was for the most powerful to want to hold on to power by minimizing warfare and establishing means of achieving social stability. A dual system of councils of the elite and general assemblies of ordinary warriors had evolved, the latter unable to initiate action without the acquiescence of the elite council. The constant threat to this social order was the continuing autonomy of all members of the warrior class; any warrior of whatever status was free to attract followers and go on raids without seeking the council’s consent.

Tacitus wrote of the Germanics in 109 C.E. that they were impatient with peace, needing war in order to win fame. The spoils of war were desired as much or more as proofs of warrior prowess and bravery as for material gain. Warriors played no role at all in the agricultural basis of the economy, and their constant need and drive for prestige and honor created perpetual social instability. Tacitus noted that young warriors would even leave their tribes to seek out others engaged in war.

Feudal System Feudalism had grown out of measures taken by European rulers in the ninth and 10th centuries to defend themselves against Vikings and Arabs; the dynastic wars of

the descendants of the Franks also served as a catalyst. It had evolved from the network of personal loyalties fanning out from a single overall war leader that Germanic groups such as the Goths had developed in Roman times. The lightning-swift and unpredictable attacks of the Viking raiders in their longships forced the development of armies of heavily armed warriors mounted on horseback, combining strength and maneuverability. Kings also embarked on extensive programs of building defensive fortifications. All of this came at a high cost, for armor and weapons, horses bred to carry the extra weight, and time for lengthy training of both horses and men. Rulers would grant lands to their soldiers to maintain them and provide for their expensive accoutrements. At first these grants of land were only for the duration of the soldier's service, but increasingly it became more common, as retainers of soldiers became permanent fixtures in society, for the lord or king to grant his soldiers permanent and hereditary ownership. The essence of feudalism was the reciprocal relationship between men of greater and lesser power, with the greater granting lands, called fiefs, and the lesser, called vassals, promising service or fealty in return. In reality relations between lords and vassals were not always so simple and straightforward, and vassals did not always accept that the grant of a fief obligated them as much as their lord demanded. These matters were often the cause of bitter dispute. Feudalism did not emerge all at once in a fully mature form but slowly as lords and vassals engaged in a tug-of-war for power.

Folkright As their societies evolved in their new lands, Germanic peoples experienced a fundamental shift from the more egalitarian tribal past. Despite the advantages of the nobility the free commoners in the homelands had enjoyed many personal rights. The free status of the commoner, marked by his right to bear arms, to attend and air grievances at local courts, and, in the case of the Anglo-Saxons in England, for example, his payment of dues directly to the king, showed that the relationship between king and commoner bypassed coercive power wielded by local lords. The rights of free commoners (whose agricultural labors formed the economic basis of society) were expressed in practice through the concept of folkright. Folkright consisted of the collective will of the people as embodied in rules and laws that had been established over time, whether written or not. Local assemblies of

commoners decided matters in accordance with folkright. The older laws of real property, succession, and contracts were mainly regulated by folkright; the law had to be declared and applied by the people themselves in their communities.

A counterprinciple to folkright, which became more important over time, was that of privilege, which could override folkright at any time by special enactments or grants of the king or overlord. Now that kings or overlords held their position permanently and were gaining ever more power, royal privilege was increasingly invoked so that it began to outweigh folkright as the most dominant legal principle. The king exercised his privilege to interrupt or set aside the older rules pertaining to the succession of kinsmen in land ownership in order to grant lands to his warriors. He could also grant the right to levy fines, further enriching his retainers. The system of privileged land tenure that was created would ultimately lead to the rise of the feudal system. The increasing power of local lords was at the expense of the commoners; those who lost their land became tenants, and the greater militarization of society placed an increasingly heavy tax burden on their tenants and on free commoners forced to pay tolls and other levies. Over time nominally free tenants became unfree serfs, and many were forced into serfdom—in Anglo-Saxon England the very word *churl*, derived from *ceorl*, which originally denoted an honorable position in society, became a pejorative term.

Military Practices

Weapons During the Roman period until about the fifth century C.E. many large, probably votive deposits of weapons in bogs were made in Germanic areas; in at least one case the weaponry of 60 warriors was thrown into a bog at one time, perhaps in thanks to the gods for a victory. The deposits give a detailed picture of Germanic armaments. Swords were gaining favor by the fourth century C.E. Although some German smiths were making steel swords of the highest quality in Europe these were too few to be carried by any but elites. Common warriors had recourse to Roman swords, no doubt either captured in battle or put into circulation in Germanic territories by Germanic individuals who were or had been Roman soldiers. The bow and arrows were increasingly important, but the javelin and the throwing ax continued in use. Body armor was extremely

rare among the Germanics, and even war leaders wore only helmets; most warriors had no more protection than their ancestors had had for centuries.

Tactics Cavalry grew in importance among Germanics during this period, especially among those who had had contact with the Sarmatians, Avars, and Huns. The cavalry of the Visigoths was decisive in their victory at Adrianople, but infantry remained the basis of Germanic fighting forces. Tactics were rudimentary, mostly consisting of the surprise attack from cover. Germanics generally avoided attacking or laying siege to walled cities or strongholds; the techniques of siegecraft, which had been taking to a high stage of development by Romans and Greeks, were beyond the abilities of the relatively undisciplined Germanic forces of this time, which relied for their effectiveness on warriors' rousing themselves to a high pitch of excitement. They lacked the patient, cold-blooded resolution needed to mount and maintain a siege that could last days or weeks.

The Vikings in the eighth and ninth centuries continued to practice this form of warfare at a time when the fighting forces of Germanic groups such as the Franks and Anglo-Saxons had evolved from motley congeries of individual war bands into true armies owing allegiance to a single great war leader or king. Some Viking warriors would transform themselves into "berserks" devoted to the god Odin, in which state they believed they would have superhuman strength and protection in battle, somehow working themselves into a frenzy or trance state in which they could feel no pain. Their ferocity and resolution may have stemmed from their belief that on dying a heroic death they would be transported in the arms of warrior maidens, the Valkyries, to Valhalla, the realm of the gods.

Germanization of the Roman Military The long struggle of the Roman military with the Germanic tribes began and ended with fundamental changes in the Roman way of war, in both cases making it resemble the Germanic. When Romans first met Germanic warriors in battle and were sorely bested by them, they embarked on the development of professional standing armies, whereas before their armies had been manned by citizen soldiers, militia-fashion, who after the war ended went home to their farms. The standing army was the civilized equivalent of the Germanic warrior society, in which the first duty of virtually every man

was to be a fighter. (The American founding father James Madison believed firmly that standing armies spelled the death of republics, and the demise of the Roman Republic only a century after the military reforms of Gaius Marius may have furnished Madison a prime example.)

From about the fourth century B.C.E. first the Roman Republic and then the Empire achieved and maintained success by constantly expanding; when this process was halted by the Germanics in the first decades C.E. Romans switched to the defensive and established a garrison system along their borders. Over the next two centuries the Roman army steadily became less "Roman" in the makeup of its soldiers, as Germanics joined in great numbers, although preserving Roman methods of warfare. When the migration period began, however, severe defeats of Roman armies by Germanics generated another Roman reorganization. The Battle of Adrianople, in which the emperor Valens was killed and his army annihilated by the Visigothic cavalry, caused strategists to decide that the Roman army, long primarily an infantry force, should focus more on cavalry. Mobile cavalry forces that could rush to a point of penetration and stop the enemy advance were established at key garrisons along the empire's borders. In addition to these the border fortifications were manned by native militias under their own commanders. In basic organization, values, tactics, and weaponry, the "Roman" army had become largely Germanic. Eventually localities with strong, well-led tribal militias, such as those held by the Franks, had become virtually autonomous polities within what was left of the empire.

Evolution of the Knight and Castle Cavalry continued to grow in importance in the early Middle Ages. The evolution of heavily armed bands of mounted warriors in northern Europe is thought in part to have been a response to Viking raids. Vikings made superb use of the mobility their ships gave them, mounting surprise attacks on towns on the coasts and along rivers. Cavalry was the earthbound response to them. As economies contracted under the relentless plundering of the Vikings, the center of socioeconomic life moved from towns and cities to the manors and holdings of local lords, replacing the fortified town with the castle seated in the midst of the lord's lands, where his tenants could flee for safety in time of war, and from which his mounted warriors could emerge to send the raiders to flight. This

change would lead to the development of the feudal system.

Later the Normans, former Vikings themselves, enthusiastically adopted the knight and castle system for their conquests. Their way of taking hold of a territory was quickly to erect there a scattering of simple timber and earth fortifications of a type called the motte and bailey castle, from which their knights could carry out mopping up raids in the surrounding countryside. When they had gained control of a region, they would build much more substantial stone fortifications to consolidate that control.

Dwellings and Architecture

Well into the first millennium C.E. the dwellings of Germanic peoples remained essentially unchanged from the longhouses of the first farmers in northern Europe, some 4,000 years earlier. Longhouses had pitched roofs, in some regions supported by a single row of posts running down the center of the building and wall posts, in others by rows on each side of the roof's apex, creating three interior aisles. A common feature was a central cross-passage dividing the house into two unequal partitions, with the smaller being the dwelling for people with a central hearth, and the larger the dwelling for cattle, often with individual stalls. The larger houses could have accommodated between 10 and 20 cattle.

Clothing

Textiles from the Bronze Age, preserved in Danish coffins made of hollowed-out tree trunks set under stone cairns, demonstrate that although clothing was sometimes decorated with embroidery, the cloth itself was mostly monochrome in color, in contrast with cloth used in the contemporary Aegean, where frescoes show people wearing clothing in bright colors. The difference hints at the impact that trade with the Mediterranean, when it reached northern areas several millennia later, would have on Germanic peoples, with their somewhat dour and simple culture.

The so-called bog corpses buried in bogs in the Weser-Ems region, Schleswig-Holstein, Jutland, and the Danish isles provide a very detailed picture of Iron Age clothing, preserved as it was in the anaerobic conditions of the bog. Women wore a long, sleeveless garment fastened at the shoulders with fibulae or brooches, the lower part often pleated and secured with a belt. Under this they wore undergarments, blouse, and a neckerchief. Men wore trousers of varying lengths, from knee

length to full length, sometimes with attached feet. Over these they wore a belted smock and a woolen cloak, often decorated and fastened at the shoulder with a fibula. Shoes and caps were of leather.

Other Technologies

From the beginnings of bronze metallurgy in Germanic lands around 2000 B.C.E. Germanic smiths particularly excelled in the new craft, and metalworking quickly became an important part of Germanic society, as attested by the enormous hoards of bronze artifacts of the Unetice culture in central Germany. The presence of both copper and tin in Unetice areas facilitated bronze production compared to that elsewhere in Europe, where both ores were rare; even more rare was the presence of both in the same region.

Bronze made certain individuals here rich as social stratification appeared for the first time in Germanic lands. These elite individuals were interred in great burial mounds with substantial timber burial chambers and rich grave goods no doubt acquired through trading in bronze. However, these were not primarily traders; many of these tumuli contained bronze-working equipment, suggesting that at this time metallurgy was considered an esoteric and even semimagical skill, as smiths turned rough ore into smooth, shining, and beautifully decorated objects. Their manipulation of the mysteries of nature may have surrounded metalsmiths and their work with an aura of awe in the eyes of their fellows, giving them power and authority beyond what we accord craftsmen today.

Unetice designs soon spread elsewhere in Germany and to Poland. In succeeding centuries fine Germanic metalwork, especially weapons—axes, swords, and spear shafts—traveled across the North European Plain and into southern Scandinavia in gift-exchange networks, reaching the hands of local chiefs over a wide area. People in Denmark in their turn took up bronze making, becoming highly proficient.

In some areas, where axes had previously been the weapon of choice, swords developed with broad blades for slashing; elsewhere daggers lengthened into dirks and then rapier-shaped swords for thrusting. Jewelry was fashioned in elaborate bronze pendants; long, spiral bracelets; and a new form of wheel-headed pin that perhaps evoked that ultimate status symbol: the chariot.

Iron Age Ironworking began to spread into Germanic lands during the first millennium

Germanic peoples of Scandinavia cast this bronze helmet plate in the sixth or seventh century C.E. (Drawing by Patt: Erway)

Germanic peoples wore medallions like this in the sixth century C.E.
(Drawing by Patti Erway)

B.C.E. Iron was abundant here, and the great forests provided wood for charcoal. As they had with bronze, Germanic peoples became highly proficient in making and working iron. Almost every village had its smelting furnace, usually of earth, and the method used in many places grew to be highly sophisticated, although time-consuming, involving up to eight separate steps. Several of these steps required careful control of temperature. The small amount of iron produced nevertheless was of very high quality. Some smiths were able to rework iron into high-quality steel and make sword blades with a core of softer steel for flexibility and harder steel on the exterior to keep a sharp edge, far finer weapons than those used in the Roman army at the time.

Such weapons were far from common, however, and the amount of iron produced in German lands remained low well into the Middle Ages. Most warriors carried only iron arrow points, a short, single-edged sword called a *scramasax* (the derivation of the name Saxon), and a shield with a central iron boss.

As in the Bronze Age smithcraft had an otherworldly aura and smiths had their own god, among Saxons called Wayland. Saxons in England gave the name Wayland's Smithy to a Neolithic long barrow grave in present-day Oxfordshire. Legend had it that if a traveler whose horse had lost a shoe left the animal at Wayland's Smithy together with a small silver coin, he would find the horse reshod the next morning.

Art

Swedish Rock Art A distinctive art form in southern Sweden in the Bronze Age was the carving of figures and symbols on rock faces. This practice, although hard to date, seems to have begun before 1300 B.C.E.; other examples found are later than 600 B.C.E. Some are found in conjunction with cemeteries. The range of motifs is limited; the single most common are images of ships (found not only near the coast but far inland as well). Animals such as cattle and deer are common; many carvings seem to depict scenes of everyday life, such as plowing. Humans appear much less frequently and are often shown in what appear to be ritual activities such as dancing with arms upraised. Some carry trumpets called *lures*, others axes; one example shows two men in a ship facing one another with axes raised; they, as are all men depicted in this art, are phallic. Women and children are seldom shown.

One remarkable example, carved on slabs lining a tomb chamber in Bredarör, Sweden, seems to depict a funeral procession, with mourners accompanied by *lure* blowers and drummers, and a chariot. Other figures are ships, animals, battle-axes, four-arm crosses in circles, and wavy lines.

Metalwork during and after the Roman Period

The great quantities of silver and gold coins that flowed from the Roman Empire into Germanic territories, together with the desire of elites there to flaunt their new wealth, fostered great advances in metalworking techniques. Filigree ornamentation, enamel inlays, and encrustation of semiprecious stones, especially garnet, made for metalware of greater delicacy and complexity than ever achieved before. From the third to the fifth century C.E. the fundamental principle driving goldsmiths was the achievement of a polychrome style, with translucent colored materials—enamel and gems—to contrast with metals. The Goths are thought to have begun experimentation with polychrome goldwork under the influence of steppe peoples, carrying the technique west with them. Parallels are known from Iran and southern Russia, but the style reached a pinnacle among craftsmen on the Middle and Lower Danube in present-day Romania early in the fifth century.

Literature

Writing played no role in Germanic culture until about the second century C.E., when a system of signs, called runes, was developed. Runes had at first mostly specialized uses, appearing mostly on weapons and ornaments, and were only a step away from functioning as ornamentation or ritual. The earliest runes represented whole words or names; those engraved on weapons, especially swords, which Germanic warriors often named, may have been intended to express the weapon's power or marshal the aid of the gods to make its action more effective. Others seem to have been devotions to deities or curses against enemies. Runes may have been used in divination, to discover the will of the gods.

The earliest runic alphabet—called *futhark*, for its first two characters—had 24 signs, four of which resemble Latin letters; nine others resemble letters of north Italic scripts used in north Alpine regions until about the first century C.E. Its origin is uncertain, and other influences may have played a role in its development. It may have been developed from

the Etruscan alphabet of northern Italy. For centuries runic inscriptions were only brief and sketchy. Only later in the migration period, especially in western Baltic regions, were they used in full texts.

In the third century C.E. the Bible was translated into the Gothic language by Bishop Ulfilas. From about the seventh century C.E. Anglo-Saxon scholastic monasteries were beginning to produce a literature of note. The first great Anglo-Saxon writer was the Venerable Bede, whose greatest work was the *Ecclesiastical History of the English Nation*.

An important historical source is the *Anglo-Saxon Chronicle*, a chronological account of events in Anglo-Saxon and Norman England, which began in the reign of King Alfred of Wessex and continued to be compiled until the 12th century. Alfred himself was a fine writer and scholar. Called “the presiding genius” of Old English prose, he ordered translation of or himself translated many Latin works into Old English and in general did much to foster learning. Although the Anglo-Saxons were the first Germanic people to commit their poetry to writing, beginning in the seventh century with a work known as *Widsithis* (The far journey), only one full-length heroic epic survives in Old English: the eighth-century *Beowulf*.

Religion

Sources Once again aspects of early Germanic religion that have been gleaned from ancient written sources since the 19th century have created the impression that more is known—and more certainly known—than is actually the case. As with the Celts, Romans reported on Germanic religious practices. In an interesting parallel with the Irish scholar monks who, living on the far fringes of the Celtic world, wrote about Irish-Celtic mythology from a Christian perspective long after paganism had ceased among them, other important sources on Germanic religion are writings from the far periphery of the Germanic world, namely, Christianized Iceland, by Snorri Sturluson and others. Snorri Sturluson, an Icelandic historian, poet, and politician who lived some 200 years after Christianity was introduced to Iceland, in his *Prose Edda*, also called the *Snorra Edda*, wrote an account of the creation of the world, pagan poetry, and stories about the gods. His writings were seized on by 19th-century German scholars, notably the Grimm brothers, in the name of seeking the ancient spiritual roots of the Germanics, even as Irish

and Welsh scholars were seeking theirs by studying early medieval writings.

Evolution in Germanic Religious Belief

Archaeology has considerably modified the picture of religious belief given by Snorri, perhaps, most important, in providing evidence of much earlier practices and deities that by the early centuries C.E. had largely been overlain by a stratum of later belief, only here and there showing through, as rock outcrops of ancient times, with their fossils of sea creatures, here and there show through the soil of today even far inland.

The goddess Nerthus, mentioned by Tacitus as an important deity, seems by the time of Snorri to have metamorphosed into a god named Njordar (perhaps originally her twin brother). Odin is thought by some scholars to have begun as a god of shamans of far northern Scandinavia but by historic times had become preeminently the god of kings and kingly power with little in terms of a popular cult of ordinary folk, judging by the few place-names or cult places clearly linked with him.

Religion among Germanic peoples was evolving as their societies were evolving with ever greater speed during the first centuries C.E., and it is not surprising to find disagreements among the various sources whose reports are from different centuries.

The Vanir or Wans The two groups of Germanic gods mentioned in sources, the Vanir or Wans and the Aesir, show this evolution clearly. The Vanir, the older of the two and agrarian in nature, supposedly had been usurped of much of their power by the newer and more warlike Aesir. Nerthus was one of the older Wannic deities, described by Tacitus in 98 C.E. as “Mother Earth.” He tells us that she was worshipped by the tribes of northern Germany and southern Jutland, whom he identifies as the INGVAEONES. He claims that a sacred grove and a carriage covered with a vestment were dedicated to her and that slaves who participated in rituals honoring her at a secret lake were drowned; wherever her carriage traveled, peace and tranquility reigned and people celebrated. This description is consistent with archaeological finds, as in the many votive offerings and also sacrificial victims deposited in bogs and watery sites during the Iron Age in Denmark and northern Germany. At the cult place of Uppsala in Sweden sacrifices were put into the well that stood before a great evergreen, and those that sank were known to have

been accepted and to indicate that the prayers given with them would be answered.

The goddess's sacred car has even older antecedents in elaborately wrought cult wagons of the Bronze Age. Frey, one of the Vanir mentioned in later sources, was the foremost of the fertility gods and was associated with the horse. The so-called Sun Chariot found in Trundholm, Denmark, dating from the Bronze Age, had a finely wrought model horse on wheels in front of a wagon with a large disk, thought to represent the Sun, being pulled across the sky. Horses were commonly used as Sun symbols in many cultures, and Frey's association with fertility may have been involved with his capacity as a Sun god.

On the other hand there are indications that overland ship processions may have been important among Germanics. Tacitus mentions that the Suebi worshipped the Egyptian goddess Isis, whose most important rite in her native land was being carried in procession in a ship. Tacitus may have heard of such an observance among Germanics and imposed his own understanding upon it, assuming the Germanics were honoring Isis. A German account of 1133 C.E. tells of a ship procession overland from Aachen to Maastricht and beyond, the ship greeted in each town with joyous shouts and dancing far into the night, possibly a celebration called forth by dim folk memory of the Peace of Nerthus. The account mentions the repugnance with which church authorities viewed this custom, denouncing it as heathenish and sinful. The elegant ship found buried in Oseberg, so clearly unfit for extended voyaging, could have been used in such processions, and Snorri says of the ship of the goddess Freyja that it could travel on both land and water.

Tacitus also tells us that the amber-gathering Germanics on the east coast of the Baltic worshipped "the mother of the gods," whose emblem was the wild boar, an image of which was worn by her folk. The boar was the sacred animal of Frey's sister Freyja. This goddess was associated with peace, too, since the boar amulet supposedly brought its wearer peace of mind and protection even among enemies.

The Aesir According to legend many of the Aesir were descended from Odin, the leader of the gods. He was known as the battle god, the god of royal power, the god of knowledge, the god of poetry, the god of seafarers, and the god of the slain. His many attributes suggest that he had absorbed a number of other deities

along with their functions, even as Gothic war leaders-cum-kings gained the allegiance of peoples of many different ethnicities. He created the first man and woman, Ask and Embla, from tree trunks. His home was known as Valhalla. Odin's quest for knowledge was motivated by the need to collect intelligence to prepare for the doomsday battle that had been foretold, called Ragnarok. He could interrogate the dead and had two ravens, named Huginn, "thought," and Munnin, "memory," which flew all over the world daily. Odin's qualities of ruthlessness and cunning and his drive to obtain strategic knowledge were qualities that would benefit both warriors and merchants, making him a god for his times. Thor, another one of the Aesir, born of Odin and the goddess of the Earth, was the protector of the gods and of humans, charged with defending the world against giants. Known for his strength and his fighting prowess, he carried a hammer. The god of rain and thunder, he was also associated with farming. The Vikings sacrificed to Odin in time of war, Thor in times of famine or plague, and Frey before wedding celebrations and possibly at funerals. Several royal dynasties in Sweden and Norway claimed Frey as their founding ancestor.

Viking religion held that slain warriors were carried to the realm of the gods. In Valhalla they would then fight battles during the day and feast at night on boar meat and mead, an alcoholic drink made from honey, in preparation for the battle of Ragnarok. Those warriors who did not die in battle supposedly rotted in the cold north.

The cosmology of the Norse described by Snorri may have been common to other Germanic peoples, although his perspective as one living in a country that had been Christian for two centuries must be remembered. Snorri describes how the brothers Odin and Vilji og Ve made the world out of the body of a giant called Ymir. Ymir's skull, held by four dwarfs standing at the poles of the compass, west, east, north and south, was the sky, and inside it were the Sun and the Moon. The Earth was flat and surrounded by sea. In the middle of the Earth was Midgardur, inhabited by men. Around Midgardur stood a great wall for protection against the giants, which lived along the coasts.

Above the Earth but rooted there was a gigantic ash tree, called Askur Yggdrasil, its crown reaching above the sky. The tree's three roots each stood in a well. One well, called Mimisbrunnur, was located in Joetunheimar, or the giants' world. Another, called Hvergelmir,

was in Niflheimar, a very cold world far up in the north. The third well, called Urdarbrunnur, was in Asgardur, in heaven, the home of the Aesir. From Asgardur a bridge, called Bifrost, reached down to Midgardur on earth. The bridge, usually invisible to humans, from time to time appears as the rainbow. Far in the south was a very hot world, called Muspell.

Conversion to Christianity The Ostrogoths, Visigoths, Vandals, and Lombards were converted to Christianity of the Arian creed rather than to orthodox Catholicism and were soon seen as heretics. The one great written remnant of the Gothic language is a translation of portions of the Bible made by Ulfilas, the missionary who converted them.

The Franks, under the leadership of their king, Clovis, converted to Roman Catholicism in the sixth century, to some degree for the purpose of winning support from the Gallo-Roman aristocracy. Several centuries later Frankish missionaries and warriors led by Charlemagne undertook the conversion of their northern Saxon neighbors by armed force, in a series of campaigns whose purpose was the incorporation of Saxon lands into the Frankish empire. Christianity seems to have been important to many Germanics, especially of the ruling class, because it represented the sacred aspect of the Roman Empire. For centuries after the fall of Rome Germanic kings sought the favor of popes in the hope of being crowned Emperor of

Rome. The fact that the “Roman Empire,” whatever that may have meant by the time of the Middle Ages, was called the Holy Roman Empire gives a sense of how closely intertwined was the concept of Christ’s kingdom with that of a secular but divinely inspired empire of the faithful, the mandate of whose emperor transcended those of the kings of the various nation-states warring and jostling among themselves for power.

The fourth-century Gothic Bible shows that the concept of the *thiudans* or sacred king still existed at that time, although among secular rulers applied only to the Roman emperor. A century later Theodoric the Great of the Ostrogoths was called *thiuda-reiks*. It is likely that in the sixth century the readiness of Clovis’s people to follow him in converting to Catholicism arose in part from the ancient Germanic custom of looking to the sacred king for spiritual leadership. The charisma of Clovis’s Merovingian dynasty was such that long after real power in Francia had passed to Charles Martel and his descendants, only the pope in Rome (formerly the seat of the Roman *thiudans*, the emperor) had the spiritual authority to anoint one of the latter as king, to transfer God’s grace from one family to another. Thus in concept at least the heritage of later Holy Roman Emperors, who conceived of themselves as descending from Charlemagne, stretched back almost without interruption to the sacred kings of the Germanics.

Martin Luther burns the papal edict in Wittenberg in 1517 in this 19th-century painting. (Library of Congress, Prints and Photographs Division [LC-USZ62-125570])

Martin Luther: Founder of Protestantism

Martin Luther, born at Eisleben in the region of Saxony, Germany, in 1483, was the son of a copper miner, Hans Luther. At the age of 17 Martin enrolled at the University of Erfurt, with the intention of pursuing law. Yet in the summer of 1505 he abandoned his studies, sold his books, and entered an Augustinian monastery; he was eventually ordained as a priest. He was selected to teach philosophy at the University of Wittenberg, a new university staffed by monks. In 1509 he received his bachelor's degree in theology, and in 1512 his doctorate, whereupon he was granted the chair of biblical theology at Wittenberg, which he held until his death.

In the course of his studies Luther began questioning the practices of the Catholic Church, in particular the selling of indulgences. On October 31, 1517, he posted his Ninety-five Theses (possibly on the door of Castle Church in Wittenberg, as tradition maintains). The emperor, Charles V, condemned him when he refused to recant before the Diet of Worms in April 1521. A friend, Frederick of Saxony, kept him in hiding at his castle, where Luther worked on his writings.

Luther maintained that God interacts with Christians through the law, such as the Ten Commandments, as well as the Gospel, the message concerning Christ, the kingdom of God, and salvation. He also maintained that all Christians are born both sinners and saints and can only be salvaged by the grace of God, not by their actions. Accordingly he believed God cannot be understood through philosophy but only can manifest himself. Luther challenged the pope's political authority as the final interpreter of the Scripture. His theology, however, was misinterpreted by the peasants during the Peasants' War against the nobility in 1524–26, which he strongly opposed, causing him loss of support.

Luther's reforms were the basis of what is known as the Protestant Reformation and the Protestant sect known as Lutheranism. As an active priest and teacher he translated the New Testament into German and published many works to support his theology, including *On Christian Liberty*, *The Babylonian Captivity of the Church*, *On the Bondage of the Will*, and *Small Catechisms*.

Luther's marriage to Katharina von Bora, a former nun, initiated the tradition of clerical marriage. His hymns inspired congregational singing. Late in life he wrote controversial polemics against Jews, the papacy, and Anabaptists (who believed baptism should only be administered to believers and not to infants). He died at Eisleben in 1546.

Portrait shows Martin Luther (*Library of Congress, Prints and Photographs Division [LC-USZ62-106323]*)

Protestant Reformation and the Holy Roman Empire The presence in German lands of the Holy Roman Empire gave added impetus to the 16th-century Protestant reform movement there. Its secularizing aspect, the determination to loosen the grip of the church on affairs of state, was apparent in the ambition of German princes, especially in the north, to

gain independence from the empire. In Germany many of the same trends fueling desires for reform existed as in other countries—growing discontent with church corruption and with theologically based strictures on financial and economic activity, and the humanist movement, among others. When Martin Luther (see sidebar), who had begun the Reformation with his highly publicized denunciations of the Catholic Church and his posting of the Ninety-five Theses in 1517, was excommunicated and declared an outlaw—the Holy Roman Emperor Charles V thundering against him—the powerful elector of Saxony, Frederick III, took Luther into his protection. The incredible speed with which the Reformation spread through central and northern Germany was in large part driven by the eagerness of German princes to be free of the empire.

The violence that for centuries would attend the Protestant-Catholic opposition all over Europe appeared early in Germany in the Peasants' War (1524–25), whose proponents saw in Luther's theology support for their cause (which Luther himself repudiated), and the Knights' War (1522–23), in which the emperor unsuccessfully attempted to force the ecclesiastical princes (those who had left church and empire) to accept his rule once more. In the 17th century the Thirty Years' War would concentrate the conflicts unleashed in much of Europe and fight them out mostly on German soil.

Throughout the 16th century Protestantism continued to spread in Germany. By 1530 the principalities of Bayreuth, Ansbach, Anhalt, and Brunswick-Lüneburg and, in the next few years, Pomerania, Jülich-Cleve, and Wurtemberg had all left the Catholic Church. Soon afterward Silesia and the duchy of Liegnitz followed. In a few years almost all of Germany, from the Netherlands frontier in the west to the Polish frontier in the east, the territory of the Teutonic Order in Prussia, central Germany with the exception of the greater part of the western portion, and (in southern Germany) Pfalz-Zweibrücken and other small domains, with numerous free cities, was Protestant. Maximilian II, emperor from 1564 to 1576, was lukewarm in defense of Catholicism, having Protestant leanings himself. By 1600 only a few Catholic enclaves remained. Two of them, Bavaria and the Tyrol in the Austrian Alps, were compared by a contemporary Catholic churchman to the two tribes of Israel, which alone were saved while all the others were carried off captive.

The Catholic Church was mounting determined efforts to turn the tide, however. This movement is generally called the Counter-Reformation. Standing nunciatures (papal embassies) were established at Catholic courts instead of the former somewhat informal special envoys; men of probity replaced corrupt church officials; colleges of Jesuits, the priestly order in the forefront of the fight against Protestantism, were established in many areas of Germany. The Hapsburg emperor Rudolph II, a staunch Catholic, pressured Catholic German princes to reform the Catholic Church in their realms. The Jesuit-educated Ferdinand of Styria, who would later ascend to the Hapsburg throne as Ferdinand II, succeeded in re-Catholicizing his previously Protestant domains of Carniola and Styria.

These efforts met with resentment in many quarters, particularly in countries, such as Bohemia, under direct Hapsburg rule. Under the Peace of Augsburg in 1555 the practice of Lutheranism had been sanctioned in the empire, and Protestants began building churches, in some cases on lands owned by the Catholic Church, but held from the Crown and thus falling under the terms of the Peace of Augsburg. Then, however, local ecclesiastical rulers made use of an ambiguity in the terms concerning such lands, declaring that they were not held from the Crown but remained under Catholic jurisdiction. In 1617 in two Bohemian districts Protestant churches were destroyed and Protestant worship forbidden. Failing to obtain satisfactory redress from the imperial government, in 1618 Protestant nobles met with two local imperial officials in Prague and hurled them out of a window in the so-called Defenestration of Prague, which inaugurated the conflict that would grow into the Thirty Years' War. Imperial forces, aided by the Catholic League, a military alliance among Catholic princes, marched against the Bohemians and defeated them in 1620.

Among the first acts of the rebel Bohemian government were to confiscate church lands and to eject the hated Jesuits from Bohemia, both indicative of the deep frustration felt in many places north of the Alps at interference in local affairs emanating from Rome. The connection of the Holy Roman Empire with the papacy, which for centuries had anointed the emperor with the chrism of Christ's own church and assured him the fervent loyalty of all Germans, would now prove its undoing.

During the first part of the Thirty Years' War the Catholic side was more successful, and

parts of Germany were returned to the Catholic fold. The Edict of Restitution (1629), issued by Ferdinand II, declared that ecclesiastical lands that had been seized by Protestant princes at the beginning of the Reformation should revert to Catholicism, an eventuality that would have had grave consequences for Protestantism. However, the entry of Sweden, France, and other Protestant supporters into the war swung the balance the other way, and when the Treaty of Westphalia brought the conflict to an end, its provisions kept the ecclesiastical lands in Protestant hands and stipulated that rulers could continue to determine the religion of their subjects (although they were free to allow toleration if they chose). Because most German princes were Protestant, this was a severe blow to the Catholic Church. However, in the Hapsburg territories of Bohemia and Austria the emperor was given a nearly free hand to reimpose Catholicism. But the fervor of the Counter-Reformation was lost in the war, which had been so devastating for the German people, exhausting them in body and spirit, and in Germany the power of the Hapsburgs, the foremost promoters of the Catholic Church, was broken.

In the study of early Germanic society it is important to understand that most of what we know dates from the time after the start of the first millennium C.E., when Germanic peoples were undergoing rapid and radical changes stemming from increasing contact with Romans. Some Germanic groups became increasingly intertwined with and integrated into Roman society as time went on, greatly changing that society as well. The frontier society that developed along the Rhine during the first centuries C.E. was neither fully Roman nor wholly barbarian. Other groups suffered dislocation and displacement during the wholesale movements that kept Europe in a turmoil for centuries. Thus no single picture of Germanic society through time or across space is possible. Some tribes, such as the Vandals and Suebi, were adventurers and invaders; others, such as the Visigoths, developed from refugees into the creators of a vibrant and stable society; the Franks, long nurtured by the last Romans as they guarded them, learned from their example how to establish an empire of their own; the Ostrogoths for a brief moment succeeded in integrating Germanic and Roman societies. Understanding the early Germanics is important because their outlook and institutions

GERMANS: NATIONALITY**nation:**

Germany (Deutschland); Federal Republic of Germany (Bundesrepublik Deutschland)

derivation of name:

Meaning "land of the spear men" from the Germanic roots *gar*, or spear, and *man*

government:

Federal republic

capital:

Berlin

language:

Official language of Germany is German; Standard High German differs from many dialects of spoken German; minorities such as Danes, Sorbs, Frisians, and Roma preserve their native languages; Italian, Greek, Turkish, Spanish, and Serbo-Croatian are also heard.

religion:

About 38 percent of the population are Protestant; about 34 percent Roman Catholic; an equal percentage profess no religious affiliation; a small percentage are Muslim and Jewish.

earlier inhabitants:

Scythians; Sarmatians; Celts; tribal Germanics (Suebi; Franks; Saxons; etc.); Romans; tribal Slavs (Polabians, etc.)

demographics:

About 90 percent of the population are Germans; Turks make up the largest minority; other groups include Danes, Sorbs, Frisians, Roma, Serbo-Croatian, Italians, Russians, Greeks, Polish, Spanish, and Jews.

formed the basis of the history and society of most of western Europe in the early Middle Ages and beyond. Even today Europe would be a far different place if it had not felt the seminal influence of the early Germanic peoples.

Germans: nationality (people of Germany)

GEOGRAPHY

Germany is bordered by the Netherlands, Belgium, Luxembourg, and France to the west;

Switzerland and Austria to the south; the Czech Republic and Poland to the east; and Denmark to the north. The Baltic Sea extends from Germany in the northeast. Germany has a total area of 137,827 square miles. Northern Germany consists of low-lying plains used for farming, notably, the North German Plain; hills and forested uplands make up central Germany, and to the south lie the Central Alps. The Bavarian Alps, part of the southern Alpine zone, contain the Black Forest, the Bavarian and Bohemian Forests, and the Franconian and Swabian Mountains. Germany's highest peak, Zugspitze (9,718 feet), is also found there. Off Germany's coast are several islands, including the Frisian Islands, Helgoland, and Rügen. The Rhenish Slate Mountains and the Ruhr Valley in the west are the sites of major mining industries; the Rhineland in the south is a large agricultural region. The important waterways of Germany include the Rhine River; the Oder, which defines the Polish-German border; and the Elbe River. These rivers are important resources for Germany's industrial and commercial development. Principal lakes include the Lake of Constance and the glacial lakes of Bavaria.

INCEPTION AS A NATION

Before the ninth century C.E., Germany was a collection of tribal GERMANICS—the FRANKS the most powerful among them. Out of these kingdoms, principalities and duchies emerged. Although the Holy Roman Empire incorporated Germanic emperors, no national German identification developed with this entity; present-day Germany was only a small portion of its territory, encompassing many different peoples, cultures, and lands (including portions or entireties of modern-day France, Italy, Hungary, Austria, and Poland). Internal struggle and outright civil war broke out, especially in the 12th and 13th centuries; whole countries were won and lost during respective periods of strong centralized power or near anarchy.

By the time the French under Napoleon I Bonaparte conquered the region in 1806, officially dissolving the Holy Roman Empire, German principalities within the empire had gradually become more powerful and autonomous. German nationalism grew throughout the Napoleonic Wars. In 1815, led by the Prussian principality, the German states formed a confederation that lasted until 1867. However, internal struggles with Austria prevented formation of a proper unified German nation until Prussian ruler Otto von Bismarck seized control in the

Germans: nationality time line**C.E.**

- c. 800** Oldest known literary work in German, epic *Hildebrandslied* (*Lay of Hildebrand*), is written.
- 843** Charlemagne's empire is divided into three kingdoms under Treaty of Verdun; Louis II wins lands east of Rhine River, which later become Germany.
- 911** German kingdom is divided into duchies of Bavaria, Lorraine, Franconia, Saxony, and Swabia.
- 955** Otto I defeats Hungarians in southern Germany, extending northern German boundary and gaining parts of middle Frankish territories, including Italy.
- 962** Otto I is crowned; he is later designated first Holy Roman Emperor.
- 1075** Henry IV and Pope Gregory VII dispute over religious power; civil wars result.
- 1138** Hohenstaufen emperors unite Germany.
- c. 1200–1210** Epic poem *Nibelungenlied* (*Song of the Nibelungen*), based on pagan Germanic traditions, is written.
- 1210** Gottfried von Strassburg writes epic poem *Tristan and Isolde*; Wolfram von Eschenbach writes epic *Parzival*.
- 1254** Hohenstaufen dynasty ends.
- 1273** Rudolf I becomes first Hapsburg ruler.
- 1300s** Hanseatic League rules northern Germany.
- 1450** Printer Johannes Gutenberg constructs printing press that uses movable type.
- 1514** *Melancholia I* by Albrecht Dürer exemplifies technique of engraving.
- 1517** Lutheran revolt brings about Protestant Reformation.
- 1521** Martin Luther publishes German translation of Bible.
- 1555** Emperor Charles V signs Peace of Augsburg, permitting Protestantism.
- 1609** Mathematician and astronomer Johannes Kepler announces laws of planetary motion in *Astronomia nova*, expanding on them in 1619 in *Harmonice mundi*.
- 1618** Ruler of Brandenburg inherits duchy of Prussia.
- 1618–48** Religious conflicts of Thirty Years' War; Peace of Westphalia ends war.
- c. 1620** In *Summa theologie* Albertus Magnus attempts to reconcile Christian and Aristotelianism teachings.
- 1721** Georg Philipp Telemann settles in Hamburg, becoming town music director.
- 1740** Frederick the Great, king of Prussia, gains Silesia, Austrian province; war between Prussia and Austria results.
- 1740–56** War of Austrian Succession
- 1742** George Frideric Handel's oratorio *Messiah* is first performed.
- 1747** Composer and organist Johann Sebastian Bach visits Prussian king Frederick II (Frederick the Great) in Potsdam and improvises on newly invented pianos.
- 1756–63** Seven Years' War begins, with Prussia and Austria competing for Silesia; Great Britain and France, allies of Prussia and Austria, respectively, carry the war abroad in an overseas struggle for colonial power; peace treaty at end of Seven Years' War maintains Prussian control of Silesia.
- 1770** Philosopher Immanuel Kant receives chair at University of Königsberg as professor of logic and metaphysics.
- 1781** *Critik der reinen Vernunft* (*Critique of Pure Reason*) by philosopher Immanuel Kant is published (revised in 1787).
- Astronomer Friedrich Wilhelm Herschel (Sir William Herschel to British) discovers planet Uranus.
- 1788** Georg Wilhelm Friedrich Hegel enters seminary at University of Tübingen, where he becomes friends with philosopher Friedrich Wilhelm Joseph von Schelling and poet Friedrich Hölderlin.

(continues)

Germans: nationality time line (continued)

- 1799** Poet and playwright Friedrich von Schiller moves to Weimar where he devotes his time to writing.
- 1799–1804** Naturalist Alexander von Humboldt conducts studies in Latin America.
- 1800–24** Ludwig van Beethoven composes nine symphonies.
- 1806** Napoleon I Bonaparte establishes series of French dependent German states known as Confederation of the Rhine, ending Holy Roman Empire; Prussia declares war on France.
- 1807** Carl Friedrich Gauss is appointed professor of mathematics and director of observatory at Göttingen.
- 1812** When Napoleon fails to conquer Russia, Austria, the United Kingdom, Prussia, and Russia unite against France.
- 1812–15** *Kinder-und Hausmärchen (Grimm's Fairy Tales)* by brothers Jacob Ludwig Karl Grimm and Wilhelm Karl Grimm are published.
- 1815** Napoleon I Bonaparte is defeated at Waterloo; German Confederation, a union of 39 independent states, is formed at Congress of Vienna.
- 1819** Philosopher Arthur Schopenhauer's principal work, *Die Welt als Wille und Vorstellung (The World as Will and Idea)*, is published.
- 1822** Heinrich Heine's first volume of verse *Gedichte (Poems)* is published.
- 1830** Robert Alexander Schumann abandons study of law in order to devote himself to music.
- 1832** Johann Wolfgang von Goethe completes poetic drama *Faust*; Werner Karl Heisenberg wins Nobel Prize in physics.
- 1843** Composer Felix Mendelssohn helps found Leipzig Conservatory and begins serving as director.
- 1847** Physicist and anatomist Hermann Ludwig Ferdinand von Helmholtz publishes paper on the principle of conservation of energy; in 1850 he determines velocity of nerve impulses.
- 1849** Frankfurt Assembly meets with hope of unifying nation after Germans revolt; German Confederation is reestablished.
- 1866** Bismarck fights Austria in Seven Weeks' War; German Confederation is dissolved; Bismarck annexes Prussian territory and establishes North German Confederation.
- 1867** First volume of *Das Kapital* by political philosopher Karl Marx is published; second and third volumes, edited by Friedrich Engels, are published in 1885 and 1894.
- 1870–71** In Franco-Prussian War France and Prussia dispute over Spanish throne.
- 1871** Wilhelm I becomes first kaiser of German Empire, uniting all German states; Bismarck becomes chancellor.
- 1874** Composer Richard Wagner completes text for four-part epic cycle *Der Ring Des Nibelungen (The Ring of the Nibelungs)*.
- 1882** Italy joins Austria-Hungary and Germany to form Triple Alliance.
- 1883–85** Philosopher Friedrich Wilhelm Nietzsche presents his theory of Übermensch ("Superman" or "Overman") in *Also sprach Zarathustra (Thus Spake Zarathustra)*.
- 1902** Historian Christian Matthias Theodor Mommsen wins Nobel Prize in literature.
- 1907–08** Rainer Maria Rilke develops new style of lyric poetry in *Neue Gedichte (New Poems)*.
- 1908** Philosopher Rudolf Christoph Eucken wins Nobel Prize in literature.
- 1910** Prose writer and poet Paul Johann Ludwig Heyse wins Nobel Prize in literature.
- 1912** Playwright Gerhart Johann Robert Hauptmann wins Nobel Prize in literature.
- 1914** Germany supports Austria when World War I begins.
Albert Einstein becomes professor at University of Berlin; in 1921 he wins Nobel Prize in physics.

- 1918** Germany becomes republic; under Treaty of Versailles, ending World War I; German part of Lorraine is ceded to France; Allies occupy Rhineland, and Germany is required to reduce army and pay reparations.
Max Karl Ernst Ludwig Planck wins Nobel Prize in physics.
- 1919** New constitution is written under an elected national assembly; Weimar Republic is established; two-parliament house and people elect president, who appoints the chancellor.
Walter Adolph Gropius founds Bauhaus school of design in Weimar.
- 1920s** German expressionism finds an outlet in such silent films as *Das Kabinett des Doktor Caligari* (*The Cabinet of Dr. Caligari*), directed by Robert Weine in 1919–20, and *Metropolis*, directed by Fritz Lang in 1926.
- 1928** *Die Dreigroschenoper* (*The Three-Penny Opera*), a collaboration by composer Kurt Weill and writer Bertolt Brecht, opens.
- 1929** Novelist Thomas Mann wins Nobel Prize in literature.
- 1934** President Hindenburg dies, and Adolf Hitler, who was declared chancellor in 1933, declares himself der führer; Nazi government is known as Third Reich.
- 1936** Germany occupies Rhineland.
- 1938** Germany annexes Austria and Sudetenland; German Jews, Jewish properties, and synagogues are attacked during Kristallnacht, or Night of Broken Glass.
- 1939** World War II begins when Germany invades Poland.
- 1945** Germany surrenders to Allies; World War II ends; Germany is divided into four zones occupied by United States, Britain, France, and Soviet Union; by Potsdam Conference the occupying powers agree to rebuild and govern Germany.
- 1945–46** In Nürnberg (Nuremberg) trials Nazi war criminals are sentenced.
- 1946** Novelist Hermann Hesse wins Nobel Prize in literature.
- 1947** German National Library is founded in Frankfurt; it moves to Berlin in 1970.
- 1948** Americans, British, and French integrate their sections of Berlin into one economic entity.
- 1949** U.S., French, and British zones become West Germany or Federal Republic of Germany; Soviet zone becomes East Germany or Communist German Democratic Republic.
- 1955** West Germany joins North Atlantic Treaty Organization (NATO); East Germany joins Warsaw Pact.
- 1957** Germany joins European Economic Community (EEC), which evolves into European Community (EC).
- 1960s–70s** Filmmakers Wim Wenders, Rainer Werner Fassbinder, Werner Herzog, and Volker Schlöndorff help establish Neu Welle, German New Wave, in cinema.
- 1961** Berlin Wall is erected.
- 1966** Poet Nelly Leonie Sachs wins Nobel Prize in literature.
- 1970** Karlheinz Stockhausen creates multimedia work *Stockhoven-Beethausen*, part of celebration of 200th anniversary of birth of composer Ludwig van Beethoven.
- 1972** Novelist Heinrich Böll wins Nobel Prize in literature.
- 1973** West Germany and East Germany join United Nations (UN).
- 1989** Berlin Wall is torn down.
- 1990** East and West Germany are united under Chancellor Helmut Kohl.
- 1991** Parliament declares Berlin new capital of United Germany.
- 1993** Germany becomes one of 12 original members of European Union (EU).
- 1999** Novelist Günter Wilhelm Grass wins Nobel Prize in literature.

German men and women cut rye near Schwarza, Germany, in the early 20th century. (Library of Congress, Prints and Photographs Division [LC-USZ62-118961])

Austro-Prussian War of 1866 and the Franco-Prussian War of 1870–71. In 1871 the German Empire was born; it consisted of present-day Germany, much of Poland, and present-day French regions of Alsace and Lorraine. Germany continued to become a major industrial and colonial power; its defeat in World War I (1914–18) led to a great reduction in its size, loss of power, and economic ruin. The ultranationalist Nazi Party emerged, launching World War II in 1939, during which Germany recovered much lost territory and occupied great portions of the European mainland. Defeat in 1945 reduced Germany's borders, and it lost much of its former Prussian lands to Poland. Germany was also divided into United States, British, French, and Soviet zones of occupation. In 1949 the U.S., British, and French zones were reconstituted, forming West Germany (the Federal Republic of Germany) and East Germany (the German Democratic Republic). The city of Berlin within the borders of East Germany was also divided. The collapse of Communist power in the East led to dismantling of the Berlin Wall in 1989 and German reunification in 1990.

CULTURAL IDENTITY

In considering the nature of the Germans' sense of their national cultural identity it is

important to remember that Germany's political organization differed greatly from those of other European nations, particularly France and Great Britain, who had unified states with strong central governments by the end of the Middle Ages. In contrast, for centuries the political organization of Germany consisted of a loose confederation of bishoprics and principalities of various sizes under the no more than notional rule of the Holy Roman Emperor. In spite of this decentralization culture flourished in German lands. The Bach family in Thüringen provides a case in point; over seven generations they produced more than 50 important musicians, many of them in the latter 17th and 18th centuries. Johann Sebastian Bach was employed by the princes of Weimar and of Anhalt-Köthen (at the latter's court he composed the *Well-Tempered Klavier*) and dedicated a set of orchestral concertos to the Margrave of Brandenburg, a small principality in the sphere of influence of Prussia but nevertheless independent. Later in life he went to Leipzig to direct music at St. Thomas's Church, where his employers were the council. However parochial the people of Leipzig were, and however often Bach quarreled with the council, his employment there afforded him the peace and security to compose almost 300 cantatas and his most epic works—among them the *B minor Mass* and the *St. Matthew* and *St. John Passions*. In the 18th century three generations of the Beethoven family were employed at the court of the elector archbishop of Cologne, who maintained, in addition to a church choir, a full orchestra capable of playing the greatest works of the day, and an opera company.

The arts and sciences have long been central to German identity, a product of the long centuries, from the later Middle Ages to the 19th century, of political impotence. In contrast to France, the German Enlightenment of the 18th century played itself out largely in intellectual rather than active political achievement and was thus marked by a somewhat unworldly idealism. Its great heroes were not princes and military leaders as in France and England but rather poets and philosophers such as Friedrich von Schiller, Immanuel Kant, and preeminently Johann Wolfgang von Goethe, sometimes called the "George Washington" of Germany. As the universalizing tendencies of the Enlightenment were replaced by the nationalist revivals of the romantic movement, the idea of a German nation rooted in a primordial substrate of the soul of the

German Volk was born in the minds of scholars such as the Grimm brothers. A strong impetus toward German nationalism came to life in Prussia in reaction to its conquest and occupation by Napoleonic France.

Thus a sense of German nationhood has been a somewhat reactive one, and when the unified German state came into being in the 19th century, its leaders looked abroad, particularly to Great Britain, for models of how to proceed. The fact that German unification very soon led to the unparalleled disasters—for Germany and for the world—of the two world wars and Nazism has cast a deep shadow on Germany as a political entity. The shadow only slowly began to lift in the latter half of the 20th century as a result of the Germany's deep commitment to pacifism, social justice, and equality and the German government's lavish support of cultural enterprises. A huge number of organizations, maintained entirely or in part by public funds, are devoted to cultural exchange between Germany and the rest of the world. These efforts are aimed at acquainting the international public with the culture, life, and language of the German peoples and familiarizing the German public with those of other countries. Special emphasis in foreign cultural exchange is placed on fostering educational and cultural ties with the world's less-developed countries. For them Germany has not only assumed a major role in lending reserves of technological skill and capital for developing resources, but it has also become a major center for the education and training of students of these countries in the professions, the sciences, and technology. In this way Germans strive to realize the ideal of the German nation as essentially a cultural rather than a political entity.

It has been said that Goethe's poetry is part of the history of the German soul, revealing its essence. Even a simple poem like "The Heath Rosebud," about a budding rose trying to fend off with her thorns the boy who would pick her, only to be plucked at last, gives a sense of German reticence in love, or "Bliss in Sorrow," that is, the value of tears of unhappy love in preventing despair.

Getae (Getians; Geto-Dacians)

The name Getae appeared in texts of the GREEKS, such as those of the fifth-century B.C.E. historian Herodotus, in reference to a people living in present-day Romania from the Carpathian Mountains to the Danube River. Ancestral tribes, grouped together as THRACIANS, are thought to have settled the region by the sixth century B.C.E.

The Getae spoke a Thracian dialect but were influenced culturally by the SCYTHIANS and SARMATIANS living to the west and became skilled horse-mounted archers. CELTS who settled in the region in the fourth and third centuries B.C.E. influenced their technology. One of the Getic deities was Zalmoxis. Getae first appeared in the Athenian slave market in the fourth century. They eventually became trading partners with the Greeks, imported Greek wine, and began to use Greek coins. The Getae formed a royal alliance with the MACEDONIANS; a Getic princess married Philip II in 342 B.C.E. Philip's son, Alexander the Great, invaded their territory during his reign.

Some scholars consider the Getae and DACIANS to be the same people at different stages of their history and discuss their culture as Geto-Dacian. In the mid-first century B.C.E. Burebistas organized a kingdom consisting of descendants of those whom the Greeks had called Getae, as well as Dacians, or Daci, the name applied to people of the region by the ROMANS.

Other peoples of other language families became known as Dacians in ancient times because they lived in the province known as Dacia. The name Getae was mistakenly applied by later writers to the GOTHs.

Golaseccans (Golaseccii)

The Golaseccans lived in the southern Alps in present-day northwestern Italy. They are considered the earliest CELTS in that region, dating to about 1000 B.C.E.; they spoke the Lepontic form of Continental Celtic. (They may have been Celtic speaking from their beginnings, perhaps Celticized as a result of contacts with Celts living north of the Alps.) The Golasecca culture is associated with that of the INSUBRES and LIBICI, who are thought to be their descendants.

Golden Horde *See* MONGOLS.**Goplanians (Goplans; Goplanes)**

The Goplanians are classified as a tribe of Western SLAVS, living in the Inowroclaw region of present-day north-central Poland by the beginning of the ninth century C.E. As were all Western Slavs they were called WENDS by early medieval FRANKS. Along with the POLANIANS, who gained hegemony over other area tribes in the 10th century, they are among the ancestors of the POLES.

Goths (Gothi; Gotones; Gothones; Gutones; Gutonen; Götar; Ostrogoths; Visigoths)

The Goths were a confederacy of tribes, including a small Germanic tribe known as the Gutones or Gutonen (from whom the Goths name may have been derived; *Gutones* may mean the people) and other peoples, some from the Asian steppes. By the third century C.E. they had gathered around the Greek and Roman cities along the Black Sea. The Gothic confederacy became increasingly unified under the command of a single overall war leader or king. They were an important conduit by which cultural elements from steppe peoples traveled west, one of these the use of cavalry.

The Goths later subdivided into the OSTROGOTHS and VISIGOTHS, who became some of the most powerful of the GERMANICS and spread into western Europe. The name Goth has also been applied to all the eastern Germanic tribes, including the Goths proper, BASTARNAE, BURGUNDII, GEPIDS, HERULI, LOMBARDS, LUGII, RUGII, SCIRI, and VANDALS, but the histories of the various groups are distinct.

ORIGINS

Events in the interior of Germanic territory in the early centuries C.E., whose details are not

known, led to changes and migrations among Germanic and other peoples.

Gothic legend maintained that the Goths had migrated from Scandinavia as a whole people in three boats and reached the estuary of the Vistula, but this event is unlikely. In any case by the first century some among them—perhaps the Gauti or Gauts, a people of present-day central Sweden—may have settled in the territory between the island of Rügen in present-day northeastern Germany and the Vistula River in present-day northwestern Poland (a region known as Pomerania and later Prussia). Archaeologists have named the culture Willenberg-Wielbark after the Polish town; it was distinct from other cultures in the region in that the deceased were buried without their weapons, a custom maintained by later Goths.

The perhaps ancestral Gutones, are thought to have settled along the eastern bank of the Vistula by the second century. For a time they were dominated by other Germanic peoples in the region, in particular the Vandals, Lugii, and Rugii. In the second half of the second century they began spreading south and southeast to parts of present-day Belarus and Ukraine; the core group eventually reached the banks of the Dnieper near present-day Kiev, Ukraine, and by about 214 the Black Sea. Another Gothic legend maintains that they began their migrations southward after a group of foreign nobles entered Goth territory from the far south and either took control of or influenced the leaders of the tribe.

Whether or not such an event happened, the movements of peoples from the Germanic territory had very probably been set in motion by a “systems crisis” there, in which the low level of raiding that had been endemic in Germanic society for centuries flared into large-scale war, as overpopulation and the unequal distribution of wealth created new competition for resources and led tribes that had become more militarized under the influence of the Romans to attack one another with devastating results. The Goths’ consolidation of power and expansion along the Vistula were probably among the causes of the crisis.

In the course of these years other peoples—neighboring Germanic tribes, BALTS, and SARMATIANS—had become part of a confederation with Gothic military leadership. The Goths, as they became known to the ROMANS, were thus polyethnic. The Romans originally referred to them as SCYTHIANS, after earlier inhabitants of the Dnieper region near Kiev.

Gothic (Germanic)

The most important and defining characteristic of the Gothic confederacy, as earlier of the Gutones, was its possession of a relatively permanent overall war leader or king. This form of leader was very uncharacteristic of Germanic peoples, who in the past had elected war leaders only as a temporary measure in times of crisis. The very existence of Gothic kings shows that the Gothic confederacy emerged from crisis. The great heterogeneity of the members of this diverse coalition of war bands, tribes, and other groupings required that all accept a single leader, whose significance transcended ethnicity. In this the king of the Goths was a barbarian equivalent of the emperor of Rome.

The territory near the Black Sea where the Gothic confederacy came into being consisted of forest steppe and steppe ecologies, which attracted steppe peoples from central Eurasia. The Goths' culture shows the influence of these peoples, some of whom joined their group. The Goths have tentatively been identified with materials of what is called by archaeologists the

Cherniakhovo culture. The dispersal of some of the Goths from the Black Sea region and the subjugation of others by the HUNS in the late fourth and fifth centuries are reflected in the collapse of the Cherniakhovo culture in some areas at that time and its survival in a form much modified by Hunnic influence.

LANGUAGE

The Goths spoke an East Germanic dialect, referred to as Gothic. With the exception of a few northern inscriptions it is the oldest Germanic dialect known from surviving fragments of the fourth-century translation of the Bible by Ulfilas, bishop of the Gothic Christians, as well as some other scattered writings.

HISTORY

Because the Romans grouped many of the invading “barbarian” tribes together, it is impossible to know with certainty when the first battle between Romans and Goths occurred. The years 213 and 238 C.E. are both given for the first conflict, depending on sources. In any case the Goths were known to carry out raids in the Roman province of Dacia (roughly modern Romania) after their arrival in the region.

In 251 the Goths under Cniva battled troops under Emperor Decius at Abrittus near the mouth of the Danube in present-day northern Bulgaria and, luring the Romans into a swampy area, defeated them, even killing the emperor. The incursions of the Goths were far more devastating to the empire than those of the MARCOMANNI in the war named after them of 166–180. In the ensuing years, first in 257, the Goths carried out nautical raids on coastal cities of the Black Sea, the Sea of Marmara, and the Aegean Sea, in both Europe and Asia Minor.

The Goths mounted a combined land and sea invasion westward onto the Balkan Peninsula and captured Athens in 267–268 but were defeated by Emperor Claudius II near Naissus (modern Niš Serbia) in 269. He became the first emperor to take Gothicus as a triumphal title (thus establishing the tribal name Goth in the historical record). Emperor Aurelian, who succeeded Claudius, drove the Goths back north of the Danube by 271, after which he took the title Gothicus Maximus. Aurelian’s armies used scorched-earth tactics in the Gothic territories, and the Gothic confederacy was destroyed. Yet, recognizing the continuing threat of the Goths, he made the decision not to attempt to hold the province of Dacia, the last European province established by Rome some century and a half earlier.

Division

The defeat of the Goths by the Romans started a period of new movement and reorganiza-

tion among the Goths, who by about 290 had formed two political entities. The group later known as Ostrogoths (eastern Goths), centered on the royal family of the Amali, inhabited the region north of the Black Sea east of the Dniester River (part of modern Ukraine and Belarus). Those who would become known as the Visigoths (good Goths or noble Goths) were the western Goths, whose domain extended northwest of the Black Sea from the Dniester to the Danube (part of modern Moldova and Romania). This group was led by a number of aristocratic families, in particular the Balthis.

Their respective domains grew. In the east a possibly legendary Amali king named Ostrogotha founded a royal dynasty. The confederacy he led was known to the Romans as the Greutungi or Scythians, the latter a Greek term for steppe peoples. Little is known about the Greutungi during this time because they were so far from Rome. The first Greutungi king known to history was Ermanaric of the fourth century, who ruled an empire extending from the Baltic Sea to the Black Sea, centered along the Dnieper River.

In 332 Ariarich of the Balthi dynasty of the Gothic confederation known as Tervingi or Tervingians negotiated the first in a series of treaties with the Eastern Roman emperor Constantine. Among their provisions the Tervingians were to receive annual payments; in return they would supply men for the Roman military. The Tervingians were in general faithful federates of Rome and became deeply influenced by Roman imperial values and structures, although there were both pro- and anti-Roman factions among them. Their polyethnic society more closely resembled the hierarchical, top-down Near East societies than those of the Germanic tribes of the first century C.E. whom Tacitus had described, whose free warriors were able to some degree to govern themselves in their own assemblies.

Friction between the pro- and anti-Roman factions, the former led by Fritigern and the latter by the Balthi leader Athaneric, grew after the mid-fourth century. To unite the Tervingians under his rule, threatened by Fritigern, Athaneric fought the Eastern Roman emperor Valens in a series of battles that culminated in a treaty in 369 in which the Goths were treated as virtual equals rather than federates.

The rivalry between Athaneric and Fritigern was largely played out in religious terms; the pro-Roman Fritigern adopted Arian Christianity (not because he was influenced

by the missionary Bishop Ulfilas, who did not profess Arianism, but because Valens practiced it); Athaneric spurned Christianity altogether and sought to maintain the Gothic tradition, perhaps fearing that Christianity would interfere with the cult of the *thiudans*, which had long been a successful unifying force. From 369 Athaneric conducted persecutions of Christians of all sects. Ulfilas led a congregation into the Roman province of Moesia (modern Serbia and Montenegro and northern Bulgaria).

The fate of the Tervingians was decided externally with the arrival in the 370s, of the Huns, a polyethnic confederacy of steppe peoples out of Asia. Athaneric's forces were destroyed, and the majority of the elite followed Fritigern across the Danube into the empire. The onslaught of the HUNS led to new movements among the respective groups, greater geographical separation, and a renewed period of ethnogenesis. The emergence of the new Gothic confederacy called the Visigoths began as Fritigern and his followers sought a place for themselves within the Roman Empire. This would take some 40 years of repeated migrations, conflict, and suffering, which later led the Visigoths to compare themselves to the biblical Hebrew people wandering for 40 years in the Sinai Desert.

The Greutungi to the east were overrun by the Huns. Their king, Ermanaric, may have sacrificed himself to the gods in a desperate plea for aid, and they were subjected to a harsh domination. A small group of them fled to the Roman Empire and were settled in Pannonia, but the majority accepted Hunnic rule, however ambivalent they were about their new masters, and served them faithfully. They even adopted Hunnic clothing, weapons, and the practice of skull deformation. Huns and Greutungi shared names—the name Attila is actually Gothic—and Goths bore Hunnic names. At the same time the Greutungi Goths retained their ancient tradition of identifying themselves in terms of their service to their ruler. But it was only on the collapse of the Hunnic confederacy after the death of Attila that the Greutungi became known to other peoples as the Ostrogoths.

The Tervingians under Fritigern pleaded with the Roman authorities for permission to cross the Danube to escape the Huns. The Romans split this group in two. One was given lands in the northern Balkans, where they were allowed to settle; the other was sent to the eastern Roman frontier to augment the military forces there.

Because of their varying fortunes the two Gothic groups even battled each other, Ostrogoths fighting as allies of the Huns and Visigoths as allies of the Romans.

Some Goths, mostly Visigoths, who had settled in Moesia in the fourth century became known as Moesogoths; the Catholic bishop Ulfilas practiced among them. The name Suiogoths has been applied to Goths of Scandinavia.

The Goths were briefly reunited under one crown in the early sixth century when the Ostrogothic king Theodoric the Great became the regent of the Visigothic kingdom for nearly two decades.

CULTURE (see also GERMANICS)

Government and Society

The origins of the institution of Gothic war leader or king can be traced to the Germanic social group called the *comitatus* by Tacitus and *Gefolgschaft* by modern German scholars. These were warrior bands or societies formed around the nucleus of a successful war leader, one whose good fortune in war signaled the favor of the gods and whose skills promised his followers much glory and plunder. Such war bands, although they might participate in tribal wars fought for the good of the whole people, stood outside tribal military lines of command and frequently went out on raids purely for their own benefit.

The original Gutones were unusual among Germanic tribes in that the *comitatus* was at the center of their tribal structure. The tribal king of the Gutones seems to have combined the functions of the *thiudans*, or sacred king, with the political and military power of the *reiks*, or war leader. He had a band of warriors loyal only to him, unlike in most Germanic tribes, the loyalties of whose warriors continually shifted over time. This stable inner circle of the Gutones, focused on their king, would stand them in good stead in the troubled times that started in the second century and allowed them to grow, in some five generations, into one of the greatest powers among northern Europeans.

The tumultuous circumstances under which the groups who formed the nucleus of the Goths moved out of Germanic territory made the warrior band, rather than the tribe, the most effective social structure, giving the Goths an advantage relative to other Germanic tribes. The tribe befitted the relatively settled and peaceful existence of the

past, in which few people engaged in large-scale movement. But central Europe of the second to the fourth centuries was a world of war and widespread social dislocation. In response for mutual safety the Goths banded into a *comitatus* writ large.

They were able to expand their political structure quickly by drawing other war bands and groupings, each under their own leaders, into orbit around the cult of the overall king, who combined the functions of *thiudans*, sacred king, and *reiks*, war leader. The individual *reiks*, or subkings, ruled their territories often from strongholds in the countryside, rather than from towns. Only their own warrior bands or *comitati* took part in governance, and free villagers were largely excluded from involvement in affairs.

The Tervingian Goths emulated the Roman imperial tradition, interpreting the emperors in terms of their own kings ruling a multiethnic society. A Roman commemorative medallion found in a treasure hoard in present-day Romania has images of the joint emperors Valentinian I and Valens inscribed with the legend *Regis Romanorum*: “Of the King of the Romans.”

Evolution of Thiudans and Reiks in the Fourth Century The Gothic words used for political and military institutions in a fourth-century translation of the Bible into Gothic are an invaluable means of understanding Germanic political life. The word *thiudans* had formerly referred to a type of sacred king among some early Germanic tribes. The translation shows that *thiudans* had now become disconnected from any political meaning for the Goths themselves. The term was used instead to denote the Roman emperor, but more importantly the deity of the Gospels: the Lord God the Father and Christ, King of the Jews. For worldly kings biblical Gothic uses a Celtic term: *reiks* (compare the Irish *ri*). Theodoric the Great of the Ostrogoths was called a *thiuda-reiks*, denoting his exceptional status.

Technology and Art

Before the coming of the Huns the Tervingian Goths produced exquisite jewelry, vessels, and decorative objects in a style much influenced by steppe peoples, as well as Greek and Roman artisans. They developed a polychrome style of gold work, using gems, particularly garnet, in intricately wrought cells or settings, so that gold objects were literally encrusted with them. This style was extreme-

ly influential in western Germanic areas well into the medieval era.

The Cherniakhovo culture, thought to have been produced by the Goths, consisted of a wide range of finely crafted products that attest to the prestige goods culture the Goths had developed under Roman influence. Settlements and graves had Roman goods, including pottery and glassware. Local pottery was well made, wheel-turned, with highly polished surfaces and incised decoration. The makers of the Cherniakhovo culture produced prolific amounts of metalwork such as buckles, pendants, and fibulae. There is evidence of specialized craftsmanship and industrial levels of production.

Religion

The fourth-century leader Fritigern adopted Christianity, possibly a political move to gain support from the Romans; Christianity by that time was the official religion of the Roman Empire. The religious doctrine that he accepted, Arian Christianity, still being debated by church leaders at that time, was ultimately decreed a heresy. The Arian faith of the Visigoths would stand in the way of their rapprochement with Romans in Gaul and Spain when they migrated there in the fifth and sixth centuries.

The most important missionary to the Goths was Bishop Ulfilas, son of a Gothic father and a Cappadocian mother probably descended from captives of a Gothic raiding party. He was educated in Constantinople (modern Istanbul) and at Antioch in 341 was consecrated “Bishop of the Christians in the Getic [Gothic] Land.” His translation of the Bible into Gothic was very helpful in his mission to the Goths. He is commonly described as an Arian Christian—one who denied the divinity of Christ—as opposed to an adherent of the belief that later was adopted by the Christian Church as orthodox—that Christ was one in substance with the Father. But in reality Ulfilas did not adopt either of these positions and simply refrained from speaking on the matter of whether or not Christ was divine (a reticence that has failed to satisfy Roman Catholic historians, by whom he is considered to this day an Arian because he did not strongly support the Orthodox position). The Tervingian leader Fritigern professed Arian belief in the hope of gaining the support of the emperor Valens, who was Arian. Fritigern’s rival, Athaneric, in keeping with his conservative bent, sought to maintain the

Gothic cultic tradition and saw all forms of Christianity as a threat.

The Goths, as important as they are to the history of Europe, were one subgrouping among many Germanic peoples. Their name, however, especially in its adjective form Gothic, has taken on broad meanings. It has been used synonymously with “Germanic” or “Teutonic” (see TEUTONES). It has also been applied to a type of art of the Middle Ages, reflecting a Renaissance contempt for the cultural influence of “barbarian” peoples. It has also been applied more generally to elements of style or behavior from the Middle Ages—that is, the “Dark Ages”—and hence is synonymous with *crude*, *rude*, or *uncivilized*.

Graioceci (Graioceci)

The Graioceci are classified as a Celtic tribe. They lived in Gaul in the Graian Alps in present-day northwestern Italy and southeastern France and are discussed as CELTS or GAULS. With the CATURIGES and CEUTRONES they attempted unsuccessfully to obstruct the ROMANS under Julius Caesar in the Alps in 58 B.C.E.

Greeks (Graeci; Hellenes; Helleni; Hellenic peoples)

It is difficult to discuss the ancient Greeks as a single people. For much of Greek history the Greeks lived in hundreds of separate, fiercely individual communities, all with strong nationalistic pride, and even strongly different dialects. Even the term *Greeks* is a late appellation, probably used by the ROMANS as *Graeci* (in the Greek form *Graekoi*) in reference to one small northwestern tribe. The Greeks themselves, when not identifying themselves as autochthonically Athenian, Spartan, or Corinthian, called themselves the sons of Hellen, after a legendary lineage for the Greeks

found in the writings of the eighth-century B.C.E. Boeotian poet Hesiod. The strong individualism and chauvinism of the Greek city-states were in great part a consequence of the fragmentation of the Greeks' homeland, either on mainland Greece, a peninsula crossed by high mountain ranges and with a rugged coast, or throughout the thousands of small islands of the eastern Mediterranean.

If by *Greeks* we mean all peoples who have spoken or speak a form of the Greek language, then the Greeks have by far the longest history of any other people in this book. The Linear B writings of the MYCENAEANS, dating from the middle of the second millennium B.C.E., show

that they spoke a form of Greek that probably would have been somewhat intelligible to Greeks of the classical era. And from the time of the Mycenaeans and throughout Greek history to the present, the Greeks have been a very mobile people, trading and settling throughout the Mediterranean and in western Asia Minor and around the Black Sea. Thus through space and time numerous subgroups of Greeks have emerged, many of whom are discussed in separate entries in this book. In addition the devotion of Greeks to literature and learning, beginning in the time of Homer and Hesiod in about the ninth to eighth century B.C.E., has meant that an enormous amount has been written by ancient Greeks about themselves, their different groupings, and their ancestors. It has

been a challenge to decide which of the very long list of peoples mentioned in Greek writings to include as entries in this book.

Homer mentions many groups, some of them tribes and some apparently language groups. The problem with the peoples mentioned by Homer is that many of them must have lived centuries before his time, and those centuries saw the disorders and dislocations of the Dark Ages, during which literacy was lost, so that Homer's sources of information were all oral records passed down from generation to generation, leading to an unknown amount of distortion. And it must be kept in mind that Homer was writing fiction, not history in the sense we think of it. A great deal of his material came from myths. In addition, Homer had

only a vague understanding of the people who created the pre-Dark Age civilizations: the MINOANS and Mycenaeans. He assumed, as his contemporaries did, that the people who fought in the Trojan War, whom he calls the ACHAEANS, had a warrior society similar to that of the ensuing Dark Age. If, as is likely, the story of the Trojan War is based in part on folk memory of the collapse of the Mycenaean civilization in about 1200 B.C.E. (near the traditional date of the Trojan War), then Homer's Achaeans were Mycenaeans and perhaps allies, whose society had gone far beyond a tribal warrior society to become a full-blown civilization. Much of what Homer understood of the peoples he wrote about is marred by a fundamental misconception.

Homer speaks of IONIANS, DORIANS, and AEOLIANS; these peoples seem to be based on language groups that had appeared by his time in various regions of Greece and Asia Minor. Historians before the 20th century have tended to accept Homer at face value concerning these peoples; archaeological discoveries since then have shown that it is very problematical to try to identify peoples known only from their material remains—pottery, weapons, dwellings—with those named by Homer. Thus we cannot trace with assurance the histories of the Ionians and the rest much before the Dark Ages that ensued after 1200 B.C.E.

Homer also mentions numerous other peoples or tribes—from the Aethikes, Agraeoi, and Akarnanes to the Visaltes, Vistones, and

Yandes. The information he supplied on them in many cases included obviously mythic events and figures, including gods. Their stories may very well have come from genealogical histories of ruling families who usually traced their ancestry to a god or to a founder hero aided by a god or goddess (a common tradition among tribal peoples all over the world). An important part of the duties of the tribal bards whose epic tales formed the basis of the Homeric epics was just this keeping and retelling of the foundation myth of a tribe or people. Since it beyond the scope of this book to cover the mythologies of peoples, we have chosen not to have entries for many of the peoples Homer mentions.

Some terms used by Homer and later Greek writers, such as PELASGIANS and Leleges, in addition to having a mostly mythic origin, have been variously applied, especially the former, their meaning changing over time. These two names have often been used in the past by historians as though they referred to real peoples; they have seemed to be important because Greeks used them to refer to earlier, pre-Greek inhabitants of Greece. Descriptions of them make them appear to have an early Neolithic culture—Pelasgos, the founder of the Pelasgians, was said to have invented the making of huts and an ancestor of the Leleges invented the grinding of corn. Yet since farming began in Greece around 7000 B.C.E., it seems unlikely that the information we have on these two peoples from the ancient Greeks thousands of years later has other than a literary or symbolic interest.

Numerous other peoples have been named by Greek historians in the centuries after Homer; Thucydides, for example, in his history of the Peloponnesian War mentions many allies of Athens and Sparta who took part in the war. Many of these, instead of being ethnic or tribal groups, were actually polities, each based upon a polis, or city-state, the basic political institution of classical Greece. They spoke Greek and considered themselves Hellenes, having the same gods and general culture as Athenians, Spartans, and other Greeks. For this reason they are not covered in separate entries; most of the information in the present entry applies to them. Similarly there are many regional names, such as Argives, Boeotians, and Arcadians, who do not have separate entries. During the classical period, a number of leagues, such as the Boeotian, Delian, and Epirote Leagues, were formed that brought different city-states together, mostly as allies in

war. Again, they all shared a general Greek culture and outlook and are not given separate entries.

Archaeology, which has shed so much light on the early Greeks and their antecedents, has discovered the cultures of peoples who inhabited Greece and the Aegean in the remote past and who were almost unknown to historical Greeks. The Mycenaeans (named after the city of Mycenae, where the first traces of their culture was found) were one of these. Another group was the Minoans, who had a magnificent civilization on the island of Crete during the second millennium B.C.E. Archaeologists have found that peoples on the Cycladic Islands shared a Bronze Age culture much influenced by trade with the civilizations of the Near East; we have included an entry on these CYCLADITES.

In antiquity Greeks lived on the Greek peninsula, which makes up much of present-day Greece, the Ionian Islands to the immediate west, the Cycladic Islands stretching eastward to present-day Turkey, the islands of the Aegean, the islands of Crete and Rhodes, and the west coast of Asia Minor, from the Hellespont (the Dardanelles) north to the Carian peninsula in the south.

ORIGINS

The ancient Greeks spoke an Indo-European language; this fact does not clarify, however, when a Greek-speaking ethnicity emerged, because the timing of the emergence and spread of the earliest Indo-European language is still unknown. A prominent but much disputed theory maintains that the proto-Indo-European language spread throughout Europe with early agriculturalists and was adopted by indigenous peoples who took up farming. If this is true, a proto-Indo-European language could have arrived in Greece as early as 7000 B.C.E. when farming began there. A difficulty with this hypothesis is that it does not accord with known rates of language change unless it is assumed that this early Indo-European language remained static for thousands of years, which seems implausible.

Another more plausible view is that proto-Indo-European, the ancestor of Greek as well as of most modern European languages, arose as a consequence of a series of socioeconomic changes in various areas of Europe that began in the fifth millennium B.C.E. in southeastern Europe, including parts of Greece, and spread across the rest of the Continent in succeeding millennia. These changes greatly increased contacts among groups who, for thousands of

years since the adoption of farming, had led an isolated existence focused on farming villages. The Indo-European language may have arisen out of these new contacts.

One of these changes was the so-called secondary products revolution in which, for the first time, cattle, sheep, and goats (and possibly horses) were first used for more than their meat—for milk, wool, transport, and traction in pulling wheeled wagons (first documented in Sumerian pictograms of the first half of the fourth millennium B.C.E.) and plows. A consequence of this development was probably much greater mobility, which resulted in contacts among different peoples and cultures. The new products and agricultural surpluses that resulted from the use of the plow may have been used in trade.

Another development was trade in copper, which had begun to be worked in the Balkans in the sixth millennium B.C.E. and now was traded eastward toward the Black Sea region. In addition, development of the civilizations of Mesopotamia in the fifth and fourth millennia B.C.E. probably exerted an economic pull that tended to open up the closed, self-centered societies of the past in Greece and the Balkans.

Climate change, with several cold phases documented for the fourth millennium B.C.E., may have made southern Greece and the Aegean Islands more attractive than the plains of Thessaly to the north and may have fostered greater mobility. Many of the tells (mounds of decayed building material) that had been occupied for thousands of years were abandoned during this period.

A common form of handled pottery found throughout Greece and the Balkans to the Hungarian Plain indicates these new wide-ranging contacts, and the shapes of the jugs and cups of this type imitate metal vessels being made in adjacent areas of Anatolia, such as at the city-state of Troy. The spread of such pottery may have accompanied the introduction in the fourth millennium B.C.E. of a new beverage, wine.

All of these changes could have facilitated the emergence and spread of the proto-Indo-European language in several ways. It could have become important as a trade language. It could have derived from the language of groups of newcomers, probably from the steppe regions north of the Black Sea where in earlier times the domestication of the horse had been developed, who now were using wheeled vehicles and whose language, as well as their new technologies, were emulated by

native peoples. The rituals of drinking that seem to be documented by the array of jugs and cups found in burials, used for forging bonds between strangers meeting for the first time, may have been conducted in the *lingua franca* of proto-Indo-European (which in Greece would later develop into Greek), both wine and language used for communication and in themselves symbols of a wider world than the closed tell societies of the past. Such settlers need not have been great in number to have had a strong influence, and there is no convincing evidence that their arrival, if indeed it occurred, had the character of a massive invasion.

As do modern Greeks the ancient Greeks called themselves Hellenes. They themselves traced their origin to the northern region of the Greek peninsula, which they called Hellas.

LANGUAGE

One of the principal factors uniting the various Greek people was their language. This is plain from the Greek word *barbarian*, used for non-Greeks, probably derived in its original form *bar-bar* from the unfamiliar sounds of foreign languages. Many Greek words are cognate with English words, because of the relation of English to Greek as an Indo-European tongue. However, English borrowed many Greek terms and contains a plethora of words derived from Greek roots. These words are found in scientific and philosophical discourse, adopted as Europe moved into the Renaissance and hearkening back to the scientific and philosophical achievements of classical Greece.

Greek is an Indo-European tongue—and thus related to the Italic, Germanic, and Indic language families. It is plain from the intrusion of many non-Indo-European place-names in addition to religious vocabulary that Greek, while retaining its Indo-European form, mingled with local dialects of an earlier population.

After the Dark Ages Greek, in its earliest history, was divided into dialects that are said to mirror the early ethnic divisions of the Greeks: Doric (of the Dorians), Aeolic (of the Aeolians), and Ionic (of the Ionians, which was refined into Attic in classical Athens and immortalized in the great literature of that time). A closer study of Greek dialects reveals that spoken dialects were interwoven and spread over the Greek world, roughly divided into West Greek (primarily Doric) and East Greek (Attic-Ionic; Arcado-Cypriot, possibly an offshoot of Mycenaean; and Aeolic).

Alexander the Great, a Macedonian tutored by Aristotle, established his Attic Greek as the official language of state in his conquest of much of the early Mediterranean world and the Middle East in the fourth century B.C.E. Despite the collapse of Alexander's empire into smaller kingdoms after his death, the principal language remained Greek, and Greek traders spread and thrived in such capital cities as Alexandria of Egypt, for which the era is sometimes named. Attic Greek developed into a simplified common tongue called Koine, a language maintained by the citizens of the eastern half of the Roman Empire and the language of much of the New Testament. Common Greek lasted throughout the ancient world until the sixth century C.E.

The learning of Greek was revived from the Renaissance through the Enlightenment, as the West began to rediscover its debt to the ancient Greeks in literature, thought, and learning.

HISTORY

Minoans

The first civilization in the eastern Mediterranean was that of the Minoans, which began to develop in the third millennium B.C.E., probably under the influence of the Near East civilizations with whom they had contact through trade in tin and bronze. Crete formed an important way station for trade in the tin necessary to make bronze, which was introduced from the west, from sources in France and Britain (although the tin, a rare metal, passed through many hands before it reached Crete). The Minoans were able to make bronze with this tin by alloying it with copper mined on Cyprus, which was within the Minoan sphere, and traded it to the metal-hungry cities of Mesopotamia. Trade in produce, olive oil, and wine was also important. They developed a highly sophisticated culture based on magnificent palaces where large amounts of produce, accounted for on clay tablets with a script called Linear A, were stored in great clay jars. (The presumption that the writing on the tablets consisted of lists is based on analogy with the use of Linear B for such purposes and also on the fact that the earliest use of writing—in Sumer in Mesopotamia—was for recording lists of raw materials and products.)

The Minoans were long thought to be related to the original prehistoric inhabitants of the Greek world who migrated from Asia Minor and were supposedly characterized by their short stature and dark hair. Later Greek

writers, such as Pausanias, believed that groups living in small wild communities in the hinterlands of the Greek world were the remnants of these original inhabitants related to the Minoans; they were called Pelasgians. The language of the Minoans was thought to be non-Indo-European, as evidenced in the names of certain gods (Poseidon) and in the names of places, such as Knossos. Their civilization was centered on Crete and on the island of Santorini. They built large multistoried palaces, had running water, and painted beautiful, colorful frescoes. Their religion was characterized by images of bulls and snake-handling priestesses.

The Minoans were capable seafarers and had an innovative method of farming that extracted the most yield out of the infertile coastal earth. They grew olives, grapes, and grain simultaneously, thereby distributing the work of cultivating them evenly over the growing season.

Mycenaeans

Minoan culture was highly influential on Greek speakers on mainland Greece, a chariot-using Bronze Age warrior society who may have begun to grow wealthy by preying on the lucrative trade of the Minoans. As would be the case later in Greek history, this society, while sharing the same basic culture, was centered in a number of cities; since the first of these to be excavated by archaeologists was Mycenae, this name was given to the civilization as a whole. The people are referred to as Mycenaeans. By the 15th century B.C.E. Mycenaean influence was felt throughout the Cyclades; a Mycenaean settlement with its own defensive walls has been found on the Asian mainland at Miletus. Trade routes, attested by finds of Mycenaean pottery, ran as far west as Sardinia, Italy, and Malta and as far east as the Levantine coast and Egypt. Twenty sites in Egypt, some far up the Nile, have produced Mycenaean pottery, and it has recently been suggested that figures of warriors on a papyrus from Tell el-Amarna might represent Mycenaean mercenaries. Meanwhile the Mycenaeans had close relations with the Minoans, their artists engaging in mutual emulation, to the degree that their products are nearly indistinguishable.

Minoan civilization repeatedly suffered catastrophic events that caused widespread destruction of buildings and cities; at least some of these probably were caused by earthquakes and volcanoes, although there is not enough evidence to show this definitively.

Mycenaean power increased at the expense of the Minoans, as through a combination of piracy, war, and diplomacy they encroached on the Minoan trade network and took advantage of the natural disasters the Minoans suffered. It is still debated whether the burning of all of the Minoan centers except Knossos, which occurred in 1425 B.C.E., was caused by an earthquake or by invading Mycenaeans. In any case after that time the Mycenaeans clearly ruled on Crete, as evidenced by the use of Greek for administrative matters, documented on numerous clay tablets inscribed with Mycenaean Linear B script, and by mainland-style chamber tombs containing weapon burials that were introduced.

The gold face masks and other exquisite artifacts found in the shaft graves at Mycenae and the massive palaces, tombs, and centrally planned agricultural estates, all of which must have required the labor of thousands, attest to the power and wealth of Mycenaean civilization. By the 13th century B.C.E., however, increasing instability can be seen in the fortification of many Mycenaean palaces; a defensive wall was built across the Isthmus of Corinth—whether as a protection against invasion from the north or from the south is unclear. The appearance at this time of a clearly intrusive form of pottery, called Barbarian Ware, and bronze daggers made in a northern style lends credence to the belief of later Greeks that a people speaking a dialect of Greek called Doric were involved in the collapse of Mycenaean civilization around 1200 B.C.E. The amount of this material does not support the idea of a wholesale invasion, however. The scanty archaeological evidence from this period makes dating of events highly uncertain. Some Mycenaean centers seem to have been rebuilt and then been destroyed again. The attacks suffered by the Mycenaeans should be seen in the context of a wave of destruction occurring at this time throughout the eastern Mediterranean. Both the Hittite Empire and Egypt were attacked by armies of what the Egyptians called the SEA PEOPLES, and other countries in the region were devastated as well.

The origins of the Sea Peoples are not known; some of them seem to have lived on Sardinia and Sicily, and the names given them by the Egyptians seem to derive from these islands' names. It seems probable that the Sea Peoples originally were bands of pirates preying on the lucrative trade routes crossing the Mediterranean, similar to the VIKINGS of a later

day. They may have joined to form armies in response to defensive efforts of the Mycenaeans and other states. They could have swept into their forces smaller groups of warriors, such as the Dorians; it is equally possible that Dorians had been hired by the Mycenaeans as mercenaries for defense; these two possibilities are not mutually exclusive and could both be true.

It is also possible that the various Mycenaean power centers—Tiryns, Athens, Argos, Mycenae—competed for access to trade routes, each trying to carve out its own sphere of power, even as the city-states of classical Greece did later. An early version of the Peloponnesian War played out among different Mycenaean powers may have been responsible for some of the damage that has been found.

Such competition could have intensified in times of climate change. The pattern of destruction could be explained by a prolonged drought that struck the areas of Crete, the southern Peloponnese, Boeotia, Euboea, Phocis, and the Argolid, where the destruction was greatest, but did not strongly affect Attica, the northwest Peloponnese, Thessaly, the rest of northern Greece, or the Dodecanese (Rhodes, Kos, etc.), which were largely spared. Meteorologists have shown that such a pattern of drought is entirely likely and has actually occurred in recorded times.

Dorians, Aeolians, and Ionians

Many Greeks fled the Dark Ages that enveloped the mainland after the Mycenaean collapse, emigrating eastward through the Aegean and settling in Asia Minor. Between the rude and warlike Heroic Age, a poetic picture of the past drawn during the desperation of the Dark Age, and the heyday of learning and refinement of classical Athens, the two loci of modern understanding of the ancient Greeks, the Hellenes lived scattered through the Aegean, divided into three basic ethnic groups by dialect, culture, and location: the so-called Dorians, the immigrants who may have precipitated or at least participated in the collapse of the Mycenaeans; the Aeolians, earliest settlers of Thessaly, in northern Greece, and Boeotia, the territory of the classical city-state Thebes; and the Ionians of Attica and Euboea, masters of the largest swath of Greek territory on Asia Minor and adjacent islands.

Archaeological evidence corroborates these legends of later Greeks that the Dark Ages saw significant migrations, with some regions left depopulated. The causes of these movements, as of the collapse of Mycenaean

civilization that brought on the Dark Ages, are not certainly known—as noted, climate change, such as prolonged drought, the consequent economic regression, and war are all strong probabilities. The distribution of different Greek dialects of the period after the Dark Ages may document these migrations. The Greek spoken by the Mycenaeans seems to have been preserved in a dialect, called Arcado-Cypriot, shared by people in the remote mountains of Arcadia and on the island of Cyprus, strongly suggesting that Mycenaean refugees fled to both these places. In the former Mycenaean region Doric predominated.

The material remains of newcomers here at the time of the demise of Mycenaean civilization do not seem to document a large-scale movement of people, as there is so little of it. An explanation for this scarcity of material remains may be drawn from an analogy with the third-century B.C.E. invasion of Anatolia by CELTS and the sixth-century C.E. invasion of Greece by SLAVS. In both these cases, which are known to have occurred from historical accounts, the invaders left almost no archaeological traces. What seems to have happened is that the invaders, whose culture was much less advanced than that of the inhabitants of the territory they were invading, quickly adopted elements of this new culture, thus becoming indistinguishable from the natives at least as far as material remains are concerned. The handmade burnished pottery found on several 12th-century sites, called Barbarian Ware, shows the process of acculturation of the invaders of Mycenaean Greece. The makers of this pottery at Tiryns soon began imitating Mycenaean pottery shapes with their handmade pottery. Production of large amounts of sophisticated, wheel-thrown Mycenaean pottery continued for a while after the destruction of the palace at Tiryns, after a time possibly by the invaders.

On the other hand it has been shown repeatedly throughout history that barbarian raiders on complex societies, such as the Vikings who raided northern Europe in the ninth and tenth centuries C.E., can have a destructive effect disproportionate to their numbers. The spread of the Doric dialect could have occurred among the peasant farmers in the Peloponnese after the demise or departure of their Mycenaean overlords. The speakers of Doric probably had an egalitarian warrior culture similar to that of many such cultures, from the Bronze Age Bell Beaker culture, to the Iron Age Celts, early GERMANICS, Slavs, and others. A fusion of cultures may have taken place.

Although the simple material culture of Doric speakers soon disappeared under late Mycenaean influence, Greeks in formerly Mycenaean areas may have adopted the Doric dialect and social structures. Pottery similar to the coarse Barbarian Ware of the Dorians has been found on the middle Danube in present-day Romania, suggesting either that they originated there or that they passed through the region. A pottery assemblage called Coarse Ware, similar to Barbarian Ware, is found near Troy from the time of its destruction. It is thus possible that Doric speakers took part in the invasions of the Sea Peoples who were attacking the Hittite Empire in Asia Minor and Egypt at the same time and who were probably responsible for Troy's destruction. The Doric dialect was spoken in Crete and across a wide area of the southern Aegean, in Rhodes, and on the southwestern tip of Asia Minor.

In the Athenian region of Attica and the island of Euboea after the Dark Ages a different dialect was spoken: Ionic or Ionian. Although Athenian tradition maintained that Athens never fell to invaders, Mycenaean civilization ended here at the same time as in other areas of Greece. It is possible that the Ionian dialect was introduced to an Attica suffering from economic distress and depopulation, caused by the Mycenaean systems collapse, by outsiders accustomed to a simpler way of life independent of long-distance trade and the agricultural central planning engaged in by the Mycenaeans. Able to support themselves with subsistence farming and simple craft goods, Ionic speakers could have taken advantage of the depopulated landscape. As in the case of the Doric dialect on the Peloponnese Ionic together with the lifeways of its speakers could have been adopted by the local peasantry of Attica and Euboea who had been left to their own devices by the collapse of Mycenaean authority. In the 10th century B.C.E. Ionic speakers seem to have migrated to Asia Minor, colonizing a region later named after them, Ionia.

Another distinct dialect of later times was Aeolic or Aeolian, spoken in the Boeotian plains and Thessaly and later in Asia Minor along its northern coastline.

End of the Dark Ages

The Dark Ages were not uniform everywhere in Greece. In spite of the loss of the Mycenaean trade network, trade on a more sporadic level apparently continued. Traders in the settlement of Lefkandi on the Euboean coast off the Greek

mainland resumed activity after a brief lapse in the 12th century B.C.E., trading with Cyprus and the PHOENICIANS on the coast of the Levant. Rich burials with gold grave goods attest to the wealth of the elites of Lefkandi. The settlement flourished until about 825 B.C.E. At Lefkandi the earliest evidence of a revival of wealth beginning to approach that of the Mycenaeans has been found. In a burial dating from between 1000 and 950 B.C.E. the cremated remains of an apparent chieftain were buried alongside the body of a woman bedecked in gold and four horses in an apsidal tomb (whether built for this purpose or adapted from a prior use is uncertain) and covered with a mound.

Within a century other Greek trade centers—Athens, Tiryns, and Knossos—were competing with Lefkandi for the eastern trade. A major stimulus for this competition were the Phoenicians, who may have been expanding their trade networks under pressure from their Assyrian overlords. By about 850 B.C.E. other trade centers had appeared on Euboea, and by 825 B.C.E. strong Greek influence was being felt at the port of al-Mina at the mouth of the Orontes River on the Levantine coast, although whether Greeks had actually settled there is in dispute. The goods Greeks received from the East are clear in the archaeological record—textiles, carved ivory, objects of precious metals, as well as iron ore and other metals. The Greek exports are uncertain—perhaps slaves, captured on raids in the north, and agricultural surplus. Some Euboean pottery from about 925 B.C.E. has been found in Syria.

The pace of change increased dramatically in the eighth century B.C.E., in part driven by population growth. Land that had lain unused since the 12th century B.C.E. was again under cultivation. Increase in wealth led to development of craft working in metals and pottery. Greek pottery, which up to now had been made mostly for domestic markets, attained a level of quality that made it desirable abroad, as attested by finds over a wide region of the Mediterranean. An increased pace of shipbuilding is a sign of expanding trade activity.

Spreading Greek Colonies

At this time the Greeks spread throughout the Mediterranean world, as merchants, mariners, and mercenaries; as artisans to paint and sculpt for Eastern satraps; and as court doctors.

Population growth also led to emigration. The earliest Greek colonies were those of the Euboeans in the west. Naxos was established at the first landfall in Sicily in 734 B.C.E.

(according to the fifth-century B.C.E. historian Thucydides). By the end of the eighth century B.C.E. Sicilian settlements created by the Euboean city of Chalcis lined the strategically important Strait of Messina. Syracuse, with the best harbor on the island, a secure water source, the spring of Arethusa, and fertile land nearby, was settled by the city of Corinth in 733 B.C.E. People from the northwestern Peloponnese founded cities on the coastal Italian Peninsula, and the Spartans founded there their only colony, Tarentum.

As the Greek presence in the western Mediterranean steadily grew, tensions with the Phoenicians increased. The latter had colonized the west coast of Sicily; now Greeks from Rhodes tried to settle in their territory, sparking clashes in 580 B.C.E. Settlers from Phocaea in Asia Minor who also moved west in the seventh century were the last contingent of Greeks who were able to find a place to colonize, but to do so they were forced north up the west coast of Italy past territory of the ETRUSCANS, then along the south coast of France, where, in about 600 B.C.E., they founded Massilia (or Massalia, present-day Marseille) near the mouth of the Rhône River. Trading expeditions north up the Rhône River brought Phocaeans in contact with Hallstatt period Celts, whose eagerness for Greek products—wine, pottery, and fine metalwork—would have an enormous influence on their society, with momentous repercussions for the world of Mediterranean civilization. Phocaeans also moved into the northern Iberian Peninsula, founding Emporion (modern Ampurias).

Persian annexation of Phocaea caused another influx of citizens to the west in the 540s B.C.E.; they had to bypass land already taken by their fellow citizens, but ingeniously they settled on the island of Corsica, founding Alalia, which allowed them to trade directly with southern France and Iberia without going through the Etruscans. This situation was intolerable to the Etruscans, who convinced Phoenicians to join them in ejecting the Greeks from Alalia. By the end of the sixth century B.C.E. competition among Greeks, Phoenicians, and Etruscans had resulted in separate spheres of trade dominance for the three groups.

Euboean Greeks also looked north along the coast of Thessaly and beyond, probably in part for timber for ships, but also for arable land; parts of Macedonia became important for the production of wine. Farther east Greek settlement in the territory of the THRACIANS met

Pytheas: Scholar and Explorer of Europe

Pytheas was born in the early fourth century B.C.E. in the Greek colony of Massilia, now Marseille in southern France, which at that time was surrounded by Celtic peoples. He received an education in mathematics and astronomy; his teacher was Eudoxos of Cnidos, a student of the philosopher Plato. Pytheas is known to have used astronomical observations to determine the latitude of Massilia and became an accomplished navigator.

In about 325 B.C. Pytheas set out from Massilia on a voyage to explore the Atlantic Ocean beyond the Strait of Gibraltar. He probably had backing from the merchants of Massilia, who were interested in establishing a direct sea route to tin and amber sources in northern Europe. At that time Greek mariners had been prevented from venturing into the Atlantic Ocean by the Carthaginians, who maintained a naval blockade of the Strait of Gibraltar. The Greeks had been further discouraged by reports of the hazards of the open sea, including sea monsters. Carthage, then engaged in a war with Rome, had temporarily left the Strait of Gibraltar unguarded, allowing Pytheas to pass through.

Pytheas sailed along the south coast of present-day Spain through the strait and into the Atlantic, then northward along Spain's and France's west coasts. He eventually reached the coast of Brittany, which he accurately described as a peninsula. From there he crossed the English Channel and landed on the coast of Cornwall, near Land's End. He established friendly contacts with the ancient Cornish, who, as tin miners and smelters, had frequent contacts with foreign traders that, Pytheas later noted, had made them less warlike than other Britons. He ventured inland and noted other aspects of life among the Britons, including the process through which alcoholic beverages were made—beer from fermented grain and mead from honey.

Pytheas next sailed northward along Britain's west coast, sighted Ireland, and rounded the north coast of Scotland. He heard reports there of an island called Thule, a six-day sail to the north, which he believed to be the northernmost point on Earth. He attempted to reach Thule but was forced back by icebergs and dense fog. Pytheas later reported on the great differences between the lengths of day and night in the north, indicating he may have approached the high latitudes near the Arctic Circle or at the very least reached as far north as the Shetland Islands or the south coast of Norway near Bergen.

Pytheas completed his exploration of Britain by sailing down its east shore, thus completing one of the first circumnavigations of the island. He is thought to have proceeded across the North Sea in search of principal sources of amber. He possibly sailed around the Jutland Peninsula (present-day Denmark) and entered the Baltic, sailing along its south coast along the coast of present-day Germany as far as the mouth of the Vistula in present-day Poland. He explored a number of islands, and then returned to open waters and followed the Atlantic coast back to the Mediterranean and Massilia, completing a sea journey of several years. After Pytheas's expedition the Carthaginians again closed off the sea route to the Atlantic. Seaward exploration of northwestern Europe was not resumed until Julius Caesar reached Britain some two centuries later.

Pytheas wrote an account of his voyages called *On the Ocean* in about 319 B.C.E. Although the work did not survive, his observations were cited in the works of geographers of later centuries, including Polybius, Strabo, and Pliny. Strabo in particular rejected as fabrication much of what Pytheas described on his voyage. However, his contributions to ancient knowledge are evident. He demonstrated that the sea route to the tin mines of Cornwall and amber sources along the Baltic was impractical compared to the much-shorter overland routes across present-day France and Germany. He also demonstrated that the supposed terrors of the Atlantic were imaginary, probably invented by the Carthaginians to discourage Greek maritime expansion. He established that the North Star did not lie above true north and that the Moon has a great effect on the tides along the North Atlantic coast of Europe, a phenomenon that was much less evident in the Mediterranean basin. Moreover he made accurate anthropological observations on northern peoples. Pytheas is considered the first scientific explorer.

with opposition; therefore Greeks colonized the island of Thasos in 680 B.C.E. At about the same time colonists from Megara, a city on the Greek coast west of Athens, had ventured into the Dardanelles, the entrance to the Black Sea; here they founded first Chalcedon on the Asian side of the straits, then in 660 B.C.E. Byzantium on the European side. The site of Byzantium was excellent, with a fine harbor and a fortifiable headland protected by the sea. This was to be the location of the Roman eastern capital, Constantinople (modern Istanbul). Despite initial hostility from Thracians and SCYTHIANS, Greek goods began to be traded up river valleys as far as present-day Russia, and their artworks heavily influenced the Scythians, who became excellent workers in metals. The Greeks received in return fish, hides, and slaves.

Greeks from Thera founded Cyrene in North Africa, located farther inland than was usual for Greek colonies. Cyrene became one of the richest agricultural areas in the Greek world, where sheep, horses, and grain were raised. Archaeological and other evidence from Cyrene suggests that Greeks there intermarried with native Libyans and adopted some of their cult practices. Inter-marriage may have been typical for Greek colonists elsewhere, because the first settlers of new territories probably included few women.

Exploration and colonization both enriched Greek culture. In about 325 B.C.E. a Greek named Pytheas engaged in a great voyage of discovery, setting sail from the port city of Massilia and passing through the Strait of Gibraltar (called in his time the Pillars of Herakles) into the Atlantic Ocean and traveling northward, visiting the British Isles and the North and Baltic Seas (see sidebar). His account of the voyage was used by a number of ancient scholars as a resource.

The Greek colonies on the edges of the known world provided Greek scholars with the opportunity to observe other lands and peoples. One such was Strabo, born in Pontus south of the Black Sea (see sidebar, p. 351).

Lelantine War

In the late eighth century B.C.E. war began between Eretria and Chalcis, the two main cities of Euboea, over control of the rich Lelantine plain that lay between their territories. As in the fictional Trojan War and later conflicts in the classical period, the two rivals were soon joined by many cities of the Greek world, who allied themselves with one or the other Euboean city, a sign that the fierce competitiveness that probably characterized the

Mycenaean period continued to be a major factor in post-Dark Ages Greece. The warriors who participated in the war were of the elite classes who had grown wealthy in the Euboean trading enterprise; the two sides even made an agreement to exclude the use of ignoble weapons such as arrows and stones in favor of face-to-face combat.

Little is known about this war; it seems to have ended with the exhaustion of both cities, since neither enjoyed again the same dominance as each had in the past. Eretria survived mostly through its association with allies in the Black Sea region, and Chalcis relied on its alliance with Corinth, which now emerged as the new power. When the Euboean city of Almina was sacked by the Assyrians, the Corinthians rebuilt it. Corinth, which had been no more than a cluster of villages as late as the eighth century B.C.E., may have gained territory on the Isthmus of the Peloponnese as a result of the Lelantine War, which would have facilitated its trade enterprise by providing an alternate eastward route to the voyage all the way around the rocky and dangerous Greek (Peloponnesian) south coast. This would explain Corinth's rapid expansion in the seventh century B.C.E. Corinth was known as a center of shipbuilding, where shipwrights improved the 50-oared penteconter, a type of galley ship designed by the Phoenicians, by making it narrower and faster and giving it a projecting keel beam that was sheathed in bronze for use as a ram. Corinth thus became a dominant sea power.

The ruling clan of Corinth, the Bacchiadae, differed from more traditional aristocratic families in not despising craftsmen, but instead offered them generous patronage. As a result foreign craftsmen flocked to the city. Pottery production, in particular, flourished; Corinthian pottery in great amounts has been found all over the Greek world. It is notable for its eastern characteristics, since Corinth was more receptive to eastern influence than Athens.

Age of Tyrants

In the seventh century B.C.E. tensions between the aristocracy and the populace with its growing power had grown in many city-states. Such conflicts were exploited in a number of cases by ambitious individuals, paradoxically often aristocrats themselves, who championed the cause of the common people. Corinth was the first tyranny, followed by its neighbors Sicyon and Megara. The first Athenian tyrant was Peisistratus, who seized power permanently in

Strabo: Traveler and Geographer

Strabo was born at Amasia in Pontus, a region south of the Black Sea in present-day Turkey, in 64 or 63 B.C.E. He studied history and philosophy in his native city and, it is thought, in Greece, Rome, and Alexandria as well. He also traveled widely, claiming to have visited lands in western Asia, southern Europe, and northern Africa, as well as islands in the Mediterranean. In 25 or 24 B.C.E. he explored the Nile River as part of the expedition of Aelius Gallus, prefect of Egypt. For most of his life he lived in Rome.

Only fragments survive of Strabo's work in 47 volumes referred to as *Historical Sketches*; many later authors quoted it, however. The extant *Geography*, a work in 17 volumes (with only part of the seventh volume missing), describes the lands of the known world as far east as India. It expands on facts and observations from his own travels, from Roman military expeditions, and from works of earlier Greek writers, such as Homer, Eratosthenes, Polybius, and Poseidonius. Strabo was skilled at selecting and organizing useful information, and his work has served as an invaluable resource on the peoples of the Augustan Age. He died sometime after 23 C.E.

Greek scholar Strabo holds a globe of the world in this print from 1584. (Library of Congress [LC-USZ62-99999])

546 B.C.E. after several abortive attempts. There were tyrannies on the Aegean islands of Samos and Naxos, for instance, and in the Ionian cities along coastal Asia Minor. Most tyrannies were short-lived, as their emergence depended on special historical circumstances: the struggle for political power in cities between the old landed aristocracy and the rising merchants and traders, who in many ways resembled the middle class of the modern era. Most tyrants gained power by backing the latter and taking steps to weaken the aristocracy. Once this was accomplished, however, citizens of the new middle class were unwilling to divide their power with an autocratic leader.

In Asia Minor and the islands of the Aegean art, architecture, poetry, and philosophy began to flourish. Out of this period and region arose epic poetry and Greek lyric poetry. Presocratic philosophers, such as Anaximander and Heraclitus, investigated the nature of the universe. City-states developed and grew, under kings, then oligarchies, finally under tyrants. These city-states formed leagues for defense—the Dorian League and Ionian League—and sent out colonizing expeditions,

renewing contacts with their kinspeople in Greece.

By classical times power and prestige had shifted from Asia to the Athenians of Attica and to the Spartans on the Peloponnese. Each claimed through a complex mythical web to be the original ancestors of Greeks on Asia Minor; the Athenians claimed the ancestral Ionians as their forefathers, the Spartans the Dorians.

Sparta

The site of Sparta has good natural defenses, probably the reason why it was a focus for settlement. The city emerged when villages scattered near the defensible area joined into a unified polis; the fact that through much of its history Sparta had a pair of hereditary kings suggests that the unification of Sparta resulted from an alliance between two powerful families. Spartan society was focused on war to a greater degree than that of any other Greek city-state, perhaps because Sparta had been born of a military alliance.

The Spartan kings had dual roles as religious leaders and generals of the army. These two roles are typical of other Indo-European peoples, although not always held by a single man; many Germanic tribes, for example, had a religious king called a *thiudans* and a war leader called a *reiks*. In general Spartan society was the most conservative in the Greek world, in a number of ways little different from that of the tribal Dorian past. The kings ruled with the aid of a body of 30 councilors, called the *gerousia*. As in most cities there was also a citizen assembly, who elected men to the *gerousia* by acclamation from among those who had reached the age of 60. The citizen assembly's role appears to have been consultative, listening to proposals of the kings or elders and approving or disapproving them. This arrangement, too, had many similarities to the *things* of Germanic tribes, also consisting of assemblies of all the warriors no matter their rank, guided by councils of elders.

The warlike character of Sparta led to the city's early expansion and absorption of neighboring towns and territories. In 736–716 B.C.E. the Spartans annexed the rich plains of Messenia to the west, Spartan citizens taking lands for themselves from the Messenians and reducing the latter, whom the Spartans called helots, to serfdom (as they also had the populations of other territories they had conquered earlier). The precariousness of Spartan control over the helots would have a profound effect through most of Spartan history. There is some

evidence that in the seventh century B.C.E. a helot rebellion was not suppressed for two decades. Sparta may have been weakened at the time because of a conflict with the neighboring city of Argos, possibly the first Greek city to use hoplites, heavily armed citizen infantry. Hoplite armies were the most powerful forces in the Greek world, eventually adopted by every Greek city-state, including Sparta. Their hoplites may have allowed the Argives to inflict a devastating defeat on the Spartans at Hysiae in 669 B.C.E.

These reverses led to a complete reorganization of Spartan society. As did most Greek city-states of the time, the Spartans recognized the necessity of building a hoplite army. The fundamentally feudal society of Sparta, all its citizens freed of the necessity to engage in economic activity, enabled the entire male citizenry to focus on war to the exclusion of everything else. Every Spartan man was assigned to a group of fifteen, called a mess or eating group, with whom he lived, trained, and went to war. This unit seems to have had its roots in the hall feasts of the warrior elite past. The Spartan army was tightly disciplined, and boys began their training in discipline and war at the age of seven, being subjected to harsh treatment to toughen them up.

Plato remarked that all education in Sparta was carried out through violence rather than through persuasion and that the emphasis was on producing hardiness through endless tests of self-reliance and endurance. At the age of 20 boys joined a mess, the *syssitia*, where they spent most of their time. Homosexual relationships may have been the norm. Men could marry, but all visits to their wives had to be conducted by stealth at night until they were 30. Even marriage ritual was conducted in such a way as to limit associations of home and the domestic side of life that would distract the husband from his primary duty: to fight. On the marriage night the bride was dressed in a man's cloak and sandals and lay in an unlit room to receive her bridegroom.

In general the insecurity of Spartan society caused by the constant necessity to keep the helots in submission fostered a culture of extreme insularity, with military discipline aimed at minimizing individuality. Spartans called themselves "those who are alike," an expression both of the suppression of individuality in favor of service to the state and of a sense of being surrounded by a hostile "other." Spartan soldiers all wore red cloaks and long hair to assure uniformity. A man's greatest glory

was to die for the state; survivors of a defeated army were shunned. Literacy was not important in Sparta; writing was used only for international treaties, and Spartans were famous for their brevity of speech (the word *laconic* is from Lacedaemon, the name of Spartan territory), a habit undoubtedly inculcated in them from childhood, both signs that freethinking was discouraged by Spartan society.

The Persian Wars

By the late sixth century B.C.E. Sparta was the most powerful of the Greek city-states, ruled by a pair of kings in an oligarchy. In Athens, the tyrant Peisistratus's son Hippias sought help from Spartan forces to remain in power but was forced to resign in 510 B.C.E. Athenians sought protection against the Spartans from Darius I of Persia, but when the Ionian Greeks of Asia Minor rebelled against Persian rule the Athenians decided to join them. This sparked the Persian Wars (490–479 B.C.E.).

In 490 B.C.E. Darius sent a fleet to capture Athens. At the Battle of Marathon the Athenian hoplites drove away the Persian army. In 480 B.C.E. Xerxes I crossed into Europe with a huge army over a pontoon bridge to attack mainland Greece. Sparta led an alliance of 31 city-states against the Persians, and Leonidas I, king of Sparta, and his personal guard of 300 men, together with 5,000 troops from allied cities, faced a huge Persian army possibly as large as 200,000 men at the narrow pass of Thermopylae. Leonidas was able to hold off the Persians for several days, but finally, as Xerxes's scouts found an alternate path over the mountain over which to send a flanking force, Leonidas sent away the allied troops and with his personal guard faced the Persians alone. The Spartans fought to the last man. The Athenians had abandoned Athens by the time the Persians reached it, and the city was largely destroyed.

The Athenians, under Themistocles, defeated the Persians, even with their numerically superior navy, at Salamis, having lured the Persian ships into a narrow channel. In 479 B.C.E. the Greeks inflicted a decisive defeat on the Persians at Plataea, destroying a large part of their army.

The Rise of Athens

Supremely confident after naval victories against the Persians, and in spite of the fact that much of the city lay in ruins, Athens used its fleet to become a naval powerhouse, aiming to

carry the war back to the Persians. Athens formed what is known as the Delian League with city-states in northern Greece, the Aegean islands, and the west coast of Asia Minor, where the Greeks were most vulnerable to Persian attack. (The treasury of the league was on the island of Delos.) Athens took control, exacting dues from member states in lieu of ships and crews. Athens surged in wealth and power by trading and raiding other states. The league developed into an empire for Athens, since the allies had almost no navies of their own. Athens refused to let states leave the alliance.

Pericles (see sidebar) was the leading Athenian politician of the 450s B.C.E., taking decisive steps to strip the Athenian aristocracy

Pericles: Statesman for the Ages ✦✦✦

Pericles, the son of the army commander Xanthippus, was born in about 495 B.C.E. He was tutored by the philosophers Anaxagoras and Damon.

Upon the banishment of Cimon in 461 B.C.E. Pericles was elected leader of Athens. The Delian League, established in 478 B.C.E. to unite various cities on the mainland with some on the Aegean Islands, prospered during his reign. In 446 B.C.E. Pericles defeated Euboea (modern Évvoia), which had revolted against the league, strengthening Athen's dominance of the alliance. The next year he arranged a truce with Sparta. He also sent a fleet to secure the grain route between Athens and the Black Sea. At the outbreak of the Peloponnesian War in 431 B.C.E. Pericles let the Peloponnesian army plunder the countryside while he gathered his countrymen inside Athens's gates. An epidemic ravaged the overcrowded city, and resentment of Pericles grew. He was driven from office and tried and fined for misuse of public funds. Reelected in 429 B.C.E., he died later that year, reportedly of plague.

Pericles, known for his statesmanship and eloquence, inspired what is known as the Age of Pericles. Among his achievements were government open to all citizens and payment for services rendered to the government. His public works program included restoring the temples destroyed by the Persians and building the Parthenon and Propylaea on the Acropolis. He supported the arts and befriended the historian Herodotus, the sculptor Phidias, the philosopher Protagoras, and the playwright Sophocles. Outliving his two legitimate sons, he was forced to legitimize his son Pericles, whom he raised with his mistress, Aspasia of Miletus, a cultured courtesan.

Pericles is depicted in this bust. (Library of Congress, Prints and Photographs Division [LC-USZ62-107429])

of its power, expanding the role of the democratic assembly in government, and promoting Athens's dominance over the Delian League. A symbol of that dominance as well as of democratic pride was the Parthenon (from *parthenos*, virgin), a magnificent temple to Athena in part built with funds from the Delian League's coffers, a fact bitterly resented by other league members. Pericles supported naval expeditions to Phoenicia and the Black Sea and frequently confronted Sparta, which had a league of its own on the Peloponnesos. Eventually Pericles advised that war was being fought on too many fronts, and Athens signed a peace treaty with Sparta to maintain a grip on its empire. At the empire's height there seem to have been some 150 subject states. Virtually every island of the Aegean was a member. Athenian control stretched along the Asian coastline from Rhodes up to the Hellespont, into the Black Sea, and around southern Thrace as far as the Chalcidice peninsula. Nearer home the cities of Euboea and the island of Aegina were members.

Athens put pressure on its shipping rivals, Corinth and Megara in the Peloponnese, which were key allies of the Spartans. This escalated into the Peloponnesian War (431–404 B.C.E.). Pericles conducted surprise naval raids on the Spartans, then retreated behind the walls of Athens when the infantry attacked. In 430 B.C.E. an epidemic started behind the walls, killing thousands, including Pericles himself, over a period of several years. The Athenians' allies revolted against their demands for cash.

Finally in 415 B.C.E. Athens launched a foolhardy campaign against Sparta's allies in Sicily, overconfident of their prospects for victory. The Athenians were defeated catastrophically at Syracuse in 413 B.C.E. Sparta meanwhile built a navy with support from Persia. In 404 B.C.E. the Athenians lost the war, after much attrition, the loss of its silver mines, and a devastated agriculture. The Athenian empire ended, and Sparta installed a puppet regime, the Thirty Tyrants. These lasted only a year, replaced when rebels restored democracy in 403 B.C.E. Athens rebuilt but was unable to gain its former power, and Sparta, Corinth, Thebes, and Athens contended throughout the first half of the fourth century B.C.E. in brutal indecisive warfare. Corinth and Thebes rose to power as the century progressed.

Expansion of the Macedonians

The two great empires of Athens and Sparta, reduced to shades of their former glory, were eventually conquered by the MACEDONIANS. In

338 B.C.E. King Philip II led a crushing victory over allied Greek forces at the Battle of Chaeronea. His son, Alexander, nominally united all of Greece, but he departed Greece for wars of conquest in Asia, leaving surrogate rulers behind. After his death in 323 B.C.E. the city-states of the Greeks declined in power as the kingdoms carved out of Alexander's empire by his successors stabilized. The era of the city-state had ended; no city could compete with the large Alexandrian states Egypt, Syria, and Macedonia. Several cities formed the Aetolian League against Macedonia, but another league, the Achaean, took the Macedonian side. The large states, ruthless and greedy, all eyed Athens as a potential jewel in their crown and competed to dominate the city. Athens meanwhile never gave up hope of regaining control over former possessions in the Aegean and repeatedly went to war in attempts to win them back, regaining and then losing them. Athens was forced to accept a Macedonian garrison in Piraeus, and history is replete with examples of Athenian sycophancy toward the latest ruler to gain control over the city, with the citizens voting statues, monuments, even deification and shrines to placate him, only to destroy and reverse all these when his power waned.

Continued warfare among the Greeks progressively weakened them, while Rome was uniting the ITALICS under its rule. After the Fourth Macedonian War in 149–148 B.C.E. the remnants of most of the Greek states fell into the hands of Rome.

In 200 B.C.E. Athens had sought Roman aid in one war and thereafter for more than a century was counted as a loyal ally of Rome, a policy that protected Athens from Roman attack until in 88 B.C.E. the city backed the pro-Hellenic and anti-Roman campaign of King Mithridates of Pontus in Asia Minor. The Roman general Lucius Cornelius Sulla, an utterly ruthless commander, defeated Mithridates in 86 B.C.E. and sacked Athens, massacring so many Athenians that whole neighborhoods were reportedly covered in blood, and destroying many Athenian buildings. Athens remained economically devastated for a generation.

Some 40 years later in the Roman civil war between Julius Caesar and Pompey, Athens backed Pompey who was defeated. Upon his victory Caesar addressed the Athenians, asking "How often do you expect to be rescued by the fame of your ancestors from the destruction you bring on yourselves?" His treatment of Athens was lenient, however.

Eventually all of the states founded by Alexander's generals fell to Rome. After the defeat of Mark Antony and Cleopatra at the Battle of Actium in 31 B.C.E. the latter took her own life, thus becoming the last Greek ruler of Egypt.

In spite of the loss of political power Greek cities long retained a degree of independence, and intellectual life maintained its vitality. Greek intellectual supremacy continued for many centuries, profoundly influencing Roman culture. After the Roman Empire was divided into Eastern and Western portions in 395 C.E. the Eastern part, which came to be known as the Byzantine Empire (*see* BYZANTINES), increasingly lost its Roman character, becoming primarily Greek in outlook.

CULTURE

Economy

Farming Level farmland was sparse in Greece except on the plains of Boeotia and Attica, but the Greeks grew wheat and made flour with mortar and pestle or, as technology developed, in mills. They made bread from barley and wheat. They grew many vegetables, including cauliflower, leeks, lettuce, onions, cucumbers, celery, and artichokes. The fruits in their orchards were various; many of them do not exist today. They grew figs, apples, pears, pomegranates, and of course grapes. Famous wines were made in Mendi, Naxos, Thassos, and the island of Rhodes. An ascerbic white wine, *retsina*, still made today, was characteristic of Attica. The Greeks used salt, pepper, oil, vinegar, dill, mint, thyme, oregano, and fennel as seasoning. They made cakes from flour, oil, dried fruits, milk, eggs, and honey.

There were many small farms on the plains outside most city walls. In Athens more people lived outside the walls than within them. These small farms were often manned by a few slaves, who used oxen to plow the field.

Goats were herded in the mountains, as they are today, and pigs and chickens farmed for meat while cattle were farmed primarily for milk and eaten typically after sacrifices. The very poor sometimes resorted to eating cattle, while the rich supplemented their diet with hunted wild boar and birds.

The diet of the ancient Greeks was in many ways similar to that of Mediterranean people today. With most of their settlements hugging the extensive coastlines of Greek territory or on islands, they primarily ate seafood augmented by meat products from sheep, goats, and pigs; goat and cow milk; small game; bar-

ley cakes; fruit from orchards; honey; and olives and olive oil. They made wine much as it is made today but drank it mixed one part wine to two parts water.

Farming in the Mediterranean then as now was a notably precarious proposition because of the very variable climate. The proximity to the Mediterranean basin of landmasses of strongly opposite character—the moist and cold European mainland to the north, the dry and scorching deserts of North Africa to the south—meant that weather patterns that caused one or the other region to affect the Mediterranean basin for a prolonged period could produce cold spells with untimely frosts or droughts. The different winds were gods of very different characters for the Greeks perhaps for this reason. Northerly winds were borne by the god Boreas, whose name meant “devouring”; he was considered a fertilizing force, perhaps because the north winds that blow down from the mountains over southern Greece during the winter are followed by the greening and flowering of spring. Boreas was legendary for impregnating mares, whose offspring were swift as the wind. But he was also a destructive force who once saved the Athenians by wrecking a Persian fleet. Another destructive wind was personified as Typhon (from which comes the word *typhoon*), a terrifying monster born of Mother Earth in revenge on the Olympian gods for destroying a race of giants who were her offspring. Typhon was associated with the burning blasts from volcanoes, but also with the *sirocco*, a prevailing wind from the deserts in Africa that could destroy crops with drought. Soil erosion was a continual problem, as suggested by Plato's comparison of the land of Attica to a human body wasted by disease, leaving nothing but skin and bone.

The Watery Thoroughfare for Greek Trade The mountainous interior of Greece fostered sea travel, since it was easier to traverse the whole Aegean than to cross mainland Greece from east to west. Also the lack of arable land led to emigration and the predominance of trade. By the eighth century B.C.E. the Aegean had become essentially a Greek sea, where the Greek trade centers, on their way to becoming city-states, competed for trade dominance. In the ensuing 200 years the Aegean became too small for all of the Greek trading interests, and Greeks began venturing farther afield. Northeast was the Black Sea, known for its cold winters and the difficult passage there through the Dardanelles strait. To the west the Tyrrhenian Sea, its name derived from the

Greek word for the Etruscans who lived on the west coast of Italy, where Sardinia, Corsica, and Sicily lay, offered many desirable goods, particularly from metal-rich Etruria.

Greek sailors ventured throughout the Mediterranean Sea and most likely beyond. Mariners and merchants sailed through the Red Sea. In the late sixth century B.C.E. a Greek mariner, Scylax, was chosen by the Persians to lead an expedition down the Indus River to the Persian Gulf. The extent of early Greek sailing can be inferred from ancient Greek myths, such as the long voyage home of Odysseus, which seems to have touched places in north Africa, southern Spain, and Italy before the return to the island of Ithaca; and the voyage of the *Argo*, through the Bosphorus and to the far end of the Black Sea. The Greeks were certainly involved in the amber trade from Scythia. And of course the voyage of Pytheas of Massilia to the “Hyperborean” regions beyond the realm of Boreas himself equalled the exploits of any mythic hero.

Trade with the Near East The topography of Greece also fostered sea travel to Asia Minor. The Aegean Islands acted as stepping stones to the east, many providing excellent harbors.

Meanwhile the Phoenicians from the Levant, whose cities there were well established by the ninth century B.C.E., soon began moving out into the Mediterranean toward Greece. They founded a colony, Kition, on the southeast coast of Cyprus in the ninth century B.C.E. The traditional date of the founding of Phoenician Carthage on the coast of north Africa is 814 B.C.E. The Phoenicians began moving westward toward Italy, a course that involved a difficult crossing from the Peloponnese to landfall on the Italian coast, probably as much as a century before the Greeks, in all probability pioneering sea routes the Greeks would use. The Greeks also later adopted Phoenician galley ship types: the 50-oared warship, the penteconter, and the three-tiered trireme.

Greek trading contacts with the Phoenicians were inaugurated by traders from Lefkandi before the end of the Greek Dark Ages and were maintained by its successor city, Eretria, and by traders from Chalcis, also on Euboea. Again absence of material evidence of Greek trade goods at this time in the Phoenician trading sphere suggests that the Greeks were exporting slaves or agricultural produce that leave no mark in the archaeological record. The site of a trading post at al-Mina in northern Syria has produced Greek materi-

als, but they seem to record a settlement of Greeks, rather than use of Greek products by other groups living here, mostly Phoenicians and CYPRIOTS. Al-Mina was important as the start of the shortest caravan route to Mesopotamia.

The growing power of Assyria, a state north of Babylon in Asia Minor based in the city of Ashur on the Tigris, increasingly disrupted trade in the eastern Mediterranean in the eighth and seventh centuries B.C.E.; Assyrians captured al-Mina in about 720 B.C.E. and destroyed the Phoenician city of Sidon in 677 B.C.E. In the long run, however, their conquest of the Phoenicians increased the latter's trade activities to satisfy Assyrian demands for tribute. Assyrian records tell of attacks on their interests by Greek raiders, perhaps based in Cilicia (modern southern Turkey).

Power politics in the seventh century B.C.E. led to the opening of Egypt to Greeks by the Egyptian king Psammetichus (Psamtek), who was attempting to expand his power at the expense of the Assyrians. He hired Greek mercenaries and welcomed Greek traders, who were primarily interested in the rich agricultural surpluses of the Nile valley. Greeks traded in oil, wine, and silver. They were allowed to set up a trading post in the western Nile Delta at Naucratis.

Trade and Settlement in the West The Phoenicians had probably been trading with SARDINIANS and perhaps settling in Sardinia from the ninth century B.C.E. Sardinia had rich deposits of copper, tin, lead, and iron ores. Probably because of Phoenician dominance of Sardinian trade, when traders from Euboea began arriving in about the mid-eighth century B.C.E., they bypassed Sardinia and established a settlement, called Pithekoussai, on the island of Ischia farther up the west coast of Italy. Here they had contact with the Etruscans, who had cities in the western region of the Italian Peninsula north of Rome. A flourishing trade with the Etruscans soon developed despite tensions between these trade rivals that sometimes led to conflict; the Etruscans particularly desired Greek pottery, and by the late sixth century B.C.E. in Athens potters of the so-called Perizoma group had developed a style of pottery specifically for the Etruscan market.

Population growth at home, as well as the Greek custom of inheritance whereby landholdings were shared equally by sons, increasingly led to emigration of Greeks across the Mediterranean, a migration that only slowed in

the sixth century B.C.E. because the best settlement sites had been taken. By that time Greeks lived throughout the Mediterranean and along the coast of the Black Sea. The new settlements varied in their functions and activities along a continuum from the *emporium*, predominantly devoted to trade, to the *apoikia* (colony, or home from home), in which colonists took and farmed land. In reality in most settlements Greeks pursued both activities to a greater or lesser degree. At first emigration was an ad hoc affair, but with the rise of the polis, city-states began sending out organized colonizing expeditions of 100 or 200 young men, sometimes gathered by force, because of land shortages. Once a colony became established, it often maintained its ties to the mother city, importing its pottery and continuing to take part in its festivals and cult rituals.

Greek colonists on Sicily seem to have maintained good relations on the whole with the native SICULI and SICANI—in the case of one colony, setting up formal arrangements for intermarriage. Peace led to prosperity; some colonies became fabulously rich and adopted lifestyles that some Greeks at home disapproved of as overly self-indulgent and hubristic. The word *sybaritic*, “given to sensuous pleasures,” is taken from the name of the Sicilian Greek city Sybaris.

Government and Society

Early Kings The first evidence of Greek political structure is from Mycenaean, where the political life was centered around a king, called a *wanax*. There was another high office, the *lawagetas*, or leader of the people, probably a war leader. This division of leadership has analogies among other Indo-European peoples, such as the Celtic and Germanic. As the Mycenaean cities grew in size and wealth, the *wanax* and other leaders gradually accumulated a bureaucracy, according to evidence from Linear B tablets and from major building projects, palaces, elaborate tombs, and even planned agricultural estates, which could only have been built by marshaling and administering great numbers of laborers. One of the minor officials who helped the *wanax* administer his court was called the *basileus*. After the collapse of the Mycenaean civilization the new rulers of the settlers who dotted the small islands of the Aegean and Asia Minor used that name, which took on the meaning “king.” Gone were the ages of strong centralized rule, however. Throughout Greece during the Dark Ages these leaders were more chiefs than

kings, who ruled so long as their followers allowed them, through cooperation.

Rise of the City-State According to the Greek philosopher of the fourth century B.C.E. Aristotle, Greek city-states emerged inevitably based on the laws of nature. It is more probable that Greek city-states arose in the political vacuum of the Dark Ages, and in reaction to the monarchical cities found on Cyprus, throughout Phoenicia, and in other parts of Asia and Africa. By about 750 B.C.E., however, Greeks all over the Greek world had established themselves in city-states. Greek city-states were autonomous, each having its own customs and religion, protector deities, and founding myths. For protection or trade the city-states would establish leagues whose relationships were cemented by festivals and panleague games. Two of these were the Ionian and Achaean Leagues. The crucial importance of trade in the rising fortunes of Greek cities meant that the merchant class was more or less equal in power to the landed gentry. Because of this the key characteristic of a city-state was the limiting of centralized power. Various city-states were ruled by oligarchy or differing forms of democracy. The city was usually established close to water, the only viable form of transportation in ancient times, but far enough away to be safe from marauders and usually at an elevation that provided the best views of the surrounding areas. Often a city-state was established around a central temple, the house of its protective deity. In Athens this was the Acropolis, on which was perched centrally the Parthenon, the house of Athena.

Modes of Justice and Lawgiving The Greek world depicted in Homer (the name attributed to a poet of the ninth or eighth century B.C.E.) had a system of justice similar to that of many other tribal warrior societies, both contemporary and later. The basis of such systems was the blood price, the compensation due from the family of a lawbreaker to the victim or his family. The form taken by homicide trials in tribal societies is shown by the description in the *Iliad* of a scene that was pictured on the shield of Achilles made for him by the smith god Hephaistos (perhaps meant to convey that justice was society’s protection and shield). The scene shows a litigation in which two men were disputing over the blood price for a man who had died. The problem in this case was not the price but the fact that one of the men, presumably the kinsman of the deceased, was refusing to accept it, a situation that mirrors

This late-19th-century photograph shows a view of the ruins of the Parthenon in Athens. (Library of Congress, Prints and Photographs Division [LC-USZ62-108932])

the stalemate in the larger narrative in which Achilles is refusing to accept the blood price offered him by King Priam of Troy for Achilles's slain friend Patroklos, intended by Priam as ransom for the body of his son Hector whom Achilles had killed to avenge Patroklos's death. Homer demonstrates the necessity in tribal warrior societies of a means of halting endless blood feuding by compensation of the victim's family, the amount of compensation determined at an assembly.

It has been suggested that Achilles's eventual acceptance of the ransom offered him by Priam is a reflection of an emerging view in Greek society of justice, one that informed and was being played out in the development of the polis, the basic larger social unit of the Greeks (aside from tribe and family), consisting of the city and the community of its people. But Achilles's acceptance of the blood price offered by Priam is part of the tribal past. The feature that distinguished the polis from earlier Greek society was not the communal activities—the seasonal round of festivals and religious observances, choruses, funerals, assemblies of justice, plus shared experiences in war, in kinship groups, in age classes, and in marriage alliances, all of which were present in tribal warrior societies—but the fact that this Greek kind of community was based in a city and that it was literate. The Greek city was a more or less self-guided community, unlike the cities of Egypt and Mesopotamia that existed to serve kings. It introduced to the urban setting the communal values of the tribal past.

Individualism The individualism of Greek society that led to the experiments with democracy in Greek city-states was given an early expression by the poet Hesiod. The bitterness with which he denounces the givers and takers of bribes, those who use unfair means of gaining advantages over their neighbors, is based on the belief that such practices trample on the rights of others and attack and demean their self-respect. Mediterranean peasant societies from Hesiod's time to the present fostered in the individual a fierce sense of his privileges and personal worth. Men who trespass on the rights of others are guilty of *hubris*, which means "violence," but also the attitude that fosters violence: a sense of superiority and a contempt for the rights of others.

The rise in importance of trade in the eighth and seventh centuries B.C.E., in contrast to the time of the Mycenaeans, when it fostered the rise of elites, tended to "level the playing field" in a number of city-states. Luck and initiative meant more to becoming a successful trader than aristocratic lineage. What may be called a middle class of merchants and craftsmen began to challenge the dominance of the aristocracy in public affairs; in Athens these tensions culminated in creation of a code of laws by a sixth-century B.C.E. citizen by the name of Solon who had grown wealthy and influential through trade.

Codification of Laws Laws were first written down at about the time that the oral poetic tradition of Homer began to appear in writing. Previously law codes had consisted of compilations of rules created by generations of past lawgivers or judges (similar to the Irish *brehon*, meaning judge in Irish law). Law codes that began to emerge in the eighth and seventh centuries B.C.E. were commonly later ascribed to a single lawgiver (as the Homeric poems were ascribed to a single poet). In the case of Athens in 621 or 620 B.C.E. a lawgiver named Draco (Dracon) drew up a code of law to resolve conflicts among the classes of Athenians. The code carefully laid out definitions of various kinds of homicides, but generally the punishments were held to be extreme (hence the term *Draconian*), and the debtor class was much distressed that the Draconian code ruled that they be sold into slavery if they defaulted. In Sparta in accordance with the conservative nature of their society the tradition was that a judge called Lycurgus forbade the writing down of laws.

Law codes, such as those observed on Crete, typically dealt with such matters as the

powers of magistrates and mandated religious observances but were mainly concerned with private matters of barter and sale, dowry and adoption, inheritance and succession, fines for trespass, and blood money. Fines were fixed in numbers of cauldrons or tripods. An inscription from 450 B.C.E. describes a trial; the procedure was oral, consisting of oaths and testimony, without material or documentary proofs. The Romans believed that the Athenians invented lawsuits.

The Greeks had the custom of settling disputes between two states or members of a single state by resorting to external arbitration. There was no systematic collection of laws. Evidence on legal matters can be found in Homeric poems. Attic law derived from speeches of orators. Aristotle was known to criticize Plato, a philosopher of the fourth century B.C.E., for his abstract treatment of law; Aristotle in contrast discusses law in relation to the constitutions of Greek states and to early Greek lawgivers.

Solon An economic depression in Athens in the late seventh century B.C.E. brought resentment against Draco's laws to a head, as many small farmers were sold into slavery. In 594 B.C.E. Solon, a wealthy aristocrat, was chosen as a mediator among the classes in Athens as well as archon (chief magistrate). He cancelled all mortgages and debts and set free all who had become slaves as a result of debt, forbidding such practices in the future. He took the further step of encouraging those whose landholdings were too small to sustain them, a common circumstance because of the Greek custom of dividing landholdings equally among sons, to take up a craft or other occupation (he himself had grown rich by engaging in overseas trade).

Solon established the right of every person to appeal to the law courts and claim legal satisfaction on behalf of anyone wronged. Courts were established with hundreds of jurors. He also made reforms in laws of inheritance.

Solon's reforms were not restricted to legal matters. Far more important were his mandates concerning the political system of Athens. He began by setting forth criteria for membership in four different political classes, based on the property each man held. The first three classes were based on long tradition: the *pentacosiomedimni*, that is, those whose annual income equaled 500 *medimni* (one *medimnus* = 1.5 bushels or 8.5 gallons) of grain, wine, or oil; the *hippeis*, or knights, who could supply a

warhorse for military service and whose income amounted to 300 *medimni*; and the *zeugitae*, or teamsters, who could supply a yoke of oxen and had an income of 200 *medimni*. Perhaps Solon's greatest achievement in his reforms was to add to these a fourth class, the *thetes*, who in general held no property. Although these *thetes* could not hold office, they could attend city assemblies and vote on policies proposed by a council of 400. This gave the general populace a voice in matters of state unheard of at the time: It was truly the birth of democracy.

Crime and Punishment For premeditated murder the penalty was death; wounding with intent to kill meant exile and confiscation of possessions. The penalty for manslaughter, or killing a slave or a resident alien, was exile without confiscation until the criminal had propitiated the relatives. Punishment for instigating a crime was the same as for committing it.

The allotment of jurors in trials was probably randomly determined the day a case was to be heard. Each court contained an equal number of jurors from each of the 10 tribes. Jurors were paid a fee. Speeches were made by advocates, one or two on each side usually. In the fifth century B.C.E. mussel shells were used for voting. Each of the jurors received a shell that he placed into one of the two urns. In the penalty phase jurors drew on wax tablets, a long line for heavy penalty, short line for lighter one. In the fourth century B.C.E. the shells were replaced by disks of bronze.

In Athens persons were executed by being hurled into a deep pit in northwest Athens; later in the time of Socrates the condemned was compelled to drink hemlock. Common criminals were beaten to death with clubs.

Rise of Tyrants The expansion of the Greek world in the eighth and seventh centuries B.C.E., which resulted from a shortage of resources, most particularly arable land, was accompanied by continuing and debilitating conflict, both in the homeland and between neighboring colonies abroad. In many cases new colonies had to fight with neighbors for their survival, for land and trade routes. The continual conflict gave rise to infantry armies made up of citizen soldiers, called hoplites, who provided their own weapons and armor, since few colonies could afford to hire mercenaries or provide arms to their soldiers. Such armies were highly successful, even against cavalry. Service as hoplites was another means

by which commoners could play a crucial role in their city's affairs, and their success against the mostly aristocratic mounted soldier gave them a sense of pride and entitlement. In addition the focus of the Homeric warrior, personal honor and glory, was replaced by an ethos of service to the community.

The conflicts that increasingly arose between the aristocratic class and the invigorated and ambitious commoners—conflicts that often ended in political stalemate—led to the emergence of leaders who knew how to appeal to ordinary citizens and give them what they wanted. These leaders, called *tyrannoi* (rulers), were usually aristocrats themselves, but whether through a greater breadth of vision than their fellows that caused them to see the value of involving the citizenry in political affairs or a cynical belief in their ability to manipulate public opinion for personal ambition, they opposed their own class to propel themselves into power. The case of Cypselus of Corinth may be similar to that of other tyrants about whom less is known. An excluded member, through his mother, of the ruling Bacchiadae clan, he may have gained popular support as a military commander. In about 657 B.C.E. he overthrew the Bacchiadae, sent the clan into exile, and distributed their land among his supporters. Tyrants (at least those who were successful) seem to have had a shrewd sense of how to please the public and in particular their supporters. They ensured the favor of the gods and glorified their cities with fine temples and other buildings and took steps to foster trade.

Most tyrannies did not last much beyond the lifetime of the first tyrant or that of his son, however. In a sense a tyranny was a step backward in political evolution from rule of the few (the aristocrats) to the rule of one, when instead the trend of the time was toward rule of the many since the hoplite citizens increasingly sought to play a greater role in the affairs of their city than that of simply defending it as soldiers. The Greek polis was far more than an accumulation of buildings. It was a community welded together by shared experiences of peace and war and shared histories. It preserved the egalitarianism of the tribal past in a society made more complex and sophisticated by being literate and urban.

As a result most tyrannies were soon replaced by either oligarchies (from Greek *oligos*, few, and *archos*, ruling) or democracies (from Greek *demos*, people, and *kratia*, power). The office of a single archon who served for 10

years was abolished in 683 B.C.E. and all his duties distributed to a group of archons who held office for one year.

Rise of Hellenism The destruction and instability caused by the city-state rivalries of the fifth century B.C.E. was the beginning of the end of ethnic rhetoric, which had ceased to matter much outside political maneuvering. Already during the threat of Persian invasion the Greeks had established an idea of Hellenism versus barbarianism, recognizing their common traits. These ideas can be found in the writings of Herodotus and Thucydides, Greek historians of the fifth century B.C.E., both of whom considered Hellenism more of a cultural trait, that is, something that could be acquired, than an ethnic one. The final defeat of these ethnic divisions was the advance of the Macedonian Alexander the Great, who conquered and united all of Greece in 336 B.C.E. and went on to establish a short-lived Hellenic empire throughout the Near East, spreading over Greece and beyond a common Greek culture and dialect.

Slavery In modern times the role of slavery in classical Greek society, which had been overshadowed by the highly idealized view of the Greeks of earlier centuries, was subject to increased scrutiny. It has become clear that those aspects of Greek society that have most been admired since the 18th century—the development of democracy, achievements in philosophy and the arts—were in large part made possible by the slave labor that freed a large segment of Greek society to engage in politics and intellectual endeavor. The wealth of Athens that allowed the city to lead the Greek world was based on the silver mines of Laurium, worked by slave labor, a source that remained constant throughout the exigencies of agriculture and trade caused by weather and war. Slaves did the agricultural labor for landowners, enabling them to engage in affairs in the cities.

Use of slave labor was a given in Greek society; Greeks seem to have been unable to imagine their world without it. Owning slaves and even working them in harsh conditions bore no moral stigma; it was commonplace for men to make money by sending their slaves to work in the Laurium mines for a fee, even though the mine passages were barely wide enough to crawl through, their walls of rough and sharp stone, so that moving through them caused cuts and abrasions. Slaves in the mines

would work for 10 hours at a stretch by the light of simple oil lamps.

Most slaves were obtained in war, and even fellow Greeks could be enslaved, although most slaves were non-Greek. The women and children of Melos, a client city of Athens that the latter attacked for insubordination, were all sold into slavery after the Melian men had been slaughtered. There is some evidence that Plato himself was sold into slavery by the tyrant Dionysios of Syracuse after a quarrel. Plato was ransomed by wealthy friends, but the episode underscores the difference between slavery in the ancient world and that, for example, in the American South before the Civil War. It may be that Greeks viewed enslavement as one of the unavoidable consequences of war, a step away from being killed or wounded. Greeks used war for political purposes and for the glory of their cities, and for Greeks perhaps sending slaves into the mines may have been equivalent to sending soldiers into battle. Another key difference was that slavery did not conflict with the Greeks' religious and ethical beliefs, as it does with Christianity. It was considered simply as one of the possible fates meted out by the gods.

Status of Women The role of women among the Greeks was limited. Women were the possessions of their fathers until they married, when they became the possessions of their husbands. Fathers paid a dowry for their daughters. Aristotle considered women less than human, and in Athens they were restricted from voting and from attending many public festivals. Women's roles in tragedies were performed by men. In the Greek household women lived in their own quarters, which other men were forbidden to visit. In the myths and legends of the Greeks, however, there is evidence that women once held stronger roles in society, and some interpreters of myths have posited that Greece was once matriarchal, a theory that has fallen into disfavor for lack of evidence. What is clear is that in Minoan and Mycenaean times powerful goddesses were worshipped as well as gods, and such a strongly patriarchal pantheon as that of the Olympian gods probably did not exist. It is probable that the social position of women in these cultures was reflected in the importance of goddesses. Women in Homeric works, particularly the aristocratic wives of heroes—Penelope, wife of Odysseus, and Arete, wife of King Alcinous of Phaeacia—enjoyed high status. The status of women was variable throughout Greek history and from community to

community. In Sparta of classical times girls exercised alongside boys, encouraged to have a strong body and mind. The female poet Sappho of the seventh–sixth century B.C.E. was a highly regarded lyric poet even in ancient times, and her poems paint a picture of a less repressed feminine spirit.

Greek plays give an idea of the view of women in the male-dominated Greek society. Heroines and female characters often depict the “other,” apparently symbolizing forces threatening to a stable and orderly society, such as the unbridled emotions displayed by women swept up in Dionysiac revels, or consumed with rage or with illicit passion, such as Phaedra for her stepson, Hippolytos. On the other hand characters such as Antigone, who gave her life to give her brother, Eteocles, a proper burial, could be held up as a model of a woman's selflessness and devotion to duty.

A female character in Euripides's *The Children of Herakles* (tellingly, she is not named but only called *parthenos*, virgin), who has emerged from a temple into the street to speak with some men there, describes the proper demeanor for Athenian women as silent and modest and asks their permission for speaking out.

The relation of women to men for the Greeks partook of the hierarchical and dualistic way in which Greeks ordered their world as a whole—woman versus man, slave versus freeman, barbarian versus Greek, emotion or unreason versus reason, senses versus intellect. As in the case of slave versus freeman it was always possible for a rational man to sink to the irrational level of a woman. In the scene described earlier, the maiden, one of the children of Iolaos's former companion, Herakles (Hercules on Roman mythology), has offered herself as the sacrifice demanded by an oracle for victory in a battle against foes determined to kill Herakles' other children. Iolaos, lacking the firmness of will to choose the appointed sacrifice, had cried out in despair, and now on the maiden's heroic departure to her death collapses. The roles of Iolaos and the maiden have been reversed, she displaying the courage of a man and he the weakness of a woman. As in the case of slavery the Greek male's attitude about his superior status in society seems to have been one of gratitude to the gods who made it so, and a recognition of the need to live up to the state to which he had been born. In the case of Iolaos his great age had rendered him weak; later, insisting on joining in the battle, he has a vision of his apotheosized

companion Herakles riding the sky in a chariot, which reinvigorates him with youthful strength. From the inscrutable gods comes all and to them all returns.

The End of the Democratic Experiment Some years before Philip of Macedon's defeat of the allied Greek city-states the orator Isocrates of the fifth–fourth century B.C.E. argued in his speeches that the only way to combat Persian power was for all to join under a single war leader; this in turn would end the internecine warfare that had severely debilitated the Greek world. He lived to see Philip's victory over the Greeks in 338 B.C.E., met the Macedonian king, and congratulated him. It had indeed been Philip's lifelong dream to lead the Greek world in conquering the Persian Empire. The united kingdom he now set about establishing formed the political model for the Greeks for years. Even though a monarchical system based ultimately on the excellence of the monarch himself and the troops and nobles who gave personal allegiance to him had become totally alien to the Greek world, it was to prove the most successful and resilient form of government in that world for the next two centuries.

Athens in the Postclassical Period Even after Athens had been stripped of the power of the glory days, conquered and looted many times, it remained the center of Greco-Roman civilization. Sons of Roman aristocrats were regularly sent to Athens to study and toured the other great sites of Greece, such as Olympia and Delphi, in a way very similar to the grand tour of Europe—Paris, Rome, Florence, and Venice—made by wealthy young people of 18th-century England and 19th-century America. Romans of taste and culture began settling in Athens as early as 100 B.C.E., “going native” as they soaked in the much superior culture of Athens as compared to that of Rome. Cultured tourists were shown the philosopher Plato's chair and the fourth–third-century B.C.E. philosopher Epicurus's house and visited Colonus, the setting of the fifth-century B.C.E. playwright Sophocles' late masterpiece *Oedipus at Colonus*. The great Roman writer Cicero of the first century B.C.E. marveled at the sense of history found at such places as the spot by the seaside where the fourth-century B.C.E. orator Demosthenes had exercised his voice against the roar of the waves.

Long after Athens had been subjugated to the Macedonian kingdom the practice of democracy continued to be vital. In the Hellenistic Age with the rise of the large

Alexandrian kingdoms and then Rome democracy was widely considered foolishness or worse. But Athenians continued to preserve equality before the law and freedom of speech for all those Athenian men who were citizens. Many officeholders were chosen by lot rather than election, a procedure that, unlike election—which tended to favor the wealthy aristocrats who could buy votes and exert their influence in other ways—ensured participation in government by all citizens and diluted the power of the rich.

As in the fifth century B.C.E. every year 500 citizens were chosen by lot to serve on the council; every month 50 of them, by rotation, acted as its executive committee. They prepared business for the assembly, the gathering of all citizens, which directed the city's affairs. The assembly made alliances, voted honors, and declared peace and war.

Recent study of public inscriptions in stone from this period, for which little in the way of narrative history was written at the time, has discovered a storehouse of information on the politics of the time. Such inscriptions recorded such matters as the membership of the national cadet force, the *ephebes*, or the award of a golden crown of honor to some foreign dynast who has conferred a benefit on the city. Sometimes such honors recognize a gift of wheat to the people or its sale at a subsidized price. Records of the names of officeholders demonstrate that for the most part a great range of ordinary citizens readily took part in public affairs, and power seldom became concentrated in the hands of a few aristocratic families.

Military Practice

As the Greeks emerged from the Dark Ages in the seventh century B.C.E. and organized themselves into city-states, they developed new tactics of warfare. These new tactics are hinted at in parts of the *Iliad*, which has at its forefront the ancient style of chariot warfare centered around great chieftains or heroes. But alongside the new political structure of Greek communities with the advent of oligarchy and democracy the heroic model was rejected, in favor of the much more effective phalanx. A phalanx was a solid wedge of infantrymen, called hoplites. Each man in the front held a large shield on his left shoulder and a double-edged sword or spear in his right. The hoplites were equipped with a helmet, a metal and leather breastplate, and shin guards called greaves. They adopted the Assyrian round shield and horsehair crest.

The hoplite was responsible for guarding the man on his left. The success of the phalanx depended on each man's holding his place so that the phalanx was not broken. The new way of fighting encouraged close and egalitarian relationships within the Greek armies. The phalanx was more maneuverable and more powerful than the disorganized groups that preceded it.

Clothing

Clothing throughout the ancient Greek world was very simple. Two main garments were worn by men and women, the *himation* (outerwear) and the *chiton* (underwear). These were worn by men and women, though the styles varied with the sex and station of the wearer. The Greeks wore sandals on their feet and leather boots in cold weather. Only under the influence of the East did clothing become more intricate.

The *chiton* was a simple tunic made out of a rectangle of either linen or wool. It was draped over the wearer and pinned at the shoulder with a brooch (called a fibula) and anchored at the waist with a belt. Depending on fashion, it could have formed sleeves, and be open or closed on the side. Excess fabric was pulled up over the belt. Spartan women of classical times wore it open on one side and were insulted for vulgarity by the more prudish Athenians. It could be pinned on one or both shoulders, but often the right shoulder and arm were left free. Soldiers wore a *chiton* with shoulders sewn together.

The *peplos* was a tubular garment worn by women; it was fastened at the shoulder and left the arms bare. A girdle surrounded and held it at the waist. The right side was open and hung from the shoulders like a shawl.

Whereas during the Archaic period vibrant colors were forbidden to ordinary citizens, later times saw the clothing, especially of women, dominated by colors, including violet, green, and gray, and patterned designs, of wavy lines, checks, stripes, and floral patterns.

The *himation* was a cloak originally worn in cold weather. It consisted of a single rectangle of rough wool worn over the other garments as outerwear. As lighter materials became fashionable, the *himation* was worn at any time. It grew in length with fashions and was draped in a more and more elaborate fashion as time passed.

Greek clothing was made primarily by the women of the household—mother, daughter, and female slaves. Women used

cosmetics, including powdered lead to lighten their complexion.

Art

Role in Society Greek art comprises ceramics, coins, gems, frescoes and so-called easel paintings, small votive sculptures, large sculptures and portraits, and monumental architecture. It was either functional in the form of painted vessels such as amphorae and cylixes or functional on a different plane, as in the temple architecture, or in statues dedicated to gods or to the heroes of the Olympic and other games. Instead the art we find is that which played a role in the community at large: in the architecture of the temples and theaters, in the statues of gods and community leaders, and in everyday life—the fine coins, the brooches that held together the Greeks' garments, and the painted pottery.

Eastern Influences Greeks avidly sought luxury goods of all kinds from the East—bronzes and objects in silver, jewelry and gems, and probably textiles—although none of these have survived. The custom at the Olympic games for victors to dedicate bronze cauldrons at the temple employed numerous cauldrons made in Assyria, Syria, and Urartu, east of the Euphrates. Greek craftsmen imitated the cast animal head attachments on these cauldrons. The Olympic games furnished the occasion for a great trade fair of goods from all over the Mediterranean and the Near East. These included carved gemstone seals from Syria and Egypt, shells from the Red Sea, worked ivory, and Phoenician silver work. Eastern styles, motifs, techniques, and materials influenced Greek artisans.

Many of the Eastern motifs that were taken up by the Greeks are so familiar to us that their non-Greek origins come as a surprise. The first Greek temples built in the classic style with rows of columns enclosing the interior began to be constructed after the seventh century B.C.E. when the Egyptian king Psamtik I opened his country to Greek traders. Thus the many-columned halls of the Egyptians were probably the main inspiration for Greek temples. In the sixth century B.C.E. the great Heraion of Samos, a temple to Hera, was built. It had a double colonnade, 21 columns along each side, eight at the front, and ten at the back. Ionian Greeks, who established trading emporia in Egypt in greater numbers than other Greeks, were especially enamored of large temples, and many temples built in Asia Minor had columns of the Ionic order.

This terra-cotta relief of the Greeks dates to about 460 B.C.E. (Drawing by Patti Erway)

This silver stater depicting Pegasus was used by Greeks in about 550 C.E. (Drawing by Patti Erway)

These six drawings of ancient Greek architecture appeared in an encyclopedia in the mid-19th century: 1) Temple of Theseus; 2) Temple of Segesta in Sicily; 3) view of ancient Athens; 4) Tower of the Winds; 5) western front of the Parthenon; 6) Choragian monument of Lysicrates. (*Library of Congress, Prints and Photographs Division [LC-USZ62-105997]*)

Depictions of Zeus holding a thunderbolt and Poseidon a trident derive from images of Syro-Hittite gods, who often bear weapons in their right hands. A number of composite animals were from the East, such as the chimera, which had a lion's head, a she-goat's body, and a serpent's tail, and the Triton, a merman. The chimera was from the Hittites; a Greek myth tells of a fire-breathing chimera that terrorized

Lycia, a country in southern Asia Minor near the western fringes of the former Hittite realm, suggesting that the story was inspired by images of chimeras on Hittite buildings and objects that Greek travelers had seen there. The Greek mythical hero Bellerophon of Corinth, aided by the winged horse, Pegasus, slew this chimera. The Triton originated in Mesopotamia. The sphinx, a bird-winged crea-

ture with the upper body of a woman and the haunches of a lion, was Egyptian; the myth of Oedipus and the riddle of the Theban Sphinx gives a sense of what early Greeks may have felt in confronting the ancient, awesome, and enigmatic civilizations that had preceded them. The 66-foot-high Great Sphinx of Egypt (made in about 2500 B.C.E.), already ancient by the time Greek travelers could have seen it, certainly exudes the aura of mystery and menace that pervades the story of Oedipus, doomed to commit the most heinous of crimes.

Plant images were elaborated into decorative borders in much Greek art, either twining tendrils of vines, or foliate shapes repeated over and over; two of the most important of these, the palm and the lotus, were from the East. Greeks adopted craft skills from the Phoenicians, whom Homer described as *polydaiidoloi* (of many skills), such as techniques of fashioning metal objects by hammering. From the Phoenicians the Greeks derived the lost-wax process, by which a piece of wax was fashioned in the desired shape and then encased in clay. This was subjected to heat, simultaneously melting the wax and firing the clay, making of it a mold into which molten metal was poured. Greeks began to use ivory for carving, although they may not have known where the material originated in their early history; tales of elephants and their tusks would have seemed no more or less fabulous to them than their own mythic creatures.

Corinthian pottery of the seventh century B.C.E. was particularly influenced by the East in motifs and in the invention of the black figure technique, which consisted in having the background of pictures left in the natural buff color of the clay, while figures in black were delineated and given details by incising line in the black paint. This technique is thought to have derived from Eastern metalworking. When Athenians adopted the technique a century later they gave their backgrounds an orange color.

Remains of Greek Art after the Classical Era

Greek art filled the Greek world throughout the heyday of ancient Greece. Sculptures multiplied in city centers; the walls of porticos, of temples, and theaters were adorned with statues and frescoes. When the Romans conquered the Greek world many of these treasures were carted away to Rome and spread through the empire, where they were copied by Roman artisans. A combination of neglect, resettlement, and a series of powerful earthquakes, not to mention the scorched-earth tactics of invaders from the Romans to the Goths, left much of Greek art and

architecture in rubble and buried for some 1,500 years. Much of what remained of Greek art until the advent of modern archaeology was to be found in later copies and in the catalogues of Greek historians and travelers, whose writings were preserved more carefully than the art objects themselves.

Painting The Greeks inherited the fresco techniques of the Minoans and Mycenaeans, which were executed similarly to those of the Renaissance masters. The pigments were primarily earth-based. Of what are commonly referred to as easel paintings there is little evidence and nothing surviving.

Pottery Pottery of what is called the Protogeometric Age (1050–900 B.C.E.) lost all lingering traces of Mycenaean influence. Pots of larger size began to be made. Increased control in the design and execution of decoration developed. The compass began to be used to make semicircles. Athenian pottery making was in the vanguard of these innovations, which, however, were not taken up everywhere, indicating that Greek culture remained considerably parochial in nature.

Pots of the Geometric style, which began in Athens after 900 B.C.E., were covered with rectilinear forms, borders, and motifs, such as zigzags and swastikas. Figures, however, are largely absent. Again this style was not adopted in many areas of the Aegean, including Euboea and the Cyclades. The earliest known harbinger of the figurative art that would be a hallmark of Greek artwork is a 10th- or ninth-century B.C.E. pot from Lefkandi bearing a depiction of a centaur, a creature part man, part horse, which would become a common decoration of Greek pottery in later periods. At this time Lefkandi perhaps continued to be in the forefront of developments in spite of the growing vitality of Athens as a center for culture.

A small explosion of figurative art occurred in Athens in the eighth century B.C.E. in the work of the Dipylon master, so-called because his only known works were found in the Dipylon Gate cemetery. The impetus for the funerary pots covered with figures seems to have been to glorify the exploits of elite warriors, for they depict battles on land and sea. Other scenes show mourners surrounding a body on a bier. These works depart from the Geometric style only in having figures, but they are highly stylized and geometrical, their upper bodies shown as inverted triangles, and their poses, repeated over and over, having a

uniform regularity like that of the geometric motifs that accompany them in parallel borders. The Dipylon master, who worked from about 770 to 725 B.C.E., had no direct imitators. But the use of the human form reappeared in about 700 B.C.E., and Greek pottery would be used from then on to render narratives of real or mythical events.

Music

A stringed instrument, the lyre, was the favorite of Greek philosophers from Pythagoras of the sixth century B.C.E. to Plato, in that it consisted of strings tightly wound of specific lengths descending in exact ratios with a mathematical precision that resonated through the Greek universe concerning ideas of natural beauty. The poetess Sappho of the seventh century B.C.E. is said to have invented the lyre (although this is undoubtedly a myth since lyres were in use centuries before Sappho's time). Pythagoras linked pitch relations to numerical ratios. According to legend he discovered this by listening to the clanging of the hammers of blacksmiths. Some of his musical ideas influenced medieval thinkers and musicians. Aristoxenus invented or at least systematized the study of pitch in the fourth century B.C.E.

The lyre was the traditional solo accompaniment for lyric poetry of the kind composed at the wane of the Archaic period by Sappho, as well as by Alcaeus and Anacreon of the sixth century B.C.E. The lyre was played and lyrics recited during the symposium, or drinking party. Much of our evidence concerning Greek musical instruments and performance is taken from vase paintings, which depict common scenes. The music of the lyre was probably composed to accompany lyric poetry. Poets were as much composers of music as of verse.

Other forms of poetry were also recited to music. The elegiac, a verse on any subject also performed at symposia gatherings of men (and at some times also gatherings of women) but composed in elegiac meter, was probably accompanied by the flute or *aulos*, a single- or double-reeded instrument with two pipes (*aula*). Music was an important part of symposia and was integral to Greek theater, in the part of the chorus, a group of actors who sang their lines and contributed to both the tension of Greek tragedy and later the amusement of Greek comedies. However, there were also competitions of solo *aulos* and lyre players, held as early as 582 B.C.E., who had careers as recitalists.

The music of symposia and the theater probably arose from early cult hymns, which were divided into the stately paean and the ecstatic dithyramb. The first written evidence are the *Homeric Hymns*, songs of praise to the Greek gods probably performed at ceremonies during the eighth century B.C.E. and recorded in writing in later centuries. These were probably accompanied by the lyre, drums, or flutes, and of the music we have only the evidence of words, which are strung together in heroic or epic verse. These hymns were the rough contemporaries and probably the forebears of the touchstone of all Greek literature, the two epic poems known to the ancients as Homer's *Iliad* and *Odyssey*.

Literature

Return of Literacy The greatly increased contact of Greeks with the Semitic cultures of western Asia in the eighth century B.C.E. led to the revival of writing in Greece, as Greeks adopted the use of alphabets from the Phoenicians, who along with other Semitic speakers had devised systems of conveying sounds through markings using Egyptian hieroglyphs. Because the Phoenician and other alphabets had symbols only for consonants, their flexibility and range of use were limited. The Greeks, in contrast, adopted Phoenician consonants that denoted sounds not used in the Greek language to symbolize Greek vowels instead, thus creating an alphabet that could be used for the whole Greek vocabulary and opening up the possibility of recording the finest products of poets, as well as more mundane material, such as recording of commercial transactions and listing of goods for which alphabets had been used earlier. By the seventh century B.C.E. the use of writing had grown; more than 150 inscriptions of that date have been found in Athens, including public inscriptions and others on gravestones. Pots offered to the gods at shrines have inscriptions as well, as though written speech in some way partook of the immortality of the Olympians, a visual means of fixing thought, so that the piety of the individual who had caused the inscription to be made would be perpetuated in eternity. This may have been the motive for tomb inscriptions as well, a form of individuality and will toward immortality.

Writing of Poetry One of the earliest known inscriptions in Greek dates to about 720 B.C.E., that on a drinking cup found at a Greek trading post on the island of Ischia off the west coast of

Italy. It gives the name of the owner of the cup, Nestor, but also includes three lines of verse (promising sexual desire to anyone who drinks from it). However, it is not known whether the greatest poetic works of the Greeks, the *Iliad* and the *Odyssey*, had yet been committed to writing by this time.

The Iliad and the Odyssey The *Iliad* and the *Odyssey* are the only surviving remains of a grand cycle of eight epic narratives in verse, which together comprised many tens of thousands of lines; these, when they were eventually written, totaled at least 77 “books,” or papyrus scrolls. These narratives were not “composed” by an individual or individuals all at once (although Homer of the ninth century B.C.E. is so credited), but instead evolved over many centuries as wandering poets kept alive, varied, and added to a traditional body of heroic tales that they performed for the entertainment of aristocratic households all over the Greek world. We have only a partial idea of the impact of Greek poetry (as well as of Greek theater, which was closer to opera than to modern drama) because poets were equally singers, chanting their words as they accompanied themselves on a lyre. Thus the narratives were far more than mere recitation of facts and happenings, as poets aimed to influence their audiences by deploying the emotional power of powerful events, to enable them to feel as well as imaginatively see and hear them. This drive to move their listeners probably led to the invention of new incidents and details, since improvisation on the traditional themes was an important component of the poet’s art.

As did the narratives of many other tribal cultures, the Greek epic tradition essentially took the form of annals describing the events surrounding the birth of a people—they comprised the foundation myth of the Greeks, the basis of Greek ethnic identity. The relationship of the Greek epics to historical fact may be similar to that of the British legends of King Arthur and the Frankish *Song of Roland*. All have a core of truth—in the case of Arthur the resistance of BRITONS to the invasion of the ANGLO-SAXONS, while the invasion of Europe by Muslims informs the *Song of Roland*—liberally garlanded with strands of poetic imaginings, such as Arthur’s Twelve Battles and his Round Table (possibly based on a Roman amphitheater). The core of the *Iliad* and the *Odyssey* may be fierce and protracted rivalries between power blocs of the late Mycenaean age, when shrinking resources may have sparked wars for

dominance of the trade networks that were the source of Mycenaean wealth. These rivalries would have been remembered and reinterpreted in the far simpler warrior societies of the ensuing Greek Dark Ages as arising from matters of personal honor and the warrior’s drive for glorious deeds of battle.

The basic story line of the Homeric epics concerns a 10-year-long war against the kingdom of Troy waged by the Achaeans, a race of heroes who apparently lived in the regions of Greece we now know were dominated by Mycenaean elites from the 15th to the 12th century B.C.E. They were led by Agamemnon, king of Mycenae. The cause for the war was nothing so prosaic as control of trade networks, but rather the abduction by Paris, son of the Trojan king, Priam, of Helen, the wife of Menelaus, king of Sparta. The traditional date for the Trojan War was the 13th century B.C.E. Archaeological excavations have shown that there was indeed a wealthy city on the coast of Asia Minor just south of the entrance to the Black Sea, roughly where Troy was said to have been located, and it was indeed destroyed, not once but twice: at the time of greatest Mycenaean expansion in the 15th century, then in the 12th century, when strongholds fell all over the Mycenaean world and throughout the eastern Mediterranean. There is no evidence of Mycenaean involvement in either of these attacks on Troy; they are not likely to have taken part in adventures abroad in the 12th century, when they were beleaguered at home.

In addition to folk memories of the wide-ranging raiding by Greeks all over the Mediterranean during the height of Mycenaean power, or of rivalries among Mycenaean powers, the concept of war between rival cities may have derived fresh emotional resonance from the Lelantine War between the cities of Euboea in the later eighth century B.C.E. None of this explains, however, why the war was located by the epic poets at Troy, where apparently the Mycenaean had never fought.

A possible explanation is that Homer’s “Achaeans” were not Mycenaean at all, but rather a group of the Sea Peoples named by the Egyptians as their 12th-century attackers, possibly speakers of Doric, more than likely makers of the Barbarian or Coarse Ware associated with the 12th-century destruction of Mycenaean cities and of Troy. These invaders, after all, were as much a part of the heritage of post-Dark Age Greeks as those who had given rise to Mycenaean civilization thousands of years earlier, and their folk memories could

well have contributed to the corpus of stories and legends that solidified into the Homeric epics. Perhaps it was the fact that the epics arose out of a fusion of traditions between those of Mycenaean Greeks and of Doric and other speakers who arrived during and after the collapse of Mycenaean civilization that made these works so important to later Greeks, whose ethnic identity had been born of this fusion.

Both this core of truth—long years of war far from home and the accompanying arduous journeys, perhaps also the names of the heroes of the war, Achilles, Ajax, Hector—and no doubt favorite episodes that audiences would always demand from poets caused the narratives to solidify over time. The evolution of Greek society away from the essentially tribal one depicted in the epic tradition probably also played a part in the gradual ossification of what had been a living tradition. By the time of classical Greece, as the city-states of Athens, Sparta, Thebes, and others began replicating the self-destructive rivalries of the Mycenaeans that may have lain at the heart of the Trojan War story, the Homeric epics, by now written, were treated in some respects as holy texts to be studied exhaustively, line by line, as though to find profound truth in their very syntax and grammar.

The identity of Homer, presumably the poet or poets who recorded or composed the Trojan War epics, may never be known. According to tradition, he was a native of the island of Chios in the eastern Aegean or of the city of Smyrna, in Asia Minor. However, the final version of the poems was written in the Ionic dialect of Euboea, possibly at the behest of wealthy elites of this important trading region. From here this Ionic version of epic poetry was carried through much of the expanding Greek world, where the Homeric tales were received with great enthusiasm, sparked an interest in the heroic past, and caused Greeks to embrace the Homeric world as the birthplace of the Greek ethnos.

Lost narratives of the Homeric corpus concerned a wide range of subjects all having some bearing on the Trojan War, some peripheral, such as the wedding of Achilles' parents and the murder of Odysseus in his old age by his son, Telegonus, his child by the witch Circe. Later summaries, paraphrases, and even quotations in learned commentaries on classical works that have survived give details about some of these tales. We know that the 11 books of the *Cypria*, for instance, cover all the action

from the wedding of Peleus and Thetis to the judgment of Paris to the abduction of Helen, all the way through to the first nine years of the war up until the moment when the *Iliad* begins.

Another body of tales, the *Little Iliad*, take up the story after the death of Achilles, from the suicide of Ajax and the mission to fetch Philoctetes to the construction of the Trojan horse, the deceitful embassy to the Trojans of the Greek soldier Sinon (who convinced the Trojans to accept the wooden horse, saying that the Greeks, fearing plague, had returned home), and the Achaeans' terrible entry into Troy. The *Aethiopis* narrated the deaths of various ancillary characters such as the Amazon queen Penthesilea and Memnon, an Ethiopian ally of the Trojans; another, called the *Nostoi*, or "Returns," narrated the arduous homecomings of the Greek heroes after the war, particularly that of Agamemnon. The *Odyssey* was probably part of the *Nostoi*.

Hesiod The poet Hesiod possibly lived in the eighth century B.C.E., born in Boeotia to a farming family. He and his brother quarreled over their shares of the family inheritance, and Hesiod's works betray a deep sense of the harshness and suffering of life and of social injustice. He was greatly influential for centuries after his death and taken to embody the worldview of early Greek civilization.

Hesiod worked at a time when Greeks were undergoing a profound transition from a mostly local, tribal society to a great cosmopolitan civilization. In a sense they were becoming "self-conscious," striving to comprehend their own essence as a society, where they had come from and where they were going, and what were or should be their guiding principles. Some of the answers to these questions were to be found in Homer and others in Hesiod. The latter's two most famous works, the *Theogony* and *Works and Days*, provide a comprehensive picture of Greek religious and sociopolitical thought of his time, a portrait of the way many Greeks may have seen themselves—or at any rate the way Hesiod saw his own society, both what it was and what it could and should become.

The title of *Works and Days* refers to two sections only of a more rambling, loosely constructed work to which Hesiod probably added over time. The *Works* section details various agricultural tasks, and *Days* gives the days of the month that are propitious or not for these tasks and other activities. In general the book contains advice and thoughts on how to lead

an industrious life. Its specific form in the beginning is a harangue given to Hesiod's brother, Perses, on the occasion of a quarrel, followed by one directed at some "kings," probably local nobility, whom Perses had bribed. Later sections gradually leave this format behind.

Works and Days finds its place in the Sumerian, Babylonian, Hebrew, and Egyptian traditions of wisdom literature whose existence can be traced continuously from about 2500 B.C.E. to the early centuries of our era. It is similar to many other such works in that the narrator is a victim of injustice and that he does not merely offer neutral advice but remonstrates against his afflicter. It also includes an animal fable, the earliest known in Western literature, a century before the reputed date of Aesop's life. Animal fables, too, had a long tradition in the Near East, beginning with the Sumerians in the third millennium B.C.E. The ages of man with its metallic symbolism also has many parallels in Asian literature (Mesopotamian, Jewish, Persian, Indian); its story of humanity's progressive deterioration from an original state of paradise is alien to much else in Greek literature, and the interruption of this decline with a second brazen race of heroes seems a compromise, reflecting Greek optimism and, perhaps, a sense of their own rising greatness as a society. Indeed for all Hesiod's pessimism he nevertheless holds out the possibility that justice can be achieved if humans work hard to preserve order in unity with the gods. He invokes Zeus as humanity's protector, a departure from the usual portrayal of the gods as indifferent to human suffering.

This concept of the paramount importance of social, ethical, and spiritual order achieved at the behest of and with the help of the gods remained a part of the Greek outlook throughout the classical period, expressed in such oracular maxims as "Nothing too much" and "Know thyself." It informed the Greeks' preoccupation with mathematics and geometry; the orderly and universal quality of numbers and ways in which they could be used to understand physical shapes showed their divine and eternal nature—Plato had a plaque at the entrance to his academy inscribed with the words, "No entrance without [knowledge of] geometry," which was the surest means of comprehending the divine. And order, *taxis*, was the fundamental principle of the society of the Byzantine Empire, the Eastern portion of the Roman Empire, the culture of which was predominantly Greek.

Greek Theater as Political Expression An important aspect of Greek theater alien to some extent to modern ideas was its use as a forum within which to explore the realm of politics. The psychological motives of characters in Greek drama played out in terms of the relationship between the individual and the state, or the individual and necessity—the fate mapped out for him or her by the gods—whereas theater since the Renaissance often explores individual psychology for its own sake. The fact that much of Greek drama assumes the nature of a dialogue between two actors allows for demonstration of the tensions underlying contradictory imperatives—personal morality versus duties imposed by the state (Sophocles' *Philoctetes*), ethical obligations to family versus those to the state (*Antigone*), and archaic, tribal emotions such as personal vengeance versus the civilized rule of law (*Oresteia*).

Other Intellectual Pursuits

Rise of Rationalism There has long been a current of thought among scholars who study the ancient Greeks that the achievements of Greek philosophers and mathematicians, and of practitioners of medicine and historians, developed from an intellectual movement away from a mythopoetic view of the world toward a rational one, a movement sometimes termed "from Mythos to Logos [logic or rationality]." Thales of the seventh–sixth century B.C.E. was the first philosopher to try to explain the world systematically by using logic rather than simply resorting to the workings of the inscrutable gods. His peer, the philosopher Anaximander, used reason rather than myth to elucidate the origin of humans. In doing so the Presocratic philosophers set the stage for the achievements of Socrates, Plato, and Aristotle of the fifth and fourth centuries B.C.E. In fundamental terms this shift represented the abandonment of the idea that events are controlled by humanlike gods in favor of the assumption that these events result from the cause and effect of physical processes.

A fundamental realignment of the relationship between physical matter and the divine took place during this time. The two ideas that exemplify this were Democritus's theory that atoms are the basic "building blocks" of matter, and the growing belief in a universal divinity above all other gods. Both the concept of atoms and of a universal, omniscient, omnipotent, and eternal God or One emerged during the course of the effort by philosophers of the fifth and

This photograph from the early 20th century shows the ruins of the theater at Delphi in Greece. (*Library of Congress, Prints and Photographs Division [LC-USZ62-110671]*)

fourth centuries B.C.E. to reconcile two competing and contradictory views, formulated in the previous century, of the fundamental principle of existence—that there is an eternal, unchangeable divine principle standing above all gods, or that the essence of the universe is eternal becoming, perpetual and cyclic change. This was the conception of Heraclitus. The concept of an eternal divine principle had been developed during the sixth century B.C.E. by the Eleatic school of philosophy on the island of Elis; this concept later evolved into that of “an intelligent, personal God who stands above and apart from the material world and directs it.” In contrast another school of Greek philosophy that flourished in the sixth century B.C.E., the Milesian of Miletus, made no distinction between the animate and inanimate—they were called by later Greeks “those who think matter is alive.” It was they who first used the word *physis* to denote the essential nature of things; to

them this essential nature was life and spirituality—they had no word for matter. One of their sages declared “all things to be full of gods”; another thought of the universe as a kind of organism animated by *pneuma*, “the cosmic breath.”

In the new conception of the fifth and fourth centuries B.C.E. the immutable divine principle was held to be manifest in the material world in the form of atoms, indivisible and invariable substances whose mixture and separation give rise to the change and variety of the world. Matter is fundamentally immutable; and the change and becoming we seem to see with our senses are illusions. Because the eternal divine principle finds expression in the world of our experience only in atoms, Greek philosophy essentially denigrated the sensory world. Even Aristotle, who made a lifelong study of natural history, believed the study of the divine was far more important; Plato’s concept of ideal

forms, of which those we see with our senses are but shadows, is another example of this attitude.

The writing of history as well used a more rational framework. Herodotus's work differs from the mythic idea of history found in Homer and Hesiod, in which the gods play central roles, in his explanation of the course of history in terms of human motivation and political processes and his care to obtain first-hand observations (many of them his own): an emphasis that demonstrates a rational, scientific outlook. Thucydides' explicit rejection of the fabulous has caused some scholars to call him the first true historian among the Greeks.

In medicine, too, practitioners sought to discover and establish general and systematic theories about the way the body works and the cause of disease, rather than relying on magical practices. Medicine became a rational art with defined rules guiding empirical observation and practice.

The work of Aristotle has been seen as an exemplar of the rational approach, as he attempted to discover the general principles that underlay the natural world he observed in voluminous detail.

However, the rationalistic approach could also encompass the work of Plato as well. Plato believed that "pure reason" (as 18th-century German philosopher Immanuel Kant would call it) was embodied by geometry and mathematics and that study of these was a surer route to true knowledge than sense observations, which are imperfect.

The work of inventor and mathematician Archimedes of the third century B.C.E. represented the ideal fusion between the Platonic style of thought, with its tendency to denigrate sense experience in favor of abstract reasoning, and the Aristotelian, which embraced an empirical approach to knowledge using observation and experimentation. The two famous stories about Archimedes demonstrate both approaches. In one anecdote, his observation of water overflowing from his bath led him to devise a means of determining the metal content of a gold crown independent of its weight. He realized that solid objects displace a given amount of water based on their volume, not their weight. Since gold is more dense than silver, weighing more per unit of volume, a given weight of gold would displace less water than the same weight of silver. Thus a gold crown alloyed with silver would displace more water than a crown of pure gold. Archimedes' story also provides us with the first example in his-

tory of the absent-minded scientist, for on coming up with this idea and uttering his immortal "Eureka!" meaning "I have found it!" he reportedly leapt from his bath and ran naked through the streets all the way home to test his new theory. In the other story he used the principle of the lever to perform a "thought experiment," saying "Give me a place to stand and I will move the world." Using pure thought he extended the powers of the lever to a level of magnitude beyond the reach of human observation. Among his many-sided accomplishments were his calculation of the value of π , his invention of war machines, and of the screw named after him that could be used to raise water and loose materials such as sand.

The basis or springboard for Archimedes' achievement was the book *The Elements* by Euclid, who was active about 300 B.C.E. In it he set out a series of axioms, propositions so basic that their validity is self-evident, and then through rational argument systematically deduced theorems from them. The simplicity of his work and the method he used has made *The Elements* the foundation of all subsequent mathematics. This universality of mathematical study that causes Euclid's work and that of his followers to retain their relevance even today (the study of conic sections by Apollonius of Perga, active about 200 B.C.E., taxes even the most advanced mathematicians) seemed to confirm Plato's view that mathematics and geometry are the surest routes to true knowledge.

Hippocrates and Galen Hippocrates, who was born in 460 B.C.E. on the island of Cos off Asia Minor, is regarded as the father of medicine. His systematic approach to medicine is recorded in a series of medical texts. To him is credited the Hippocratic oath, in which he defined the role of the doctor in relation to the patient: "Do no harm." He encouraged careful diagnostic techniques. Doctors were to observe their patients carefully with all the senses and to treat disease with herbal medicines, and with diet and exercise.

Before and after Hippocrates Greeks depended on religious solutions to many of their medical problems. The Greeks doctors had no means of dealing with infections, and often people in apparently perfect health could decline and die rapidly.

The Greek physician and writer Galen lived six centuries later than Hippocrates and was thus the recipient of the ancient Greek medical tradition as it had evolved since

Hippocrates laid its foundations. After study in his native Pergamon (in present-day Turkey), a center of learning second only to Alexandria, he moved to Rome, where he quickly gained fame as a public demonstrator of anatomy. His reputation for profound medical knowledge placed him in great demand as a practitioner among the Roman elite, including emperors. Among his patients were the emperors Marcus Aurelius, Commodus, and Lucius Septimius Severus. Because of his exalted status, his writings on medicine were widely disseminated and survived the upheavals of the collapse of the Roman Empire. After his death, in 203 C.E., the increasing disorder in the Greco-Roman world and also the rise of Christianity, increasingly dominated by an apocalyptic worldview that denigrated the present world of mortality in favor of the coming end of days in the Last Judgment, led to a steady erosion in intellectual life. Thus Galen's writings represent the culmination of a Greek medical tradition that already was beginning to fade away as a living, ongoing enterprise of new research based on reason. The fact that, although he was not Christian, his writings evince a belief in one God and that he held the study of philosophy to be as essential for medical practitioners as the study of anatomy saved his work from being suppressed during the Middle Ages, either by Christians or Muslims. He declared that the body was an instrument of the soul. During much of the medieval period learning consisted mostly of reading and copying texts and accepting received knowledge. In this atmosphere Galen's authority on medicine was absolute and not until the 16th-century Belgian anatomist Andreas Vesalius began to conduct his own research did Galen's legacy begin to be seriously questioned.

Socrates and Plato Plato's philosophical system can be seen to have grown out of his lifelong attempt to understand his master, Socrates. Socrates was an extraordinary figure. Living in a fifth-century B.C.E. society that—at least in its higher echelons, in which Socrates for the most part moved and taught—worshipped physical beauty, Socrates was a notably ugly man. Yet a portrait sculpture of him was made in a realistic mode, the first of its kind (as though his ugliness embodied a counterstandard to the established canon of masculine beauty), and Socrates' appearance did not prevent Alcibiades, the most sought-after beauty of his generation, from falling in love with him. Socrates was neither well born (his father was

a stonecutter) nor wealthy (although apparently he was well off enough to be able to spend most of his time philosophizing in the Agora, possibly through receiving gifts or a stipend from wealthy friends).

Yet for all this his thought and life had great influence on virtually all of the most gifted and powerful men in Athens and elsewhere during his lifetime and beyond. The great playwright Aristophanes conversed with him (and later caricatured him); among those who sought him out were generals, statesmen, and internationally famous intellectuals. The famous "Socratic" dialogue became an important literary genre—this though Socrates himself wrote nothing. A number of dialogues written by others include speeches by Socrates, making him perhaps the first Greek to receive biographical treatment from his fellow Greeks. His influence on the young was considered to be so great, and so dangerous, that laws were enacted by the Athenian government specifically to curtail his activities. His serene acceptance of his own death by self-execution for flouting those laws is the first example known in European history of a person's accepting martyrdom rather than giving up his way of life and belief. And besides all this his personality and thought helped lead to the development of Plato's philosophy, a critical juncture for Western philosophy. The history of the interpretation of Plato has been called a great part of the history of philosophy.

For Socrates philosophy was not merely a system of thought but a way of life. In his relentless pursuit of the *elegchos*, the elenchus or refutation, stripping away all givens, all presuppositions and assumptions, all illusions "that we know what we do not know," he seems to have aimed at the ironic self-annihilation that precedes genuine insight and self-creation, that is, the creation of a self that experiences the world at first hand, not through cultural filters, that arrives at a harmonious state of existence composed of thinking self and sensuous experience conjoined.

Some scholars believe that the course of Plato's works shows his struggle to understand Socrates. What many of Socrates' followers found so difficult to understand was his opacity, his refusal to tell them what to think. The early dialogues tell us nothing about how Socrates arrived at his life of philosophic virtue—Socrates even refuses to claim any knowledge of virtue. This creates a paradox that Plato cannot allow to stand.

In some of his dialogues, the *Meno*, *Gorgias*, and *Phaedo*, through striking metaphors often of

great beauty Plato strives to evoke the spiritual state beyond the world of sense experience; he claims that the material forms we experience on Earth are but shadows of the original forms that make up the realm of the One (as Plato called it), of the timeless and changeless, the fountainhead, the good and the beautiful, all virtue and wisdom. He depicts the soul as a charioteer driving winged horses and striving to fly to the upper regions, the habitation of the gods. Plato believed that Socrates had experienced that vision, and that his wisdom and virtue derived from his familiarity with the unseen world of true, eternal reality.

Finally in the *Republic* Plato outlined the institutions and laws that would create a society that fostered the good life—the life Socrates had by intuition or genius created for himself.

It can be said that to imitate Socrates is to create oneself. It follows, however, that in the course of such self-creation one will become increasingly unlike Socrates or any other human being, and increasingly original and true to oneself: probably what Socrates hoped to bring about in his followers.

Writing of History Many of the greatest historical texts providing information about ancient times were written by Greeks. The work of the Greek historians, indispensable to our knowledge of antiquity, also represents a signal literary achievement. One of the earliest historians of the ancient world and probably the most influential and important is Herodotus (see sidebar). He may not have invented history, for there is evidence earlier lyric poets wrote historical ballads, but his was the first work to show the personal search for history, through first-person investigation and interviews. Herodotus's history spans the entire ancient Greek world, and beyond, in his efforts to record the causes of the Persian War.

Herodotus was probably born in 484 B.C.E. in Halicarnassus in the former Greek region of Caria and spoke and was educated in Greek in the liberal arts of grammar, gymnastics, and music. At the time under the rule of the tyrant Artemisia, Halicarnassus was dependent on Persia. Born to a prominent family there, Herodotus found ample time and means to travel through the lands of Persia, visiting Susa and Babylon. In 457 B.C.E. Herodotus left Halicarnassus and moved to the island of Samos, which belonged to the Athenian confederacy. This allowed Herodotus to travel through the Greek world, and even to Egypt.

Herodotus: "Father of History" ❦❦❦

Born in about 484 B.C.E. Herodotus was a native of the Greek city of Halicarnassus on the east coast of Asia Minor, the site of present-day Bodrum, Turkey. He is believed to have been exiled from Halicarnassus in about 457 B.C.E. for participating in a revolt against Persian rule. He probably traveled first to the Ionian island of Samos in the Aegean Sea and soon afterward embarked on his travels around the Mediterranean region, heading northward along the coast of Asia Minor to the Greek colonies on the shores of the Black Sea. He also traveled into the ancient region of Scythia (parts of modern Ukraine, Russia, and Kazakhstan) as well as Syria, Palestine, and Egypt. By 447 B.C.E. he was in Athens.

In 443 B.C.E. Herodotus supposedly helped found the Greek colony of Thurii on the Gulf of Taranto in present-day southeastern Italy. Settling there, he undertook the writing of his great *History*. As a background to historical events, in particular the sixth-century B.C.E. wars between Greece and Persia—which he presented as the centers of Eastern and Western culture, respectively—Herodotus described the geography of the known world, including parts of Europe, Asia, and Africa. His descriptions were based on his own travels, reports from traders, and the writings of Hecataeus of Miletus in the previous century. Among the diverse cultures he described were the Scythians and Sarmatians, early nomadic dwellers of the Central Asian steppes who had moved into Europe. He also correctly identified the Caspian Sea as a landlocked lake.

Herodotus established a systematic approach to history and geography and expanded the European view of the world and its peoples. A century after his death in about 425 B.C.E. his *History* helped inspire Alexander the Great's campaign of conquest. Herodotus is sometimes referred to as the father of history.

In Herodotus's history, it is obvious that the historian had been exposed through his literary education to the works of Homer and the lyric poets, as well as writings of earlier historians, such as Hecataeus of Miletus of the sixth–fifth century B.C.E., who traveled as an Ionian ambassador.

In 447 B.C.E. Herodotus reached Athens, where he probably gave readings from the history he had been writing. This was a history of the Persian Wars, which had concluded a few decades before Herodotus's birth and whose results were still reverberating through the ancient world.

Herodotus's position as an educated Greek living in Asia gave him an ideal perspective from which to understand the relationship between Greeks and so-called barbarians. His history makes clear that sociology or anthropology was his principal interest. In moving from Persian-dominated Halicarnassus to a community of Greeks ruled by Greece and through his many travels through the Greek and non-Greek world he must have gained a good sense of Greek identity. The main feature of his description of non-Greek peoples is the sense of otherness in

Ptolemy: Scholar of the Ages

Claudius Ptolemaeus, born in about 90 C.E., lived most of his life in the city of Alexandria, Egypt, when it was ruled by Romans but still under the influence of the Greeks. He was a leading scholar and scientist among the city's Greek intellectual community, conducting studies in mathematics, astronomy, and geography. His exact ancestry is not known; he may have been Greek, Roman, or Egyptian, or a combination; he wrote in Greek.

From 127 to 147 C.E. Ptolemy produced an eight-volume work summarizing the geography of the known world. Known as *Geographia*, or *Introduction to the Description of the Earth*, it includes a compilation of 8,000 places, along with their coordinates of longitude and latitude, with relative distances obtained from travel reports and some astronomical observations. The work was fairly accurate about the Mediterranean region and correctly located Ireland as lying west of Britain. His northernmost point, known as "Ultimate Thule," has since been identified as one of Scotland's Shetland Islands. He also mentions Eastern Europe's Volga River and makes the first known reference to the Carpathian Mountains. Much of his work was drawn from Greek geographers, including Strabo.

After the decline of Roman rule in Egypt Ptolemy's *Geographia* was preserved by Arab scholars. Translated into Arabic it greatly influenced geographic thought in the Muslim world throughout the medieval period. In about 1400 a copy in Greek translation was taken from Constantinople to Florence, along with 27 maps, reported to be copies of originals produced under Ptolemy's direction. They showed the locations of ancient peoples and are a principal source for modern studies. His studies of the principles of cartography, trigonometry, astronomy, music, optics, and the property of light—as presented in *Almagest* and other works—were also groundbreaking and shaped intellectual activity for centuries after his death in about 150 C.E.

This 19th-century print is a representation of Ptolemy of Alexandria. (Library of Congress, Prints and Photographs Division [LC-USZ62-92884])

their customs. The religion of the Persians is described in opposition to that of the Greeks. A key incident is his description of the visit of the archetypal Greek democrat Solon to the court of the Lydian king Croesus, in which Croesus's personal accumulation of wealth is contrasted with the Athenians' universal community spirit. At the time Herodotus settled in Athens conflict was beginning to rise between the Greeks. His great history sought to demonstrate to the Greeks that they were kindred peoples in the face of outsiders, hoping to remind them of the successful alliance, primarily of the Spartans and Athenians, against the barbarian invaders. Although his message

was accepted by some of the Athenian literati, it was ultimately ignored.

Another writer of history in the tradition of Herodotus was the second-century C.E. geographer Ptolemy (see sidebar), who made his home in the city of Alexandria in North Africa when it was under Roman rule but wrote in Greek, although he may have had Egyptian or Roman ancestry. His book *Geographia*, summarizing the geography of the known world, and 27 maps he presumably helped create are the only record of a number of ancient peoples.

Philosophy in Postclassical Athens Athens continued to be the world center of philosophy even after its fall from power, a consequence of the establishment of formal, permanent schools with buildings and endowments like those of the universities of the modern world. Plato had pioneered this practice in the early fourth century B.C.E. when he established a school outside the city in the grove of the hero Academos, the famous Academy. His pupil Aristotle later founded his own establishment, the Lyceum or Peripatos. The founder of the Stoic sect, Zeno from Citium in Cyprus, settled in Athens, probably at the turn of the fourth century. He gathered disciples and eventually left a flourishing school. The group was completed when Epicurus established his philosophical community (The Garden).

All four schools operated for centuries, debating their contrasting views with increasing subtlety and sophistication, alternating in their levels of influence over time—one flourishing more than the others, then another rising to prominence according to the intellectual fashions of the time and the talent of their proponents. They attracted pupils from all over Greece and beyond. Many sons of prominent Romans, such as the son of Cicero, were sent to Athens to study with that school most appealing to the parents. In the second century B.C.E. Hasdrubal from Carthage, under the Greek name of Clitomachus, became head of the school of Plato.

Hellenistic Age Greek intellectual endeavors centered at Alexandria, Pergamum, Dura, and other cities beyond the Greek homeland are generally called Hellenistic to distinguish them from the Greek culture before the time of Alexander the Great. These cities outside Greece spread Greek influence and preserved the Greek heritage for later ages. The libraries of Alexandria and Pergamum were centers of literary criticism and the compilation of anthologies and catalogues.

These drawings of ancient Greek and Roman architecture appeared in an encyclopedia in the mid-19th century; the centerpiece, Phidias's statue of Athena, stood in the Parthenon. (*Library of Congress, Prints and Photographs Division [LC-USZ62-99145]*)

The period saw a great increase in the level of education, which resulted in the emergence of a popular literature and of new literary forms, such as the romance. The greatest achievement of the time was keeping the intellectual traditions of the past alive; they were thus absorbed by Rome, playing an important role in Roman culture and to some degree the Romans' basic outlook. Hadrian, the great Roman emperor of the second century C.E., was steeped in Greek culture and believed Rome's most important duty was to preserve and promote it. Greek thought also played a seminal role in the development of Christian theology.

Religion

It is difficult to get a comprehensive grasp of Greek religion because of the sheer amount and variety of material that remains. Nearly all extant Greek texts, on whatever subject, contain references to religion, some with evidence of very ancient practices, yet much of this writing on religion is hard to interpret. It is important to remember that although the sheer volume of writings that remain is great, it still

represents only a fraction of what once existed. What was kept, what destroyed deliberately, and what simply lost through neglect all reflect the choices of writers, readers, and keepers of books. In the case of religion in particular the zeal of the early Christian Church to stamp out paganism must have resulted in much loss of material; on the other hand early church fathers wrote many descriptions of pagan practices that have to be carefully evaluated for their natural bias. Even such works, however, contain valuable information.

The loss of so much means that only mainstream religious practices for the most part have come down to us. From the time of Homer and Hesiod through the classical period the vast majority of writings deal with the religion of the Olympian gods, while another class of rituals that were practiced throughout this period alongside the Olympian, those honoring the so-called chthonic (of or relating to the underworld) deities, were relatively neglected, at least in what has survived. These rituals were a particular feature of women's festivals, which, because of the suppressed role of women in

Greek society, were less likely to be written about, since most writers and scholars were men. It is probable that our sense of Greek religion is lopsided, with goddesses seen through an Olympian lens—Hera, queen of heaven, as the jealous, scheming wife of the boundlessly unfaithful Zeus and Athena, goddess of wisdom, having no mother, but born fully formed from Zeus's head and remaining virginal for eternity, in her armor looking as much like a beautiful youth as a woman, as though femininity was somehow at odds with wisdom. Even Demeter, apparently the most influential goddess, had to suffer the abduction of her daughter by Hades, god of the underworld.

The mythology is enormously complex, having accumulated over a very long time span, and in many cases it is difficult to tell which myths arose out of the deep preliterate past and which are late, mostly literary or philosophic inventions. Archaeology continues to uncover new evidence, and ethnology has been used to compare Greek ceremonies and rituals with rituals of nomadic and hunting peoples in remote areas of Europe who still in the late 19th century preserved their ancient practices. Over the course of the 20th and into the 21st century scholarship has increasingly revealed the multicultural currents that entered the sea of Greek religious belief throughout antiquity. From its Minoan and Mycenaean beginnings and influences by the cultures of the Hittites, Phoenicians, and Egyptians; through the probable contributions of migrating peoples such as the Dorians at the onset of the Dark Ages; to later arrivals, such as the cult of Adonis, Greek religion continued to change and evolve. During the classical period it was increasingly attacked by means of the *logos*, the logic of Socratic philosophy.

Around the turn of the 20th century discoveries about religious practices of primitive peoples around the world had a strong impact on the study of Greek religion. The practice of magical ritual to promote the fertility of crops, shown by various scholars to occur all over the world, was used to understand the Eleusinian mystery cult and other rites. The importance in many religious systems the world over of a feminine principle and of goddesses, particularly in India, caused scholars to look behind the patriarchal Olympian pantheon or interpret its myths as revealing a matriarchal past.

Greek Gods The Greeks had a polytheistic religion, that is, one of many gods. It has a complex origin, with many influences from the

East, especially from the Phoenicians and the Egyptians. Some evidence that some elements of the Greek pantheon were taken from Africa through Egypt bridges the divide between Africa and the Near East.

The Greeks' views of their gods changed subtly through their history. The earliest religious practices on Crete and of the Mycenaeans seemed to combine two tendencies: the placement of religious shrines on remote mountaintops, where early Greeks sacrificed and worshipped gods much as the ancient Canaanites did, and the location of religious complexes in the early Greek cities, with the king serving as high priest, and a religion subsumed into the daily workings of the state. Evidence for early Greek religious practices is sparse, much of it reconstructed from confusing archaeological finds, partially translated texts, and reconstructive analyses of more modern myths alongside linguistic comparisons. These latter find a connection between some of the leaders of the Greek pantheon and Indo-European deities of India, Celtic countries, Germany, and Italy.

The earliest Greek god worshipped seems to have been Poseidon. He was worshipped by the Minoans as sea god and as the Earth Shaker, and later by the Mycenaeans. The Greeks of northern Greece worshipped Zeus, whose name is connected linguistically to that of Jupiter, the Germanic Thor, the Celtic Teutates, and the Sanskrit Dyasis.

It seems that every community had an associated god and gods, which were regarded as protecting it. Moreover, different groups of Greeks had different festival calendars. Greeks who had similar origins would often gather in sacred areas for joint festivals. At the festivals there were contests in singing, dancing, chariot races, and footraces. This custom led to the drama contests at Athens, where tragedians had their tragic plays performed for the citizens of the polis. The games from these festivals included the Olympic games at Olympia to honor the entire pantheon, participated in by nearly all the Greeks, and the Pythian Games at Delphi to honor Apollo. In addition to honoring the gods, these gatherings served to bind together the citizens of one polis, or the citizens of various leagues of cities, or, as in the case of the Olympic games, the Greeks themselves as a whole. Victories in the games were important for the prestige of city-states, especially those ruled by dictators, with whom the victor of a race was often closely identified, and

who expended great sums in their pursuit of victory.

Other than the names of gods, which have been identified in the script of the Mycenaeans, the works of Homer and Hesiod represent the first textual evidence of Greek religious attitudes and beliefs. In Homer the gods are represented as having human features and human vices. The gods are both all-powerful and themselves bound by fate. In the *Iliad* Zeus, the leader of the gods, cannot save the life of his own son because of the disorder doing so would cause in the balance of the cosmos. The Homeric gods squabble among themselves and take sides in human affairs. Humans can do little but try to propitiate the gods and through the agency of priests and oracles figure out how best to please them.

Mythology in Hesiod's *Theogony and Works and Days* In Hesiod gods and humans are even more intertwined than in Homer. His *Theogony* gives the origin of the universe and of humans, and of the different Greek peoples. It also attempts to combine different myths and folklore into one authoritative narrative.

Hesiod's description in the *Theogony* of the creation of the gods and of the universe complements Homer's Olympian pantheon by describing how the Olympians originated. He wrote that both the inspiration for singing about the gods and the instruction to do so were from the Muses themselves, who visited him while he was tending his father's lambs on a remote mountain pasture. (Whether this claim was a poetic convention or the result of a genuine religious experience, invoking the Muses certainly became a poetic convention that was used long after antiquity—for example, by Milton at the opening of his *Paradise Lost*.) Hesiod gives the names of some 300 deities, some of whom seem to be of his own invention, all of them related to one another. Some are gods who were actually worshipped; others play a role in the myths Hesiod relates; others seem to exist only to fill in genealogical blanks. Some are merely personified abstractions: Death, Sleep, Deceit, Strife, Victory, and the like.

It is now understood that Hesiod's creation story and pre-Olympian deities contain elements of Babylonian religion, showing that Greeks were strongly influenced by the Near Eastern cultures with which their growing trade activities gave them contact. They seem to have understood that the Near Eastern civilizations were vastly older than their own.

When Hesiod wished to go to the beginning of time, discover the first gods and the creation of the universe, it was natural for him to look to the tales of the ancient Babylonians that had been preserved by the Assyrians contemporary with them.

A major theme Hesiod derived from the Near East was what has been called the *succession myth*, relating how several "generations" of gods succeeded one another. Hesiod's version relates how heaven was overcome by Kronos, the leader of the Titans, and how the Titans in turn were overcome by the younger gods led by Zeus. The first god and goddess were Uranus, god of heaven, and Gaia, goddess of Earth. Their son, Kronos, supplanted his father by castrating him; Uranus's genitals fell into the sea, and their semen and blood mixed with the ocean brine to bring forth Aphrodite, the goddess of love, conventionally described as "foam-born Aphrodite." Kronos went on to swallow all of his own sons to prevent any of them from succeeding him, until he was tricked into swallowing a stone instead of his youngest son, Zeus, who overthrew him. The succession myth is known from a Hittite text of the 13th century B.C.E. and a Babylonian text of the 11th century B.C.E. Hesiod says that Zeus was born in Crete, suggesting that the tale entered Greece from there. It became part of Greek religious worship; for example, the stone that Kronos swallowed instead of Zeus was displayed at the sacred site of Delphi.

A number of Hesiod's tales explain the origins of religious rituals, a source for many Greek myths in general; the story of Prometheus explains that the reason the meat of sacrificed animals is eaten and only the inedible parts dedicated to the gods is a trick that Prometheus once played on Zeus. He concealed the best meat in the animal's entrails and offered Zeus only the bones concealed in fat. In retaliation Zeus prevented humans from using fire to cook their ill-gotten meat; Prometheus then stole fire from heaven for human use. Finally Zeus contrived a punishment for men from which there would be no escape—and gave them women. He had Hephaestus create a woman named Pandora, who had a jar from which she released all the world's ills (the Renaissance scholar Erasmus mistranslated the word *jar* as "box"—thus the phrase "Pandora's box"). This tale reveals a deep misogyny in Hesiod, although it did not prevent him from maintaining a pious belief in goddesses, such as his Muses.

In *Works and Days* the life of toil we experience is presented in the context of a progressive downward trajectory in humankind's passage through time, from an original state of bliss experienced by the first humans, the golden race, who were subjects of Kronos. They lived together in the harmony of a hive of bees: dancing and laughing, without cares or labor; eating acorns, wild fruits, and honey; and drinking sheep and goat milk. They disappeared from mortal life but survive as spirits or genii who aid in the enjoyment of music, give good fortune, and uphold justice.

They were succeeded by a silver race, eaters of bread, the men of whom were completely subject to their mothers. They were quarrelsome and ignorant and did not sacrifice to the gods, but at least they did not make war. Zeus destroyed them all. It is possible that here Hesiod is recording a folk memory of the first farmers of Neolithic Greece and the Balkans, who made numerous female figurines. The worship and ritual of the grain goddess Demeter maintained great importance even among later Greeks with their patriarchal pantheon and seem to have had ancient roots. It is probable that early farmers had at least a sense that a feminine principle, perhaps worshipped through the agency of female ancestors whom the figurines represented, played an important role in agriculture; folk memories of this worship of the feminine, viewed from the perspective of worshippers of almighty Zeus such as Hesiod, could have been interpreted as evidence of the dominance of women in society in those ancient times (a situation that modern archaeology has not so far borne out).

There followed two different brazen races, both warlike; the second of these took part in the Trojan War, the heroes of which (in contrast to Homer's account) dwell immortal in the Elysian Fields, a Greek version of heaven. In the present race of iron, "humans will no longer respect their parents, war and looting will be the order of the day."

The works of Hesiod document the Greeks' embrace of many religious themes and narratives. The realm of the dead, Hades, has similarities with an underworld of mud and darkness described in the Mesopotamian epic, *Gilgamesh*. The flood in *Gilgamesh* that influenced biblical mythology gave rise to the Greek story of Deucalion's flood.

The Role of Government in Religion Gods were worshipped through the agency of the government. Many founding ideas of Greek law can

be traced to origins in ancient taboos, as can the idea of taking oaths to bind contracts. Priests and priestesses were civil servants, and temples were administered by the polis. Greek temples were the houses of the gods, not places for worship. The god was felt to reside there, and a cult image or statue was always found within. Outside the temple was an altar, where public sacrifice was performed. The sacrifices were community events and took place in a rigidly prescribed ritual. Usually cows, pigs, and goats were the sacrificial animals, although there are strong hints that human sacrifice continued to be practiced from time to time into the seventh and sixth centuries B.C.E. Also highly ritualized and administered by groups of priests and priestesses were the oracles that guided many important decisions by heads of state, even outside the Greek world.

The most famous of these oracles was the oracle at Delphi, where people would journey to seek guidance. The priestess would sit atop a tripod and enter a trance. Her utterances were written. They were often cryptic and would have to be interpreted by the receiver of the oracle. Herodotus reports that when the sixth-century B.C.E. Lydian king Croesus asked the oracle whether he should march on the Persians, she replied that he would destroy a great empire. Taking it as encouragement, Croesus marched on the Persians and was defeated; he had destroyed his own empire. Alexander was another who had supposedly consulted the oracle in the fourth century B.C.E., as did the Roman emperor Claudius I in the first century C.E. The ancient theory that gas rose from a crack in the Earth and caused the trance has recently been posed again with modern geological evidence after being dismissed as impossible for hundreds of years.

Alongside the public religion were the mystery cults. These cults remain little known because of the intense secrecy involved. The most important was the cult of Demeter and Persephone at Eleusis, often called the Eleusinian mysteries. Also important was the cult of Orpheus, and later the cult of Isis and Osiris, which was imported from Egypt and spread throughout the Hellenistic world and into Rome. The worship of Adonis originated in the annual death of a god of vegetation celebrated in the Phoenician city of Byblos. A similar god in Syria and Lebanon was called Tammuz. People on Cyprus, who worshipped the goddess of love, Aphrodite, incorporated this rite into their own, in which Adonis was beloved of Aphrodite. As was Tammuz Adonis was killed

by a boar and translated underground to Hades, the Greek abode of the dead, where he became the beloved of Persephone, goddess of the underworld. But Aphrodite in later classical myth pleaded with Zeus to release Adonis from Hades; he did so for only part of the year, and Adonis spent the gloomy winter months with Persephone. When she herself was released in the spring to join her mother, Demeter, goddess of grain, Adonis rejoined Aphrodite.

These cults introduced to the Greeks the religious concept of death and resurrection, which was increasingly important throughout the course of ancient Greek history and became part of a new religion: Christianity. The mystery cults offered the secrets of eternal life and happiness to their initiates, who had to undergo secret learning and initiation ceremonies and were sworn to silence. We know something about these cults from tablets that have been found in burials, with instructions for the afterlife written on them. The cults have also been reconstructed from the myths and legends that relate to the gods on whom the cults have been based.

The cults spread through Greece during times of difficulty accompanying waves of mysticism and with the influence of Eastern philosophy and religions that had a more detailed view of afterlife. The mystery cults have been associated with Pythagoras and found their way into the philosophy of Plato. They were a combination of life practices, such as the Pythagoreans' prohibition against eating beans, thought to contain the souls of the dead because of the gastric discomfort brought on by their ingestion (wind also was thought to consist of spirits), and a series of instructions on what to do to have the best possible afterlife (do not drink from the stream of Lethe and lose your memories, for example). The cults were successful because they became divorced from civic and tribal boundaries and spoke to people's dissatisfaction with their present life and their fears of death. They had their heyday in times of chaos during the Hellenistic period.

Rituals of the Chthonic Deities Much writing on Greek religion in classical times portrayed it in a positive light as a fellowship with the gods and even a festival. Ritual in Homer consisted of the sacrifice of an animal followed by a feast on its flesh. This was also the view of later writers such as Thucydides, for whom religion was "a rest from toil." Pericles talked of providing for Athenians opportunities for recreation, through celebration of games and sacrifices

throughout the year. Other writers of the fifth century B.C.E. talk of sacrifices in terms of social banquets, and of temples to the gods not as places of awe, but as beautiful places of resort for citizens to gather in celebration of the splendor of the city and its gods.

In Plato's dialogue the *Euthyphron* Socrates explored this conventional idea of religion, in full ironic vein revealing that its essence was a quid pro quo between gods and mortals. Mortals give the gods their due—their portion of the sacrifice (which, ever since the trick played on Zeus by Prometheus, consisted of the inedible parts only)—and the gods give, in return, peace and prosperity, the good things of life. In this religion elements that inform many modern religions—ideas of sin and repentance, purification, fear of imminent judgment, longing for an afterlife of beatitude in God's presence—play no role.

The rational entered into this view of religion in the sense that if the gods were honored and accorded their due, they would be pleased and smile on humans, a cause-and-effect equation. By classical times the obverse of this equation, that the gods would do harm to humans if they failed to worship them properly, was not considered. The writer Plutarch, speaking of the gods of Homer, who shows them being harsh and cruel, insists that the evil consequences of war must not be ascribed to Ares, god of war, but considered as inherent in war itself as waged by men, independent of any action or will of Ares: "If evil be spoken of Ares we must imagine it to be said of War, if of Hephaistos, then of Fire, if of Zeus, then of Fate . . ." or as Euripides said, "If gods do anything shameful, they are no gods."

There seems to be a missing link, gods who are not gods. That an entirely other element of Greek spiritual belief existed than the benign worship of the Olympian gods is strongly suggested by a Greek word meaning "fear of spirits" or of the supernatural. By Plutarch's time this word was being used to connote what we would call superstition. Plutarch wrote that this superstition is a perversion of normal spiritual feeling. He writes that the superstitious approach the shrines of the gods with as much fear as they would come near dens of bears and holes of snakes. By Plutarch's time it had almost been forgotten that in the past certain places, especially the lairs of snakes, were in fact the dwellings of gods where mortals went to sacrifice. In classical times a second class of rituals, intended not to please gods but to ward them away, continued to be practiced. The

more primitive nature of such rites seems to suggest that they were a part of the original religion of Greeks before the benign Olympian rituals were devised in cities such as Athens, probably as a means of promoting civic order, cohesion, and pride.

The orator Isocrates distinguished two classes of gods, the Olympians, source of all good things, and another, which he declined to name, saying only that they have “harsher titles.” These others, instead of the prayers and burnt sacrifices given to the Olympians, received ceremonies of *apotrophoi* “riddance,” “sendings away,” or exorcism. They are referred to as gods of riddance or aversion.

In classical times the locales of such rites were often the shrines of heroes, often barrows; the ghosts of such heroes, it was thought, could cause only evil and thus must be placated so that they would stay away. In light of the strong probability that in the Neolithic Age ancestors were worshipped as protectors, sometimes buried under houses, and that the numerous female figurines found in Neolithic settlements in Greece and the Balkans probably were used in fertility rites, this fear and abhorrence of the ghosts of the dead in classical times may well be analogous to the abhorrence felt in Christian Europe against anything that smacked of pagan practices. In such periods a religion that had been successfully suppressed was felt, nevertheless, to retain enough dangerous power to necessitate its containment through ritual actions. The gods of riddance in ancient Greece probably represented a substratum of earlier religious belief that had not been abolished entirely but whose significance had been transformed. Hippocrates says that to avert hostile things “we must pray to Earth and the heroes”—chthonic deities dwelling underground.

Some of the most important festivals in Greece, the Diasia of Zeus, the Thargelia of Apollo and Artemis, and the Anthesteria of Dionysos, ostensibly in honor of Olympian gods, were celebrated with ritual quite unlike the joyful feasting and games usual in Olympian worship. Instead they have a gloomy, underworld character and consist of rituals of purification and of communication with ghosts. It seems likely that these festivals became associated with the Olympians but nevertheless retained their original character.

The festival of the Diasia in honor of Zeus under his title of Meilichios, for example, was described as having a character of “chilly gloom,” a figure of speech that evokes Hades and the Erinyes, agents of vengeance, who

were often called “chilly ones.” It is apparent that this aspect of Zeus is far different from his usual one of dwelling in the high heaven. The customary sacrifice for Zeus Meilichios was a holocaust of pigs, which were burned to ashes, none of the meat shared in a feast as was usual for Zeus in his Olympian mode. Uneaten sacrifices were typical of rites to placate angry ghosts, and Meilichian Zeus was, as were the Erinyes, the avenger of kindred blood; as such the latter hunted down Orestes, who had murdered his mother. The rituals of Zeus Meilichios took place under cover of night. Moreover reliefs have been found, inscribed with the name Zeus Meilichios, depicting a large coiled snake. In one case three worshippers approach a snake several times their size.

The shrines of heroes all over Greece had attendant snakes, who were given offerings of food; in all probability their acceptance or rejection of the offering indicated to the suppliants whether or not their prayers were to be answered. Snakes are appropriate symbols of the underworld because they often dwell underground or in caves; their shed skins may have been explained as evidence that they could become invisible; a common epithet for winds was “snake-tailed,” and winds were considered to contain spirits and ghosts, both for evildoing and for fertility (Boreas, the god of the north wind, was believed to impregnate mares). Thus by mythic logic the snakes at hero shrines were probably considered incarnations of the heroes’ ghosts, who had drawn on their skins again and become visible. Such heroes were addressed by titles similar to that of Meilichios, which means “gentle” or “gracious,” probably attempts to placate a deity only too likely to be anything but gentle. It seems then that Zeus Meilichios—or rather, Olympian Zeus—took over the worship and attributes of a hero customarily entreated by the name of Meilichios.

This combination of Zeus and other Olympian traditions with local hero cults is documented by titles given him and other gods in different regions in Greece; in Athens itself Zeus had several titles. In addition to Meilichios he was called Zeus Philios, “the friendly”; in this case, according to an inscription, he had this title from his mother, Philia, the Friendly One. From the similarity of this epithet to that of Meilichios, the Gracious One, it is likely that Philia was a chthonic deity of riddance who was given offerings to keep away and do the suppliant no harm. Such deities were probably also invoked to ward off ghosts

and evil influences in general; the essence of their worship was purification.

Although in classical times the chthonic cults had an atmosphere of nearly unrelieved gloom and dread and were primarily concerned with purification and exorcism, certain details of their ritual hint that they were not always so. This is seen in the festival that preserved to the greatest degree a pre-Olympian character, the autumn festival of the Thesmophoria. Herodotus writes that it was a festival introduced from Egypt and taught to the women of the Pelasgians, the name given by Greeks of his time to the original inhabitants of Greece, who were thought to be related to the Minoans. The festival may have entered Greece from Crete, whether or not it originated in Egypt. It was celebrated all over the Peloponnese until the entry of the Dorians, Herodotus says, after which it died down and was preserved only by the Peloponnesians (probably meaning pre-Dorians or Mycenaean Greeks) who were left and by the Arcadians in their remote region. The Thesmophoria was also celebrated in Attica, at Eleusis, where it eventually developed into the Eleusinian mysteries. Curiously Herodotus does not mention this. It remained nearly uncontaminated by Olympian practice because it was a women's festival; such festivals were viewed by men with a mixture of contempt and dread, and little attempt was made to infuse it with a triumphal Olympian character because the primary purpose of so doing, to promote cohesion and solidarity among the male citizens of a polis, was in this case irrelevant.

The Thesmophoria was fundamentally an autumn sowing festival, held on three days in the Athenian month that corresponds to late October and early November. The three days were called Downgoing and Uprising, Fasting, and Fair-Birth. The goddess who oversaw the Thesmophoria was Demeter, who had joined the Olympians but was much older than they and whose worship preserved many pre-Olympian elements.

Instead of consisting wholly of negative actions of aversion, purification, and warding off, the Thesmophoria included positive rituals of promotion. Pigs were sacrificed and taken down into two chasms called *megara* (chambers), one sacred to Demeter and the other to Demeter's daughter, Kore. This is probably reflected in the name "Downgoing," and the "Uprising" referred to the act of taking up the rotted remains of pigs that had probably been deposited there previously, perhaps the year

before. Pigs were reportedly used because they were prolific breeders. The rotted remains were then taken to an altar and offered to husbandmen to mix with their seed in order to yield a good crop. Although these remains probably had a property of purification, of warding off of harmful insects and blight, they also had a positive promotional value: Because pigs were seen as prolific, their remains would help the seed to sprout abundantly.

Another fertility-promoting feature of the Thesmophoria were cakes made of cereal paste in the shapes of snakes and, most probably, phalluses, which were deposited in the chasms. The cakes were supposedly left to placate snakes in the chasms that had been feeding on the rotted remains. The very name of the Thesmophoria refers to these cakes and probably also to the pigs, for it derives from *thesmoi*, "things laid down" or "tokens deposited." The fact that the name of the hero Theseus, who was a mythical king of Athens and a sort of King Arthur for the Athenians, means "he who deposits" or "lays down" suggests that the original rite of the Thesmophoria was a sacred marriage or hierogamy between the king and a woman, priestess or queen, representing the Earth goddess, a practice, possibly once common to all Indo-European cultures, preserved among the Celts into historic times. A reenactment of such a rite seems to have been observed as one of the secret rituals of the Eleusinian mysteries that developed from the Thesmophoria.

Another aspect of chthonic worship is illustrated in sixth–fifth century B.C.E. lyric poet Pindar's 10th *Nemean Ode*, which tells of events at the Argive annual festival of the Hekatombaia, a spring festival in honor of Hera, probably on the occasion of her bringing the Earth back to life and renewed vigor. He says that the winner of the bronze shield (awarded to the best athlete at the games) will win as his ultimate fate the kind of "oblivion" won by the mythic twins Kastor and Polydeukes (Castor and Pollux), who chose to spend their lives after death alternately in golden Olympus and in the underworld. This myth probably had its roots in beliefs dating to the Neolithic that equates the death and rebirth of plants with the fate of departed ancestors or heroes.

The gloomy rituals of the chthonic deities, the despised women's festivals, are likely to have been in the mainstream of religious practice in Minoan and Mycenaean times and to have had their roots in Neolithic practices.

Some scholars have found vestiges of this substratum of belief appearing like bedrock throughout Greek mythology. The imposition of Olympian religion on this bedrock or subsoil may have been carried out by the Dorians and other warrior groups involved in the destruction of the Mycenaean world. On the other hand the clear use of the yearly round of festivals in Greek city-states to foster loyalty to the state and strengthen bonds among citizens suggests that many of the religious observances of classical Greece were self-conscious “inventions” or compositions. These developed along with the emergence of the polis as the basic social unit of the Greeks—a series of sacred plays with the function of what ethnologists would call “social imprinting,” teaching the people about the origins of their society and about their history and heroes and giving them the sense of solidarity born of participation in communal activities. Pericles was clearly involved in providing such sacred plays, probably employing poets to devise beautiful rituals in parallel with the actual plays they composed for the theater.

The fertility-giving aspect of festivals such as the Thesmophoria was mostly forgotten in classical times; with the growing importance of rationalism belief in such magical rituals was on the wane, at least among the educated. Vestiges of fertility rites can be seen in the custom of obscene jesting that was observed at the Thesmophoria and other similar festivals. The mythic explanation given for this practice was the story of a maidservant’s pulling up her dress to amuse the grieving Demeter (a method of amusement more likely to appeal to a male than a female imagination). Recent thinking on the purpose of such practices sees in them a departure from the decorous behavior usually demanded of women, to allow the release of antagonisms between the sexes. It probably also furnished a way for men to laugh at rituals that they clearly found repellent and even threatening. In general women’s festivals may have served as a release of social tensions to promote subsequent acceptance of prevailing conditions.

The ancient Greeks gave rise to a succession of great civilizations that left an indelible mark on the Western world. Throughout their varied history the Greeks were daring seafarers, innovative thinkers, and monumental artists. Their culture bridged the gap between the great

Eastern civilizations of Phoenicia, Babylonia, and Egypt and the West.

Greeks: nationality (people of Greece)

GEOGRAPHY

Greece lies along the southern tip of the Balkan Peninsula bordering Albania to the northwest, Macedonia to the north, Turkey to the east, and Bulgaria to the northeast. The

Aegean Sea extends to the east of the peninsula, the Mediterranean to the south, and the Ionian Sea to the west. Mountains make up about three-quarters of the landscape, and only a quarter of the land is used for agriculture. The Chalcidice peninsula and the Pindus Mountains, where Greece's highest peak, Mount Olympus (9,570 feet) is found, are located in northern Greece. Low-lying plains are found in central Greece and along the Nestos and Struma Rivers. The Peloponnese, a peninsula separated from the mainland by the Isthmus of Corinth, constitutes southern Greece; the Talyetos Mountains lie to the south of the peninsula. Principal rivers include the Vardar, the Struma, the Néstos, and the Aliákmon, Greece's longest river. The total area of Greece is 50,949 square miles, of which islands make up about 20 percent. Principal islands, of the more than 2,000, include Crete in the Mediterranean; Kérkira, Kefallinía, and Zákynthos in the Ionian Sea; and the Cyclades, the Northern Sporades, and the Dodecanese in the Aegean Sea.

INCEPTION AS A NATION

Ottoman Turks, led by Sultan Muhammad II seized Constantinople, capital of the Byzantine Empire, in 1453 C.E. (see **TURKICS**). Greece, as in the time of the ancient GREEKS, consisted of small city-states, easily conquered by invaders. By 1669 Turks completely dominated the Peloponnese, Aegean Islands, and Crete. Throughout the 18th century Grecian revolts against Ottoman rule occurred. Greeks finally won the support of Britain, Russia, and France to defeat the Ottoman Turks in 1829 after eight years of war and declare its independence. The following year Britain, France, and Russia issued the London Protocol, officially recognizing and agreeing to protect the kingdom of Greece. Greece at the time stretched from Arta in the west to eastern Vólos on the mainland and included the Peloponnese and small islands. The Treaty of Constantinople of 1832 defined the modern boundaries of Greece.

Greece acquired the Ionian Islands from Britain in 1864 and the province of Thessaly and part of Epirus in 1881 after the earlier Turkish defeat in the Russo-Turkish War (1877–78). After various revolts the island of Crete won autonomy under Ottoman rule and proclaimed its union with Greece in 1913. Greece gained Ioánnina, the capital of Epirus, from the Turks the same year. In the Balkan War of 1912–13 Greece and Serbia defeated

Bulgaria; the Treaty of Bucharest divided the majority of Macedonia between Greece and Serbia. Greece won Bulgarian territories in western Thrace and Macedonia in 1919 and acquired eastern Thrace and the Aegean Islands from the Ottoman Empire the following year. In the 1923 Treaty of Lausanne Greece ceded eastern Thrace and the islands of Imbros and Tenedos to Turkey.

CULTURAL IDENTITY

From ancient times Greece has been the portal by which cultural influences from the Near East entered Europe. The development of ancient Greek civilization was aided greatly by contacts with the more advanced societies of Asia Minor; later as Greek trade, society, and political power impinged more and more on Near Eastern civilizations, especially Persia, a protracted power struggle ensued, from the classical period of Greece through the entire history of the Byzantine Greek Roman Empire (see **BYZANTINES**) until the final victory of the Ottoman Turks in the 15th century. Throughout the period of Asian dominance Greeks preserved their sense of a European identity and kept alive hopes of throwing off the Ottoman yoke. An active Greek nationalist movement came into being in the 18th century as Greeks studying in Europe became aware of the reverence in which the civilization of classical Greece was held. The Greek movement to win independence gained the powerful assistance of Britain, Russia, and France in part for strategic reasons but also because of the love of many in Europe, where classical studies formed the basis of education, for ancient Greece. (The great English poet Lord Byron, for example, died in Greece while doing his utmost to aid the rebellion against the Turks.) Thus from its modern inception Greece's self-perception has been based on continuity with the classical past.

A part of Greek cultural identity concerns the Turks (see **TURKS: NATIONALITY**) and involves rejection of as many vestiges as possible of the centuries-long rule over Greece of the Ottoman Empire. Greek Independence Day on March 25 remains an important holiday, and Greeks still view Turkish foreign political aims with deep suspicion. The Turkish invasion of Cyprus (see **CYPRIOIS: NATIONALITY**) in 1974 and the Turks' systematic destruction of all signs of Greek culture there only confirmed Greek fears. Greek anxiety about recovering and preserving their folk and traditional culture has led to attempts to

Athens

language:

Official language is Greek; Demotike is the spoken vernacular, Katharevousa the formal form; English, German, and Turkish are also spoken; Slavic Macedonian, Vlach (Romanian dialect), Albanian, and Pomak (Bulgarian dialect) are used by ethnic minorities.

religion:

About 94 percent of the population are Eastern Orthodox Christian; small numbers are Muslim or nonreligious.

earlier inhabitants:

Mycenaeans; Greeks; Macedonians; Romans; Byzantines; Turks

demographics:

More than 95 percent of the population are Greek; minorities include Turks, Albanians, Pomaks, Rroma, Macedonian Slavs, Armenians, and Vlachs.

Greeks: nationality time line**C.E.**

- 1204** Crusaders sack Byzantine capital of Constantinople; Greece is divided among western conquerors.
- 1453** Ottoman Empire expands to include Constantinople and Greece.
- 1821–29** Greece, aided by France and Great Britain, wins independence from Ottoman Empire.
- 1828** Ioánnis Antónius Kapodistrias becomes first president of Greece.
- 1832** Treaty of Constantinople defines modern-day boundaries of Greece and places it under protection of Britain, France, and Russia.
National Library is founded.
- 1833** Athens becomes capital of Greece.
- 1834** Rebuilding of Athens and excavations on Acropolis begin.
- 1844** First constitution creates democratic parliamentary system of government.
- 1854** Performances of *Karagiozis*, shadow puppet theater, are first presented in Athens cafes.
- 1864** Constitution is enforced to allow a stronger parliament; Prince William of Denmark becomes King George I of Greece.
- 1866** National Archaeological Museum is founded in Athens (building completed in 1889).
- 1881** Ottoman Empire cedes Thessaly and part of Epirus to Greece.
- 1896** First modern Olympic Games are held in Athens.
- 1898** Restoration of Parthenon begins.
- 1900** National Art Gallery and Alexandros Soutzos Museum is founded in Athens (reorganized in 1976).
- 1909** Military coup establishes new government.
- 1912–13**: Balkan Wars further increase Greek territory.
- 1913** Greece obtains Ióannina, capital of Epirus, and island of Crete from Ottomans.
- 1914–18** During World War I Greece relinquishes neutrality, joining Allies.

demonstrate continuity in culture from classical times to the present, “uncontaminated” by Turkish influence.

Greek nationalism was greatly influenced by ideas of the 19th-century German scholar Johann Gottfried von Herder, who formulated the concept of a nation with a common language, folk, and moral values as the most “natural” state for a national culture. The most unnatural state, he claimed, was one in which various races and nations mingled under the rule of one scepter.

Because of the influence of this form of romantic nationalism there has been a tendency for Greek cultural preservationists to minimize influences from non-Greek cultures, taking at face value ancient Greek assertions about Greeks versus “barbarians”—that is, all non-Greek speakers—oblivious of the fact that such cultural chauvinism is at odds with the reality of important “orientalizing” tendencies

of ancient Greeks. This rejection of cultural borrowing and insistence on the greatness of ancient Greek culture tend to erect (real or imagined) boundaries between Greek and neighboring cultures, such as those of Slavic nations. The establishment of cultural boundaries by Greek folklorists has been used by the Greek state to justify the establishment of political boundaries on the grounds that all inhabitants within a region are Greeks (culturally and therefore politically). In this way culture is politicized to bolster arguments of territorial integrity and national security. A majority of Greeks in Greece believe that politicizing culture is necessary for the legitimate purpose of preserving the Greek nation. But Greek folk dance researchers and enthusiasts are very aware of the regional cultural diversity found in Greece; the state’s attempts at cultural homogeneity for the sake of nation building are at odds with preserving regional

- 1923** At end of war with Turkey Greece cedes all territories in Asia Minor to Turkey.
- 1924** Monarchy abolished by popular vote; Greece becomes republic.
- 1927** Poet Angelos Sikelianos and American wife Eva Palmer sponsor First Delphic Games at Delphi, a celebration of Greek culture, including athletic games, concert of Byzantine music, exhibition of folk art, and performance of *Prometheus Bound*.
- 1935** Monarchy reestablished.
Píímata (The Poems of Constantine P. Cavafy) by Constantine Cavafy (Konstantínos Pétrou Kaváfis) appear posthumously.
- 1936–41** General Ioannis Metaxas becomes dictator.
- 1939–44** During World War II, Nazi Germany occupies Greece.
- 1944** Greece comes under British control.
- 1946–49** Monarchy is restored; civil war begins between Communist army and reigning government.
- 1952** Greece is reestablished as parliamentary democracy with reigning monarch; it joins North Atlantic Treaty Organization (NATO).
- 1963** Poet George Seferis (Gorgios Sefariadis) wins Nobel Prize in literature.
- 1964** Novel by Nilkos Kazantzákis is made into movie *Zorba the Greek* with music by Mikis Theodorakis.
- 1967** Military coup takes over government.
- 1974** Civilian government replaces military and abolishes monarchy; new president is elected.
- 1979** Poet Odysseus Alepoudhelis (pseudonym, Osyseeus Elytis) wins Nobel Prize in literature.
- 1981** Greece joins European Community (EC).
- 1985** New restoraton of Parthenon begins.
- 1993** Greece becomes one of 12 original members of European Union (EU).
- 2000** National Museum of Contemporary Art is founded in Athens.
- 2004** Second Athens Olympic Games are held.

cultural diversity and with the influx of immigrants from abroad.

A threat to the continuity of traditional culture is rapid urbanization. In response cultural organizations, clubs, and societies whose stated purposes are to preserve Greek cultural heritage and ethnic identity have been created. These organizations usually focus on certain elements of their heritage. One cultural element that is readily accessible and whose basic principles are most easily taught is folk dance. The Greek government has recognized this fact and has included folk dance in the physical education curriculum of Greek secondary educational institutions. Physical education teachers must receive a specific accreditation in Greek folk dance to teach the subject in Greece. As a result Greek folk dance groups are flourishing.

Greek society is noted for its close-knit families, whose members are obliged to provide

mutual support. Rather than disappearing in the face of modern, urban economic life, the family is seen as a primary forum for economic pursuits. Marriages still function to a degree as economic alliances. The great majority of the country's businesses, including those of the all-important ship-owning industry, remain family-run enterprises. Yet this family structure of industry tends to impede modernization, as *mesa* (family connections) and *rouspheti* (exchange of favors) count for more than the objective analysis characteristic of modern business decision making.

One aspect of Greek family tradition that has changed markedly is the role of women. The sphere of women in the past was almost exclusively home and family, and they did not gain the right to vote until 1955. Since the 1980s, however, there have been significant changes in the status of women, as they increasingly enter the workplace. Changes in

Greek women harvest tea in the early 20th century. (*Library of Congress, Prints and Photographs Division [LC-DIG-prok-11522]*)

family law, particularly the abolition of the dowry system, which had required brides to give property or money to grooms, have accorded greater equality and economic freedom to women.

Modern Greeks resemble their ancient counterparts in conducting much social intercourse outside, especially in the hot summers. A very popular custom in small towns and villages is the *volta*, the evening stroll along the main street or the waterfront.

Greutungi See OSTROGOTHS.

Grudii

The Grudii are classified as a Celtic tribe. They lived in Gaul, their location unknown, at least by the first century B.C.E. and are discussed as CELTS and GAULS. They were a subgroup or allies of the NERVII.

Gutones See GOTHs.

Gypsies See RROMA.

H

Haedui See AEDUI.

Hasdingi See VANDALS.

Havelians (Hevellers; Hevelli)

The Havelians are classified as a tribe of Western SLAVS, living along the Havel River, a tributary of the Elbe, in present-day northeastern Germany by the early eighth century C.E. As were all Western Slavs they were called WENDS by early medieval FRANKS. In 929 the Havelians, OBODRITES, POLABIANS, and VELETIANS were defeated by Henry I, king of Germany. Their resistance continued into the 12th century, however.

Hellenes See GREEKS.

Helvetii (Helvetians; Helvetes)

The Helvetii are classified as a Celtic tribe, although they probably had Germanic ancestry as well. They lived in present-day central Switzerland by the second century B.C.E. They are grouped among the CELTS or GAULS living to their west. The TIGURINI and the TOUTONES were perhaps subgroups.

In 58 B.C.E. because of population growth and pressure from Germanic tribes to the north, such as the SUEBI, the Helvetii decided to migrate westward under Orgetorix and Divico,

the latter perhaps of the Tigurini. Some BOII, LATOVICI, RAURICI, and TULINGI accompanied them. The ROMANS under Julius Caesar defeated them, the final battle at Bibracte, a town of the AEDUI on Mont Beuvray 12 miles west of present-day Autun. Caesar reported the deaths of two-thirds of some 386,000 enemy combatants. He forced survivors to return home. Six years later some Helvetii fought as allies of the ARVERNI under Vercingetorix in a rebellion against the Romans.

Aventicum on the site of present-day Avenches was the Helvetii *civitas* capital during the Roman occupation of Gaul lasting until the fifth century C.E. The Helvetii were known for their goldwork.

Helvii

The Helvii are classified as a Celtic tribe. They lived in Gaul near the Ardèche River in present-day southeastern France at least by the first century B.C.E. and are discussed as CELTS or GAULS.

Herminones (Irminones; Erminones)

According to the Roman historian Tacitus of the first and second centuries C.E. the Herminones were the most easterly proto-Germanic tribe or collection of tribes. In his account they supposedly lived between the Elbe and Oder Rivers in present-day central and eastern Germany by the first century B.C.E.

HERMUNDURI**location:**
Central Germany**time period:**
First to fifth century C.E.**ancestry:**
Germanic**language:**
Germanic

By the early first century C.E. a number of tribes emerged from this region, such as the LOMBARDS, MARCOMANNI, and QUADI, perhaps Tacitus's Herminones. Tacitus refers to three early groups, descended from Mannus, son of the Earth-born god Tuisto and, according to legend, founder of the Germanic nation. From his three sons the INGAEVONES supposedly emerged near the ocean in the north, the ISTAEVONES to the west and south, and the Herminones to the east and south. Tacitus reports a second mythic version of the origins of GERMANICS in which Mannus had more sons who founded other tribes.

**Hermunduri (Hermanduri;
Hermenduri; Hermunderi;
Hermunduringi; Hermonduri;
Hermondurians; Ermunduri)**

The Hermunduri are classified as a Germanic tribe, a subgroup of the SUEBI. They lived in present-day central Germany by the early first century C.E. and eventually farther south around present-day Augsburg (the former Roman colony of Augusta Vindelicorum founded in 14 B.C.E. in the Roman province of Raetia).

The Roman historian Tacitus of the first and second centuries describes them as the only GERMANICS to trade extensively with the ROMANS in the first century C.E., although modern archaeology has proven that Roman trade goods were spread throughout much of Germanic territory far beyond Hermunduri territory. He further writes that certain among them were allowed in Roman cities without armed escorts.

The ALAMANNI and IUTHUNGI possibly displaced some Hermunduri or absorbed them as part of a new confederation, which included the SEMNONES living to the north, by the early third century. Some descendants of the Hermunduri are thought to have merged with the THURINGI in the fifth century.

Hernici (Ernici; Aernici)

The Hernici are classified as an Italic tribe. They inhabited northern parts of the region of ancient Latium (part of modern Lazio) in present-day west-central Italy and had contacts with the ETRUSCANS as early as the seventh century B.C.E. By 493 B.C.E. they had allied themselves with the ROMANS in response to the alliance between their neighbors the AEQUI to the north and the VOLSCI to the

south, fellow ITALICS. In 362 B.C.E. they broke with the Romans.

By 306 B.C.E. some Hernici had joined other ITALICS battling the Romans in the Second Samnite War (326–304 B.C.E.). Their principal and sacred town Anagnia (modern Anagni) fell to the Romans that year and was occupied. Other Hernici towns—Aletrium (modern Alatri), Ferentinum (modern Ferentino), and Verulae (modern Veroli)—were allowed to maintain their independence. By the end of the third century B.C.E. the Hernici had been Romanized.

At Anagi, the location of many temples and sanctuaries, were flaxen books containing sacred writings as late as the second century C.E., according to Emperor Marcus Aurelius.

**Heruli (Heruls; Herules; Herulians;
Eruli)**

The Heruli were a tribe of GERMANICS active in eastern Europe in the third and fourth centuries C.E., then in central Europe in the fifth and sixth centuries. In the course of their history they were both enemies and allies of the ROMANS and HUNS and were part of the ever-shifting alliances of Germanic peoples.

ORIGINS

The Heruli are thought to have migrated from present-day Denmark or southern Sweden to the Black Sea region, north of the Sea of Azov in present-day Ukraine, by about 250, probably because of pressures from other Germanic peoples. Their migration was in the context of mass migrations all over the Germanic world. In the Black Sea region they engaged in struggles for dominance with other Germanic peoples who had migrated there; their name was perhaps derived from the Greek *hele* for “swampy places.” Although they emerged from these struggles as a distinct group, they are considered part of the Gothic confederacy that became dominant in the region. Some among them are thought to have migrated westward into Gaul (present-day France and Belgium), where they lost their tribal identity, killed by or absorbed into other tribes.

LANGUAGE

The Heruli spoke an East Germanic dialect, probably close to that of the GOTHS, whose core group, the Gutones, migrated from southern Scandinavia about the same time.

HISTORY

During their time along the Black Sea the Heruli were known to carry out raids along coastal areas, including Asia Minor, and into the Mediterranean Sea as well. They were part of the series of raids and incursions carried out by Gothic groups in the Balkans and Greece from the 250s. In 267 they attacked the **BYZANTINES** in Constantinople (modern Istanbul). They and Goths penetrated deep into Greece, after an intense struggle taking Athens and sacking the city. It was long told of this episode by the Byzantines that when the Heruli were about to burn a vast pile of books, an Athenian stepped forward and said they should leave the **GREEKS** their books so that they would read and spend less time in the exercise of arms that had made them so hard to defeat. It seems clear from this anecdote that the Heruli were for the Byzantines the very type of ignorant and savage barbarian tribe that formed the antithesis of Greek civilization. They, along with the Goths, were defeated by the Romans in 269 at near Naissus (modern Niš in present-day Serbia).

The Heruli also joined the Goths in resisting the Huns after their invasion of the Black Sea region in 370, eventually succumbing to them. Heruli warriors served as part of the Hunnic force that invaded Gaul under Attila in 451.

In the mid-fourth century after the death of Attila the Heruli joined a coalition of Germanic tribes under Ardaric of the **GEPIDS** against surviving Huns and defeated them in 455. The Heruli then established a kingdom in present-day northern Hungary and Moravia (eastern Czech Republic). From there they launched raids into Illyria along the east coast of the Adriatic Sea.

In 476 Odoacer, thought to be Scirian by birth, led an alliance of **SCIRI**, Heruli, and **RUGII** and captured Ravenna, the capital of the Western Roman Empire, causing the deposition of the last Western emperor, Romulus Augustus. In 487 Odoacer led the Sciri and Heruli against their former allies, the Rugii. In 505 the Heruli defeated the **LOMBARDS**, who had invaded lands of the Rugii in present-day northern Austria. The Heruli forced them to pay tribute. Yet in 508 the Lombards launched an army against them and dispersed them. Some Heruli settled in Moesia (modern Serbia and Montenegro and northern Bulgaria), submitting to the Byzantine emperor and adopting Orthodox Christianity. Others joined the **GEPIDS** and shared their fate. Late in his reign in the 510s–530s Wacho, king of the Lombards, took as his third wife Silinga, daughter of the last Herulian king, to legitimize

his claim to the Herulian kingship in the region. Soon afterward the Heruli disappeared from the historical record.

CULTURE (see also GERMANICS)

Government and Society

The Heruli, originating from a part of Germania far from direct influence by Romans, probably had a society close to the relatively simple and unstratified societies most Germanics had known for millennia, in which all free men were warriors and anyone could rise to leadership through bravery and success in war. They may have taken part in the Roman slave trade by providing slaves that they had captured in raids to Germanic tribes to their south, closer to the imperial border, the latter acting as middlemen. If so, this would account for their warlike character, for among other tribes who took part in the slave trade, the activity fostered a greater importance of war than had prevailed in the past.

Military Practices

Because of their location along the Black Sea Heruli are thought to have been skilled seafarers, using boats to raid coastal settlements southward. They also were much sought after to serve in the Roman Imperial Guards. The Byzantines referred to a type of sword they used as a “Herul” sword.

Religion

The Heruli, originally pagans, were practicing Arian Christianity by the end of the fourth century C.E.

The Heruli are renowned for their military service to the Huns, to the Romans, and to

Herzegovinians *See* BOSNIANS AND

HERZEGOVINIANS: NATIONALITY.

Hessians (people of Hesse)

The name Hessians refers to people living in the region or state of Hesse, situated in present-day southwestern Germany, once the domain of the SUEBI. During the Middle Ages the territory expanded from the west of the Rhine River to the south of the Main River. In the 16th century Hesse divided into the houses of Hesse-Darmstadt, Hesse-Cassel, and Hesse-Nassau. The region was alternately controlled by France, Austria, and Prussia. The houses united in 1945 to form the western German state Hesse (*see* GERMANS: NATIONALITY).

Hevellers *See* HAVELIANS.**Hiberni** *See* IRISH.**Horvatians (Horvats)**

The Horvatians were a Slavic tribe, associated with both Eastern SLAVS and Southern Slavs. They are mentioned, along with Eastern Slavic peoples, as being under the suzerainty of the RUS of the Kievan Rus principality in the second half of the ninth century C.E., paying tribute to them and serving under their princes in military campaigns, including the attack by Oleg on the BYZANTINES of Constantinople (modern Istanbul) in 907. Their name was later used synonymously with CROATS, who were Southern Slavs, indicating shared ancestry.

Hungarians *See* MAGYARS.**Hungarians: nationality (people of Hungary)****GEOGRAPHY**

Hungary is landlocked: Slovakia lies to the north; Ukraine to the northeast; Romania to the east; Austria to the west; and Croatia, Serbia and Montenegro, and Slovenia to the south. The total area is 35,919 square miles. Hungary's principal river, the Danube, forms part of the Slovakian-Hungarian border and then flows southward through the center of the country. To

the east of the Danube lies the Great Hungarian Plain (Great Alföld); to the west lies the Transdanubian region. Transdanubia contains the Mecsek Mountains to the south and Little Plain to the northwest; to the north the forested Bakony Mountains overlook Hungary's principal lake, Lake Balaton. Mount Kékes (3,327 feet), Hungary's highest peak, is found in the Mátra Mountains (part of the Carpathian Mountains) near the northeastern Slovakian-Hungarian border. Other important rivers include the Tisza, the Raab, and the Drava.

INCEPTION AS A NATION

The MAYGARS, led by Árpád, seized present-day Hungary and invaded German territories, the Italian Peninsula, Moravia, and Burgundy by the late ninth century C.E. Holy Roman Emperor Otto I stopped Maygarian expansion in 955. With this defeat the Maygars united remaining territory under Stephen I, king of Hungary. His successors expanded Hungary's territory to include Croatia, Bosnia, Dalmatia, and parts of Transylvania, much of which by now was the homeland of the SLAVS. MONGOLS briefly conquered Hungary in 1241, leaving it in anarchy. Charles I reconsolidated the Hungarian monarchy in 1308, further increasing Hungary's borders through conquest. His son, Louis I, acquired the Balkans and Poland. Battles with the Ottoman Turks (*see* TURKICS) in the late 15th century cost Hungary some of its territories in the Balkans and destabilized the country.

In the mid- to late 15th century, Matthias Corvinus reclaimed power for Hungary in central Europe, annexing Moravia, Silesia, and Lusatia and temporarily ending Hapsburg control. Hungary dissolved after his death; the Ottomans conquered some former Hungarian territories, while other territories gained autonomy. Constant war of the following 150 years led to the partitioning of Hungary among Austria, the Ottoman Empire, and Transylvania. By 1718 Austrian Hapsburg monarchs gained control of the entire region. A brief attempt at independence was made in 1849; the movement was suppressed with Russian military aid.

When Prussia defeated Austria in the Seven Weeks' War (1866), Hungary regained independence. In 1867 Austria-Hungary formed; it lasted until the defeat of the Austro-Hungarian Empire in World War I (1914–18). The Hungarian Democratic Republic was established in 1918 only to be overthrown by Communists the following year. Czech and Romanian forces invaded the country, forcing the Allies to

Hungarians: nationality time line**C.E.**

896 Magyars settle in Carpathian Basin.

997–1038 King Stephen I of Árpád dynasty reigns.

11th century Hungary acquires Dalmatia, Slavonia, and Croatia.

1222 King Andrew II issues Golden Bull, limiting monarchy.

1241 Mongols invade territory.

1308 Charles I reconsolidates Hungarian monarchy.

1458–90 King Matthias Corvinus rules; resists Turkish invasion.

1526 Turks defeat Hungarian army at Mohács in southern Hungary.

1540 Hungarian version of Bible is published.

1541 Hungary territory is divided; Hapsburgs govern the west, Turks rule central area, and Hungarians occupy Transylvanian principality in southeast.

1699 Hungary, except Banat, is ceded to Austria.

1703–11 Prince of Transylvania Ferenc Rákóczi II starts rebellion against Hapsburgs and fails.

1806 First Hungarian language newspaper, *Hazai Tudósítások*, is published.

1815 József Katona writes *Bánk bán*, first modern tragedy in Hungarian.

1822 Brothers Sándor Kisfaludy and Károly Kisfaludy publish annual literary review *Aurora*.

1824 Pianist Franz Liszt makes debut in Paris.

1828 Poet and translator Ferenc Kazinczy is elected member of Hungarian Academy

1846–48 Collections of Hungarian folklore are published by János Erdélyi.

1847 Hungarian National Museum (and library) opens.

1847–54 Poet János Arany publishes epic trilogy about legendary Hungarian hero Toldi.

1848 “Talpra Magyar,” poem by Sándor Petőfi, becomes anthem of revolution.

1848–49 Revolution against Hapsburg dynasty begins in Pest; Hapsburgs, aided by Russia, subdue revolts.

1867 Hapsburgs and Hungary establish dual monarchy, Austria-Hungary, with seats in Vienna and Pest-Buda.

1873 Budapest is formed when Pest, Buda, and Obuda are unified.

1906–21 Composers Béla Bartók and Zoltán Kodály publish Hungarian folk songs.

1908 Literary review *Nyugat* (The West) is founded.

1909 *Liliom*, play by Ferenc Molnár, opens; it later serves as basis for 1944 musical *Carousel* by Rogers and Hammerstein.

1910 *Sárarany* (Gold nugget), first of many novels by Zsigmond Móricz, is published.

1915 During World War I Russia and Austria-Hungary occupy Poland.

1918 World War I ends; Austria-Hungary is defeated; monarchy dissolves; Hungary proclaims itself a republic.

1919 Communists, led by Béla Kun, run government; Kun starts war with Czechoslovakia and Romania.

1920 Hungary loses two-thirds of country to Czechoslovakia, Romania, Russia, and Yugoslavia under Trianon Treaty; National Assembly restores kingdom of Hungary.

1923–29 Artist László Moholy-Nagy teaches at Bauhaus school of design in Berlin.

2002	Novelist Imre Kertész wins Nobel Prize in literature.
2004	Hungary joins European Union (EU).

reestablish a monarchical government under the Treaty of Trianon in 1920; decreasing Hungary by two-thirds; removing Transylvania, Croatia, and Slovakia; and forming the borders of present-day Hungary. The country attempted to regain many of its lost territories while allied with Germany and Italy in World War II (1939–45). Its attempt to withdraw from that alliance led to German occupation, and at the end of the war the majority of its 1920 borders were reinforced by Allied powers. After World War II Hungary again became a Communist state with strong ties to the Soviet Union (USSR) that lasted until the Communist Party voted to dissolve itself in 1989. By 1991 all Soviet troops had withdrawn from the country, and Hungary established a multiparty democracy.

CULTURAL IDENTITY

Hungarian cultural identity first arose out of a fusion of Magyar and Slav elements that occurred after the MAGYARS, steppe warriors speaking a Ugric language (part of the Finno-Ugric language family), conquered the territory of the principality of Moravia, where Slavs were in power. Its oldest roots thus lie in the steppe and forest steppe cultures out of which the Magyar and Slav ethnicities emerged. Centuries-long domination of Hungary by foreign powers, in more recent times the Austrian Hapsburg dynasty, has caused the Hungarian cultural identity to become politicized. Hungarians, like many European peoples who were swept into the orbit of great powers, defined themselves as a people in part as a reaction to their conquerors.

The rise in the 19th century of a romantic fascination with ancient ethnic roots that swept across Europe affected Hungarians as well. As a result cultural life has been highly political. Theater, opera, and literature in particular played crucial roles in developing national consciousness. Poets and writers rose to the status of national heroes and prophets.

In the case of the Hungarians, however, the experiences of having been a center of high culture during the late Middle Ages and of being on the front line in the battle between Europe and the Ottoman Turks have left their mark. The focus on Hungarian cultural identity has often been modified by the sense of Western European identity, honed by resistance against the Turks and amplified by Hungary's inclusion in the Hapsburg Empire. All of this has resulted in a diverse mix of genuine Hungarian peasant culture and the cosmopolitan culture of an influential German and Jewish urban population.

Hungary's cuisine is notable for the ubiquity of the use of the spice paprika, made from the pods of chili peppers (*Capsicum annuum*), which may have been introduced either from Spain, from India by way of the Turks, or from the Americas. The fondness of Hungarians for this spice, used in the way salt and pepper are in other countries, may be an exotic echo of the Magyar past. Hungarian food is very rich, and red meat is frequently used as an ingredient, again possibly a relic of the steppe nomadic Magyar past, when people subsisted on the meat of their cattle. Goulash (*gulyás*), bean soup with smoked meat, and beef stew are

national dishes. Among Hungary's spicy dishes are *halászle*, a fish soup, and *lecsó*, made with hot paprika, tomato, and sausage.

Today in Hungary there is a rise of interest in the ancient steppe practice of shamanism and the extent to which it may have influenced Hungarian culture as practiced by the ancient FINNO-UGRIANS. Researchers have pointed to elements of folk song and dance and the use of the drum in both as possible derivatives of shamanistic practices.

Huns (Hunni; Hsiung-nu; Xiongnu; Runs)

The Huns were steppe people out of Asia. Although they were defeated by the ROMANS and GERMANICS after an invasion of western Europe, their period of dominance in much of Europe helped bring about the downfall of the Western Roman Empire. Attila the Hun is the most famous leader of all the ancient invaders of Europe.

ORIGINS

The genetic makeup of the Huns is uncertain. A tribe in western China in the second and first centuries B.C.E., who had migrated there from central Asia in the third century B.C.E., the Hsiung-nu or Xiongnu perhaps were the original ancestral Hunnic group (although the name as used by the Chinese may have referred to all nomadic peoples who lived beyond the Great Wall of China, built specifically as a barrier against them). In the first century C.E. pressure from the Chinese or other nomadic peoples

caused the people known as Hsiung-nu to migrate both southward and northwestward. The group that headed westward took up residence along the southern reaches of the Ural Mountains and the steppelands north of the Caspian Sea, some of them settling on the Volga River in eastern Europe.

There is considerable evidence of intermingling of peoples and cultures all over the steppe region, both European and Asian, in the Bronze and Iron Ages. Thus the Huns, especially those who migrated to the west, may have been a combination of central Asian Turkic, Mongolic, and Ugric stocks (see TURKICS, MONGOLS, and FINNO-UGRIANS). Another central Asian group, called the White Huns or Hephthalites or Ephthalites (as known to the GREEKS), and Hunas (as known by the Indians), held territory from the Aral Sea to the east, along the eastern border of the Persian Empire, and south into India. It is not certain that they were related to the Huns. As the western Huns advanced into Europe and absorbed other peoples as part of their empire, they began to have Sarmatian and Germanic bloodlines as well.

LANGUAGE

The exact linguistic affiliation of the Huns is not known. They may have spoken Mongolic, Turkic, or Ugric dialects. It eventually included Germanic vocabulary.

HISTORY

According to the Chinese historian Ssu-ma Ch'ien in about 176 B.C.E. the Huns defeated the Yüeh-chi, known in Europe as the Tocharians, the most eastern-dwelling speakers of an

B.C.E.	
c. 176	Huns defeat Yüeh-chi, or Tocharians, in western China, pressuring steppe groups known collectively as Sarmatians to expand into present-day Romania and Hungary.
first century	Huns move into the southern region of Ural Mountains and along Volga River.
C.E.	
370s	Huns reach Black Sea and conquer Ostrogoths and other Germanics.
433–434	Attila rules with his brother, Bledu.
445	Attila becomes sole ruler.
451	Huns and allies battle Romans and allies in Gaul.
453	Attila dies; three sons take power.
455	Germanic tribes defeat Attila's sons, and Huns disperse eastward.

Indo-European language, who lived in Xinjiang province, also called Chinese Turkistan. Their growing power caused steppe groups known as SARMATIANS to move away from them into Romania and Hungary. In the first century B.C.E. possibly under pressure from expansionist China the Huns moved into the southern region of the Ural Mountains and along the Volga River. They thus were part of the age-old phenomenon of the vast Eurasian steppes, the ripple effect caused when a disturbance in one region led to a series of migrations.

Arrival in Europe

In the 370s C.E. the Huns living on the Caspian steppes and Volga River pushed farther westward. In about 372, led by Balamir, they defeated a force of ALANS on the banks of the Don River and soon afterward extended their domain to the Black Sea, conquering the HERULI and GOTHs by 375. They also defeated some of the tribes of CAUCASIANS living north of the Caucasus

Mountains. They pushed on into the Roman province of Dacia (roughly modern Romania), and on the Dniester River defeated the VISIGOTHs, who afterward took refuge in Roman-held lands south of the Danube. The Huns took up residence on the Hungarian plain, settling along the Danube. From here they launched small-scale raids, some clans hiring themselves out as soldiers to the Romans, and engaging in trade with Rome. The Goths were absorbed into the Hunnic confederation as mostly loyal soldiers. Roman influences began to change Hunnic society in fundamental ways. The career of later leaders was in part allowed by these changes, which included a greater degree of social stratification and a need to construct a more ordered society ruled by the more powerful elites who emerged, one of which was Attila's family.

Rugilas, Bleda, and Attila

By about 420 the various Hunnic factions had formed a confederacy under Rugilas and begun

a more aggressive policy of conducting raids for the purpose of plunder. During his rule and that of his nephews (sons of his brother, Mundzuk), Bleda and Attila (see sidebar), who succeeded him in 434, the Hunnic Empire stretched from the Baltic to the Caspian. In 437 the Germanic BURGUNDII while attempting to expand into Gaul were defeated by the Huns, who probably attacked them with the complicity of the Romans under General Flavius Aetius, who had spent time among the Huns as a boy and had been a friend to Attila. The Burgundian king Gundicar was killed in battle. (This defeat provided the germ of the epic poem *Nibelungenlied*.) During this period the Huns negotiated an agreement with the BYZANTINES of the Eastern Roman Empire under Emperor Theodosius II to stay out of the Balkans. In 441, taking advantage of Roman wars with the VANDALS and Persians, the Huns did invade southward. They hoped to take Constantinople (modern Istanbul), but the Hunnic army, primarily a cavalry without siege skills, after negotiating for greater tribute withdrew.

Attila's Invasion of the West

From 433 to 444 Attila united all of the Hunnic tribes under his and his brother's rule. In about 445 Attila killed Bleda. Meanwhile he had instituted a policy of great annual plundering raids that soon threatened the existence of the Eastern Roman Empire. Attila demanded an annual tribute that amounted to 2,100 pounds of gold a year. In 447–450 the Huns overran the Balkans, entering northern Greece. The new Eastern emperor who rose to power in 450, Marcian, refused to pay further tribute to the Huns, as did Valentinian III, emperor of the West. When Valentinian's sister, Honoria, tried to forge an alliance with the Huns, Attila claimed this to be a marriage proposal and demanded as her dowry half the Western Empire. Valentinian's refusal gave Attila political justification to invade Gaul in 451.

The Huns moved through Gaul attacking towns but were forced to give up the siege of Orléans. They took up a position on the Catalaunian Plains south of present-day Châlons-sur-Marne in northeastern France. There they did battle with the Roman army led by Attila's former friend and ally Flavius Aetius. Fighting alongside the Huns were the OSTROGOTHS led by three brothers—Thiudemir, Walamir, and Widimir; the Alans; Heruli; GEPIDS; MARCOMANNI; RUGII; SCIRI; SUEBI; and a

Attila: Empire Builder

Attila (also Etzel or Ethele) was born in about 406 C.E. Little is known of his childhood other than that he was the son of Mundzuk, brother of Bleda, and nephew of Rugilas, on whose death he and his brother became supreme rulers. He also reportedly developed a childhood friendship with Flavius Aetius, who was sent by the Romans as a child hostage to the Hunnic camp and who grew up to be a Roman general.

Attila and Bleda became rivals, and, in about 445 Attila murdered his brother, becoming sole ruler. Attila was an effective leader both militarily and politically, and the Hunnic Empire expanded. The Huns were traditionally master horsemen; Attila adopted some of the techniques of the Romans and developed an extensive infantry as well. He made use of conquered peoples to expand his empire, the Ostrogoths and Heruli among others helping strengthen his army. He also effectively played political angles, allying himself with the Roman emperor's sister, Honoria, as a basis for a claim of half the Western Roman Empire. He lived modestly as his subjects lived but could demonstrate a sense of appreciation for the fine objects of other cultures when hosting emissaries.

On the battlefield Attila encountered Aetius, his boyhood friend, who made a study of the Huns as Attila himself made a study of the Romans, and lost a critical battle. But the Huns may have in the end proved triumphant over the Roman Empire if Attila had not died in 453, choking from a nosebleed while passed out after a night of celebrating his latest marriage to Ildico.

Attila endured as a larger-than-life historical figure among Western Europeans, referred to as “the Scourge of God.” In later centuries he appeared under the name Etzel in the German epic *Nibelungenlied* and under the name Atli in the Icelandic *Volsungasaga*. Although having a reputation as a “barbarian,” Attila was a sophisticated politician who learned much from contacts with Westerners and was more than a match for other European rulers of his day.

This is an artist's rendition of Attila the Hun. (Library of Congress, Prints and Photographs Division [LC-USZ62-87255])

faction of FRANKS. Roman allies included the Visigoths under Theodoric I and his son, Thorismond, as well as the BURGUNDII and a faction of Franks. After bitter fighting the Huns were forced to retreat.

The Huns invaded northern Italy the next year and destroyed Aquileia at the head of the Adriatic Sea, whereupon the inhabitants, the VENETI, fled and founded Venice, as well as Milan, Padua, and other cities. At the intercession of Pope Leo I and probably because of a shortage of provisions and a rumored threat of an attack by the Byzantines from the east Attila decided not to attack Ravenna, the capital of the Western Romans at the time, or Rome;

instead he withdrew and recrossed the Alps. In 453 Attila prepared another invasion of Italy, but he died before carrying out his plan.

After Attila

Ardaric, leader of the Gepids, led a coalition of tribes—among them Heruli, Rugii, Sciri, and Suebi—against Attila's three sons, Ellak, the oldest, and Dengizik and Ernak. In 455 the allies defeated the Huns in the Battle of Nedao, probably along a tributary of the Sava River in the Roman province of Pannonia (roughly modern Hungary). Ellak was killed. Followers of Dengizik fled eastward to the steppes between the Dnieper and Volga Rivers, where they fused with wandering Turkic-speaking peoples, mostly Ogurs. Followers of Ernak settled southeast of the Sea of Azov with other Turkic tribes. Those who had been Ellak's followers migrated farther eastward with still other Turkic peoples to territory near the Caspian Sea. Some among the Huns and Turkic peoples evolved into the BULGARS and reentered central Europe in later years. Other Huns meanwhile stayed in Europe and fought as mercenaries in the Roman army.

CULTURE

Economy

The Huns originally were steppe pastoralists who obtained wealth from herding and also raiding. Some Hunnic groups were known to grow wheat, millet, and beans as well. After arriving in Europe they began to engage in trade with the Greco-Roman world on a scale they had not experienced before. The main "products" of the Huns were slaves obtained in their wars, whom they traded to Romans and Greeks for wine, silk, gold, and other goods at fairs held along the Danube River.

Government and Society

Settlement Patterns Before the Huns moved out of their traditional territories, they were completely nomadic, living in moving camps rather than towns or cities. The harsh climate of the central Eurasian steppes, with low rainfall and temperature extremes, made suitable grazing lands sparse; summer and winter pasturages were often as much as a thousand miles apart, so that much of the time the Huns were on the move. This lifestyle worked against centralization of authority among the Huns, and their society probably consisted of loose networks of kinship groups ruled by elite warriors whose status was based on their protection of

their moving families and the booty they obtained in raids.

The Hunnic Confederation The Huns, similar to CELTS, Germanics, and earlier steppe peoples such as the SCYTHIANS, were deeply affected both by contact with the Greco-Roman world and by the stresses of migration. The former affected them through the luxury goods that the Hunnic elite sought eagerly: wine, silk, gold, and jewelry made of coral, carnelian, mother-of-pearl, quartz, pyrite, and lapis. Luxury goods fostered greater social stratification as elites acquired the most desirable items, with which they demonstrated their status, and handed lower-status goods to retainers, setting in motion gift-exchange cycles.

The intensification of trade, as well as the challenges of war with such a sophisticated power as Rome, obliged the Huns to develop a more structured way of governing themselves and curb the egalitarian instincts of their war bands. As did the Germanic Goths, who had found it necessary to have an overall war leader to rule their polyethnic coalition, the Huns ceded to Attila more authority than Hunnic leaders had had in the past; for the first time it was he who decided on war and peace for his people. Attila chose a body of advisers from among his nobles (comparable to a political cabinet), who helped him develop a system of collecting food and tribute from his subjects. Even from his camp in Pannonia Attila maintained contact with and control over a vast region. The Huns drew on Sassanid Persian and Roman models in forming their government but retained their own confederate structure based on personal loyalties. (Meanwhile the Hsiung-nu Huns in China were changing their society as well, as attested by the discovery of a city built by them in northwestern China's Shaanxi Province in the fifth century C.E.)

The ethnic Huns formed the core group of a polyethnic confederation in many ways similar to that of the Goths. This was the reason many Goths became loyal soldiers in the Hunnic confederation, for it meant for the most part merely a change in leadership. This is not to say that the subjection of the Goths and other Germanic groups by the Huns was not harsh to the extreme. Families of the Ostrogoths whom they chose to favor, particularly the Amalis, received fair treatment, but for the rest a mere glance from Attila or one of his nobles was enough to awaken fear and trembling, such was their habitual cruelty, according to later Ostrogothic accounts.

The Huns differed from the Goths in having a more clearly defined structure for their allied groups, based on noble families. Under Attila and his family and the Hunnic families allied with him were specific families of Germanic chiefs—such as the kingly lines of the Gepids and Ostrogoths. The Huns kept control of their Germanic allies by playing different dynasties against one another; even after they accorded the Ostrogothic Amali line rule over all Goths, they encouraged certain other Ostrogothic noble families to maintain their independence as a check on the Amalis. A princely burial uncovered in Hunnic territory in Romania contained a gold sheathed rod (possibly formerly a spear shaft or standard), which is thought to be the token of office borne by noble allies of the Huns. Another sign of alliance with the Hunnic empire was the eagle, fashioned in gold for use as a saddle mount or brooch. Hunnic influence is also shown in the use of a crown or diadem, which the Huns had adopted from Sassanid Persian ritual. The Huns often chose men of humble background to elevate in a new elite loyal only to themselves and not part of earlier Gothic networks of alliance.

Chinese sources state that some Hunnic groups practiced polyandry; two or more brothers shared a wife.

Military Practices

The Huns fought primarily as mounted bowmen. The quality of their horses, their superb horsemanship and use of horseshoes and stirrups, and the devastating power of their composite bows made them among the most effective troops in the ancient world. Their military structure was loose, consisting of hordes who carried out independent campaigns, maintaining themselves by plundering conquered territories. The Hungarian plain did not offer as much grazing land as did the Asian steppes, and the Huns were forced to develop an infantry to supplement their cavalry.

Clothing

The Huns wore a loose robe to the calf, split at the sides and gathered in by a girdle whose ends hung down in front.

Personal Habits

The Huns practiced the custom, common among steppe nomads, of deforming the skulls of their infants, while they were still soft, into an elongated shape. According to Chinese

sources they wore fairly bushy moustaches and no beards except tufts of stiff hair on the chin; their ears were pierced and adorned with rings. They usually shaved their heads, except a tuft on the top.

Religion

The early Huns probably practiced a form of the shamanism observed for millennia by peoples all over the steppe lands. Shamanism usually involved the shaman's entering a trance state, often attained by ingesting cannabis, to communicate with the spiritual realm and gain wisdom. The Huns worshipped certain mountains as sacred, probably those overlooking their migrations and grazing lands, to whose deities they would pray for rain and protection for the herds. Later other religious impulses moved through the steppe lands—Persian Zoroastrianism, Hinduism, and Buddhism, especially the Tantric sect.

The Huns had the practice, similar to that of the Scythians, of making the skulls of their enemies into drinking cups; this may have had a ritual basis.

The Huns, while they remained an organized group, were adamant in spurning all Christian efforts at converting them.

The Huns' arrival in Europe in the late fourth century C.E. led to the displacement and migration of numerous peoples, known in German as the *Völkerwanderung* (folk wanderings). For all their remote Asian origins, a steppe climate and ecology vastly different from those of Europe, the Huns' reactions to contact with the Greco-Roman world were remarkably similar to those of many different European peoples—Celts, Germanics, IBERIANS, THRACIANS, and others. The Greco-Roman luxury trade and Roman military power transformed all of these peoples, making their societies and economies more complex and creating powerful impulses toward war and domination on a scale not previously known.

Hutsuls (Huculs)

The Hutsuls are a Slavic people currently living in Transcarpathia, that is, the Carpathian Mountains and surrounding regions. Their lands are located in southwestern Ukraine, extending into northern Romania. To their west are the BOIKOS and the LEMKOS. All three groups of SLAVS, who speak distinct dialects, are among the people known as RUSYNS or Carpatho-Rusyans. The Hutsuls speak an East Slavic dialect

known as Hutsul; it has both Polish and Romanian influence. Slavs lived in the region as early as the late fifth century C.E.; the exact time the Hutsuls assumed a distinct identity is not known.

The Hutsuls, as have their Carpathian neighbors, have preserved Ukrainian traditional farming culture although their principal occupations involve animal husbandry, especially the breeding of cattle and sheep: their land is used primarily for grazing and growing hay. Many Hutsuls also work gathering timber. Their homes are in remote valleys in the higher altitudes. They are known for their work in wood, brass, ceramics, and textiles, especially the weaving of rugs. Although Eastern Orthodox Christian, they have preserved pre-Christian rituals, including folk festivals and belief in demons.

Hyperboreans *See* BRITONS.

Iapyges (Iapygi; Iapygii; Iapygians; Iapigi; Iapigians; Jagyges)

Iapyges is an ancient name applied by writers in antiquity to the assumed ancestors of ILLYRIANS who lived in historical times on the southeastern Italian Peninsula, including the APULI, the MESSAPI, and the PEUCETI. The ancestors of these groups may have been named Iapyges by the ancient GREEKS after the mythological Iapige (Iapyx) from whom the Greeks believed them to be descended; Iapyge was son of Daedalus by a Cretan woman during Daedalus's exile on Crete (*see* MINOANS) and brother of Icarus. That Iapige was supposedly a leader of the Cretans points to a Cretan ancestry for the Iapyges, perhaps from traders who had settled in Italy. Alternatively the name may have evolved from Illyrian tribal names indigenous to the Balkans, Iapodes and Iapuzkus, borne by Illyrians who came to Italy. The geographical names Apulia and its modern form Puglia are derivative of the tribal name.

Herodotus, the Greek historian of the fifth and fourth centuries B.C.E., wrote that a city he called Hyria, in what was in his time Iapygian territory, was founded by Cretans who had defected from the fleet of King Minos while sailing to Sicily to capture Daedalus. In one account these Cretans were led by Iapige; Hyria may have been the city of Uria. Although the story of Minos and Daedalus is mythical, Cretans may have founded a trading post or city here; if so, Uria would date to the second

millennium B.C.E., when the Cretan trading empire was at its height. Again it is uncertain whether these were the ancestors of the historical Iapyges, who migrated to Italy at least by the ninth century B.C.E.

The Iapyges may have also played a role in the founding of Tarentum (Taras, modern Taranto), which the Greeks occupied in the eighth century B.C.E. After this time, however, Tarentum became dominated by Greeks who had ties with the Greek mainland city of Corinth. By the fifth century B.C.E. Tarentine Greeks had, probably repeatedly, engaged in war with Iapyges and Peuceti, the latter two sometimes in alliance. In the beginning of that century the Tarentines won victories, one of which was the subject of a bronze monument dedicated at Delphi in Greece, which commemorated the battle in which King Opis of the Iapyges, leading Peucetian forces, was killed. In about 473 B.C.E. the Tarentines suffered a disastrous defeat by the Iapygians leading a confederation of native peoples. The Tarentines did not recover from their losses for a generation. Tarentum's subsequent rise to become a great and prosperous city was not accompanied by conquest of the Iapyges, suggesting that some kind of peaceful accommodation had been reached.

In addition to similarities of tribal names a connection is made with the Illyrian-speaking people across the Adriatic Sea because of the Messapic dialects known from inscriptions

written in the Greek alphabet, from place-names, and from words recorded by ancient writers. Some of the Iapyges joined the ITALICS in revolt against the ROMANS in the Social War of 90–88 B.C.E.

Iazyges (Iazigs; Iazygians; Iasians; Jazyges; Yazigs; Metanastae)

The Iazyges were an Iranian-speaking tribe, their nomadic ancestors originally from Asia; they are classified as SARMATIANS. Their early history is not known, other than that they lived east of the Carpathian Mountains in eastern Europe, probably in western Russia.

In the first century B.C.E. Iazyges joined King Mithridates VI Eupator (Mithridates the Great) of Pontus, a kingdom in Asia Minor, in his wars against Rome, attracting the attention of the Romans as enemies. Sometime after 20 C.E. Iazyges settled on the Hungarian plain in present-day Hungary along the Tizsa River.

By the mid-second century C.E. Germanic pressures on the Roman frontiers intensified. In 167 C.E. the Iazyges joined Germanic tribes, the MARCOMANNI and the QUADI, in a massive invasion southward, reaching the head of the Adriatic Sea. The ROMANS under Emperor Caracalla (Marcus Aurelius Antoninus) waged successful warfare against them, restoring the Danube frontier. Some 8,000 Iazyge cavalry were forced to serve in the Roman army. The arrival in their homeland of first the VANDALS in the third century and then the HUNS in the late fourth century led to the dispersion of the Iazyges. Some of them were said to be among the LOMBARDS in the sixth century.

Iberians (Iberi; Iberes)

The Iberian Peninsula is named for the Iberians, people living mostly in the southern part of the peninsula with whom Greek traders had contact from about the seventh century B.C.E. The GREEKS named them Iberians probably after the Iberus River (today called the Ebro). Different groups made up the Iberians, some of them organized into proto-city-states centered on trading towns. The most important of these were the TARTESSIANS, whose major center was Tartessos on the southern Atlantic coast of the peninsula, probably at the site of present-day Huelva. Other Iberians had more

tribal societies. Iberians had contacts with PHOENICIANS, CELTS, CARTHAGINIANS, and ROMANS in addition to Greeks. Some Iberian and Celtic tribes intermingled, resulting in the ethnic and/or cultural mix known as the CELTIBERIANS. (The Greeks also applied the name Iberians to peoples of present-day Georgia in Asian lands south of the Caucasus Mountains, a people not related to those of the Iberian Peninsula. It is the latter people whom we discuss here.)

ORIGINS

It is probable that at least some of the Iberian known to history were descendants of Neolithic and perhaps earlier peoples living on the Iberian Peninsula, since many of them spoke a non-Indo-European language. Indo-European languages spread though most of Europe sometime in the latter part of the Neolithic Age. For this reason peoples speaking non-Indo-European languages into historic times, especially in more peripheral areas, such as the northern forest zone where peoples spoke Finno-Ugric tongues, and the Iberian Peninsula, the home of the Iberians, are thought to have lived there before the spread of Indo-European. Some scholars theorize that people migrated to the Iberian Peninsula from North Africa by the mid-second millennium B.C.E. and intermingled with other Neolithic peoples; archaeological evidence for this hypothesis is ambiguous or lacking.

The Iberian Peninsula was among the first regions of Europe to receive migrations of hominids from Africa. Neanderthals lived there for thousands of years, and some of the latest Neanderthal remains have been found there, including bones of a child, dated to 24,500 years old, who may have been of mixed Neanderthal and modern human parentage. Among the finest examples of Upper Paleolithic cave art were made by modern humans in caves along the north coast of the peninsula in the region called Cantabria. The Cantabrian coastal region at that time had a mixed tundra ecology whose huge migratory herds supported human population densities close to those of later agricultural peoples. It was one of the most favored areas of Europe, in the forefront of cultural developments such as the Upper Paleolithic Revolution. More than 90 percent of all European cave art of the time is concentrated in a small region that includes northwest Spain, the Pyrenees, and adjacent areas of southwest France.

The ecological challenge posed to people of the Iberian Peninsula during the Mesolithic Age as the Ice Ages ended was lack of moisture,

IBERIANS**location:**

Iberian

rather than the return of dense forests that occurred elsewhere in Europe. Despite the challenges, people here continued making masterful figurative art, paintings on open-air limestone outcrops that are found in the Spanish Levant of archers hunting red deer and other animals. Other pictures show figures climbing trees for honey, in one example carrying a collecting pot and being greeted by a swarm of bees. Other scenes show dancers, and groups of archers confronting one another; the latter have been variously interpreted as battle scenes or, because of what appear to be slain deer shown between the two groups, a cooperative hunt that has rounded up a deer herd.

Sedentary populations settled from about 6500 B.C.E. along Atlantic estuaries of present-day Portugal, where shell middens have been found. Although the evidence for the arrival of agricultural practices in Iberia is sparse and hard to decipher, the existence of such sedentary groups provides good evidence that the

relative sedentary existence fostered by agriculture would not have been new to indigenous people. Farming may have come to Iberia both as farming groups migrated there and as native peoples adopted farming practices themselves. Caves in eastern Spain with the earliest evidence of farming, including sheep and goat remains and impressed pottery, date from 6000 B.C.E. Cereals were being grown from the sixth millennium B.C.E. An unanswered question is whether people from North Africa migrated to Iberia, introducing farming practices with them; as yet the evidence is too sparse to determine this. The aridity of southeastern Spain adjacent to the Strait of Gibraltar could have discouraged migration.

In the late Neolithic along the Atlantic coast of Spain and later also the Mediterranean coast large stone constructions began to be built. The megalithic works in Iberia are similar to large timber and stone tombs covered by long or circular mounds built in a zone that

Iberians time line**B.C.E.**

80–73 Lusitani rebellion under Roman expatriate Quintus Sertorius against Romans

13 Hispania divided into three Roman provinces: Baetica, Lusitania, and Tarraconensis.

spans the coastal regions of France, Britain, Netherlands, Denmark, and southern Sweden. The constructions are found typically where incoming farming groups met dense populations of Mesolithic foragers, or where farmers and foragers coexisted. In Iberia simple passage graves appeared first in farmed lands inland from the Mesolithic shell mounds. It has been theorized that this development resulted from a kind of compromise between the farming and foraging lifestyles, with prominent mortuary tombs satisfying sedentary impulses of farmers, their sense that farming connected them with the land in a spiritual way that must be acknowledged, while more mobile settlement patterns allowed travel through the landscape to seasonal foraging opportunities. The long-range contacts that seem to have begun among megalith builders along this Atlantic coastal zone would become ever more important in the future. Chambered stone burial mounds first built in Spain in the fourth millennium B.C.E. show stylistic similarities with similar constructions in North Africa. Among the best preserved of all European Neolithic clothing remains, robes and hats made of esparto grass fibers, have been found preserved by the aridity of southern Iberia.

Production of copper began in Iberia, where there were rich local sources of ore, after 3500 B.C.E. Iberia experienced a flowering of tomb building and ritual activity at this time.

People were buried in collective tombs accompanied by fine artifacts such as ivory combs. Ostrich eggshell from Africa was used in artifacts. Elaborate settlements were constructed in some areas, with defensive walls, bastions, and complex entrances perhaps used in ritual processions. They combine elements of contemporary settlements in western France with others, including the bastions, found in Sardinia, Sicily, the Aegean, and the southern Levant. People in settlements in the arid Almería region used floodwater impoundments for irrigation. The settlement at Los Millares had some 100 corbelled chamber tombs and bastioned forts on nearby hills. The rock art tradition of the Spanish Levant that had begun in the Mesolithic continued.

In the Bronze Age Iberia became influenced by the Bell Beaker culture, named for a characteristically shaped pot found in burials, which spread quickly throughout the Atlantic zone from Britain to Spain in about 2800 B.C.E. The Bell Beaker culture was not borne by a migration of people (in a now-discredited theory from Spain) but by a movement of ideology and technology. This was the first European culture to show clear signs of the emergence of a warrior class, for Bell Beaker graves are well equipped with weapons such as daggers, bows, and arrows. The earliest bell-shaped beakers are from the Rhine delta region in present-day Germany, but there is some evidence that the warrior lifestyle may have emerged first elsewhere, possibly Iberia. Iberia received Bell Beaker influences both from Brittany along Atlantic seaways and from west Mediterranean Beaker groups who had connections to the Rhine region via the Rhône River corridor in southern France. These Beaker connections and trade routes remained important for centuries.

The quick adoption of the Bell Beaker pottery and other elements in southern Iberia, so far from the Rhine, implies that the ideology was introduced by traders, rather than by slower means of diffusion such as movement of peoples or gift exchanges. It spread quickly all over Iberia and even to North Africa. The meeting of Beaker users with people living in the large fortified centers such as Los Millares was peaceful. Burials document an exchange of elite goods by the groups. Iberians received horses (which had entered the Beaker network originally from communities on the Middle Danube); northern recipes for food and drink, probably including flavored mead; and a repertoire of geometric motifs for decoration of pottery. Beaker groups in Iberia and also Brittany

received Iberian copper and a few objects in silver. A connection of the Beaker network with advances in metallurgy that has been demonstrated in Britain may have existed in Iberia as well, since beakers are found in buildings used in metalworking.

El Argar Culture

At first the Beaker ideology was absorbed by Iberian communities such as Los Millares with little change. Gradually however the Beaker emphasis on mobility and individuality eroded the centrality of ritual in southern Iberia; possibly a greater desire for elite goods put a strain on the economy, based as it was on the small-scale farming that was all the arid land could sustain, leading to environmental degradation. Around 2200 B.C.E. these settlements were abandoned and new centers established at different sorts of locations, although still in the same southern coastal region. The new settlements were on hilltop sites, some precipitous, defended by thick stone walls enclosing rectangular huts laid out in streets. A radical shift in agricultural practice probably took place, involving a greater reliance on livestock rearing. This culture has been named after the site at El Argar. Individual burial had become the most common rite, both in stone cist graves and later in large pottery storage jars and brewing vats. People were buried with many grave goods—men with copper or bronze axes, daggers, or halberds; women with awls, knives, and sometimes silver ornaments. El Argar pottery is very fine, with elegant shapes and a smooth finish, made of micaceous clay, which gives it a glittering look, perhaps in emulation of silver cups possessed by people in contemporary Brittany.

The culture had an abundance of metal relative to that of other regions in Europe, most from local sources, but technologically simple. Although Iberia continued to participate to some extent in the long-range links established in the Bell Beaker period, the higher standard of metalworking, both in shape and in quality of metal, of northern regions such as Britain, Ireland, and central Europe did not affect southern Iberia at this time. Long-distance trade in bronze and bronze-working techniques in northern Europe was driven by a scarcity of tin and copper and the fact that the two metals seldom occur together in the same region. Iberia's ready supply of metals may have precluded a need for its people to seek out bronze objects from elsewhere, which would have made them aware of innovations; its iso-

lation, in terms of the capacity of Bronze Age shipping, prevented it from participating in the bronze trade of the north.

Engraved stelae (grave markers) made in Iberia later in the Bronze Age give eloquent testimony to the new world that had been evolving through the period. The most common depictions are of warriors fully armed with sword, spear, shield, and helmet with horns. Perhaps significantly the bodies of the men are no more than stick figures, as if their humanity was less important than their identity as warriors; on the other hand the pictures prevented the dead from disappearing into the anonymity of the grave and may have served as memoirs of their deeds.

LANGUAGE

The Iberian language is non-Indo-European. It endured into Roman times but was eventually replaced by Latin. Inscriptions, mostly on third-century B.C.E. coins, have been found in the Iberian script, which has 28 alphabetic and syllabic characters, some of them derived from Phoenician or Greek alphabets. Decipherment of the Iberian script has led to an understanding of place-names, but little else. Their language has been studied in relation to the language of the BASQUES, which manifests some phonological similarities and is thought by some scholars to have evolved from Iberian. Yet separate parent languages seem to be indicated.

HISTORY

Mycenaean and Phoenician Presence in Iberia

The earliest Iberian contacts with the outside world known to history involved the Phoenicians, traders from the eastern Mediterranean, and somewhat later, the Greeks. However, Mycenaean trade there can be deduced by the presence in southern Spain of Mycenaean pottery from the 14th and 13th centuries B.C.E. The raw materials of Iberia, especially bronze and silver, must have attracted the MYCENAEANS, with their high demand for such goods, which they traded to the civilizations of the Near East. The Phoenicians, skilled mariners, were active as traders by the mid-13th century B.C.E. It has been claimed that they established coastal colonies on the southeastern Iberian Peninsula by about 1200 or 1100 B.C.E., but this hypothesis lacks archaeological confirmation. The earliest evidence for Phoenicians dates only from the eighth century B.C.E. At least by 800 B.C.E. the Phoenicians were probably acting as middlemen

The Iberian torc (neck ring) possibly dates to as early as the fourth century B.C.E. (Drawing by Patti Erway)

transporting Iberian silver to Assyria, where it was in great demand for coinage. The fifth-century B.C.E. Greek historian Herodotus tells us that the Phoenicians received such great amounts of silver from the Tartessians of the Atlantic port town of Tartessos, in exchange for a little olive oil and sundry other small wares, that in order to prevent their ships from sinking with the weight, they had to make all metal implements and their anchors out of silver. We need not take this story literally; it could easily have begun as a tall tale spun by a delighted Phoenician who had made his fortune in the Tartessian silver trade, but it gives an indication of the large scale of that trade. Their seaports included Abdera (modern Adra), Malaca (modern Málaga), and Sexi (modern Almuñécar), as well as Gadir (later Gades, modern Cádiz) beyond the Strait of Gibraltar. These ports attracted products from the rich hinterlands of the intermontane plateau of the Sierra Nevada and the valley of the Guadalquivir River. The Phoenicians also traded along the Tunisian coast, probably a medium through which North African influences arrived in Iberia.

Greek Presence in Iberia

The Greeks, as were the Phoenicians, were highly skilled mariners who became active traders throughout the Mediterranean and established trading colonies along the east coast of the Iberian Peninsula starting in about 630 C.E. and over the next centuries, such as Ampurias and Rosas and the site of modern Alicante and of modern Sagunto (formerly Murviedro and Saguntum). According to Herodotus Greeks from the town of Phocaea on the Aegean coast of Asia Minor opened up Spain and Tartessos, the latter around the lower Guadalete, Guadalquivir, and Tinto Rivers on the southwest coast. Again the minerals of this region drew the Phocaeans, not only those mined in Iberia—importantly, tin from Galicia—but also metals from Brittany and Cornwall transported along the age-old Atlantic seaways. Tartessos was a major source of tin for Greece. The Tartessian king invited the Phocaeans to emigrate and settle in his kingdom; they declined.

Greek shipping tended to follow coastal routes with established safe anchorages along the way; thus their probable route to Tartessos would have been from the southern coast of France, south along the Iberian coast, then through the Pillars of Hercules and around Iberia's Atlantic coast to the Tartessian ports on the southwest coast just north of present-

day Cádiz. The Greeks' stopovers along the southern Iberian coast put Iberians for the first time in contact with the burgeoning city-state culture of Greece.

The Iberians and the Celtiberians

It is thought that by about 600 B.C.E. Celtic peoples had settled on the Iberian Peninsula, having migrated across the Pyrenees from the north, and displaced as well as intermingled with Iberians. The term Celtiberia is sometimes used specifically for a region in the north-central part of present-day Spain between the Tagus and Ebro Rivers, where the Celtic presence and influence were strongest. But it is also used for all those tribes in the western two-thirds of the peninsula exposed to Celtic influence to any degree. The Iberian tribes of the east were influenced to a greater degree by other Mediterranean cultures.

The first historical references to the Iberians are in Greek sources, based on colonization of coastal areas. Greek geographers originally applied the name Iberian to tribes of the southeast coast, but Herodotus applied it to all the peoples between the Ebro and Huelva Rivers, who had managed to maintain continuity with earlier times, maintaining their pre-Celtic languages and way of life and having material culture distinct from that of the Celtiberians in the north and west. This distinctive Iberian culture is thought to have reached its pinnacle in the fourth century B.C.E.

The Carthaginians in Iberia

The Carthaginians first developed their interests in the southern Iberian Peninsula as traders, along with their kinsmen the Phoenicians, in the sixth century B.C.E. After the collapse of the Phoenician cities of Tyre and Sidon in the eastern Mediterranean they inherited many of the Phoenician trade relations, and Phoenician traders now made Carthage their home base. The Carthaginians took over the Greek trade routes to Tartessos and their southern Spanish ports. As a result the Greeks developed their port of Massalia (modern Marseille) near the mouth of the Rhône River in southern France as an alternate route to obtain tin from the north. This development led to the Greeks' historic trade with Celtic groups in central France and Germany, the inception of the relationship between northern European and Mediterranean societies (later to include the ROMANS) that would have such momentous consequences in coming centuries.

In general the foreign trade contacts experienced by the Iberians during this period fall into two phases: an opening phase from about 800 to 600 B.C.E., during which the Phoenicians and Greeks established and developed their trade networks peacefully, followed by a phase of conflict and competition among them from 600 to 450 B.C.E., during which the Carthaginians ousted the Greeks from the Iberian trade.

Carthaginian and Roman Battleground

With victory in the First Punic War of 264–241 B.C.E. between Rome and Carthage Rome appropriated Carthaginian trading centers in Sicily, Sardinia, and Corsica, thus depriving Carthage of revenue. As a result Carthage placed new emphasis on its holdings in Spain. However, it now set out to conquer where before it had been content to trade.

Carthaginian forces campaigned in southern Spain under Hamilcar Barca from 237 B.C.E. until his death in battle in 229 or 228 B.C.E. In 237 B.C.E. Carthage founded the city of Cathago Nova or New Carthage (modern Cartagena) on the southeast coast, which served as the major Carthaginian supply base on the Iberian Peninsula in a northward expansion. Some Iberian settlements sought to eliminate Carthaginian expansion through Roman contacts. The Greek cities on the coast of southern France and northern Spain appealed to Rome for help. Rome and Carthage negotiated a treaty in 226 B.C.E., in which Carthaginian influence extended as far north as the Ebro River, with Roman interests to the north. One exception was the seaport of the Roman-allied Saguntum, 100 miles south of the Ebro River. In 219 B.C.E. the Carthaginian general Hannibal laid siege to and captured Saguntum. In 218 B.C.E. the Roman senate declared Spain a Roman province. This was the start of the Second Punic War of 218–201 B.C.E. between Rome and Carthage. At its end the Carthaginians relinquished claims to lands on the Iberian Peninsula.

Roman Rule of Iberia

In 197 B.C.E. Rome divided Spain into two provinces, known as Hispania Citerior (Hither or Near Spain) and Hispania Ulterior (Farther or Far Spain). Even before the end of the war with Carthage Romans began founding new towns, including Italica, near present-day Seville, and Córdoba in the Guadalquivir River valley. Rome extracted huge quantities of Iberian silver and gold; some 40,000 slaves

were reputed to work in the silver mines near Cartagena. Moreover the Guadalquivir River valley held fertile farmlands, where olives, wine, and grain were produced in abundance. The rewards reaped in Iberia showed Rome the advantages of colonization, an encouragement for further expansion. Before and after reorganization Roman legions were forced to campaign against the Iberians and Celtiberians, many tribes of whom offered stiff resistance. Starting in 206 B.C.E. the Ilerges and in 197 B.C.E., the TURDETANI battled the Romans until final defeat by the consul Marcus Porcius Cato in 195 B.C.E.

The LUSITANI living to the west in present-day Portugal mounted a number of organized but small-scale revolts against the Romans in 195–190 B.C.E. Roman troops under Tiberius Sempronius Gracchus destroyed 300 Celtiberian “cities,” probably typical Celtic towns or hill fort compounds, in 179–178 B.C.E. By 170 B.C.E. Roman colonies were established, although the Romans did not attempt to occupy the entire peninsula. Lusitani finally mounted a full-scale rebellion in 154–150 B.C.E., with Celtiberians as allies. The murder of tribal representatives by Roman troops during peace negotiations furthered Celtiberian resolve to continue fighting. Beginning in 147 B.C.E. the Lusitani and allied tribes under Viriathus, whose charismatic leadership counted for much in the victories they achieved, waged a successful guerrilla war until the Romans bribed his retainers to assassinate him in 138 B.C.E., after which Lusitanian resistance crumbled, but the Celtiberians continued to fight.

The Romans waged war among the Celtiberian tribes along the Ebro valley. Among the Roman generals was Scipio Aemilianus Africanus Numantinus (Scipio the Younger), grandson by adoption of Scipio Africanus, who became consul in 134 B.C.E. The next year Aemilianus took the fortress of Numantia (from which he took his honorific) from the Celtiberians after a long siege, ending their rebellion.

Even while resistance continued in parts of Iberia, the products of the country were having an important impact on the Roman economy. Pliny, writing in the first century C.E., emphasized Iberia’s raw materials, but also her people: assiduous laborers, robust in body and character, perfect slaves. Manpower, including slave labor, was a crucial component of the Roman economy.

The increasing importance to Rome of its Iberian provinces, given Roman distrust of sea travel, made securing the land route through

Iberians of Portugal used this small silver cup in about the third to first century B.C.E. (Drawing by Patti Erway)

southern Gaul a prime goal and turned Rome's attention toward southern Gaul itself as a trading opportunity. Local pirates preyed on shipping from Massilia and other Greek cities there, which appealed to Rome for help. Successful intervention gained for Rome the territories of the tribes involved, further involving Romans in affairs in Gaul, a harbinger of the future.

In 80 B.C.E. the Roman expatriate Quintus Sertorius, who had been sent to govern Hither Spain, led a campaign against other Roman factions. He sought the support of Iberians and Celtiberians, even establishing a school to educate the sons of chieftains. His other allies were Mediterranean pirates, for whom he set up a naval base at Dianium (modern Denia) in southeastern Spain. Sertorius was defeated by Pompey in 73 B.C.E., whereupon he was executed. The Lusitani were defeated once and for all by troops under Julius Caesar in 61 B.C.E., three years before his first campaigns in Gaul.

Continuing resistance from the northwest corner of Iberia was suppressed during the reign of Emperor Augustus by the year 19 B.C.E., allowing withdrawal of troops there to take part in the conquest of Germania east of the Rhine. In 13 B.C.E. Rome divided Hispania into the provinces *Tarraconensis*, which comprised the north, northeast, and part of the southeast of the peninsula; *Lusitania*, comprising the southwest; and *Baetica*, comprising the south, including the Strait of Gibraltar. As part of the Roman provincial system the Iberians became increasingly Romanized.

Hadrian in Iberia

Many Romans emigrated to Hispania and stayed for generations, in some cases intermarrying with Iberians. One of these families produced the great emperor Hadrian, who ruled Rome at its zenith of power and cultural achievement, both due in large part to his efforts. Hadrian's ancestors had entered Spain generations before his birth, from the town of Hadria in Picenum, at the end of the Second Punic War. His mother, Domitia Paulina, was from a distinguished family of Gades. Although it is not certain whether Hadrian was born in Baetica, as was his kinsman and predecessor, Trajan, he can be considered to some degree a product of Romano-Iberian culture and had probably spent much time there while growing up. His Iberian ties, which he shared with Trajan, fostered a bond between them beyond kinship, that, no doubt, contributed to Trajan's decision to name Hadrian as his heir. Hadrian's upbringing in the less sophisticated society of

Iberia, away from the increasingly decadent Rome, may have bred in him his hardihood both in battle and in pursuit of his lifelong habit of travel to the roughest far reaches of the empire, and the relative moderation of his personal life.

In the fifth century C.E. the Romans lost control of the Iberian Peninsula. The Germanic-speaking VANDALS and the SUEBI occupied Spain in 411 C.E.; the Germanic VISIGOTHS occupied southwestern Gaul and Spain in 412–414, driving the Vandals into Africa. The Visigoths ruled Spain from Toledo, near the southern limits of their territory in northern Spain. The south continued to be the most prosperous area with the highest standard of culture, and the culture of Visigothic Spain was hardly Gothic at all, dominated by that of the Romano-Iberian south. The intellectual life of Visigothic Spain was unmatched in any other Germanic state, as attested by the career of the great scholar Isidore of Seville. The Visigothic kingdom was quickly toppled by the Arabs, who invaded in 711.

Subtribes

Iberian tribes included the already-mentioned Tartessians, as well as the BASTETANI, BASTULI, CARPETANI, ILERGETES, ORETANI, TURDETANI, TURDULI, and VASCONES (assumed tribal ancestors of the BASQUES). There were many other Iberian groups (as distinct from Celtiberian), and some of them organized around a single urban center. The second-century C.E. geographer Ptolemy, living in Alexandria in North Africa, cited more than 60 groups, with different names appearing at different times in history. The mountainous terrain led to the formation of isolated enclaves. The Lusitani of central Portugal and western Spain are classified as either Celtiberians or Iberians. They manifested some Celtic cultural traits but spoke a different language, Lusitanian.

CULTURE

Economy

Farming, particularly cattle and sheep rearing, formed the basis of the Iberian economy. Fishing also provided sustenance and trade goods. Mining provided raw materials—iron, lead, gold, silver, tin, and copper. Ironwork reportedly was taken to the region by Phoenicians. Iberian pottery also was traded; archaeologists have located it in France, Italy, and North Africa. It is thought that the Greeks introduced grapevines and olive trees, and wine and olive oil became exports.

Trade with Phoenicians and Greeks greatly intensified the Iberian economy in terms of the amount of materials being exchanged. An excavation in present-day Huelva, which is thought to be located on the site of ancient Tartessos, found in a single six- by four-meter trench the shards of some 1,400 Greek pots from Athens, the islands of Chios and Samos, and other places, dating from the seventh and sixth centuries B.C.E. If representative of the entire site, the density of material implies that hundreds of shiploads had arrived during this period.

Tartessos also participated in the Atlantic coastal trade, which linked it with ports as far away as the Shetland Isles of Britain, and with Armorica (Brittany), Wales, Devon, and Cornwall. A ship excavated there that was wrecked probably in the seventh century contained a consignment of bronze Irish spearheads. The poem *Ora Maritima* by the Roman poet Avienus, based on a now-lost source that was already ancient in Avienus's time, mentions Tartessian traders' traveling to Armorica, Ireland, and Britain.

Burials indicate the wealth enjoyed by elites in Tartessos. In one excavated tomb the deceased was accompanied by a walnut wood chariot with bronze decorations. Other burials contained finely carved ivories and lavish gold jewelry made both locally and from Syria and Egypt.

The reorientation of trade that occurred as the Carthaginians ousted the Greeks after the sixth century also led to a change in trade dominance among Iberians. The Carthaginians seem to have begun to establish contacts with the interior Sierra Morena silver-producing region from Iberia's Mediterranean coast via the Guadalquivir River valley, resulting in the rapid rise of towns there during this period. The Atlantic ports of the Tartessian region accordingly became less important. The discovery of new sources of silver near Cartagena may have stimulated the development of ports along the southeast coast, such as Ibiza. By the fifth century a vibrant urban-based society had emerged along the whole Mediterranean coast of Iberia.

In Roman times the region, along with North Africa, served as a primary granary for the Roman market, with wheat a major export. *Garum*, a sauce made from decomposing fish entrails, was sought after in Rome. The Romans introduced irrigation projects, which increased agricultural output. Peoples of the south also acted as middlemen for products. Gadir (Cádiz) was a stopover point between the Mediterranean and the North Atlantic commerce in tin. Coins became a medium of exchange among peoples.

Government and Society

The Iberians evolved from a tribal people to urban dwellers, especially in the east. Urban centers, many of them independent of one another, began to emerge especially as a result of foreign trade; the Guadalquivir River valley underwent rapid urban development in the period of 770 to 550 B.C.E.

As elsewhere in undeveloped societies who formed Phoenician and Greek contacts, Tartessian society was transformed by the luxury trade, which led to greater social stratification as elites acquired the wealth and demonstrated their status. Local craftsmen stretched their skills as they strove to copy the exotic luxury items, and in general the local economy was invigorated and conducted on a more intensive scale than ever before. And Tartessian elites adopted new customs from the foreigners in their midst.

By the end of this period substantial towns had been built with encircling defensive walls. In these towns sophisticated artwork began to flourish, testimony to the wealth of local elites, who marked their high status by their patronage of the arts. By the fifth century the whole east coast of Iberia had developed urban centers, in which writing in a distinctive Iberian alphabet made possible a more sophisticated governmental and military structure than in the tribal past. In Galicia, long the major source of tin for the Mediterranean world, large hill forts (*castros*) were built during the Iron Age. Some of the southern peoples, such as the Tartessians, organized into monarchies.

Military Practices

The Iberians were known in the ancient world as accomplished cavalymen, riding the local breed of horse known as Lusitano, known for its agility. In about 370 B.C.E. the Greek historian Xenophon described the effectiveness of the quick charges and retreats of Iberian and Celtiberian cavalymen in the Peloponnesian wars between Athens and Sparta in Greece. The Romans, who adopted some of these techniques, set up stud farms in Spain. Some Iberian infantrymen typically wore flax armor, leather helmets, and small shields hanging from their neck and carried long spears and a short dagger. Celtiberians developed a two-edged sword that later became the standard sword used by Roman legions.

Clothing

Among the Iberian clothing documented are garments made of black woolen cloth or goat fur.

Art

The Iberians were known for metalwork and ceramics. Among their works are bronzes and terra-cotta figures. As in so much else, the goods taken to Iberia by Phoenicians and Greeks had strong influence on craftsmen. In the period from about 770 to 550 B.C.E. Iberian pottery, especially in the Guadalquivir valley, changed dramatically from its former dull gray to a lighter, ochre color painted with red and black geometric patterns.

Soon after the sixth century a fully developed, indigenous Iberian fine art style appeared with great suddenness, beneficiary of the wealth generated by the Phoenician and Greek trade. Large stone sculptures were made, often of limestone, clearly influenced from the east but fully original in style and details of clothing and armor. Subjects included animals, prominently bulls, and full-size human statues, often of participants in religious ritual and of mounted warriors.

Religion

A number of menhirs, upright slabs with carved reliefs, of the megalithic period in Iberia have been interpreted as depicting female figures, possibly deities. They are similar in style to others found in France and elsewhere in the Atlantic zone, suggesting a common cult. At Los Millares bone and schist figures called “eye idols” have been claimed as evidence of goddess worship, although this belief is not universally held.

The many sculptures of bulls made by Iberians of the first millennium B.C.E. strongly suggest the presence of a cult whose deity was manifest in these animals, understandable in a society for whom cattle rearing had long been central. There is some evidence that a goddess similar to the Roman Venus was worshipped in coastal cities and received offerings of doves.

Tartessians, especially the elite, seem to have adopted elements of religious belief and ritual from the eastern Mediterranean through their contacts with Phoenicians and Greeks. Some elite burials contain ritual bronze vessels, including incense burners.

After Iberia fell under Roman rule the Romans, as was their wont, rather than imposing their own religion on the Iberians, identified Iberian deities with Roman ones who had similar attributes. For example Ataecina was an Iberian goddess identified with the Roman Proserpina, an underworld goddess. Such identifications give us an idea of Iberian gods and their functions. Candamius, whose cult was strongest in northern Iberia, was identified

with Jupiter, the Roman ruler of heaven. Eacus was a weather god identified with Jupiter probably as creator of thunder and lightning. Cariociecus was a war god conflated with Mars. Dercetius ruled mountains and upland regions.

The Iberians were one of the many Mediterranean peoples, such as the ETRUSCANS, whose rich and distinct culture was subsumed into the Greco-Roman culture that became dominant during the first millennium B.C.E. Their culture is thus something of a mystery. They became so intertwined with the Romans that in some cases it is difficult to unravel what aspects of what we think of as Roman culture were actually Iberian. Historically the importance to Rome of its experiences in Iberia can hardly be overstated, for the annexation of this rich province greatly affected the Roman economy as well as Roman politics, making both to some extent dependent on conquest—or at least extension of trade relations—in new territories. The Roman economy ran on booty from conquest, large-scale export of goods—importantly wine and pottery—to annexed lands, and importation of foodstuffs made necessary because so much land in Italy was given over to wine production. Roman politicians after Caesar used successful campaigns of conquest to make their political fortune. For several centuries after annexing Iberia Rome was in a sense “addicted” to conquest until the Iberian-raised Emperor Hadrian halted expansion and turned to consolidation instead.

Icelanders: nationality (people of Iceland)

GEOGRAPHY

Iceland is an island of the Atlantic Ocean lying south of the Arctic Circle, west of Norway, and southeast of Greenland. Iceland's total area is 3,100 miles. Embayments, such as Faxa Bay

and Breidha Fjord, and peninsulas make up the coastline. The republic includes many small islands such as Vestmannaeyjar off the south coast. Iceland's terrain is marked by broad plateaus, glaciers (notably Vatnajökull, 3,265 square miles) in the south, volcanoes, craters, and thermal springs (notably Geysir). Of the 200 volcanoes Mount Hekla (4,900 feet) is the highest. About one-fourth of the land is habitable; most residents live along the southwest coast, where Iceland's lowlands are found. To the southeast lie highlands, including

Hvannadalshnúkur (6,952 feet), Iceland's highest peak. The principal river is the Jökulsá, which flows into the Axar Fjord.

INCEPTION AS A NATION

The IRISH, mostly monks, settled Iceland in the early ninth century C.E.; Norwegian VIKINGS soon followed. By 930 settlers organized the Althing, a parliament, establishing a republican state without an official head. Icelanders recognized King Haakon IV Haakonsson of Norway as their king around 1262 after a civil war.

Icelanders: nationality time line

C.E.

- 874–930** Norwegian Ingólfur Arnarson settles Reykjavík.
- 930** Althing, annual parliament, is established; Republic of Iceland forms.
- 1056** Ísleifur Gissurarson becomes first Catholic bishop of Iceland.
- 1230** Icelanders resist occupation; beginning of civil war.
- 1262** King of Norway is recognized as Iceland monarch; end of civil war.
- 1380** Iceland and Norway are united with Denmark; Danish government takes measures to stifle Icelandic trade to England and Germany to avoid competition.
- 1550** Danish government forces Lutheranism on Iceland by executing Catholic bishops.
- 1662** Absolute monarchy is enforced.
- 1666** Lutheran pastor and poet Hallgrímur Pétursson writes *Passíusálmar* (Hymns of the Passion).
- 18th century** Economic oppression by Denmark has caused drastic drop in Iceland's population.
- 1800** Althing is nullified.
- 1814** When Norway joins union with Sweden, Iceland remains part of Denmark.
- 1818** National Library is founded in Reykjavík.
- 1843** Althing reconvenes in Reykjavík.
- 1850** Jón Thóroddsen writes earliest Icelandic novel, *Piltur og stulka* (Lad and lass).
- 1863** Icelandic Museum of Antiquities is founded (now National Museum) in Reykjavík.
- 1874** New Icelandic constitution is established, permitting limited autonomy.
- 1904** Iceland gains home rule under Denmark.
- 1911** University of Iceland is founded in Reykjavík; in 1940 University Library is founded.
- 1918** Act of Union recognizes Iceland's independence under Denmark, limiting control over foreign affairs.
- 1940–45** During World War II Iceland is occupied by British and United States troops.
- 1942–50** Sculptor Asmundur Sveinsson designs Ásmundur Sveinsson Sculpture Museum for his works, part of Reykjavík Art Museum.
- 1944** Republic of Iceland is founded.
- 1946** Iceland becomes member of United Nations (UN).
- 1949** Iceland joins North Atlantic Treaty Organization (NATO).
- 1951** United States pressures Iceland to allow troops as part of NATO; Iceland gives permission, which divides country.

ICELANDERS; NATIONALITY

nation:

Iceland (Danish, Island; Icelandic, Ísland)

derivation of name:

Meaning "land of ice"

government:

Constitutional republic

capital:

Reykjavík

language:

Official language is Icelandic, derived from the Old Norse and part of the Scandinavian branch of Germanic languages; English, German, Danish, and Nordic are also spoken.

religion:

About 90 percent of the population belong to the Evangelical Lutheran Church; Roman Catholics and independent Christians make up the remaining percentage.

earlier inhabitants:

Inuit; Irish; Vikings

demographics:

Over 95 percent of homogeneous population are a mixture of Norwegian and Celtic descendants; only a small percentage are of Inuit or other origins.

Icelanders: nationality time line (continued)

1955	Novelist Haldór Laxness wins Nobel Prize in literature.
1970	Iceland joins European Free Trade Association.
1973	Kjarvalsstaðir, part of Reykjavík Art Museum, is inaugurated, named in honor of painter Jóhannes Sveinsson Kjarval
1980	Vigdís Finnbogadóttir becomes world's first woman elected as chief of state in Europe.
1985	Althing, by unanimous decision, votes to ban nuclear weapons from Icelandic soil.
1990	Combined National and University Library of Iceland opens in new building in Reykjavík.

Iceland, a suzerainty of Norway, became a part of Swedish rule when Norway, Sweden, and Denmark united under the Union of Kalmar in 1397. Icelanders were forced to pledge allegiance to the Danish absolute monarch Frederick III in 1660. The activist Jón Sigurdsson helped the Althing reconvene in 1843, during a period of nationalism and sought-after independence and in 1874 helped in the establishment of a constitution. By 1904 Iceland was granted autonomy. Denmark officially recognized its independence in 1918, although it was still bound to Denmark by the Treaty of Union. The Republic of Iceland was officially proclaimed in 1944.

CULTURAL IDENTITY

Icelandic cultural identity strongly relates to the Icelanders' experience of being pioneers, of having created for themselves a new society in a new land, even though this happened over a thousand years ago. Although their culture is in many ways close to that of SCANDINAVIANS through heritage and language, Icelanders see

themselves as sharing some traits with Americans as well. The Icelandic government (which is the oldest parliament in the world) was a conscious experiment by Icelanders, rather than an inherited tradition, as was the government of the United States. Like Americans, Icelanders prize independence, both individual and national, and the entrepreneurial spirit of the free market. Icelanders also value American egalitarianism, but even to a greater degree than many Americans do. Icelanders believe in the importance of equality of conditions and opportunity for all, which the free market in itself does not provide. Thus Icelanders favor social democratic principles, with the state helping to level the playing field. Such egalitarianism derives from the Viking past, when warriors themselves played at least some role in governing. This attitude has led to a very progressive culture in terms of tolerance for a wide range of social behavior.

Thingvellir, the "Parliament Plains," where the first Althing was held in 930, is considered the most sacred place in Iceland, designated by law as such. A special ceremony of sanctification that took place before each Althing, first recorded in the 12th century, has continued to be performed in a modified and Christianized form ever since. Recently Icelanders have begun to focus on the pagan aspects of the Althing ceremony and others, and at midsummer in the year 2000, the oldest known version of the ritual was performed at Thingvellir at 11:00 at night (according to tradition)—still full daylight during summer in this northern land.

The dramatic and unique Icelandic landscape, three-fourths of which is uninhabited—the endless summer days and winter nights, forbidding coasts, vast realms of glaciers and volcanic rock, hot springs and geysers, numerous small lakes and swift-flowing rivers—make it a haven for outdoor enthusiasts, and Icelanders engage in hiking, skiing, canoeing, fishing, ice climbing, and trekking on the back

Icelanders walk along a street in Reykjavík in 1938. (Library of Congress, Prints and Photographs Division [LC-USZ62-95106])

of Iceland ponies. During the summers people often sleep little as they make up for the long winter nights.

More book titles are published per capita in Iceland than in any other country in the world. The largest city, Reykjavík, has the cultural richness of a city several times its size in the number of art galleries, bookstores, cinemas, and museums and in its vibrant nightlife. It also holds a biennial international art festival.

Icelanders still allow for shared mythological tradition in their lives, as in the case of trolls. Supernatural beings variously described as giants or misshapen dwarves, trolls are supposedly capable of giving humans serious problems. Their anger is terrible if they are crossed, and they exact a cruel revenge. But if on the other hand someone does them a good turn, they show their gratitude by returning the favor and often assist people without being asked. Trolls, according to legend, live in crags and cliffs and caves, subsisting by hunting and fishing and perhaps raising livestock. When in the 1970s the construction of the Ring Road around Iceland met with a series of accidents and problems in an area where trolls were said to live, the road designers erred on the side of superstition and altered the course of the road, which then reportedly was completed without further trouble. The trolls of Icelandic mythology are very similar to those in Norway, but some Icelanders claim that they entered Iceland with the Irish monks who lived there before the Norse arrived.

Iceni (Eceni)

The Iceni are classified as a Celtic tribe. They lived in Britain in the present-day county of Norfolk and parts of Suffolk and Cambridgeshire in eastern England and are discussed as CELTS or BRITONS. Coin finds dating to about 70 B.C.E., indicate that they were a thriving people in the first century C.E.

The Iceni did not resist the invasion of the ROMANS under Emperor Claudius I in 43 C.E., but when Publius Ostorius Scapula became governor of Britain in 47 C.E. some tribesmen rebelled. Scapula defeated an Iceni force in battle.

Probably at that time Prasutagus became the client-king of the Iceni for the Romans. After his death in 60 C.E. and reported abuses by the Romans, his wife, Boudicca (Boadicea), led a rebellion (see sidebar “Boudicca” under Britons). Iceni and allied TRINOVANTES attacked a number of towns, destroying parts of Roman-held Camulodunum (modern Colchester) in Trinovantes territory and Londinium (modern London) and Verulamium (modern St. Albans) in CATUVELLAUNI territory. Iceni warriors also annihilated the Ninth Legion. Yet in 61 B.C.E. were defeated in a battle, the site of which is unknown, by a Roman force under the Roman governor Suetonius Paulinus. Tradition has it that Boudicca took her own life soon afterward.

Venta Icenorum in Iceni territory on the site of present-day Caister St. Edmund was a *civitas* capital during the Roman occupation until 410 C.E.

Ijores See IZHORIANS.

Ilergetes (Ilergeti; Ilergates)

The Ilergetes are classified as IBERIANS. They lived in the Lower Ebro River valley near the confluence of the Segre River in present-day northeastern Spain. In 206 B.C.E. during the Second Punic War between the CARTHAGINIANS and ROMANS the Ilergetes under Indibil revolted against the Romans, who, led by Scipio Africanus, defeated them. They continued to resist after Roman colonization of Spain, and Marcus Porcius Cato, who became consul in 195 B.C.E., defeated them.

Illyrians (Illyrii; Illyrici)

The Illyrians were a group of tribes living along the Adriatic Sea, an arm of the Mediterranean, and inland, and speaking a number of related dialects. They may have been ancestral to modern Albanians (see ALBANIANS: NATIONALITY).

35–33 Romans under Augustus defeat southern Illyrians.

C.E.

6–9 Romans suppress Illyrian revolt and found Illyricum.

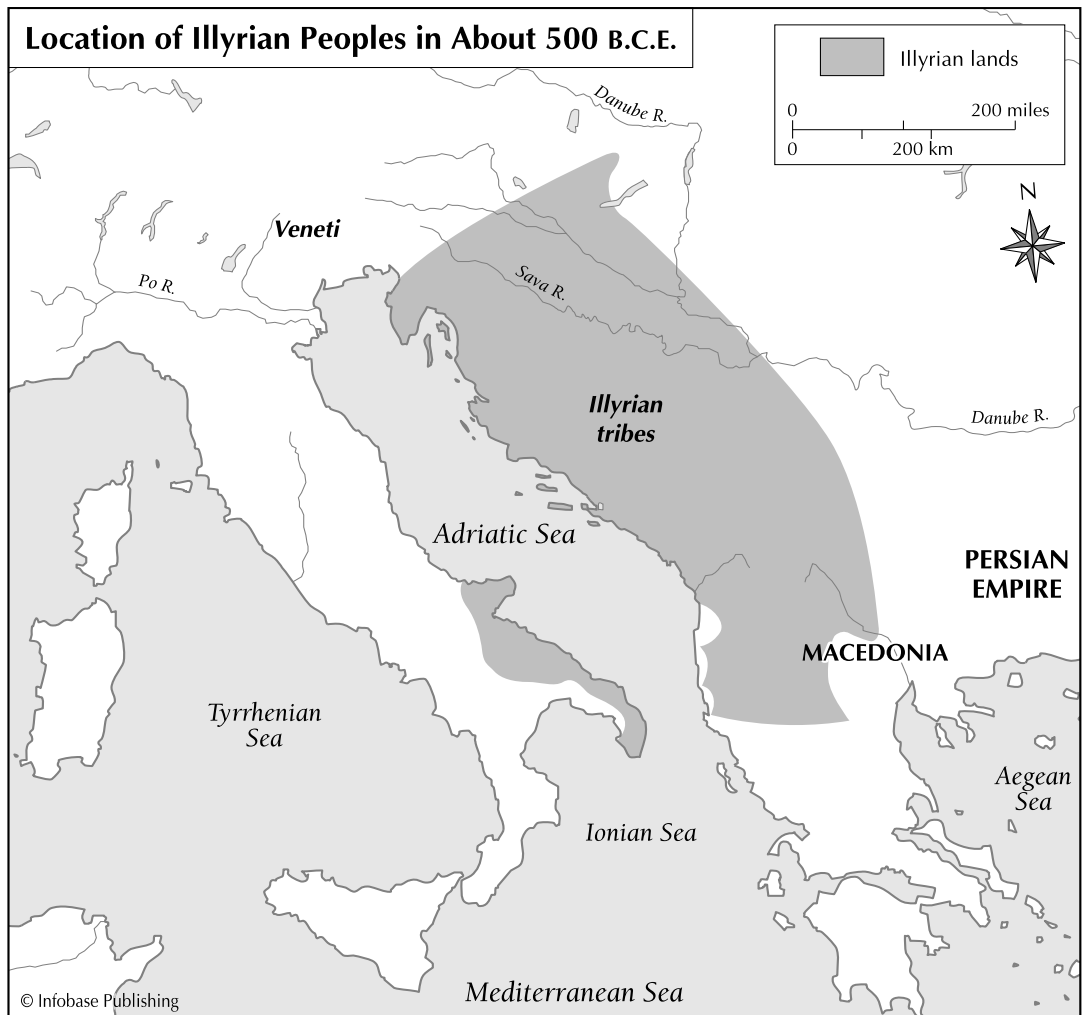

395 Illyricum becomes part of Eastern Roman Empire.

The history of the Illyrians relates to that of THRACIANS living to their east, separated by the Morava and Vardar River valleys; the GREEKS living to their south; the MACEDONIANS living to their east; and the ROMANS living to their west on the Italian Peninsula. They also had contacts with CELTS, who invaded their lands.

ORIGINS

Proto-Illyrians, that is, peoples possibly speaking a language ancestral to the Illyrian of historic times, are thought to have reached the region sometime before the first millennium B.C.E. during the transitional period between the Bronze Age and Iron Age, settling the western Balkans. From the relation of the Illyrian language to Thracian, it is postulated that these proto-Illyrian speakers came from Thrace and possibly from the steppe lands to the east. They also migrated to the Italian Peninsula by sea or land over the next years. They are associated with the Hallstatt culture, known for early ironwork.

It is likely that the ancestors of the Illyrians had been living in their western Balkan territory for many centuries before Greek historians first made note of them. Important societal changes would have resulted from the copper ore deposits in the Balkan region that, during the Bronze Age, gave rise to an important bronze-working industry there.

LANGUAGE

The Illyrians spoke a now-extinct Indo-European language known as Illyrian related to the language of the THRACIANS. It probably split off from an ancestral Thraco-Illyrian tongue spoken in Thrace to the east when peoples ancestral to the Illyrians of historic times migrated to the Balkans. An apparently related language of tribes of the eastern Italian Peninsula in pre-Roman and early Roman times is known as Messapic or Messapian. It is generally believed that modern Albanian evolved from Illyrian.

HISTORY

Illyria as a place-name was variously used throughout ancient times. Since some Illyrian peoples settled as far north as present-day Hungary, the place-name Illyria sometimes was applied to the lands from present-day north-western Greece and Albania to the Danube River, lands comprising ancient regions known as Dalmatia (Adriatic coastal parts of modern Montenegro, Bosnia and Herzegovina, and Croatia) and Pannonia (including parts of modern Hungary extending south and west into Serbia, Croatia, Slovenia, and Austria). Thus one sees the regional names DALMATIANS and PANNONIANS in reference to Illyrian peoples (although ancient texts do not necessarily distinguish between the original Illyrians and invading peoples, in particular the Celts). Ancient Greeks tended to use Illyrians as a collective term for non-Greek peoples living adjacent to the Greek territory of Epirus on the west coast of Greece. A more narrow definition of the territory of Illyria is that it comprises the Adriatic coast north of central Albania to the Istrian Peninsula in Croatia and Slovenia, and west of the Dinaric Alps, mountains paralleling the Adriatic coast.

Tribes of greater Illyria included Arbëri, Ardian, Dalmat, DARDANI, Dasaret, Delmatae, Encheleae, Eordej, Epiriot, Japod, Japyg, Kaon, Labeat, Liburni, Mesap, Molossi, Paion, Parthin, Penest, Pirust, Taulant, and Thesprot. The Chaones of the region of Epirus in Greece may have been Illyrian as well, along with other tribes generally presented as Hellenic in ancient texts.

Illyrian Warfare

The Illyrians were known as an independent people who carried out acts of piracy on the Adriatic shipping of more organized neighbors. Their lands were desirable to outsiders because of the iron, copper, silver, and asphalt

An Illyrian is depicted in this detail of a bronze situla from Slovenia, dating to the seventh or sixth century B.C.E. (Drawing by Patti Erway)

mines. The Greeks established coastal cities there as early as the late seventh century B.C.E., such as Epidamnus (modern Durrës, Albania), and in the sixth century. Other important colonies were Apollonia and Aulon (modern Vlorë) to the south. Yet the Greeks had little success advancing into the mountainous interior. From the late fifth century and into the third century B.C.E. Celts from Transdanubia (eastern Hungary) raided Illyria, and Illyrians formed tribal alliances to defend against them. In the fourth century they were united in the kingdom of Bardhyllus. The Macedonians under Philip II in 358 B.C.E. campaigned against them successfully, seizing lands as far as Lake Ohrid. In 335 B.C.E. his son, Alexander the Great, defeated the Illyrian chieftain Clitus.

After the breakup of Alexander's empire the Illyrians regained control of their lands. In 312 B.C.E. King Glaucius expelled the Greeks from Epidamnus. By the end of the next century the Illyrians founded a kingdom with its capital at Scodra (present-day Shkodër, Albania).

By about 310 B.C.E. the Celtic raids had increased enough in intensity to cause panic among the Illyrians. The numbers of Celts grew until 279 B.C.E. They overran Illyria and moved into Macedonia. These Celts, known to the Greeks as GALATOI, penetrated deep into Greece, reaching Delphi.

Regular attacks on Roman merchant ships by Illyrians under Queen Teuta—and a Roman expansionistic policy—prompted Roman campaigns in the Neretva River valley in 229–228 and 219 B.C.E., known as the Illyrian Wars. Epidamnus became known as Dyrrachium under their rule. In 168–167 B.C.E. the Romans defeated King Genthius, captured Scodra, and founded Illyricum, one of the earliest Roman colonies. The Romans sent legions north to Dalmatia in 156, 119, and 78–77 B.C.E. In the first century B.C.E. the Dardani specifically are mentioned as causing trouble in Roman Macedonia, and in about 70 B.C.E. a Roman army waged war against them.

In 35–33 B.C.E. Augustus, soon to be emperor (who had been sent by his uncle, Julius Caesar, to study at Apollonia), defeated the southern Illyrians and secured the region. Follow-up campaigns in 29–27 B.C.E. and 12–11 B.C.E. pacified other Illyrian tribes, including those to the north in Pannonia. The Romans eventually built aqueducts and roads in Illyria, including the Via Egnatia, a military highway and trade route that led from Dyrrachium along the Shkumbin River valley to Macedonia and eventually Constantinople (modern Istanbul).

The Illyrians mounted a revolt in 6–9 C.E. After suppressing it Emperor Tiberius founded the province of Illyricum (formerly a colony). In the fourth century C.E. the Roman province of Dalmatia was created. After the Roman Empire was subdivided into East and West in 395 C.E. Illyricum became part of the Eastern Roman Empire and a Roman prefecture comprising most of the Balkan Peninsula. The southern Illyrian region went to the Eastern Roman Empire and the Eastern Church; the northern Illyrian region went to the Western Roman Empire under the ecclesiastical authority of the pope.

The Illyrians, known for their skill in warfare, served in the various armies of their conquerors. Some among them became part of Alexander's army in his conquest of Persia in the fourth century B.C.E. Others served Roman legions. Some among them, especially during Rome's decline, served in the elite Praetorian Guard and rose to high ranks in the army. A number of them even became emperors late in Roman history—some of the most famous, such as Diocletian (ruled 284–305 C.E.) and Constantine I (ruled 306–337 C.E.), as well as Justinian I (ruled 527–565 C.E.) of the Eastern Roman Empire.

Late History

In the fifth century C.E. the Illyrians suffered other invasions. The VISIGOTHS, HUNS, OSTROGOTHS, and AVARS all occupied some of their territory for a time. Between the sixth and eighth centuries SLAVS settled in the Balkans, and the Illyrians were assimilated by varying groups who founded kingdoms in the region and spread Slavic dialects. The peoples of southern Illyria, however, those in Albania, managed to preserve their native tongue (with some elements of Latin). The name Albania in fact is derived from that of the Arbëri (Albanoi) tribe of central Albania, their name first recorded by the second-century geographer Ptolemy of Alexandria.

Illyrian Peoples of Italy

The Illyrians who migrated to the Italian Peninsula were documented in relation to early Roman expansion. They include the IAPYGES (APULI, MESSAPI, PEUCETI), FRENTANI, and VENETI, and their histories are summarized under those tribal names.

CULTURE

Economy

The Illyrians grew crops and raised livestock and fished for both sustenance and trade. Among their trade goods were fish, oil, wine, and cheese. They also traded raw materials from mining as well as metalwork, including tools and luxury goods. Piracy also provided revenue. Some Illyrians supported themselves as mercenaries.

Government and Society

Early Illyrian peoples were organized into tribes and clans. Councils of elders selected the chieftains. Tribal confederations led to the establishment of kingdoms. Mountain clansmen retained much of the local authority even through Macedonian, Greek, and Roman rule. In later years, although they were forced to swear allegiance to the Roman emperor and his envoys, they still made many of the day-to-day decisions for their people. An annual ceremony in which the tribes reaffirmed their loyalty to Rome evolved into the *kuvend*, a ceremony still held in northern Albania.

Archaeology has shown that Dardanian society began to develop urban centers by the fourth century B.C.E., probably under influences from the Greeks, with whom trade had begun at least by the seventh century.

Art

Illyrian friezes depicting a variety of activities, such as warfare, ceremonies, feasts, and sporting events near present-day Ljubljana, Slovenia, have been found.

Religion

The Illyrians originally practiced an animist and polytheistic religion. Contact with other cultures led to worship of new deities, such as Mithra, the Persian god of light. Christianity took hold early in the first century; the apostle Paul wrote that he preached in Illyricum. In 58 C.E. a bishop was assigned to Dyrrachium. Although Albania became part of the Byzantine Empire, Albanian Christians remained under the jurisdiction of Rome until 732, when the Byzantine emperor Leo III placed them under that of Constantinople. When the church divided in 1054, the dividing line between Roman Catholicism and Eastern Orthodoxy cut through the region, and both religions are still practiced there. Some peoples of possible Illyrian ancestry also converted to Islam, when the Ottoman Turks gained control of the region in the 14th century.

With so many peoples playing a role among the Illyrians, they became an ethnic mix. The Albanians honor their Illyrian ancestry. The name Illyria endured. It has appeared in fiction, as in the English playwright William Shakespeare's play *Twelfth Night*. In 1809–13 Napoleon Bonaparte named a division of his French empire the Illyrian Provinces. After reclaiming the region Austria established the Kingdom of Illyria, which endured as part of Austria from 1815 to 1849.

Ilmen Slavs (Novgorod Slavs; Slovens)

The Ilmen Slavs were a tribe of Eastern SLAVS, living in the vicinity of Lake Ilmen in present-day northwestern Russia. Although the name Slovens has been associated with them, they have a different tradition from the Southern Slavic SLOVENES.

Related to the neighboring SEVERIANS, the Ilmen Slavs were centered in the vicinity of Novgorod, which was probably built under the impetus of VIKINGS and became an important trading center. In 862 C.E. the supposed founder of the Novgorod principality and the Rurikid dynasty of RUS settled among them.

The Ilmen Slavs, with other Slavic tribes of the region, eventually fell under the suzerainty of the Kievan Rus principality, paying tribute to them and serving under their princes in military campaigns, including the attack by Oleg on the BYZANTINES of Constantinople (modern Istanbul) in 907.

Ingaevones

According to the Roman historian Tacitus of the first and second centuries C.E. the Ingaevones were the most northerly proto-Germanic tribe or collection of tribes. In his account they lived on the Jutland Peninsula and along the North Sea and Baltic Sea in present-day northern Netherlands, Germany, and Poland by the first century B.C.E. By the mid-first century C.E. a number of tribes emerged from this region, such as the ANGLES, FRISIANS, JUTES, and SAXONS, perhaps descendants of Tacitus's Ingaevones. Tacitus refers to three early groups, descended from Mannus, son of the Earth-born god Tuisto and, according to legend, founder of the Germanic nation. From his three sons the Ingaevones supposedly emerged near the ocean in the north and the HERMINONES and ISTAEVONES to their south. Tacitus reports a second mythic version of the origins of GERMANICS in which Mannus had more sons who founded other tribes.

Ingrians

The name Ingrians is used to designate the various Finnic-speaking peoples, a subgroup of

Nakh (Caucasic)

FINNO-UGRIANS, native to the present-day St. Petersburg region near the Gulf of Finland in northwestern Russia. Their homeland was formerly known as Ingria or Ingermanland, and the name has been used variously: for the IZHORIANS (also known as the Izhora Ingrians, Ijores, or Lyds); for the VOTES (or Vodes); for two smaller tribes known as the Evremeisets and Savakots, whose descendants now live in the city of Leningrad itself; and for the Ingrian Finns, that is, FINNS from Finland, especially from the subgroup known as Tavasts, who settled in Ingria. The region of Ingria (the Anglicized form) has been known variously as Vod in Russian, as Ingermanland in Swedish, and as Inkeri in Finnish. It is said to be named after the daughter Ingegård (Ingigerd) of the Swedish king Olof Skötkonung. She married Yaroslav I the Wise, ruler of the RUS, in 1019 C.E.

Ingria became Swedish territory in 1617, after which much of the migration of Finns to Ingria occurred. In 1703 Peter the Great annexed Ingria to the Russian Empire; in 1712 St. Petersburg became Russia's capital. The self-appellation of the Ingian Finns, inkerin suomalaisen (Finns of Ingria), came about in the 19th century because of a newfound feeling of unity with the Finns of Finland largely because of shared Lutheranism.

During the existence of the Soviet Union (USSR) in the 20th century the Ingrian Finns were referred to by Russians as the Leningradskie Finny. The new, accepted pluralism in the Russian Federation has led to increased ethnic awareness among the Ingrian Finns, many of whom have chosen to migrate in recent years.

See also RUSSIANS: NATIONALITY.

Ingush (Ghalghaaj; Ghalghai)

The Ingush are a Caucasian-speaking people, living for the most part in the north-central Caucasus region of southwestern Russia. Their North Caucasian language is classified as part of the North-Central (Nakh) branch and related to the languages of the CHECHENS and the Bats of the nation of Georgia to the south in Asia. The Cyrillic alphabet is used in the written form. The name Ingush was applied to them by the Russian SLAVS, based on the name of the village Angusht; their native name is Ghalghaaj, a clan confederation. Like other CAUCASIANS, the Ingush are considered indigenous to the region, perhaps maintaining tribal identity since the second millennium B.C.E.

Traditionally organized by clans and tribes, they were originally a mountain people who

herded livestock in the highlands and farmed in the lowlands. The Sunzha and its tributary the Assa are the principal rivers in the region. Christian missionaries converted many in the 11th century C.E., but Islam took hold from the 17th to the 19th century.

Northern Ingush lands were under Russian rule by 1750, and the rest in 1810. Unlike most of their neighbors, the Ingush did not resist Russian occupation in the 19th century or Soviet control in the 20th century. In 1924 the Ingush Autonomous Oblast was formed as part of the Soviet Union, becoming in 1936 part of the Checheno-Ingushetiya Republic with Chechnya situated to the east.

In 1944 during World War II Joseph Stalin accused the Ingush and other Muslims in the region of collaborating with Germany and ordered their deportation to Soviet Asia, especially Kazakhstan, where many still live. It is estimated that one-quarter to one-half of the migrants died in transit. The Ingush were allowed to return to their homeland in 1956–57.

After the breakup of the Soviet Union (USSR) in 1991, the Ingush and Chechen established their own republics, and since 1992 Ingushetiya (or Ingushetia or Ingush Republic) has been a republic within the Russian Federation. Many non-Ingush also live there. The Chechen independence movement and war with the Russian government have led to the deaths of Ingush as well, and an influx of many Chechen refugees to Ingushetiya.

See also RUSSIANS: NATIONALITY.

Insubres (Insubrians)

The Insubres are classified as a Celtic tribe. They lived around present-day Milan in northern Italy. They are thought to have been descendants of the GOLASECCANS, the first CELTS in the region. A powerful tribe for centuries, they were defeated by the ROMANS at Telamon west of Lake Bolsena in 225 B.C.E. (along with the BOII) and in their homeland in 196 B.C.E. They were known for wearing trousers and bright-colored clothing.

Ionians (Ionic Greeks)

The Ionians were one of the four main ethnic groups into which the ancient GREEKS divided themselves; the others were the ACHAEANS, AEOLIANS, and DORIANS. On mainland Greece the Athenians in Attica and the Greeks of Euboea identified themselves as Ionians. They and many Greeks in Sicily and Italy regarded

IONIANS**location:**

themselves as related to the Ionians of Ionia, a small strip of western Asia Minor. Ionia also included the adjacent islands in the Aegean Sea. A dialect of Greek and an order of Greek architecture take the name Ionic from the Ionians. The Ionians have been classified as having four tribal groupings: Aigikoreis, Argadeis, Geleontes, and Hopletes. The name Ionian is associated with the names of two mythological characters, Io and Ion. The exact derivation is unknown, however.

ORIGINS

Before the classical period the name Ionian was primarily a linguistic designation for people speaking the Ionic dialect of Greek. Thus it is extremely difficult to identify Ionians from prehistoric times before written records were kept. It is known that after the Greek Dark Ages by about the eighth century B.C.E. Ionic speakers were living in Attica (the territory surrounding Athens) and on Euboea. Earlier the existence of an Ionian ethnicity increasingly becomes a matter of speculation. Identification by 19th-century and early 20th-century scholars of Ionians, along with other post-Dark Age linguistic groups—Achaean, Aeolian, and Dorian—with waves of Bronze Age invaders to Greece as early as the third millennium B.C.E. rests on very uncertain ground.

It seems clear that many groups and cultural influences entered Greece from abroad as early as the Copper Age or even earlier. The first Indo-European speakers may have arrived (probably in small bands rather than waves of invaders) as early as the fourth millennium B.C.E. Throughout the Bronze Age Greece was in touch with a wider world through trade and small-scale movement of peoples, but again there is no positive evidence of the existence of Ionians. Writing first emerged in Greece with the MYCENAEANS, whose civilization flourished from about 1400 to 1200 B.C.E. From this period evidence for the dialects of later Greeks might be found; however, the Greek spoken by the Mycenaeans is similar only to the dialect called Arcado-Cypriot spoken in later times on Cyprus and in the remote mountain region of Arcadia. Theories that Ionians may have been part of the Mycenaean civilization are based only on the logically unsound method of extrapolating backward from classical times: Athenians of the classical period spoke Ionian-derived Greek; Athens has been part of Mycenaean civilization; therefore Athenians of Mycenaean times must have been Ionians. Such a scenario would only be plausible if the interval between the

Ionians time line

B.C.E.

eighth century Ionic speakers living in Attica

478–404 First Delian League, a confederation between Athens and Ionian states of Asia Minor

336–335 Alexander the Great unifies Greece; Greeks begin to identify themselves as Hellenes, and not as different ethnic groups.

Mycenaean and classical periods had been a relatively peaceful, stable one, enabling a single ethnic group to survive largely unchanged.

Instead the period under consideration saw the violent collapse of the Mycenaean system, and Greece was plunged into an economically and culturally regressive period called the Dark Ages, during which writing was lost, cities were abandoned, and foreign trade languished. There was widespread depopulation of some areas along with population movement, the details of which are unclear. There is evidence that warrior groups from the Danube region north of Greece played some role in the demise of Mycenaean civilization, although they probably were not the decisive factor, only one of a number of factors involved. The fact that speakers of Arcado-Cypriot after the Dark Ages lived only on the margins of the Greek world, while Doric, Ionic, and Aeolic speakers dominated the Greek mainland, may imply that the ancestors of the latter were among the warriors from the north who had arrived in Greece around 1200 B.C.E., probably taking part in the civil wars and large-scale raiding that were devastating the region and later settling lands abandoned by the fleeing Mycenaean elites.

Although later Athenian tradition maintained that Athens never fell to invaders, Mycenaean civilization ended there at the same time as in other areas of Greece. It is possible that the Ionic dialect was introduced to an Attica suffering from the economic distress and depopulation of the Mycenaean systems collapse, by newcomers accustomed to a simpler way of life independent of long-distance trade and the agricultural central planning engaged in by the Mycenaeans. Able to support themselves with subsistence farming and simple craft goods, speakers of Ionic could have taken advantage of the depopulated landscape. As in the case of the Doric dialect on the Peloponnese Ionic together with the lifeways of its speakers could have been adopted by the local peasantry of Attica and Euboea who had been left to their own devices by the collapse of Mycenaean authority.

The origin of the name Ionian is unknown. In the *Iliad*, written in Ionic presumably by Homer in the ninth or eighth century B.C.E., some inhabitants of Attica, the area of mainland Greece centered around Athens, are called Ionians. A group identified as Yauna in Old Persia, and the related Javan of Hebrew from a similar period indicate that the eastern Greeks were probably widely known as Ionians. Literary evidence from the eighth and seventh centuries B.C.E. indicates that the Ionians of Ionia considered their cities to be recently founded by colonists from Attica. There is evidence of a large migration of Greeks from the mainland eastward into the Aegean and to the coast of Asia Minor between 1200 and 1050 B.C.E., in the wake of the fall of the Mycenaean civilization. The linguistic connection between Attic Greek and that of the Ionians lends credence to the claim of the Ionians of Ionia to be descendants of a group of Greeks who had moved through Athens before emigrating to Asia.

Origin Myth

In his genealogy of the Greeks or Hellenes the poet Hesiod of the eighth century B.C.E. calls the Ionians descendants of Ion (perhaps the source for the name Ionian), the son of Xuthus, and grandson of Hellen, ancestor of all the Greeks. Xuthus was granted the Peloponnese, the southern peninsula when Greece was portioned out to the sons of Hellen, but later the Ionians were pushed by the Dorians into Athens, a foreshadowing of the centuries-long enmity between Athens and Doric Sparta on the Classical period. Neleus and Androclus, sons of Codrus, the last king of Athens, supposedly led the colonizing expedition to Asia Minor. In the continuing myth the sons of Dorus—that is, progenitors of the Dorians—later reclaimed the land of the Peloponnese for the sons of Heracles.

LANGUAGE

The Ionians are identified with Ionic, one of the main dialects of ancient Greek, but it is not certain where the dialect first developed. It is related to the Attic dialect, spoken by Athenians and other inhabitants of Attica. Sometime in the eighth century B.C.E. the Ionians adopted the Phoenician alphabet. Ionic is also referred to as Homeric Greek, since the Homeric epics, the *Iliad*, and the *Odyssey*, were written in Ionic Greek. Ionic Greek, also called proto-Greek, is the foundation on which classical Greek developed; it in turn gave rise to Koiné (a common variety), Byzantine dialects, and eventually modern Greek.

HISTORY

Migrations to Asia Minor

The Parian Marble, a marble tablet found on the island of Paros (probably carved in the third century B.C.E.) bearing an inscription, essentially a long chronology of events, gives the date of the Ionian migration to Asia Minor as 1077 B.C.E. There is no reason to accept this date as completely accurate, given the clearly mythic nature of many of the events of the distant past that are recorded on the tablet, such as Deucalion's flood or Demeter's invention of corn. Events closer to the chronicler's time seem to be more historically accurate, so that the date of the Ionian migration could have some validity, although in 1077 B.C.E., because Greece was still in its period of illiteracy, it is difficult to know how the Parian chronicler could have discovered a specific date. It is likely that Ionians had begun moving to Asia Minor sometime during the Dark Ages, very possibly by the 11th century B.C.E. Since there is no evidence to back up historical accounts of the Ionians as conquerors, small numbers of migrating Ionians probably mixed with the existing population, perhaps some of whom were earlier Greek colonists. The migrating Ionians founded the first of the Greek city-states. By the ninth century B.C.E. these city-states dominated Ionia, and in historical time, the city-states of Ionia formed the Pan-Ionian league, a loose confederation of 12 cities. The cities of Ionia were Clazomenae, Colophon, Ephesus, Erythrae, Lebedus, Miletus, Myus, Phocaeam, Priene, Teos, as well as the islands Samos and Chios. Ionia was bordered by Caria on the south and the Hermus Valley to the north, and the Aegean Sea to the west and Lydia to the east. The Ionians were excellent seafarers, who had contact with the Egyptians and the PHOENICIANS and established colonies along the Mediterranean as far east as present-day France.

Links between Attica and Ionia

Until the sixth century B.C.E. there is no evidence that Athens and the rest of Attica regarded themselves as linked to the Ionians of Asia. Solon, however, the Athenian who reformulated the laws of Athens in the seventh–sixth century B.C.E., declared Attica “the oldest land of Ionia.” Athens continued to express its ties to Ionia even as the Ionian lands were conquered by Croesus, the king of Lydia, in the sixth century B.C.E. After the Persians under Cyrus II conquered the Lydians in 546 B.C.E. the Greek cities of Ionia became subject to the Persians. In 499 B.C.E. the Ionians revolted under Aristagoras of Miletus

and were aided by the Athenians. The Ionians, however, were defeated in the naval Battle of Lade in 494 B.C.E. Miletus was burned to the ground and its inhabitants slain or enslaved. Many Ionians fled to Greece and to Italy.

As a result of the early success of the revolt the Persian emperor Xerxes I invaded mainland Greece in 480 B.C.E. The Persian army was a formidable force that modern scholars believe comprised about 200,000 men and 1,000 ships, but it suffered a defeat at the Battle of Mycale in which Ionians participated. This victory secured partial independence for the Ionians, who joined with Athens in a league of Ionian cities known as the Delian League, which lasted from 478 to 404 B.C.E. The ease with which the Ionians subjugated themselves to the Lydians, Persians, and then Athenians, and their taint of oriental luxury, lent a pejorative cast to the name Ionian.

By this time the Athenians had already changed their tribal structure, replacing the Ionian tribes with tribes based on 10 uniquely Attic heroes, and were stressing their independent roots, while the Ionians of Ionia maintained the Delian League. The Ionian identity was used in opposition to the Spartans, who emphasized their Dorian roots. Conflicts between the two principal powers in Greece, Athens and Sparta, led to the Peloponnesian War, which ended with the humiliating defeat of Athens in 404 B.C.E., followed by Sparta's loss of Greek hegemony to Corinth and Thebes.

Pan-Hellenism

Warfare and instability in the fifth century B.C.E. were the beginning of the end of the ethnic rhetoric that had ceased to matter much outside of political maneuvering. Already during the threat of Persian invasion the Greeks had established an idea of Hellenism versus barbarianism, recognizing their common traits. These ideas can be found in the fifth-century B.C.E. writings of Herodotus and Thucydides, two of the greatest Greek historians, both of whom considered Hellenism more of a cultural trait—that is, something that could be acquired—than an ethnic one. The final defeat of these ethnic divisions was the advance of Alexander the Great of the MACEDONIANS, who conquered and united all of Greece in 336–335 B.C.E. and went on to establish a short-lived Hellenic empire in parts of Asia and North Africa, spreading a common Greek culture and dialect, based largely on the Attic Greek of Athens related to Ionic. (Alexander's father, Philip, had spent part of his youth as a hostage in Athens, an experience that instilled in him a lifelong love of all things Athenian. For

this reason, he insisted that his son learn to speak Attic Greek, no doubt a factor in the importance of Attic, rather than Macedonian, in Alexander's court and government.)

CULTURE (*see also* GREEKS)

The Ionians are thought to have introduced innovations in pottery and warfare to Greece. Extensive trade led to the adoption of the Phoenician alphabet, probably in the sixth century B.C.E., allowing Greek oral poetry to be written, such as that by Homer, said to be a blind poet of Smyrna, a city in Asia Minor. Ionia also saw the birth of forms of architecture, art, and music all called Ionic. These show traces of the art of the Mycenaean civilization, as well as influence from the Hittites of Asia Minor.

The Ionic order of architecture may well have had Egypt for its inspiration. The Greek trading post at Naukratis in Egypt, about 100 miles from the pyramids at Giza, was largely settled by Ionians. Ionian cities were notable for their monumental architecture, such as the temple of Artemis at Ephesus with its double row of columns similar to the columned halls of Egypt, and the famous row of marble lions at Delos had many predecessors in the traditional sacred processional routes of Egyptian temples. Ionic columns are distinguished from square topped Doric columns by the spiral volutes of their capitals.

Claims by Athenians of classical times about their putative ancestors, the Ionians, were uncritically accepted by modern scholars for centuries, even into the 20th century, because of the enormous prestige accorded Athenian scholarship and historiography. With the unprecedented new wealth of knowledge about the ancient world bestowed by archaeology, we can now see the Athenians' narrative about their early history as the product of a people emerging from a Dark Age of societal chaos, during which memory of things past is largely lost from generation to generation in the exigencies of the moment, into the self-consciousness of literate civilization. Other peoples have created similar narratives in similar circumstances. The Athenians' semi-mythical narrative of the Ionians, Achaeans, Dorians, and other groups, much of it told in the Homeric epics, tells as much about the values and dreams of a people as about actual events; their truth is not less than that of factual history but of a different order.

IRISH**location:**

Island of Ireland

time period:

7000 B.C.E. to present

ancestry:Primarily Celtic;
pre-Celtic**language:**Irish (from the Gaelic
branch of Insular Celtic)
and English

The classification of the Ionians as a distinct people is a convenient one, using the ancient texts as sources. Yet it is important to keep in mind that they no doubt consisted of a number of different ancestral tribes and that an exact time frame is impossible to determine for them.

ry, at which time a sovereign nation of Ireland was formed (see IRISH: NATIONALITY).

ORIGINS

People are thought to have begun to settle in Ireland by about 7500 to 7000 B.C.E. Ice Age conditions prior to this made the land unsuitable for permanent settlement. The first arrival were probably seasonal hunters. Even by 7000 B.C.E. tundra conditions prevailed, with the soil locked in permafrost. People probably arrived first from Britain and Brittany in France. During the Neolithic, Bronze, and Iron Ages other groups may have migrated to Ireland from the Continent and Britain and possibly also from the Iberian Peninsula, linked with Ireland by trade, especially in copper and gold. Movement of peoples is hard to document archaeologically, since changes in material remains such as house types or pottery could have been brought about by the arrival of new ideas rather than that of new people. Ireland clearly received many influences from the mainland, from farming practices to metalworking and art styles. Traders entered Ireland both by way of present-day northern France and Belgium and from the Iberian Peninsula along the Atlantic coast and from Britain.

The Bronze Age

The earliest metal tools found in Ireland were made of copper and date to the Copper Age. The presence in Ireland of copper and gold deposits brought the remote island firmly into the sphere of mainland-wide trade networks, which increased in importance from the Copper Age onward and must have kept people there au courant with new ideas and techniques.

The Bronze Age in Ireland is considered to have started in about 2500 B.C.E. More Bronze Age gold hoards have been discovered in Ireland than anywhere else in Europe.

In about 2150 B.C.E. artifacts of the Bell Beaker culture, in particular the bell-shaped vessels for which it is named, began to appear in Ireland. It has been suggested that with this culture the original language, called Common Celtic, which evolved into Irish Gaelic, may have begun. The Bell Beaker culture seems to have represented an entirely new ideology of individualism, as opposed to the communalism of the Neolithic megalithic tomb builders of such monuments as Newgrange, expressed through the adoption of a warrior lifestyle. At least as important as the beakers were weapons: daggers, bows, and arrows. In Ireland Beaker

Some Celtic Tribal Groupings in Ireland in the Second Century C.E.

motifs were used in elaborately worked crescent-shaped gold necklaces (*lunulae*) and other ornaments, but drinking and burial practices were not adopted. The extent to which this culture was taken to Ireland by outsiders is unclear and hard to document archaeologically. Beaker ideas, embodied in weapons and clothing as well as in behavior and practices, could have been introduced by a small number of elite warriors and widely imitated by indigenous Irish. There is little sign that Beaker warriors engaged in conquest of territory.

The Late Bronze Age began in about 1200 B.C.E., signaled by the appearance of new bronze implements and weapons, such as socketed axe heads and swords. At this time hill forts and ring forts were first made, the latter more prevalent in Ireland. A common type of dwelling in use at this time was the crannog, an artificial island, palisaded on all sides, constructed in the middle of a lake.

The Iron Age

The earliest clearly identifiable Celtic artifacts and remains are from the Hallstatt C culture of the Iron Age (800–500 B.C.E.) in the Upper Rhine and Danube valleys of central Europe. Swords of the Hallstatt type are found in Ireland from about 700 B.C.E., but made of bronze rather than iron. They may have been copies in bronze of iron models made by local smiths or castoffs of weapons made of an obsolete material imported from the Continent to be melted down for reuse.

The Iron Age in Ireland may have begun as early as 500 B.C.E. and lasted up to 500 C.E., although clear evidence of the predominance of iron is not found in Ireland until around the third century B.C.E. This contrasts with Britain, where ironworking began in the late seventh century B.C.E. The lag time for ironworking to arrive in Ireland is not well understood. Flourishing Late Bronze Age industries seem to have collapsed and disappeared by the seventh century B.C.E., and the two centuries before 500 B.C.E. in terms of artifact, are a dark age for Ireland. Long earthworks such as the Dorsey in county Armagh and the Black Pig's Dyke, which run across much of lower Ulster, were thought to have been built during the Iron Age.

Celtic Migrations

During the large-scale migrations of the continental Celts of the fifth and fourth centuries B.C.E. some Celtic groups may have entered Ireland as well. After this period Irish craftsmen were strongly influenced by the La Tène style, although reinterpreting it to create their own style. Ireland shows other influences from the Continent as well, but this is not a new phenomenon, as mentioned. There is still much disagreement as to the extent of Celtic migration to Ireland. The weight of scholarly opinion is against wholesale migration and displacement; rather, Celtic influences impinged on Ireland in a more piecemeal, mosaic process involving trade and the movement of ideas as well as people. The conquest of the GAULS by the ROMANS in the first century B.C.E. may well have caused Gallic Celts to migrate to Ireland. The conquest of the BRITONS in the first century C.E. may have led to migrations from Britain as well.

LANGUAGE

Ancient Irish peoples spoke dialects of Gaelic or Goidelic, one of the branches of Insular Celtic (the other is Brythonic or Brittonic). Insular Celtic languages evolved in the British Isles from Continental Celtic, which com-

prised Celtic languages spoken in mainland Europe, including Gaulish (or Gallic), all of which have disappeared and are little known. The Gaelic dialects retain archaic features of pronunciation and grammar, indicating that the Brythonic dialects represent a later evolution from Continental Celtic. Another set of terms for the two main Insular Celtic groups is q-Celtic (Gaelic) and p-Celtic (Brythonic), referring to the fact that Brythonic dialects substitute the letter *p* in words for *q*, another sign of evolution away from Continental Celtic.

HISTORY

The writings known as the ancient Irish annals are a possible source for early Irish history. They consist of year-by-year contemporary accounts of notable happenings that were handed down for centuries solely through oral tradition until, on the conversion of the Irish to Christianity and their adoption of writing in the fifth century C.E., scribes began to write them. Many of them were compiled in 1636 C.E. from a large collection of vellum manuscripts into a work called the *Annals of the Masters*. These annals are considered a “shadow” of history or a kind of pseudohistory, as much folk tradition as verifiable fact. They also typically describe the actions of elites rather than those of common people. Yet what they describe often intersects with known physical sites, a characteristic that seems to lend credibility to their accounts.

Annals recorded for the latter half of the first millennium C.E. contain dates for eclipses and comets that have been verified scientifically. The likelihood that the methods used for recording these later annals were similar to those used in prehistoric times may give the ancient annals some validity as well, allowing for the distortions that can happen to orally transmitted material. A significant feature of the annals is that they mention repeated waves of invasions and migrations into Ireland from Brittany in present-day France as well as from Spain and Greece. Movement of peoples is hard to document archaeologically, since changes in material remains, such as house types or pottery, could as easily have been brought about by the arrival of new ideas as by new people. Given the fact, however, that large-scale movements of peoples across Europe are known to have happened in historic times, beginning with the Celts in the Iron Age, the waves of invaders mentioned in the annals perhaps should not be dismissed out of hand.

Ancient Peoples of the Irish Annals

According to the annals the Fomors (or Fomorians) were supposedly in Ireland long before any other races, living by the sea. They may have been the original Mesolithic settlers of Ireland, there by about 7000 B.C.E. The first invasion described is that of the Partholons, who competed with the Fomors for 300 years then died out in an epidemic. Next were the Nemed. Most of them also died in an epidemic, and any survivors were supposedly absorbed by the Fomors.

Four major invasions that may have taken place during the Celtic period are mentioned. The first is that of the Cruithin, which may include tribes known to the ancient GREEKS as Priteni, estimated by some scholars as around the eighth–fifth century B.C.E. Members of this tribe may have migrated to Scotland, for the people known in Roman times as the PICTS were sometimes also called the Cruithne.

After the Cruithin were the Erainn or Firbolgs, possibly from Spain or Greece (possibly around the fifth–third centuries B.C.E.). The Erainn (also known as Firbolgs and Bolgi, as well as BELGAE and MENAPII, names applied to mainland groups) called their new home Euerio, which would later evolve through the Old Irish Eriu to Eire, and from Eire to Ireland. The early annalists tell us the Erainn survived as distinct tribes well into early historic times. In southern Ireland they may have descended as the Corca Loigde and the Osraighe. In east Ulster they were said to descend as tribes of the DÁL RIATA and the DÁL FIATACH. In Connacht the tribes of the Ui Maine and the Conmaicne are sometimes claimed as their descendants.

Then arrived the Laigin—also known as Domnainn, Gailionn/Gailing/Gaileng, or Tuatha de Danaan—tribes from Armorica (Brittany) in northwestern France (possibly around the third–first centuries). According to tradition these people founded Tara in the Boyne Valley, the ritual inauguration and burial place for the ancient kings of Ireland. Archaeological traces remain of Tara. The Tuatha de Danaan traced their ancestry to the goddess Danu (also called Brighid), daughter of the Dagda, the chief god of Ireland. The province of Leinster takes its name from the Laigin.

The last major invasion was that of the Goidel/Gael or Milesians, sons of King Milesius, who are said to have been from either northern Spain or southern France (possibly around the first century B.C.E. to the first century C.E.)

Irish people crafted this gold boat model in the first century B.C.E. (Drawing by Patti Erway)

Greco-Roman Sources

Probably from at least the sixth century B.C.E. CARTHAGINIANS and GREEKS traded regularly with the British Isles and could have provided eyewitness accounts of the peoples there. The fourth-century C.E. Roman writer Rufus Festus Avienus gives an account thought to be based on information from a Carthaginian named Himilco, who traveled to the British Isles in about 480 B.C.E. Avienus calls Ireland *Insula Sacra* (Holy Island) and its inhabitants *gens hiernorum*. This in all likelihood is a modification of the word Eriu, from the Euerio of the Erainn, a validation by an independent source of information from the ancient annals. In 52 B.C.E. Avienus seems to have thought the name *hiernorum* reported by Himilco meant the same as *hieros* for “sacred,” hence the name Holy Isle. The Romans referred to Ireland as Hibernia, possibly derived from *hiernorum* and the people as Hiberni or Hibernians.

In about 325 B.C.E. Pytheas, a Greek from the trading emporium Massilia (modern Marseilles, France), traveled to the British Isles and circumnavigated them. The Alexandrian geographer Ptolemy published a map of Ireland—Hibernia, as he called it—produced in 127–147 C.E., probably based on a map made by Pytheas. This map includes some names of rivers and islands that can be identified with existing features.

Among some of the tribal names on Ptolemy's map are the ROBODI in the northeast. These were people ruled by a line of kings called the Dál Riata, who raided and later colonized Scotland and became known by that tribal name. The Dál Fiatach, or Darini of present-day Down, within whose territory Emain Macha is located, claim descent from the same people as the Dál Riata. The Volunti are known in Gaelic sources as the ULAID, a name later to become Ulster. They are said to have had their cult center at Emain Macha, even though Ptolemy's map shows it as within Dál Fiatach territory. By about 200 C.E. the Ulaid seem to have absorbed the Dál Fiatach into their sphere of influence. The Menapii (Manapii) may correspond to the MONAIG, who survived into the early Christian period as the Fir Manach (or Fermanagh). The CORIONDI (Koriondi) in the southeast may have been related to the Celtic tribe CORIONOTAE in Britain. Their neighbors, the BRIGANTES, have the same name as a tribal group that occupied much of the north of Britain during the time of the Roman Empire, possibly evidence that some of the Brigantes fled Roman depredations in Britain and went as refugees to Ireland. The USDIAE are perhaps the early peoples of the territory known as Osraige, later to become Ossory. The DUMNONII, too, had counterparts in Devon and Cornwall in Britain; the name recurs in the province of Leinster and later in the province of Connacht as the Domnainn, also one of the names from the Irish annals. The IVERNI in the southwest are associated with the Erainn of the Irish annals. The Auteini in the west are later identified as the UAITHNE of present-day county Limerick and county Tipperary.

New Dynasties

According to the Irish annals the first centuries C.E. until the coming of Saint Patrick and Christianity in the fifth century C.E. saw a series of wars for dominance among the main tribes of Ireland. It is thought by historians that during this period aggressive new dynasties were engaged in supplanting a political order characterized by many small independent petty kingdoms that had held sway for centuries. They did this in part by appropriating to themselves symbols of past power. Most important of these was the ancient site of Tara (Teamhair), for centuries the place of inauguration of kings.

In the third century C.E. the great High King Cormac macAirt, grandson of Conn Cétchathach (Conn of the Hundred Battles), founder of the Connachta kingly line of the previous century, was said to have established a new royal

capital at Tara, even though it was located within the territory of another line known as Breagh or Brega. Cormac was ancestor to later generations of kings and high kings ruling Gaelic dynasties of the northern provinces of Connacht, Midhe, and Ulster. In claiming Tara, which by this time was probably an unoccupied site used for ritual purposes only, Cormac was attempting to assume a mantle of sacred kingship, a proof of the favor of the gods, and this may have had a significance similar to that of the papacy in Christian Europe of the Middle Ages, when papal sanction guaranteed royal legitimacy. In past times the sacral kingship of Tara may indeed have been more like the papacy in the early Christian church when it was mostly apolitical, but now kings such as Cormac increasingly seem to have used it to forward territorial ambitions. Finds of Roman glass, pottery, and other artifacts dating from the first three centuries C.E. at Tara give tangible evidence both that this was a period of heightened activity there and that Roman influences may somehow have been involved.

By about the fourth century C.E. the major provinces in Ireland were said to be Uladh (Ulster) in the north, with Emain Macha as its royal site; Cruachain (Connacht) in the west, with its capital at Cruachu; Breagh (or Brega) in the east, with its royal site at Teamhair (Tara); Laigin (Leinster) in the southeast with its royal site at Dun Ailinne; and Caisil (Munster) in the southwest, centered on the royal site of Caiseal (Cashel). Another province, known as Midhe or Mide (middle), in the center of Ireland is also referred to in Irish folklore. The "province" of Mide (or Meath) is later connected with the rise of the southern Ui Néill and eventually included Breaghan territory within its borders.

The Ulaid (Volunti) were ousted from their position of power in the north in the fifth century by the Ui Néill, a dynasty controlling a loose confederacy of tribes and claiming descent from a great ruler called Niall of the Nine Hostages. The Ui Néill had formerly been part of the confederacy of the Connachta, who held central and west-central Ireland including Tara in the former territory of the Breagh. In breaking away from the Connachta the Ui Néill also wrested control of Tara. The south was dominated by a similar group called the Eoganacht, whose kings took the title of king of Cashel or king of Munster.

Ireland had between four and 10 provinces at any one time, as alliances and confederacies were made and then broken. Today's four provinces—Ulster, Munster, Leinster, and

Connacht—represent only the final stage of the changing borders.

Question of a Roman Invasion of Ireland

Although Ireland was never subjected to large-scale invasion and conquest by the Romans, the island was definitely within the Roman sphere of influence, and the Romans may have staged military incursions there that were never chronicled. Roman artifacts are known in Ireland. The fact that areas, particularly Leinster in the southeast, where Roman artifacts and even Roman-style burials and cemeteries have been found, lack much native material may suggest substantial intrusions there that caused evacuation by natives. If this happened it would have been around the beginning of the first century C.E. In the first and second centuries C.E. there is evidence of sporadic trading between the Irish and the Romans of Britain. The Roman historian Tacitus in the first century C.E. writes of Ireland, “The interior parts are little known, but through commercial intercourse and the merchants there is better knowledge of the harbors and approaches.” Evidence of a Roman trading post has been found near Dublin.

The lack of documentation of such an invasion may not rule it out as a possibility. We only know of Julius Caesar’s aborted attempt to invade Britain in the first century B.C.E. because of his writings. Gnaeus Julius Agricola’s campaign in Scotland in the first century C.E., which had no real strategic importance since it was not followed by annexation, is only known because of Tacitus’s book *Agricola* (DEVITA IULLI AGRICOLAE). Other Roman commanders in search of political capital, a prime motivation for Caesar and possibly Agricola as well, could have contemplated and even carried out similar unsuccessful forays into Ireland that were never documented.

Only by the fourth and fifth centuries C.E. as the Roman Empire waned and then collapsed is there substantial evidence of prolonged Roman influences in Ireland. There is evidence that the language spoken by the Eóganacht of Munster, who arrived at the end of the Iron Age, had been heavily influenced by Latin. Ogham, the first written script in the Irish language, was based on the Latin alphabet. Such “Roman” influences were exerted by Romano-Britons on the Irish, probably in part by Christian missionary work in Ireland itself, by trade between Britain and Ireland, and by interaction between Irish raiders and settlers in western Britain and native Britons.

Irish Migrations in the First Millennium C.E.

Toward the end of the Roman Empire the Irish took advantage of Roman weakness by raiding western Britain. Eventually the Irish began to colonize western Britain. The Erainn of Munster settled in Cornwall, the Laigain of Leinster settled in southern Wales, and the Déisi of south-east Ireland settled in northern Wales. Cormac of Cashel (writing much later, in 908) records that “the power of the Irish over the Britons was great, and they had divided Britain between them into estates . . . and the Irish lived as much east of the sea as they did in Ireland.” These colonies were all defeated by the Britons within the next century or so, although Irish kings seemed to be still ruling in southern Wales as late as the 10th century. Irish raiders called by the Romans “Scoti,” many of them presumably from among the Dál Riata, repeatedly attacked western Scotland, eventually founding a kingdom there called Dalriada. Their colony thrived and most or all ultimately left northern Ireland for the new colony. The kingdom of the Dalriada, as it was known in Scotland, was well established by the sixth century. In the ninth century under King Kenneth MacAlpin the SCOTS took control of Pictland, to the east, founding the united kingdom of Alba.

Irish immigrants and their descendants formed a new ruling dynasty in western Wales in the fifth century. They reached an accommodation with the native aristocracy that included the acceptance of Christianity. They founded a subkingdom in Breconshire and later sent colonists to Cornwall (see CORNISH), where Christianity became widespread only in the seventh century, primarily through evangelization from west Wales. Early Christian inscribed memorial stones from the fifth–seventh centuries found in western Britain and Ireland may document the process by which the Irish immigrants became Christian. The earliest stones have brief inscriptions in Irish ogham script; later ones are bilingual in ogham and Latin; by the seventh century they use Latin alone with clearly Christian formulae such as *hic iacit*.

Ireland’s Golden Age

Ireland’s Golden Age began in the sixth century and lasted well into the ninth century. Ireland was known as an Island of Saints and Scholars. The rise of Christian monastic schools in the latter half of the sixth century led to a flowering of literature and learning in early Ireland. The scribes and monks of these schools played a critical role in preserving the West’s written heritage by copying and preserving the texts of the

ancient world. From these monastic centers Irish missionaries established religious centers of learning in other parts of Europe. These early missionaries included Saint Columba, who went to Iona off the coast of Scotland in about 563 to convert the Scots and Picts. Another missionary Columbanus went to Gaul in about 591, and later into other parts of Europe, to establish monastic schools, including the monastery of Bobbio in Italy in 614. In his writings Columbanus displays an erudition practically unknown at the time on the Continent, quoting from scripture and from classical authors. His disciple Gall founded a Scholastic center later named after him, called Sankt Gallen in Austria, where an important collection of insular manuscripts still exists. Fursa went to East Anglia in England and to Gaul around 633 to establish monasteries. Aidan became the first bishop of Lindisfarne in Northumbria in about 635.

Among European cities that grew up around monasteries founded by Irish monks are Lumièges, Auxerre, Laon, Liège, Trier, Würzburg, Regensburg, Salzburg, and Vienna. There are many more. The scope of Irish influence in fostering the emergence of European civilization has been called incalculable.

Early Christianity in Ireland as well as in the rest of the British Isles was as important politically as spiritually. It was no small part of Columba's influence that he was a kinsman of King Conall of the Dál Riata, who may have given him the island of Iona for his central monastery. No doubt with the aid of King Conall's wealth the monastery on Iona soon became one of the most important centers of learning in northwestern Europe. The monastery played a vital role in mediating among Picts, Scots, Britons, and ANGLES, who were contesting territory all over Scotland. The abbots of Iona enjoyed great prestige because of their aristocratic connections. Among the most influential was Abbot Adomnan, friend of the king of Northumbria in northern Britain and of the Anglo-Saxon historian Bede.

Iona became the most important center for cultural exchange between Ireland and Britain. King Oswald of Northumbria in England, who had spent time at Iona before ascending the throne in 633, sought help from the monastery in furthering the conversion of his people, the ANGLO-SAXONS. In answer the monk Aidan was sent and helped found the great monastery of Lindisfarne. Because of Iona the culture of Northumbria received a strong admixture of Celtic influence, which bore fruit in the seventh century in what has been called the

Northumbrian Renaissance. Iona was a critical link whereby Anglo-Saxon influence reached both the Picts and the Irish.

Vikings in Ireland

The first recorded attack by VIKINGS on Ireland occurred in 795, although there may well have been others around that time. In that year the Annals of Ulster recorded "the burning of Rechru by the heathens." It is not certain whether Rechru was the island monastery of Lambay off the coast of county Dublin, or Rathlin Island off the Antrim coast. By the mid-ninth century the Vikings had established a foothold in Dublin.

The intensity of Viking attacks waxed and waned; they occurred within a context of considerable violence among the Irish themselves. Between 795 and 820 the Irish annals record 26 acts of violence committed by Viking raiding parties, compared to 87 acts of violence committed by the Irish. In the period between the years 795 and 836 the level of raiding averaged about one raid every 18 months.

Monasteries were a prime target for the Viking raiders because of their wealth, both in artworks made of precious materials and in food provisions, livestock, and cattle. Even the human population of monastic settlements was valuable, and many were carried off to be sold as slaves. But again the Viking attacks on monasteries occurred in a context within which they also suffered violence from Irish tribes at war with one another. Monasteries were often closely identified with their patrons and benefactors among the local lay aristocracy who had endowed them with their lands. The office of abbot, for example, was frequently a hereditary office occupied by a member of the original founding family, often an aristocrat. The consequence was that a monastery could become a target for attacks for prestige or wealth during the feuds waged by rival aristocratic factions. The monastery or church belonging to a nobleman or noble family, being a symbol of prestige and a source of much wealth, became a target for attack by rivals.

The great shock expressed in the annals over the first Viking attacks arose more from the suddenness with which the seaborne raiders would appear, utterly without warning, marching up from seashore or riverbank to fall with fire and sword on their victims.

Major monasteries, such as Armagh or Clonmacnoise, managed to survive the Viking raids with their economic resources intact. Some smaller monastic foundations were abandoned

during this period, but their demise could have been brought about by a combination of causes, Viking raids giving the coup de grace to houses already weakened by local political circumstances. These could include the ambition of more powerful monastic houses, which were steadily seeking to increase their influence by putting smaller foundations under their control. Only more detailed research into the history of individual monasteries will provide an accurate assessment of the Viking impact on the church.

After 837 the Vikings began raiding more intensively and farther inland and establishing more permanent bases, a process also happening in England at the same time. However, in contrast with England, over half of which was under the control of Vikings by the end of the ninth century, permanent Viking settlement in Ireland was confined to coastal areas. In Anglo-Saxon England those political units that were more stable and physically larger than those in Ireland may have allowed the Vikings to acquire large territories by treaty. The fractious society of the Irish may have made their territories less attractive to potential settlers. Moreover the Vikings raiding Ireland were from Norway, those in England primarily from Denmark. The Norwegians had a much longer voyage to sail to reach Ireland, a factor that militated against taking large armies and numerous settlers. In general Norwegian immigrants seemed to have preferred settling in sparsely or uninhabited regions where minimal warfare was needed to establish settlements, such as the Faeroe Islands, Iceland, and Greenland.

There was no united Irish military response to the Viking raids, as there was no sense of a united Irish nation to defend. The Vikings must quickly have seemed no more than another set of warrior bands among many others. Individual Scandinavian strongholds, such as that established at Dublin in about 841, seem to have been absorbed rapidly into the flux of shifting hostilities and alliances. Within less than half a century after the Viking raids had begun Viking groups were engaging in alliance with Irish against other Irish. The first recorded alliance between an Irish king and a Viking leader against a fellow Irish king occurred in 842. Norse-Irish alliances soon became commonplace.

The famous Battle of Clontarf fought in 1014 is often used to exemplify a clear-cut division between the Scandinavians as aggressors and the Irish as defenders. The story of this battle and others is told in *The War of the Irish against the Foreigners*, a tract written in the

12th century under the auspices of the descendants of the Irish king Brian Bóruma. There the battle is portrayed as a major victory by the Irish against the Vikings, in which Brian defeated the Vikings and ended Scandinavian aspirations of conquering Ireland. Supposedly it occurred at the climax of a long campaign waged by Brian on behalf of all Irish. Yet the major participants in the battle were all Irish. It involved a struggle between the king of Leinster and his overlord, King Brian. Both sides had Viking allies, the Scandinavians of Limerick and Waterford fighting on behalf of Brian, and the Scandinavian king of Dublin fighting on behalf of the king of Leinster, to whom he was related by marriage. Instead of depicting the struggle of Irish against Vikings, the battle illustrates how well the Vikings fit into the sociopolitical mix in Ireland.

By the mid-10th century the Vikings had assimilated into Irish society. This included conversion to Christianity, as attested by the death in 981 of Olaf Sihtricson, Viking king of Dublin, at the monastery of Iona after a "victory of repentance." The culture in the mostly coastal regions where the Vikings had settled can be characterized as Hiberno-Norse. The old Norse language of the settlers did not survive, although it contributed loanwords to Irish. These loanwords, fittingly enough, relate to fishing, shipping, and trade, prime contributions of the Vikings to Irish society.

The small Hiberno-Norse colonies were centered on the trading towns of Dublin, Waterford, Wexford, Limerick, and Cork. From the mid-10th century they were under the overlordship of the more powerful of the Irish kings. Yet their influence on Irish society was out of proportion to their importance according to the standards of the centuries-old political culture based on warfare between chieftains and kings. Theirs was a different kind of dynamism fueled by different ambitions than the old Celtic thirst for glory in war. The Scandinavian towns engaged in expanding trade that fostered greater contact with the outside world. They provided an important new source of wealth for their overlords, mostly in the form of silver exacted as tribute or rents. In general they played an important role in moving parts at least of Irish society into the early modern era that was beginning in Britain and the rest of Europe.

Norman Invasion

In 1171 King Henry II of England ordered the invasion of Ireland. He received approval for this

from the newly elected pope, Adrian IV, an Anglo-Norman. The ostensible reason given for the invasion was that morals in Ireland had become corrupt, and religion almost extinct, and his purpose was to put the barbarous nation within the fold of the faith and under church discipline. The NORMANS often acted as champions of the church and of church orthodoxy.

The Normans eventually acquired large areas of Kildare and Munster, county Waterford, county Cork, Meath, Connacht, and county Louth. They founded many towns, usually near navigable rivers. These include Kilkenny on the Nore, Athlone on the Shannon, Trim on the Boyne, and New Ross on the Barrow.

Bruce Invasion

In 1315 Edward Bruce of Scotland, as part of the campaign of his brother, Robert I, to assume the monarchy of Scotland, invaded Ireland with the intent of complete conquest. Robert's purpose was to weaken the colony of ENGLISH in Ireland and to give his brother a chance to win a new kingdom. The O'Neills of mid-Ulster promised support.

Before Edward embarked, Robert had written a letter to "all the kings of Ireland, the prelates and clergy and to the inhabitants of all Ireland, our friends." The Scots would arrive, he said, "not as invaders but as liberators." Bruce had reason to believe that native Irish kings would join with him against Norman English, who were entrenched in eastern Ireland but who had left the Irish in the center and western regions to continue their way of life unchanged. However, there was no more sense of "Irish national unity" now than when the Vikings invaded, and although some Irish kings went to Bruce's aid, others resisted his armies vigorously. In 1318 Edward Bruce himself was killed in battle at Fochart, and by the end of the year the Scots were gone. However, the rhetoric of Robert's letter to the Irish would be taken up again and again in the following centuries as Irish rebellion against English rule became a reality.

The concept of Irish nationhood for centuries had little or no political coherence but was kept alive by two factors: One was a sense of shared language and culture distinct from that of the Anglo-Normans in Ireland; the other was the continuation of the idea of the high kingship of Ireland as a goal to be sought by the members of the several kingly dynasties, who continued to compete for it in violent struggle. In a sense the native Irish were continuing to engage in Celtic Iron Age politics at the same

time as Anglo-Norman England and the English in Ireland were developing early modern political institutions.

In reality after the Norman invasion Ireland had become irrevocably part of the Anglo-Norman political sphere; English power politics slowly but steadily encroached more and more on Ireland, for better or worse. Power struggles in England itself during the 13th and 14th centuries diverted attention from Ireland until the 15th century.

The Pale

English royal power in Ireland reached a low point by the end of the 14th century, as wars and the epidemic known as the Black Death drained English resources. Furthermore the Anglo-Norman nobility in Ireland was assimilating more and more with the native Irish and losing their allegiance to the Crown to become independent warlords. In response the ports and the territory around Dublin, which remained loyal to the Crown, were fortified to create a zone that became known as the Pale. (A *pale* was a pointed stake driven into the ground to form a palisade or fence). Apart from Carrickfergus castle the province of Ulster was not included in this fortified area and thus was "beyond the Pale."

The rise of the Tudor dynasty in the later 15th century finally stabilized the English monarchy and the effects were quickly felt in Ireland. Henry VII provided stable government and insisted on the loyalty of his subjects within the Pale but made no attempt to expand his power and territory. He employed the most powerful Anglo-Norman family in the country, the FitzGerald of Kildare, to act on his behalf.

Fitzgeralds ("the Geraldines")

The Norman family of the Fitzgeralds, known as the Geraldines, were the dominant political force in much of southern Ireland for centuries. At first they maintained a policy of intermarriage with the Norman aristocracy in England and Ireland, but gradually through intermarriage and contact with the Gaelic Irish they began to see themselves more as Irish than as Norman.

By the 15th century the Geraldines were in the forefront of promoting the welfare of the Irish by promoting trade between Ireland and the mainland and bringing Norman and Gael together into a united Irish nation.

Gerait Og, ninth earl of Kildare, was appointed lord deputy of Ireland by his cousin, Henry VIII of England, in 1513. Becoming

embroiled in English power politics, in 1526 Kildare was denounced by Cardinal Thomas Wolsey as a traitor and imprisoned in the Tower of London.

Meanwhile his son, Thomas Fitzgerald, 10th earl of Kildare, whom he had appointed lord deputy in his stead, declared an abortive insurrection against English rule in Ireland. Thomas was captured and sent to the Tower of London, where his father had already died, reportedly of a broken heart on learning of Thomas's insurrection. He was hung, drawn, and quartered at Tyburn in 1537. An act of Parliament that year decreed all the Geraldines' counties to be forfeited to the Crown.

Henry VIII and Ireland

Henry VIII, the king of England in 1509–47, driven in part by his efforts to secure the Church of England, which he had created, undertook a deliberate policy of annexation of Ireland. His efforts should be seen in part in the context of the political struggles unleashed over Europe by the Protestant Reformation. His Draconian measures against English Catholics, including the wholesale confiscation by the Crown of the wealth of the church, extended to Catholic Ireland as well. By an act of Parliament in 1541 he was proclaimed Henry king of Ireland.

Conspiracies by Irish with Henry's archrival, Francis I of France, led to drastic measures to curb Irish resistance and sense of separate nationhood from England. Laws were enacted against Irish forms of marriage, fosterage, and other customary law and against the use of native literature and its language. On the other hand Henry had tried to cajole the Gaelic chiefs to accept English rule, offering them secure title to their land and a role in government in return for their abandonment of Gaelic law, language, and customs in favor of English ways. Many of the native Irish noble families, including the O'Neills, O'Donnells, O'Briens, MacCarthys, and Burkes, in an effort to obtain Henry's favor did acknowledge him king of Ireland and head of the church. They promised to substitute English for Brehon Law. But progress in Anglicization among other Irish families was slow.

To replenish the English Exchequer, perennially depleted by Henry's wars, the Irish were subjected to the heavy tax burden that had led to riots among the English. Lands of native Irish rulers were confiscated through the use of misleading contracts by which false claimants to territories would be supported by English soldiers in civil wars, until the actual chief was

exiled or yielded the land to the king's ownership. But since in Irish traditional Brehon law chiefs had no power to give away the people's land, such practices led to rebellion by the common people.

Confiscation and "Plantation"

Actual confiscation of lands from Irish landowners and settlement of English colonists, called plantation, did not take place until the reign of Mary I, Henry VIII's daughter. The experiment proved ruinously expensive, however, since many troops were needed to repel the exiled chieftains. Colonization of Ireland continued on a larger scale under her half sister, Elizabeth I.

Elizabeth I and Ireland

Queen Elizabeth considered Ireland "an unwelcome inheritance." Unrest in Ireland consumed 10 percent of the royal budget, as large numbers of troops were needed there. Society was highly militarized. English landowners outside the towns and the inner Pale were forced to live in defended tower houses (while their tenants and many Gaelic clansmen lived in wattle-and-daub cabins). And the English in Ireland, called Anglo-Irish, continued to become more assimilated into Irishness, increasingly speaking Irish Gaelic rather than English. They resented the "new English" colonists and troop captains almost as much as the Gaelic Irish did.

Ireland seemed to be a quagmire with no good solution to the problems it posed the English monarchy. Wholesale withdrawal would be an unacceptable blow to Tudor prestige. Moreover, Ireland was a "side door" through which the Catholic powers of France and Spain might become dangerously close. On the other hand there was little glory or profit in conquering the Gaelic part of Ireland, to the English mind of the time a wilderness inhabited by savages. Conquest, although feasible, would require a substantial army to drive the Irish out of their woods and bogs, and an enormous effort subsequently to hold the country with garrisons and colonies.

An interim solution to the endemic warfare and unrest caused by the age-old competition for power among the old Irish chieftain families was the establishment in Connacht and Munster in 1569–70 of regional councils (or presidencies), along the lines of those in Wales and the English north, aimed at providing a counterweight to the chieftains that would convince the Irish of the benefits of English rule. Some of these became successful,

self-financing bodies that allowed a measure of local self-government to commoners.

Experiments in colonization, notably in east Ulster in 1572–73, and the Munster plantation from 1584, however, went awry as troop captains such as the half brothers Humphrey Gilbert and Walter Raleigh, following the example of Spanish conquistadors in the Americas, saw their service in Ireland as a chance to make their fortune by goading the Irish into hopeless rebellion and then seizing their land. After the rebellion of the Desmonds in Munster, for example, Gilbert subjected the province to a reign of terror on a par with what is known today as ethnic cleansing, and Munster was left a wasteland.

The wreck of ships of the Spanish Armada on the coast of Ulster in 1588 had turned English attention there, as castaways from the fleet were given shelter by Irish chiefs, who repelled an army of Lord Deputy William FitzWilliam attempting to slaughter all Spaniards in Ulster. This led to confiscation and plantation in Ulster.

The Plantation of Ulster

King James I continued these efforts. They were attended with the same violence and rebellion aroused by heavy-handed behavior of soldiers and officials on the ground in Ireland, leading to more confiscation and widening of plantation and to bloody massacres. The vicious cycle continued for decades.

The plantation of Ulster was more resolutely Protestant than earlier plantations had been; James was much more committed to the spread of Protestantism than Elizabeth. Under his successor, King Charles I, Puritan forces in the English Parliament continued this trend; the lord deputy levied strict “recusancy” fines on Gaelic Irish lords for nonattendance at established Church services.

The Effects of the English Civil War

As the English Civil War between the Royalists and the Puritan-influenced Parliamentarians broke out in 1642, most of the Catholic Old English in Ireland declared themselves for King Charles I; at the same time they had in effect joined the rebellion of the Gaelic Irish of Ulster. A confederation of Irish Catholic lords and clergy was set up as an alternative government. Their rebellion was crushed, however, in 1649 (the same year Charles was executed by order of the English Parliament), when Oliver Cromwell, as commander in chief and lord lieutenant of Ireland, stormed Dogheda and Wexford.

During the 1650s after almost a decade of conflict famine swept the island and wolves so increased in number that rewards were paid for killing them. Hundreds of people were executed, around 12,000 were transported to the West Indies, and millions of acres were confiscated. Only those landowners who could prove “constant good affection” to the parliamentary cause were not punished. All Catholic landowners disappeared in Ulster; many obtained smaller estates in Leitrim as compensation.

At the accession of Charles II in 1660 the ban on Catholic worship ended in Ireland and a period of economic recovery set in. By 1682, for example, county Armagh produced a significant agricultural surplus, in part brought about by improved farming techniques and land recovery through drainage.

William of Orange and the Williamite Wars

The accession of James II, a Catholic, in 1685 ended the peace as Catholic and Protestant were once more in conflict. James’s inept government led to his exile and replacement by William III of Holland. Once again Ireland acted as the side door to the British Isles from the mainland, as James landed with a large French army and marched to Dublin in 1688, intent on regaining his crown.

During the Williamite Wars of 1689 to 1691 Ireland became the center of European power politics, as Louis XIV of France fought William of Orange for domination of western Europe. William’s victories over the French armies were a severe blow to the French king’s ambitions. So complete was William’s victory that Ireland was at peace for the ensuing century. The island prospered and the population grew, but the gulf between the privileged and the poor was enormous.

Catholic Penal Laws

The Irish Parliament after 1691 almost exclusively represented the landed interest of members of the Church of Ireland—that is, the Anglican Church. The Protestant elite were determined to keep Catholics in subjection. The first penal code, enacted in 1695, prevented Catholics from bearing arms, educating their children, or owning any horse above five pounds in value.

Catholics could not vote or buy land; estates had to be divided equally among sons, preventing the aggregation of wealth; and Catholics could not have leases running for more than 31 years. Although Catholic worship was not forbidden, the legal profession, the

army, and all public offices were closed to Catholics, and Catholics could not be members of Parliament or of municipal corporations nor sit on grand juries. Jesuits, monks, and friars were expelled in 1698. Catholic churches could not have bells or steeples, and clerical garb could not be worn in public; nor could Catholics have their own schools.

Even so Irish Catholics circumvented the laws by embarking on pilgrimages and establishing outdoor schools (“hedge schools”) or educating their children abroad, especially in Belgium, France, and Spain.

The Enlightenment in Ireland: Hope for Religious Tolerance

The Enlightenment was influential in Ireland, particularly among descendants of Scots Presbyterians in Antrim and Down in Ulster, perhaps because of the importance of Scots thinkers such as David Hume, whose writings were crucial to Enlightenment thought. The new faith in reason, as opposed to revealed religion, as a primary force for good led to a general increase in religious tolerance, reflected in the repeal of most of the Penal Laws against Catholics in 1778, 1782, and 1792–93. Yet in some regions overpopulation among the lower class and competition for scarce resources caused Catholic-Protestant rivalries to flare. An increase in sectarian violence occurred in county Armagh during the 1780s and 1790s among weavers in the linen trade. Meanwhile Protestants and Catholics formed armed gangs that grew into large, organized forces. By 1782 40,000 Protestants had enlisted in a long-standing group called the Volunteers. At first a militia group that formed only in wartime the Volunteers began to make political demands, inspired by the American Revolution. One of these was greater legislative freedom from Parliament in England for the Dublin Parliament, which was granted in 1782. The Parliament was made up of Protestants only, because of the Penal Laws.

United Irishmen: The Rebellion of 1798

The outbreak of the French Revolution in 1789 inspired a group of Protestants, members of the educated class, to form the Society of United Irishmen in Belfast in October 1791. The organization sought equal representation of all the people, including Catholics, and radical reform of the legislature. The movement became secret and revolutionary in 1795 when Defenders, a Catholic militia group, joined in great numbers. They were determined to spark

an armed revolt, and one of their members, Wolfe Tone, successfully obtained the promise of help from the French Revolutionary government. Once again Ireland had become Britain’s side door opened to political forces from the Continent. A major French expedition sailed from Brest in 1796 but, beset by storms in Bantry Bay in December, made no landing. The sight of French warships caused many more people to enroll in the society, however. The government seized many of the leaders, singling out the Defenders to be hanged or transported. The Society of United Irishmen decided on rebellion to begin on May 23, 1798.

The rebels were able to deal government forces some humiliating defeats, and through June the end was still in doubt. The rebellion was most formidable in county Down, where Presbyterians rose in impressive numbers. The tide began to turn in June, however, as government forces began to prevail, even though French troops, which had landed at Kilally in August, won a decisive victory. They were later defeated in another battle. A French naval force was overwhelmed in Lough Swilly in November, and Wolfe Tone was captured and committed suicide in prison shortly after.

Union with Great Britain

During the rebellion the English prime minister, William Pitt, decided that the Irish Parliament should be dissolved and that Ireland should be governed directly from Westminster. Since legislative independence had been granted in 1782, the Irish Parliament had to vote itself out of existence. Great efforts were made to convince Irish Parliamentarians to do so. Catholics, who had been promised full emancipation from the remaining provision of the Penal Laws, the right to become a member of Parliament, were generally in favor of union, but many Protestants were not. Nevertheless the Irish Parliament passed the bill in 1800 and union went into effect on January 1, 1801.

Pitt, however, needing Protestant votes, had failed to win emancipation for Catholics before the union and spent much of his political capital trying for it afterward. The effort led to a new mass movement created by Daniel O’Connell, a Catholic lawyer, who in 1823 created the Catholic Association, in which ordinary people could become members by paying a farthing a week. O’Connell held large outdoor rallies but was a committed pacifist. Because of support for it by the prime minister, Arthur Wellesley, first duke of Wellington, the Catholic Emancipation Act was passed in 1829,

but by that time the majority of Irish Catholics were opposed to the union.

O'Connell decided to work to repeal the union and launched a campaign called Monster Meetings; one of his meetings, on the Hill of Tara, drew a million people. After this meeting the government issued a ban on further gatherings, with which O'Connell complied. Meanwhile Protestants opposed repeal because a restored Dublin Parliament would inevitably have a Catholic majority.

Economic Instability and the Potato Famine

During the first part of the Industrial Revolution Ireland saw the emergence of successful enterprises, especially in cotton and linen manufacture, though the lack of coal made it hard to compete with English industries. After 1815 agricultural prices fell steadily because of imports from the Americas, and destitution in the Irish countryside increased. By 1845 one-half of the population was dependent on the potato for survival. Potatoes from a single acre of ground could support a family for a year. The land system encouraged having large families. Scraps of land, sublet from tenant farmers and freeholders, were rented by verbal agreement to individuals from year to year. Poor, landless parents relied on having numerous children who would take these rentals as a way of providing them with some security in old age. Thus a large proportion of the population led a subsistence existence whose basis was precarious.

This was demonstrated with devastating completeness in the late 1840s, as successive outbreaks of a potato blight, the fungus *Phytophthora infestans*, destroyed the means of subsistence of more than one-third of the population for four or five years in a row.

The response of the British government to the disaster was sporadic and incomplete, though the main accusation often levied against the government—that it continued to force the exportation of Irish wheat desperately needed at home—is only partly true, since the amount of Irish wheat grown in the first years of the famine would not have alleviated it. Three times as much wheat was imported into Ireland during the famine years as exported. The problem was distribution, and the British government's management, based partly on ideological biases, was inadequate.

Prominent among these biases was the economic doctrine of laissez-faire and minimal government interference in the free marketplace. The theological underpinning of this was the Protestant evangelical belief in divine

providence, which unfolded in the unfettered operations of the market economy; therefore it was considered evil to interfere by giving the Irish too much aid or to halt wheat export. Finally the British harbored a deeply rooted ethnic prejudice against the Catholic Irish.

The potato blight continued until 1852; meanwhile epidemics of typhus struck thousands weakened by hunger. At the same time the indigency of those unable to function or work caused eviction by landlords; as many as 500,000 people were evicted in the years from 1846 to 1854. It is estimated that 1 million people perished in the famine and, combined with emigration, almost 20 percent of the entire population of Ireland was lost.

The Famine and Nationalist Aspirations: The Fenians

The famine reignited revolutionary nationalist aspirations, but such movements were ineffectual for many years. A movement begun in the United States among militant exiles was called the Fenian Brotherhood. The corresponding movement in Ireland, officially called the Irish Republican Brotherhood but better known as the Fenians, spread rapidly among laborers, shopkeepers, and others hard hit by successive harvest failures of the early 1860s. After the end of the American Civil War some among the many Irish who had served in the war returned to Ireland intending to take part in the rebellion, but because of disorganization the rebellion came to nothing.

Tenants' Rights and the Land League: The Boycott

In 1879 a group called the Land League formed; it resorted to nonviolent means to fight for tenants' rights, and their tactic of organizing farmers in a mass refusal to work for a landlord named Captain Boycott coined a new word. As a result of their pressure the prime minister, William Ewart Gladstone, drafted in 1881 the Land Act, which gave tenants new rights and set up courts to control (and generally reduce) rents. The Land League failed, however, in its aim to have the landlords removed altogether.

Gladstone and Home Rule

Gladstone's declared mission was to pacify Ireland, and he had done much for the country by disestablishing the Church of Ireland in 1869 and by increasing the rights of tenant farmers. He announced support for Home Rule for Ireland in 1885 and the next year introduced a

bill to establish a parliament in Dublin with limited powers, which, however, was defeated.

The introduction of the bill and its defeat sparked Protestant-Catholic violence, especially in Ulster, where Home Rule was equated with "Rome Rule." The teeming city of Belfast, which had absorbed people from the countryside, most of them from mid-Ulster, where sectarian tensions were severe, was the most violent in Ireland. Immigrants took with them their memories of past wrongs and their resentments and subdivided themselves in ghettos along sectarian lines.

In Parliament the cause of Home Rule was weakened by division in the Irish Parliamentary Party brought about by the involvement of its charismatic leader, Charles Stewart Parnell, in a scandalous divorce case and his refusal to step down. This led to the defection of many party members to other parties opposed to Home Rule.

New Militancy in the Struggle for Home Rule: The Easter Uprising

In 1914 the pro-unionist Ulster Volunteer Force (UVF) was mobilized with masses of smuggled weapons that it hid in dumps all over the countryside, ready for resisters to Home Rule.

World War I postponed resolution of the Irish question; both the Nationalists and the Unionists pledged the support of their volunteers to the Allies. However, one group of Nationalist militants, the Irish Republican Brotherhood, saw England's distraction with the war as an opportunity. They staged the Easter Rebellion in Dublin in 1916. It was put down because of lack of support, but the brutal reprisals against the rebels, including the execution of the leaders, gained public support for the movement.

Sinn Féin

In 1918 Sinn Féin (meaning "ourselves"), an umbrella separatist political party formed in 1917, overwhelmed the Irish Parliamentary Party, capturing most of their seats and ending with a larger representation in Parliament than any Irish party had ever held. Meanwhile Unionist seats had also increased markedly. Unionist leaders had decided to stop resisting Home Rule but instead to insist, in the event Home Rule was granted, on partition of the six most Protestant counties in northeastern Ireland from the rest of the country. For their part the Sinn Féin members of Parliament refused to take their seats at Westminster and instead met in Dublin, claiming to be the government of Ireland. They named their assembly Dáil Éireann.

War of Independence: The Irish Republican Army

On the same day as the Dáil met in January 1919 members of the Catholic militia group the Volunteers attacked unarmed policemen at Soloheadbeg in county Tipperary, the first in what became a groundswell of incidents growing into a full-blown war of independence. By 1920, the government had suppressed the Dáil. But columns of Volunteers, who called themselves the Irish Republican Army (IRA), were conducting effective guerrilla warfare in the countryside.

Government of Ireland Act and a Divided Ireland

With the Sinn Féin members absent the British Parliament passed without difficulty the Government of Ireland Act in December 1920, which partitioned Ireland as the Unionists wanted, with the grouping together of six Protestant counties into the Republic of Northern Ireland, guaranteeing that no Nationalist group could take power. Sinn Féin rejected the scheme out of hand and continued to support the IRA in its military campaign for a united Irish republic. Catholics in Northern Ireland deeply resented their exclusion from the Irish Free State formed in the act and feared the treatment they might receive from the Protestant majority. In local government elections in 1920 the Unionists lost control of Londonderry Corporation and a majority of councillors pledged themselves to the Irish Republic proclaimed by Dáil Éireann. Tensions erupted into pitched battles in Londonderry and also in Belfast as elements of the UVF and the IRA clashed. As many as 11,000 Catholics were driven out of workplaces in Ulster cities. By 1921, however, the IRA sought a truce; negotiations resulted in the Anglo-Irish Treaty, which created an Irish Free State with dominion status within the British Empire.

CULTURE (*see also* CELTS)

Economy

Farming Prehistoric domestic artifacts have rarely been found by archaeologists in Ireland. Rotary quern stones have been found and also a wooden plow that would have been pulled by oxen. On analogy with Britain, dairying would have been common in Ireland, as well as growing of grain crops such as corn, oats, barley, wheat, and rye. Almost all farming was probably subsistence-based, and there was very little trade in food.

Trade By about 2000 B.C.E. a flourishing metal industry had developed and bronze, copper, and gold objects were exported widely to Britain and the mainland.

Traders in the Bronze Age were first attracted to the British Isles because one of the few sources in Europe of the tin needed to make bronze was in Cornwall. The tin trade there was soon augmented by trade in other metals from other regions in the area, among the most notable gold from Ireland. Gold was transhipped from Ireland to southwestern Britain; an important port was Mount Batten in Devonshire.

After the establishment of Christianity in Ireland a modest trade with the eastern Mediterranean in exotic pottery came into being. Trade items included wine and oil jars, perhaps for use in Christian worship. Irish received Roman and Germanic glass as well.

The Viking presence in Ireland introduced new overseas trading activity to Irish culture. As in England the Vikings fostered the development of large trading settlements. It has been said that the Vikings founded the first towns in Ireland—towns in the modern sense of open entrepôts or “free markets” where “socially neutral” economic transactions can take place. In this they differed from the monasteries, which certainly functioned as nuclei for economic activity but nevertheless were in essence closed social entities—as their primary reason for being was the service of God.

The symbol of the free marketplace is the mint, and a mint was established at Dublin in 997 C.E. The coins produced at Dublin were exact copies of contemporary English silver pennies and were intended for use in trade with England. Dublin’s natural east-facing harbor gave it great potential for long-distance trade, linking it with the Scandinavian lands, with western France, and with the Mediterranean via the Irish Sea. Archaeological excavations in Dublin have revealed the extent of its activities as a manufacturing and trading center. Dublin had specialized craftsmen, especially bronze smiths, comb makers, and leather workers. Imported items show the extent of Dublin’s overseas trading contacts. Sometime after the middle of the 11th century the fine metalwork from Dublin began to be traded to the Irish interior. By the end of the 11th century Scandinavian styles and tastes had become highly influential on native artisans at centers such as Clonmacnoise.

Government and Society

The Irish in the Bronze and Iron Ages had a society very similar to that in Britain and across

a broad region of Europe. The heroic tales of Irish mythological literature bring to life a world suggested by the material culture that, aside from contemporary accounts by non-Celts, is all we know about the Celts of mainland Europe. The elaborately worked arms and armor, the chariots and horse gear, the great cauldrons and drinking cups and other accoutrements of feasting bear silent witness to this world. Notable among the heroic Irish epics is the *Ulster Cycle*, which tells of the exploits of the hero Cu Chullain. Once thought to be historically unreliable, these stories for all their exaggeration give a glimpse of life in Iron Age Ireland and across much of Celtic Europe.

The protagonists of Irish mythological literature are usually one of two character types: kings and heroes. The principal role of kings was guardian and protector of the people or tribe, whether in war or as judge and lawgiver. Kings also interceded with the gods on behalf of their people. Coronation rituals bear this out; in them prospective kings engaged in a symbolic “marriage” with a goddess who was the personification of the land or territory. In another type of ceremony the king would climb naked into a cooled cauldron of broth in which a foal had been boiled, then climb out and crawl beneath the foal’s mother, as though reborn as her son, thus ensuring the favor of the horse goddess for his people. (Cauldrons are thought to have represented the womb in Celtic mythology.)

In general kings are positive figures, in contrast to heroes, who are much more ambivalent in their relationship to society. Cu Chullain, for example, could be immensely destructive when in his battle rage; in one tale he had to be tricked into letting himself be doused in two cauldrons of cold water until he was restored to normal. On the other hand he loyally served and protected Chullain, replacing Chullain’s hound, whom he had killed, hence his name, which means “Hound of Chullain.”

Brehon Law Brehon law was a body of traditional law codes that governed Irish life in some regions until the 17th century. It derives its name from the Irish word *Breitheamh* (genitive *Breitheamhan*, pronounced “Brehoon” or “Brehon”), which means “judge.” These codes consist of the digests or compilations of generations of such lawgivers; some may date from early in the first millennium C.E. or earlier.

According to Brehon law Ireland was governed by a ruling class called kings, of different grades, the highest being the high kingship of Ireland, until about the 10th century—a large-

ly hollow, ceremonial title. Kings were normally elected from among males who could trace chieftainly descent back at least four generations. Kings were often selected after victorious combat with rival claimants. A candidate had also to be of good legal standing, be physically unblemished, and be a man of property.

Below kings were the nobles or princes called in Irish *flaith* (pronounced like “flah” or “floiuh”). In all there were, including kings and *flaiths*, seven different kinds of *aires*, or nobles. Nobility was not exclusive, and farmers or peasants could attain it. If a farmer or peasant possessed twice the wealth of the lowest of the seven ranks and had held it for several generations, he could become an *aire*, or noble, of the seventh, or lowest degree. Under ancient Irish law the land did not belong to the king or the chief or the landlord, but to the tribe, and the lowest of the free tribesmen had as much right to his share as had the chief himself. Over time parts of the tribal territory appear to have become assigned more permanently to specific subtribes or families. The chief, who had administrative authority over some aspects of land use, appears to have had certain specific portions of the tribal land allotted to him for his own use and for the maintenance of his household and relatives. He was in no sense, however, a landlord exacting rent from tenants or serfs as in the seigneurial system of the Middle Ages, although over time the power of chiefs increased at the expense of their tribes and vassals, a process that occurred all over Europe during the latter part of the first millennium C.E.

Kings, too, of aggressive dynasties, such as that of the Ui Néills, attempted to widen their sphere of influence and assume to themselves overlordship of kings of lesser status, as attested by the numerous claims to the high kingship of Ireland. The kings’ principal roles were those of war leader and judge; in the Irish annals kings appear as protectors of the tribe, their warfare carried out more for that purpose than for personal glory, which instead was the province of heroes such as Cu Chulainn.

By the later Celtic period Ireland was ruled by a series of perhaps 100 to 200 kings, each ruling a small kingdom or *tuath*. The three grades of kings were the *rí túaithe*, ruler of a single kingdom; “great king,” or *ruiri*, who ruled over a number of local kings; and “king of overkings,” or *rí ruirech*, who was a king of a province. Each province had a royal site, a place where important events took place.

According to the surviving law tracts the people who had the most important status were

the poets. For many years even beyond the Anglo-Norman invasion of the 12th century poets enjoyed the rich patronage of the wealthy families. They were held in the highest esteem but were also feared because people believed that their satire could wound or even kill.

Relatively little is known archaeologically about the life of common folk in Ireland. For most of the civilian population by analogy with most of Celtic Europe life was spent in small farmsteads consisting of wooden or wattle-and-daub houses within a circular enclosure. Most would have had access to common land on higher ground on which to graze animals.

Ceremonial Capitals For the ancient Irish ceremonial capitals held special significance. In the *Ulster Cycle* epic Emain Macha (from Emain, perhaps meaning twins, and Macha, the name of the local goddess) was portrayed as the headquarters and sacred place of a military dynasty, the so-called Red Branch knights, ruled by Conchobar mac Nessa, who was advised by the Cathbad, a Druid, and championed by Cu Chulainn.

An earthwork excavated by archaeologists, called Navan Fort (in the mistaken belief that it was a hill fort), has been identified as Emain Macha. Navan Fort is a large circular earthwork consisting of a ditch and external embankment surrounding the summit of a glacial hill. East of the hill is a small lake where a votive deposit of four large horns or trumpets and a number of human skulls was unearthed in the 18th century. The earthwork encloses two monuments on the hilltop, a ring barrow (an Iron Age burial site) and a large mound. Excavations in the 1960s revealed that the mound was a composite structure built in 94 B.C.E. at the end of a long sequence of earlier activity. Artifacts from earlier periods include a bronze socketed sickle and ax similar in form to implements made in Hallstatt in Austria during the phase known as Hallstatt C, dating from c. 800 to 500 B.C.E. From the second or third century B.C.E. were the skull and jaw of a Barbary macaque, a North African monkey, an intriguing find indicating both contact with the Mediterranean and the presence of elite inhabitants in Emain.

By far the most remarkable structure at Navan Fort was a large timber building erected, according to dendochronological (tree ring) dating of surviving wood fragments, in the early part of the year 94 B.C.E. The circular building was 121 feet in diameter and had four concentric rings of posts surrounded by an outer wall; in all 275 posts were used in its

construction. It had a conical roof and a single timber, much larger than the others at two feet in diameter, was placed in the center. This was the last post to be erected, and a prominent feature of the building was an aisle precisely fitted to it, suggesting that the introduction and erection of the timber were the climax, or rather, penultimate climax for which the entire structure had been built. For after the wooden part of the building was complete, it was filled with a cairn of limestone blocks eight feet high, and then the outer timber wall was set on fire. After the fire the whole structure was covered with turfs of sod, a layer higher at the center than the underlying stone cairn. This series of constructive and destructive acts may well have been planned out in their entirety beforehand. At Dun Ailinne, county Kildare, in the early Iron Age a series of large circular timber structures were built, partially burned, partially dismantled, and then covered over in apparently ceremonial acts comparable, if not exactly similar in detail, to those at Navan Fort. The conjunction of a circle of uprights surrounding a central cairn perhaps recalls the stone structures of Newgrange and Clava of the Early Bronze Age. The use of the act of construction as ritual has a far longer history, dating to the early Neolithic in the British Isles.

Emain is one of a small number of sites identified as a prehistoric tribal capital in the early sources. Archaeological excavations are corroborating the early annals as they reveal ceremonial structures of Iron Age date in these monuments that are closely comparable with one another.

Feasting and Politics Trade and other links with the Continent fostered in Ireland a society basically similar to that of Celts in other regions. By the end of the second millennium B.C.E. Irish trade in bronze with the Continent, together with a wide range of other commodities less visible in the archaeological record, seems to have intensified. Among the variety of implements and weapons found in Ireland from this time certain items of elite gear stand out as common to most areas, showing a common warrior ethos. Along with circular shields, long swords, and spears were cauldrons, hooks for clawing the hunks of meat out of the stew, and spits for roasting the joint over the fire. These items, often found in warrior burials, show that feasting as well as war was part of the warrior ideal. Feasting formed the focus of gatherings hosted by society's leaders. At feasts

bards and poets would celebrate the warriors' deeds, redoubling by reflection their glory.

The distribution of artifacts shows that these same social values were adopted throughout the Atlantic zone of Ireland, the area most affected by trade with Europe. The political symbolism of drinking, particularly the connection between *laith* (Irish for liquor) and *flaith* (Irish for sovereignty or lordship), appears to have endured well into the Middle Ages. Drinking horns, such as those found in Celtic burials in Hochdorf, Germany, are frequently referred to as symbols of authority and kingship in Irish poetry, and as late as the 15th century a 300-year-old drinking horn was cited by the Kavanagh family as the basis for their claim to the kingship of Leinster.

Christianity and Society By the sixth century C.E. Christianity, through the medium of the monasteries, had become an important force in society. In addition to their educational function, by which they opened up to the Irish the knowledge of Greco-Roman civilization, monasteries became a significant counterweight to the political influence of kings. The faith of monks, their devotion to their abbots and their order, united them into a force for communal action to a degree far beyond that of the retainers and warriors of kings. The fact that many monks and abbots were former aristocrats who put their wealth and lands in the monastic fold gave their monasteries added political and also economic clout. This influence allowed monastic organizations to promote conventions for the protection of noncombatants in warfare and of widows and orphans, and the right of sanctuary within monastic precincts. A strong tradition of devoting children to the church emerged.

A concentration of labor under monastic direction resulted. The inhabitants of a monastery included the tenants who farmed monastic lands. Monasteries received lands and other wealth from members of the nobility who had become monks as well as from those people who sought sanctuary. Abbots used this personnel and wealth for land improvement, road building, and the development of groups of specialized craftsmen. In general as elsewhere the church became the conduit by which the kind of socioeconomic organization that had powered the Roman Empire became a powerful force in a land never within the Roman sphere.

Military Practices

Although warfare was fairly common, it most often took the form of cattle raids on neighbors. In general warfare seems to have been a

highly formalized affair only several steps away from a rough sport such as rugby, in which honor and prestige were the most important goals. Common farmers were usually not involved. On occasion though warfare probably took a more serious turn, as when powerful royal dynasties such as the Ui Néills attempted to conquer new territory. Tales such as those of Cu Chulainn's slaying thousands of men, although undoubtedly highly exaggerated, need not be seen as wholly fictitious.

Iron swords have been found in Ireland, as well as spear butts made in a variety of shapes that were attached as counterweights to the ends of wooden spear shafts. Chariots may have been used, but scant evidence of them has been found.

Dwellings and Architecture

Stone Circles A monument type common to the Bell Beaker period is the stone circle, a building style favored at this time in Britain as well, where its greatest expression is Stonehenge. Stone circles may have been made as a reinterpretation or variation on Newgrange-style constructions, and possibly as a means by which the Bell Beaker ideology was made to accord with the potent ritual activity that must have taken place at and within the great tombs. Of the more than 200 stone circles almost 100 are concentrated in the southwestern counties of Cork and Kerry, many of them consisting of no more than five stones. Also in the southwest of Ireland are four stone groupings known as "Four Posters." Another great concentration of stone circles is found in central and southwestern Ulster in the north of Ireland, individual circles often consisting of more stones than in the southwest. The many stone circles seem to represent a dispersal and opening up of ritual activity. A simple stone circle provides a ritual venue open to the many, in sharp contrast to Newgrange, with its dark passageway and inner chamber, within which an elite priesthood may have engaged in secret and esoteric rites.

Newgrange itself has a circle of 12 remaining of an estimated 38 large boulders up to eight feet high forming a ring of about 340 feet in diameter surrounding the central mound. The stone circle probably dates from the Bell Beaker period, another indication of compromise between the Bell Beaker ideal and the older communalism exemplified by the great Neolithic earth-and-stone constructions. This combination of circle and central mound or cairn of stones has only two analogues in the British Isles, both in Scotland: Clava near

Inverness and Loanhead of Daviot near Inverurie. The entrance to the central cairn at Clava, as of that of Newgrange, is oriented to the winter solstice sunrise.

Raths and Cashels Compared to those of Britain little is known archaeologically about the normal occupation sites of the Iron Age Irish. The most common dwelling sites in Ireland seem to have been *raths*, or ring forts, small circular earthen enclosures containing single houses, sometimes with an outbuilding. As elsewhere in the Celtic world houses were round until later in the first millennium C.E. *Raths* were largely self-sufficient in food and in basic ironworking, which was done on site. Some *raths* show evidence that their owners had accumulated some wealth in remains of exotic Mediterranean pottery. Evidence of high-quality, fine-art metalwork is occasionally found. *Cashels* were stone-built equivalents of *raths*.

High-status dwellings in the Irish midlands were located on crannogs, houses on artificially built islands. The word *crannog* is from the Irish *cran*, meaning "tree."

In Ireland clear evidence that hill forts were as important as elsewhere in the Iron Age Celtic world has not been found. The dating of those hill forts that exist is obscure. At any rate occupation of them ceased in the early medieval period, but they retained great prestige as places for ceremony.

Churches and Monasteries The earliest churches in Ireland were of wood. By the eighth century C.E. high-status stone churches began to be built, but wood continued in use for others.

Monasteries were built as *raths* and *cashels* were, enclosed within an earthen or stone wall. Churches were built slightly off center. The typical dwelling of monks were beehive-shaped huts, one per monk. By the ninth century the standard layout of monasteries included two separate enclosing walls, the outer area where day-to-day activities were carried out and the inner enclosure containing the church, the abbot's house, a round stone tower and, for wealthier monasteries, sculptured stone crosses. A distinctively Irish characteristic of church building was the stone roof.

Other Technologies

Copper and Bronze Ages In the mid-third millennium B.C.E. copper metallurgy appeared in Ireland with great suddenness. Large numbers of tools and weapons were made in southwestern

Ireland in what is now the province of Munster. Other mines on the slopes of Mount Gabriel in county Cork consisted of some 25 mineshafts. A simple form of flat ax was the most common artifact. The metal used was a superior copper containing arsenic, found in the Mediterranean region but not elsewhere in Europe, except in the Alpine region, where the use of this copper was pioneered. A significant addition of arsenic to copper produces better mechanical properties, and higher levels produce a metal of striking silvery appearance. Artifacts with higher levels tended to be high-status objects such as daggers and halberds.

There is evidence that the level of arsenic in the copper was carefully controlled, both in the alpine region where such copper was first mined and worked and in Ireland. The proportion of arsenic in artifacts ranges from less than 1 percent to 7 percent and never more than that, whereas ores can contain up to 30 percent, suggesting that means had been devised to reduce arsenic.

The appearance of this strikingly advanced copper industry coincided in time with that of artifacts of the Bell Beaker culture in Ireland. Evidence found at Ross Island, on the eastern edge of Lough Leane in county Kerry, demonstrates a link between the Beaker culture and the new copper industry. The ore there was not the low-grade copper of Mount Gabriel, the only copper mine previously known in Ireland, but rich arsenic-bearing sulfide ore. At a miners' work camp were numerous early Beaker potsherds, confirming the long-suspected link between the users of the distinctive pottery and the mining of the superior metal.

The Bell Beaker culture is believed to have spread by sea along Atlantic sea lanes to coastal regions of Europe. The trading network may well have fostered the spread of knowledge of copper metallurgy to Ireland as well as knowledge of the presence in Ireland of copper ores superior to those of the Mediterranean region.

The advanced techniques for mixing and controlling the amounts of different materials in metal developed in Ireland and Britain are believed to have contributed to the development of bronze making when tin from Cornwall was discovered. Irish and British bronze, in contrast to the earliest bronze made in Anatolia, where bronze making was discovered, was produced from the beginning with an almost standard composition of 8 to 12 percent tin, ensuring the optimal mix of qualities. Already in 2500 B.C.E. bronze made in the British Isles was the best in

northern Europe and may have spread to other regions from there.

Iron Age Irish bronze smiths continued to possess a high level of technical competence and originality in the Iron Age, as attested particularly by the great sheet-bronze trumpets they made, a distinctive Irish specialty. A hoard of late La Tène gold objects found in Brougher, county Derry, constitute some of the only personal ornaments known from the period, but their level of craftsmanship is spectacular.

Horse trappings make up almost half of the surviving metal objects of the Iron Age. Many of them are ornate and show signs of intense wear, showing the importance of the horse as a status symbol. On the other hand almost no evidence of chariots survives.

Art

Visual Art Early La Tène art of the fifth and fourth centuries B.C.E. is hardly known in Ireland, which seems to have continued its isolation from continental influences as far back as the early Iron Age. But by the third century high-quality metal objects influenced by the La Tène style were being made. Irish smiths engaged in cross-fertilization with British artisans is stylistic ideas. A prominent characteristic of insular La Tène art is the filling in of areas surrounding motifs in raised relief with "microdesigns" such as cross-hatching, parallel lines, or tiny spirals to give an impression of shading and to set off the raised ornaments.

During the first century B.C.E. while La Tène art on the Continent was in terminal decline, in Ireland it was reaching new heights of vigor and originality. The compass began to be used to create circles and circular spirals. More than ever the "negative" background areas are given equal importance to the figures and motifs they surround. The La Tène art tradition continued uninterrupted in Ireland until it received new influences as a result of the entry of Christianity and contact with the Germanic world.

Christian Art

After the fifth century C.E. while the La Tène style continued to influence Irish visual arts provincial Roman motifs became important. These included palmette derivatives and fleshy C-shaped scrolls called *peltae*. Typical La Tène features that continued to be used were a trumpet-shaped scroll and the bird-headed spiral, which sometimes holds a human head in its mouth. Such motifs can be found even on

crosses. In metalwork sunken areas filled with red enamel often set off raised metal spirals.

New techniques such as gilding and filigree and Germanic-style animal art became influential through contact with the Anglo-Saxons, who flocked to Irish monasteries in great numbers. As with the La Tène style the Irish showed themselves to be imaginative adapters, reinterpreting new elements into a new decorative style of great complexity and refinement. This new style is best known perhaps from the *Book of Kells*, created in the late eighth and early ninth centuries, possibly partly on Iona and partly in Ireland after Viking raids forced evacuation from Iona, but it was as important for metal and stone as for manuscripts. Similarly to Celtic art in the past the style was essentially an art of the surface, linear, and two-dimensional, depending on the rhythm and energy of line and of color relationships rather than the symmetrical and proportional arrangement of mass so crucial to the spatial art of the Greco-Roman world.

The earliest known manuscript in this tradition is a psalter called the *Cathac of St. Columba*, thought to have been created around 600 C.E. (the dating of manuscripts is problematic). In it the integration of Irish and Anglo-Saxon elements is already complete, although in simple form. The monastery on Iona thus seems to have been crucial in the development of this style. A masterpiece of the style is the *Book of Lindisfarne*, possibly created on the occasion of the translation of the relics of St. Cuthbert in 698.

After the St. Columba monastery was transferred to Kells in the ninth century a Pictish tradition carried there, of inscribed standing stones adapted to Christian use by having a picture of a cross on one side and Christian narrative scenes on the other, developed into the large, three-dimensional ringed cross called an Irish high cross. The meaning of the ring centered on the “crux” of the cross, where the vertical and horizontal axes meet, has been variously explained—among other theories as a Celtic Sun symbol or a triumphal wreath celebrating the Redemption.

Literature

The oldest extant Irish texts are inscriptions written in the ogham script, from the fifth century C.E. or earlier. The ogham letters consisted of strokes inscribed on each side of or crossing a stem line; ogham inscriptions were often carved on stones, with the strokes cut along a stem line represented by an edge of the stone.

Ogham has been shown to have developed from Latin.

The period from the sixth to ninth century C.E. was marked by the flowering of scholarship and literature in Irish monasteries. For the first time Irish was written, and the ancient mythological tales and historical annals precipitated, as it were, out of the living and flowing oral tradition into solidified texts. Irish literature for the first time felt the influence of Mediterranean civilization, including not only Greco-Roman literature but, perhaps most important, the Old and New Testaments.

Much of that early Irish literature has been lost, and what remains is contained in the few priceless manuscripts that have survived centuries of warfare and invasion. In the *Táin Bó Cuailnge* (Cattle Raid of Cooley) in the Book of Leinster is a line that suggests that practitioners of the oral tradition took great pains to preserve its integrity: “A blessing on all those who memorize The *Táin* with fidelity in this form and do not put any other form to it.”

The earliest Irish manuscript of known date is the Würzburg Codex of 700 C.E., kept and perhaps written in a church in Würzburg, Germany, founded by the Irish monk Killian in 687. The great prose narrative literature is preserved in folio vellum manuscripts of which the oldest is *Lebor na hUidre* (The Book of the Dun Cow), compiled in about 1100. Other important surviving manuscripts from that period include *Lebor Laighneach* (The Book of Leinster), compiled before 1160, and *The Yellow Book of Lecan*, a manuscript from the 14th century.

The Four Cycles Irish tales have been classified as belonging to one of four different cycles. In the Mythological Cycle with its *Book of Invasions*, the chief characters belong to the Tuatha De Danann, the supposedly divine race inhabiting and ruling Ireland before the arrival of the Celts. The sagas of this cycle recount the exploits of hero-divinities such as Lugh the Long Arm (or Lugh Samildánach, the Multitalented), Nuada of the Silver Arm, and the Dagda. A notable poem in this cycle is “The Song of Amergin,” which records the first words of the Amergin (called a *fili*, a type of Druid), who accompanied the Milesians, the last invaders, who displaced the Tuatha De Danann, on his arrival on the Irish shore. His song consists of a series of statements about his transformations into animals and birds, even into a wind and an ocean wave. It captures that sense of union with nature and the land, also

unity at the center of multiplicity, that lies at the heart of the spirituality of the ancient Irish.

Tales of the Ulster Cycle (Red Branch) tell mainly of the Ulaid, King Conchabar of Ulster, and the warriors of the Red Branch. The Ulster Cycle also contains the greatest of all Irish sagas, the *Táin Bó Cuailnge*, the Cattle Raid of Cooley, which recounts the exploits of the greatest champion in all early Irish literature, Cu Chulainn, the Hound of Ulster.

The stories of the Fenian Cycle (Ossianic) are about the deeds of Finn MacCumhaill; his roving warbands known as the Fianna; his son, Oisín (Ossian); Conán, Goll, Oscar, and other heroes. This cycle is also known as the Ossianic Cycle because most of the poems in it are attributed to Finn's son, Oisín.

Also known as the King's Cycle, the Historical Cycle is a more miscellaneous group of stories celebrating the activities of various high kings of Ireland. It is set between the third century B.C.E. and the eighth century C.E.

Filid Inheritors of the Druidic Tradition Even after the Druidic order was done away with when Christianity came to Ireland, many of their functions aside from religious ones became the province of the poets called in Irish *fili* (a term previously used interchangeably with Druid, suggesting an earlier overlap of function). The most important role of the *filid* (plural, or *filidh*) was to learn and transmit the poetry, tales, and lore of the people. They were in effect the keepers of the historical and genealogical record of their community. Like Druidic bards they underwent long years of training, both to memorize poetry and to learn to compose themselves. Their duties included eulogizing the king and telling of the deeds of his ancestors, satire, and singing at ceremonies or feasts. In *The Cattle Raid of Cooley* (set in pre-Christian times) we find a woman *fili*, known as Fedelm, a *banfili* (woman poet). Queen Medb also refers to Fedelm as *banfaith* (woman prophet).

During Druidic times the *filid* had created their songs and poetry out of what was assumed to be a higher order of vision than that available to ordinary mortals; they seem to have shared some of the qualities of shamans, the wise men of many traditional cultures who were believed to have visions of the immortal otherworld, of spirits, and of the dead, from whom they gained wisdom and supernatural powers. "The Song of Amergin" (mentioned above) suggests the *fili* Amergin possessed shamanic powers, which typically included

shape-shifting. *Filid* raise blisters of shame on the faces of their victims and bring about the deaths of kings in *The Cattle Raid of Cooley*; even the Dagda, chief god himself, is forced by Crindbál the satirist to give him the three best pieces of his serving each night. The fact that the *filid* of medieval Ireland were feared for their otherworldly powers, particularly of satire, which people believed could cause physical illness and harms, suggests that even in Christian Ireland poets retained something of their former supernatural essence.

On at least three occasions, according to tradition, the *filid* were banished from Ireland. The last banishment was mediated by the Christian monk Columba on their behalf. He worked out a compromise with the church to the effect that the number of *filid* would be reduced, but that nevertheless the order would be preserved by installing a *fili* to serve each lord of every district throughout the country. In spite of the demands of the *filid* and resulting conflict with their protectors and patrons, their hold on the reverence of a culturally conservative people was such that the order survived in Irish society down to the abolishment of the Gaelic social system itself in the 17th century.

Religion

Bronze Age Burials Wedge tombs seem to have been an Irish reinterpretation of the circular mounds typical of the Bell Beaker culture. Wedge tombs have long, rectangular burial chambers usually roofed with large stones and covered with a long, wedge-shaped mound. Nearly 400 are known, built between 2000 and 1500 B.C.E., and Bell Beaker pottery is often associated with them. Similar tombs also associated with Bell Beaker finds are common in the French region of Brittany, suggesting that Bell Beaker ideas may have entered Ireland from there. Wedge tombs are found throughout northern Ireland, with large concentrations in the west, particularly around county Clare, northern Connacht, and county Cork.

Iron Age Beliefs In Ireland as elsewhere in the Celtic world at the heart of spirituality was an intense concern for nature and for the land and its sacred geography. An important branch of learning in Ireland was called *dindshenchas*, "the lore of famous places," stories to account for hundreds of place-names. Names were given to nearly every discernible feature, hill, mountain, field, river, ford, confluence, or spring. Features near territorial boundaries were especially subject to naming and associa-

tion with the sacred in some way. In common with those of the rest of Celtic Europe natural features, particularly springs, streams, lakes, and bogs, were probably the sites of open-air worship. The Brouighter hoard of masterfully wrought gold torcs (torques; metal neck rings) and other ornaments had been deposited in a salt marsh on the edge of a bay called Lough Foyle. The marsh experienced periodic flooding both from an adjacent river (called the Roe, roarer) and from the sea. As Lough Foyle was believed to be the home of the sea god Manannan mac Lyr the hoard was probably an offering to him.

The land as a whole, whether that of a tribe or of the totality of Ireland, was conceived of as a goddess. In one of the tales concerning Lugh, who may be considered the exemplar of sacral kingship, his consort is a woman who represents the sovereignty of Ireland. A goddess named Eriu gave her name to Ireland. Such goddesses also represented the fertility of the land, assured by marriage with the sacred king. It may be deduced from the countless tales on this theme that marriage rituals of this sort, involving a new king and a woman standing as surrogate for the goddess, had two main elements: the offering of a libation by the bride to the new king and sexual union. A paramount figure in Irish myth, Queen Medhbh of Connacht, had a long succession of husbands, and an epithet commonly given to her was “the intoxicating one.”

The goddess Brighid, thought to be the Irish equivalent of the Gallic goddess that Julius Caesar called Minerva, was patroness of poetry, learning, healing, and various crafts. She, or perhaps her human representative, was later made a saint and patroness of the great monastery of Kildare, which she was said to have founded and presided over as abbess. She may also have been the tutelary goddess of the tribe of the Brigantes, a powerful tribe in Britain who also had kinsmen in Ireland.

Tara Tara was a place of coronation of Irish kings and had been a ritual site since at least the Late Neolithic, when a passage grave was built there. By the first centuries C.E. kings aspiring to the status of high king of Ireland, no matter where their territory, seem to have taken pains to be inaugurated at Tara. There are a number of earthworks at Tara, most probably dating from the Iron Age. They include ditch and bank enclosures, mounds or tumuli, a pair of linear earthen walls probably used as a processional way, and traces of other routeways. The largest feature is an earthen rampart enclosing an inte-

St. Patrick: The Apostle of Ireland

Patrick (British name Succat) was born in about 389 C.E., possibly in Wales, the son of a Romanized Briton by the name of Calpurnius. At the age of 16 he was captured by Irish raiders and sold as a slave to a chieftain named Milchu in the territory of the Dál Riata. He spent six years, most of the time alone, tending to flocks of sheep, an experience that greatly intensified his Christian faith. His master Milchu, according to tradition, was a Druid, who taught Patrick about his Celtic gods, from whose “bondage” Patrick would one day free the Irish.

According to tradition, after a prophetic dream in which a ship awaited him Patrick went to the mainland to study for the priesthood. He spent time at the monastery of St. Martin at Tours and at Auxerre under the guidance of St. Germain, before he was sent by the pope back to Ireland in the early 430s. He began to win followers, the first supposedly a chieftain whose arm had become numb when he had attempted to slay Patrick. A legendary incident occurred at Tara, reportedly on Easter, when Patrick encountered Leoghaire, the high king, and his chieftains and Druids, who were there to take part in a special religious ritual involving the putting out of all fires in the kingdom and the ritual rekindling of a sacred fire by the Druids. The fire was to be distributed throughout the land. Before the Druids could light their fire, Patrick kindled one of his own, which burned despite attempts to extinguish it.

During his career Patrick codified traditional Irish laws according to Christian values and developed the Celtic abbot-bishop system. He wrote two Latin works, *Confessio*, a spiritual biography, and *Epistola*, a letter to Coroticus, a British king of Strathclyde, that recounted British mistreatment of Irish Christians. He also introduced the Roman alphabet to Ireland and supposedly established the shamrock as an Irish national symbol of the Holy Trinity.

Patrick retired to Saul in present-day northeastern Northern Ireland in 457 and died there about four years later. Saint Patrick’s traditional feast day is March 17, the date he supposedly died.

St. Patrick does battle with serpents in this 1872 lithograph. (*Library of Congress, Prints and Photographs Division [LC-USZ62-2901]*)

rior ditch (not a defensive structure), a construction type also found at the royal sites of Emain Macha in county Armagh and Dun Ailinne in county Kildare. Tales from the ancient Irish annals suggest that significant tribal rituals were enacted here in which the sacred king engaged in a symbolic marriage with the Earth to fructify crops and animals.

The five provinces of Ireland mentioned in the annals—Ulster, Leinster, Munster, Connacht, and Midhe—have a mystical, cosmological aspect. In particular the middle province of Midhe, with Tara at its center, seems to have

been the embodiment or symbol of the doctrine of a unity that transcends tribal differences. Other cultures have had the concept of the sacred center, where the changes and the divisions of the world are dissolved in mystical union. Such concepts give a sense of the meaning of the rituals that took place at Tara.

Christianity The conversion of the Irish to Christianity was primarily carried out by Britons. Christianity in Britain was well established by the fourth century C.E., and by 431 a Christian community, apparently of limited scope, existed in Ireland, proved by the papal order that sent a missionary to assume episcopal rule over those Irish “believing in Christ.” But by far the most successful early missionary to the Irish was Saint Patrick (see sidebar p. 441).

Patrick was raised in a Romanized Briton. In the early fifth century when he was 16 he was kidnapped by Irish raiders and enslaved as a herdsman near the territory of the Dál Riata, in the present-day county Antrim, or possibly in Connacht. Patrick eventually escaped to the mainland. Choosing a religious path, he was ordained into priesthood by St. Germain at Auxerre, and sometime after 431 he was appointed successor to St. Palladius, the first bishop in Ireland. But his main effort to further Christianity in Ireland occurred, fittingly enough, at Tara, where he converted Leoghaire, the high king, with his chieftains and Druids, after which he converted many of the Irish tribes.

In Ireland a distinct type of Christianity emerged; it differed from that of the church based in Rome primarily in the importance of monasticism and the primacy of abbots. For the Roman Church bishops were the foundation of authority, beginning with the pope, the bishop of Rome. Another matter of bitter dispute between Celtic and Roman churches was the method of calculating the date of Easter.

Irish Martyrdom and Missionaries Martyrdom was an all-important element of early Christianity, in emulation of the first Christians who were persecuted by Rome. The newly converted Irish learned about this legacy through reading books about the lives of martyrs and saints, although the Christianization of Ireland had been attended by little bloodshed. In all probability many warrior nobles who had embraced Christianity were as eager to prove their spiritual prowess as formerly they had their prowess as warriors. Denied what they called the “Red Martyrdom” of physical suffering and death, they created the concept of

“Green Martyrdom,” which consisted of leaving ordinary human society and retiring to remote places deep in forests, perhaps in memory of the Celtic order of Druids and their sacred groves, on mountaintops or one of the many rocky, storm-girt islands off Ireland’s coasts, such as Skellig Michael, where in braving physical adversity they could draw closer to God. Green martyrdom led some monks to go on long sea voyages in search of solitude. Saint Brendan was one of these travelers in the sixth century. During such voyages Irish monks discovered Iceland and settled there, until driven away by pagan Viking settlers.

In many cases these holy hermits soon attracted followers and disciples, and hermitages grew into monasteries, many of which became centers of learning that attracted thousands of students, from all over Ireland and also from abroad. In addition during the sixth century monks and scholars from all over Europe, fleeing the repeated waves of Germanic tribesmen who were laying waste to the remains of the Roman Empire, found refuge in “transmarine places like Ireland, bringing about a great increase in learning”—and no doubt many books—“to the inhabitants of those regions,” according to a contemporary account. The copying of these books by innumerable Irish scribes preserved for the future a substantial part of the intellectual legacy of the Greco-Roman world.

However, for heroic Irish monks like Saint Columba of the sixth century, the learned monastic life was not a sufficient martyrdom; they substituted for it what was called the White Martyrdom, which consisted of leaving Ireland to spread the Gospel elsewhere.

The islands of Ireland and Britain, so similar in climate and geographic position, provided for both peoples a combination of isolation from and participation in influences from mainland Europe. But the relative smallness of Ireland and its greater isolation led to a different experience. The Romans did not occupy much if any of it. The fact that the Vikings contented themselves with only a limited amount of Irish territory allowed the natives to withdraw to the west and continue their Iron Age way of life.

The arrival of the Normans was the start of dramatic change: Individual Norman nobles were inextricably entwined in a large and powerful mechanism—the feudal system—and

Ireland was moving into an era during which individual peoples and cultures were far less important than institutions. Increasingly peoples would be absorbed, or crushed, in the juggernaut of the large socioeconomic forces that the new more powerful kings, the church, and legislative bodies could set in motion although not necessarily control. The subsequent history of the Irish became one in which such forces, largely in the control of foreigners—in particular the English—swept over them with destructive force again and again. Nevertheless the Irish left an incalculable legacy for the world in their preservation of ancient cultural traditions.

Irish: nationality (people of Ireland)

GEOGRAPHY

The island of Ireland is situated in the Atlantic Ocean and separated from Great Britain by the Celtic Sea, St. George's Channel, the Irish Sea, and the North Channel. The Isle of Man, part of the United Kingdom, lies in the Irish Sea between Ireland and England.

Ireland consists of highlands in the north, west, and south and a large, fertile central plain extending to the Irish Sea in the east. The main ranges are the Caha Mountains in the southwest, the Nephin Beg Range in the west, the Boggeragh Mountains in the south, and the Wicklow Mountains in the east. There are numerous lakes in Ireland and wide stretches of rivers known as loughs. The Shannon and the Erne are the two largest rivers. The Lagan, Bann, and Foyle are important rivers in Northern Ireland. Off the west coast are many small islands, including the Aran Islands, the Blasket Islands, Achill, and Clare Island.

The Republic of Ireland is 26,600 square miles; Dublin, located on the Irish Sea, is its capital. Northern Ireland is 5,452 square miles; Belfast, on the Belfast Lough, an inlet of the North Channel, is its capital.

INCEPTION AS A NATION

The ancient and early medieval IRISH maintained their independence for most of their history, despite raids by VIKINGS.

In 1171 C.E. King Henry II of England invaded Ireland with the approval of Pope Adrian IV, an Anglo-Norman. In 1315 Edward Bruce of Scotland invaded the island with intent to weaken English influence. In the early 16th century King Henry VIII of England annexed Ireland, intending to secure the Church of England; he was proclaimed the "king of Ireland" in 1541. Charles II ascended the throne in 1660, ending the ban on Catholicism. At the outbreak of the French Revolution in 1789 an activist Protestant group in Belfast called the Society of United Irishmen formed, instigating rebellions. The Irish Parliament was dissolved, and Ireland was governed from Westminster, England, establishing a union by 1801. Prime Minister William Ewart Gladstone supported Home Rule for Ireland and enacted a bill establishing limited Parliament in Dublin in 1886.

In 1918 Sinn Féin, a separatist political party, formed in Dublin as the government of Ireland. The British Parliament passed the Government of Ireland Act in 1920, separating

Republic

capital:

Dublin

language:

Both English and Irish (Gaelic) are spoken, English by a majority of the population, and Gaelic by about one-fourth, mostly along the western seaboard.

religion:

About 85 percent of the population are Roman Catholic; others are Anglican or other denominations of Protestant.

earlier inhabitants:

Pre-Celtics; Irish (Celts); Vikings; Normans; British

demographics:

Ethnic groups include Celtic and English; few minorities have gained citizenship status in Ireland.

Irish: nationality time line**C.E.**

late seventh–early eighth century *Book of Kells* is written, containing Four Gospels, fragment of Hebrew names, and Eusebian canons.

700 Würzburg Codex, manuscript containing examples of much earlier Irish literature, is compiled, possibly in Würzburg, Germany, where the Irish monk Killian founds a church and converts the local nobility and common folk.

1160 *Lebor Laighneach (The Book of Leinster)* is compiled; it contains *The Cattle Raid of Cooley*, greatest of all Irish epics, featuring exploits of hero Cu Chulainn.

1171 England, under King Henry II, invades Ireland.

11th or 12th century *Aislinge Mac Conglinne (The Vision of MacConglinne)* by anonymous author satirizes monastic life.

1315 Edward Bruce of Scotland invades Ireland, intending to weaken English colony.

15th century Norman family, the Geraldines, controls southern Ireland.

1534 Henry VIII is acknowledged as head of church and state of Britain; Catholic religion is banned in Ireland through penal laws.

1541 Henry VIII is crowned king of Ireland.

1592 Citizens of Dublin obtain charter from Queen Elizabeth to found Trinity College.

16th century Geoffrey Keating writes religious works and historical study of Ireland, which lay foundation of modern Irish literature.

1642 Gaelic Irish of Ulster rebel during English Civil War.

1649 Oliver Cromwell crushes Irish rebellion.

1650 Archbishop James Ussher publishes *The Annals of the Old Testament*, which includes chronology giving supposed date of Creation, calculated based on biblical genealogies, as October 23, 4004 B.C.E.

1689–91 During Williamite Wars, Ireland becomes center of European power politics.

17th century “D’Aithle na Bhfileadh” (*The High Poet Are Gone*) by poet Dáibhí O’Bruadair laments suppression of Gaelic language and literature by English rulers of Ireland; poet Aogán O’Rathaille writes several poems personifying Ireland as beautiful maiden waiting for her male rescuer.

1710 Philosopher George Berkeley publishes *Treatise Concerning the Principles of Human Knowledge*, laying out his theory in support of philosophical tradition known as idealism.

1726 *Gulliver’s Travels*, novel by Jonathan Swift satirizing British society, is published.

1756 *The Vicar of Wakefield*, novel by Oliver Goldsmith, is published.

1778–93 Most of the penal laws against Catholics are repealed.

1782 Protestants and Catholics form armed gangs.

1798 Society of United Irishmen initiates rebellion.

1801 Great Britain and Ireland are united to form the United Kingdom.

1804 Composer John Field plays his First Piano Concerto in St. Petersburg, Russia; in 1812 he invents term *nocturne* for type of piano piece and style.

1829 Catholic Emancipation Act is passed; nevertheless, Irish Catholics oppose union.

1845–54 Potato Famine leads to great emigration.

1857 Natural History Museum opens in Dublin; it later becomes part of National Museum of Ireland.

1869 Prime Minister William Ewart Gladstone establishes Protestant Church of Ireland; in 1885 he announces support for Irish Home Rule.

1877 National Library of Ireland is founded in Dublin.

1884 Anglo-Irish playwright George Bernard Shaw founds socialist Fabian Society; in 1925 he wins Nobel Prize in literature.

- 1890** Dublin Museum of Science and Art opens; it later becomes part of National Museum of Ireland.
- 1895** Oscar Wilde writes successful comic play *The Importance of Being Earnest*; same year, he is sentenced to two years' hard labor in prison for crime of sodomy.
- 1898** Playwright John Millington Synge first visits remote Aran Isles, where his study of Irish language still spoken there and Hiberno-English dialect (which combines English vocabulary with Irish sentence structure) and his acquaintance with people inform his plays for Abbey Theatre, including *Playboy of the Western World* (1907).
- 1899** Poet and playwright Isabella Augusta, Lady Gregory, along with poet William Butler Yeats and others, found Irish Literary Theatre (later Abbey Theatre) with goal of promoting Irish nationalism through appreciation for Irish language and literature; she writes and directs many plays for theater in subsequent years; in 1923 Yeats wins Nobel Prize in literature.
- 1914** Pro-Unionist Ulster Volunteer Force rebel.
- 1916** Easter Rebellion, staged by Irish Republican Brotherhood, erupts in Dublin.
- 1918** Sinn Féin, separatist political party, wins majority of Ireland's parliamentary seats; in 1919 representatives form assembly known as Dáil and declare independence.
- 1920** British Parliament passes Government of Ireland Act, forming Northern Ireland and Irish Free State; it is not accepted in south.
- 1921** After negotiation of Anglo-Irish Treaty creates Irish Free State, dominion status in British Commonwealth of Nations is ratified.
- 1922** *Ulysses*, novel by James Joyce, is published.
- 1923** Sean O'Casey's play, *The Shadow of a Gunman*, is produced at Abbey Theatre; it is first play in his Dublin trilogy, which helps rescue theater from financial ruin.
- 1936** Fourteen-year-old Brendan Behan joins IRA, leading to his arrest and three-year confinement in reform school in England; this experience forms basis of his masterpiece, *Borstal Boy* (1958).
- 1937** New constitution declares Irish Free State, henceforth known as Eire, independent democracy.
- 1939–45** During World War II southern Ireland remains neutral while north is attacked.
- 1940** Playwright Samuel Beckett, author of *Waiting for Godot*, joins French Resistance against Nazi occupation; in 1969 he wins Nobel Prize in literature.
- 1945** Northern Irish nationalists form Irish Anti-Partition League.
- 1949** Eire becomes Republic of Ireland, detached from British Commonwealth.
- 1950** Publication of *Nuabhéarsaíocht*, edited by Sean O'Tuama, introduces new generation of lyric poets writing in Gaelic.
- 1972** Irish Republican Army (IRA) carries out attacks known as "Bloody Friday."
Poet Seamus Heaney leaves his native northern Ireland because of sectarian violence there, moving to Republic of Ireland; he wins Nobel Prize in literature in 1995.
- 1973** Ireland joins European Community (EC).
- 1985** Anglo-Irish Agreement is signed.
- 1990** Mary Robinson becomes first woman president of Ireland.
- 1993** Ireland becomes one of 12 original members of European Union (EU).
Neil Jordan's movie *The Crying Game* about Irish Republican Army provisional wins 1993 Academy Award for best screenplay.
- 1998** Belfast Agreement (Good Friday Agreement) is negotiated by Irish and British government; independent government is established in Northern Ireland in 1999.
- 1999** British government formally transfers power to new provincial government in Northern Ireland.
- 2005** IRA orders its members to end military activity and pursue democratic process through peaceful means.

Northern Ireland from the Irish Free State. Civil War began in 1923 over negotiations of the Anglo-Irish Treaty. In 1949 John Aloysius Costello declared that the Irish Free State would henceforth be Eire, the Republic of Ireland. The Irish Republican Army (IRA) regarded London rule as worse than Belfast rule and carried out acts of violence, notably in 1972, on "Bloody Friday." The Ulster Defense Association (UDA), a Protestant group in favor of British rule, carried out acts of violence against Catholic interests. Violence intensified on both sides in the early 1990s until finally on Good Friday 1998 all the main parties, with the exception of the Democratic Unionist Party, announced a peace agreement.

CULTURAL IDENTITY

Modern Irish cultural identity is impossible to understand without consideration of the dire economic plight of the country brought on by British rule. Beginning in the 17th century rule by Britain prevented the Irish economy from developing freely, as economic measures taken in the country were wholly for the benefit of Britain, such as the ban on the Irish export trade of cattle, milk, butter, and cheese to England in the 17th century, in order to benefit English farmers, and the destruction of the Irish woolen industry because it competed with that of England. Over time the majority of Irish were reduced to a subsistence existence based mainly on agriculture.

The Irish, many already impoverished, were especially hard hit when the potato blight destroyed crops, first in 1845. Widespread famine soon resulted, eventually leading to some 1 million deaths from starvation, disease, and exposure, when tenants unable to work were callously evicted by landlords. Immigrants poured by the thousands into the United States, where many were subjected to injustice, mistreatment, and prejudice.

The British harbored a deeply rooted ethnic prejudice against the Catholic Irish that came to the fore during the famine; historians have recently given it the name *moralism*. Moralism ascribed to the Irish "national character" fundamental moral defects. Some British leaders actually considered the famine a stroke of Providence that laid bare the deep root of social evil in the Irish people, although the British government did take steps to supply food to Ireland.

After the Irish state won its independence from Britain, its economy, crippled by centuries of distortion by British policies, had to

face the general economic downturn after World War I. The Irish thus lived in the deepest poverty, while maintaining the custom of having large families, which the Catholic Church, with its steadfast opposition to birth control and abortion, did nothing to alleviate. Only by the 1950s, as a result of policies of the Irish government, did the economy begin to grow.

In the 1990s institutionalized scandals began to be revealed and investigated, reluctantly, by the Irish government. Two of the most notable of these were the Magdalen laundries and the industrial schools. The Magdalen laundries were institutions run by nuns founded in the 19th century to house prostitutes. They soon evolved into homes where young women and girls who had become pregnant out of wedlock were admitted, often against their will. Other girls, often of illegitimate birth or in families unable to care for them, who had been placed in convents in infancy, were transferred to a Magdalen laundry for showing signs of flirtatiousness or for being too attractive. Girls and women in these institutions, which typically did the laundry for an entire town or neighborhood, were subjected to appalling conditions of overwork, undernourishment, lack of sleep, and systematic humiliations to purge them of sin. Deprived of their own names (and thus kept incommunicado from families), forbidden to talk or form relationships with fellow inmates, kept in total ignorance of current events, many were unable to function in the outside world even when given the chance to leave. It has been estimated that some 30,000 women were admitted to the Magdalen laundries during the 150 years of their existence (some continued in operation late into the 20th century), and some spent their entire lives there. The public was first made aware of this tragedy when one of the convents running a laundry sold some land where the remains of 155 bodies of women buried in unmarked graves were found. Meanwhile, industrial schools were established to care for the orphaned and abandoned children, of whom, because of large families, there were many. They were run by religious orders and funded by the public and reached a peak in 1900 of 71 schools housing some 7,000 children. Meanwhile industrial schools were mismanaged on a large scale, with inmates systematically underfed, inadequately housed and clothed, and subjected to many forms of sometimes horrific abuse. Conditions in both the Magdalen laundries and the industrial schools have been called "Dickensian" (from social conditions described

in Charles Dickens's novels), throwbacks to the worst abuses of the early 19th century.

These and other examples of great rents in the social fabric of Ireland underlie the more overt history of rebellion and resistance to British rule and bespeak one aspect of Irish cultural identity, characterized by dark pessimism of many Irish about themselves and their fate as a people. The darkly sardonic songs and poems about, for example, an Irish propensity for drink and inability to face up to reality reveal this aspect of deep self-denigration. The Irish have in some cases reacted to their harsh colonization by Britain in ways analogous to, if on a lesser scale than, the civil wars and genocides in other parts of the world. The extreme Puritanism of the Irish Catholic Church, as illustrated by the schoolroom lecture in James Joyce's *Portrait of the Artist as a Young Man* (1916), which describes in obsessive and gruesome detail the torments of hell that awaited those guilty of the most minor infractions, can be seen as a form of spiritual self-genocide.

The Irish have to some extent been able to triumph over their vicissitudes through their music, poetry, and literature. The heritage of learning and poetry that had its beginnings with the Druids survives to the present and continued through all the travails of Irish history. Mysticism was of central importance to the poet W. B. Yeats, who for many years held séances with his wife in which she performed automatic writing under the guidance, they believed, of spirit helpers called "Communicators." His purpose in doing this was to formulate for himself a philosophical/mythic framework for his poetry.

Poetry and literature—in a word, the word—has permeated Irish life, from that taught to Irish children in the hedge schools of past centuries (founded to flout the Penal Laws forbidding Catholics to teach and held outdoors in the shelter of walls or hedges), where Gaelic brehons (storytellers and musicians) taught Irish history and traditions and told tales of the Irish children's ancestry, to the works of the great writers. The oral traditions of the Druids live in the Irish mastery of conversation—storytelling, poetry recitations, and meteoric displays of wit.

The pub is the institution where these delights can be tasted along with Irish ale, stout, and porter, and where the renaissance of traditional Irish music has to a great degree been carried out. The traditional band of the Irish pub consists of the fiddle, the tin whistle, the bodhran (drum), flute, Irish harp, "squeeze box" (button accordion), and uilleann pipes (Irish

An Irish man and woman pose in front of their house in the early 20th century. (Library of Congress, Prints and Photographs Division [LC-USZ62-107621])

bagpipes). Another form of traditional musical gathering is the *ceili*, in which people meet to sing and dance. The greatly popular Irish dance production called *Riverdance*, which set the feet of audiences all over the world moving to the infectious rhythms of Irish step dancing, can also be said to symbolize the recovery of the Irish from their tragic past.

Irminones See HERMINONES.

Istaevoles (Istaeones; Istwaeoni)

According to the Roman historian Tacitus of the first and second centuries C.E. the Istaevoles were the most westerly proto-Germanic tribe or collection of tribes. In his account they lived along the Rhine and Weser River systems in present-day west-central and southern Germany, by the first century B.C.E. By the early first century C.E. a number of tribes emerged from this region, such as the CHATTI, FRANKS, and HERMANDURI, perhaps descendants of Tacitus's Istaevoles. Tacitus refers to three early groups, descended from Mannus, son of the Earth-born god Tuisto, and according to legend the founder of the Germanic nation. From his three sons the INGAEVONES supposedly emerged near the ocean in the north and the HERMINONES to the east and south and the Istaevoles to the west and south. Tacitus reports a second mythic version of the origins of GERMANICS in which Mannus has more sons who founded other tribes.

Italians: nationality (people of Italy)**GEOGRAPHY**

Italy borders France to the northwest, Austria and Switzerland to the north, and Slovenia to the northeast. The Italian Peninsula, making up more than half of Italy, is flanked by the Adriatic Sea to the east, the Ionian Sea and Mediterranean Sea to the south, and the Tyrrhenian Sea, the Ligurian Sea, and the Mediterranean Sea to the west. The total area is 116,341 square miles. Elba, Sardinia, and Sicily, islands of the Mediterranean, also belong to Italy.

The Alps form Italy's northern border, where lies Italy's highest elevation. The Apennine Mountains run southward from the Gulf of Genova, through the center of the peninsula, to the toe of Calabria. The Maritime Alps, part of the Northern Apennines, run along the northwest coast of the Gulf of Genova; Monte Corno (9,554 feet), the highest peak of the Apennines, is in the eastern mountain district.

About one-third of the country consists of plains, notably the Plain of Lombardy to the northeast, which is used for agriculture. The northeast coasts along the Adriatic Sea are sandy and low with shallow waters; Venice is among the few commercial ports. Marshlands stretch south along the west coast, including Campagna di Roma, the Pontine Marshes, and the Maremma. Important commercial ports and cities are situated along the western coastline.

An active volcano, Mount Etna, measuring 10,902 feet, is found in Sicily and another on Stromboli, a Lipari Island. Principal rivers include the Po and the Adige in the north and the Arno and the Tiber along the peninsula.

INCEPTION AS A NATION

Before and after the final defeat of the ROMANS in 568 C.E.—and the end of the Western Roman Empire—Italy was invaded and divided time and again. The Holy Roman Empire, established in 962 and dissolved in 1806 by Napoleon I Bonaparte, along with various foreign powers, especially France, Spain, and Austria, played a part in the changing regimes and shifting borders. Numerous and often competing states were created. The unification of Italy as a constitutional monarchy under the constitution originally adopted by Sardinia in 1848, with Victor Emmanuel as king and an elected parliament, marked the beginning of modern Italy. Moderate political and social reforms were enacted over the next years.

Italy fought World War I (1914–18) on the side of the Allies. According to the terms of the Paris Peace Conference, Italy obtained south Tyrol, Trieste, Istria, part of Carniola, and the Dalmatian Islands. Italy under the Fascist dictatorship of Benito Mussolini (1922–43) formed an entente with Germany and sided with Nazi Germany in World War II (1939–45). In 1946 Italy voted to abolish its monarchy and establish a republic. The peace treaty of 1947 defined Italy's present-day borders, with France, Yugoslavia, and Greece gaining former Italian territory. In 1948 a constitution officially established Italy

as a democratic republic with a bicameral elected parliament, and a president elected by parliament.

CULTURAL IDENTITY

Until less than a century ago Italians lived in a highly traditional agricultural society. The great geographical diversity of Italy, where the central mountain chain produces considerable climatic differences, as well as highly disparate cultural heritages derived from many different peoples, have led to strong regional diversity, evident in persistent local dialects, which until the 20th century were mutually unintelligible, and in holidays, festivals, songs, and regional cuisines.

Political unification of Italy occurred late, in 1861, and regional identity remains strong. It is something of an irony that the very concept of nationhood was born in the work of an “Italian”—the ancient Roman poet Virgil, whose depictions of the Italian landscape evoked a sense of belonging to the land as part of a nation beyond Rome or any one city. For Virgil the land of Italy was *patria*, the fatherland of all those sharing a history and ancestry played out there.

The concept of Italian nationhood that informed political unification in the 19th century was to a large extent a self-conscious intellectual construct. Its ideal was the cultural and social fabric created by the Italian city-states of the Middle Ages and Renaissance, with their towering artistic achievements and the civic social and economic order, made possible in large part by the active participation of wealthy patrons. Florence of the Medicis was the model. This concept based on only one region of Italy placed other regions at a disadvantage, particularly southern Italy (the Mezzogiorno), which, because of its different society and economy came to be seen as backward. Northern Italians came to regard southerners with contempt. This “southern question” has plagued Italian economic, political, and cultural life from unification to the present, and southern Italians have accused northerners of falsification of history in ascribing the reasons for southern economic woes—frivolity, laziness, and even immorality—and of neglect.

In a sense modern ideas of Italian nationhood, like those of ancient Romans, contain a strong element of coercion, imposition by a dominant people on all the rest. The experience of unification has become a controversial point of reference for 21st-century Italy. The experience of the Fascist dictatorship (whose

Division [LC-USZ62-122544])

icon, the *fasces*, a bundle of sticks meant to symbolize how individuality with all its frailty when bound together in a union becomes strength) has also cast a shadow over the idea of a unified Italian nation.

In recent years the Italian government has made progress in developing the Italian economy and stabilizing society, in the south as well as the north, and resentments have lessened to some degree.

In spite of regional differences, Italians do share certain fundamental traits and a basic outlook. The latter places high value on what has been called *la dolce vita*—the good life—an insistence on the importance of achieving a balance in life, for example, between work and play, with both regarded as essential. Many Italians believe it is a mistake to take matters too seriously and often use irony and humor to deflect the unpleasant aspects of life. Although Italians are famous for their volatile emotional outbursts, the fact that these are usually brief and quickly followed by tranquility underscores a certain ironic self-consciousness in them. (This ironic detachment and control of powerful emotions are characteristic of Italian music. A composer such as Gioacchino Antonio Rossini of the 19th century in his comic operas will whip up emotions to the

Italians: nationality time line

C.E.

11th century Florence and Milan become independent city-states; southern Italy is dominated by foreign rule.

1321 Dante completes *Divina commedia* (*Divine Comedy*).

1334 Giotto becomes chief architect of Duomo in Florence.

1341 Petrarch is crowned poet laureate in Rome.

1353 Giovanni Boccaccio publishes *Decameron*, which helps lay foundation of classic Italian prose.

1425 Fra Angelico becomes friar, soon beginning work as painter.

c. 1430–35 Donatello sculpts *David*.

1436 Leon Battista Alberti defines laws of perspective in *Della pittura*, based on work of architect Filippo Brunelleschi.

1494 Italian city-states are conquered by French armies; France and Holy Roman Empire compete to control Italy.

1503–06 Leonardo da Vinci paints *Mona Lisa*.

1508–12 Michelangelo decorates Sistine Chapel ceiling in Rome.

1515 Painter Raphael becomes director of all excavations of antiquities in and near Rome.

1516 Titian is named official painter of Venetian state.

1527 Charles V, Holy Roman Emperor, conquers Rome and wins control of Milan and Sicily from France.

1559 After Italian Wars of 1495–1559 Hapsburgs control most of Italy.

1592 Giordano Bruno is arrested by Inquisition for promoting Copernican cosmology and burned at stake eight years later.

c. 1595–1606 Caravaggio works in Rome; his paintings include scenes of life of St. Matthew.

c. 1605 Sculptor Pietro Bernini moves to Rome.

1609–10 Mathematician and scientist Galileo Galilei constructs refracted telescope and makes astronomical discoveries, such as that moonlight is reflected light, Jupiter has four moons, and sunspots move across surface of sun.

1684 Opera *Pompeo* by Alessandro Scarlatti is performed in Naples.

1720 Piedmont, Savoy, and Sardinia are united as Kingdom of Sardinia.

1725 Antonio Lucio Vivaldi composes concerto *Four Seasons*.

1754 Painter Giovanni Battista Tiepolo becomes director of Venetian Academy.

1794 Physician and physicist Luigi Galvani announces experiments establishing presence of bio-electric forces in animal tissue.

1796 Napoleon I Bonaparte conquers most of northern Italy, establishing Italian republics.

1797 Cispadane and Transpadane are united as Cisalpine Republic by Treaty of Campo Formio; renamed Italian Republic in 1802.

1804 Napoleon unites northern Italy as Kingdom of Italy.

1806 Holy Roman Empire ends.

1814 After Napoleon's defeat Italy divides into Papal States, Austrian duchies, Kingdom of Sardinia, and the Kingdom of the Two Sicilies.

1816 Opera *Il barbiere di Siviglia* (*The Barber of Seville*) by Gioacchino Antonio Rossini is performed in Rome.

1848 Kingdoms of Sardinia and Naples create constitutions; people of Milan expel Austrians; Venice, Rome, and Tuscany establish republics.

1849 Austria regains control of most of Italy.

- 1851–53** Three operas by Giuseppe Verdi, *Rigoletto*, *Il Trovatore*, and *La Traviata*, receive public acclaim.
- 1859** Austria begins war with Kingdom of Sardinia; Sardinia and France drive Austrians from northern Italy, although not from Venice.
- 1860** Northern Italy, except Venice, becomes part of Kingdom of Sardinia; Giuseppe Garibaldi conquers Bourbon rulers in Sicily then captures Naples.
- 1860–61** The Kingdom of Italy including entire peninsula except Rome, Venice, and San Marino, is formed under Victor Emmanuel II.
- 1866** Italy annexes Venice.
- 1870** Italy occupies Rome.
- 1871** Rome becomes capital of Italy.
- 1876** National Central Library of Rome is founded.
- 1882** Italy joins Austria-Hungary and Germany in Triple Alliance.
- 1884** Giovanni Verga's stage version of his novel *Cavalleria Rusticana* is performed. Giacomo Puccini writes his first opera, *Le Villi (The Witches)*.
- 1906** Painter and sculptor Amedeo Modigliani settles in Paris; poet Giosuè Carducci wins Nobel Prize in literature.
- 1911** Italy declares war on Ottoman Empire.
- 1912** Italy wins war against Ottoman Turks and acquires Libya and Dodecanese Islands.
- 1914** Despite Triple Alliance Italy sides with Allies when World War I begins.
- 1920** Painter Giorgi De Chirico cofounds magazine *Pittura Metafisica*.
- 1922** Benito Mussolini, Fascist leader, becomes prime minister of Italy.
- 1926** Novelist Grazia Deledda wins Nobel Prize in literature.
- 1929** Lateran Treaty establishes normal relations between Italian government and Vatican.
- 1934** Playwright Luigi Pirandello wins Nobel Prize in literature.
- 1936** Rome-Berlin Axis, agreement of common policy, is signed by Mussolini and Hitler; Mussolini conquers Ethiopia.
- 1937** Italy withdraws from League of Nations.
- 1939** Italy annexes Albania.
- 1940** Italy enters World War II, siding with Germany.
- 1943** Italy surrenders to invading Allies; government overthrows Mussolini; Italy declares war on Germany; in 1945 World War II ends.
- 1945** Roberto Rossellini films *Città Aperta (Open City)* during Nazi evacuation of Rome.
- 1946** By free election Italians vote to abolish monarchy and establish republic.
- 1947** Vittorio De Sica's film *Ladri Di Biciclette (The Bicycle Thief)* helps bring world renown to neorealism in cinema.
Architect Pier Luigi Nervi becomes professor at University of Rome.
- 1950s** Filmmakers Federico Fellini, Michelangelo Antonioni, Luchino Visconti, and Pier Paolo Pasolini gain international acclaim.
- 1955** Italy joins United Nations (UN).
- 1957** Italy joins European Economic Community (EEC), which evolves into European Community (EC).
- 1959** Poet Salvatore Quasimodo wins Nobel Prize in literature.
- 1975** Poet Eugenio Montale wins Nobel Prize in literature.

Italians: nationality time line (continued)

- 1992** Political corruption begins period of arrests and investigations.
- 1993** Italy becomes one of original 12 members of European Union (EU).
- 1994** Freedom Alliance, enforcing neo-Fascist elements, is led by Silvio Berlusconi; coalition falls apart; Berlusconi resigns as prime minister.
- 1997** Playwright Dario Fo wins Nobel Prize in literature.

brink of collapsing into chaos, then with a turn of phrase restore all to normal.) Italians will let their emotions loose temporarily in order to discharge them and restore balance. All this distinguishes Italians from Europeans in the north, particularly in Germany and Scandinavia, who tend to view work as an end in itself and to be reticent about expressing their emotions. A recent poll found that Italians spend roughly half their time in non-work-related activities such as eating, cleaning, and grooming. Food especially is an important element of Italian life. Work patterns in the country revolve around the midday meal.

Belief in the importance of family, religion, and one's homeland is also shared by most Italians. Central to Italian life is the tradition of the family as a guiding force, a focus of loyalty, and a bulwark when times are hard. The Catholic Church also has long been central to the life of Italians, and many attend Mass every day. The experience of emigration abroad has demonstrated that Italian émigrés maintain closer ties with their homeland (especially the family) than do many other European immigrants.

Given the diversity of Italian society, it is not surprising that, unlike other European literatures, contemporary Italian literature lacks a major work of fiction representing the nation's cultural identity. Rather, Italian literature consists of a kaleidoscope of brief narratives that express the complexity of Italian culture. In the variety of their forms and genres—realistic novels and philosophical short stories, memoirs, and literary essays—as well as in that of their subject matter such works provide a good entry into the multifaceted and contradictory identity of Italy as a nation.

Italics (Italic peoples)

The term *Italic*, applied by linguists, is used variously. In its broadest sense it refers to cultural characteristics relating to all the peoples of ancient and modern Italy, regardless of language. Yet it is most often applied to an Indo-European language family, which includes Latin and related ancient languages, as well as modern languages descended from Latin (although some scholars reserve the term *Italic* for the ancient languages only). And even when applied in its narrow sense—that is, relating to a language family of peoples on the ancient Italian Peninsula, there is disagreement, because of limited texts and inscriptions, as to what languages should be included and how they relate to one another. Some of the dialects of ancient Italy, such as Etruscan, seem pre-Indo-European and unique. Others, such as Venetic, seem to be related to Illyrian, spoken on the Balkan Peninsula.

The Italics described in this book include the ROMANS (whose historians provide many of the sources about the other Italic peoples) as well as the ADRIANI, AEQUI, AURUNCI, BRUTII, CAMPANI, FALISCANS, FRENTANI, HERNICI, LATINS, LUCANI, MARSI, MARRUCINI, PAELIGNI, PALMIENSI, PRAETUTII, SABINES, SAMNITES, UMBRIANS, VESTINI, and VOLSCI. These groups as listed in this book are not necessarily mutually exclusive. The Romans are a subgroup of Latins, the people who dominated the Italian Peninsula. The Sabines are considered a parent group to others. Ancient writers classified some of the tribes as Samnites. As regions were reorganized

and resettled by the Romans, the meaning of the names evolved.

Many other tribal names appear in the ancient historical record, some of them perhaps alternate names of the same groups, some subtribes, but others that formed a distinct political identity for a time but about whom little is known. Some among them apparently pre-Indo-European—CARPENATI, ENOTRI, LIGURIANS, OPICI, and VILLANOVANS—are not grouped with the Italics in this book, although they are part of the story of ancient Italy. The ETRUSCANS are thought to have migrated to Italy about the same time as the Italics, but it is not known from where. Other peoples, such as the IAPYGES (APULI, MESSAPI, and PEUCETI) and VENETI, are grouped as ILLYRIANS. Some of the tribes included in the list of Italics, such as the Frentani, Marrucini, Paeligni, Palmiensi, and Praetutii, may have originally been Illyrian-speaking peoples who fused with the Italics. The language of the PICENES is not known. The affiliations of the ELYMI, SICANI, and SICULI on the island of Sicily are also unknown (although the Siculi may have spoken an Italic dialect). Some of the peoples listed may actually be descendants of indigenous pre-Indo-European people who spoke Italic dialects. Another group on the Italian Peninsula were the GREEKS, who colonized Sicily and southern coastal areas, beginning in the eighth century B.C.E., sometimes referred to as Italiotes.

ORIGINS

The origins of the various Italic peoples are largely hypothetical. Evidence about them is taken from tribal names, place-names, ancient inscriptions, works of ancient writers, and archaeological discoveries. Ancient historical accounts are written by the Greeks as well as Romans, who used often-unreliable sources based in mythology and who wrote from their own nationalistic bias.

The timing of the arrival in Italy of speakers of an Indo-European language or languages ancestral to the Italic languages is uncertain, since archaeological evidence rarely provides direct information about language. This uncertainty is compounded by the fact that the timing and place of origin of the Indo-European language family itself are in doubt, with hypotheses ranging from the earliest Neolithic Age, with the first farmers in Europe, to the later Neolithic and the Early Bronze Age. In addition the mechanism of the spread of a proto-Indo-European language—whether by the movement of popula-

tions or of ideologies—and their concomitant practices, is still debated. The weight of current thinking is against population movements, at least on any large scale. Hypotheses from different disciplines are converging on a picture of proto-Indo-European as emerging during the fourth millennium B.C.E. or somewhat before as part of the slow adoption of a more mobile, pastoral lifestyle in southeastern Europe facilitated by the arrival of wheeled transport and an important change in farming practice. Proto-Indo-European may have begun as a sort of pidgin or creole dialect used by different peoples to communicate with one another, or it may have been a language chosen to be a lingua franca for the same purpose.

The implications of this picture for the arrival of an Indo-European language in Italy derive from the idea that the makers of the Corded Ware culture, which appeared in central Europe soon after these innovations in about 3500 B.C.E., began the spread of proto-Indo-European over a wide area. The Corded Ware culture did not reach Italy. Only after the evolution of the Corded Ware complex into the Early Bronze Age Bell Beaker culture in about 2500 B.C.E. did Italy come into contact with this tide of cultural change. The appearance of Bell Beaker artifacts in Italy around this time may signal the arrival of a variant of proto-Indo-European, possibly introduced by small groups of warriors and adopted by natives who emulated the Beaker lifestyle or used it as a “trade language”—for trade was an important means by which the Beaker lifestyle spread. Thus the first Indo-European-speaking migrants would have crossed the eastern Alpine passes into the plain of the Po River sometime around 2500 B.C.E. when the Beaker

Some Italic and Pre-Italic Peoples on the Italian Peninsula in About 500 B.C.E.

artifacts begin to appear there and then spread. Later Indo-European groups may have migrated from elsewhere in about 1200–1100 B.C.E. during the Late Bronze Age, when many peoples were on the move in the Mediterranean region, and settled other regions of the Italian Peninsula. They could have commingled with, displaced, or absorbed pre-Indo-European peoples, such as the Ligurians and Villanovans; a combination of all these processes is likely.

Other groups, perhaps non-Italic speaking, such as the Carpenati, Enotri, and Picenes, developed into distinct cultures in later centuries, perhaps indigenous or migratory, influenced by the Italic-speaking peoples. Various Illyrians are assumed to have migrated to the eastern Italian Peninsula from the western Balkan Peninsula across the Adriatic and to have commingled with the Italics. The Veneti, perhaps an Illyrian people, held territory in the northeast contiguous with that of the Balkan Illyrians. Many of the peoples of Italy started to become Hellenized in the eighth century B.C.E.,

and Celticized and Romanized from the fourth century B.C.E., making it even more difficult to determine origins. (The Italian Iron Age, during which many of these changes occurred, is said to have begun about 900 B.C.E. and to have lasted until 580 B.C.E., although while the Romans and Etruscans progressed from the tribalism of the Iron Age into the Archaic and Early Republic periods when writing began to be used and cities grew, other peoples can be said to have maintained an Iron Age society and way of life over the next centuries.)

LANGUAGE

The Italic language is divided into two branches: Romance and non-Romance. The modern Romance languages are descended from Latin, such as Italian, French, Portuguese, Spanish, Sardinian, Moldavian, and Romanian. The non-Romance branch is variously organized by different linguists. One system lists two major subgroups: Latino-Faliscan (or Latinium-Faliscan or Latinian), including various dialects of Latin and Faliscan; and Osco-Umbrian, including various dialects of Oscan and Umbrian. Within the Oscan classification is sometimes grouped a subfamily known as Sabellian or Sabelic (leading to use of the name Osco-Sabellian for Oscan); Sabellian dialects include Aeolian, Marrucinian, Marsian, Paelignian, Sabine, Vestinian, and Volscian. Other tribes spoke related dialects, about which less is known.

Various scripts were used to write these various languages, among them Greek, Latin, Etruscan, and five other alphabets, some of them derived from the others: Faliscan, Oscan, South Picene, Umbrian, and Venetic. Other inscriptions have yet to be classified.

HISTORY

Conflicts and History

The historical period of the Italics coincides with the rise of the group that became dominant among them, the Romans, before that period much is hypothetical because of limited archaeological evidence. Moreover the history of the Italics relates to neighboring non-Italic groups, such as the Etruscans. Italic peoples, especially the Romans and the mountain people known as the Samnites, were caught up in the struggle for dominance of the Italian Peninsula. The wars among ancient peoples, and alliances developing out of them, are typically documented by Roman (and Greek) historians. (In fact, here were other tribal groups on the Italian Peninsula

about whom little is known because they did not have direct conflict with the Romans.) In addition to non-Italic peoples inhabiting Italy peoples from other regions also were involved in the conflicts in the centuries B.C.E., such as the CELTS in the north and the Greeks and CARTHAGINIANS in the south.

Founding and Early Expansion of Rome

The date applied to the founding of Rome by people identified as Latins and Sabines is 753 B.C.E. The actual events surrounding this are not known; legend mixes with fact, and the emergence of Rome as a state is thought to have occurred several centuries later. In their early stages the Etruscans, living in the northwest in the present-day region of Tuscany, exerted political influence on the native inhabitants, and Rome was ruled by kings. By 509 B.C.E. the Romans had rid themselves of outside rule and developed a republican government. In 493 B.C.E. they joined the Latin League, an alliance of some 30 tribes and villages, and were one of many city-states vying for power in the region of Latium (part of modern Lazio). In 358 B.C.E. the league was reorganized under Roman leadership. In 341 B.C.E. the other members of the Latin League rebelled against the growing power of Rome. The Aurunci, Campani, Sidicini, and Volsci joined them. After suppressing the rebellion Rome dissolved the league in 338 B.C.E., its garrisons now imposing Roman will on neighboring cities.

Romans and Samnites

In the meantime in 343–341 B.C.E. the Romans had become embroiled in a conflict to the south between the Samnites and the Campani and their allies, the SIDICINI, sometimes referred to as the First Samnite War, which erupted when the Samnites attempted to expand from the region of Abruzzo (modern Abruzzi) into Campania. The Campani appealed to the Romans for help and they drove back the Samnites.

The Samnite power was far from broken, however, and competition between the two most powerful Italic peoples erupted in two wars, known as the Second (or Great) Samnite War of 326–304 B.C.E. (with the great Roman defeat at Caudine Forks in 321 B.C.E.) and the Third Samnite War of 298–295 B.C.E. (with the Roman victory at Sentinum in 295 B.C.E.).

To rule their territory the Romans build a system of roads, the most famous the Via Appia, or Appian Way, built in 312–264 B.C.E. and originally connecting Rome with Capua. It was later extended to Beneventum (modern Benevento),

Tarentum (modern Tarento), and Brundisium (modern Brindisi). Branch roads led to Neapolis (modern Naples) and other ports.

The Social War

After the Third Samnite War the Italics were generally pacified and increasingly Romanized, at least in the cities and towns, where Roman garrisons were stationed. The various peoples of Italy, as dominated by the Romans, were known as *socii*, meaning “allies.” In the third and second centuries B.C.E. they helped the Roman army in its increasingly wide-ranging campaigns. They were also trading parties. Many of them used Latin as much as their native dialect. Yet they were not Roman citizens and did not have the same property, travel, trade, and marriage rights and were subject to the will of Roman-appointed magistrates.

The various Italic peoples had distinct traditions and cultures. Moreover many of their towns were autonomous (and the people were known by the town name rather than a tribal name). Yet in the first century B.C.E. many of them, especially in the south, became united in a single cause, attaining equal rights as Roman citizens. Among the participants were the Frentani, Lucani, Marrucini, Marsi, Paeligni, Samnites (including their subtribe, the Hirpini), and Vestini, many of them mountain people. Other peoples were also involved, such as the Picenes, who were perhaps Italics in origin, and the Iapyges (except the Messapi) descended from Illyrian-speaking peoples, although, by this time, having commingled extensively with Italics. The inhabitants of Pompeii, referred to in some texts as Pompeiani (many of them Samnites), and of Venusium (modern Venuso), referred to as Venusini, also participated.

In 91 B.C.E. Marcus Livius Drusus, the tribune of the Roman people, proposed granting citizenship to the *socii*. His assassination that year, arranged by his opponents in the Senate, prompted the revolt known as the Social War or Italic War. Chief among the opponents were the Marsi (hence still another name for the conflict, the Marsic War). Fighting began in 90 B.C.E. with the massacre of Romans at Ausculum, the principal city of the Picenes (its inhabitants referred to as the Asculani). Various tribes began organizing a confederacy independent of Rome. The capital of the Paeligni, Corfinium, south of Paelignian Sulmo (modern Sulmona), became the rebel capital. Its name was changed to Vitallio, as indicated by inscriptions on the coins struck there in 90

B.C.E. to honor the hoped-for Italia Republic, with equal rights for all Roman citizens (the name Vitallio is the Oscan version of Italia). They also issued a special coinage and placed some 100,000 men in the field under the Marsians Quintus Pompeius Silo and Caius Papius Mutilus. The allied force had some early successes and, in view of the threat of other peoples joining them, the Roman consul Lucius Julius Caesar managed to convince the Senate to pass a law granting citizenship to noncombatants before the end of the year. This undercut the alliance, and the Romans won victories under Gnaeus Pompeius Strabo in the north and Lucius Cornelius Sulla in the south. Nevertheless with the Samnites still undefeated, the Romans granted citizenship to all peoples south of the Po Valley in 87 B.C.E.

Organization of Italic Lands

With Rome ever wary of the Samnites in 82 B.C.E. Sulla invaded Samnium and massacred and dispersed its inhabitants. Territorial expansion abroad would accelerate in ensuing years. In 27 B.C.E. the republic collapsed and Rome was ruled by emperors, the first of whom was Augustus.

Augustus divided Italy into 11 regions based on ancient regions and many of the names relating to tribal names: (1) Latium and Campania, from the mouth of the Tiber to that of the Silarus (Sele) River; (2) Apulia (Puglia) and Calabria, comprising the “heel” of Italy in the south; (3) Lucania and Bruttium, bounded on the west coast by the Silarus River, on the east by the Bradanus (Bradano) River, comprising the “toe” of Italy); (4) Samnium, bounded on the south by the Tifernus (Biferno) River and on the north probably by the Matrinus (Piomba) River; (5) Picenum, bounded by the Aesis (Esino) River and Matrinus River; (6) Umbria, bounded by the Upper Tiber, Crustumius (Conca), and Aesis Rivers; (7) Etruria, bounded by the Macra (Magra) and Tiber Rivers; (8) Gallia Cispadana, limited by the Po River, from Placentia (modern Piacenza) to its mouth, and by the Crustumius River; (9) Liguria, bounded by the Varus (Var), Po, and Macra Rivers; (10) Venetia and Istria, between the Po River and the Alps in the northeast; and (11) Gallia Transpadana, bounded by the Alps and the Po and Addua (Adda) Rivers, in the northwest. Other than slight modifications this system of organization was retained until the late fourth century C.E. and the reorganization by Emperor Diocletian.

CULTURE (*see also* ROMANS)

Economy

Farming Stock rearing was an important component of Italic agriculture. The products obtained from cattle and sheep, including leather and wool as well as meat and milk, formed part of the basis of Italic economy.

Trade Crete, the islands of the Aegean, and the southern Greek mainland formed natural way stations for trade between the urban civilizations of the Near East and the western Mediterranean. Knowledge of bronze making had spread from the Near East to Italy early in the Bronze Age, sometime after about 2500 B.C.E., reflecting at least intermittent contacts at this time. Material evidence for this trade is slight in its earliest stages and depends mostly on the rare Bronze Age shipwrecks that have been found. Pottery from the MINOANS of Crete entered Italy. By the 14th and 13th centuries B.C.E. trade between the MYCENAEANS and southern Italy, Sicily, and Sardinia had greatly increased. Metals, particularly copper and tin, formed an important part of this trade, part of which the Mycenaeans, acting as middlemen, transshipped to the Near East, where high-grade copper was scarce; bronze implements were also traded, made by the accomplished smiths of Italy and Britain, Armorica, and elsewhere in northwestern Europe. European cut-and-thrust swords, axes, and spearheads found in Greece probably entered there by way of Italy via the Po River valley.

Contacts with Inland Europe and Mycenae

After the arrival of Beaker users and their ideology Italy had more contact with peoples to the north. Northern Italy became part of a circum-Alpine province, as Alpine passes began to be used more regularly, both for trade and for grazing of animals in the summer; this practice of transhumance led to contacts with people in present-day Slovenia, Switzerland, and France. Concentrations of rock carvings are found along transhumance routes. From this time bronze workers in Italy were kept abreast of technical developments elsewhere by imports, as elites acquired the latest weapon styles. Fortifications with timber-laced ramparts began to be built, similar to those built in regions to the north. Central Italy had a stock-rearing economy with a less rich material culture, while in the south and Sicily Mycenaean contacts caused substantial changes in society.

Minoan and Mycenaean traders did not create a trade network in the western Mediterranean but rather established contacts

with an already-existing one. It was probably here that the amber found in 16th century B.C.E. Mycenaean sites was obtained, after being imported to Italy via Beaker networks. During the 15th and 14th centuries B.C.E. trade with the Mycenaean world continued to increase, but the collapse of Mycenaean civilization in about 1200 B.C.E. brought this to an abrupt end.

Renewal of Trade Links with Greeks and the Eastern Mediterranean The trading networks established in the western Mediterranean by the Greeks after 800 B.C.E. fostered the manufacture of goods in Italy, such as pottery, and the cultivation of wine, especially after the Greeks began trading with the Celtic Hallstatt culture in western Germany and France. This trade carried increasing quantities of slaves to Italy, a major resource of the northerners.

Government and Society

Arrival of Bell Beaker Warrior Culture in Italy After 2500 B.C.E. artifacts of the Bell Beaker culture began to appear in northern and central Italy. In contrast to that in other regions of Europe, from Britain to Iberia, there is clearer archaeological evidence in eastern France and the Alpine region that this warrior culture was spread by actual migrations of small groups of mounted warriors along the Upper Rhine and Rhône Rivers. Burials in Italy at this time contain remains of horses, rare for this period. The characteristic beakers of this culture, used to drink mead or possibly other alcoholic beverages, have been found on Corsica, Sardinia, and western Sicily, where they were decorated with paint in the local style. The Beaker culture was also borne by traders, and the start of inter-island trading in the western Mediterranean on a significant scale may have received its initial impetus from the Beaker trade networks.

Mycenaean Influences Mycenaean influences in Italy are shown by the palatial building constructed in Sicily in the 14th century B.C.E. with corridors and suites of rectangular rooms. Although not on the scale of Mycenaean palaces, this edifice demonstrates the existence in Sicily of an increasingly complex socioeconomic situation and the rise of elites. Elsewhere in southern Italy settlements for the express purpose of trading were built during this time.

Given the lack of sophistication of the Italian pottery of the 13th century B.C.E. found on Crete, compared to highly accomplished ware made by the Mycenaean themselves, it is possible that people from Italy had settled on

Crete, taking their pottery with them, somewhat before the series of disasters and dislocations in 1200 B.C.E. that would end Cretan and Mycenaean civilization.

One of the causes of the disappearance of Minoan-Mycenaean civilization appears to have been a series of devastating attacks on Mycenaean power centers. The identity of the attackers is unknown and has long been debated. A clue is provided by Egyptian accounts and depictions of SEA PEOPLES who attacked that country at the same time. The Egyptians called them the Shardana and the Shekelesh, and these names have been associated with Sardinia and Sikelia (Sicily), although whether the raiders originated in these places or settled there after their raids is still uncertain (the latter is the favored view).

The founding myth of the Romans may contain elements common to the founding myths of other Italic peoples, in part because they had absorbed so many of them into their society. The legend of Aeneas's fleeing the burning city of Troy, stopping at Carthage in North Africa, then settling on the banks of the Tiber, and founding the dynasty that would produce Romulus, founder of Rome, may have derived from oral histories of the Sea Raiders' sacking all over the eastern Mediterranean cities and then sailing to Italy to settle.

After 1000 B.C.E. trade expansion and political changes begun under Mycenaean influence continued to lead to the state societies that emerged in Italy in the mid-first millennium B.C.E.

Resurgence of Greek Influence Colonists and traders from Greece began to impact Italy once more from 800 B.C.E. as rapid population increases in Greece strained the capacity of local resources. New colonies and trading emporia were established; one of the earliest known was created on the island of Ischia in the Bay of Naples, an ideal site for trade with the metal-rich Etruscans (in modern Tuscany). Greeks created this and numerous other settlements in southern Italy and Sicily; by about 650 the region was known as Magna Graecia (Greater Greece). Meanwhile traders from among the PHOENICIANS were penetrating the northern coast of Africa and the southern Mediterranean, including western Sicily and southwestern Sardinia.

Increasing competition among Greeks, Etruscans, Phoenicians, and Carthaginians on the North African coast caused increasing con-

flict, which eventually led to the outbreak of the First Punic War in 264 B.C.E. All of these events resulted in the militarization of societies in Italy, which competed with each other for dominance, the process that would lead to the rise of Rome.

Dwellings and Architecture

The early dwellings of the Italics were round-houses with mud walls, tapering sides, and a conical roof supported by external posts. After 1300 B.C.E. as elsewhere across a wide region of Europe the Italics began building settlements on hilltops, constructing large, walled compounds where people lived and farmed. It is not certain whether these hilltop settlements (or *oppida*) were built for defense or for reserving of arable land for farming and grazing. The city of Rome began as an *oppidum* on the Palatine Hill.

Other Technologies

From the early Bronze Age metalworkers in Italy maintained contact with technological developments elsewhere in Europe and created their own styles. Iron was increasingly used in this transitional period on the Italian Peninsula from the Late Bronze Age to the Iron Age.

Art

Beads of amber were used to decorate fibulae in the Bronze Age. Amber remained an often-used medium into the Iron Age. Small amber carvings of natural and mythic animals, stylized thunderbolts, and human heads were suspended from necklaces or decorated belts and fibulae.

Italic artists made sculptures of bronze and stone. Many bronze figurines of warriors have elongated bodies and limbs. Stone carvings include menhirs, upright slabs inscribed with two-dimensional figures, usually of warriors, which were first made in Bell Beaker times, and relief sculptures used for tomb slabs. Italic artists were influenced by the Etruscans and by Mycenaean and Minoan art.

Religion

The early Italic peoples worshipped spirits, called Numina, instead of gods. Numina dwelled in rivers and trees, groves, fields, and buildings. Some of the gods worshipped by Romans and other Italic tribes in later times may originally have been Numina. The Romans' household gods, the Lares and Penates, protectors and nourishers of each family, probably had their beginnings as Numina. Belief in a multitude of spirits surrounding humankind on every

level, which each person encountered by day or night, waking or sleeping, gave rise to the complex system of rituals of placation that pervaded every aspect of Roman life, even after the tribal past had been left behind. Romans were guided in their every action by the principle of *pietas* (duty), probably derived from the ancient worship of Numina. Duty consisted of proper worship and sacrifice to the gods, in return for which the gods would provide good fortune.

Although some of the gods worshipped in Rome in republican and imperial times were introduced from abroad, others must have existed among the Italic peoples from much earlier times. The worship of Ceres, the goddess of grain, probably had its roots in placation of the spirits of growing things. The homegrown nature of the offerings due to Ceres as described by the Roman poet Ovid in his *Fasti* (*Festivals*) suggests their antiquity. He advises worshippers to offer Ceres spelt, a kind of grain used by early peoples, a little salt, and grains of incense tossed onto the flame of an old hearth. If they lacked incense, pine resin would do, as it had for the rustic Italic peoples unacquainted with the essences of the Near East—frankincense and myrrh.
