The women keep prudently out of the way during this struggle, and stand aside to watch the chief and concluding ceremony. This is nothing more than a general fight. The inhabitants of the island arrange themselves in two divisions, one half fighting against the other. All engage in this battle, the highest chiefs as well as the lowest cooks taking part in it. There is no respect of persons, the king, or even the Tooi-tonga himself, being assaulted without compunction, and handled as roughly as any of the common people.

Severe as is the fighting, it is all conducted with the greatest good humor, and no one displays a sign of ill-temper at the injury which he receives. If a man is knocked down, he gets up with a smile; if his arm is broken, he retires from the battle and has it set, but he never thinks of complaining. The same system is observed in the boxing and wrestling matches of which the Tongans are so fond.

In wrestling matches, for example, it is not thought polite for any one man to challenge another; he ought to give a general challenge, by striking with the right hand the bent elbow of the opposite arm. If the challenge be accepted, the antagonists meet very leisurely, and take care to fasten tightly the gnato belt that surrounds the waist. They grasp the belt with a hand on each side, and endeavor to throw their antagonist by lifting him from the ground and flinging him on his back. The vanquished man rises and retires to his place among the spectators without showing any displeasure. Only in one case did Mariner know a man display ill-feeling at being beaten, and in that instance the man, although a chief, was looked upon as an ill-bred fellow.

The victor seats himself on the ground for a few seconds, and then retires to his place, his friends belonging to his own side singing, or rather chanting, a song of victory. After a short time he again rises and offers another challenge, and if it be accepted by several antagonists, he may select one from them. If they find that they are equally matched, they leave off by mutual consent; and sometimes, if a man encounters a chief much superior to him, he will generally yield out of respect to the other's rank. This only takes place in single combat, not in the general fight of the Tow-tow festival.

Boxing is conducted on similar principles of fair play. The challenger proceeds into the middle of the ring, holding one arm stretched out in front and the other behind, and advances sideways, changing sides at every step. When the challenge is accep-

ted, both combatants wrap a piece of cord round their hands and proceed to blows, which are given with great force and rapidity. When one is vanquished, he retires with apparent unconcern to the ring, and sits to watch the combats of others, knowing that to be vanquished is not considered a disgrace. When the victor returns to his people, they welcome him, but do not sing the chant of victory unless he has knocked his antagonist down. Falling is on these occasions considered as equivalent to being killed in real battle, and, in consequence, the song of victory is not sung unless the antagonist has fallen to the ground. If a man be beaten in wrestling, he may not wrestle a second time in the same day, though he may box, and *vice versa*.

In the ceremony of Tow-tow, these scrambling, boxing, and wrestling matches are carried on every tenth day, and are repeated eight times, so as to make up the eighty days of the festival. After each battle, those who have touched a superior chief come to be relieved of the tapu which they have contracted by touching him. Even the Tooi-tonga, whose nose has been flattened, his teeth knocked out, and his face pounded to a jelly by a mere peasant, over whom he has supreme command of life and death, performs the needful ceremony with perfect good humor.

The illustration No. 1, on the 999th page, represents the concluding scene of this ceremony. In the foreground are seen the two contending parties, one of which is beginning to get the victory over the other. In the centre of the illustration, and on the left, are the fragments of the food-piles, with a few men still scrambling for them, and in the distance the women are seated under the trees, watching the progress of the fight.

Fighting is not confined to the men, but is practised also by the women, who on this occasion lay aside the ordinary gentleness and mildness for which they are remarkable. When Captain Cook visited Tonga, he was much surprised to see the girls step into the ring and box with as much spirit and determination as had been shown by the men. They do not, however, carry the combat to such extremes, and if one of them does not speedily yield, the combatants are parted by the elder women. Even the merest children box after a similar fashion, the little girls knocking each other about with hearty good-will as long as they are allowed to fight.

On one occasion, Finow ordered that all the women who were seated as spectators should engage in a general fight, after the manner of the men. They seemed nothing loth, and all the women who lived on the north of the island fought against those who lived on the south side. Nearly fifteen hundred women engaged on each side, and

fought with the greatest courage for more than an hour, both parties contending with such determination that neither could gain a foot of ground; and at last Finow ordered them to desist, seeing that several ankles had been sprained and limbs broken.

Besides boxing and wrestling matches, the Tongans have club fights on great occasions. As with the other matches, the combatants are divided into two parties, one being seated opposite to the other, with a considerable space of ground between them.

When all is ready, a man jumps up, runs to the people of the opposite side, and sits down in front of them, asking if any of them will fight him. As in the boxing and wrestling matches, to challenge a particular opponent is bad manners. If the challenge

be accepted, the combatants walk to the middle of the ring, each attended by his second, and then settle whether they shall fight after the Tongan or Samoan manner. The former mode does not allow a man to strike an antagonist after he is knocked down, but only to flourish his club over him in token of victory. By the latter mode he is allowed to beat the fallen man as long as he shows signs of life. When the fight is over, the men on the side of the victor chant their song of triumph, and the conqueror advances to the king, sits down before him in token of respect, and then rises and returns to his own party. On one of these occasions, the young prince fought no less than fourteen battles, and was victorious in every one of them.

CHAPTER CI.

TONGA—*Concluded.*

SICKNESS — BURIAL — GAMES.

SACRIFICE OF THE FINGER, AND MODE OF OPERATING — SACRIFICE OF CHILDREN — CONSULTING THE GODS — MODES OF INSPIRATION — SACRIFICE OF WIVES — FINOW'S GOOD SENSE — SUPPOSED CAUSES OF DEATH — FINOW'S FUNERAL — CUTTING THE HEAD — OPENING AND CLOSING THE VAULT — DRESSING THE GRAVE — APPOINTMENT OF A SUCCESSOR — CONCLUDING CEREMONIES — IDEAS OF RELIGION — VARIOUS SPORTS AND GAMES — RAT SHOOTING AND BIRD CATCHING — FINOW AND THE DECOY BIRD — BALL PLAY — A DANGEROUS STAKE, AND HONORABLE PAYMENT — THE LOVER'S CAVE, AND A NATIVE LEGEND.

As might be expected, various ceremonies take place with regard to sickness and burial.

If any one is ill, the inferior relations cut off a joint of the little finger as an offering to the gods. Sometimes a whole joint is taken off at once, but those who have many superior relations remove only a portion, so that they may be able to offer the sacrifice several times. In consequence of this superstition, there is scarcely a person in Tonga who has not lost a considerable portion of the little finger of one or both hands.

The mode of amputating the finger is simple enough. It is laid upon a flat block of wood, and the edge of a knife or axe, or even a sharp stone, placed on it. A smart blow is given with a mallet, and the stump, which bleeds but little in consequence of the nature of the operation, is held over the smoke of fresh grass, so as to check any after bleeding. No application is made to it, and in a week or two it heals without trouble. The Tongans do not seem to fear this operation, and even little children may be seen quarrelling with each other for the honor of having it performed upon them.

Should the illness take an unfavorable turn, instead of a mere finger, a child is offered to the gods by being strangled. For example, when Finow fell ill of the malady from which he died, and was apparently sinking, his eldest son took a young child of the king's from its mother's lap, strangled it, and offered it to the gods at various consecrated houses. The people look with the greatest compassion on the poor little vic-

tim, but think that it is right to sacrifice a little child who at present is useless to the community, and may not live to be of service, so that they may obtain in exchange the life of a chief who is needed by his people.

Such a sacrifice is sometimes made on other occasions, when the anger of some god is to be averted. In Tonga there are several sacred places, in which to spill blood is a sacrilege, so that they serve the purpose of cities of refuge. Once a chief named Palavali was pursuing some men, who ran for refuge to the nearest sacred spot. One of them was just getting over the fence, when Palavali, in the heat of the moment, struck him on the head, so that he fell dead within the enclosure. As soon as he had done the deed he was filled with fear, and reported what he had done to Finow, who consulted a priest. The priest, becoming inspired, said that a child must be sacrificed to the gods, and the chiefs, after holding a consultation, agreed that they should sacrifice a child of one of their own number by a female attendant. Such children are always selected, for two reasons; firstly, because the child of a chief is held to be a worthy sacrifice, and secondly, because, as its mother is of inferior rank, it could never live to be a chief.

The mother, knowing the custom, took alarm, and hid the child, but it was at last found by the men who were sent to search for it. The rest must be told in Mariner's words. "Its poor mother wanted to follow, but was held back by those about her. On

hearing its mother's voice it began to cry, but when it arrived at the fatal place of execution, it was pleased and delighted with the band of gnatoo that was put round its neck, and, looking up in the face of the man who was about to destroy it, displayed in its beautiful countenance a smile of ineffable pleasure.

"Such a sight inspired pity in the heart of every one; but adoration and fear of the gods was a sentiment superior to any other, and its destroyer could not help exclaiming, as he put on the fatal bandage, 'O yaooé chi vale!' ('Poor little innocent!') Two men then tightened the cord by pulling at each end, and the guiltless and unsuspecting victim was soon relieved of its painful struggles. The body was then placed upon a sort of hand-barrow, supported upon the shoulders of four men, and carried in a procession of priests, chiefs, and Matabooles clothed in mats, with wreaths of green leaves round their necks.

"In this manner it was conveyed to various houses consecrated to different gods, before each of which it was placed on the ground, all the company sitting behind it, except one priest, who sat beside it, and prayed aloud to the god that he would be pleased to accept of this sacrifice as an atonement for the heinous sacrilege committed, and that punishment might accordingly be withheld from the people. After this was done before all the consecrated houses in the fortress, the body was given up to its relations, to be buried in the usual manner."

This particular case had a strange termination. Four or five days after the sacrifice, Palavali went on a foraging excursion at the head of a body of men who were not tried soldiers, and met with a smaller body of real warriors. In a very short time Palavali's men began to run, and it was in vain that he tried to rally them. At last, in boldly facing the enemy to set his men an example, he received four spears in his body, and fell. This sight angered his men so much that they charged the enemy, drove them back, and rescued their dying chief. They were proceeding to draw out the spears, but he told them that it would be useless, as the gods had doomed him for his sacrilege, and he must die. His prognostication was correct, for he died half an hour after the battle.

When a priest is consulted on any subject—say, on the sickness of any one—a carefully regulated ceremony is performed. On the previous night a hog is killed and prepared, and taken to the place where the priest lives, together with plantains, yams, and kava root. Next day they all go to the patient's house, and there seat themselves in order, the priest taking his place just within the eaves, if the appointed spot be a house. Opposite to the priest is the kava

bowl, and around him sit the Matabooles as usual; but on this occasion the chiefs always mix with the people, or even sit behind them, thinking that such retiring and humble behavior is pleasing to the gods.

From the moment that all are seated, the god is supposed to take possession of the priest, who sits silently with his hands clasped in front of him, his head bowed, and his eyes bent on the ground. The kava being prepared, the required questions are put to him. Sometimes he answers them at once, but very often he remains in silence until all the provisions are eaten and the kava drunk. When he does speak, it is in a low, constrained voice, generally above its natural pitch, the words being supposed to be the utterances of the god through him without his volition. In some cases he is quite calm and quiet while delivering his answers, but at others his face becomes inflamed, his eyes seem ready to start from their sockets, tears pour from his eyes, and his words issue in broken sobs and gasps.

This paroxysm lasts for some time, and then gradually subsides. As it is passing away, he takes up a club which is placed near him for the purpose, gazes at it attentively, and then locks round, apparently without seeing the object at which he looks—"his eyes are open, but their sense is shut." Suddenly he raises the club, and dashes it violently on the ground, at which instant the god is supposed to leave his votary, who immediately rises and leaves the place of honor, retiring to the back of the ring among the people. The man of highest rank present then takes the place of honor, and more kava is served.

When a priest is consulted on behalf of a sick person, the inspiration retains its hold as long as the patient is in his presence, and in some cases the inspiration lasts for several days. If one priest cannot find a cure, the patient is taken to another, and so on, until he either recovers or dies.

The illustration No. 2, on the next page, represents a consultation of the priest respecting a sick child. In the foreground are the provisions and the presents brought to the priest, and in the centre is the kava bowl. On the right is the priest, seated in a state of inspiration, with crossed hands and bowed head, listening to the questions which are being put by the Mataboole. The mother of the child is seen with the infant in her arms, and around are members of her family, all wearing coarse mats instead of fine gnatoo, and having round their necks the leaves which denote humility.

Other persons beside chiefs become inspired, generally by the spirits of those whom they had known in life. The eldest son of Finow, who afterward succeeded to the throne, used to be inspired by a great chief who had been murdered by his father and another chief. Mariner asked him

(1.) THE TOW-TOW. (See page 995.)

(2.) CONSULTING A PRIEST. (See page 996.)

what were his feelings on such occasions, and he replied that he felt restless and uncomfortable, and all over in a glow of heat, and that his mind did not seem to be his own. When asked how he knew the name of the spirit who then visited him, he answered that he could not tell—he knew it intuitively, but could give no explanation.

While Mariner was in the Tonga Islands, a young chief, remarkable for his beauty, became inspired to such a degree that he fainted, and was taken to the house of a priest, who told him that the spirit was that of a young woman who had died two years before, and was now in Bolotoo the Tonga heaven. She inspired him because she wished for him as a husband in Bolotoo, and would soon take him there. The young chief acknowledged the truth of the exposition, saying that for several nights he had been visited in his sleep by a young woman, and had suspected that she was the person who inspired him. Two days after he was taken ill and died. Mariner was present when the priest gave his explanation of the illness.

Shortly before Mariner was at the Tonga Islands, a still graver form of human sacrifice was practised than that of a child.

When the Tooi-tonga died, his chief widow was strangled on the day of the funeral, and buried in the same grave with him, just as is the case in Fiji, whence in all probability, the Tongans borrowed the practice. Comparatively short as was Mariner's stay two Tooi-tongas died; but in neither case was this terrible rite observed. In the one case there happened to be no chief wife, all his wives being so equal in rank that neither of them ruled the household; and, in consequence a selection of a victim became impossible. In the second case the chief wife was the daughter of Finow, who said openly, that if the husband were to die first, his daughter should not be strangled, for that to destroy a young and beautiful woman because her husband had died was inflicting a double loss upon the community. As it happened, the Tooi-tonga did not die until after the elder Finow was dead and had been succeeded by his son, who not only carried out his father's wishes on that subject, but would not allow another Tooi-tonga to succeed; thus abolishing the source of the only rank that was superior to him.

The Tooi-tonga being abolished, it necessarily follows that the ceremony of Ináchi was abolished too, and but for the fact of Mariner's enforced residence in Tonga, this curious and interesting ceremony would have passed away without being known to European civilization.

Mariner was present at the wedding of Finow's daughter to the Tooi-tonga, and describes it with some minuteness. It much resembled a Fijian wedding, except in the costume of the bride, who was first copiously

anointed with cocoa-nut oil scented with sandal-wood, and then arrayed in a vast number of the finest Samoan mats, which were wrapped round her in such quantities that her arms were stuck out almost horizontally from her body, and her legs were so much trammelled that she could not sit down, but had to rest in a bent attitude upon her attendants.

She was eighteen at the time. Had it not been for the good sense of Finow, Mariner would have seen within a very short time her wedding, her murder, and her burial. The technical name for the ceremony of strangling is Nawgfa.

We now come naturally to the subject of funerals, and will take as a typical example the funeral of the elder Finow.

Almost immediately after the death and burial of his favorite daughter, a child about seven years of age, Finow fell ill, his malady having been increased by the exertions which he made during the long ceremony of the funeral. It was on this occasion that he ordered the women to box in general combat. On the evening of that day Finow retired to a small house that had just been built for him, and was seized with a violent illness, which almost deprived him of the power of speech, though not of intellect. He evidently knew that his end was at hand, and continually muttered "My country! my country!" evidently feeling that calamities might come on his land if he were suddenly taken away.

A child was offered on behalf of him, which had already been selected, but, by the time that the sacrificing party had come back to the house where the king lay, he had lost both his speech and his consciousness, and in a few minutes the great and wise Finow had departed this life. When his death was ascertained, a curious ceremony was performed. The body was carried to the Tooi-tonga's house, and placed on the hole in which the cooks were accustomed to light their fires. This was a symbolical expression of humility and submission to the gods, the cooking place being so degraded a spot that only the lowest Tooas would condescend to touch it.

Not only the king himself, but all those in his confidence, fully believed that his death was caused by a god named Toobo Totai, to whom he had prayed in vain for his daughter's recovery. In revenge for the negligence of the god, Finow had made arrangements for killing his priest, and had been heard to say that if Toobo Totai did not change his conduct, and exert himself a little more, his priest should not live long. Finow's sudden death put a stop to this project, which was only known to one or two of his immediate friends. It is not unlikely that the threatened priest may have heard of his intended assassination, and saved himself by getting a dose of poison

administered to Finow at the funeral banquet.

Finow was right in his prognostications of trouble, for no sooner was his death known than a number of the principal chiefs of different islands began to assemble their forces, with the intention of seizing on the throne. His successor, however, inherited his father's wisdom, and took such precautions that the attempt of the conspirators was quietly foiled.

After the royal corpse was brought back from the Tooi-tonga's dwelling, it was laid on bales of gnatoo in the large conical house, which was nearly filled with women, who kept up a continual lamentation, led by his daughter, a beautiful girl of fifteen. Even by night the lamentations went on, the house being lighted up with lamps made of cocoa-nut shells half filled with cocoa-nut oil, which is only used on such occasions; and on the following morning the people assembled on the marly to take part in the obsequies of their late king, whom they both loved and feared. Indeed, among savage nations, there is no love toward a chief who is not thoroughly feared.

By this time the faces of the principal mourners were scarcely recognizable, being swollen and disfigured by the repeated blows which they had inflicted on themselves as signs of sorrow. The chiefs and Matabooles who were especially attached to the person or household of the deceased king proceeded to inflict even severer injuries upon themselves, using the club, or shell, or a sharp stone; and running two or three at a time into the open space, while they cut their heads with the clubs and shells so that the blood poured down their bodies in streams; as they did so, they uttered a sort of dirge, some specimens of which have been given by Mariner. The following is his translation of the death chant and accompanying proceedings.

"Finow, I know well your mind; you have departed to Bolotoo, and left your people, under suspicion that I or some of those about you are unfaithful; but where is the proof of infidelity? where is a single instance of disrespect?' Then inflicting violent blows and deep cuts in the head with a club, stone, or knife, would again exclaim at intervals, 'Is not this a proof of my fidelity? does this not evince loyalty and attachment to the memory of the departed warrior?' Then perhaps two or three would run on and endeavor to seize the same club, saying with a furious tone of voice, 'Behold, the land is torn with strife, it is smitten to pieces, it is split by revolts; how my blood boils; let us haste and die! I no longer wish to live: your death, Finow, shall be mine. But why did I wish hitherto to live? it was for you alone; it was in your service and defence only that I wish to breathe; but now, alas! the country is ruined. Peace and happi-

ness are at an end; your death has insured ours: henceforth war and destruction alone can prosper.'

"These speeches were accompanied with a wild and frantic agitation of the body, whilst the parties cut and bruised their heads every two or three words with the knife or club they held in their hands. Others, somewhat more calm and moderate in their grief, would parade up and down with rather a wild and agitated step, spinning and whirling the club about, striking themselves with the edge of it two or three times violently upon the top or back of the head, and then suddenly stopping and looking steadfastly at the instrument spattered with blood, exclaim, 'Alas! my club, who could have said that you would have done this kind office for me, and have enabled me thus to evince a testimony of my respect to Finow? Never, no, never, can you again tear open the brains of his enemies. Alas! what a great and mighty warrior has fallen! Oh, Finow, cease to suspect my loyalty; be convinced of my fidelity! But what absurdity am I talking! if I had appeared treacherous in thy sight, I should have met the fate of those numerous warriors who have fallen victims to your just revenge. But do not think, Finow, that I reproach you; no, I wish only to convince you of my innocence, for who that has thoughts of harming his chiefs shall grow white-headed like me (an expression used by some of the old men)? O cruel gods, to deprive us of our father, of our only hope, for whom alone we wished to live. We have indeed other chiefs, but they are only chiefs in rank, and not like you, alas! great and mighty in war.'

Such were their sentiments and conduct on this mournful occasion. Some, more violent than others, cut their heads to the skull with such strong and frequent blows, that they caused themselves to reel, producing afterward a temporary loss of reason. It is difficult to say to what length this extravagance would have been carried, particularly by one old man, if the prince had not ordered Mr. Mariner to go up and take away the club from him, as well as two others that were engaged at the same time. It is customary on such occasions, when a man takes a club from another, to use it himself in the same way about his own head; but Mr. Mariner, being a foreigner, was not expected to do this: he therefore went up, and, after some hesitation and struggle, secured the clubs one after another, and returned with them to his seat, when, after a while, they were taken by others, who used them in like manner.

The next proceeding was to place the body of the dead king in the grave, which was at some distance from the place where those wild laments had been made. Having arrived at the spot, a small house was speed-

ily put together, the body was laid in it, and the whole house was covered with coarse black gnato, the sign of mourning, which passed over the top of the house, and hung from the eaves to the ground, so as entirely to conceal it.

Here another set of lamentations took place, while a number of men were employed in opening the grave. All great families bury their dead, not merely in the ground, but in a solid vault, about eight feet long by six wide, and eight deep. It is made of six enormous stones, the upper one, which forms the cover, being necessarily larger than the others. For the convenience of raising it when required, the upper stone does not fit quite closely upon the lower, some smaller stones being placed between them at one end.

After digging some ten feet deep, the men came to the vault, and, having cleared away the earth, they passed a rope under the end of the stone cover, and by the united force of nearly two hundred men raised it on end. Several bodies were already in the grave. Two of them, which had been buried for full forty years, were dried and nearly perfect; while others, which had not been buried nearly so long, were reduced to a few bones. In some cases the vault is lined with the gnato on which the body rested, while in others it becomes the property of the presiding Mataboole.

All being ready, the body of Finow was handed down into the vault, still lying on the gnato, and the body of his daughter, at whose funeral he was seized with illness, was buried by his side. The stone was then let down with a great shout, and the head-cutting and maiming began afresh. The next ceremony was that of collecting sand for the decoration of the grave.

The whole company formed themselves in single line, the women going first, and proceeded to the back of the island, singing loudly to warn stragglers of their presence. For any one not actually engaged in a funeral to be seen on the road is held as so great an insult that any ordinary man would lose his life. Even if the king himself saw a similar procession advancing, he would hide himself until it had passed. Remaining on his feet, though it might not actually cost him his life, would probably be so bitterly remembered that he might lose his throne. As soon as the funeral party arrived at the place where the sand was found, they all set to work at making baskets out of leaves, which they suspended from sticks and carried on their shoulders. By the time that they reached the grave, it was nearly filled up with earth, and the remainder was filled with sand, which was carefully and neatly smoothed.

Next came a very curious custom, that of burning the cheeks. The mourners, clothed in mats and green leaves, set fire to little

rolls of bark, and pressed them against each cheek-bone, so as to raise a circular blister. This is then rubbed with the juice of an astringent berry, which causes the wound to bleed, and the blood is smeared over the cheeks. The friction is repeated daily for twenty days, so that an indelible scar is the natural result.

The day after the burial a ceremony took place by which the young prince was installed in his father's place, and invested with his father's name. Finow was the name of the reigning family; but, according to custom, no one but the actual king was allowed to bear it. Sometimes, as a mark of especial favor, he allowed it to be borne by a relation, but always in conjunction with some other name. The name by which the young prince had previously been called was Moegnagnongo.

The ceremony was begun by a kava party, at which the young prince presided. The two first cups having been filled and drunk, the third was due to the president. The Mataboole who directed the proceedings said, while all eyes were fixed on the prince, "Give it to FINOW," thus acknowledging him as the king of Tonga. The young king displayed not the least emotion on being called by the new name, as that would have been thought beneath his dignity, but took the cup as quietly as if he had been called by the name of Finow all his life.

Rites similar to those which have been described went on for nineteen days, and on the twentieth the concluding ceremony was performed. All the relations of the deceased king, together with those who had taken part in the funeral, went to the back of the island, and procured a great quantity of flat pebbles, mostly white, but having a few black among them. These they carried to the grave, and strewed completely over the grave in the form of an oval, each pebble being laid by the side of the other. The black pebbles were laid upon the white ones.

Dances, wrestling matches, and head-cutting then took place, in which latter rite the fishermen of the late king distinguished themselves in a very curious manner. Into each cheek they thrust three arrows, the points of which passed into the mouth. The shafts of the arrows were brought over the shoulders, and to each pair was tied another arrow across the shoulders, so as to make a triangle. Equipped in this extraordinary manner, they walked round the grave, and, not satisfied with this proof of their devotion to their late master, they cut their heads with their paddles, and pinched up the skin of their breasts, thrusting a spear through the fold. A grand wrestling match ended this complicated series of ceremonies.

At the burial of one great chief, who was assassinated while walking with the king (apparently with his connivance), a very curious variation of the ceremony took place.

As soon as the body had been lowered into the vault, one of the assassins, a man of exceptional strength and stature, advanced toward the grave, and, brandishing his club, avowed himself as the murderer, and challenged any friend of the deceased chief to fight him.

The challenge was not accepted, and, although one of the wives of the murdered man did her best to arouse the family to vengeance, she could only succeed in inducing them to erect a strong fortress, in which they hoped to bid defiance to Finow. The king, however, was too wise to allow such a standing menace to remain, started off with four thousand warriors, and reduced the disaffected chiefs to obedience. In storming the fort, the challenging chief distinguished himself by his deeds of arms. Though wounded in the breast with a five-barbed spear, he broke off the shaft, scaled alone the enemy's fortress, knocked out a man's brains with his club, and made good his escape. As he retreated, however, he received another spear in his back, and died on the following day. It is remarkable that in this battle nearly all the assassins perished.

The religious system of the Tongans is tolerably simple. They believe that there are several orders of gods, just as there are several ranks of men. The principal gods are self-existent and eternal; but the second order of gods are the souls of deceased chiefs and Matabooles. All of noble blood have souls, and take rank in Bolotoo, or Paradise, not according to their moral merit, but according to the rank which they held in the world. Matabooles become ministers to the gods, just as they were ministers to the chiefs; but they are not powerful enough to inspire priests. There is also a class of mischievous gods, who are, fortunately, much less powerful than the benevolent deities.

As to the Mooas, or middle class, the learned are rather doubtful whether they go to Bolotoo, or whether they have souls. But that the Tooas, or peasantry, have no souls, there is not the slightest doubt, and that they can go to Bolotoo is therefore impossible.

With regard to Bolotoo, or Paradise, the Tongans believe it to be an island somewhere to the north-west of Tonga. It is a most beautiful place, full of the choicest fruits and the most lovely flowers. Pigs are plentiful, and never die unless they are killed to supply food for the gods, in which case another hog comes into existence to supply the place of the one that was killed. So, when a fruit or a flower is plucked, another immediately takes its place. These particulars are learned from some Tongan voyagers, who were returning from Fiji, but were driven out of their reckoning by a storm. At last they were blown to a lovely island, on which they succeeded in landing.

There was abundance of fruit, but their hands could not grasp it. They walked through the trunks of trees, and through the walls of houses as if they were mere shadows; while some of the inhabitants walked through their own bodies in a similar manner. Then they found they were at Bolotoo. The gods told them to go home at once, and promised them a favorable wind. They reached Tonga in safety, but all died soon afterward, the air of Bolotoo not suiting mere mortals.

It has already been mentioned that the religious and secular lives of the Tongans are so blended together that it is very difficult to separate them, and that even their amusements partake somewhat of the religious character. There are, however, one or two of their games which partake but slightly of this element, and which are yet characteristic of the natives. One of these sports is called Fanna-kalai, and is a very ingenious mode of bird catching by means of decoys.

In order to practise this amusement, the sportsman furnishes himself with a bow and arrows, goes into the woods, and there encloses himself within a large wicker cage covered with green leaves, so that the inmate may not be seen, but having plenty of openings through which the arrows can be aimed. By his side he has a small cage, in which is kept a hen bird, and on the top of the large cage the cock bird is tied by the leg. When properly trained, these birds continue calling to each other, and thus attract numbers of their own species, which fall victims to the arrows.

Well-trained birds are exceedingly valuable, and one chief has been known to make war upon another for the sake of procuring an especially fine bird. Indeed, the Tongans look on these birds much as sportsmen of the olden times looked on their falcons. To each pair of birds there is a keeper, whose whole business it is to attend to and train them. He is careful to teach the cock bird to flap its wings as it calls to its mate, and to utter its notes loudly, so that they may be taken as a challenge to other birds to come and fight him. The bird keepers have almost unlimited powers, as nothing is allowed to interfere with the welfare of their charge. Even when a famine visits a district, the birds must not starve. The keeper forages for the birds, and if he sees a fine bunch of plantains, he is allowed to put the tapu on it by sticking a reed in the tree, after which the proprietor dares not touch the fruit which he has saved for himself and his family. He may starve, but the birds must be fed.

As may be imagined, the keepers attend to their own interests as well as those of the birds, and are great pests to the neighborhood, fleeing the people without mercy.

Now and then they go a little too far in their insolence, and a complaint is laid against them, in which case the man seldom escapes without a severe beating.

In order to show the enormous value of these birds, Mariner tells a story respecting the elder Finow. The chief of Hihifo possessed a bird which he had himself trained, and which was the best that ever was known. Finow heard of this bird, and sent a commissioner to Hihifo in order to treat with the chief for the purchase of it. This the owner declined to do, saying that not only had he an affection for the bird, which he had himself trained, but he had sustained many wars made on him by neighboring chiefs who wanted to get the bird — many lives had been lost, and he felt his honor involved in keeping it. However, he intrusted the ambassador with another pair of birds, very nearly as good, and asked him to present them to Finow.

The king tried the birds next day, and was so delighted with their performance that he was the more anxious to obtain the bird which was even superior to them. He therefore prepared a present, which according to the Tongan ideas of that day was of almost incalculable value, comprising, beside whales' teeth, gnattoo, kava, and other native productions, several iron bolts, a quantity of beads, a looking-glass, a grindstone, and some axes, all of which had been procured from Europe, and most of them from the vessel in which Mariner had been wrecked. Seeing that Finow was determined to have the bird, and that he would probably make war if again refused, the chief wisely accepted the present, and sent the desired prize with a polite message.

As this sport is necessarily a very expensive one, it can only be practised by the king and very great chiefs, even the lesser chiefs being unable to bear the cost. There is another sport which is limited to chiefs and Matabooles. This is Fanna-gooma, or rat shooting, and is conducted as follows. Two chiefs take the command of two parties who intend to shoot rats, and arrange the preliminaries, *i. e.* settling the course which they mean to take, the number of shooters on each side, and so forth. On the appointed day, they go to some place which has been previously fixed upon, each being provided with his bow and two arrows.

These arrows are six feet in length, and made of a reed headed with hard wood. They are most beautifully made, the heads being smooth and polished with the greatest care, and the junction of the head and shaft guarded with plaited sinnet. In some of these weapons in my collection, the sinnet is scarcely broader than sewing silk, and is laid on with a perfection that is scarcely credible. After the sinnet is finished off, a slight coating of transparent varnish is laid over it, so as to bind the plait more firmly

together, and to give it an uniform polish. In some arrows there are several similar belts of plaited sinnet. No feather is needed, as they are never aimed at any distance, and their great length is requisite to allow them to go straight through the bushes among which the rats lurk.

The bow is about the same length as the arrows, and not very powerful, so that the aim may not be disturbed by the effect of drawing it.

When they are ready to start, a couple of attendants are sent forward, who take in their mouths some roasted cocoa-nut, which they chew, and spit the fragments on either side of the path. If they come to a cross-road, they plant in it an upright reed, by means of which a tapu is laid on the path, in order to prevent any one from passing along and disturbing the rats. No one ever disregards this tapu. Even if one of the greatest chiefs come toward it, he will stop at a distance and sit down until the sportsmen have passed, while an inferior chief would to a certainty be clubbed for his insolence if he were to break the tapu.

When the party start, they arrange themselves in the following manner. They walk in Indian file along the path, the leading chief of one party going first, followed by the leading chief of the other side. Then come the men of next rank on either side, and so on alternately. Except the leading man, no one may shoot at a rat that is in front of him, though he may do so if it be on either side, or behind him. As soon as any one has shot his arrow, he changes places with the man behind him, no matter whether the shot be successful or not, so that each in turn has his chance of becoming the leading man, and so getting a double chance of a rat. Every sportsman has an attendant who follows the party, and, as soon as his master has discharged an arrow, picks it up and returns it to him.

In order to attract their game, the sportsmen imitate the squeaking of a rat, which often has the effect of bringing them out of their holes, and if a rat should run away instead of waiting to be shot, one or two of them, with a sharp percussion of the tongue, utter another sound, which has the effect of making the rat stop and sit up to listen. The party that shoots ten rats first wins the game. Birds of any kind are counted as rats.

These two sports are necessarily restricted to chiefs, on account of the expense in one case and the power of the tapu in the other, but there is another which is played only by chiefs and Matabooles, being restricted to them by etiquette and not by necessity.

The two players sit opposite each other, and one of them makes one of three movements with his right hand, *i. e.* presenting the open palm, the closed fist or the

extended forefinger. His antagonist endeavors to imitate the movements, but if he can succeed in making five without being imitated, he wins a point, and marks it by laying down a little piece of stick. Should the antagonist be successful, he asks of the other player what were the preceding movements, their order and the reason for each of them. If his opponent should fail to give the correct answer, he loses a point, but if he succeeds, the game is continued.

The skill lies not in seeing and imitating the various movements, which are made so rapidly that an inexperienced eye cannot detect one of them, but in remembering the movements made by the antagonist, and in giving a feigned explanation of each. This explanation must be made according to the laws of the game, and alters with every variation in the order of the movements, so that considerable readiness and ingenuity are needed in order to invent on the spur of the moment an explanation according to the laws of the game. The chiefs are exceedingly fond of this game, and, while playing it, work themselves up to a wonderful pitch of excitement. The lower orders play a game somewhat similar to this, except that no discussion about the moves is allowable, and the intellectual element is therefore wanting.

There are many other games that are common to all ranks. One of these is called Tolo. A piece of soft wood, nine inches in diameter, is fastened to the top of a post of harder wood about five or six feet high, and the game consists in throwing a heavy spear so that it shall stick in the soft wood. Six or eight persons play on each side, every player being allowed three throws. Another game with spears somewhat resembles the djerid, and consists in hurling blunted spears at each other.

The Tongans are singularly dexterous of hand. They excel in ball play, and have a game which consists in playing with five balls, which are thrown from one hand to the other, so as to keep four balls always in the air. They sing a song at the same time, each cadence coinciding with the transfer of the balls from one hand to the other, and for every verse that they can finish without a mistake they score one point. They have also a game very much resembling our cup and ball.

Another game in which dexterity of hand is needed is called Lafo. A mat is laid on the ground, and the players throw beans on it, each trying to knock off those of his antagonist. This game has a sort of celebrity from having been connected with one of the few acts of cannibalism attributed to the Tongans. During a severe famine, two daughters of a chief played a game of lafo with two young warriors. If the men won, they were to have half the yam, but if they lost, they were still to have half the yam,

but were obliged to go out, kill an enemy, and divide his body with the girls. They lost the game, ate their yam, and waited until night for the fulfilment of their promise. After dark they stole out, and hid themselves near the fortress of the enemy. As they had anticipated, in the early morning one of the men came out to fetch salt water, and passed near the spot where they lay in ambush. They struck him down with their clubs, and at the risk of their lives brought his body off to the spot where the girls lived. If in any of these games there should be a dispute, the men settle it by an extemporized wrestling match, and the women by spinning a cocoa-nut.

Being islanders, they are very familiar with the water, and practise the well-known sport of surf swimming. This sport will be described when we come to treat of the Sandwich Islands. They have another aquatic sport peculiar to themselves. Two posts are driven into the bed of the sea, about seventy yards apart, a spot being chosen where the water is about ten feet deep. Each player takes in his hands a large stone, jumps into the water by one post, and tries to carry it to the other post by running along the bottom. The chief difficulty is to pursue a straight course, as at such a distance the winning post is not visible through the water.

While Mr. Mariner was at the Tonga Islands, he took part in an amusement which derived its origin from a love legend. He accompanied Finow to a small island called Hoonga, and, on walking down to the sea-shore, he saw his companions bathing near a great rock, and was startled to find that they one after the other dived into the water and did not come up again. Just as the last was preparing to dive, he asked the meaning of this astonishing proceeding, and was told to follow, and he would be taken to a place where he had never been before, and where Finow and his Matabooles were then assembled.

He then dived into the water, and Mr. Mariner followed him, guided by the light reflected from his heels. Passing through an aperture in the base of the rock which has just been mentioned, he rose to the surface of the water and found himself in a cavern. At first he could see nothing, but he could distinguish the voices of Finow and his other friends; and after a while became so accustomed to the dim light that he could just manage to see that he was in a vast stalactitic cavern.

As the only light which entered it was reflected from the bottom of the water, and exceedingly dim, he dived out again, wrapped up his loaded pistol in a quantity of gnatoos, directed a servant to prepare a torch in the same manner, and dived back again. By means of the pistol he lighted the torch, and probably for the first time

since it was formed, the cavern was illuminated. It was about forty feet wide and as many high, and ran off at one side into two galleries. Its roof was covered with stalactites hanging in the fantastic patterns which they are apt to assume. The story which was told him respecting the discovery of this cavern is quite a romance of savage life.

Many years ago a young chief of Vavaoo discovered the cavern by accident, while diving after turtles, but took care to keep the discovery to himself, as he thought he should find it useful in case he was detected in a plot against the principal chief of the island, a man of cruel and tyrannous disposition. Another chief had the same intentions, and was organizing a revolt, when he was betrayed by one of his own followers, and condemned to be drowned, together with the whole of his family. It so happened that he had a very beautiful daughter whom the young chief had long loved, but to whom he dared not speak, knowing her to be betrothed to a man of higher rank than himself.

When, however, he found that her life was to be sacrificed, he contrived to make his way to her in the evening, told her of the fate which was in reserve for her, and offered to save her. The girl at once consented, and the two stole gently to the sea-side, where a little canoe was drawn up. On their way to Hoonga the young chief told the girl of this place of retreat, and as soon as the day broke took her into the cavern. He was not long in finding out that the affection was mutual, but that the fact of her being betrothed to another had caused her to avoid him.

She remained in this cavern for two months, during which her young husband brought her the finest mats and gnatoo, the best food, and everything which constitutes Tongan luxury. He was, however, forced to spend a considerable part of his time at Vavaoo, lest the tyrannical chief should suspect him, and he was naturally anxious to take his wife to some place where they could live together in safety.

Accordingly, he called together his subordinate chiefs and Matabooles, and told them to prepare for a voyage to the Fiji Islands, accompanied with their wives and families. This expedition was kept secret lest the tyrant should put a stop to it. Just as they started, one of the chiefs advised him to take a Tongan wife with him, but he declined to do so, saying that he should find one by the way. They took his reply for a joke, and set sail toward Hoonga. When they neared the shores of the island, he told his men to wait while he went into the sea to fetch a

wife, and, leaping into the sea from the side of the canoe which was farthest from the shore, he dived and disappeared.

After waiting for a while the people began to be seriously alarmed, thinking that he must have met with some accident, or that a shark had caught him. Suddenly, while they were debating as to the best course to be pursued, he appeared on the surface of the water, accompanied by a beautiful young female, whom he took into the canoe. At first his people were terribly frightened, thinking that she was a goddess; but, when they recognized her features, they took her for an apparition, believing that she had been drowned together with the rest of her family. The young chief arrived safely at the Fiji Islands, where he lived for two years; and at the expiration of that time, hearing that the tyrant of Vavaoo was dead, he returned to his native island, bringing with him his strangely rescued wife.

The facts of this story show that the cave must have some opening which admits the outer air, as otherwise no one could have lived in it so long. Even granting that the time of the girl's residence was exaggerated, Mr. Mariner found that the air was perfectly fresh and sweet after Finow and his friends had remained in it for several hours, and a torch had been burned in it besides.

The island in which this extraordinary cavern is found is rather venerated by the Tongans as being the origin of their group of islands. Tongaloa, the god of arts and inventions, let down a fishing-line from the sky into the sea, when he suddenly felt his hook caught. He hauled up his line, thinking that from the resistance he had caught a very large fish. It turned out, however, that the hook had got itself fixed in the bed of the sea, and as the god continued to haul he drew up the Tonga islands. They would have been much larger, only the line broke, and the islands were left imperfect.

Mr. Mariner learned that the hook by which the Tonga islands had been drawn from the bed of the sea was kept in the custody of the Tooi-tonga, but had been burned, together with the house, about thirty years before. It was about six inches long, and from the description was one of the ordinary fishhooks of the country. Mariner asked why it did not break when hauling up so enormous a weight, and was told that it was a god's hook, and therefore could not break. Being asked how it happened that the line, which was also the property of a god, broke, his interlocutor declined to pursue the subject any further, saying that so he had been told, and that there was no necessity for further inquiries.

CHAPTER CII.

SAMOA, OR THE NAVIGATORS' ISLANDS.

APPEARANCE — CHARACTER — DRESS — MANUFACTURES.

POSITION OF THE GROUP, AND DERIVATION OF THE NAME — GENERAL APPEARANCE OF THE PEOPLE — THEIR CHARACTER FOR GENTLENESS, HOSPITALITY, HONESTY, AND COURTESY — CARRYING A MISSIONARY AND HIS FAMILY — AFFECTION FOR CHILDREN — DRESS OF THE SAMOANS — THE TATTOO A PARTIAL SUBSTITUTE FOR DRESS — MODE OF TATTOOING — TIME OCCUPIED IN COMPLETING THE OPERATION — THE FINE MATS OF SAMOA — WIG MAKING — FEATHER HEADDRESSES — DRESS OF THE WOMEN — DANCING COSTUME — ADVICE TO FAA-SAMOA — MODE OF DRESSING THE HAIR — TREATMENT OF WOMEN — MODE OF MAKING CLOTH — THE PROFESSIONAL AND HEREDITARY MANUFACTURER.

NORTH of the Tongan group, and a little to the eastward, lie the NAVIGATORS' ISLANDS, more properly called by their native name of SAMOA, or HAMOA. The former of these names was given to them by Bougainville, in consequence of the skilful seamanship of the natives. There are eight islands comprehended in this group, the largest of which is Savaii.

As is often the case among these island groups, no single king or head chief is recognized, each island having its own ruler; under whom are subordinate chiefs of different ranks. This mode of government is so similar to that of the Tongans that we need not expend any time upon it.

The Samoans are a fine race of people, much exceeding the English in average stature, and peculiarly well made. Their skin is smooth, soft, and a warm reddish-brown in color, and the hair, though copious, possesses none of that woolliness which distinguishes the hair of the Papuan races, but is long, straight, and, in a few cases, possesses a slight wave. Naturally there is but little beard, and the Samoan takes a pride in extirpating every sign of a hair upon his chin. He is quiet, composed, and stately in manner, so that in all things he presents a bold contrast to the black, harsh-skinned Fijian, with his frizzed and woolly hair, his copious beard, and his quick, restless, suspicious manner.

Being savages, the Samoans have many of the imperfections which necessarily accompany savage life, but at the same time they approach nearer to the "noble savage"

of the poet than most races of men. They are hospitable, affectionate, honest, and courteous, and have well been described as a nation of gentlemen. Toward strangers they display a liberality which contrasts greatly with the cruel and bloodthirsty customs of the Papuan tribes. The Fijians, for example, do all in their power to repel strangers from their shores, either driving them off, or killing and eating them. The Samoans, on the contrary, welcome strangers, allot to them their best houses, give them the best food, and make them feel that they are honored guests.

They are singularly affectionate in their disposition, and as parents are rather too fond of their children. As a rule, a Samoan parent cannot bear to thwart a child, and allows it to do what it likes. In consequence of this absence of discipline, many a child dies through the mistaken kindness of its parents, who have allowed it to eat food that was unsuitable to it, or to engage in games for which it had not sufficient strength.

The honesty of the Samoans is really wonderful. When a number of them were on board of an English vessel, they scrupulously refrained from stealing. Property which to them was equivalent to unbounded wealth lay within reach of their hands, but not even a nail or a needle was touched. In one instance, an European vessel went ashore on the rocks. The whole of its cargo was at the mercy of the Samoans, but not a man went on board of the vessel, and the

whole of the property was reserved for the rightful owners. There are many civilized countries where the vessel would have been ransacked within an hour of her striking on the rocks.

Once when a great chief, named Malietoa, went on board an English vessel, accompanied by a younger brother, he examined everything with great attention, but asked for nothing, only requesting the white men to come on shore and visit him. This they did, bringing with them a present of axes, mirrors, beads, knives, scissors, needles, and similar articles. When the present was offered, Malietoa took up each article separately, laid it on his head, and returned thanks for it, and after he had gone through the whole of the present in detail, he made a complimentary speech, in which he thanked the donors for the entire gift. His brother, to whom a similar present had been offered, at first refused to take the basket, priceless as were its contents, but passed it on to his elder brother, saying that he would take whatever his brother did not happen to want.

"At the close of this important and interesting interview, Malietoa informed his people, who had been gazing with wonder upon the novel proceedings, that a large quantity of valuable property had been given to him, and that the English chiefs, to whom he was indebted for it, would want something to eat on their return. 'For,' said he, 'there are no pigs running about upon the sea, neither is there any bread-fruit growing there.' Upon hearing this, the whole company instantly rose and scampered away; and in about an hour they returned, bringing with them fifteen pigs of various sizes, with a large quantity of bread-fruit, yams, and other vegetables, the whole of which the chief presented to us." This extract, from the journal of Mr. Williams, the well-known missionary, gives a good idea of the hospitable nature of the people.

Courtesy is, among the Samoans, reckoned as one of the duties of life. They address each other by titles of honor, and it is considered as an essential point of etiquette that, when one man addresses another, he should use a title rather higher than that to which his interlocutor has any claim. Should he be ignorant of the rank of the person whom he addresses, he uses the term chief, as a safe one.

The earlier voyagers have all been struck with the Samoans, whose gentle demeanor, perfect honesty, scrupulous cleanliness, graceful costume, gigantic stature, and polished manners, made a strong impression upon them. When Messrs. Williams and Barth visited these islands, they were received in the most hospitable manner. As they went on shore, the former happened to mention that he was tired, when a young chief addressed a few words to the people,

and in a moment the visitor was lifted off the ground by a number of gigantic young men, who seized him, "some by the legs, and others by the arms, one placing his hand under my body, another, unable to obtain so large a space, poking a finger against me; and thus, sprawling at full length upon their extended arms and hands, I was carried a distance of half a mile, and deposited safely in the presence of the chief and his principal wife."

Several children were on board, and were carried off by the natives in great glee. One or two of them were missing for several hours, causing their parents great anxiety. However, they were all brought back in safety, their absence being due merely to the exuberant hospitality of the Samoans. The natives were so delighted at their good fortune in having the charge of a white child that they could not make up their minds to restore it to its parents, but took it home, killed and baked a pig and other food, feasted the child to the fullest extent, and then, having kept it as long as they dared, restored it to its parents. This anecdote carries out the statement already made, that the Samoans are exceedingly fond of children. Mr. Pritchard mentions that on one occasion, when he was witnessing a native dance, which is a performance requiring the greatest exertion, the chief's wife sat as a spectator, with two fine twin children in her lap. The chief, engaged as he was in the absorbing amusement of the dance, could not keep himself away from his children, but every now and then left the dance to caress them. The mothers nurse their children for several years, and a child of five or six years old may often be seen to pull away its younger brother or sister and take its place.

THE dress of the Samoans varies considerably, according to the rank of the individual and the occasion on which it is assumed. The usual dress of the men is a sort of small apron, about a foot square, made of the green leaves of the *Dracæna* tree, but on occasions of ceremony they generally wear a flowing robe called the lava-lava. This is made of bark cloth, and is beautifully fine and soft, the Samoans excelling in such manufactures, which will presently be described. This robe is gathered round the waist into folds, and reaches down to the ankles.

Small as may be the ordinary dress of the Samoan men, they always seem to be fully dressed, in consequence of the tattooing with which they are carefully decorated. Even to European eyes the tattooing conveys the same impression, and has been mistaken for a dress by some of the early voyagers, who described the people as being clothed from the waist downward, with fringed lace "made of a silken stuff, and artificially wrought."

The reader will remember that the New Zealanders tattoo no part of the body except the hips, and that even in that case a semblance of dress is produced. The Samoans tattoo the whole of the body from the hips to the knees, covering the skin so completely with the pattern that it looks at a little distance exactly as if the man were wearing a tight pair of ornamental drawers.

Even European eyes become so accustomed to the tattoo that they are rather shocked at its absence; and, according to Mr. Pritchard, an untattooed Samoan does in truth look unmanly, looks even naked, by the side of one who is tattooed. So completely is this feeling realized by the natives that chiefs who have arrived at middle age frequently undergo the process of tattooing a second time, in order to renew the patterns, as they become dim and uncertain by lapse of years; for, though indelible, the tattoo does fade in the course of years, as I can testify from personal experience. When a very young boy, I read of the custom of tattooing, and must needs try it on my own arm. I did not do much of it, but the whole arm swelled up to the shoulder, and was useless for some time. At first the marks were bright blue, clear and well-defined, but now the blue is of dull indigo, and the outline very undecided.

The production of this elaborate decoration is a work of considerable time, the operation being, in the first place, too painful to be continued for any long time; and, in the second, it is apt to cause so much disturbance in the general system that the result would be fatal if the whole were executed at once. The operation is generally performed in company, a number of young men keeping company with the son of the chief. When, for example, a chief's son arrives at the proper age, *i. e.* about eighteen, all the lads of his tribe assemble to partake with him of the tattoo, which is to transform them from boys into men.

There is quite a ceremony, or rather a series of ceremonies, for the occasion. The tattooer or Matai, is a man of great influence, and his services have to be requested in regular form, accompanied by a present of fine mats. His acceptance of the mats ratifies the bargain, though no regular charge is made. On the appointed day, the lads and their friends meet in a house set apart for the ceremony, and more mats are presented to the Matai. Should the youth be wealthy, he sometimes gives a canoe. The friends of the lads are also bound to supply provisions as long as the operation lasts.

The tools are simple enough, being a set of five "combs" and a little mallet. The combs are made of human bone, and are an inch and a half in length, varying in width from the eighth of an inch to an inch, and looking very much like little bone adzes

with the edges cut into a number of teeth. These blades are attached to handles about six inches in length. The pigment which is introduced into the wounds is made from the ashes of the cocoa-nut.

All being ready, the young chief lies on his face in front of the operator, and lays his head in the lap of his sister or some other female relation, while three or four young women hold his legs, and sing at the tops of their voices, in order to drown any groans or cries that he may utter. This is done out of consideration for his reputation, as it is thought unworthy of the state of manhood to utter a sound. Still the pain is so intense that the lads often do utter groans, and now and then actually yell with the pain. In one or two instances they have been so utterly overcome with the agony that, after they have been released they have not dared to submit themselves again to the operation, in which case they are despised for life as cowards.

Having traced out his pattern, the operator begins his work, driving the teeth of the comb through the skin by sharp and rapid taps of the mallet; there is an art even in holding this instrument, the handle of which passes under the thumb and over the fore-finger, and is used with wonderful rapidity and regularity. "The rapidity with which the Matai works his fingers," writes Mr. Pritchard, "the precision with which he moves the instrument and punctures exactly the right spot, and the regularity of tapping with the mallet, are astounding." By the side of the patient are placed several assistants, furnished with strips of white masi, whose duty it is to wipe away the blood as it flows from the punctures of the comb, and to leave the skin clear for the operator. Between every two or three strokes the toothed end of the comb is dipped into the pigment, which is mixed with water.

The pattern is in its main elements alike throughout all the Samoan Islands; but there are usually slight variations which denote the island in which the man lives, and others which mark the family to which he belongs. Sometimes, after a man has slain an enemy, he will make an addition which corresponds to a grant of arms among ourselves. The form of some animal is the ordinary pattern for such a badge of honor.

About an hour is occupied in executing a patch of tattoo not quite three inches square, and when this is done, the lad rises and another takes his place. In a week or so, the turn of the first lad comes round again, and so the process is continued for three or four months, according to the number of the patients, not more than five being operated on in a single day. When the pattern is about half completed, the Matai has another present; but the great payment is only made when the last finishing touch is put to the

(1.) TATTOOING DAY IN SAMOA. (See page 1013.)

(2.) CLOTH MAKING. (See page 1015.)

work. Should the Matai feel dissatisfied with his fees, he will not go on with the work, and, as an unfinished tattoo is thought to be most disgraceful, the friends of the youths get together what property they can, and make up the deficiency.

During the time engaged in the operation, the patients look most miserable beings, the wounded parts swollen and inflamed, and displaying as yet none of the elegant pattern which has been traced on them. The lads hobble about in all sorts of contorted attitudes, fanning away the flies with flappers made of white masi, and doing all in their power to alleviate the pain. At last, however, comes the reward of all their sufferings. As soon as the wounds are healed, their friends get up a grand dance. As the costume of the male dancers is nothing but the little apron of leaves which has been already mentioned, the pattern of the tattooing is freely displayed; and the lads, now admitted among the men, think themselves well repaid for their former sufferings by the honor and glory of being ranked as men, and by the admiration of the opposite sex.

An illustration on the preceding page represents the process of tattooing. In the centre is lying the patient with his head in his sister's lap, and his legs held by her companions, who are singing, in order to cover his groans, should he utter any. Near him are two assistants with their white masi cloths, and at his side kneels the operator, busily at work with his mallet and comb. The little vessel of pigment is by his side. Ranged round the wall of the house are the young men who are waiting their turn. Painful as is the operation, and expensive as it is, involving not only the fees to the operator, but a constant supply of provisions, all the lads look forward to it with the greatest anxiety, knowing that they will never be considered as men unless they can show a complete tattoo.

Both men and women wear mats, called in the native language "je-tonga." One of these mats is in my collection, and is a beautiful piece of work. It is made of very narrow strips of leaf scraped thin, each strip being about the fifteenth of an inch in width. These are plaited together with beautiful regularity, and the whole is edged with a very fine and almost silken fringe of the same material.

Some of these mats are decorated with the red feathers of the parrot tribe, and increase in their value by age, being handed down to successive generations, and having legends attached to them. My own specimen has been adorned in a way which doubtless was very imposing to a Samoan eye, though not to that of an European. The native maker had evidently treasured up some scraps of English calico, and some blue and yellow paper such as is used for wrapping parcels. These treasures she has fastened to the mat,

to which they give a most ludicrous appearance.

Samoan chiefs, when full dressed for war or state, may be known at a great distance by the splendid headdress which they wear. In the first place, they increase the apparent size of their heads by enormous wigs made of their own hair, which is suffered to grow long for this express purpose. When it has attained sufficient length, it is cut off, and is stained red, and frizzed out, until it assumes as large dimensions as the woolly head of a Papuan. They also wear great plumes of feathers, sometimes towering to the height of nearly two feet above their heads; so that the height of a Samoan chief, measured from the top of his plume, is not far from nine feet.

One of these headdresses in my collection is made of a vast number of feathers, tied by the stems in little bundles, and carefully arranged so that they shall droop evenly. There are about ten feathers in each bundle. These tufts are arranged closely together in circles composed of leaf stems and cocoa-nut fibre, and there are four of these circlets placed one over the other, so that several hundred feather tufts are employed for this single dress. The maker has ingeniously, though ignorantly, copied the peacock, the egret, and other birds which are furnished with trains. In them, the tail feathers are short and stiff, so as to allow the long train of feathers to droop gracefully over them. In a similar manner, the Samoan artificer has employed the shortest and stiffest feathers in the lower-most circlet, while in the uppermost are placed the longest and most slender plumes. The headdress is really very handsome, and even when worn by an European gives a most martial aspect to the countenance, especially when the war mat is worn, and the huge Samoan club carried on the shoulder.

The dress of the women is made of the same material as that of the men, but differently arranged. Their work costume is a petticoat of *Dracæna* leaves, but instead of being, like that of the men, a mere short apron, it is much longer, and completely surrounds the body. On occasions of state or ceremony, however, they wear lava-lavas of siapo like those of the men, only put on rather differently, and of much larger size. A woman of rank will often have this garment so long that it trails on the ground far behind her.

Captain Hood, in describing an entertainment given in honor of the white visitors, writes as follows. "After the men had danced a number of girls entered, who went through a somewhat similiar set of evolutions, with infinite exactness and grace. It may seem incredible to our fair sisters in England, that a young lady arranged in no other garment but a mat tied round her waist should look handsomely dressed; but could they see these Samoan belles enter

the circle in their full evening costume, with their coronets of nautilus shell and scarlet hibiscus, and their necklaces of red and yellow flowers, I believe they would admit that their appearance is highly imposing.

"Some wore beautifully plaited fine mats, which are so highly prized that they cost more than a rich silk or satin dress. Others had white shaggy dresses, made from the inner fibres of the hibiscus, the amplitude of which would satisfy the most extensive patronesses of crinoline, and indulged in trains equalling in length that worn by those dames of England in former days, while their carriage and air plainly showed that, whatever we might think, they felt themselves superior beings." To judge from the photographed portraits of these Samoan beauties, Captain Hood is perfectly right; they not only look well dressed, but, if anything, over dressed.

That this opinion was not a rare one is evident from Mr. Williams's account of Samoa, which he visited more than thirty years before Captain Hood. The missionaries' wives had endeavored to persuade the Samoan women to wrap their abundant mantles over the whole of the body, but without success. On the contrary, the Samoan belles in their turn tried to convince the white visitors that it would be much better for them to *faa Samoa, i. e.* to do in Samoa as the Samoans do. Garments that covered the whole of the body might do well enough in the white woman's country, but when they came to Samoa they ought to dress themselves like the Samoans, tie a shaggy mat round the waist, coquettishly looped up on one side, and anoint themselves with scented oil and color themselves with turmeric; wear a flower on the head instead of a bonnet, and a necklace of flowers by way of a bodice. Thus accoutred, they might *fau-riaria, i. e.* strut about in the consciousness of being well dressed, and certain of admiration. There is much to be said on both sides of the question.

The women wear their hair differently from the men, generally cutting it rather short, and combing it back. It is then powdered with fine lime made of burning coal, which has the effect of staining it of a reddish purple hue, which is thought to be the most fashionable color. After this is done, a Samoan belle merely twists a wreath of scarlet hibiscus flowers among the hair. In both sexes great pains are taken about the hair, and in order to promote its growth in after years the head is kept shaved in childhood, the boys having a single lock of hair on one side, and the girls one on either side.

There is a slight distinction of dressing the hair in the different islands of the Samoan group. In some of them the women separate the hair into multitudinous

ringlets, each bound with cocoa-nut fibre, and cut square at the bottom, much like the ancient Assyrian fashion. As if to carry out the resemblance still further, the men preserve their beards, and dress them almost exactly like those of the figures on the Nineveh marbles.

In bodily form the women are by no means equal to the men, the latter being truly magnificent specimens of humanity, while the former are rather short, and stoutly made, with features that are pleasing in expression, but have otherwise little beauty. They are as well treated as in Tonga, and are not expected to do hard work. In fact, the men seem to take a pride in assisting the weaker sex. Mr. Pritchard writes on this subject as follows:—"We saw several women sitting quietly in their canoe, whilst their cavaliers swam alongside, towing them through the surf, not because they are at all less at home in the water than their husbands and brothers, as we saw this afternoon, when a large number of girls were alongside, who were as often swimming about, laughing and talking, for about half-an-hour at a time in the water, or sitting in their boats, which they are constantly upsetting."

When the husband of a Samoan wife dies, his widow is not sacrificed at his funeral, but is usually taken by his brother, after the ancient Jewish custom. It is remarkable, by the way, that many of the Mosaic laws still exist in full force among the Samoans. In time of war no male captives are taken, all being killed. Their female relatives, whether wives or sisters, are considered as the property of the victors, and mostly become their wives. Thus it often happens that women are related to both sides, and, as they are by courtesy allowed to visit their relatives, all the designs of one side are speedily told to the other. So, whenever the principal chief prepares any plan of action, some of the women who have relations on the opposite side, immediately go off and tell them about the proposed movements. Still, the Samoans seem to make it a matter of honor not to take advantage of this knowledge, and to allow the enemy to execute his movements without interruption.

The women seem quite at their ease in warfare, and mostly accompany their husbands to the wars, in order to supply them with necessaries, and to nurse them if they should be wounded. Mr. Pritchard says that he has seen them in the heat of action, carrying water to the wounded, and seeming to care less for the thickly flying bullets than the warriors themselves.

BEFORE passing to another subject, we will complete our notices of dress. The reader may remember that on page 977 was given a full account of the various processes

by which the inner bark of the paper mulberry is made into garments. The Samoans employ the same method as the Tongans, but are even more careful in the manufacture of the cloth, which is in great request throughout many parts of Polynesia, and can be recognized at once by a skilful eye.

The women are the sole manufacturers, and are wonderfully skilful and patient over their work. In the first place, for the finest cloth they always employ very young trees, not more than fourteen to fifteen months old, and only two or three inches in diameter. They begin their work by cutting down the trees, peeling off the bark, and steeping it for eight and forty hours in water, so as to enable the rough outer bark to be removed from the thin and delicate inner bark. The well-known "bass," with which gardeners tie up flowers, is a familiar instance of "*liber*," or inner bark, procured from the lime tree. By constant beating, this substance becomes greatly increased in width and reduced in thickness, and, like gold leaf, it can be beaten out to almost any extent.

As the strips of bark are only ten or twelve inches wide, a number of them are united by overlapping the edges and putting between them arrow-root dissolved in water. The united pieces, while still wet, are again beaten, and after a while the two pieces become incorporated into one, and all signs of the junction disappear.

When a piece of sufficient size is made, printing and staining are the next processes. The dyes are generally of three kinds, red, brown, and yellow. The two first tints are obtained from clays, and the third from the ever useful turmeric. The women who make and print the cloth do not prepare the dyes, that being a separate occupation, and in these islands the different professions are strictly limited to certain families, just as is the case with the castes in India. The printing is done on exactly the same principle that is employed in rubbing brasses in this country. The pattern is made by fastening the flexible ribs of the cocoa-nut leaf on a board. When the ribs are quite hard and dry the cloth is stretched over them, and the dye rubbed over it with a stiff brush, so that it only adheres to those parts of the cloth which press against the raised pattern below. For patterns of a larger description a softer bark is used, which holds a quantity of color.

There are in my collection several specimens of Samoan bark cloth; one is very fine, pure white, six feet long, by two wide, and ornamented with a fine fringe all round it. Another is thicker and stronger, being made of four layers of bark, one placed upon the other. In some places the junction has not been completed, and the different layers are quite distinct. It measures rather more than seven feet in length and three feet ten inches in width. It has a deep-colored border about eighteen inches in width, composed of a diamond pattern impressed upon a number of perpendicular parallel lines and dots. This border is a light red in color, and upon it are several circles of dark brown. Circles of a similar kind are scattered over the uncolored portion of the robe, which is of a creamy yellow hue.

The third specimen is still thicker, and larger. It is seven feet square, and has been completely covered on the outside with the clay pigment, which has been put on so thickly as to make the fabric comparatively stiff. Two broad bands of deep black are drawn across it so as to divide it into three equal portions, and in each division are four patterns also drawn in black, very much resembling the "broad arrow" used in the government mark of England.

In the second illustration on page 1012 are shown the successive processes of converting the bark into cloth. In the foreground and at the right hand are seen some women kneeling in the stream, engaged in scraping the *liber* to free it from every particle of the outer bark. One woman is examining a piece against the light, to see whether it is quite clean. Behind them, and toward the left centre of the illustration are more women, some of them beating and scraping the bark with the square mallets which have been already described when treating of Tonga, and another is busily employed in joining two pieces with arrow-root. Just above them is another woman engaged in the more skilful part of the manufacture, *i. e.* printing by rubbing dye over the cloth when laid on the pattern board, and one or two of the boards themselves are given, in order to show the cocoa-nut leaf pattern upon them. In the distance, the other women are seen hanging the still wet cloth up to dry.

CHAPTER CIII.

SAMOA, OR THE NAVIGATORS' ISLANDS—*Continued.*

WAR.

CAUSES OF WAR IN SAMOA—THE MALO, AND STRUGGLES FOR ITS POSSESSION—THE CHIEF'S VENGEANCE—FIRE-ARMS PREVENTIVE OF WAR—SAMOAN WEAPONS—THE CLUBS—PATTERNS OF CLUBS THROUGHOUT POLYNESIA—STRANGE MODE OF USING THE SPEAR—THE SHARK-TOOTH GAUNTLETS—SUITS OF ARMOR—GETTING TOGETHER AN ARMY, AND MODE OF FIGHTING—UNPLEASANT POSITION OF NEUTRALS—THE SEA-FIGHT—DISTINGUISHING PENNANTS—THE DEFIANCE BEFORE BATTLE—TROPHIES OF WAR, AND ELATION OF THE VICTOR—DISPOSAL OF THE BODIES—THE HEAD PILE—SINGLE COMBAT BETWEEN CHIEFS—SAMOAN LAW—PUNISHMENT FOR MURDER AND LESSER OFFENCES—CANNIBALISM—NATIVE LAWYERS—THE PLAINTIFF DEFEATED WITH HIS OWN WEAPONS.

It was mentioned on page 1014, that women when captured in war become the absolute property of those who take them; we will therefore devote a short space to warfare among the Samoans, omitting those characteristics in which it resembles war among the other Polynesian tribes, which have already been described.

The causes of war may mostly be reduced to four; namely, the desire of political supremacy, disputed succession to chieftainship, revenge for the murder of a chief, and infringement of the strange marriage laws of the Samoans.

The first of these causes is always ranking. Each island is divided into several districts, and when one begins to show signs of special prosperity, another is sure to take umbrage at it and go to war in order to secure the "Malo," or political supremacy. One example of such a war occurred only a few years ago in the island of Apolo.

Manono, one of the three districts into which it is divided, held the supremacy, and the chiefs felt indignant because another district, Aâna, was prospering under the teaching of the missionaries. The chiefs of Manono therefore began to oppress Aâna by making continual demands of property and food. Still, in spite of their exactions, the district would persist in flourishing; it made and sold more cocoa-nut oil, and sold it for more hatchets, calico, and other European treasures, than the other districts. The Manono chiefs were naturally indig-

nant that when they went to a subject district they found it better cultivated and richer than their own, and constricted the inferiority which they could not but feel into an intentional insult on the part of Aâna. So they proclaimed the people of Aâna to be rebels, and made war against them.

Such a cause of war, absurd as it may be, and subversive of all real progress, is intelligible, and to be explained by the petty jealousies of human nature, which is too prone to feel itself personally hurt at the prosperity of another. Vengeance for a murdered chief is intelligible, and so is a war for succession; but the last cause needs some explanation.

By the laws of Samoa, a woman once a wife is always a wife, even though she may be put away by her husband. The Samoan chiefs claim the right of marrying as many wives as they choose, and putting them away as often as they like. Indeed, a man often marries a girl merely for the sake of her dower of mats and other property. But even after he has put away a wife, he still considers her as his own chattel; and if any other chief takes her to his house, war is at once declared against him. It is a curious fact that the original husband cares nothing about the morality of the wife whom he has put away, but only for the insult offered to himself by taking his property. Such cast-off wives mostly attach themselves to the Fala-tele, or visiting

house, leading most immoral lives, and may do so without incurring any resentment from their former husband. But let them marry another, and vengeance immediately follows the insult.

Before the introduction of fire-arms, the principal weapons of Samoa were the spear and the club. The older chiefs have a rooted objection to the musket, and, like Hotspur's fop, have not been particularly willing to take the field since that "villanous salt-petre" has come into vogue. Muskets, say they, are weapons for boys; clubs for men. They have some reason to complain of the bullets, which, as they say, do not know chiefs, because their towering headdresses make them so conspicuous that they afford excellent marks to the enemy; and if by chance one of their opponents should have even a moderate notion of taking aim, their chance of coming safely out of the battle would be a very small one.

The clubs used in Samoa are remarkable for the excellence of their make, and the polish and finish with which the native carver loves to ornament them. Some of them are short, used for one hand, and made just like the steel maces of European chivalry. Others are almost exactly like the club No. 1, figured on page 949. The example which is given in the illustration entitled "Club," on page 1018, is drawn from a specimen in my collection, and belonged to the same chief who owned the war mat and feather headdress which have been described. It is five feet in length, and very heavy, so that none but a very powerful man can use it. As it has seen much work, it has been battered about, the wood of the head cracked, and the carving defaced. I have therefore had it drawn as it was when new.

As a rule the clubs of Tonga, Samoa, Fiji, and other Polynesian groups can hardly be definitely referred to any one of them. The commerce which passes between them has caused an interchange of weapons as well as of peaceful commodities, so that the two distinct races which inhabit Fiji and the Tongan and Samoan group use weapons which are almost identical. Thus the serrated club which has just been mentioned is equally used in New Guinea, Fiji, and Samoa, the pattern having been found a convenient one, and so transmitted from one island to the other.

The spears, again, have a great similitude, and are armed with barbs, the best being tipped with the tail-bone of the sting-ray. In former days, when a warrior had pierced an enemy with his spear, he tried to lift him from the ground upon it; and if he were unable to do so, he was generally assisted by several of his comrades, who all thrust their spears into his body, lifted him in the air, and bore him aloft in triumph, not caring whether he were alive or dead.

One weapon, however, seems to be peculiar to Samoa, and has been mentioned by Mariner. It consists of a pair of gauntlets made of cocoa-nut fibre, on the inside of which are fixed several rows of sharks' teeth, set edgewise. In fact, this weapon is made exactly on the principle of the terrible "tiger-claw" of India, and is intended for the purpose of ripping up an adversary, the abdomen being the part that is always attacked, both by the Samoan and the Hindoo.

One chief, who was of gigantic dimensions, even for a Samoan, always fought with these terrible gauntlets. He used them, however, in a different manner, and disdained to tear open the body of his antagonist. As all the points of the teeth are directed backward, it is impossible for any one who is grasped by these gauntlets to tear himself away. The gigantic chief was accustomed to rush at one of the enemy, seize him with his gauntleted hand, fling him on his face, place one foot on the small of his back, grasp him by the head and bend him forcibly upward so as to break his spine. This was his mode of dealing with able-bodied men. If, however, he seized a small man, he merely threw the victim across his knee, broke his back, and flung his dying foe on the ground. The illustration on page 1025 is taken from a beautiful specimen in the collection of the United Service Museum.

In order to guard themselves against these weapons, the Samoan warriors gird themselves with a very broad and thick belt, made of cocoa-nut fibre, wide enough to reach from the arm to the hip. It is not quite long enough to encircle the body, but is worn mostly on the left side, that being the side most exposed to the enemy.

One of these belts, in my collection, is two feet nine inches in length, so that when fastened round the waist it leaves a considerable portion of the right side exposed. It is made by taking a number of plaited cords, and passing them over two sticks, so that all the cords are parallel to each other. They are then bound firmly together by strings of twisted fibre, which pass under and over each alternately, and make a very strong armor, through which the dreaded sharks' teeth cannot make their way.

Sometimes the Samoan warrior seems to have been mistrustful of the efficacy of the belt, and to have feared the effects of the shark's teeth on his naked arms and legs. There is in the collection of the United Service Museum a complete suit of armor, most ingeniously made out of fibre, and so formed as to cover the greater part of the body and limbs. It is in two portions, the upper being put on as a coat, and the lower as trousers. By the sides of the armor, on p. 1018, are two small sketches, showing on an enlarged scale the patterns of the plaiting.

There is no definite army among the Samoans, each man being considered as a soldier, and having his weapons always at hand. He is liable at any time to be called out by his chief, and, as a rule, he troubles himself very little about the cause of the war, only concerning himself to fight in the train of his chief. The Samoans are a brave race, and, if properly led and taught the veriest rudiments of discipline, would make good soldiers. As it is, however, no Samoan warrior fights with the knowledge that his movements are directed in accordance with a definite plan, or that he will be supported by others. He does not feel himself a simple unit among many, but has to look out for himself, to select his own adversary, to advance when he thinks he can do so with advantage, to run away when he feels himself getting into undue peril.

Whenever a few Samoans have put themselves under the guidance of a white man, they have always repelled their foes. In one such case, twenty men drove off a body of five hundred enemies, flushed with success and bloodshed. Both parties were armed with muskets, but the regular though insignificant volleys of the twenty men so completely disorganized the five hundred undisciplined foes, that the latter dared not attack the little stone wall, five feet high and twenty-five yards long, behind which the defenders were lying.

Had the latter been left to their own devices, they would have fired all their pieces at once, and been left with unloaded muskets at the mercy of their foes. But being taught always to keep half their muskets loaded, they had always a volley ready for their enemies, who were utterly discomfited at their reception, and at last were only too glad to escape as they best could, with the loss of many men.

The position of a neutral is not at all a pleasant one in Samoa, as, in case either side should appear to be likely to win the day, those of the losing side who happen to be friendly with the unfortunate neutral make a point of stripping him of all his property, to prevent it from falling into the hands of the enemy. Those Europeans who know the native customs always erect barricades whenever war parties come near them, knowing that they stand in equal danger from friends or foes.

When a chief decides on going to war, he calls out all the warriors in his district. Though there is no real discipline of the soldiers, there is at all events some semblance of order in their arrangement. Each town has its definite place, and the inhabitants would resent any attempt on the part of another town to take the place which they consider as their own. The most honorable post is in front, and, though it is a post of danger, it is so honorable that if a man belonging to any town privileged to

lead the war were placed in the rear, he would probably desert to the enemy. In fact, a vast amount of desertion does take place, and by means of the deserters and the women, both parties know tolerably well the designs of their antagonists. The idea of conceiving, maturing a plan, keeping it secret, and then suddenly acting on it, seems never to have entered the mind of the Samoan chiefs.

Though the vanguard is the post of danger as well as of honor, it is greatly coveted, for it is also the post of profit both in peace and war. The inhabitants of the privileged towns claim the largest share at the feasts, and generally rule the district in which they live. As all the Samoans dress much alike and speak the same language, they are obliged to wear a sort of uniform, by which they shall know friends from foes. In the case of warriors, the hair is dressed in some strange way, or a white shell is hung round the neck, or a strip of cloth tied round the arm, these symbols being changed every three or four days, in order to prevent the enemy from imitating them.

When canoes unite under one leader, they hang out symbols of a similar character, such as bunches of leaves, strips of matting, or even a sort of flag made of native matting, and having painted on it the rude figure of some animal, such as a pig, a dog, or a bird. True to the independent nature of Samoan warriors, the two men who respectively command the land and the sea forces never think of consulting together, and acting in concert together, but each does what he thinks best on the spur of the moment. In the case already mentioned, where twenty Aâna men repulsed five hundred of the Savaiis, the latter might have been cut off to a man. While they were kept in check by the twenty disciplined warriors, a fleet of Aâna canoes appeared off the shore; and, if the commander had only landed his men, a most thorough example would have been made of the invaders. But he had nothing to do with the land force, and so allowed the enemy to escape without even attempting to stop them.

The student of anthropology always finds that human nature is much the same in different parts of the earth, and that manners and customs wonderfully resemble each other in principle, though they may be modified in detail by the accident of time and place. It has already been mentioned that many of the Samoan laws are identical with those given by Moses, though there is no possibility that any geographical connection could ever have taken place between Polynesia and Sinai.

Warfare is carried on at the present day in Samoa just as the scriptures tell us it used to be in Palestine and Syria, and as Homer tells us it was waged on the plains of Troy. When two opposing bodies meet, the leaders

challenge and abuse each other in good set terms, each boasting of his own prowess, depreciating that of the adversary, and threatening after he has killed his enemy to dishonor his corpse in some way. Thus, we find that when David had accepted the challenge of Goliath, before they proceeded to action they reviled each other, Goliath threatening to give David's flesh unto the "fowls of the air and the beasts of the field," and David retorting in almost the same words; but adding that he would do the same by the bodies of the whole army.

Thus, in the old Homeric story, where Ulysses flings his spear at Socus, he uses almost exactly the same formula of words:—

"Ah, wretch! no father shall thy corpse compose,
Thy dying eye no tender mother close;
But hungry birds shall tear those balls away,
And hovering vultures scream around their prey."

Thus, the Fijian warrior defies his enemy in words before he proceeds to blows, threatening to bake and eat his body and make a drinking-cup of his skull. Thus, the Samoan war parties always think it necessary to pause and defy each other in words before they proceed to blows. For example, when the Manono and Aana men fought in the struggle which has just been described, they exchanged threats and injurious epithets wonderfully like the "winged words" of the Homeric warriors, the sentiment being identical, though the imagery is necessarily different. The illustration No. 1, on page 1027, shows these Samoan warriors exchanging defiance with their foes.

"You banana-eating Manono men, be your throats consumed by Moso."

"Ye cocoa-nut eating Aana men, be your tongues wasted."

"Where is that Savii pig that comes to his death?"

"Roast that Atua king who is about to die by my spear;" and so on *ad infinitum*.

These war parties afford excellent opportunities of studying the dress and ornaments of the Samoans. It is thought a point of honor with them, as with the American Indians, to go into action in the fullest dress and decorated with every ornament that can be procured, so that the headdress and general accoutrements of a chief when engaged in war are sure to be the best examples that can be seen.

The proceedings that take place after a battle are well described by Mr. Pritchard. "After a fight, the heads of the slain warriors are paraded in presence of the assembled chiefs and people, when the heroes are individually thanked, and their general prowess and daring publicly acknowledged. The excitement of the successful warrior is intense, as he passes before the chiefs with his bleeding trophy, capering in the most fantastic evolutions, with blackened face and oiled

body, throwing his club high in the air, and catching it behind his back or between his legs; sometimes himself carrying his dead enemy's head, sometimes dancing round a comrade who carries it for him, all the while shouting in his loudest voice, 'Ou te mau tangata! Ou te mau tangata!' ('I have my man, I have my man!')

To a young Samoan this is the realization of his highest ambition, to be thus publicly thanked by the chief for slaying an enemy in mortal combat, as he careers before his comrades with the reeking head of his foe in one hand, and his club in the other.

"Then, again, when the war is over, and he returns to his village, to hear his companions rehearse the exploit, and the girls pronounce him 'toa' *i. e.* brave; then it is you see in their very perfection the complacent dignity and latent pride that lurk within that brown-skinned islander. As he assumes an air of unconscious disregard of the praises his deeds evoke, you see the sublime and the ludicrous neatly blending, when he turns to the girls, and mildly exclaims, 'Funa mai si rului!' ('Woman, hand me a cigar.')

This modest little order is at once pretty and pert, dignified and careless, when it falls from the lips of a hero or a beau. And proud is the girl who hands it to him; she has but one ambition then, to become his wife, even with the certainty of being cast off in less than a month for another.

"After the heads have been paraded before the chiefs, they are piled up in the malae, or open space in the centre of the town, the head of the greatest chief slain being placed uppermost. If among the visitors there are any relatives of the slain, they claim the heads and bury them, or send them back to the comrades of the deceased. The unclaimed heads are buried together in the malae. Any bodies that may be recognized are also buried by their friends, while those who have no relations among the visitors are left to rot and make food for the dogs.

"The relations are careful to bury the bodies they identify, lest their spirits should haunt them or wander about the field of battle, disconsolate and mournful, lamenting the fate which left their bodies to rot or to be eaten by the dogs. I have often heard the natives say, 'Hear that spirit moaning, I am cold! I am cold!' when a stormy night has thrown its darkness and poured its torrents of rain and gusts of wind over the battle-field. It was vain to tell them that the noise they heard was merely the creaking boughs or the pelting rain; to them it was nothing else than the spirit of the unburied dead enemy."

The feelings of vanity are so acute in a Samoan warrior that he will do almost anything to procure applause at these meetings after a battle. One man who had failed to kill an enemy was greatly annoyed with

himself at having missed the public applause which he had hoped to gain, and hit upon another mode of obtaining a sort of celebrity. He cut off the great toes of a dead enemy whose head had already been taken, and with these toes in his mouth paraded before the chiefs as if he had taken a head. Finding that this novel act excited admiration, he became so excited that he ate the toes, even without cooking them, in the presence of all the people.

Such an act as this might induce the reader to suppose that the Samoans, like many Polynesians, are cannibals. In the ordinary sense of the word, they are not so. After a battle they will sometimes cook and eat a human body, but this is done as an act of disgrace, and not as a gratification of the appetite. In one instance, a young woman whose father had been killed in battle obtained a scalp that had belonged to the enemy. She first burned it to ashes, then beat it to powder, and scattered the dust on the fire over which she cooked her provisions.

After a decisive battle, the chiefs of the beaten side come humbly before their victorious antagonists, carrying firewood, stones and pieces of bamboo. They lay their burdens before the principal chief, and prostrate themselves on the ground, lying there in silence. Should, as is generally the case, the victors be willing to accept the submission, the prostrate chiefs are told to rise and return home; but if they should not be satisfied, the men are clubbed where they lie, while the people whom they represent suffer all the horrors of savage warfare.

The firewood, stones, and bamboo are considered as emblems of the utterly abject state to which the bearers have been reduced. The stones, being the material with which the native ovens are made, signify that those who deposit them at the feet of the victors give themselves up to be baked and eaten by the conquerors. The firewood represents the material with which the ovens are heated, and the bamboo serves as a double symbol. In the first place, the knives with which the Samoans cut up their food were always made of bamboo before the use of iron was introduced by Europeans; and in the second place, the instruments by which torture was inflicted on prisoners by cruel captors were made of the same material.

When the conquered party are pardoned, they enter the house of the chief, kiss his feet, and present him with fine mats, bark cloth, food, and similar property. This ceremony is called *Ifonga*, and is sometimes employed on other occasions. For example, during the war between Manono and Aâna, two of the most influential chiefs of the latter party took umbrage at some slight, either real or fancied, and deserted to the enemy. Desertion of this nature is quite a common event in Samoan warfare, inas-

much as the chiefs are almost entirely independent of each other, and are bound together by the slightest of ties. In fact, the condition of these islanders much resembles that of the Scottish Highlanders in the old times, when it was hardly possible to wage a regular war on account of the rival jealousies of the different chiefs, besides the internal dissensions among the members of each clan.

Besides, as in the old Scottish clans, there is no discipline by which even the men are bound together. Each man serves as long as he chooses, and no longer. If he thinks himself slighted, or if his crops at home have to be got in, he has no hesitation in shouldering his club, and going off to his own village; nor is there any law by which he can be punished for so doing. In the war to which we are now alluding, a vast number of the Savaii allies of Manono had gone off to their own plantations.

In order to carry out the principle of obtaining the Malo, or sovereignty, it was necessary that the deserters should do homage to Manono, and be replaced in state in their homes, which they were supposed to hold under Manono as vassals in charge. If they could take possession without being attacked by the opposing party, they were supposed to have asserted their rights.

Accordingly, a great ceremony was projected. The Manono chiefs recalled all the allies who had escaped from the war, ostensibly to look after their plantations, but in reality because they had a strong objection to bullets, and summoned them to bring the produce of their plantations to a great "fono," or discussion. Accordingly, they all came back, allured by the prospect of the feast which accompanies such a "fono." The two deserting chiefs were introduced to the assembly, and went through the ceremony of *Ifonga* as a matter of form. Next they had to be safely installed in their own villages. With one of them this was a comparatively easy matter, as the whole district was deserted. So the chief was taken there in triumph, escorted by thirty or forty canoes, and formally installed in his own domains, as vassal to Manono, and therefore acknowledging the right of Malo to belong to that district. He had no followers with him, and in a day or two he left the place and returned to Manono. Still, the transaction had been completed, the time during which he held his domain not being of any importance. The reader may be glad to know that this chief suffered the usual fate of renegades, being received at first with great ceremony, and made much of, and afterward sinking into utter obscurity.

As to the other chief, there was a difficulty respecting the installation. It so happened that, he having been one of the most influential leaders, all the united forces of

the two districts, Aana and Atua, were encamped in and about the place, and if he had been taken there he would not only have been attacked, but the invading party would probably have been repelled by the united forces of the other two districts. So, after much deliberation, it was determined that he should be installed at a convenient season, but that the precise time for performing the ceremony need not for the present be fixed upon.

Sometimes a couple of chiefs quarrel, and, instead of going to war, fight it out themselves with their clubs. They display great dexterity in fencing and guarding, as well as striking, and are watched intently by the spectators. They are usually parted before they do any serious harm to each other, because in case either were killed, or even seriously injured, a war of vengeance would be the inevitable result.

COMPARATIVELY little is known of the native laws of Samoa, which, like all similar institutions, are always on the change, and of late years have been almost forgotten by reason of the presence of Europeans in the islands. We find, however, from several travellers, especially from those who have lived among the Samoans as missionaries, that a tolerably well-defined code of laws is recognized, and administered by the chief and his councillors.

Murder, for example, was punishable by death; and this was so well known that when one man murdered another, he and all his family generally fled to another district, where they were sure of protection. It was necessary that all the family should accompany the murderer, because the relatives of the slain man might wreak their vengeance upon any relation of the murderer. Practically, the punishment for murder resolved itself into a heavy fine. The fugitive necessarily left behind him his plantations, his house, and other property, all of which was seized by the chief. Sometimes the whole of the property was confiscated, the house burned down, the plantation devastated, and a message sent to the murderer that he might never return to his own village. Generally, however, this extreme punishment was commuted for a heavy fine, part of which consisted in giving a feast to the entire village.

Damaging a fruit tree was held to be a crime deserving of heavy punishment; and so was speaking disrespectfully to a chief, destroying a fence, or behaving rudely to strangers. For several offences the Samoans had a curiously graduated scale of punishments. Sometimes, when the offence was a light one, the offender was sentenced to seat himself in front of the chief and his council, and take five bites of a cruelly pungent root. Sometimes he was obliged to toss and catch a certain number of times

one of the prickly sea-urchins, which are covered with slender spikes, as sharp as needles and as brittle as glass. Sometimes he had to beat his head with sharp stones until his face was covered with blood.

These punishments were usually inflicted, but there was a severe set of penalties for graver offences. In some cases the offender was hung by the feet to the branch of a tree, or stripped of all his clothes, and set in the burning rays of the mid-day sun. One of the severest, as well as most degrading punishments consisted in taking a pole cut from a very prickly tree, tying together the culprit's feet and hands, slinging him on the pole as pigs are slung when they are being taken to the oven, and carrying him to the house or village against which he had offended.

The degrading part of this punishment consisted in likening the offender to a pig going to the oven. It is always held as a deep insult to a Samoan to compare him to a pig; while the very idea of being baked in the oven is most repulsive to the feelings of the people, who have the same contempt for any of the processes of cookery that prevails throughout New Zealand, Fiji, and Tonga. So utterly humiliating is this punishment, that when the culprit is laid helpless at the feet of those whom he has injured he is almost invariably released and forgiven, the extreme degradation being accepted as an atonement for almost any offence, no matter how heinous. This is the reason why the ceremony of Ifonga is considered as so degrading.

Indeed, it is in consequence of this feeling that cannibalism is occasionally practised, though, as has already been mentioned, it exists in a very modified form. Formerly, the women always attended upon the warriors for the sake of obtaining the bodies of the slain foes, which they dragged out of the field, and then cooked, by way of expressing the utmost contempt for them. The priests used also to accompany the warriors, and pray to the gods for success. They had good reason for wishing for victory, as their portion of the food was only the hands of the slain warriors, and as long as the struggle lasted they were not allowed to eat any other food except these hands. The priests of the losing side have sometimes been obliged to fast for several days in succession.

When the body of a chief was carried off to the oven, great rejoicings were made, and every one was expected to eat a piece of it, no matter how small. On such occasions, even the women and little children had a share, the question being frequently asked whether all have tasted. Sometimes, when a captive has been taken alive, the Samoans have been known to tie him up to a tree, dig a hole in front of him, line it with stones, heat it before his eyes, and then throw him into it.

According to the accounts of the natives, wars were formerly much more common than is now the case, the musket having almost driven the club and spear out of the field, and rendering useless the strength and skill of the warriors, who prided themselves on their dexterity of handling their weapons. How well they fence with the club has already been described, and that they were equally efficient in the use of the spear is evident from an anecdote told by Mr. Williams.

A chief named Matetau had come on board an English vessel, and the captain, wishing to test the skill of his visitor, painted on the foresail a ring about four or five inches in diameter, and asked Matetau to throw his spear at it. The chief retired to the quarter-deck, about eighty feet from the mark, poised his spear for a moment, and sent it through the middle of the ring. Warriors thus skilful in the use of their weapons might well feel indignant at the introduction of fire-arms, which equalize the weak and the strong, and enable a mere boy only just tattooed to kill the greatest chief.

When cases are brought before the council for adjudication, both plaintiff and defendant exhibit the greatest ingenuity in stating their case, and are wonderfully fertile in inventing new arguments. The Samoan litigant is as slippery as an eel, and no sooner has he found one post untenable than he has contrived to glide away from it and establish himself in another. Mr. Pritchard gives a very amusing instance of this characteristic of the Samoan.

The property of an English resident, who was popularly called "Monkey Jack," had been wantonly destroyed, and the injured man referred the case to the council. As at that time two ships of war arrived, the matter was by common consent referred to the senior officer, and the plaintiff, accompanied by his friends, proceeded to the spot. The chiefs were convened, and, though they could not deny that the property had been destroyed, they put forward a series of excuses for refusing to pay any indemnity.

Firstly, they said that the plaintiff had joined the enemy, and that they were therefore entitled to wage war on him. This accusation being refuted, they shifted their ground from the man to his wife, saying that she was related to the enemy, and that her husband necessarily partook of the relationship. Fortunately, the woman happened to be related equally to both sides, so that the defendants had to abandon that plea.

Their next count was, that the destruction of the property was accidental, and that therefore the owner had no claim on them. As their own previous admissions contradicted them, there was no difficulty in disposing of this allegation. Their next line of

defence was a very ludicrous one, and showed that they were nearly brought to bay. It so happened that "Monkey Jack" was something of an armorer, and used to repair for the natives the muskets which their rough hands had damaged. His opponents suddenly recollected this and turned it to account, saying that his charges for repairs were so much heavier to them than to the enemy, that in self-defence they had taken his property in compensation. Evidence was brought that his charges were always the same to any natives, no matter to which party they belonged, and so the defendants were again beaten.

Like wise men, however, they had reserved their weightiest argument to the last. It has already been mentioned that in time of war either party has no scruple in destroying or confiscating the property of a friend, on the plea that it is better for them to have the use of the property than for the enemy to take it. The defendants brought forward an argument based on this custom, saying that they only acted in accordance with national custom, and that they had destroyed the property of the plaintiff, in order to keep it out of the hands of the enemy.

This was by far the most formidable argument they could have employed, but "Monkey Jack" was as clever as his opponents, and replied with crushing effect, that for several weeks the opposite party had been able, if they had desired to do so, to destroy all his property, but had refrained from touching it.

When the chiefs saw that they had met with men more skilful than themselves in argument, they were sadly perplexed, and some of the younger chiefs hit on a mode by which they thought that they might escape from paying the indemnity. They agreed quietly to surround the spot where the captain and the consul were sitting, and suddenly carry them off, and retain them as hostages until the indemnity should be given up. Fortunately, Mr. Pritchard detected their plot, and contrived to slip back to the boats, where he arranged a counter plot.

Before very long, the Samoans surrounded the place where the intended captives were sitting, and, just as they were about to seize them, Mr. Pritchard called out to them, and showed them that they were covered by the levelled muskets of the sailors and marines, who had accompanied the captain and the consul to the spot. Knowing that, unlike themselves, the English warriors had an inconvenient habit of hitting when they fired, the Samoan chiefs acknowledged themselves conquered, and agreed to pay the indemnity.

Another case, much more petty, was a very ludicrous one, the Samoan absolutely

granting himself to be defeated by the logic of his opponent.

There was a certain West Indian negro, who had taken up his residence in Samoa, and had attained in a neighboring tribe the rank of chief, together with the name of Paunga. A native chief, named Toe-tangata (called, for brevity's sake, Toe), had a dog, which was in the habit of stealing from Paunga's house. The latter had often complained to the owner of the animal, but without success, and at last, as the dog continued to steal, Paunga shot it. Now in Samoa to insult a chief's dog is to insult the owner, and so Toe considered himself to have been shot by Paunga.

The case was at last referred to the captain of an English man-of-war, but Paunga refused to appear, saying that he was a Samoan chief, and not under the jurisdiction

of a foreigner. A file of armed marines was at once sent for Paunga, who ingeniously took advantage of the proceeding, placing himself at their head, and telling the people that they might now see that he was a chief among the white people as well as among natives, and had his guard of honor, without which he would not have stirred out of the house.

Both being before the captain, Toe made his complaint, and was instantly crushed by Paunga's reply. He admitted that the property of a chief was identical with the owner. Consequently, when Toe's dog ate Paunga's food, he, Toe, ate Paunga. Therefore, when Paunga shot Toe in the person of his dog, he only balanced the account, and neither party had grounds of complaint against the other.

SHARK-TOOTH GAUNTLET.

(See page 1019.)

CHAPTER CIV.

SAMOA, OR THE NAVIGATORS' ISLANDS — *Concluded.*

AMUSEMENTS — MARRIAGE — ARCHITECTURE.

SAMOAN AMUSEMENTS — PIGEON CATCHING — THE DECOY BIRDS, AND MODE OF USING THEM — TRAINING THE BIRDS — FISHING: THE NET AND THE LINE — DARING MODE OF SHARK CATCHING — A BOLD FISHERMAN — CURIOUS ACCIDENTS TO THE DIVERS: THE SHARK AND THE CORAL — THE BOAR HUNT — A DANGEROUS Foe — SAMOAN COOKERY — THE PALOLO — ITS CURIOUS APPEARANCE, MODE IN CAPTURE, AND WAY OF COOKING IT — MARRIAGE IN SAMOA — CEREMONIES IN THE MARRIAGE OF A CHIEF — THE WEDDING FEAST AND DANCES — SAMOAN ARCHITECTURE — DIVISION OF THE HOUSE BY MOSQUITO CURTAINS.

THE amusements of the Samoans are in many respects identical with those of other Polynesians, and therefore only those will be described wherein is anything characteristic of these islanders. One of the principal sports is pigeon shooting, which is carried on in certain parts of the wood expressly prepared for it. The principle on which the sport is followed much resembles that of the rat shooting practised by the Tongans. Several chiefs agree to go off on a pigeon-catching expedition, and at the appointed time the fowling ground is cleared of bush, a large circle is marked out by stones, and just outside the circle are made a number of ambushes, formed from leaves and branches, which are cut fresh daily.

The sport is precluded by a drink of kava, and when this indispensable preliminary is over, the chiefs repair to their stations, each having a net and a trained bird. The net is small, and is fixed to the end of a bamboo, thirty or even forty feet in length. The bird is perched on a stick near its master, and is attached to its perch by a string forty or fifty yards in length.

At a given signal, the birds are thrown into the air, and, following the instructions they have received, wheel round and round for some little time. The wild pigeons see them from a distance, and fancying from their movements that they are hovering over food, fly to join them. As they wheel to and fro with the decoy birds, the chiefs raise their nets and dexterously capture

them. He who takes the greatest number of pigeons wins the game, and receives from each of the other players a stake which has been previously fixed upon. Generally the stakes consist of food or kava roots, and in such cases the winner practically gains nothing but the honor of winning the game, as the food is cooked and distributed by the winner to all his companions, and the kava is converted into drink.

These bird-catching parties last for a very long time, the players sometimes remaining on the spot for a month. Huts are consequently run up around the open space on which the birds are flown. The second engraving on the next page illustrates this sport very accurately.

The decoy birds are most carefully trained, the object of the trainer being to make them rise at the word of command, fly to the end of the string, wheel round in graceful circles for some time, and then return to the perch. When a bird will remain on the wing for five minutes and return to its perch at its master's call, it is considered as having been highly trained, and is held in great estimation. The natives may be often seen engaged in training the birds in the open space in the centre of the village. The birds are encouraged in their flight by a peculiar mode of jerking the string.

Fishing is a very favorite amusement with the Samoans, who display a wonderful amount of skill and often of courage in their sport. The latter quality is chiefly

(1.) SAMOAN WARRIORS EXCHANGING DEFIANCE. (See page 1021.)

(2.) PIGEON CATCHING BY SAMOANS. (See page 1026.)

brought into play when the natives are occupied in shark fishing. Whenever a great feast is to be held, the fishermen go off in search of sharks, the flesh of this fish being one of the principal dainties of Samoa. The fishermen go off in canoes, each canoe being manned by two or three fishermen, who are supplied with a strong rope, having a noose at one end and a quantity of animal offal.

Going to the edge of the lagoon, where the sharks lie under shelter of the rocks, the men throw the offal overboard, for the double purpose of attracting and gorging the sharks. They then peer into the water, and when one of the fishermen sees a shark lazily stretching itself on the sand that lies under the overhanging rocks, he lets himself very quietly into the sea, dives down with the rope in his hand, slips the noose over the shark's tail, and rises to the surface. As soon as he gets into the boat, the men drag the shark out of his retreat, and haul away until the creature's tail is raised out of the sea, when it becomes nearly helpless. A sudden jerk brings it into the canoe, where it is instantly killed.

Sometimes the shark lies in a deep submarine cave, with only its head out of the opening. The Samoan fisherman, however, is not to be baffled by this attitude, but dives down to the shark, and taps it gently on the head. The fish replete, with food, feels annoyed at the interruption, and turns round, exposing as it does so its tail to the daring fisherman, who slips the noose over it in a moment.

One young man, mentioned by Mr. Pritchard, was celebrated for his daring in this sport. He disdained assistance, and used to go out alone in a little canoe, dropping bait overboard in order to attract the sharks, and throwing his noosed rope over their tails. On one occasion the rope broke, but the brave fellow had no idea of losing both shark and rope. He leaped overboard among all the sharks, seized the rope, scrambled into his canoe again, and, after a long and severe struggle, succeeded in killing his shark and towing it ashore.

Sometimes the hook is used in shark fishing. The fishermen bait a hook, carry it out in a canoe in twelve feet or so of water, and bring the line back to land. Before very long a shark is nearly sure to seize the bait; and when the fish is fairly hooked, several men haul at the rope and drag the shark into shallow water, where it is allowed to flounce about until it is exhausted, and is then killed without difficulty.

Such a sport as this is necessarily attended with much danger, but the Samoan fisherman is nearly as much at home in the water as the shark itself, and treats his dangerous game with the same easy indifference which a Spanish matador displays toward a furious bull. Accidents certainly do happen

in both cases, but they are the exception, and not the rule.

Another of their amusements which is dangerous is pig hunting. As the swine are allowed to run loose in the woods, they have reverted to their wild modes of life, and are sly, swift, active, and ferocious. It is thought a point of honor for a chief to challenge a wild boar, and to receive no assistance except in case of extreme need. The hunter is armed with his knife and tomahawk, or sometimes with a whale spade, which makes a very formidable weapon if the edges are kept sharp.

To kill one of the animals is no easy task. In the first place, a wild boar is so quick that nothing but the greatest activity can save the hunter from its tusks; and were the fight to take place on an open plain instead of among trees, behind which the hunter can jump when hard pressed, the beast might probably get the better of the man. Then the boar is wonderfully tenacious of life, and has a skin so tough that a sharp weapon and a strong arm are needed to inflict a mortal wound. Even when the animal has fallen, and is apparently dead, an experienced hunter always drives his knife into its throat, as boars have an awkward way of suddenly reviving, leaping on their legs, and dashing through their foes into the bush.

The sows are even more dangerous antagonists than the boars. They are, as a rule, lighter, thinner, and more active, and, although they have no long tusks wherewith to rip up their foes, they can bite as sharply and as quickly as wolves. Indeed, were it not for the dogs which are trained to boar-hunting, and are wonderfully courageous and skilful, though very ugly and most unpromising to the eye, they would seldom be brought to bay.

Mr. Pritchard gives an account of an adventure of his own with a boar, which gives an excellent idea of the ferocity, cunning, and activity of the animals. The boar had actually received two rifle bullets in his left shoulder, inflicting wounds which would have disabled, if not killed, most animals, but seemed only to irritate the boar by the pain.

"The fury of the beast was intense, with its two wounds and the worrying of the dogs. He stood grinding his teeth and frothing at the mouth, looking first at one and then at another of us, as if measuring an antagonist for fight. The chief suggested that one of us should tackle him, while the others looked on without interfering. Of course I had to claim the *privilege* to do so after such a challenge; though, in truth, this being the first boar I had ever encountered, I felt as if I had somewhat rashly undertaken the combat, for, even with his two wounds, I fancied he might possibly hold out longer than myself, and, if

I failed to kill him, the failure would be fine sport for my comrades, and not soon forgotten in their jokes.

"However, I stepped out in front of the infuriated beast, and no sooner was I there than he was there too—quite promptly enough, I thought. He made a furious charge at me, which I received with the butt end of my rifle, trying to throw him over on his wounded side, but ineffectually. A second time he came at me, and a second time I checked him. As he drew up for the third charge, his long bristles standing on end, grinding his tusks and tossing the froth from his huge mouth, I drew my tomahawk. On he came, swifter than ever; the tomahawk fell deep into the thick part of his neck, and my boy Atamu did the rest with his long knife.

"It was rather hot work, for these boars have immense strength and no little dogged pluck, and their skins are so tough that often a spear will break short off without leaving even a mark where it struck."

The same boar had previously forced the writer to employ rather a ludicrous manoeuvre. He had fired at the shoulder of the animal, thinking that, if the bullet did not reach the heart, it would at all events disable him. But the boar made at him almost as it received the shot, and sprang on him so quickly that he was forced to jump over its head upon its back, and roll off toward the nearest tree. The smaller pigs are killed in a different manner. The dogs are trained to catch them by the ears, shoulders, and tail, and when the hunters come up they place a stick across the animal's throat, and press it down until the pig is dead.

As to the cookery of the Samoans, there is little to distinguish it from that of the Tongans and other Polynesians of the same race. They have a great abundance of dishes, being able to produce almost as great a variety in that respect as the Fijians, and many of their dishes are extremely palatable to an European. Vegetables form the staple of the Samoan's food, and of those he has abundant choice. Putting aside those vegetables which have been imported from Europe, he has yams, taro, bananas, bread-fruit, cocoa-nuts, and plantains. Sometimes these are cooked separately and sometimes mixed, in order to produce a compound more palatable to native taste. As a rule, the simpler specimens of Samoan cookery please even the English palate, but when the native cooks dress compound dishes the natives are generally the only persons who can eat them.

For instance, there is nothing better in its way than the young cocoa-nut, which is entirely different from the hard, indigestible state in which we see it in England. But when the milk is poured out, its place is supplied with salt water, and the contents allowed to become putrid, the compound is

offensive to more senses than one. Some of their compounds are, however, excellent. Such is a sort of pudding made by pouring the juice of cocoa-nuts over bananas, and baking them together. Even the very young kernel of the cocoa-nut makes a very rich dish when baked.

The strangest diet of the Samoans is the annelid called the Palolo (*Palolo viridis*). Mr. Pritchard gives an excellent account of this curious being and the mode of cooking it.

It appears only in certain strictly defined and very limited localities in each group (*i. e.* in Fiji, Tonga, and Samoa); a month earlier, about the first week in November, in Samoa than in the two other groups. It rises directly from the bottom of the sea to the surface, appearing first about four o'clock in the morning, and continuing to increase in number, until about half an hour after sunrise, when it begins to dissolve, and gradually disappears. By eight o'clock not a trace of the palolo remains in the sea. They look just like so many worms, from an inch to a yard in length, showing every conceivable color as they wriggle about, and are soft to the touch.

"The time of their appearance is calculated by the old men of the various tribes, and is known by the sun, moon, and stars having a particular bearing to each other. A month before the great appearance, a few are found in each of the localities where they rise. Parties go out in their canoes to watch for this first appearance, for by it the calculation as to the second and great appearance is verified.

"When that time comes, whole villages, men, women, and children, crowd the scene; by two o'clock the sea is covered with canoes, the outriggers getting foul and breaking adrift without distracting the attention, as by four o'clock all are busied scooping up the palolos and pouring them into baskets made for the occasion. The noise and excitement from four to six o'clock is something astonishing, and the scrambling most amusing. And when, with canoes landed, the crowd disperses, the next thing is to prepare the ovens to cook the palolos, which are merely wrapped in bread-fruit leaves. They are sent round with much formality to friends at a distance, and sometimes kept three or four weeks by being occasionally warmed in an oven.

"I never could muster courage to do more than merely taste them, so repulsive is their very appearance as they roll and coil together, though Englishmen and even English women there are who eat them, and professedly with a relish, for which I suppose one cannot but accept their word. One lady in particular there is, as described by Dr. Seeman, a 'strong-minded individual,' who eats palolo with a remarkable gusto. I think she will not be deprived of her fancy dish by many of her visitors."

There has been much discussion about the palolo, many persons having doubted whether it was ever an annelid, and believing the worms to be mere strings of spawn. The question has, however, been settled, and there is an elaborate paper on the palolo in the "Transactions of the Linnæan Society," vol. xxii. p. 237.

The worm is allied to the well-known Nereids, several species of which are so plentiful on our own shores. It is flattish, about the sixth of an inch in width, and consists of a vast number of segments. The entire specimen has never been secured, so delicate and fragile is the creature, and it is with the greatest difficulty that a head can be discovered. Among the specimens first sent to the British Museum, not a single head could be found, and among a large bottle full of palolo collected expressly for scientific purposes, only one head was discovered. The head is a little narrower than the joints which compose the neck, and is furnished with two little eyes on the upper surface, between which are placed three tentacles, of which the middle is the longest.

The normal color of the annelid is green, and it is remarkable for the regularly dotted appearance of the back, one black dot being placed on the middle of each segment. So regularly does the palolo make its appearance, that among the Fiji group the months of October and November are known by the names of the Little Palolo and Great Palolo, the former being the month in which it is first seen, and the second that in which it makes its grand appearance.

MARRIAGES in Samoa are conducted much like those of Tonga, the latter group of islands having borrowed many of the Samoan customs. It is thought rather below the dignity of a chief to court a wife for himself, and that office is generally undertaken by his friends, who praise him in the most unmeasured terms, and do all in their power to induce the girl to yield. When her consent has been given, the chief sends property to her father, and receives in return fine mats and other articles, this exchange being considered as the betrothal.

On the day of marriage, the bride, well anointed with oil, colored with turmeric, and dressed in large quantities of the finest mats, is placed in the malae, or open space in the centre of the village, attended by her young friends, who are arrayed in all the gorgeousness of savage finery, with wreaths of flowers and nautilus shells on their heads. She is also accompanied by the two duennas who have had charge of her, and who chant her praises and extol her virtue. The object of this public assembly is to prove whether the girl be worthy to be the wife of a chief. Should the verdict be in her favor, she is presented to the people as the chief's wife, and, amid their acclamations, is taken into the house by her duennas and attendants.

Should, as is very seldom the case, the verdict be adverse, all the male members of her family, even her fathers and brothers, rush on her with their clubs and kill her on the spot, in order to take away the disgrace which she has brought on her house.

After the bride has been led away there is a grand dance. This differs somewhat from the dances which are usually seen among the Polynesians. The spectators being seated in a circle round a cleared space, and keeping up a monotonous chant, the men first enter the circle, led by a young chief, and clothed merely in the little leaf apron, so as to show off the tattoo to the best advantage. Their leader goes through a vast number of steps, sometimes leaping high in the air, and sometimes executing movements of a slower and more graceful character, while every step is watched and criticised as it is danced by the leader and imitated by his followers. After the men have danced for some time they retire, and a number of girls enter, who go through evolutions of a similar character, and afterward both men and women dance together.

THE houses of the Samoans are all built on the same model. They are very conservative in some of their ideas, and follow implicitly the plan which was adopted by the chief who, according to their traditions, first built a dwelling. At a distance, the appearance of the house has been compared to a large mushroom.

The first process is, to make a large platform of rough stones, covered with gravel, extending some twenty feet on every side beyond the walls of the house. In the centre are planted three posts, standing about twenty-five feet out of the ground. Upon these central posts are supported the rafters of the roof, one end of each rafter being fixed to them, and the other end to the tops of short posts about four feet high, which form, or rather which do duty for, the walls of the house. Real walls there are none, but at night the space between the posts is closed by blinds made of plaited cocoa-nut leaves. The whole framework of the roof is made in several sections, so that it can be removed.

The thatch is made of the leaves of the sugar-cane, nailed by the women to reeds with spikes made of the ribs of the cocoa-nut leaves. About four thousand leaves are required for thatching a house, and they are lashed carefully with cocoa-nut fibre.

The floor of the house is strewn with very fine gravel and covered with mats. There are no separate chambers, but at night the house is divided into a number of sleeping places by means of the mosquito curtains which are attached to the central post, and let down when required. It is a point of etiquette that all guests should be supplied with clean mats. The pillow used in Samoa is like that of Fiji, and is nothing more than a stick supported on a foot at each end.

CHAPTER CV.

EASTWARD of Samoa, and rather southward, lie the Hervey, or Cook's Islands. The group includes seven islands, the principal of which is Rarotonga, an island between thirty and forty miles in circumference. This island is remarkable for the lofty mountains of the interior, and round it extends a large reef of coral. Some of the islands are entirely coral, and all of them are surrounded by the dangerous coral reefs, at which the coral "insects" are still working.

In general appearance the people bear much resemblance to the Samoans, but seem to be of a more warlike and ferocious character. Indeed, so quarrelsome and bloodthirsty are the natives of this group, that when Mr. Williams visited Hervey's Island he found that only sixty of the population survived, and a few years later they were reduced to five men, three women, and some children, and these were on the point of fighting among themselves, in order to ascertain which should be king.

One of the principal islands of this group, namely, Mangaia, was discovered by Captain Cook in March 1777. The natives were very unwilling to come on board the vessel, but at last two men put off in a canoe, their curiosity overcoming their terror. The name of one of them was Mourooa, and he was distinguishable by a large scar on his forehead, the result of a wound received in battle.

"Mourooa," writes Captain Cook, "was lusty and well-made, but not very tall. His features were agreeable, and his disposition seemingly no less so, for he made several droll gesticulations, which indicated both good nature and a share of humor. He also made others which seemed of a serious kind, and repeated some words with a devout air before he ventured to lay hold of the rope at the ship's stern; which was probably to recommend himself to the protection of some divinity.

"His color was nearly of the same cast common to the most southern Europeans. The other man was not so handsome. Both of them had strong, straight hair, of a jet color, tied together on the crown of the head with a bit of cloth. They wore such girdles as we perceived about those on shore, and we found they wore a substance made from the *Morus papyrifera*, in the same manner as at the other islands of this ocean. It was glazed, like the sort used by the natives of the Friendly Islands, but the cloth on their heads was white, like that which is found at Otaheite.

"They had on a kind of sandal made of a grassy substance interwoven, which we also observed were worn by those who stood upon the beach, and, as we supposed, intended to defend their feet against the rough coral rock. Their beards were long; and the inside of their arms, from the shoulder to the elbow, and some other parts, were

punctured or tattooed, after the manner of the inhabitants of almost all the other islands in the South Sea. The lobe of their ears was pierced, or rather slit, and to such a length that one of them stuck there a knife and some beads which he had received from us; and the same person had two polished pearl-shells and a bunch of human hair loosely twisted hanging about his neck, which was the only ornament we observed."

After some time, Mouroua ventured on board the ship, but seemed very uneasy at his position, his feelings of curiosity being overcome by those of alarm at finding himself in so gigantic a vessel. He showed little curiosity about the ship and the various objects which it contained, but the sight of a goat entirely drove out of his mind any emotion except wonder, he never having seen so large an animal. He wanted to know what *bird* it could be, and, as soon as he could get ashore, he was seen narrating to the people the wonders which he had seen on board the great canoe.

All the Hervey Islanders are gifted with a natural appreciation of art, and the inhabitants of Mangaia seem to be pre-eminent in this respect. They lavish the most minute and elaborate carving on various objects, the handles of tools and the paddles seeming to be their favorite subjects. The beautiful paddle which is shown on the 1018th page, is drawn from a specimen in my own collection. It is nearly four feet in length, and the blade is eleven inches wide in the broadest part. The pattern is given as well as can be done, considering the minute elaboration of the original. The opposite face of the blade is even more carefully decorated, and perhaps with a more artistic design. The squared shaft of the paddle is covered with carving, as is also the peculiarly shaped handle.

Another paddle is made in a similar manner, except that the shaft is rounded instead of squared, and decorated at the handle with a row of ornaments which seem to be conventional imitations of the human face (see fig. 2). The wood of which these paddles are made is light, though strong and elastic; and, as the implement is sometimes used as a club, both these last-mentioned characteristics are needed.

Captain Cook noticed the peculiar shape of these paddles, though he does not appear to have handled them, or to have examined them carefully. "The canoe they came in (which was the only one we saw) was not above ten feet long and very narrow, but both strong and neatly made. The fore-part had a board fastened over it and projecting out, so as to prevent the sea from getting in on plunging . . . but it had an upright stern about five feet high, like some in New Zealand, and the upper part of this stern-post was forked. The lower part of the canoe was of white wood, but the upper

was black, and their paddles made of wood of the same color, not above three feet long, broad at one end and blunted."

Another paddle was brought to England by the late Admiral Young, and presented to me by his daughter. It is not so large as the specimens which have been just described, but is the most delicately carved specimen I have ever seen. The wood of which it is made is a very rich dark brown, and takes a high polish, so that the effect of the carving is peculiarly good. The blade is covered with a vast number of stars, wonderfully well carved, seeing that the native maker had no compasses by which to take his measurement, and that his only tools were sharks' teeth and bits of stone. The maker has spared no pains over this trophy of his skill, and, as if to show his own fertility of invention, he has not covered the whole of the shaft with the same pattern, as is the case with the two paddles that have just been described, but has changed the pattern every few inches. I have also a much smaller and shorter paddle, not quite three feet in length, which is made with equal care, but which is not intended so much for use in propelling boats as for ornament in dancing.

The love of ornamentation is displayed in all their manufactures, which are decorated in a manner equally elaborate and artistic. Even their drinking cups, which are made from cocoa-nut shells, are covered with carved patterns of a nature similar to those of the paddles.

The reader will remark that many Polynesians adorn with carving the handles of their tools and weapons, examples of which have been given in the preceding pages. The Hervey Islanders, however, leave no portion of the implement without carving, and in many instances sacrifice utility to ornament. This is generally the case with the adze handles, many of which are so extremely ornamental that it is not easy to see how they can be useful.

The specimen which is represented on page 1018 (adze magnified), is a good example of such an adze. The lower part of the handle is completely hollow, the native manufacturer having contrived to cut away the wood through the intervals between the upright pillars. As these intervals are not quite the third of an inch in width, the labor of removing the interior of the handle must have been very great, and the work exceedingly tedious. Even with European tools it would be a difficult piece of workmanship, and its difficulty is greatly enhanced by the fact that the native who carved it had nothing but a sharp stone or a shark's tooth lashed to a handle by way of a knife. This particular specimen has been in England for many years, and must have been made before the introduction of European tools among the natives.

The head of the adze is made of stone, and is lashed to the handle in a way exactly like that which is employed by the New Zealanders, except that it is far more elaborate. As if desirous of giving himself as much trouble as possible, the maker has employed the finest plaited sinnet, not wider than packthread and quite flat, and has laid it on the tool in a manner so elaborate that to give a proper idea of it the artist must have occupied an entire page with his drawing. Suffice it to say that the illustration gives a good general idea of the mode in which the head is lashed to the handle. The sinnet is laid as regularly as if wound by machinery, and the native artist has contrived to produce the most extraordinary effects with it, throwing the various portions into a simulated perspective, and making the lashing look as if there were four distinct layers, one above another.

Between the stone of the adze head and the wood of the handle is placed a piece of very strong tappa cloth, which seems to have been laid on while wet, so that the bands of sinnet have pressed it well together, and aided in strengthening the junction. The end of this tappa is seen projecting on the upper part of the head, just where it is joined to the handle. That such an implement as this should have been intended for use seems most unlikely, and I believe that it has only been constructed as a sample of the maker's skill. Sometimes adzes of a similar character are made, the handles of which are from four to five feet long, and carved with a pierced pattern throughout their entire length, so that they could not have been intended for hard work.

A similar elaborate ornamentation is found upon the Hervey Islanders' spears, one of which is shown in the illustration entitled "Spear," on the 1018th page.

The spear, which is in my collection, is rather more than ten feet in length, and beautifully made. The shaft is very straight, very slender, and highly polished, but without any carving; indeed, it is so slight that it could not bear any pattern to be carved upon it. The ornament is therefore confined to the many-barbed head, which is a beautiful specimen of savage art.

By referring to the illustration, the reader will see that just below the first set of barbs the wood of the spear swells into a slightly oval form. This portion of the head is covered with carving, necessarily very shallow, but sufficient for ornament. Between the various sets of barbs the spear is wrapped with very narrow strips of some reed, which is highly polished and of a bright yellow color, so that the contrast between the dark wood of the barbs and the shining yellow of the wrapping is very striking. In spite of the large size of the head, the spear is well balanced, the length of the slender and elastic shaft acting as a counterpoise; and alto-

gether the weapon is as formidable as it is elegant.

Their clubs are ornamented in a similar manner. Mr. Williams describes one of a very curious form. It was carved like the club, fig. 1, on page 949, but was bent nearly at right angles, rather beyond the junction of the handle with the head, and was ornamented with a great bunch of long and slender feathers. Slings of great length and power are used by these people.

According to the accounts of this missionary, the inhabitants of Mangaia can use their weapons with great skill and courage. They do not try to hide behind trees and bushes, and take their foes by surprise, but boldly meet them in the open field. When two parties meet, they form themselves into four lines. The warriors who compose the first row are armed with the long spears which have just been described, the second rank carry clubs, the third are furnished with slings, and the fourth rank is composed of the women, who carry additional weapons, in case the men should be disarmed, together with a supply of small stones for the slingers. This arrangement of forces is represented in the battle scene given on the opposite page.

Sometimes the women take an active part in the fray. One young chief told Mr. Williams that in one battle he was fiercely assailed by the wife of his antagonist. He told her to desist, as he had not come to fight with women. However, she would not listen to him, and exclaiming, "If you kill my husband, what shall I do?" flung a stone at him, which struck him to the ground. Had it not been for the prompt assistance of his own people, who came to the rescue, he would assuredly have lost his life through this woman's fury.

The people are apt to be ferocious in battle, and Mr. Williams mentions that several of his converts forgot the maxims of Christianity in the excitement of battle, and killed their vanquished enemies in spite of their entreaties for mercy. In all probability, these people were carrying out some feeling of vengeance, according to the custom of these islands.

Throughout the greater part of Polynesia the friends or relatives of the murdered man are bound to avenge his death by killing the murderer, if they can secure him, or at all events by killing one of his family. The family of the victim then retaliate in their turn, so that when a man goes into battle he mostly has a number of feuds on his hands. Like the Corsican Vendetta, if such a feud cannot be carried out in a man's lifetime, he bequeaths it to his son, so that it may be carried on for any number of generations.

This savage custom has stood greatly in the way of the missionaries. They found no very great difficulty in persuading the people that to harbor malice against another, who

(1.) THE BATTLE. (See page 1034.)

(2.) VILLAGE IN THE KINGSMILL ISLANDS. (See page 1038.)

might be totally innocent, was exceedingly wrong, and that they ought to abandon the feud. But the new converts argued that it was very unfair to demand that they should abandon their feuds against others while the feuds against themselves were still in operation.

In their architecture the Mangaians display the same love of carving which has already been mentioned. Mr. Williams thus describes a building which had been erected for him, and which was large enough to hold sixteen hundred persons:—

“It was a fine building, of an oval shape, about one hundred and twenty feet in length. The large posts which supported the roof (eight in number), the ridge-pole, and the rafters were most beautifully carved, and tastefully colored with various native preparations.

“It is impossible, however, so to describe them as to enable the reader to form a correct idea of their appearance, or of the taste and ingenuity displayed in their execution. These posts were twenty-five feet high, and from twelve to eighteen inches square, and when we considered the tools with which the work was done, which were principally old nails, pieces of iron hoop, and a few chisels, we were amazed both at the patience and skill of the carvers. The effect on entering the place was very striking.”

On the shores of this island fish appear to be less plentiful than is generally the case, and the inhabitants are obliged to have resort to various modes of procuring and preserving food. For example, when they have caught a large quantity of flying fish, they do not eat them at once, but dry them in wood smoke, much as herrings are cured among ourselves. They have an ingenious method of catching these fish by night. The boatmen go out in their double canoes, supplied with torches and large ring nets fastened to the end of handles ten or twelve feet long. They stamp on their canoes so as to make a noise, which is communicated to the water and alarms the fish, and at the same time wave their torches about. According to their instinct, the flying fish dart out of the water toward the light, and are easily captured in the nets.

Rats form a most valued portion of their diet. When the missionaries first visited Mangaia, the natives were so fond of this food that they measured all other kinds of diet by comparison with rats' flesh. Indeed, the flesh of these animals is far better than is generally supposed. Several English rat-catchers have learned by practical experience the value of rat's flesh, which is said by those who have tried it to be equal to that of the squirrel and better than that of the rabbit. The Mangaians caught the rats by digging a hole in the ground, and throwing bait into it. When a sufficient number had entered the hole, a net was thrown over

the mouth of it, and the inmates easily secured.

In RAROTONGA, another island of this group, the rats swarmed in such numbers that they were not only a nuisance, but an absolute pest; and, if it had not been for the pigs which were introduced by the Europeans, and allowed to run wild, the rats would probably have driven the natives out of their villages. At every meal one or two persons were detailed for the sole purpose of keeping the rats from the provisions. When the people sat down in their houses the rats ran over them, and when they lay down to rest the rats had made a settlement in their bed.

At last warfare was declared against the rats, and a number of baskets were made to contain the bodies of the slain, each basket being five or six feet in length. The inhabitants then armed themselves with sticks, and in an hour no less than thirty of these great baskets were filled with dead rats. Even then no diminution seemed to have taken place among these pests. Next, the missionaries tried the introduction of cats, and with some success, but the most fortunate introduction that was made was that of the pig. These animals were brought to Rarotonga for the purpose of supplying the sailors with meat which should supersede the flesh of the rat, and the pigs repaid their introducers by eating every rat which came across them.

When the natives were converted to Christianity, they consulted the missionaries, wishing to know whether the flesh of rats was unlawful food for Christians. They evidently asked this question because they saw that their teachers abstained from these animals. The missionaries returned a very judicious answer to this question, by saying that in their own country rats were not eaten, because the white man had a repugnance to them, but that there was nothing unlawful in eating them, and that the Mangaians might do as they pleased. The people were satisfied with this answer, and contented themselves with passing a law that all Christians should catch and cook their rats on Saturdays, so as to avoid working on the Sunday.

The idols of the Hervey Islanders are very odd-looking things, and would scarcely be recognized as objects of worship. It might naturally be imagined that if these people bestow such pains upon their weapons and implements, they would at least take equal pains with their gods. Yet the gods of the Hervey Islanders are the rudest possible specimens of native workmanship. They consist principally of a staff about sixteen or seventeen feet in length, the upper part of which is carved into a rude representation of a human head. On the staff are laid a few red feathers and

a string of beads, which are called the soul of the god. Round the staff and the beads is wrapped a vast quantity of native cloth, so as to form a slightly conical roll about a yard in diameter, and ten feet in length.

One of these idols is placed at the bow of every canoe, and whenever the natives are out on a fishing excursion they always make offerings to this strange deity.

THE KINGSMILL ISLANDS.

NORTH-WEST of the Samoas is a group known by the name of Kingsmill Islands. It consists of about fifteen islands, all of coral, and all lying very low, so that they might easily escape the attention of voyagers. As is always the case with coral islands, the navigation among them is very dangerous. They are mostly very long in proportion to their width, the largest of the group, called Taputeonea or Drummond Island, being nearly forty miles in length, and in many places not a mile in width.

The inhabitants of these islands have a character for ferocity which is not often to be found among this race of Polynesians, and are said to be lower in the human scale than any whom we have hitherto described. Those of one of the group, called Pitt Island, are said to be less liable to this charge than any other, being quiet, peaceable, and not so perpetually at war as is the case with the inhabitants of the other islands.

Their color is approaching nearer to black than that of the inhabitants of Tonga and Samoa, and the people are of more moderate stature than those of the latter group of islands. They are well made and slender, and have black and glossy though rather fine hair. The mouth is large, but has nothing of the negro character about it and the teeth are kept very white. The nose is mostly aquiline, and the hair of the beard and moustache black, and by no means coarse.

It is rather remarkable that the people of Pitt Island are not only more quiet and peaceable than their neighbors, but are also of a lighter hue, approaching in this respect the naturally peaceful though courageous inhabitants of Tonga. Their faces are oval and neatly rounded, and their features delicate. It may be that they have been modified by the mixture with the Samoans or Tongans, who have been blown out of their course by gales, landed on the island, and gradually became absorbed in the community.

Architecture among the Kingsmill Islands is rather distinguished for strength and massiveness than for beauty, the natives preferring to employ their artistic powers on smaller objects, such as swords, spears, and similar articles. The houses vary much in size and form according to their uses. For example, the ordinary dwelling-house of the Kingsmill Islanders consists of two stories, the upper part being used as a sleep-

ing-house, and the lower entirely open. In fact, the houses of the Kingsmill Islands are exactly similar in principle to those of Nicobar, which have been described on page 903.

Some of the houses wherein the chiefs sit and talk among themselves and receive visitors are mere sheds, being nothing more than roofs supported on poles. As is usually the case in Polynesia, there is in every village a central council house, in which the people assemble on stated occasions. It is of enormous dimensions, having a lofty roof thatched with leaves and lined with matting. Several examples of their houses are illustrated on the 1035th page, and the reader will see that the lower part affords a complete and yet an airy refuge from the sun in the heat of the day, while the upper part, which is too hot to be comfortable during the day-time, forms comfortable sleeping-rooms at night.

Dress varies much according to the particular island. Tattooing is practised by both sexes, but the women are far less decorated than the men, the lines being very fine and far apart. The men are tattooed at the age of twenty, the process being always left in the hands of professional tattooers, who, as in other islands of Polynesia, are paid according to the celebrity which they have attained, in some cases obtaining very large fees. They dress chiefly in mats made of the pandanus leaf cut into narrow strips, and dyed brown and yellow. These strips are plaited together in a very ingenious fashion so as to form diamond or square patterns. A small cape, worn, in poncho fashion, with a slit in the middle, through which the head passes, is worn over the neck, and a conical cap of pandanus leaf is worn on the head.

The dress of the women consists of a petticoat of leaf-strips reaching from the waist to the knees, and fastened by a thin rope, sometimes five or six hundred feet in length, made of human hair. On the rope are strung at intervals beads made of cocoa-nut and shells, ground so as to fit closely together, and strung alternately so as to form a contrast between the white shell and the dark cocoa-nut.

It has already been mentioned that the Kingsmill Islanders are a warlike people. War, indeed, seems to be their chief business, and indeed their whole thoughts appear to

be given to fighting. Even their principal amusement is of a combant character. There is nothing which delights the Kingsmill Islanders so much as cock fighting, and large groups of the people may be seen seated in a circle, eagerly watching the progress of the combat which is taking place in the midst. Cock fighting is largely practised in many other countries, but is almost invariably accompanied by betting. The Malays, for example, are passionately fond of the sport, and wager whole fortunes upon it. Betting, however, has no charms for the Kingsmill Islander, whose martial soul is utterly absorbed in the fight, and does not require the additional excitement of betting.

This being the nature of the people, it is natural that their weapons should be of a formidable character. They are indeed exactly suitable to the fierce and bloodthirsty people by whom they are made. Instead of contenting himself with a club or a spear, the Kingsmill Islander must needs arm his weapons with sharks' teeth, which cut like so many lancets.

The spears and swords which are shown on the 1041st page are drawn from specimens in my collection, and are admirable examples of these extraordinary weapons.

For want of a better word, we must use the name of sword for these weapons, as they are constructed with edges, and are meant more for striking than thrusting. I have often wondered that in none of these weapons that I have seen is the point tipped with a sharp bone, such as that of the sting-ray, or even with a shark's tooth. Perhaps they are formidable enough even for these ferocious islanders, as the reader may easily infer by looking at the illustration. By the side of each figure is a specimen of the shark's tooth drawn on an enlarged scale, partly to show the nature of the tooth itself, and partly to exhibit the principal methods by which it is fastened in its place.

On referring to these illustrations, the reader will see that the teeth are not merely sharply edged and pointed, but that their edges are finely and regularly serrated, so that their cutting power is greatly increased. Indeed, the weapons armed with these teeth have such a facility of inflicting wounds that they must be handled with the greatest caution. I have cut myself more than once with them, and visitors who insist upon handling them generally suffer for their curiosity.

Although these teeth are fastened to the blade of the weapon on the same principle, the makers vary the detail according to their own convenience. In the weapon represented in fig. 1. a slit runs along each edge, into which the bases of the teeth fit rather tightly. A hole is bored through the tooth, and a corresponding one through the edge of the sword, and each tooth is fixed in its

place by a piece of fine sinnet passed repeatedly through the holes, drawn tight, and neatly finished off. A plaited loop of broad sinnet serves to suspend the weapon round the wrist, and a piece of the hard, ivory-like skate-skin holds it in its place.

The next, fig. 2, shows a much more elaborate weapon, which, instead of consisting of a single piece, has one central blade and three auxiliary blades. Moreover, as the reader may see by carefully examining the illustration, there are four rows of teeth instead of two on each blade, and the teeth are larger and more deeply serrated than those of the other weapon. In this case the maker has most ingeniously contrived to spare himself the trouble of making a fresh tie for every tooth, which, as upwards of two hundred teeth are employed, would have been a very tedious business.

Firstly, he has shaped the wooden blades with four bold ridges, and cut a slight groove along each ridge, so as to keep the teeth straight. Instead of troubling himself to bore holes in the sword as well as in the tooth, he has laid along the edges of each groove a strip of elastic wood obtained from the rib of the palm leaf, which is as hard and elastic as whalebone. The sinnet has then been passed through the holes in the teeth, and over all them palm-leaf strips, so that one piece of sinnet serves to fasten four teeth. As in the other case, the sinnet is exceedingly fine, and is passed several times round the sword. It is observable that in this weapon the teeth have been most carefully selected and graduated, the largest and longest being near the handle, and diminishing equally to the point, where they are comparatively small.

The auxiliary blades diverge more than is shown in the illustration, and it is hardly possible to imagine a more formidable weapon, especially when employed against the naked skin of a savage. In actual warfare the Kingsmill Islander has a mode of protecting himself, which will be presently mentioned; but in a sudden skirmish or a quarrel the sword would be used with terrible effect. As may be inferred from its shape, it is not merely used as a striking weapon, but is driven violently backward and forward against the body of the antagonist, one or more of the blades being sure to take effect somewhere.

The next sword, fig. 3, has the teeth fixed exactly in the same manner as those of the many-bladed sword, as may be seen by reference to the single tooth, where is seen not only the tooth but the strips of leaf stem between which it is placed, and the mode of fastening off the sinnet. The wooden blade of this weapon is quite unlike that of the others, being marked with a rich black graining, to which the glittering white teeth form an admirable contrast.

The last of these swords, fig. 4, is remark-

able for the cross-guard. I cannot but think that the maker must have seen an European sword with a cross-guard, and made his own in imitation of it. Otherwise, without the least idea of the object of a guard, it is not easy to see why he should have armed the guard with teeth, especially in the centre, or where they come against the handle, and must be quite ineffectual.

The Kingsmill Islanders do not restrict the sharks' teeth to the swords, but also use them as armature to their spears. One of these spears, also in my collection, is fifteen feet in length, and about as formidable a weapon as can well be imagined. It is made of a very light wood, so that it may be wielded more easily, and at the butt is nearly as thick as a man's wrist, tapering gradually to the point. The butt is unarmed, and rounded for about four feet, so as to act as a handle, but from this point to the tip it is rather flattened, like the sword blades, for the more convenient reception of the teeth, which are fixed along each edge nearly to the point of the weapon. The teeth are fastened by means of the leaf ribs. In order to render it a more dangerous weapon, it is furnished with three projections, also armed with teeth, and made exactly like the auxiliary blades of the sword, though much smaller.

This remarkable spear is shown in the illustration No. 2, on the next page, accompanied by sections and a portion drawn on a larger scale, so as to show the mode of its construction. Fig. *a* represents the method in which the teeth are fastened to the weapon by the sinnet passing through the hole in the teeth and bound down by the cross loop under the little strips of wood. At fig. *b* is a section of the spear, showing the oval shape of the weapon, and the mode in which the teeth are supported by the wooden strips at each side. It is worthy of notice, that if the jaw of a saw-fish were to be cut through the section would present a wonderfully similar appearance.

In order to show more clearly the source whence the natives obtain such vast numbers of sharks' teeth, I have introduced a drawing of a shark's mouth on same page, taken from a specimen in my collection. The reader will see that the jaws are furnished with row after row of teeth, all lying upon each other, except the outer teeth, and constructed so that when one tooth is broken or falls out of the jaw, another takes its place.

In the jaw which is here figured, the teeth lie in five rows, and altogether there are three hundred of them — largest toward the middle of the jaw, and becoming gradually smaller toward the angles of the mouth. The native, therefore, has no difficulty either in procuring the requisite number of teeth, or in selecting them of the requisite shape and dimensions.

That they may look more imposing in battle, the chiefs wear a cap made of the skin of the didon, or porcupine fish, which, when inflated, is covered with sharp spikes projecting in every direction, and upon this cap is fixed a bunch of feathers. Both sexes fight in battle, and both are killed indiscriminately, women and children being slaughtered as well as the warriors.

The chiefs, of whom mention has just been made, are the principal persons in the islands. With one exception, there is no chief who is looked upon as a king, ruling over subordinate chiefs, each being independent of the other. Government is carried on by a council of chiefs, the eldest taking the first place, and the others being reckoned by seniority. To this council are referred crimes of great importance, while those of lesser moment are left to be punished by the offended person and the relatives. The solitary exception to the independence of the chiefs is in the three islands Apamama, Nanouki, and Korua, which are governed by the chief of Apamama.

Each chief has a mark peculiar to himself, and when a stranger arrives, and can place himself under the protection of a chief, he receives the mark of his protector. The symbol is a very simple one, and consists of a patch on the forehead, made of some colored paint, and a stripe drawn down the middle of the face as far as the chin. Next in rank to the chiefs come the land-holders, and the slaves form the third and last division of the people.

In order to accommodate the council of chiefs and the people in their public assemblies, there is in every village a central town-house, called the Mariapa. It is built very much after the fashion of the Samoan houses, having an enormous arched roof, and the walls being composed of posts and matting. It might be thought from their warlike and ferocious character that the Kingsmill Islanders are cannibals. Such, however, is not the case. It is very true that in some instances portions of a human body have been eaten. For example, if a celebrated warrior is killed, the victors sometimes cook the body, and each eats a small portion of it. This however is done, not from any predilection for human flesh, but from a feeling of revenge, and probably from some underlying notion that those who partake of such food also add to themselves a portion of the courage which once animated the body. Animated by the same spirit, they preserve the skulls of such warriors, and use them as drinking vessels.

The skulls of the dead are always preserved by their friends, provided that they have died natural deaths, or their bodies been recovered in battle. The body is first laid out on mats for eight days, being every day washed, oiled, and laid out in the sunshine at noon, while the friends mourn,

(1.) SHARK'S JAW.
(See page 1040.)

2.) SHARK TOOTH SPEAR.
(See page 1040.)

3.) SWORDS OF KINGSMILL ISLANDERS.
(See page 1039.)

dance, and sing praises of the dead. The body is then buried for a time, and lastly, the skull is removed, cleaned, oiled, and stowed away. Each family preserve the skulls of their ancestors, and, occasionally, bring them out, oil them afresh, wreath them with flowers, and set food before them. When a family change their residence, they take the skulls with them.

In one portion of the Kingsmill group, Pitt Island, or Makin, there exists the most extraordinary funeral ceremony in the world. The body is washed, oiled, exposed to the sun, and walled over, as already related. But, after the first wailing, it is laid on a new mat spread over a great oblong plate or tray made of tortoise-shell sewed together. A

number of persons seat themselves opposite each other on the floor of the house, and support the plate on their knees as long as they are able. When they are tired, they are relieved by others, and thus the body is borne by friends and relations for two years, the bearers relieving each other at intervals. During this time a fire is kept burning in the house, and is never extinguished night or day.

After the two years have expired, the head is removed, and the skull cleaned and preserved, as has been already mentioned, and not until that time are the bones wrapped up in mats and buried. The place where the warriors have been interred is marked with three stones.

CHAPTER CVI.

THE MARQUESAS ISLANDS.

DRESS — AMUSEMENTS — WAR — BURIAL.

ORIGIN OF THE NAME — APPEARANCE OF THE NATIVES — THEIR DRESS — THE ELABORATE TATTOO OF THE MEN — DIFFERENCE IN STATURE BETWEEN THE SEXES — CARE OF COMPLEXION — A BLEACHING PROCESS — A MAN IN FULL DRESS — MODES OF WEARING THE HAIR — THE CHIEF'S NECKLACE — CLOSE SHAVING — PECULIAR HEADDRESS — METHOD OF OBTAINING FEATHERS — ARCHITECTURE IN THE MARQUESAS — AMUSEMENTS — DANCING AND STILT-WALKING — THE AMPHITHEATRE OR PAHOOA — WAR — TROPHIES OF VICTORY — MODE OF WARFARE — DESTRUCTION OF PROPERTY — ETIQUETTE OF WAR — REPLACING A PRISONER — CANOES AND FISHING — FLY-FISHING IN THE MARQUESAS — BURIAL CUSTOMS.

WE now come to that very interesting group of islands called the MARQUESAS, or MENDANA ISLANDS. Both these names derive their origin from the Spanish navigator Mendana, who discovered them nearly two hundred years ago. The discoverer named them Los Marquesas de Mendoca, in compliment to the then Viceroy of Peru, and by many succeeding voyagers the islands have been called by the name of their discoverer.

The character of the islands is rather peculiar, and very picturesque. They are craggy, mountainous, and volcanic, having exceedingly lofty peaks in the centre, which look at a distance as if they were the ruins of vast buildings. Being situated near the equator, their temperature is warm, and, as at the same time they are well watered, the vegetation is peculiarly luxuriant. Like most of the Polynesian Islands, the Marquesas are surrounded with coral reefs; but these are not so large as is generally the case, so that, although the navigation among them is not so difficult as in many islands, the ships do not find that protection from storms which is afforded by the great coral reefs of other islands.

The inhabitants are splendid specimens of humanity, the men being remarkable for their gigantic size, great strength, and fine shape, which emulates those of the ancient Greek statues. One of the chiefs was measured carefully, and was found to be six

feet eight inches in height, and said that he knew another chief who was at least a foot taller than himself.

In general they wear but little raiment, a slight piece of bark cloth round the waist being the only garment which they think needful, the place of clothing being supplied by the tattoo. There are many nations where this decoration is worn; but there are no people on the face of the earth who carry it out so fully as do the Marquesans, every part of their bodies, even to the crown of the head and the fingers and toes, being covered with the pattern. The "Tattooed chiefs" on the opposite page illustrate the extent to which the Marquesans carry this custom. This extreme elaboration is only to be found in the men, the women contenting themselves with a bracelet or two tattooed on their arms, and a few similar ornaments here and there. A very interesting description of the tattooing of the Marquesans is given in Langsdorf's "Travels."—

"Sometimes a rich islander will, either from generosity, ostentation, or love to his wife, make a feast in honor of her when she has a bracelet tattooed round her arm, or perhaps her ear ornamented. A hog is then killed, and the friends of both sexes are invited to partake of it, the occasion of the feast being made known to them. It is expected that the same courtesy should be returned in case of the wife of any of the guests

(1.) TATTOOED MARQUESAN CHIEFS. (See page 1048.)

(4.) MARQUESAN CHIEF. (See page 1049.)

being punctured. This is one of the few occasions on which women are allowed to eat hog's flesh.

"If, in a very dry year, bread-fruit, hogs, roots, and other provisions, become scarce, any one who has a good stock of them (which commonly happens to the chief), in order to distribute the stores, keeps open table for a certain time to an appointed number of poor artists, who are bound to give in return some strokes of the tattoo to all who choose to come for it. By virtue of a tapu, all these brethren are engaged to support each other, if in future some happen to be in need while the others are in affluence.

"The same person may be a member of several of these societies; but, according to what we could learn, a portion must always be given to the priest, or magician, as he is called, even if he be not a member. In a time of scarcity, also, many of the people who have been tattooed in this way unite as an absolute troop of banditti, and share equally among each other all that they can plunder or kill.

"The figures with which the body is tattooed are chosen with great care, and appropriate ornaments are selected for the different parts. They consist partly of animals, partly of other objects which have some reference to the manners and customs of the islands; and every figure has here, as in the Friendly Islands, its particular name. Upon an accurate examination, curved lines, diamonds, and other designs are often distinguishable between rows of punctures, which resemble very much the ornaments called *à la Grecque*.

"The most perfect symmetry is observed over the whole body. The head of a man is tattooed in every part; the breast is commonly ornamented with a figure resembling a shield; on the arms and thighs are strips sometimes broader, sometimes narrower, in such directions that these people might be very well presumed to have studied anatomy, and to be acquainted with the course and dimensions of the muscles.

"Upon the back is a large cross, which begins at the neck and ends with the last vertebra. In the front of the thigh are often figures which seem intended to represent the human face. On each side of the calf of the leg is an oval figure, which produces a very good effect. The whole, in fact, displays much taste and discrimination. Some of the tenderest parts of the body—the eyelids, for example—are the only parts not tattooed."

As may be seen by the illustration No. 2 on the 1046th page, even the hands are tattooed with the same minute care that is bestowed on the body. Each finger has its own pattern, so that the hand looks as if enclosed in a very tight-fitting glove. The reader will notice the great length of the nails. Among the Marquesans, as among the Chinese, very long nails are esteemed as a mark

of rank, being a proof that the wearer is not obliged to do any hard work.

This elaborate ornamentation answers the purpose of dress, and is considered as such. Indeed, it would be useless to undergo so much pain, and to pay the operator such costly fees, if the tattooing were to be hidden by clothing. The men, therefore, wear nothing but a slight cloth round their waists, and the women of rank a similar garment, with the addition of a larger piece which they throw over their bodies to keep off the darkening rays of the sun.

Few phenomena struck the earlier travellers more than the difference in appearance and stature between the men and the women; and the same writer who has just been quoted remarks more than once that it was difficult to believe that the undersized, stumpy, awkward women could have been the parents of the magnificent, gigantic, and graceful men. There is, however, a great distinction between the women of rank and those of the lower orders. As was afterward discovered, the better class of women, who for some time kept themselves aloof from the strangers, being well developed, and of a fair complexion, about which they were very careful, enveloped themselves in their bark cloths, and never ventured into the sunshine without holding over their heads a bunch of leaves by way of parasol.

So careful are they of their complexions, that if they find themselves getting sunburnt they have a mode of bleaching themselves again, which they adopt before all great ceremonies, though at the cost of much time and trouble. They take the sap of three trees, with which they anoint the whole body. The immediate effect of the mixture is to dye the skin of a deep black. The pigment is allowed to remain on the skin for six days, during which time the woman remains within the house. At the expiration of that time she bathes, when all the black dye comes off, and the skin is left beautifully fair.

A woman who has just undergone this process, and who has dressed herself in all her native finery, is a very striking object, her body being gracefully enveloped in bark cloth, her hair adorned with flowers, and her fair skin almost without ornament except upon the feet, hands, and arms, which appear as if she were wearing boots, gloves, and bracelets.

The mode of tattooing is almost exactly like that of the Samoan islanders, except that the "comb" is made of the wing-bone of the tropic bird. The operation is always conducted in certain houses belonging to the professional tattooers, who lay on these buildings a tapu, which renders them unapproachable by women. As is the case in Samoa, the best tattooers are men of great importance, and are paid highly for their services, a Marquesan thinking that he is

bound to be liberal toward a man to whom he is indebted for the charms which he values so highly. These men gain their skill by practising on the lower orders, who are too poor to pay for being tattooed, and who would rather wear a bad tattoo than none at all. A considerable amount is generally exacted at each operation, which lasts from three to six months; and so elaborate is the process, that a really complete tattoo can hardly be finished until the man is thirty years old.

By the time that the last piece of tattoo is executed, the first generally begins to fade, and if the man is rich enough he has the pattern renewed. Some men have been tattooed three times, and, as the patterns cannot be made to coincide precisely with each other, the result is that the whole skin becomes nearly as dark as that of a negro. In this state it is greatly admired, not because the effect is agreeable to the eye, but because it is an indubitable mark of wealth. The pigment used in the tattooing is the well-known aleurita, or candle nut, burned to a fine charcoal and mixed with water.

The ornaments worn by the men are more imposing than those of the women. In the first place, they allow the hair to grow to a considerable length, and dispose of it in various ways. For a number of years it is tied in a bunch on the top of the head; but when the man is rich enough to be entirely tattooed, he shaves all the head with the exception of a patch at each side, in order to allow the pattern of the tattoo to be extended over his head. In such a case, the tuft of hair at each side is still suffered to grow long, but is twisted into a conical form, so as to make a sort of horn projecting outward over each temple. Examples of this curious mode of wearing the hair may be seen in the illustration No. 1, on page 1046.

Sometimes a man may be seen wearing the whole of his hair in curled ringlets. Such men are cultivating a crop for sale, as the Marquesans are very fond of decorating with these ringlets the handles of their spears and clubs, and of making them into ornamental figures which are worn on the ankles. The most valued of these decorations are long white human beards, which are grown for the express purpose, and sold at a very high price. The purchaser uses them either as plumes for his head or as ornamental appendages to his conch-shell trumpet. One of these beards is now always reckoned as equivalent in value to a musket, and before fire-arms were introduced was estimated at an equally high rate.

The ear ornaments of the Marquesan men are very curious. An univalve shell, of a dead-white color, is cut into a circular shape, and filled with a sort of cement made of the resin and wood of the bread-fruit tree. Into this cement is pressed an ivory stem, carved

with figures in relief, so that the whole ornament looks like a very large white headed nail. The stem is pushed through a hole in the lobe of the ear, so that the head of the nail projects forward, as seen in the right-hand figure of "tattooed chiefs" on page 1046. The name of the ornament is "taiana."

Ornaments made of whales' teeth are as fashionable among the Marquesans as among the Polynesians, and are worn by the chiefs suspended round their necks. Wooden ornaments bleached white are also used, and others are cut from shells. One ornament of which they are very fond is made from wood, wax, and seeds. It is in the form of a horseshoe, the framework being made of wood, which is thickly covered with wax. Into this are pressed the pretty black and scarlet seeds of the *Abrus precatorius*, arranged in rows radiating to the circumference. One of these ornaments is shown in the illustration No. 3, on the same page and is drawn from a specimen in my collection. It measures eight inches in diameter, and is slightly concave on the outside, and convex on the inside. Very great pains have been taken in arranging the seeds; they are placed in a regular series of double rows, the black portion of each seed being pressed into the wax, so that only the brilliant scarlet portion is visible. Upward of eight hundred beads have been used in making this ornament, so that the trouble which is taken by the natives is very great.

Some of the chiefs wear a very curious ornament, which seems to take the place of the hair which they shave from their own heads, and is nothing more than a large bunch of hair cut from the head of a wife. As a rule, the Marquesan removes all hair from the body, except from the head, only one or two of the very old men allowing a few straggling hairs on the chin.

In Langsdorff's travels an amusing incident occurred, illustrative of that feeling. In those days close shaving was the custom in Europe, so that when the officers went on shore they were found to have conformed to the fashion of the islands. They were talking very amicably together, when suddenly a chief stared intently into the face of one of the officers, and, with horror depicted in his features, rushed forward, and grasped him tightly. The officer naturally thought that he was going to be murdered; but the fact was, that the Marquesan had actually discovered a hair on his face, and was going to pull it out with his shell tweezers.

When they wish to be considered as wearing full dress, the better class of men wear a most elaborate cap, made of fibre, feathers, and shells. First, a broad fillet is plaited from cocoa-nut fibre, so as to pass round the forehead, after the manner of a cap without a crown. On the centre of this fillet is fixed a large plate of mother-o'-pearl, decorated with carving. In the middle of this

plate is fixed a smaller but similarly shaded plate of tortoise-shell, and in the middle of that a still smaller disc of pearl shell. Some headdresses have three of these ornaments, as is the case with that which is figured in the Marquesan chief on the 1046th page.

In the fillet are also fastened a number of feathers, either from the tail of the cock or from that of the tropic bird, so that when the fillet is bound on the forehead the feathers will stand upright. The feathers of the tropic bird are greatly prized by the natives, who use them for various ornaments, and display great ingenuity in procuring them. Instead of killing the birds, and so stopping the supply of feathers, they steal upon them when they are asleep, and dexterously twitch out the two long tail-feathers. In process of time the feathers grow again, and so the supply is kept up. I mention the custom because it is contrary to the recklessness respecting the future which is usually found among savages.

The houses of the Marquesans are rather peculiar, especially those of the better kind. The native builder begins with making a platform of large stones, many of them being so enormous that ten or twelve men are required to move them. This platform is from ten to eleven feet high, and about thirty feet long by twelve wide. Upon this is erected the house, which is built with the back very much higher than the front, so that the roof slopes considerably, the back being perhaps twelve or more feet in height, and the front only five feet. The door is naturally small, and no one can enter without stooping. The walls at the end are no higher than that of the front, so that a considerable portion of each end is left open. As, however, the climate of the Marquesas is so equable, this is rather an advantage than otherwise.

The interior of the house is divided into two portions, one of which is left bare, with no covering to the stony floor, while the other part is considered as the dwelling-place, and the floor is covered with mats. The walls are also covered with matting. Near the back wall is the strangely made family bed. Two horizontal poles are placed about six feet apart, and a foot or so from the ground, and the space between them is filled with dry grass covered with mats. The sleepers lie on the mats, resting the back of their heads on one pole, and their feet on the other, and pass the night in this position, which seems to have been invented for the purpose of making the sleepers as uncomfortable as possible. Round the walls are hung the weapons and implements of the owner, such as spears, clubs, stilts, drums, slings, axes, and similar articles. The houses are always placed near trees, so that they may have the advantage of shade.

The Marquesans have a curious custom of

erecting small and highly decorated buildings in honor of the children of great chiefs. These buildings are considered as acknowledgments of the legitimacy of the children; and if they were omitted, the parents would consider themselves insulted. They are protected by tapu, and after they are made are not repaired, but allowed to decay. Dr. Bennett, in his "Whaling Voyage round the Globe," thus describes these edifices:—

"This compliment had been paid to Eutiti's daughter at Vaitahú a few weeks before our arrival. It consisted of two small huts, neatly built with peeled hibiscus rods, which were covered with white tappa (bark cloth) and stained cocoa-nut sinnet. The interior was occupied by many of the same rods ranged vertically, graduated in height, and entwined with bunches of herbs. The face of the building was ornamented by a few boards, painted with mystic figures in black and red.

"The white and delicate appearance of the hibiscus rods, the fluttering pennants of fine tappa, and the various gaudy hues employed, gave the entire edifice a fantastic and imposing appearance. A low stone wall enclosed the two huts, and within its precincts were several bundles of cocoa-nut leaves placed upright, and intended to represent the tutelary deities of the spot. A striking edifice of the same description had been erected in honor of Eutiti's son at Anamahai, the territory of his guardian. It differed from that dedicated to his sister in being placed on an elevated stone platform, as well as in having a long wicker basket placed at the entrance."

In every village there is a sort of amphitheatre, in which the dancing and similar amusements are conducted. For this purpose the natives choose a sheltered and level spot, surrounded on all sides with rising banks. The middle of the amphitheatre is carefully smoothed and covered with mats, and the rising banks serve as seats for the spectators.

When a dance is to be performed, the mats are laid afresh, and a large amount of food is prepared. The spectators take the food with them, and, seated on the banks, remain there throughout the greater part of the day. The dances are not very graceful, consisting principally of jumping, without moving from the same spot. Various ornaments are used by the dancers, the most curious of which are the finger-rings, which are made of plaited fibre, adorned with the long tail-feathers of the tropic bird. When women dance they are not allowed to wear clothing of any description, and this for a curious reason. None dance except those whose husbands or brothers have been killed in war or taken prisoners, and the absence of clothing is accepted as an expression of sorrow on their part, and of vengeance on the part of the spectators.

They have several other amusements, which are conducted in this theatre, or *pahooa*, as it is called. The Marquesans are most accomplished stilt-walkers, and go through performances which would excite the envy of any professional acrobat. One of the games in which they most delight is a race on stilts, in which each performer tries, not only to distance his opponents, but to cross their course and upset them. They are such adepts at this pastime that they walk over the rough stones of the house platform with ease and security.

If the reader will refer to the portrait of the Marquesan chief, he will see that the head is not only decorated with the feather fillet, but is also covered with a veil that falls on either side of the face. This is a mark of war, and is worn when chiefs go into battle. The Marquesans do not use the bow and arrow, but they throw spears, sling stones, and use clubs. The slings are made of plaited grass, and are very powerful, often exceeding five feet in length, and carrying stones of a considerable size. The spears are generally about ten feet long, and the clubs are carved out of hard wood, which is made harder by burying the weapons for a considerable time in the mud.

They are fierce in war, and are never satisfied until they have gained a trophy of victory. When a Marquesan kills an enemy, he cuts off the head of his fallen antagonist, tears open the skull, and eats the brain. He then cleans the skull very carefully, adorns it with tufts of bristles, and slings it by a cord to his girdle. When he goes to battle again he always carries this trophy with him, partly on account of the respect in which it is held by his comrades, and partly in order to strike awe into the enemy by the sight of so redoubtable a warrior.

According to most travellers, the Marquesans are a quarrelsome people among themselves, and much addicted to making raids in each other's districts. These districts are generally divided from each other by natural boundaries, such as mountain-spurs and ridges, many of which are of enormous height, and so steep and precipitous as to be almost inaccessible. The worst part of their mode of warfare is not the cruelty exercised on the vanquished warriors, but on the destruction to property, and the distress inflicted on non-combatants.

When one chief intends to make war upon another, he tries to steal by night into the district of his enemy, and silently damages all the bread-fruit and cocoa-nut trees he can find. The former are stripped of their bark, and, though their vitality is so great that they are not absolutely killed by the injury, they bear no more fruit for five years, and thus the whole population are deprived of an essential article of diet, and for a long time are reduced to great straits for want of food.

The cocoa-nut trees are killed after a different manner. The destroyer walks up the tree after the mode employed by these islanders; namely, by applying the palms of his hands to either side of the trunk, and so ascending the tree in monkey fashion. He then bruises with a stone the central shoot, or "cabbage" of the palm, and descends the tree, knowing that it must soon die. The reason for the fatal nature of the injury is, that the tree is an endogenous one, and consequently the destruction of the central bud involves the death of the tree. Sometimes the tree is killed in another way, a sea-slug (*bêche-demer*) being laid at the root of the "cabbage," killing the tree as it decays.

Quarrelsome as they are and cruel to the persons and property of the vanquished, they have yet some slight etiquette in war, one rule of which is so curious that it must be given in the relator's own words:—

"June 18. — Captain Riggs of the *General Gates*, just arrived from the Marquesas, informs us that he has had a narrow escape of his life there. At the island of Nukahiva, as he was attempting to go on shore, a native chief, assisted by a posse of dependants, seized and carried him off, stripped him of his clothing, and then presented him to the king, an infirm old man, who took him under his protection. That protection, however, could have little availed him, for the sovereign had not power to set the prisoner at liberty unless a suitable ransom were paid for him.

"The captors first demanded five muskets and five barrels of gunpowder, which being agreed to, they rose in their violent extortion, and required more; and this also being conceded, they still refused to liberate him unless their rapacity was still further gratified. The captain then resolutely stood out, and insisted on being set at liberty, at the same time having but small hopes of obtaining it, or any other issue of his captivity except to be killed and eaten by these cannibals, some of whom had conspired to spear him, but the king's authority restrained their violence.

"At length, however, the terms of ransom being settled, he was ordered to be released; but here an unexpected difficulty arose. The law of the land requires that whoever captures another on board of a boat must, when the prisoner is at liberty, carry him down to the water again, and reinstate him in the same situation as he was found. This the cowardly and treacherous chief, who had readily acted the part of kidnapper, was unwilling to do, lest he should be shot from the ship. The obligation, however, being indispensable, he obtained the captain's assurance that no harm should be attempted against him, and then performed the ungracious office. When Captain Riggs had reached his vessel, the natives on the shore gave three hideous howls,

which were returned by three hearty cheers of the crew."

Finding that their captive had been so profitable to them, the natives tried boldly to take the ship, and displayed equal ingenuity and daring in their attempt. On the same evening a native was detected in trying to cut the cable, and was shot for his temerity. Finding that an open assault of this kind was useless, the natives, who are wonderful divers, swam off to the ship, carrying with them a rope, one end of which they fastened to the rudder, well under the water, the other end being carried ashore. Fortunately this trick was discovered in time to save the ship, and, had not the rope been seen, the natives would have waited until the vessel weighed anchor, and then have dragged her ashore.

In the above narrative the Marquesans are described as cannibals. It is, however, very doubtful whether they can be justly charged with this revolting custom.

THE canoes of the Marquesans are furnished with outriggers, after the custom of all Polynesia, and are well-built and swift vessels. They have, besides the outrigger, a small stage projecting over the stem, on which the steersman stands when the vessel is under sail. The bow of the canoe is much turned up in front, probably for the purpose of acting as a defence to the rowers, when advancing against an enemy.

They are very skillful in the fishing art, both with line and net. They have different modes of using both these implements. When they fish with the line, they sometimes bait the hook, pass the line over the side, and angle in the mode adopted in this country. But when they fish for the albacore, they employ a totally different method, which bears some resemblance to fly fishing, except that the bait is not made to represent an insect, but a fish.

A very ingenious imitation of a flying fish is made by cutting the shape of the fish out of a mother-of-pearl shell, and inserting a long tuft of hog's bristles at either side to represent the wing fins, and another at the extremity to do duty for the tail. This is armed with a hook, and fastened to one end of a line, the other end of which is attached to the top of a long bamboo rod planted in the stern of the canoe. Sail is hoisted, and the vessel is driven over the waves at full speed, the sham flying-fish leaping and bounding through the air in a manner that wonderfully resembles the action of the living fish. The albacore naturally takes the bait for a real fish, leaps at it, and is caught before it has time to discover the imposition.

Net fishing is carried on in several modes, but the most curious and perhaps the most sportsmanlike plan is that which compels the fisherman to pursue his occupation under water. He takes with him a hand-

net and a stick about two feet in length, jumps into the water, and dives among the coral, holding his net over the nooks and crevices with one hand, while with the stick he drives the fish out of their hiding places into the net.

By this mode of fishing great numbers are captured, but the fisherman is always exposed to two dangers. In the first place, there is a chance that a shark may come up unobserved, and carry off a limb, even if it does not kill the man. The Marquesans are such excellent swimmers that they care little for a shark as long as they can see him, and it is only when the terrible fish darts unexpectedly out of a hiding place that they know any real fear.

Sometimes a rather strange circumstance occasions the death of the diver. It has already been mentioned that up to the time when a man can afford to have his head tattooed he wears his hair very long, and tied up in a knot on the crown of his head. Before going into the water, the natives untie the fillet, and allow the hair to float down their backs. It has occasionally happened that a diver, who has thus prepared himself, finds, when he tries to rise to the surface of the water, that his long floating hair has become entangled in the branching coral; and, as he has already remained under water nearly as long as his breath will last, he is sometimes drowned before he has time to extricate himself.

When a Marquesan dies a natural death, his relatives make great preparation for his funeral, including the usual accompaniment of feasting. They send for a "tana," or priest, who makes a long oration over the corpse, which is then delivered to the relatives, who have a long and disagreeable task before them. They first wash the body thoroughly, and then rub it with cocoa-nut oil, laying it in the sun, and turning it continually. Several times daily the corpse is newly anointed, until at last the combined effects of the sun and oil reduce it to a mummy. Wrapped in cloth, it is laid on a bier, and deposited in the cemetery.

Each district has its cemetery, or "morai," which is adorned with gigantic human figures carved in wood, and similar decorations. It is surrounded by a wall, and held in great respect by the inhabitants of its district. Unfortunately, the inhabitants of other districts hold it in no respect at all, and, when war is declared, try to steal out of the morai the body of any man of rank. When, therefore, war seems to be imminent, the bodies are carried away and hidden, or sometimes buried. A similar custom prevails in many parts of Polynesia, and Mr. Williams mentions an instance where a man climbed an apparently inaccessible precipice with a corpse lashed to his back, placed the body on a lofty shelf, and descended in safety.

CHAPTER CVII.

NIUE, OR SAVAGE ISLAND.

ORIGIN — COSTUME — LAWS — BURIAL.

REASON FOR THE NAME OF THE ISLAND — SINGULAR LEGEND — THE SAILOR AMONG THE SAVAGES — APPEARANCE OF THE NATIVES — A SAVAGE WAR DANCE — MODE OF DRESSING THE HAIR — COSTUME OF THE MEN — A CURIOUS WEAPON — PRESUMED ORIGIN OF THE SAVAGE ISLANDERS — DEFEAT OF THE TONGANS — CODE OF LAWS AND PUNISHMENTS — CANOE MAKING — SAILING — NIUAN ARCHITECTURE — DISPOSAL OF THE DEAD.

BETWEEN the Hervey and the Tongan groups, there lies an island which was called by Captain Cook "SAVAGE ISLAND," on account of the behavior of the natives, who not only declined his overtures of peace, but attacked him "like so many wild boars." The native name of the island is Niue.

This ferocity of theirs is due to an ancient custom of putting to death all strangers who land on their shores, a fate from which even their own people do not escape, if they have been absent for any length of time. The history of this strange people has of late years become better known, owing to the exertions of the missionaries, who have discovered that fear rather than ferocity was the cause of this savage custom. They had an idea that their island was naturally free from disease, and that all ailments were brought by foreigners, and they in consequence had a law that all foreigners should be killed as soon as they could be captured.

On one occasion a native teacher narrowly escaped death in consequence of his absence. He was obliged to exert all his powers of eloquence to persuade his countrymen to spare him for a time, so that he might keep himself far away from their residence, and purify himself by the healthy air of Niue.

When Mr. Williams visited the island, he contrived to induce two lads to go off with him for the purpose of being instructed. They were at first very miserable on board, and howled incessantly for the first few days, thinking that the white sailors were cannibals and that they were only carried

off to be fattened and eaten. Finding, however, that the sailors were eating pork, and not human flesh, they became reconciled to their lot, and were even pleased at the prospect of seeing new lands. These lads were taken to Raietea, and, having been educated for their task, were sent home again. Unfortunately, soon after their arrival, an epidemic disease spread over the island, and the natives, naturally attributing it to the two travellers, killed them both.

The first white man who landed there since the time of Cook met with a singular fate. A ship was lying off the island, and bartering with the natives. Just as the ship got under weigh, the master flung one of the sailors overboard among the savages, who took him on shore, and held a great debate as to the course to be pursued. Some were for keeping up the old custom, and killing him, but others argued that the man had not landed of his own free will, and that he ought not to be liable to the usual penalty, even though salt water was in his eye — this being the mark of a shipwreck.

After a vast amount of discussion they agreed to a compromise, put him into a canoe, gave him a quantity of bananas and cocoa-nuts, and sent him out to sea. The man contrived to slip on shore again without being seen, and, after hiding in caves for some days, he succeeded in getting on board a whaler that was passing near the island.

The appearance of the natives as they were before the missionaries came to them was anything but prepossessing. Mr. Williams gives a graphic account of an old chief who was induced, after much trouble, to come on

(1.) THE WAR DANCE OF THE NICANS. (See page 1055.)

(2.) PRESENTING THE CLOTH. (See page 1060.)

board. "His appearance was truly terrific. He was about sixty years of age, his person tall, his cheek-bones raised and prominent, and his countenance most forbidding. His whole body was smeared with charcoal, his hair and beard were long and gray, and the latter, plaited and twisted together, hung from his mouth like so many rat's tails. He wore no clothing except a narrow strip of cloth round his loins, for the purpose of passing a spear through, or any other article he might wish to carry.

"On reaching the deck the old man was most frantic in his gesticulations, leaping about from place to place, and using the most vociferous exclamations at everything he saw. All attempts at conversation with him were entirely useless, as we could not persuade him to stand still for a single second. Our natives attempted to clothe him, by fastening round his person a piece of native cloth, but, tearing it off in a rage, he threw it upon deck, and, stamping upon it exclaimed, 'Am I a woman, that I should be encumbered with that stuff?'

"He then proceeded to give us a specimen of a war dance, which he commenced by poising and quivering his spear, running to and fro, leaping and vociferating, as though possessed by the spirit of wildness. Then he distorted his features most horribly by extending his mouth, gnashing his teeth, and forcing his eyes almost out of their sockets. At length he concluded this exhibition by thrusting the whole of his long grey beard into his mouth, and gnawing it with the most savage vengeance. During the whole of the performance he kept up a loud and hideous howl. On the preceding page the artist has given the reader an illustration of this singular war dance of the Niuanis.

These islanders do not use the tattoo, though they are fond of decorating their bodies with paint. Those who come on board European vessels are delighted to be adorned with streaks and spots of red and green paint, especially the latter, which is a novelty to them, and for which they are willing to pay highly. At a little distance, they look much as if they were suffering from some cutaneous disease, but a closer inspection shows that their appearance is partly due to the salt of the sea crystallizing on their oiled bodies, and partly to the multitudinous flies which settle upon them.

The hair is sometimes seen very short and sometimes very long, and this is the case with both sexes. They allow it to grow to a considerable length, and when it is a foot or eighteen inches long, they cut it off, and plait it into thin bands which are worn round the waist. The men prize these ornaments highly, and Captain Hood thinks that the love-locks are exchanged, and are valued accordingly. The younger men do not wear their beards, but the elders

suffer them to grow to a great length, plait them, and adorn them with pieces of oyster or clam shell. They know the art of coloring the hair a yellowish red by the application of lime.

As to dress, the men think it quite needless, and wear nothing but the belt round the waist. Some, however, wear a very small apron, only ten or twelve inches square, and this is considered rather in the light of ornament than of dress. They are of moderate stature, rather under than over the middle height, thus forming a strong contrast to the gigantic Marquesans and Samoans. The natural color of the skin is a clear brown, and their limbs are round and well shaped.

In weapons, they use the spear, the club, and the bow, all made well and neatly. They do not seem to invade other islands, and their warfare is therefore waged mostly among themselves. It seems rather strange that in an island only thirty miles in circumference war should exist, but in Niue, the usual Polynesian custom exists of dividing an island into several districts, among which is perpetual feud.

They use a very curious weapon. On their island are a number of caves in the coral limestone, similar in character to that which has been described in page 1006, though not approached in the same curious manner. From the roof hang vast numbers of stalactites, from which water continually drops. Indeed, the natives owe their fresh water almost entirely to these caves, and since the missionaries came to reside among them have learned to collect it by digging wells in the caves, into which the water flows, and so insure a certain instead of a precarious supply. The floor of the caves is covered with stalagmitic masses, and from these the natives make oval balls about the size of cricket balls, which they hurl from the hand with wonderful force and accuracy, not using the sling, as is the case with so many Polynesian tribes. Specimens of these balls are in the Christy collection.

These caves are evidently due to the character of the island, which is partly coral and partly volcanic, the coral having been upheaved by volcanic force, leaving the surface fissured and broken by the sudden violence of the shock. The native legend respecting the origin of the island points to the same conclusion. They state that the island was raised to its present elevation by two of their ancestors, named Hananaki and Fa'o, who swam there from Tonga, and found the island only just above the waves. They stamped twice upon it, the first stamp elevating the island to its present height, and the second clothing it with trees and plants. They made wives for themselves out of the Ti tree, and so the island became peopled. We may easily see in this tradition a record of the two facts that the island

was elevated suddenly from the sea, and that the inhabitants are not aborigines, but emigrants from some other part of Polynesia, probably from Tonga. Though they believe themselves to be derived from this origin, they have been subject to invasion from the restless and daring Tongans, whom they repulsed by an ingenious stratagem. The Tongans, possessed of far better weapons and better disciplined than the Niue islanders, and being equally courageous, were rapidly completing the conquest of the island, when the natives took advantage of the peculiar formation of their country.

The reader will remember that Niue is rocky, and covered with deep and narrow clefts, the result of the upheaval which elevated the island above the sea. Across one of these the Niuans laid small branches, which they covered with banana and coconut leaves, and then strewed over all a slight covering of earth, which they arranged so as to look exactly like the surrounding soil. They then executed a sham retreat, and slipped round to the further side of the chasm, so that the Tongans, flushed with victory, rushed on their retreating enemies with yells of triumph, and a great number of the foremost and best warriors were hurled down to the bottom of the cavern. Before the survivors could recover from their surprise, an attack was made upon them in overwhelming numbers, and of the whole Tongan expedition not a man escaped alive.

It was formerly thought that the Niuans were cannibals, but, as far as can be ascertained, the natives have never eaten human flesh. They do not even care for animal food of any kind; and, though at the present time they have pigs in abundance, they use them almost entirely for the market to European ships, contenting themselves with bananas, yams, taro, and fish. Strangely enough, they have not imported into Niue the custom of kava drinking, and they stand almost alone in their non-use of tobacco.

Polygamy is still practised among the inhabitants of Niue, though it is fast dying out under the influence of the missionaries, who have further conferred a vast boon on the people by their discouragement of infanticide, which at one time prevailed to a terrible extent. The mere check which they have placed on this custom has already raised the number of the population by more than three hundred — a considerable increase when the small size of the island is taken into consideration.

Even before the missionaries came, a tolerably comprehensive and just code of laws was in existence, so that the Niuans were in reality much less savage than many of their neighbors, and the missionaries had a better ground to work on than in other islands of more promising aspect. Their standard of morality was much higher than is usually the case among savages, infidelity

among women being severely punished. So great was their horror of this crime that illegitimate children were always thrown into the sea until the missionaries taught the people that, though the parents might be liable to punishment, the innocent children ought not to suffer.

Their punishment consisted generally in deprivation of food. For example, for some offences, the criminal was tied to a post, and allowed no food except bitter and acrid fruits, while for more serious offences he is lashed hand and foot to a bamboo for a considerable length of time, only sufficient food being given to save him from actually dying of starvation. For these punishments the missionaries have induced the natives to substitute forced labor in well sinking, road making, and other useful works.

The Niuans are good canoe-makers, constructing their vessels very neatly, and ornamenting them with devices in shells and mother-of-pearl. They manage these canoes well, and as a rule are excellent swimmers. There are, however, some families living in the interior of the island who, although they can be barely four miles from the sea, have never visited it, and are greatly despised by their neighbors because they can neither swim nor sail a canoe.

The native architecture is not particularly good, but it has been much improved by the instructions of the Samoan teachers, who have instructed the Niuans in their own mode of building houses, upon which the Niuans have engrafted their own mode of adornment, so that altogether the effect of a modern Niuan house is quaint, and at the same time artistic. The natives seem to be wonderfully quick at learning, and have even acquired the use of the pen, so that a Niuan can now be scarcely better pleased than by the gift of a pencil and a supply of white paper.

Nothing shows the wonderful advance that these people have made more than the fact that they have not only utterly discarded their old habit of murdering foreigners, but that they display the greatest eagerness to be taken as sailors on board European ships. They contrive to smuggle themselves on board without the knowledge of the captain and crew; and whereas in former times it was scarcely possible to induce a Niuan to venture on board a European ship, the difficulty is now, to find a mode of keeping them out of the vessels.

The method of disposing of the dead is twofold. When one mode is followed, the body is laid on a bier and left in the woods until all the flesh has decayed, when the bones are removed to the family burying-place, which is usually a cave in the limestone rock. When the other method is employed, the body is laid in a canoe, and sent adrift in the sea to go wherever the wind and tides may carry it.

CHAPTER CVIII.

THE SOCIETY ISLANDS.

APPEARANCE, DRESS, AND SOCIAL CUSTOMS.

DISCOVERY OF THE ISLANDS, AND REASONS FOR THEIR NAMES—THE ISLAND OF TAHITI OR OTAHEITE—CONFORMATION AND CLIMATE OF TAHITI—THEIR EFFECT UPON THE INHABITANTS—EFFEMINATE APPEARANCE OF THE MEN, AND BEAUTY OF THE WOMEN—SOCIAL CONDITION OF THE SEXES—GENERAL MODE OF LIFE IN TAHITI—SEPARATE TABLES FOR THE MEN AND WOMEN—POMARÉ'S CRUCIAL TEST, AND ITS RESULTS UPON IDOLATRY—DRESS OF THE SOCIETY ISLANDERS—MODES OF WEARING THE HAIR—TATTOOING IN TAHITI—MEANS EMPLOYED BY THE MISSIONARIES TO ABOLISH THE PRACTICE—HOSPITALITY OF THE TAHITANS—MODE OF MAKING PRESENTS—SOCIAL USE OF PRESENTS—THE BAKED PIG AND THE CLOTH—DISTINCTIONS OF RANK—REASONS FOR OMAI'S FAILURE—EXTERNAL INDICATIONS OF RANK—DEPORTMENT OF TAHITANS TOWARD THEIR SOVEREIGN—AMUSEMENTS OF THE TAHITANS—THEIR SONGS AND MUSICAL INSTRUMENTS—SURF RIDING—BOXING AND WRESTLING MATCHES.

THIS interesting group of islands was originally discovered in 1605 by De Quiros, and has derived the name of the Society Islands from the liberality of the Royal Society, which, in 1767, sent an expedition under Captain Cook for the purpose of observing the transit of Venus over the sun. There are many islands of this group, the best known of which is TAHITI, or OTAHEITE, as the word was given in Cook's Voyages. This island forms one of a portion of the group which is distinguished by the name of the Georgian Islands, in honor of George III.

Tahiti is singularly picturesque when viewed from the sea, in consequence of its mountainous character, the island being so filled with lofty peaks and crags that the only way of reaching the interior is by following the courses of the valleys. Sometimes the rocks shoot up into sharp and spire-like peaks, sometimes they run for miles in perpendicular precipices, several thousand feet in height; sometimes they are scarped and angular like gigantic fortresses, sometimes they are cleft into ravines of terrible depth, and sometimes they are scooped out into hollows like the craters of extinct volcanoes.

Down these craggy steeps dash torrents that fertilize the soil, and so equably genial is the temperature that every shelf and ledge is covered with luxuriant foliage and gorgeous flowers. Tahiti indeed, as has been well said, is the gem of the Pacific. Our

business, however, lies not so much with the island as with its inhabitants—not the semi-civilized people of the present day, but the uncivilized people of 1769, when Captain Cook visited them. In the following description, we will take Tahiti as the typical island of the Society group, merely introducing the lesser islands by way of illustration of the manners and customs which pervaded the whole group.

In consequence of the superior fertility of Tahiti, and the consequent supply of food without the need of labor, the Tahitans are more plump and rounded of form than are the inhabitants of most other Polynesian islands. In the case of the men, the fair skin and plump rounded forms give them an effeminate appearance, and the earlier voyagers have all noticed the strong contrast between the dark, nervous, and muscular frames of the Tongan men, and the fair, smooth limbs and bodies of the Tahitans. The men, too, wear their hair long, and, if it were not that they permit the beard to grow to some length, they would well deserve the epithet of effeminate.

Not only is this smoothness and fairness one of their distinguishing marks, but they also are characterized by a sort of languor in their movements and timidity in their carriage, very unlike the demeanor of the bold and warlike Tongans and Samoans. "This observation," writes Captain Cook,

"is fully verified in their boxing and wrestling, which may be called little better than the feeble efforts of children, if compared to the vigor with which those exercises are performed at the Friendly Islands."

They are so careful of their complexion that when they think their skins are becoming darkened by exposure to the sun, they have a mode of bleaching themselves. Captain Cook merely mentions that they remain within doors for a month or two, wear great quantities of clothing, and eat nothing but bread-fruit, this diet being supposed by them to have a strong bleaching power. It is probable, however, that besides the diet and the confinement within the house, they also employ some preparation similar to that which is used by the Marquesan women under similar circumstances.

The Tahitians place such reliance on the effect of food on complexion, that they believe themselves to change the hue of their skins several times in the year, owing to the kind of food on which, owing to the change of season, they are obliged to live. They do not, however, like many nations, think that corpulence is a mark of rank and wealth.

That fairness of skin and roundness of form which detract from the manly beauty of the male sex only add to the feminine charms of the women, who are far more beautiful even than those of Tonga, while they infinitely surpass the short, thickset women of the Marquesans. A Tahitian woman would be reckoned beautiful even among Europeans, the skin being fairer than that of many a Spanish girl, and the large full eyes and rich hair having a fascination peculiar to themselves, a charm which many travellers have endeavored to describe, and all, according to their own statements, have failed to convey in words.

Yet the lot of the Tongan women is far superior to that of the Tahitian. As we have already seen, the woman of Tonga is by no means the mere slave of the despotic husband, but is often his true helpmeet and best adviser. Among the Tahitians, however, we find that the effeminate, smooth-limbed, long-haired, fair-skinned man, who would not abide the charge of a Tongan boy, is a very tyrant at home, having no idea that women can be anything but chattels, and beating his wives, his dogs, or his pigs, with equal disregard of their feelings.

The women are not allowed to eat of various kinds of food, as they would offend the gods by so doing, and it is a remarkable coincidence that the gods do not permit the women to eat exactly those articles of food which the man likes best, such, for example, as turtle, and certain kinds of fish and plantain.

Neither are the women allowed to eat with their husbands, but take their meals in

a separate part of the house. This prohibition is the more galling because, in a well-to-do Tahitian's family, eating goes on all day with very short intervals. The family breakfast at eight, and have a first dinner or luncheon at eleven. Thus invigorated, they are able to wait until two, when they take their first dinner. This is followed by a second dinner at five and supper at eight, after which they retire to rest. But as it is manifestly impossible to go without food for twelve hours, they awake at two, take another meal, or "rere-supper," and sleep again until daybreak.

As to the turtle, a certain sort of sanctity is attached to it. When one of these reptiles is caught, it is always sent to the king, who, however, does not cook so sacred a creature in his own house, but sends it to the temple, where it is offered to the idol. It is cooked in the marae, or sacred enclosure, and, after a portion has been taken by the priest for the idol, the remainder is sent back to the king. Unless this offering were made, the offender would immediately suffer from the vengeance of the offended god.

This custom was exploded by Pomaré about 1820. The king had long believed that the idols were nothing more than images, and that the gods were but human inventions, and determined to try the subject by a crucial test. He waited until his subjects had caught a turtle, and sent it to him according to the custom of the island. Instead of sending it to the marae, he had the turtle taken to his own kitchen and cooked there. It was then served up, and his whole household sat down with him to partake of it. No one, however, except the king, had the courage to eat a mouthful, and even Pomaré himself was in a state of nervous trepidation, and had very little appetite when he came to apply his test. However, he was a man of great moral courage, and though he could not eat much of the royal dainty, he ate enough to bring down upon him the wrath of the god.

Finding that no harm happened to him, he convened an assembly of the chiefs, and narrated the whole of the circumstances, telling them they were free to act as they liked, but that for his part he abjured idolatry from that time. The consequence was, that of their own accord the people voluntarily abandoned their idols, and either gave them to the missionaries, used them as seats, or put them in the fire with which food is cooked, the last proceeding being the very depth of degradation.

One of these raids on the idols was conducted after a very curious manner.

When the converts had reached the temple in which were deposited the idols that they had so long worshipped, their hearts failed them, and not a man dared to enter the house and lay his hands on the sacred images. They bethought themselves, how-

ever, of trying the effect of fire-arms, with which they were furnished, and, in the presence of the terrified population, made ready to fire upon the idols. After calling upon the images, warning them that they were about to be fired upon, and calling upon them to avenge themselves if they could, they fired a volley into the house. Finding that no harm ensued, they advanced more boldly, and burned down the temple together with its occupants.

A curious instance of courage similar to that of Pomaré occurred at the island of Rurutu. A native teacher recommended at a public assembly that a feast should be held, and that the king, his chiefs, his people, and their wives should together partake of turtle and pork, both these articles of diet being prohibited to women in Rurutu. The test was accepted, and the party assembled, having by a curious coincidence selected ignorantly a piece of ground sacred to Oro, the vengeful god of war. That any one should eat on so sacred a spot would have been sufficient to draw upon the delinquents the full terrors of Oro's anger; but that men and women should eat together on the spot, and that women should absolutely eat both turtle and pork, were enormities almost too great to be conceived.

The feast took place, and, as writes Mr. Bennett, "when the Rurutuans saw that, they said, 'No doubt they will die for this trespass on the sacred ground,' and looked earnestly, expecting some one to have swollen or fallen down dead suddenly; but after they had looked for a considerable time and saw no one come, they changed their minds, and said, 'Surely theirs is the truth; but perhaps the god will come in the night and kill them: we will wait and see.'

"One man actually went in the night to the wife of the chief Auira, who also ate a part of a hog or turtle on the sacred spot, and said, 'Are you still alive?' When the morning arrived, and the Rurutuans found that no harm had happened to any of them, they became exceedingly disgusted at their having been deceived so long by the evil spirit."

LIKE many other Polynesians, the Tahitans are of fair complexions, and very well made. Both men and women are good-looking, and many of the latter may be called beautiful, their graceful robe of bark cloth, and the flowers with which they love to entwine their hair setting off their charms in an admirable manner. It is rather strange, by the way, that the women of Eimeo, one of this group, are very inferior to those of the other islands, being darker, of lower stature, and not so graceful, and, as Captain Cook remarked, if a handsome woman were seen at Eimeo, she was sure to have come from another island.

The men dress in rather a variable man-

ner. All wear the primitive garment of Polynesiā, namely, a piece of bark cloth passed round the waist, then through the legs, and the end tucked into the girdle. Over this garment many wear a sort of mantle made of finer cloth, gathered neatly round the waist, and sometimes flowing over their shoulders; while others wear the *tiputa*, or *tibuta*, a garment made in poncho fashion, with a hole in the middle through which the head passes, and hanging down in front and behind, but open at the sides. This garment is found in a very great number of Polynesian islands, the material and the form varying according to the locality. The bark cloth is made exactly after the fashion employed in Tonga and Samoa.

Both sexes usually cut their hair short, and sometimes crop it so closely at the crown of the head that it looks as if shaven. They anoint their locks freely with scented cocoa-nut oil, or with a resinous gum, which gives it a moist and glossy appearance, and causes it to retain the shape into which it is twisted. Beside the flowers worn in the hair and ears, and the garlands twisted round the head, the women wear a very elegant and striking ornament. They take the very young stipe of the cocoa-nut palm, peel it into long strips, and dry it. When properly prepared, it is of a glossy, pure white, looking much like white satin ribbon, and is worn twisted into rosettes and similar ornaments. The normal color of the hair is mostly black, but in some cases it takes a lighter and reddish hue. In children it is often light, but assumes a dark hue in the course of a few years.

The Tahitans think that the shape of the head is much improved by being flattened at the back. Accordingly, the mothers have a way of supporting their children during infancy by the heels and back of the head, and, as they think that the shape of the nose can be improved by art, they continually squeeze and press it with the hand while it is tender and plastic.

Tattooing was once much esteemed, and the operation was performed by means of a comb and mallet, as has been described when treating of Samoa. Professional artists executed the tattoo, and were accustomed to travel about the islands, remaining for some months at each spot, and being paid highly for each lad whom they decorated. The face was almost invariably left untouched; the bust, legs, arms, and even hands being covered with the graceful patterns. The women also employed the same decoration, but in a less degree, wearing the tattoo mostly on the arms, ankles, and feet, the latter being tattooed nearly half-way to the knees, so that at a little distance the woman looked as if she were wearing boots or socks fitting tightly to the skin. The missionaries, however, discouraged the tattoo, which by degrees came to be accepted as a

mark of a revolutionary spirit, and rendered the offender liable to punishment.

Mr. Bennett mentions two instances where old men were tattooed on the face as well as the body, one of them being a man who had been the high priest of the god Oro, the Polynesian Mars, who was worshipped with every accessory of bloodshed and cruelty. This deity, together with other objects of Tahitian worship, will be presently described.

The means that were employed to put an end to the practice of tattooing were of a very severe and rather despotic character. It was found that ordinary punishments were of little avail in checking a practice so much in consonance with the feelings and habits of the natives. Even after they had submitted themselves to the laws which the white colonists introduced, they could scarcely bring themselves to obey the edict which forbade the tattoo, and evaded it on every possible pretext. They would even voyage to another island, nominally on mercantile affairs, but in reality for the purpose of being tattooed while out of the reach of the white men and their laws.

As to the punishment which ensued, the delinquents cared little about it—the allotted task of road making or well digging was completed in time, whereas the decoration of the tattoo lasted throughout life. After trying to check the practice by various penal laws, the new legislators hit upon a plan described by themselves as merely disfiguring the pattern made by the tattoo. Dr. Bennett, however, uses more forcible terms. “The ancient practice of tattooing the skin is gradually declining amongst the Society Islanders generally. The missionaries have been much opposed to the custom, and among the laws framed for these islands was one which made tattooing criminal; but this has since been repealed, or continues in force only in the islands of Huahine, Raiatea, and Tahaa.

“When viewed in connection with the habits of the natives, tattooing is not, certainly, so innocent a display of savage finery as most Europeans imagine it to be; nevertheless, we felt much regret, not unmingled with indignation, when we beheld, in the house of the royal chief of Raiatea, a native woman of naturally agreeable features, disfigured by an extensive patch of charcoal embedded in her cheek—a punishment inflicted upon her by the judges for having slightly tattooed herself. While we were regarding this spectacle a second female showed us her hand, which afforded a similar instance of judicial severity.”

The various figures employed by the Tahitans have each a separate name, and these figures are imprinted not only upon the skin, but upon the bark cloth garments of both sexes.

The Tahitans are naturally a hospitable

people, and have invented a complete code of etiquette for making presents, the most curious of which is that which is employed in giving bark cloth. Captain Cook's description of this custom is very interesting. It is also illustrated on the 1054th page. “I went with Otoo to his father's house, where I found some people employed in dressing two girls with a prodigious quantity of fine cloth, after a very singular fashion. The one end of each piece of cloth, of which there were a good many, was held up over the heads of the girls, while the remainder was wrapped round their bodies, under the arm-pits. Then the upper ends were let fall, and hung down in folds to the ground, one over the other, so as to bear some resemblance to a circular hoop-petticoat.

“Afterward, round the outside of all were wrapped several pieces of differently colored cloth, which considerably increased the size, so that it was not less than five or six yards in circuit, and the weight of this singular attire was as much as the poor girls could support. To each were hung two *taames* or breastplates, by way of enlivening the whole, and giving it a picturesque appearance. Thus equipped, they were conducted on board the ship, together with several hogs and a quantity of fruit, which, with the cloth, was a present to me from Otoo's father.

“Persons of either sex, dressed in this manner, are called *atee*, but I believe it is never practised except when large presents of cloth are to be made. At least, I never saw it practised on any other occasion; nor, indeed, had I ever such a present before; but both Captain Clarke and I had cloth given to us afterward, thus wrapped round the bearers.”

These cloths are mostly put on the bearers by laying the end of the cloth on the ground. The girl then lies down on the end of the piece, holds it tightly to her body, and rolls over and over, until she has wound herself up in all the cloth that she is intended to present. When the bearers are taken into the presence of the chief to whom the offering is made, they reverse the process, and unroll themselves, by revolving on the floor in the contrary direction.

Food is presented in another way. The donor sends his servants with the hogs, bread-fruit, and other provisions, to the house of the person to whom the present is made. They do not enter the house, but simply spread leaves on the ground, lay the provisions on them, and then return to their master. The donor then enters the house, and calls upon his friend to come out and look at the present that has been brought for him. The latter signifies his acceptance by ordering his servants to carry the food within his house, but utters no thanks.

In most of these cases, it is expected that a present of equal value should be returned,

and, if the recipient should be a wealthy man, he would be thought rather shabby if his return present were not rather more valuable. In consequence of this theory, Captain Cook found that when he purchased provisions he got them much more cheaply than when they were presented to him.

In these islands is found the widely spread practice of selecting friends from strangers. When a ship arrives, each of the officers and crew is selected by a native as his particular friend, and during the time of the vessel's stay is placed under his charge. Every day, the "apoa" or friend will come on board with his present of cooked bread-fruit and other provisions; and should his visitor go on shore, he takes care that all possible necessaries, and even luxuries, shall be provided for him. It is assumed that when the visitor departs he will in his turn make a present; but there have been many instances where the natives have been so grateful for some kindness that they have refused to accept anything in return for their hospitality.

One very graceful mode of giving presents is by offering them in the name of a child. In this case, whenever provisions are sent, they are always accompanied by the child, who is supposed to present them, and to whom all returns are made.

There is a custom—once very prevalent but now become nearly if not wholly extinct—which is evidently based on the same principle. When a man is in want of something which he cannot obtain, such as a new house, or a quantity of cloth, he bakes a pig, and sends it by his friends to all the population of the place. The bearers offer the pig, and mention at the same time the needs of the owner. All those who partake of it, even though they eat but a mouthful, thereby bind themselves to share in assisting the petitioner, either in building the house or in making the cloth.

Mr. Bennett mentions one instance, where a man wanted thirty-six yards of cloth, and sent a pig after the usual fashion. No one, however, would touch it, and the poor man would have gone without his cloth had not the queen taken compassion on him. She ordered the bearers to leave the pig in her house, thereby assuming to herself alone the task of providing the cloth. A number of women who saw the proceeding, felt rather ashamed that the queen should be left to perform the task alone, so they went into the house, ate the pig, and made the desired cloth.

Among the Society Islands, the distinctions of rank are jealously insisted upon, and no one can command any respect unless he be in the possession of some acknowledged rank. Ignorance of this characteristic was the real cause of Omai's failure. Most of my readers are aware that this man, the first Polynesian who had ever visited England, was a native

of Raietea, one of the Society Islands, and that he was brought to England for the purpose of being educated, so that he might act as a missionary both of Christianity and civilization in his native country.

In Captain Cook's third voyage, Omai was taken back again, after he had been loaded with presents of various kinds. It was found, however, that all that he really cared for was the possession of weapons, especially fire-arms, by means of which he might make himself master of the island. He had several muskets and pistols, together with ammunition, but Captain Cook remarked in his journal that he fancied Omai would be happier without the fire-arms than with them, and expresses a doubt whether he would not have been happier still if he had never been removed from his island.

The result justified these anticipations. No one, except the lower orders, would have anything to do with a man of no rank, and the nobles, who led public opinion, would not even look at him as he paraded up and down, clad in the suit of armor which had been presented to him with more generosity than prudence. In fact, they felt that his possession of all these treasures was a slight upon themselves, and the natural result was that Omai was soon fleeced of all his property, and speedily sank back again into his original barbarism and idolatry.

Tenacious as they are of their rank, the Tahitian nobles show but few external marks of it. Even at the present day, although they have obtained considerable wealth from trade, and though implicit deference is paid to them by their own people, the chiefs, as a rule, dress and fare no better than the generality of their subjects. The fact is, that every person's rank is so well known, that there is no necessity for indicating it by outward show or luxurious habits, which would only serve to bring upon them the contemptuous epithet of *fahie*, or conceited.

In illustration of this principle, Mr. Bennett remarks in his "Whaling Voyage round the Globe," that it was "usual to see the Queen Aimata clad in a loose cotton gown, bare-headed and bare-footed, mingling with natives of every class. Her meals, too, are equally unostentatious, the bread-fruit, poë, cocoa-nuts, and baked pig, intended for her food, being placed on a layer of fresh leaves spread on the ground; while the partaking party display, by the use of their fingers, a thorough contempt for the modern innovation of knives and forks, in the use of which, however, they are perfectly well versed." This visit to Tahiti was made in 1834.

Nothing, perhaps, shows the innate respect for rank more than the conduct of the Tahitians toward their queen. Personally she was not in the least respected, nor indeed did she deserve respect. Being the only daughter of Pomaré II., and deriving

from her birth the title of Pomaré Vahine, by which she was better known than by the name of Aimata, she became queen in 1827, on the death of her infant brother. Her conduct as queen was at first of the most unqueneely kind. She resisted to the utmost the attempts that were being made to improve the moral condition of the people, and did her best, both by precept and example, to bring back the state of unrestrained licentiousness which had reigned through the land. Yet, in spite of her conduct, the respect for her rank was in no way diminished, and, as has been seen, she could be on familiar terms with the lowest of her subjects without derogating from her dignity.

THE amusements of the Tahitans are much like those of other Polynesians, and therefore need but little description. The Tahitans are fond of singing, and possess good voices and ears, so that they have been apt pupils in European music. As a rule, however, they prefer singing the air, or at most a first and second, the more elaborate movements of concerted music scarcely pleasing them. They excel in keeping time, and exhibit this capacity not only in their songs but in their dances. The native mode of singing is not pleasing to an English ear, being of a monotonous character, nasal in tone, and full of abrupt transitions from the highest to the lowest notes.

The native songs are mostly on two subjects, namely, love and war, the former predominating, as is likely to be the case from the quiet and peaceable character of the people. Sometimes their songs assume a more patriotic cast, and set forth the praises of their island home, the beauty of its scenery, and the fertility of its soil. The singers are usually women, whose sweet voices render pleasing even the nasal intonations. The men sing but seldom, and when they do exert their voices, they almost invariably use the harsh native mode of vocalization.

Their musical instruments are but few. They have of course the drum, with which they accompany their songs and dances, not by beating it violently after the African style of drumming, but gently tapping it with the fingers. The drums are of different sizes, and are all cylindrical, and very long in proportion to their diameter. Like many other uncivilized people, they display a great fondness for the Jews' harp, partly because it is easy to play, and partly because it reproduces to some extent the peculiar intervals of savage music.

The chief native instrument that is capable of producing different notes is a sort of flageolet or "hoe," which produces a low, deep tone, something like the "drone" of the bag-pipe. The native musician can tune his instrument in a very simple manner. The mouth-piece is split longitudi-

nally, so that the pieces vibrate like those of any "reed" instrument. Surrounding the mouth-piece is a ring of soft wood, and by pushing this forward, or driving it back, the performer can tune his instrument with some nicety, the former movement producing a sharp, and the latter a graver tone.

The hoe is seldom played alone, and is generally used as an accompaniment to the native dances. The performers, after tuning their instruments, sit in a circle, pressed closely together, and, bending forward so that their heads are bowed over their knees, play in admirable time, though as much praise can scarcely be given to the melody.

Following the instincts of the savage nature, the Tahitans are passionately fond of cock-fighting, and amusements of a similar character. Some of them are of a more harmless character. One of the most manly and graceful of these amusements closely resembles the surf swimming of the Sandwich Islanders, and is thus described by Captain Cook:—

"Neither were they strangers to the soothing effects produced by particular sorts of motion, which in some cases seem to allay any perturbation of mind with as much success as music. Of this I met with a remarkable instance. For on walking one day about Matavai Point, where our tents were erected, I saw a man paddling in a small canoe so swiftly, and looking about with such eagerness on each side, as to command all my attention.

"At first I imagined that he had stolen something from one of the ships, and was pursued, but on waiting patiently saw him repeat his amusement. He went out from the shore till he was near the place where the swell begins to take its rise; and watching its first motion very attentively, paddled before it with great quickness till he found that it overtook him, and had acquired sufficient force to carry his canoe before it without passing underneath. He then sat motionless, and was carried along at the same swift rate as the wave, till it landed him upon the beach, when he started out, emptied his canoe, and went in search of another swell.

"I could not help concluding that this man felt the most supreme pleasure while he was driven on so fast and so smoothly by the sea, especially as, though the tents and ships were so near, he did not seem in the least to envy, or even to take any notice of the crowds of his countrymen collected to view them as objects which were rare and curious.

"During my stay, two or three of the natives came up, who seemed to share his felicity, and always called out when there was an appearance of a favorable swell, as he sometimes missed it by his back being turned and looking about for it. By this I understood that this exercise, which is called

choroee, was frequent amongst them, and they have probably more amusements of this sort, which afforded them at least as much pleasure as skating, which is the only one of ours with whose effects I could compare it."

Like the Tongans and Samoans, these people are fond of boxing and wrestling matches, not only as spectators, but actors. They do not, however, enter into them with the spirit and courage displayed by the more hardy islanders, and there is little doubt that a boxer or wrestler of Tonga would scarcely be able to find a worthy opponent in the Society Islands.

Of these two sports, the Society Islanders much prefer wrestling, boxing being thought rather too rough an amusement, and being apt to leave unpleasant marks on the face of the vanquished combatant. Wrestling, however, is much more common, and is conducted after the following manner.

The intending combatants first went to the temples of their special gods, and laid offerings before them, asking for their assistance in the approaching struggle. They then proceeded to the spot selected for the sports, which had always a smooth surface, sometimes covered with grass and sometimes with sand. A circle of thirty or forty feet in diameter was left clear for the competitors, and around it sat the spectators, the inhabitants of the island or district on one side, and the visitors on the other. All being ready, the combatants enter the arena, wearing nothing but the simple girdle, and mostly having well anointed their bodies and limbs with cocoa-nut oil. The mode of challenge and wrestling has been so well described by Mr. Ellis that I prefer to give his own words:—

"The fame of a celebrated wrestler was usually spread throughout the islands, and those who were considered good wrestlers, priding themselves on their strength or skill, were desirous of engaging only with those they regarded as their equals. Hence when a chief was expected in whose train were any distinguished wrestlers, those among the adherents of the chief by whom the party were to be entertained who wished to engage, were accustomed to send a challenge previous to their arrival.

"If this, which was called *tipaopao*, had been the case, when they entered the ring they closed at once without ceremony. But if no such arrangement had been made, the wrestlers of one party, or perhaps their champion, walked round and across the ring, having the left arm bent with the hand on the breast, and, striking the right hand violently against the left, and the left against the side, produced a loud hollow sound, which was challenging any one to a trial of skill. The strokes on the arm were sometimes so violent as not only to bruise the flesh, but to cause the blood to gush out.

"When the challenge was accepted the antagonists closed, and the most intense interest was manifested by the parties to which they respectively belonged. They grasped each other by the shoulders, and exerted all their strength and art each to throw his rival. This was all that was requisite; and although they generally grappled with each other, this was not necessary according to the rules of the game.

"Mape, a stout and rather active though not a large man, who was often in my house at Eimeo, was a famous wrestler. He was seen in the ring once with a remarkably tall heavy man, who was his antagonist; they had grappled and separated, when Mape walked carelessly toward his rival, and, on approaching him, instead of stretching out his arms as was expected, he ran the crown of his head with all his might against the temple of his antagonist, and laid him flat on the earth.

"The most perfect silence was observed during the struggle, but as soon as one was thrown the scene was instantly changed; the vanquished was scarcely stretched on the sand when a shout of exultation arose from the victor's friends. Their drums struck up; the women and children danced in triumph over the fallen wrestler, and sung in derision of the opposite party. These were neither silent nor unmoved spectators, but immediately commenced a most deafening noise, partly in honor of their own clan or tribe, but chiefly to neutralize the triumph of the victors. It is not easy to imagine the scenes that must often have been presented at one of these wrestling matches, when not less than four or five thousand persons, dressed in their best apparel, and exhibiting every variety of costume and brilliancy of color, were under the influence of excitement. One party were drumming, dancing, and singing, in all the pride of victory and the menace of defiance; while, to increase the din and confusion, the other party were equally vociferous in reciting the achievements of the vanquished, or predicting the shortness of his rival's triumph. When the contest was at an end, victor and vanquished once more repaired to the idol temple, and renewed their offerings of young plantain trees.

"Although wrestling was practised principally by the men, it was not confined to them. Often when they had done, the women contended, sometimes with each other, and occasionally with men. Persons of the highest rank often engaged in this sport; and the sister of the queen has been seen wearing nearly the same clothing the wrestlers wore, covered all over with sand, and wrestling with a young chief in the midst of the ring, round which thousands of the queen's subjects were assembled."

CHAPTER CIX.

THE SOCIETY ISLANDS — *Continued.*

RELIGION.

RELIGION OF THE SOCIETY ISLANDS — THEIR IDOLS — PARALLEL BETWEEN THE IDOLATRY OF MODERN POLYNESIA AND ANCIENT SYRIA — ORO, THE GOD OF WAR — EXTENT OF HIS WORSHIP — LEGEND OF A SHELL — ORO'S MARAE, OR TEMPLE — THE HUMAN SACRIFICE — HIRO, THE GOD OF THIEVES — HIS WORSHIP AND APOTHEOSIS — TANE, THE CHIEF GOD OF HUAHINE — HIS MARAE AND HIS BED — DRESSING TANE — THE TREES AROUND HIS MARAE — HIS UNFORTUNATE TAIL — HIS HIGH PRIEST — AN INGENIOUS EVASION — TANE'S HALF-WAY HOUSE — TANE AVERSE TO BLOODSHED, BUT NEEDING THE SACRIFICE OF LIFE — TANE'S STONE CANOE — THE SHARK GOD, AND HIS WATER TEMPLE — APOTHEOSIS OF A LIVING MAN — SINGULAR PERFORMANCE OF THE INSPIRED PRIESTS — MOVABLE SHRINES.

WE now come to the somewhat complicated subject of the religious belief of the Society Islanders. It is not an easy subject, involving, as it does, a great variety of national customs, including the all-pervading tapu, the burial of the dead, and the human sacrifices which accompany a funeral or are offered on great occasions. We will begin with a brief account of the religious system of these islanders, as far as it is possible to reduce to a system a subject so obscure in itself, and so little understood by the first travellers, who alone would be likely to witness and gain information about the various religious ceremonies.

As might be expected from these islanders, their religion is pure idolatry, or rather, it consists in the worship of certain images which are conventionally accepted as visible representatives of the invisible deities. The idols are of two different kinds, the one being rude imitations of the human figure, and the other, certain combinations of cloth, sinnet, and feathers, rolled round sticks, not having the slightest similitude to the human form, or being recognizable as idols except by those who understand their signification. The human figures are held as being inferior to other idols, and are considered in much the same light as the Lares and Penates of the ancient Romans. They are called by the name of Tu, and are supposed to belong to some particular family which is taken under their protection.

The other gods are, in the ideas of the natives, possessed of far more extensive powers, sometimes being supposed to watch over particular districts, or even particular islands. There are gods of the valleys and gods of the hills, exactly as we read was the belief of the Syrians nearly three thousand years ago: when Ahab had repulsed Benhadad, "the servants of the king of Syria said unto him, their gods are gods of the hills, therefore they were stronger than we; but let us fight against them in the plain, and surely we shall be stronger than they." (1 Kings xx. 23.)

Fully believing in the protection which these deities are able to extend over their worshippers, it is no matter of wonder that the latter consider that they have a right to the good offices of their gods, and complain bitterly when anything goes wrong with them. So, if a god has been worshipped in some locality, and the ground becomes barren, or the cocoa-nut trees do not produce their full amount of fruit, or the district is devastated by war, the people think that their god is not doing his duty by them, and so they depose him, and take another in his place.

Although these gods are in a manner limited in their scope, many of them are acknowledged throughout the whole of the group of islands; and the chief, because the most dreaded, of them is Oro, the god of war.

This terrible deity is held in the greatest awe by his worshippers, and at one time was feared throughout the whole of the islands. His name was associated with sundry localities, and with many objects, so that his dreaded name was continually in the mouth of the people. There was even a small species of scallop shell which was held in such fear that not a native would dare to touch it. It was called tupe (pronounced *toopeh*), and was said to be the special property of Oro. When a man died, and was to be converted into a spirit, the body had to be entirely consumed. This was done by Oro, who scraped the flesh from the bones with a tupe shell, and thus ate the body.

The subsequent career of the spirit was rather peculiar. After issuing from Oro in its new form, it betook itself to a great lake in Raiatea, round which is a belt of trees, which from some cause are quite flat at the top, presenting a level surface like a leafy platform. On this place the newly enfranchised spirits danced and feasted, and after they had passed through that stage of their existence, they were transformed into cockroaches.

In Huahine there was an enormous marae, or sacred enclosure, dedicated to Oro. It was a hundred and fifty-six feet long by eighteen wide, and was built by a fence made of flat slabs of coral-rock placed on their edges, and the intervals between them filled in with earth. One of these blocks of stone measured nine feet by ten, so that the labor of cutting them and conveying them to such a distance from the sea must have been enormous.

On this platform a smaller one was erected, so as to leave a space of about four feet in width, and within this upper story were laid the bones of the many victims that had been slain in the worship of the god. The temple itself, called Fare no Oro, or the House of Oro, was quite a small building, eight feet long by six wide, and a little beyond this was the square stone on which the priest stood when about to offer a sacrifice, a higher stone behind it answering as a seat whereon the priest might rest himself when wearied.

Small as was this house, it had been the scene of many human sacrifices, and even its erection cost a number of lives, every post having been driven into the ground through a human body. Besides these victims, others had been sacrificed on many occasions, fourteen of whom were enumerated by an old man who had once officiated as the priest of Oro. When the chief of the island became converted to Christianity, this man tried to conceal the idol which he had so long worshipped, and to save it from destruction, hid it in a hole in the rock. The chief, however, very rightly feared that if the idol were allowed to remain its worship might revive, and accordingly insisted upon

its destruction. Besides the priest who offered the sacrifice, Oro had another officer, whose special duty it was to kill the victims. He was officially termed the Mau-buna, or Pig-owner, a human body killed for sacrifice being named a "long pig." When the victim was pointed out to him, the Mau-buna, having a round stone concealed in his hand, found an opportunity, of getting behind him, and, with a single blow, struck him senseless to the ground, where the murder was completed. He then packed the body in a basket of cocoa-nut leaves, and delivered it to the priest.

Next to Oro was Hiro, the Polynesian Mercury, or god of thieves. He was originally a man, but was elevated to the society of the gods in consequence of his wonderful deeds on earth, the chief of which seems to have been his daring in taking the image of Oro and flinging it to the ground with impunity.

The worship of Hiro extended through all ranks, from the highest chief to the lowest cook, and his votaries always asked for his help when they went on a plundering expedition, and promised him a share of the spoil. This promise they always performed, but as they were careful not to define the amount of booty which was to belong to the god, they contrived practically to have it all to themselves. For example, a thief would go out pig stealing, and promise Hiro a share of the stolen pork. Accordingly, if he had been successful, he would take home his ill-gotten booty, bake it, break off an inch of the tail, and go with it to the shrine of Hiro, where he would offer it with as much ceremony as if it had been half the pig, and at the same time beg the god not to divulge the theft of a votary who had kept his promise.

The natives are quite dexterous enough in the thieving way to be worthy of the protection of this god, having the most ingenious modes of stealing the goods of another. For example, if the objects are small, a hook is fastened to the end of a long bamboo, and the coveted article is slyly withdrawn by the actual thief while a confederate directs the attention of the victim elsewhere. Sometimes the hook is tied to a line, and the thief literally angles for the property.

The apotheosis of Hiro was a very remarkable one. After his life of theft, rapine, and murder, in which he did not spare even the temples of the gods, and had, as we have seen, the hardihood to fling Oro's image on the floor, and roll on it as if he had conquered Oro in wrestling, he was thought to have been so superhumanly wicked that he must have been a god. Accordingly, his skull was placed in a huge marae which he himself had erected, while his hair was put into an image of Oro, and both buried together, this act constituting the apotheosis.

When Messrs. Bennett and Tyerman were at the Society Islands, this skull was still in existence, but it disappeared, together with the idols and other relics of the old religions.

The next god is Tane (pronounced *tah-neh*), who was worshipped over a considerable range of country, and was in one or two islands considered as their supreme god. Such was the case with Huahine, in which Tane had a marae or malae of gigantic dimensions. I may here remark that in most Polynesian dialects the letters *r* and *l* are interchangeable, so that marae and malae are, in fact, the same word.

This marae is a hundred and twenty-four feet in length by sixteen in breadth, and is composed, like the marae of Oro, of two stories, the last being nearly ten feet in height, and built of coral blocks, some of which are ten feet in width, and correspondingly long and thick, so that their weight is enormous. As the marae is about a hundred yards from the shore, a prodigious amount of labor must have been expended in getting these huge stones out of the sea and fixing them in their places. The upper story is barely a yard in height, and has at each end an upright stone six feet high.

In the middle of the principal part is the idol's bed, which he occupies once annually, and in which he ought to feel comfortable, as it is twenty-four feet long by thirteen wide. It is built, like the marae, of stone and earth, and is only eighteen inches high. This is a very ancient structure, as is shown by the trees that surround and spread their arms over it. Near the bed is a small house about twelve feet by six, in which rests the god Tane, together with lesser gods, each of whom is set over a district.

Tane himself—burned in 1817—was carved out of a great block of wood, and was about as large as a tall man. He was not remarkable for an elegant shape, having no neck and no legs, the body terminating in a cone. The head was furnished with apologies for eyes, mouth, nose, and ears, and the whole was covered with sinnet.

Once in every year, Tane had a new dress, and was invested with great solemnity. He was brought out of his house by his priest and laid on his bed, having four lesser gods on either side of him. The chiefs of the district stood each in front of his own god, and the priests stood round Tane as being the great god of them all. The old garments were then removed, and examination made into the interior of the idol, which was hollow, and contained various objects, such as scarlet feathers, beads, bracelets, and other valuables. Those that began to look shabby were removed, and others inserted to take their place, and the idols were then invested in their new robes.

Meanwhile, a vast amount of kava was pre-

pared—the natives saying that it was equal in cubic measure to the marae—and a scene of drunken debauch took place, lasting for several days, even the priests being so intoxicated that they were unable to stand while performing their duties, but had to chant their incantations while lying on the ground. This stage of the idol-dressing is represented in the fine engraving on the opposite page. At the expiration of the three days a special god called Moorai was produced and stripped, and, as soon as his garments were removed, violent rain showers fell, as a signal for all the idols to be removed to their respective houses. The greatest care was taken that no woman should witness this ceremony, and if a female of any age had been detected coming within a certain distance of the marae, she would be at once killed, and even her father, husband, or brother, would have been among the first to strike her down.

The trees which decorated this marae are the banyans (*Ficus Indica*), one of which is described by Mr. Bennett as being seventy feet in girth at the principal stem, and throwing out vast horizontal branches, each of which is supported by a root which looks more like the trunk than the root of a tree. "More than forty of these we counted, standing like a family of earth-born giants about their enormous parent. A circle drawn round all these auxiliary stems measured a hundred and thirty-two feet in circumference, while a circle embracing the utmost verge of their lateral ramification was not less than four hundred and twenty feet.

"The upper stories (if such we may call them) of this multiform tree presented yet more singular combination of interesting and intertwisting boughs, like Gothic arches, circles, and colonnades, propped as by magic in mid-air. These were occasionally massy or light, and everywhere richly embellished with foliage, through which the flickering sunshine gleamed in long rays that lost themselves in the immensity of the interior labyrinth, or danced in bright spots upon the ground black with the shadows of hundreds of branches, rising tier above tier, and spreading range above range, aloft and around."

This tree was one of the places in which the bodies of human beings were offered, being packed in leaf baskets and hung to the branches. One branch, which was hugely thick and strong, and ran horizontally at a small height from the ground, was pointed out as the principal gibbet, on which human sacrifices, thousands in number, have been offered century after century.

Tane, all powerful though he was, labored under one disadvantage. He had a very long tail, and whenever he wished to leave his house, rise into the air, and dart through the sky on some errand of mischief, he was

SOCIETY ISLANDERS DRESSING THE IDOLS.

(See page 1066.)

restrained by his long tail, which was sure to become entangled in some object, which from that time became sacred to the god. For example, the magnificent tree which has just been described was several times the means of detaining Tane on earth, and the several branches round which his tail was twisted became tapu at once. On one side of his house there was a large stone, which had become sacred in consequence of having arrested the flight of the god.

This idea of the long and streaming tail has evidently been derived from meteors and comets, which are supposed to be the gods passing through the air, and whenever a native saw one of them, he always threw off his upper garments, and raised a shout in honor of the passing god. Mr. Bennett suggests that the permanent tail attached to Tane is in all probability a commemoration of some very magnificent comet with a tail measuring eighty or ninety degrees in length.

So sacred was the idol that everything which was touched by it became tapu, and might not be touched by profane hands. There was only one man who was allowed to carry it, and he was called from his office, "Te amo attua," *i. e.* the god-bearer. His task was not an easy one, and his office, though it caused him to be viewed with nearly as much reverence as the god of whom he was the special servant, must have deprived him of many comforts. The god-bearer was not even allowed to climb a cocoa-nut tree, because, if he did so, the tree would be so sacred that no one might ascend it after him; indeed, every action of his life was fenced about with some similar restriction. He could not marry, as, in the first place, no woman could be deserving of the honor, and, in the second place, he would be defiled and unfitted for his office if he were to take any woman to wife.

A celibate life does not seem to us to entail such self-denial as seems to be implied by the prominence given to the celibacy of the god-bearer, who appears to have been the only bachelor in the whole group of islands. But among most savage nations a man's wealth and consequence are regulated by the number of his wives, who do all the work of the household, and in fact keep their husband in idleness.

The house in which the god lived was a small hut elevated on posts twenty feet high, and there were no means of access except by climbing one of these posts. The god-bearer, therefore, had no easy task in climbing up these posts with the great wooden image fastened to his back.

In the illustration on the 1084th page we see the chief priest of Tane—the god-bearer—ascending the pole of the sacred house, with the unwieldy idol slung on his back. A gust of wind has risen, and has wafted Tane's long tail into the air, so that

it has been entangled in a neighboring tree. One of the principal priests is running to ascend the tree and free the god's tail, and from that time the tree will be tapu, and no one of lower rank than the priest who freed the tail will be allowed to ascend the tree.

Sometimes Tane paid a visit to a marae at some distance, and when he did so, his bearer was naturally fatigued with the weight of his burden. It was, however, thought derogatory to the character of the god to say that his bearer could by any possibility be tired of carrying him, and so, by an ingenious evasion, the god himself was thought to be fatigued with the journey, and was laid to rest for a while on a flat stone about half a mile from the sacred tree. This stone was tapu to women, and if a woman had sat upon it, or even touched it with her finger, she would have been at once killed.

The stone was not a large one, being only four feet long, one foot broad, and nine inches thick. It is a singular fact that this sacred stone, which had so often been the witness of idolatrous rites, should also have witnessed the destruction of the idol to whom it was consecrated. After Christianity had been fairly established in the island, the chief men who adhered to the worship of Tane made war upon the Christians, who repelled them, so that they were obliged to bring out their idol and lay him on the sacred stone. The two bodies of warriors met face to face close to the idol, and the struggle was about to commence when the chief of the Christians made a speech to the enemy, laying before them the distinctions between idolatry and Christianity, and recommended peace instead of war.

His voice prevailed, and those who came to fight against the Christians renounced their idols, and, as a proof of their sincerity, they built a large fire on the spot, threw Tane into it, and then held a great feast, at which the men and women ate together. They then proceeded to Tane's house, burned it down, and dismantled his great marae.

The feathers attached to these idols and placed within their hollow bodies are mostly the two long tail-feathers of the tropic bird, white and broad toward the base, and narrow and scarlet for the remainder of their length. When the gods are newly dressed, it is considered a meritorious act for any one to present fresh feathers in lieu of those which have been deteriorated by age. After the old garments are unrolled, the feathers are placed inside the image, and a corresponding number of old feathers taken out and presented to the devotee, who values them beyond all things, as partaking of the sanctity which surrounds the original idol. These feathers are then carefully wrapped with sinnet, so as to cover them, with the exception of a little portion of both ends,

and they are then laid before the idol, while the priest recites a prayer, in which he beseeches the god to transfer his sanctity to these feathers, which from that moment become minor gods.

The happy devotee has already provided himself with bamboo tubes, in each of which he places one of the feathers, and from which he never takes them except to pray to them. Sometimes he has a smaller idol made, and places the feathers within it; but in this case, he has to take the new idol to be laid before the original one, so that the transfer of sanctity may be guaranteed to them. This mode of honoring the sacred feathers is usually employed when the devotee has enjoyed some piece of good fortune after he has received them, and in most cases he not only encloses them in a new idol, but builds a small temple in which that idol lives.

Formerly, when animals were brought to be sacrificed to Tane, no blood was shed, but they were laid upon a stone and strangled by pressing their necks between two sticks. Food of all kinds was presented to him, part of which he was supposed to consume himself, part was taken by the priests, and the remainder was consumed by the worshippers. All first fruits went to Tane, a peasant being supposed to offer him two of the earliest fruits, while a *raatira* or gentleman offered ten, and the chiefs still more, according to their rank and wealth.

Not very far from the sacred stone was a marae containing a very sacred object, no less, in fact, than a piece of Tane's own canoe. According to the people, it was a very miraculous canoe, for it was made of stone, and yet floated as well as if it were made of wood. In proof of this statement, they placed the fragment in water, where it floated, as it was likely to do, being nothing more than a piece of pumice stone. No one knew where the stone had been obtained, but they said that there were more pieces in different parts of the island.

Besides the idol gods, there are gods which are symbolized by living creatures, of which the shark is the chief, being worshipped for the same reason that crocodiles and venomous serpents are worshipped in some parts of the world, viz. on account of its destructive powers. Mr. Bennett saw a large marae which had been consecrated to a shark god on account of a miraculous event which was said to have happened some time previously. In one particular spot the ground began to shake and tremble, and, as the people were flying in terror, the ground opened, and a huge shark forced his head through the cleft in the soil.

The formation of the maraes has already been mentioned. Some time before Mr. Bennett arrived at the place, a shark had contrived to force its way through the sand into the marae, which was situated on the shore

of the lagoon. The water flowed in with the fish, and the natives, feeling delighted that their god had actually come to take possession of his temple, blocked up the passage by which he had entered, cleared out the marae, and kept the shark in it for the rest of his life, feeding him abundantly with fish and meat.

Indeed, in one bay the sharks were regularly fed by the priests, and the consequence was that they became quite familiar, and would swim to the beach to be fed with fish and pork. They would also accompany the canoes, knowing well that the natives always threw overboard some of the fish which they had caught, for the sake of propitiating the shark gods. The latter, however, were so little sensible of the kindness bestowed upon them, that had one of their worshippers fallen overboard they would have eaten him, in spite of all his propitiatory offerings.

Sometimes a living man has been elected to the rank of a god, and worshipped as such during his lifetime. This was done at Raiatea, the king, Tamatoa, having been reckoned among the gods by means of a series of ceremonies which might have been very appropriate in assigning him a place among the very worst and vilest of demons, but were singularly unsuitable to an apotheosis. After this ceremony, the king was consulted as an oracle, prayers and sacrifices were offered to him, and he was treated as reverently as if he had been Tane himself.

It is a most remarkable fact that Tamatoa became a Christian in his later life, and afforded most valuable information respecting the religious belief of the Society Islanders. He corroborated, as having been an eye-witness, the accounts that have been given of the astonishing deeds done by the heathen priests while in a state of inspiration. They have been seen to dash their hands against the ground with such violence that they imbedded the whole arm up to the shoulder. Captain Henry, the son of one of the missionaries, states that he has seen one of these priests plunge his arm into the solid earth as if it were water, and that he would perform the feat on any ground wherever he chanced to be.

"The infuriated priest, on that occasion, foamed at the mouth, distorted his eyeballs, convulsed his limbs, and uttered the most hideous shrieks and howlings. After he had seemingly buried his arm like a spear stuck suddenly in the ground, he held it there for a considerable time; then, drawing it out uninjured, he rushed toward the shore, and, laying hold upon a large canoe, which ordinarily required three or four men to launch, he shoved it before him with apparent ease, and sent it adrift.

"He afterward threw himself into the sea, wallowed about in it, and kept his head under water for a long time. When this act of the tragical pantomime was finished,

he sat among the waves, and delivered his prophecies in very figurative and hyperbolic language, at the same time sufficiently ambiguous to be fulfilled in one of two senses, whatever might happen."

Portable shrines of the gods were once used in the Society Islands, but so complete and rapid has been the demolition of everything connected with idolatry, that Mr. Bennett, who was eye-witness of many idolatrous practices, was only able to procure one specimen, which is now in the museum of the London Missionary Society.

In form it resembles a house, with sloping roof, and is about a yard in length. It is supported on four short legs, and underneath there is a round hole through which the idol

was passed into its shrine, a door exactly fitting and closing the aperture. The idol which was in this shrine represented a female god greatly venerated by the people, because she was so very mischievous, and had killed thousands of people, gaining from her bloodthirsty propensities the name of Tii Vahine, or Queen Tii. The idol is a horribly repulsive example of the ugliness with which savages invariably invest their deities.

The shrine, with the idol within it, was hidden in a rock cave by priests of Tii Vahine when idolatry was overthrown by Christianity, and was not discovered for a considerable time, when it was brought from its place of concealment and sold.

CHAPTER CX.

THE SOCIETY ISLANDS—*Continued.*

HISTORY—WAR—FUNERALS—LEGENDS.

THE PRIESTS THE HISTORIANS OF THE SOCIETY ISLANDS—THE MARO, OR KING'S ROBES, AND ITS HISTORICAL VALUE—THE HEREDITARY TITLE OF THE KING—THE KING'S BEARER—ARCHITECTURE IN THE SOCIETY ISLANDS—TAHITAN WARFARE—RETENTIVE MEMORY, AND ITS USE IN WAR—BEHAVIOR OF THE VICTORS TOWARD THE VANQUISHED—NAVAL BATTLES AND MANŒUVRES—MILITARY ETIQUETTE—HUMAN SACRIFICE BEFORE BATTLES—CAPTAIN COOK'S ACCOUNT OF THE CEREMONY—FUNERALS AMONG THE TAHITANS—EMBALMING OF A CHIEF'S BODY—STRANGE DRESS OF THE CHIEF MOURNER—THE AROFOI SOCIETY, AND THE INFLUENCE WHICH IT EXERTED ON THIS GROUP OF ISLANDS—LEGENDARY TALES OF THE AROFOI.

THE priests performed the office of historians as well as of hierophants, every chief of consequence having in his household at least one of these men, who made it his business to chant on all great occasions the most important events which had happened in the country, and especially those which affected the family of his patron. Not only did he relate those events of which he had been a witness, but he also sang of the deeds of past days, the records of which had been transmitted to him by his predecessors.

The priests were, therefore, the only historians of the Society Islands; and, indeed, there was no other mode of delivering to each succeeding generation the traditions of the past. As, however, much of their accuracy depended on the memory of the historian, and as that memory was likely to fade by age, it naturally followed that the history of earlier times was considerably modified by each succeeding narrator. Tamatoa was himself a well-known chronicler, and could repeat a wonderful number of narratives, in which fact and fiction were mixed together in a manner that exactly resembled the semi-mythic history of ancient Greece and Rome.

These chroniclers, though they were unable to write, were not without some means whereby they could refresh their memories. Chief of these was the Maro, the sacred scarf of royalty. The word "Maro" signifies the simple girdle which the men wear by way of clothing, but that of the king is called, by way of pre-eminence, THE MARO; and, like

the crown of an emperor, is only worn when the kingly rank is conferred. When not in use, it is rolled up in native cloth so as to make a large bundle, and is only untied when it is wanted. When Captain Cook saw it he described it as being fifteen feet long, but when Mr. Bennett was in the Society Islands it measured twenty-one feet in length the additional measurement being due to the coronation of successive kings. It is only six inches in width, and when worn is rolled round the body, so that the end flows far behind on the ground. It is covered with the precious red feathers, and to it is attached the needle with which it is worked. So sacred is the maro thought to be, that, according to the ideas of the natives, whenever a new stitch was taken the event was marked by peals of thunder.

The maro was never intended to be finished, but, according to the original projection, would receive an addition at the coronation of every new king, so that it would continue to increase in length as long as the kingly succession was kept up. In several respects it bears a great resemblance to the Bayeux tapestry. It is very long in proportion to its width, and the patterns described upon it are records of the time when the maro was woven, and act as aids to the memory of the professional historians, who celebrate in their songs the deeds of past days.

The manufacture of the maro was stopped in a very curious manner. After Tamatoa

became a Christian, he was so horrified at the unspeakable iniquity of the ceremonies that took place at each lengthening of the maro that he determined to destroy the maro itself. Fortunately, instead of destroying it, he gave it up to his teachers, and it was sent, together with many specimens of the idolatrous arts of Polynesia, to the museum of the London Missionary Society. I may here mention that Tamatoa is the hereditary name of the king, like the Pharaoh of Egypt and the Finow of Tonga.

All the kings, or rather the principal chiefs, have the greatest idea of their dignity, and are regarded by their subjects almost as demigods. Like some of the African royalties, they are carried on men's shoulders when they travel from one place to another by land, and when they go by sea they are said to fly and not to sail. There is a special language for the king, whose canoe is called the Rainbow, and whose house is termed the Cloud of Heaven. No one is allowed to stand above him: and this idea is so strongly impressed upon him that a great chief dislikes going into the cabin of an European ship, lest an inferior should tread on the deck over his head. The king even claims authority over the language. We speak in England familiarly of the king or queen's English. In the Society Islands the language really does belong to the king, who invents and alters words according to his own caprice, and even strikes out of the language those words which he does not happen to like.

The power of the king being so absolute, it might be imagined that the house in which he lived would be far superior to those of his subjects. His power is, however, more real than apparent, and though he has despotic authority, he is lodged, clothed, and fed, scarcely better than any of his subjects, and not in the least better than the chiefs. His house is built in the same manner and of the same materials as those of his subjects. It is certainly larger, because it has to accommodate more persons; but in other respects it is in no way superior.

The houses of the Society Islands are, indeed, little more than thatched roofs supported on pillars about seven or eight feet in height, the pillars tapering from the base to the top, and not being quite upright, but sloping a little inward. The floor is generally covered with grass and mats, while to the rafters of the roof are hung baskets, bundles of cloth, and other property.

WARFARE among the Society Islands differs little from the mode which is practised in many other parts of Polynesia, and therefore does not require a lengthened notice.

Formerly, when their weapons were the spear, the club, and the sling, the wars used to be very protracted and caused much

bloodshed, but the later introduction of fire-arms has had its usual effect, and not only reduced the number of wars but the loss of life in battle.

Some of their spears were dreadful weapons, the worst of which seems to have been a sort of trident, something like an eel spear. The head of it was armed with three bones from the tail of the sting-ray. They were not fastened to the head of the spear, but only slipped into sockets, just tightly enough to hold them. When an enemy was struck with either of these points, it became detached from the spear, and, in consequence of its peculiarly barbed edges, kept working its way deeper and deeper into the body, so that certain death was the result of a wound with one of these spears.

The natives of the Society Islands also used the bone of the sting-ray for secret assassination. They watched the intended victim while he slept, and, by gently touching him with a feather, made him turn about until he was in a favorable position. The fatal dagger was then struck into the body, and the assassin made his escape, being sure that the wound must sooner or later be mortal.

The peculiar character of the people shows itself in other ways. They are most tenacious of memory in everything that has a personal interest to them, and are equally unwilling to forget an injury or a benefit. They will cherish a life-long vengeance against any one who has offended them, so that one man has been known to follow another from year to year, from one island to another, with the certainty and tenacity of the bloodhound, and never to cease from his quest until he has avenged himself upon his enemy. There is, however, a redeeming point in this trait of character, namely, that although it is mostly exercised for evil purposes, it sometimes takes the opposite course. Mr. Bennett mentions that on one occasion, after a battle, a chief of the victorious side knew that among the flying enemy was a man who had shown a kindness to him in a former war. Knowing the fate that would befall the man if he fell into the hands of the victors, he followed on the track of the fugitive, and after seeking his friend from cover to cover, and from bush to bush, he at last discovered him, took him to his own house, kept him there for a time, and then dismissed him in safety.

Cruelty toward the vanquished is one of the invariable accompaniments of savage warfare, and we cannot expect to find that the Society Islanders are more free from it than others. The only cannibalism of which they are guilty is in connection with war, and even on those occasions the victorious party only eat a small portion of the dead adversary's body, in accordance with custom, and do not feast upon human flesh, as many of the Polynesians do.

They are, however, on some occasions very cruel to the captured or wounded enemies, absolutely tearing them to pieces by degrees, and taking care to avoid the vital parts, so as to prolong the agony of the sufferer as much as possible. Even Pomaré, before he became a Christian, was guilty of many abominable atrocities. He has been known to take the children of vanquished chiefs, run sinnet cords through the backs of their necks, and drag them about until they died of the torture.

Even when the enemy was dead, the victors could not be content without insulting the senseless corpse. "When a combatant had slain a distinguished adversary," writes Mr. Bennett, "after the fray was over, the perishing carcass was left upon the field for a day or two. It was then dragged to the marae, when the victor and his friends would stand over it, and exult in the most savage manner over the corrupted mass.

"Each taking a fibrous wand of cocoa-nut leaf, tough as whalebone, in his hand, to employ as a drumstick, they would beat the body with these till they were weary; saying to it, 'Aha! we have you now; your tongue fills your mouth, your eyes stand out of your head, and your face is swollen; so would it have been with us, had you prevailed.' Then, after a pause, they would renew their impotent stripes and not less impotent taunts. 'Now you are dead, you will no more plague us. We are revenged upon you; and so you would have revenged yourself on us, if you had been the strongest in battle.' Again: 'Aha! you will drink no more kava; you will kill no more men; you will disembowel no more of our wives and daughters. As we use you, you would have used us; but we are the conquerors, and we have our vengeance.'

"When they had tired themselves, and beaten the flesh of the corpse to a mummy, they broke the arms above the elbows, placed flowers within the hands, and, fastening a rope about the neck, they suspended the mangled remains on a tree, and danced with fiend-like exultation about it, laughing and shouting as the wind blew the dislocated limbs and the rent muscles to and fro."

The canoe fights show some skill in manœuvres. The war canoes are double, with a platform laid across the bars, forming a sort of stage, on which the warriors stand to fight. The movements of the canoes are directed by one man, who tries to take the adversary at a disadvantage, and orders the vessel to advance or retreat as he thinks best, while the warriors are dancing on the platform, and exciting themselves to rage by frantic shouts, brandishing club and spear, and exchanging defiance with the enemy when near enough. As soon as one of them can take the other favorably, the canoes close, and the warriors from one try to board the other and kill its defenders.

The reserves receive and take care of the wounded, laying them in the bottom of the canoe, where they are safe from the weapons of the enemy, and in their turn take the place of those who are disabled, so that a constant succession of fresh warriors is continually coming to the front. When at last one party gets the better of the other, those of the vanquished side who are able to use their limbs leap overboard and try to save themselves by swimming. They have, indeed, no other alternative, for no quarter is ever given or expected, and if the lives of the vanquished be spared at the time, it is only that the unfortunate men may be tortured to death next day.

When Captain Cook visited the Society Islands, he found that all the decisive battles were fought by water, and that such a thing as a great battle on land was never thought of. Indeed, the chief strength of these insular people lies in their canoes, and in a sea fight a great number of them were usually engaged. In such a sea fight, whenever one party found themselves being worsted, they immediately made for the beach, drew their canoes ashore, jumped out, and made the best of their way to the hills, where they concealed themselves during the day, and at night slipped off to their own homes.

When a pitched battle of this kind is determined upon, it is fought out very fairly, and becomes a sort of general tournament. The two opposing chiefs arrange with each other as to the time and place for the battle. The whole of the day and night preceding the battle are occupied by both parties in feasting and dancing, evidently on the principle that, if they are to be killed on the morrow, they may as well enjoy themselves while they can. Before daybreak the canoes are launched and made ready for battle, and with the dawn the fight commences.

After the engagement is over, and the vanquished have run away, the victors go in great triumph to the maraes, where they return thanks to their gods, and offer to them the dead, the wounded, and the prisoners whom they have taken. The chief of the conquered party then opens negotiations with his successful opponent, and a treaty is arranged, in which peace is restored on certain conditions. These are often very hard, and force the vanquished to give up large tracts of land as well as to pay heavy fines in property. Sometimes a whole district changes masters, and, in one or two cases, an entire island has been added to the conquerors.

As human sacrifices have several times been mentioned, it will be as well to describe the circumstances under which they take place. We have already seen that in times of war the captured enemies are offered to the idols. There is a sort of excuse

for this act, the idea being that, as the captives had sought the lives of the worshippers of the gods, their own lives should be sacrificed to them as an atonement for their presumption.

There are, however, other occasions on which such sacrifices are offered, and where the victim is selected by the chief and killed in cold blood. If, for example, the king or principal chief of an island or district should project a war against another, he generally sacrifices a man to his god in order to bespeak his aid against the enemy. One of these sacrifices was seen by Captain Cook in 1777. He did not witness the actual murder of the victim, who was killed, as usual, unawares, by a blow from a stone, but saw the body as it was prepared for offering, and was present at the curious ceremony which accompanied the sacrifice.

It appeared that Towha, the chief of his district, intended to make war against the island of Eimeo, and sent a message to his friend and relative Otoo that he had sacrificed a man, and wished for Otoo's presence when the body was offered at the great marae of Attahooroo. Having previously doubted whether the usually mild and gentle Tahitans would really offer human sacrifices, Captain Cook asked permission to accompany Otoo, and accordingly went with him to the marae. The party accordingly embarked in their canoes, taking with them a miserable, half-starved dog, which was to form part of the sacrifice.

When they arrived at the landing-place, they found the body of the slain man already there, lying in a canoe which was half in and half out of the water, just in front of the marae. Otoo, his visitors, and the chiefs halted about ten yards from the body, while the rest of the people looked on from a distance.

"The ceremonies now began. One of the priests' attendants brought a young plantain tree, and laid it down before Otoo. Another approached with a small tuft of red feathers, twisted on some fibres of the coconut husk, with which he touched one of the king's feet, and then retired with it to his companions.

"One of the priests, seated at the marae, facing those that were upon the beach, now began a long prayer; and, at certain times, sent down young plantain trees, which were laid upon the sacrifice. During this prayer a man, who stood by the officiating priest, held in his hand two bundles, seemingly of cloth. In one of them, as we afterward found, was the royal maro; and the other, if I may be allowed the expression, was the ark of the Eatooa (*i. e.* the Atua, or god). As soon as the prayer was ended, the priests at the marae, with their attendants, went and sat down with those upon the beach, carrying with them the two bundles.

"Here they renewed their prayers; dur-

ing which the plantain trees were taken, one by one, at different times, from off the sacrifice, which was partly wrapped up in cocoa leaves and small branches. It was now taken out of the canoe and laid upon the beach, with the feet to the sea. The priests placed themselves around it, some sitting and others standing; and one or more of them repeated sentences for about ten minutes. The dead body was now uncovered by removing the leaves and branches, and laid in a parallel direction by the sea-shore.

"One of the priests then, standing at the feet of it, pronounced a long prayer, in which he was at times joined by the others; each holding in his hand a tuft of red feathers. In the course of this prayer some hair was pulled off the head of the sacrifice, and the left eye taken out; both which were presented to Otoo, wrapped up in a green leaf. He did not, however, touch it, but gave to the man who presented it the tuft of feathers which he had received from Towha. This, with the hair and eye, was carried back to the priests.

"Soon after, Otoo sent to them another piece of feathers, which he had given me in the morning to keep in my pocket. During some part of this last ceremony, a kingfisher making a noise in the trees, Otoo turned to me, saying, 'That is the Eatooa,' and seemed to look upon it as a good omen.

"The body was then carried a little way, with its head toward the marae, and laid under a tree, near which were fixed three broad thin pieces of wood, differently but rudely carved. The bundles of cloth were laid on a part of the marae; and the tufts of red feathers were placed at the feet of the sacrifice, round which the priests took their stations; and we were now allowed to go as near as we pleased.

"He who seemed to be the chief priest sat at a small distance, and spoke for a quarter of an hour, but with different tones and gestures; so that he seemed often to expostulate with the dead person—to whom he constantly addressed himself—and sometimes asked several questions, seemingly with respect to the propriety of his having been killed. At other times he made several demands, as if the deceased either now had power himself, or interest with the divinity, to engage him to comply with such requests. Amongst which, we understood, he asked him to deliver Eimeo, Maheine its chief, the hogs, women, and other things of the island, into their hands,—which was indeed the express intention of the sacrifice. He then chanted a prayer, which lasted near half an hour, in a whining, melancholy tone, accompanied by two other priests, and in which Potatau and some others joined. In the course of this prayer some more hair was plucked by a priest from the head of the corpse, and put upon one of the bundles.

"After this, the chief priest prayed alone, holding in his hand the feathers which came from Towha. When he had finished, he gave them to another, who prayed in like manner. Then all the tufts of feathers were laid upon the bundles of cloth; which closed the ceremony at this place.

"The corpse was then carried up to the most conspicuous part of the marae, with the feathers, the two bundles of cloth, and the drums, the last of which beat slowly. The feathers and bundles were laid against the pile of stones, and the corpse at the foot of them. The priests having again seated themselves round it, renewed their prayers, while some of the attendants dug a hole about two feet deep, into which they threw the unhappy victim, and covered it over with earth and stones. While they were putting him into the grave a boy squeaked aloud, and Omai said to me that it was the Eatooa.

"During this time, a fire having been made, the dog before mentioned was produced, and killed, by twisting his neck, and suffocating him. The hair was singed off, and the entrails taken out and thrown into the fire, where they were left to consume. But the heart, liver, and kidneys were only roasted, by being laid on hot stones for a few minutes; and the body of the dog, after being besmeared with the blood, which had been collected in a cocoa-nut shell, and dried over the fire, was with the liver, &c., carried and laid down before the priests, who sat praying round the grave.

"They continued their ejaculations over the dog for some time, while two men at intervals beat on two drums very loud, and a boy screamed as before in a loud shrill voice three different times. This, as we were told, was to invite the Eatooa to feast on the banquet that they had prepared for him. As soon as the priests had ended their prayers, the carcass of the dog with what belonged to it were laid on a *whatta*, or scaffold, about six feet high, that stood close by, on which lay the remains of two other dogs, and of two pigs, which had lately been sacrificed, and at this time emitted an intolerable stench. This kept us at a greater distance than would otherwise have been required of us; for after the victim was removed from the seaside toward the marae we were allowed to approach as near as we pleased. Indeed, after that, neither seriousness nor attention were much observed by the spectators. When the dog was put upon the *whatta*, the priests and attendants gave a kind of shout, which closed the ceremonies for the present."

The scene is well represented in illustration No. 1, on the opposite page. In the foreground is the canoe, in which lies the body of the slain victim, attended by two priests; while just above it on the shore is the dog that is intended to furnish the second

portion of the offering. Just in front of the house are two platforms, on the taller of which lie the dogs and pigs that have already been sacrificed, and on the lower lies the embalmed body of the late king, which is brought out for inspection. In front of the bier are the drummers performing on their elaborately carved instruments. A portion of the marae is seen on the left hand of the illustration, and on it lie the skulls of the human sacrifices that have been offered on various occasions.

Next day the ceremonies were resumed; more pigs were killed, some gifts were laid upon the movable house in which the Atua (or god) was carried about, and a young plantain tree was plucked up and laid at the feet of the king.

The mysterious bundles of cloth which had been laid on the marae were then unrolled, and out of one of them was taken the sacred maro, or royal girdle, which has already been described. It was remarkable for the fact that a portion of the scarlet feathers with which the maro is decorated were sewed upon an English pennant which had been hoisted by Captain Wallis when he landed on the island, and left flying when he left it. The second bundle contained the idol to whom the sacrifices were made.

Another hog was then killed, and the entrails inspected, exactly after the manner employed by the old Roman augurs; and the ceremony ended with rolling up the Atua, together with a number of scarlet feathers, in the bundle of cloth from which it had been taken.

At the funerals of very great men human sacrifices are often made, and near the large *whattas*, or platforms, on which the pigs and other provisions are offered, there are numbers of human skulls, each a relic of a human sacrifice. The only redeeming point about these sacrifices is, that the victim is quite unconscious of his fate. He is struck to the ground suddenly by an assassin who comes stealthily upon him, and never feels the real bitterness of death, namely, the dread of the coming fate.

The bodies of great chiefs undergo a process by which they are preserved for a considerable time. Captain Cook saw the corpse of a chief who had been dead for several months, and whose body had suffered scarcely any apparent change. There was a slight contraction of the muscles and sinking of the eyes, but the body was otherwise perfect; and when the attendants on the corpse unrolled the cloth in which it was enveloped, the limbs were found to be nearly as pliant as in life.

This result is obtained by removing the whole of the interior of the body, supplying its place with cloth soaked in cocoa-nut oil, and anointing the whole body repeatedly with the same substance. The bodies are exposed to public view for some time; but the em-

(1.) THE HUMAN SACRIFICE. (See page 1076.)

(2.) CORPSE AND CHIEF MOURNER. (See page 1079.)

balming only postpones the process of decay, and, sooner or later, decomposition does its work. At first the body is exposed for several hours daily, provided that there be no rain; but by degrees it is only shown at intervals, and at last is scarcely ever exhibited, except by request.

There is a special building, called a *tupapau*, in which the bodies of chiefs are exhibited when lying in state. First, there is a tolerably large house, with a palisade around it, and within this house is the *tupapau* itself. It is made exactly like the little pent-houses that are built upon the larger canoes, and is profusely decorated with scarlet feathers, cloth, and other precious ornaments. Two men are attached to the *tupapau*, who watch over it night and day, attend to the proper arrangement of the cloth and feathers, receive the offerings of fruit and provisions that are constantly made, and prevent intruders from venturing within the palisades.

The second illustration on the 1077th page exhibits the manner in which the bodies of ordinary chiefs are laid out under the protection of a covered shed, as well as the extraordinary dress worn by the chief mourner. The dress is composed in the most ingenious manner of mother-of-pearl shell, feathers, bark cloth, and similar materials, and has a peculiarly startling appearance from the contrast between the glittering white of the pearl-shell and the dark feathers with which the shell is surrounded. Several of these extraordinary dresses have been brought to England, and may be seen in different collections.

BEFORE leaving the Society Islands, it will be necessary to mention an extraordinary institution that in former times prevailed among them. It consisted of a society called the "Areois." They were worshippers of the god Oro; and though they formed a single confraternity throughout all the Society group, each island furnished its own members.

Some writers have likened the society to that of Freemasonry; but no two institutions can be more utterly opposed than those of the Masonic and the Areoi societies—the one insisting on monotheism, while the other is based on idolatry; the one being an universal, and the other a local society; the one inculcating morality, and the other being formed for the express purpose of throwing aside the small relics of morality possessed by a native Polynesian.

It is not improbable, however, that on its first foundation the Areoi society possessed something of a religious nature. When Areois who had been converted to Christianity managed to shake off the dread with which they contemplated any reference to the mysteries of their society, they all agreed in the main points, though differing in details.

In the first place, the Areois believed in the immortality of the soul, and in the existence of a heaven suited to their own characters. Those who rose to high rank in the Areoi society were believed, after their death, to hold corresponding rank in their heaven, which they called by the name of Rohutu-noa-noa, or Fragrant Paradise. All those who entered were restored to the vigor and bloom of youth, no matter what might be their age; and in almost every respect the resemblance between the Polynesian Rohutu and the Mohammedan Paradise is close and almost startling.

The method by which this Paradise was to be gained was most extraordinary. Fanatics of an ordinary turn of mind believe that everlasting happiness hereafter is to be gained by self-denial and mortification of the body during the present life. The Areois, with an almost sublime audacity, held precisely the opposite view, and proclaimed both by words and deeds that a life of eternal enjoyment in the next world was to be obtained by leading a life of unbridled license in the present world.

In order to carry out this theory to the fullest extent, the Areois formed themselves into a society, and travelled about from one island to another, disseminating their peculiar opinions wherever they went, and gaining fresh recruits to their number in each island. On one occasion Captain Cook saw seventy canoes filled with Areois set off on an expedition to the different islands. Wherever they landed, they proceeded to the nearest marae, and offered a sacrifice of a sucking pig to the god who presided over it, this sacrifice being in the first place a thank-offering to the god for their safe landing, and in the next a notification that they wanted pigs for themselves.

Partly on account of the terror inspired by their numbers and unanimity, and partly on account of the spread of their very intelligible doctrines, the invitation always met with an immediate response, and great numbers of pigs, together with vegetable food, cloth, kava, and other luxuries were produced. A great feast was then held, during which the peculiar doctrines of the society were carried out to the full, and a scene ensued such as cannot be described.

Among the worst of their doctrines was that which declared them all to be celibates, because the god Oro was unmarried. Consequently, the existence of children among them could not be recognized, and as soon as a child was born, it was murdered, and the fact of its existence ignored. By a similarly convenient fiction, all Areois were presumed to be in the full vigor of human life. Consequently, the possibility of age and debility was ignored, and in order to prove the non-existence of either senility or sickness, any old or sick person was quietly buried alive. The victims were never ap-

prized of their fate, as is the case in Fiji, but a grave was dug surreptitiously, the sick person was decoyed to it on some pretence or other, dropped into the grave, the earth flung on him, and stamped down almost before he had time for a remonstrance.

Sometimes, when provisions ran short, the Areois had a very strange method of supplying themselves. A party of them, led by some chief, whose rank was known by the marks tattooed on his body, would visit a house where they saw evidences of prosperity, and look about until they came on a little boy—an easy matter enough in a country where polygamy is practised. They would then take the child, and go through various ceremonies, by which they represented him as having been raised to kingly rank.

They would then simulate the utmost deference to the new king, place him on an elevated seat, prostrate themselves before him, and appeal to him as though he really held the kingly rank. "We are come to the king's house, poor, naked, and hungry. We need raiment—give us that piece of cloth. We need food—give us that pig." Accordingly, the father of the child was forced to fall in with their humor, and, in return for the honor conferred upon his house, to give them whatever they demanded.

The only redeeming point of the Areois was their value in keeping up the old historical records of the islands. The food and clothing which they obtained from the various people were repaid by the dramatic performances and recitations which they gave, and which debased as they were by the licentious element which permeated every section of the society, performed toward their local history the same part which the ancient mysteries performed toward the Christian religion. The Polynesians being unable to read or write, and having no mode of recording historical events except by tradition, these performances rendered as it were history visible, and enacted before the eyes of the illiterate people the deeds of days long gone by.

Sometimes the story was that of a celebrated ancestor, much on a par with the semi-mythical legends of ancient European and Asiatic history, and sometimes it took a graver cast, and narrated the deeds and

powers of the native gods. For example, the legend of Taroa, the father of gods and men, was somewhat as follows:—

In ages long gone by, Taroa existed only in the form of a vast egg, and hung high in the firmament, inclosing in the shell the sun, moon, and stars. After floating in ether for ages, he thrust his hands through the shell, so that the light of the sun burst upon the universe and illumined the earth beneath him. And the earth was then small as it lay beneath him. Then Taroa saw the sands of the sea, and cried to them, "Sands, come up to me, and be my companions." But the sands replied, "We belong to the earth and sea, O Taroa, and may not leave them. Come thou down to us." Then he saw the rocks and cliffs, and cried to them, "Rocks come up to me, and be my companions." But the rocks replied, "We are rooted in the earth, O Taroa, and may not leave it. Come thou to us."

Then Taroa descended, and cast off his shell, which immediately added itself to the ground, and the earth was increased to its present dimensions, while the sun and moon shone above. Long did Taroa live on the earth which he peopled with men and women; and at last the time came when he should depart from it. He transformed himself into a large canoe, which was filled with islanders, when a great storm arose, and suddenly the canoe was filled with blood. The islanders with their calabashes baled out the blood, which ran to the east and west of the sea; and ever afterward the blood of Taroa is seen in the clouds which accompany the rising and setting sun, and, as of old tinges the waves with red.

When the canoe came to land, it was but the skeleton of Taroa, which was laid on the ground with its face downward, and from that time all the houses of the gods have been built on the model of Taroa's skeleton, the thatched roofs representing the backbone and the posts the ribs.

Legends such as these are often transmitted from one reciter to another, and recited verbatim, being merely illustrated and exemplified by such poetical digressions as the mind of the narrator may suggest. With others, on the contrary, the orator has only the mere skeleton, and tells the story in the manner that seems him best.

CHAPTER CXI.

THE SANDWICH ISLANDS.

CLIMATE — DRESS — ORNAMENTS — WOMEN.

LOCALITY OF THE GROUP — CONFORMATION AND CLIMATE OF HAWAII — APPEARANCE AND DRESS OF THE MEN — FEATHER MANTLES AND HELMETS — SINGULAR RESEMBLANCE TO CLASSIC MODELS — APPEARANCE OF THE WOMEN — A HAWAIIAN BEAUTY — DRESS OF THE WOMEN — MODES OF WEARING THE HAIR — BRACELETS AND OTHER ORNAMENTS — FONDNESS FOR PIGS AND DOGS — OCCUPATIONS OF THE WOMEN — HOSPITALITY TO STRANGERS — FISH PONDS, AND MODE OF MAKING THEM — TREATMENT OF WOMEN — SEMI-AMPHIBIOUS NATURE OF THE SANDWICH ISLANDERS — INGENUOUS METHOD OF OBTAINING SOUNDINGS.

CONSIDERABLY to the northward of the Society Islands lie the SANDWICH ISLANDS, so called by Captain Cook, in honor of the Earl of Sandwich. The entire group consists of eight inhabited islands, and a few which are too barren and rocky to maintain human beings. The largest and most important of them is HAWAII, or Owhyhee, as the word is spelt in Cook's "Voyages." It was on the shore of a bay on the western side of this island that Captain Cook was killed in 1779. Owing to the interchange of the letters *l* and *r*, which is so prevalent among the Polynesian languages, the name of this bay is sometimes spelt as Karakakooa, and sometimes as Kealakekua.

The capital city of the Sandwich Islands is not situated in Hawaii, but in Oahu, or Woahu, one of the smaller islands, and is called Honolulu. It rightly deserves the name of a city, because it is the seat of a bishopric. The climate of the Sandwich Islands is said to be the most charming in the world. The variation is exceedingly trifling, as near the sea the temperature is below that of sultry English summer-time, while on the coldest winter's day the thermometer never sinks below 62° Fahr. Owing, however, to the mountainous nature of these islands, any one may live throughout the year in almost exactly the same temperature, by ascending into a cooler atmosphere when the weather is too hot, and descending into the warmer strata during the months of winter.

Adhering to the principle which has been followed in this work, I shall say but little of the present Europeanized condition of the natives of these islands, and confine myself as far as possible to the manners and customs of the people as they were before the white men had introduced their own mode of civilization. Even at the present day, however, the old savage character continually shows itself, and among the very people who seem to be most completely under the influence of civilization the original old heathenism exhibits itself when they are off their guard, or when they think themselves out of the ken of white men. It will be understood, therefore, that although the present tense may be used in the following pages, all descriptions apply to them as they were originally, and not to them as they are at the present day.

THE men are tall, active and powerful, and in color are of an olive brown, the precise depth of tint varying much according to the exposure to the sun, so that the skins of the chiefs are much lighter than those of the commonalty. The hair is jet black, and not in the least woolly, being sometimes quite straight, and sometimes wavy. The face is mostly wide, and is a very handsome one, the only fault in it being a tendency to width across the nostrils.

The men all wear the maro or malo, *i. e.* the slight girdle of cloth which has already been mentioned, and having this, they con-

sider themselves dressed for all purposes of decency. They also have a tappa, or bark-cloth garment, which is twisted round the waist, and falls below the knees, while the better class wear also a sort of mantle, to shelter their skin from the darkening sunbeams.

The great chiefs have also mantles made of a sort of network, into each mesh of which are interwoven the feathers of various birds, the most precious of them being that which supplies the yellow feathers. This is a little bird called *Melithreptes pacifica*. It is one of the honey-birds, and under each wing there is a single yellow feather, one inch in length. The late king, Kamehameha, had a cloak made of these feathers alone. It was four feet long, and eleven feet wide at the bottom. No less than nine successive kings died before this priceless mantle was finished.

The headdress of the chiefs is of so graceful and classical a form as absolutely to startle the spectator. It is a helmet made of wicker-work and covered with feathers, the shape being exactly that of the ancient Grecian helmet even to the elevated crest which runs over the top. One of these beautiful helmets is shown on the 1097th page. It is not intended as a protection for the head, the material being too fragile for such a purpose, but is simply a badge of rank and wealth. Mostly they are covered with scarlet and yellow feathers, disposed in bold bands or belts, and the wealth of the wearer may be known by the proportion which the yellow and scarlet feathers bear to each other.

Examples of these beautiful ornaments may be seen in several museums, where it is to be hoped that they will be kept from the destructive moths and beetles, inasmuch as they form the sole memorials of a time now passed away.

The birds which furnish these feathers are eagerly sought by the Sandwich Islanders, who have the same love of scarlet that distinguishes not only all Polynesians but all savages and children. The birds are usually caught by means of a tenacious substance much resembling our birdlime, and used in a similar manner by being smeared on twigs and poles, to which the birds are attracted by means of baits.

The natural taste in color is as good as that which displays itself in form, and although the brightest and most boldly contrasting colors are used by the Sandwich Islanders, they are used with such admirable judgment that they do not look gaudy, or even obtrusive.

The women, when young, are singularly beautiful, and retain their good looks longer than is usual among Polynesians. Like the other sex, however, they generally attain to great size in their latter years, those of the better sort being remarkable for their enor-

mous corpulence. This development is probably owing, like that of the Kaffir chiefs, to the great quantity of porridge which they are continually eating. When young, however, they are exceedingly beautiful, their features having a peculiar charm of their own, and their forms being like those of the ancient Grecian statues. An American traveller, writing under the *nom de plume* of Haöle, *i. e.* foreigner, gives a most animated description of a native girl, in his interesting work on the Sandwich Islands, showing that the partial civilization to which the natives have been subjected has not destroyed their beauty of features nor symmetry of form.

"In truth to nature, it may be safely asserted that beauty is not confined merely to the saloon of the monarch, nor to the tapestried chambers of the patrician. It is more frequently found amid the lowlier walks of life, on the desert, or the distant isle of the ocean. In this instance I wish to be understood as speaking of physical beauty only. On leaving the shore-road to ascend the mountains for Halawa, I met just such a specimen as has often driven men mad, and whose possession has many a time paved the way to the subversion of empire on the part of monarchs.

"She was rather above the medium size of American women. Her finely chiselled chin, nose, and forehead were singularly Grecian. Her beautifully moulded neck and shoulders, looked as though they might have been borrowed from Juno. The development of her entire form was as perfect as nature could make it. She was arrayed in a single loose robe, beneath which a pretty little nude foot was just peeping out. Her hair and eyebrows were as glossy as a raven's wing. Around her head was carelessly twined a wreath of the beautiful native *ohelo* flowers (*Gualtheria penduliflorum*). Her lips seemed fragrant with the odor of countless and untiring kisses. Her complexion was much fairer than the fairest of her countrywomen, and I was forced into the conclusion that she was the offshoot of some white father who had trampled on the seventh precept in the Decalogue, or taken to his embrace, by the marriage relation, some good-looking Hawaiian woman.

"But her eyes! I never shall forget those eyes! They retained something that spoke of an affection so deep, a spiritual existence so intense, a dreamy enchantment so inexpressibly beautiful, that they reminded one of the beautiful Greek girl Myrrha, in Byron's tragedy of 'Sardanapalus,' whose love clung to the old monarch when the flame of the funeral pile formed their winding sheet.

"In no former period of my life had I ever raised my hat in the presence of beauty, but at this moment, and in such a presence, I *took it off*. I was entirely fasci-

(2.) SANDWICH ISLAND WOMEN AND FIG. (See page 1085.)

(1.) IDOL TANE RETURNING HOME. (See page 1084.)

nated, charmed, spell-bound now. I stopped my horse; and there I sat, to take a fuller glance at the fair reality. And the girl stopped, and returned the glance, while a smile parted her lips, and partially revealed a set of teeth as white as snow, and of matchless perfection. I felt that smile to be an unsafe atmosphere for the nerves of a bachelor; so I bowed, replaced my hat, and passed on my way, feeling fully assured that nothing but the chisel of Praxiteles could have copied her exquisite charms. And as I gently moved past her, she exclaimed, in the vocabulary of her country 'Love to you.'

The same writer mentions in several other places the beauty of the young girls whom he saw in Hawaii. There was no reason for the surmise that the girl who impressed him so deeply was a half-caste, because, as has already been mentioned, people of the better class are much fairer than those of lower rank, and are scarcely so dark as the inhabitants of Southern Europe.

The dress of the Sandwich Islands women is much like that of the Tongans, and consists essentially of a wrapper of bark cloth passing round the waist and falling below the knees. It is often arranged so that the end may be thrown over the shoulders, and many of the better class of women have a separate piece of cloth which is used as a mantle. When young they wear no clothing at all.

The methods of wearing the hair are somewhat various. The women generally cut it behind, but allow it to grow to its full length on the rest of the head. The men sometimes divide the hair into a number of locks, and plait or twist each lock into a sort of tail about the thickness of a man's finger. These tails are allowed to grow to their full length, and stream for some distance down the back. The length of tail seems to be much valued among these people, who are in the habit of adding to their length by supplementary additions of hair woven into their own locks. The hair is often stained of a reddish color by the use of lime, as is done in Fiji and other parts of Polynesia. Sometimes the men shave the whole of the hair on either side of the head, leaving only one crest of long hair to run from the forehead to the nape of the neck, just like the crests of the feather helmets.

Captain Cook remarks that the Sandwich Islanders stand almost alone among Polynesians in refusing to perforate their ears, and that they have no idea of wearing ornaments in them. They are fond of ornaments, some of which are worth a brief description. They have a sort of necklace made of black cord, doubled forty or fifty times, and supporting a piece of wood, shell, or bone cut into the form of a broad hook. Necklaces made of small shells strung to-

gether are also common, as are also necklaces of dried flowers.

Bracelets of various kinds are valued by the women. Some of these ornaments are made of hog's teeth placed side by side, with the concave parts outward, and joined by a string running through the middle. Some of these bracelets are made entirely of the long curved tusks of boars, and are really handsome ornaments. Others are formed from pieces of black wood, fastened together in a similar manner, and being variegated by small pieces of hog's teeth let into them.

The men sometimes wear on their heads tufts of feathers tied to slight sticks. The most valuable of these plumes are those which are made of the tail-feathers of the tropic bird. Others, which are not so valuable, are made of white dog's hair. The sticks are sometimes two feet in length.

Tattooing is but slightly practised among the Sandwich Islanders, though some of them have the arms and chest decorated with lines and figures tolerably well executed.

Like many of the Polynesians, the Sandwich Islanders have an absurd liking for pigs and dogs, carrying them about and feeding them when young, as if they had been children. Even when the animals attain their full growth they are petted to no small extent. The "Haöle" narrates an amusing example of the extreme tenderness which the Hawaiian women evince for these animals, and the artist has represented the description in engraving No. 2, on the preceding page. He was travelling through the island, and noticed a group of women sitting under the shade of a pandanus tree, and surrounding something in which they seemed to be greatly interested. On coming closer, he found that the object of their attention was an enormous hog.

The women were taking it to market, a task which usually devolves upon them, and had to drive the animal for a considerable distance over lofty mountains, a task which could not occupy them less than thirty-six hours. To produce the hog in good condition was evidently their principal object, and they would therefore hurry it as little as possible, coax it along, rather than drive it, by day, and sleep by its side at night. It so happened that the day was a very warm one, and the hog, which was in very good condition, was oppressed with its own fat, with the heat and the fatigue of the journey. Accordingly, the women had led their charge to a shady spot, taken off their only garments, soaked them in water, and spread them over the panting animal, which uttered occasional grunts of satisfaction at the coolness caused by the wet garments, and the continual fanning which the women kept up with leaves.

When the pig is of smaller size, and the

market is near at hand, so that there is no danger the animal may get out of condition, a much simpler plan is followed, the legs of the pig being tied together, and a pole run between them, which is lifted on the shoulders of two or four men, according to the weight of the animal.

Although the Sandwich Islanders will eat dogs, pigs, and cats too, when they can afford themselves the luxury, they are so fond of them while living that a man will sooner resent an injury done to his dog or pig than to his child. When travelling, accompanied by their dogs, they treat the animals just like children, taking them in their arms, and carrying them over any rough or muddy places, lest perchance the poor animals should hurt or soil their feet. It is possible that this extraordinary predilection may arise from the fact that none of these animals are indigenous, but have been introduced by Europeans.

It will be seen that the women do not spend their lives in idleness. Indeed, though they are not treated with the harshness that too often falls to the lot of women in uncivilized countries, they do a very fair share of the work. The cooking, for example, is entirely their business, and they are as great adepts at procuring as at cooking food. For example, if a stranger should call at the house of a native, the wife is sure to come out, pass her hand over him, and inquire whether he is hungry. Should he reply in the affirmative, she or another girl runs out to one of the fish ponds, launches a small canoe, and in a very short space of time she has caught some fish, broiled them, cooked some taro, and laid them on plantain leaves before the guest.

These fish ponds are very common in Hawaii, and are mostly made by the women. They are formed by taking advantage of the coral beach, which has numerous small bays or inlets with comparatively narrow mouths. Across the mouths of these bays the natives pile pieces of coral rock so as to prevent any fish from escaping. They are deepened as occasion may require, and it is not an uncommon thing to see a number of women up to their waists in mud and water busily employed in cleaning out a fish pond, and evidently enjoying the work rather than thinking it a hardship. While they are thus at work on land, their husbands and brothers are equally hard at work on sea, catching the fish which are to be transferred to the pond.

The natives rely much for their supplies of food on these ponds, as fish forms a considerable portion of their diet, pork and fowls being too expensive to be considered anything but luxuries, and only to be eaten constantly by the rich. The ponds vary much in size, but are generally of considerable dimensions. Few of them cover less than an acre of ground, while others are a hundred times as large. One or two of the largest

are very ancient, and may be considered as historical monuments, the coral blocks which shut them off from the sea being of such enormous size as to tell of the time when the kings or principal chiefs were absolute, and could command any amount of human labor.

Even at the present time the natives rely much on their fish ponds for their supplies of food, and the size of the pond is an invariable test of the rank and wealth of the owner. They are watched as carefully as game preserves in our own country, and suffer as much from poachers, who, however, seldom escape detection.

While, therefore, the women do their share of the work, their life is by no means a laborious one, because there is so little work to be done. The taro patch has to be prepared and cultivated, but this is not a very laborious task; the fish ponds have to be made and left in order, the cooking has to be done, and the bark cloth to be made. Of all these tasks the second is the hardest, and this is rather considered as an amusement than a labor, the women being so amphibious in their habits that to spend half the day in mud and water is no hardship to them, as is seen by the merry talk and laughter that accompany the work.

Mr. Bennett mentions one instance in which a woman was badly treated by her husband. Being in a state of intoxication, he ordered her to carry him on her back up one of the precipices with which these islands abound. In spite of the almost perpendicular rocks, which are in that spot so steep that the white visitors could barely climb up them without any burden at all, the woman undertook the task, and succeeded in reaching the summit in safety.

The semi-amphibious nature of the Sandwich Islanders has already been mentioned. The mode in which both sexes turn their aquatic powers into a means of amusement will be presently described, but we are now dealing with the work done by the women, and not with their amusements. There is a salt-water lake called *Loki Nomilu*, which was said by the natives to be the handiwork of the terrible fire-goddess *Pele*, who dug deep into the ground in search of fresh water, but was baffled by the sea finding a subterranean entrance, although the lake is many yards from the shore. Being angry with the sea for its misconduct she took her departure, and took up her abode in the crater of the great volcano of Hawaii, which is called by her name. There is little doubt that the lake in question is itself the crater of an extinct volcano. The "*Haöle*" went to visit this extraordinary lake, and gives the following account of the mode by which its actual depth was ascertained:—

"Having been informed that this lake was fathomless, I felt only more solicitous to test the mystery. There were no means, however, on the premises; and, two women ex-

cepted, the little village was temporarily deserted. There were several canoes on the shore, but the lake was much disturbed by a heavy north wind, so that they would have been rendered nearly useless. But I felt as though I could not abandon the expedition. The gentleman who accompanied me thither informed the women of my object in coming, and assured them I was extremely anxious to know the depth of the water in that lake, and that we would wait until some of the men returned from their fishing excursion.

"But one of them soon provided a remedy. She proposed swimming into the lake with a sounding-line to make the required measurement. Our remonstrance against such a measure was in vain, for she resolutely assured us it would be not only an easy performance, but afford her much satisfaction to have an opportunity of serving me. She procured a piece of wili-wili wood, exceedingly light, about six feet long, and as many inches in diameter. This she insisted on carrying to the north end of the lake, where, under the lee of the high hills, she launched the log of wood. After wading in until it was deep enough to swim, she placed the log firmly under her chest, keeping it there with

one hand, and retaining the sounding-line with the other. In this position she struck down the lake, stopping at short intervals to let down the line, which she knotted at the surface of the water every time she found the bottom. This done, she would gather up her line, replace her log, and resume her course. And she pursued this plan until her task was done.

"It would be superfluous to say that this feat excited our admiration, or that we compensated her for her pains. It was the most novel expedition I had ever seen; nor could I fully realize it until I remembered that in these islands, as in other parts of Polynesia, and in the Caribbean Sea, the women and girls are the best swimmers. The Hawaiians are almost amphibious. Volumes might be written detailing their extraordinary feats in the water. It is owing to their frequent bathing that many of the women of Polynesia display such an exquisite *contour*."

The woman who performed the feat was the mother of nine children, all of whom were living — an extraordinary event in the life of an Hawaiian woman, so many children perishing either by neglect, disease, or intentional violence.

CHAPTER CXII.

THE SANDWICH ISLANDS — *Concluded.*

WAR — SPORT — RELIGION.

WEAPONS OF THE SANDWICH ISLANDERS — KAMEHAMEHA AND THE SPEARS — TWO KINDS OF SLINGS — THE WOODEN DAGGER OR PAHŪA — THE KNIFE FOR CUTTING UP THE BODIES OF SLAIN ENEMIES — THE WAR MAT AND ITS USES — THE TOOTH BREASTPLATE — SUPPOSED CANNIBALISM OF THE SANDWICH ISLANDERS — VARIOUS GAMES — SURF SWIMMING — CHILDREN AND THE WATER — MASKED PADDLERS — BALL PLAY — CUP AND BALL — THE HIDDEN STONE — A BOXING MATCH IN THE SANDWICH ISLANDS — SLEDGING AND ITS DANGERS — RELIGION OF HAWAII — FEATHER AND WOODEN IDOLS.

SOME of the weapons used by the Sandwich Islanders are rather curious.

In the first place they have the spear, which is made of a chestnut colored wood, which takes a high polish, and is usually barbed at the point and brought to a flattened point at the butt. They are exceedingly skilful in the use of this weapon, not only in throwing it, but in warding off the weapons that are flung at them. Kamehameha, the well-known king or chief, was celebrated for his skill with the spear. He used to stand with a spear in his right hand in front of six men, also armed with spears. At a given signal they flung their spears simultaneously at him, when he used to strike three aside with the spear in his right hand, and catch the other three in his left hand. Illustration No. 1, on the next page, shows the king performing this dangerous and remarkable feat.

These spears, which are intended to be thrown, are from six to eight feet in length, and are made to fly straight by being tapered gradually from the head to the butt. There is another kind of spear, which is used as a pike. This is from twelve to fifteen feet in length, and is not barbed.

The sling is another of the Sandwich weapons. It is of considerable length, and the receptacle for the stone is made of plaited matting. The stones are oval in shape, and are ground down for the express purpose, so that the slingers evidently possess much accuracy of aim. There is a modification of the sling, the use of which seems to be forgotten at the present day,

and even in Captain Cook's time was far from universal. The stone is out of an oval shape, with a groove round it, much like a lady's tatting-needle, and the cord is passed round the groove with a half-hitch, so that when the end of the sling is liberated the stone flies off. Some of these stones obtained by Captain Cook were made of hæmatite, or blood-stone, and were very heavy, weighing at least a pound. It was rather curious that, although there was little difficulty in purchasing the stones, which must have cost much trouble in making, it was not possible to persuade the natives to part with the cord by which they were flung.

Another of their weapons is the dagger, or *pahūa*, as the natives call it. The material of which it is made is a very hard wood, something like ebony, and it is shaped much like the ordinary steel dagger, except that it has no guard. It is about two feet in length, and is secured to the wrist by a cord passing through a hole at the end of the handle. Some of these daggers are still larger, and double-pointed, being held in the middle like the antelope-horn daggers of India. This weapon has a mournful interest from the fact that when Captain Cook was murdered his body was pierced with innumerable wounds mostly made by wooden daggers, though one of the natives had a dagger made of iron, which they snatched from each other's hands in their eagerness to inflict fresh wounds.

On some occasions the Sandwich Islanders employ a weapon which much resembles the meral of the New Zealanders. It is a

(1.) KAMEHAMEHA AND THE SPEARS. (See page 1088.)

(2.) MASKED ROWERS. (See page 1095.)

battledoor-shaped piece of wood, armed with shark's teeth round the edges. Its primary use is that of a knife, and it is employed in cutting to pieces the bodies of foes that are slain in battle. Still, though it was originally intended as an implement and not as a weapon, it is of so formidable a character that it is often employed in the latter capacity. As far as can be ascertained, this knife is considered to be especially devoted to the one object of cutting up human bodies, and is never employed in any meaner work.

As to clubs, they are of various shapes, the natives having no special form, but carving them into any device that may suit them best, and using different kinds of wood for the purpose.

The defensive armor of the Sandwich Islanders is generally a thick mat, which is worn in time of war, and is sufficiently strong to save the wearer from the thrust of a spear or the stroke of a dagger, and can even greatly deaden the blow of a sling stone.

When Captain Cook was killed, the man who precipitated the attack was wearing his war mat, and, on threatening Captain Cook with a dagger in one hand and a stone in the other, the captain was obliged to fire at him in self-defence. Not wishing to kill, but only to wound and terrify his adversary, he fired a charge of shot, which was resisted by the war mat, so that the man escaped unhurt, his impunity encouraging the natives to proceed with their attack. Had Captain Cook fired the other barrel, which was loaded with ball, against which the war mat would have been no protection, it is probable that the natives would have been deterred from their attack, and that Captain Cook might have lived to complete the voyage of discovery.

One of the most curious examples of defensive armor is a breastplate made entirely of teeth, so arranged that they overlap each other just like the plates of scale armor. One of these curious breastplates is in the United Service Museum. Teeth hung in a similar fashion are employed as castanets, and are hung to the legs of dancers.

Warfare as originally practised by the Sandwich Islanders was scarcely deserving of the name, being little more than a series of desultory skirmishes. They usually began by practising in earnest the skill in avoiding spears which has already been mentioned as exhibited in sport. When the opposing parties met, one of the chiefs, clad in his feather helmet and cloak, advanced in front of his own men, totally unarmed, having nothing in his hand but a fan, and challenging the enemy to throw their spears at him. This they did, and by means of wonderful agility in leaping, stooping, and twisting his body, when the weapons could not be struck aside by the fan or caught in the left hand, he often contrived to escape with his life.

Though it was a piece of military etiquette that he should take no weapon into the field, he was at liberty to hurl back at his adversaries any of the spears which he could catch. Should one of the enemy's spears bring him to the ground, or should he be successful in killing an adversary, there was an immediate struggle for the possession of the dead body, which is looked upon much as is a flag among ourselves, to be defended or captured at all risks, even of life.

This statement naturally brings us to the disposal of the bodies of the slain, and to the practice of cannibalism. That the latter practice existed to a certain degree cannot be denied, but it is equally certain that the practice was always exceptional, and that it was followed rather as a portion of military etiquette than as a means of indulging the appetite. As may be imagined, the higher the rank of a slain man the greater the desire to eat a portion, however small, of his flesh; and this theory will account for the fact that the remains of Captain Cook which were rescued from the natives bore evident marks of fire.

It has often happened that cannibalism has been thought to exist on the strength of native evidence, which has afterward been found to have been misunderstood. A remarkable instance of such an error occurs in the account of Captain Cook's voyages. In vol. ii. p. 209, there is an account of a native who was observed to carry with him a very small parcel carefully tied up with string. After resisting many solicitations, he allowed it to be opened, when there appeared a small piece of flesh about two inches long, "which to all appearance had been dried, but was now wet with salt water." On being further pressed on the subject, the man admitted that it was human flesh, and, pointing to his own stomach, indicated the portion of the body from which it had been cut.

Nothing could be clearer than this account, but in vol. iii. p. 133, the whole of this evidence is shown to be utterly untrustworthy. It seems that almost every Sandwich Islander was in the habit of carrying about with him a small piece of hog's flesh very highly salted, which he was accustomed to nibble occasionally as a delicacy, or by way of sauce when eating vegetable food. By pointing to his stomach the man merely used the conventional sign expressing the excellence of the food; and as to his statement that the flesh was that of a human being, he was so eagerly and closely questioned that, being a mere lad of sixteen or seventeen, he gave an affirmative answer to leading questions. As far as we can see, the Polynesian race is not given to cannibalism, while the Papuans are devoted to it.

WE now come to the various games with

which the Sandwich Islanders amuse themselves. Chief among them is the sport of surf-swimming. This is practised in several of the islands of Polynesia, but in none is it carried out to such perfection as in the Sandwich group. The following spirited account of this sport is given in Captain Cook's Voyages:—

“Swimming is not only a necessary art, in which both the men and women are more expert than any people we had hitherto seen, but a favorite diversion amongst them. One particular mode in which they sometimes amused themselves with this exercise in Karakakooa Bay, appeared to us most perilous and extraordinary, and well deserving a distinct relation.

“The surf, which breaks on the coast round the bay, extends to the distance of about one hundred and fifty yards from the shore, within which space the surges of the sea, accumulating from the shallowness of the water, are dashed against the beach with prodigious violence. Whenever from stormy weather, or any extraordinary swell at sea; the impetuosity of the surf is increased to its utmost height, they choose that time for this amusement, which is performed in the following manner:—

“Twenty or thirty of the natives, taking each a long narrow board, rounded at the ends, set out together from the shore. The first wave they meet they plunge under, and, suffering it to roll over them, rise again beyond it, and make the best of their way by swimming out into the sea. The second wave is encountered in the same manner with the first; the great difficulty consisting in seizing the proper moment of diving under it, which, if missed, the person is caught by the surf, and driven back again with great violence; and all his dexterity is then required to prevent himself from being dashed against the rocks. As soon as they have gained, by these repeated efforts, the smooth water beyond the surf, they lay themselves at length on their board, and prepare for their return. As the surf consists of a number of waves, of which every third is remarked to be always much larger than the others, and to flow higher on the shore, the rest breaking in the intermediate space, their first object is to place themselves on the summit of the largest surge, by which they are driven along with amazing rapidity toward the shore.

“If by mistake they should place themselves on one of the smaller waves, which breaks up before they reach the land, or should not be able to keep their plank in a proper direction on the top of the swell, they are left exposed to the fury of the next, and, to avoid it, are obliged again to dive and regain the place from which they set out.

“Those who succeed in their object of reaching the shore have still the greatest

danger to encounter. The coast being guarded by a chain of rocks, with here and there a small opening between them, they are obliged to steer their board through one of these, or, in case of failure, to quit it before they reach the rocks, and, plunging under the wave, make the best of their way back again. This is reckoned very disgraceful, and is also attended with the loss of the board, which I have often seen, with great terror, dashed to pieces at the very moment the islander quitted it. The boldness and address with which we saw them perform these difficult and dangerous manœuvres was altogether astonishing, and is scarcely to be credited.”

These swimmers used often to pass nearly a mile seaward, in order to enjoy the rapid motion of their return as long as possible. Both sexes and all ranks unite in it, and even the very chiefs themselves, who have attained to the corpulency which they so much admire, join in the game of surf-swimming with the meanest of their subjects. Some of the performers attain to a wonderful degree of skill, and, not content with lying on the board, sit, kneel, and even stand on it as they are hurled shoreward by the giant waves. The boards are of various sizes, according to the age and stature of the owner. For adults they are about six feet in length. They are slightly convex on both sides, and are kept very smooth—all surf-swimmers cherishing a pride in the condition of their boards, and taking care to keep them well polished and continually rubbed with cocoa-nut oil. The artist has finely represented on the following page the marvellous conquest of the sea by these islanders.

Such utter mastery of the waves can only be obtained by familiarity with the water from earliest childhood. A Sandwich Island child can swim as soon as it can walk, if not sooner, the mothers taking them from the breast, laying them on the surface of the water and encouraging them to kick about as if lying on their mats ashore. One writer mentions his encounter with an object which he took to be a very large frog, but which turned out to be a Kanaka (*i. e.* Sandwich Island) baby, which was lying on its back and disporting itself quite at its ease.

Indeed, in the mind of a Sandwich Islander there seems to be no connection between the ideas of water and danger, neither does it enter his imagination that any human being is unable to swim. Consequently, there have been several instances where white men have fallen into the water and have been almost drowned, though in the presence of the natives, simply because the idea that any one could be endangered by falling into the water never occurred to them.

They are equally skilful in managing

SURF SWIMMING BY SANDWICH ISLANDERS.

(See page 1092.)

their canoes, and have a curious mode of extracting amusement out of them. A number of men will sometimes paddle a canoe after dressing themselves up in a most ludicrous fashion. They take large empty gourds, and put them over their heads, after cutting holes in them corresponding with the eyes and nose, so that the effect is not at all unlike that of a turnip lantern. To the upper part of the gourd is attached a bunch of slender green twigs, which look at a little distance like a plume of feathers, and to the lower part are suspended a number of narrow strips of cloth, looking like a long beard. Their appearance is shown in illustration No. 2, on the 1089th page.

In every case where these masks were worn, the wearers seemed exceedingly jovial, laughing, shouting, and playing all kinds of antics. It was suggested that these masks were in fact helmets, used to protect the wearers against the stones slung by their adversaries; but the whole demeanor of those who wore them was so completely that of mere masqueraders that the helmet theory seems quite untenable.

Ball play is a favorite sport with the Sandwich Islanders, and is carried on with infinite variations. Like the Tongans, they can play with five balls at once, throwing them from hand to hand, so that four of them are always in the air. The balls are extemporized on the spot, being made of green leaves rolled together, and bound with string.

They have a modification of this game, which very much resembles our cup and ball. They take a wooden stick, or handle, about a foot or eighteen inches long, and through one end of it they pass a peg of hard wood, some three inches in length, so that an inch or more projects on either side. They bring both ends of the peg to a sharp point, and the toy is then ready. Throwing up the ball with the left hand, they catch it on one of the pointed ends of the peg, and then jerk it into the air, and catch it again, reversing the stick so as to catch it upon the other end of the peg. This game they will keep up for a very long time without missing ball once.

Another amusement is very popular. Two players sit opposite each other, one having a stone and a piece of bark cloth, and the other a stick. The first player takes the bark cloth, spreads it on the ground, and with his right hand crumples it up into folds, while with the other he deposits the stone under the cloth. The peculiar character of the cloth causes the folds and wrinkles to remain unaltered, just as would be the case if a piece of thin paper were treated in the same way. The other player carefully examines the cloth, endeavoring to discover the spot under which the stone is concealed, and, when he has made up his mind, strikes at the stone with his

stick. Should he hit it, he wins a large stake from his opponent; but in the very likely event of missing it he forfeits a small stake to the adversary. Great interest is taken in the game by the spectators, and heavy bets are laid on the two players.

They have many athletic amusements, such as bowls, spear throwing, stick darting, and similar sports and occasionally engage in the rougher sport of boxing. As may be seen from Captain Cook's account, this sport is not carried on with such fury and pertinacity as in Tonga, the victory being gained on comparatively easy terms:—

“As we had not yet seen anything of their sports or athletic exercises, the natives, at the request of some of our officers, entertained us this evening with a boxing match. These games were much inferior, as well in point of solemnity and magnificence as in the skill and powers of the combatants, to what we had seen exhibited at the Friendly Islands; yet, as they differed in some particulars it may not be improper to give a short account of them.

“We found a vast concourse of people assembled on a level spot of ground, at a little distance from our tents. A long space was left vacant in the midst of them, at the upper end of which sat the judges, under three standards, from which hung slips of cloth of various colors, the skins of two wild geese, a few small birds, and bunches of feathers.

“When the sports were ready to begin, the signal was given by the judges, and immediately two combatants appeared. They came forward slowly, lifting up their feet very high behind, and drawing their hand along the soles. As they approached, they frequently eyed each other from head to foot in a contemptuous manner, casting several arch looks at the spectators, straining their muscles, and using a variety of affected gestures. Being advanced within reach of each other, they stood with both arms held out straight before their faces, at which part all their blows were aimed. They struck, in what appeared to our eyes an awkward manner, with a full swing of the arm; made no attempt to parry, but eluded their adversary's attack by an inclination of the body or by retreating.

“The battle was quickly decided; for if either of them was knocked down, or even fell by accident, he was considered as vanquished, and the victor expressed his triumph by a variety of gestures, which usually excited, as was intended, a loud laugh among the spectators. He then waited for a second antagonist, and, if again victorious, for a third, till he was at last in his turn defeated.

“A singular rule observed in these combats is, that whilst any two are preparing to fight, a third person may step in, and choose either of them for his antagonist, when the

other is obliged to withdraw. Sometimes three or four followed each other in this manner before the match was settled. When the combat proved longer than usual, or appeared too unequal, one of the chiefs stepped in, and ended it by putting a stick between the combatants. The same good humor was preserved throughout which we before so much admired in the Friendly Islanders. As these games were given at our desire we found it was universally expected that we should have borne our part in them; but our people, though much pressed by the natives, turned a deaf ear to their challenge, remembering full well the blows they got at the Friendly Islands."

A sport which was formerly in great vogue in the Sandwich Islands is sledging, the sloping sides of the mountain ranges being pressed into the service of the players. The game is called *hobua*, and is played in the following manner:—

Each player is furnished with a sledge, made of two narrow runners, varying from seven to eighteen feet in length, three inches deep, and rounded off at one end, just like the steel runner of a skate. These are placed side by side, not parallel, but slightly diverging, the space between the runners being about two inches at the tips, and five inches at the other end. They are connected together with cross-pieces of wood, and mostly covered with strong matting. The native name for the sledge is *papa*. In order to prepare a path on which the sledge can travel, the natives cut a narrow and shallow trench from the top of the mountain to the base, and even carry it for a mile or more on level ground. Before the sport is begun, the trench is laid with grass so as to make the path easier.

When the players have assembled at the top of the mountain, one of them takes the sledge in his hands, holding it in front of him, retreats a few paces, and then runs forward with all his speed, flings himself head foremost into the trench, and glides down it at a terrific pace, resting on his sledge. The rapidity with which a well-managed sledge will dash down the trench, is absolutely fearful, the incline being often at an angle of forty-five degrees. The art of balancing the narrow sledge is a very difficult one, and if a player should chance to lean too much to one side, or should guide his sledge out of the trench, it is scarcely possible for him to escape with his life. The sledge flies to pieces in a moment, the rider is hurled high in the air, and goes rolling down the steep hill, without any means of guiding or stopping himself.

The winner in this game is the player who travels the farthest along the trench, and so fascinating is the sport, that the natives have been known to stake the whole of their property on their skill. They staked their houses, their lands, their fruit trees,

and their crops. Husbands staked their wives and children, and wives staked themselves. And after they had lost all that they had, or were likely to have, they staked their very bones, to be used after death in making fish hooks and arrow heads.

THE religion of the Sandwich Islanders resembles so closely that of the Polynesians that little need be said about it. What worship they have is extorted by fear, and, in accordance with this principle, they make their idols as ugly as possible. There is a certain character about the idols of the Sandwich Islands which, like the carving of New Zealand, cannot be mistaken.

In order to show how completely this character is impressed upon the workmanship, I introduce upon the following page two specimens, one from the British Museum, and the other from my own collection. The former of these, No. 1, is made, like the feather helmets, of wicker-work, and is very much larger than any human head and neck. It is covered with the red and yellow feathers which have already been mentioned, and, from the mere price of the material, must have been, in the days in which it was made, a most costly and precious object.

The eyes are made of mother-of-pearl, and in the centre of each is set a black bead by way of pupil. The enormous teeth which beset the open mouth are simply the fangs, or canine teeth, of dogs. The top of the head is furnished with a crest, just like that of the feather helmet. In spite of the rudeness of form, the image possesses a certain force and vigor, which shows that the native who made it had some modicum of artistic power, which in this case expresses itself in outline, just as in the case of the feather cloak it is exemplified in color.

By way of contrast with this idol, we will now look at another specimen (No. 2, on same page), in which the artist has been obliged to renounce color, and trust entirely to outline; and it cannot be said that he has been unsuccessful. The head and body of this image are cut out of a white and very light wood, and have been covered with bark cloth. This cloth has been stained black, and the native artist has contrived to apply it with such perfection of manipulation that it fits closely to all the inequalities of the carving, and cannot even be seen until specially pointed out.

The head and neck are separate from the trunk, and carved out of a single piece of wood; and even the bold crest and its supporting rays are cut out of the same piece of wood. The teeth of the upper jaw are those of a human being; but those of the lower jaw are simply a row of the palatine teeth of some large fish, and are sixteen in number. They are flanked at each angle of

*Top Human teeth.
Lower, Fish teeth.
Mouth larger.*

(2.) WOODEN IDOL. (See page 1096.)

SANDWICH ISLAND HELMET. (See page 1082.)

(1.) FEATHER IDOL. (See page 1096.)

the mouth by a human tooth. After the teeth have been inserted into the wood, the bark cloth has been applied, and is turned in at the roots of the teeth, so as to represent the gums. The eyes are simply oval pieces of mother-of-pearl.

It is rather remarkable that the strip of cloth which runs over the crest has not been stained black, like that which covers the head, face, and neck, but is nearly white, and of much stronger and coarser texture. The skill with which the maker has applied the cloth to the wood is really admirable. He has evidently soaked it until it was quite soft and tender, and by means of careful stretching and pressing has "coaxed" it over the various irregularities—such as the nose, eyes, and mouth—so that it fits as closely as if it were the real skin.

The neck is small, narrow, and scarcely worthy of the name, being in fact little more than a large peg, by which the head may be attached to the body when needed. In consequence of this arrangement, the position of the head can be altered at will, and the variety of expression gained by so simple an arrangement is scarcely credible.

The body of the idol is made of the same

light wood as the head, and is also covered with the black bark cloth. There is a socket between the shoulders, into which the neck fits loosely. The arms are nothing more than bundles of rushes or reeds, tied with cloth; and each hand is furnished with six fingers, probably as a symbol of extraordinary power. The fingers are merely dogs' teeth, the whiteness of which presents a curious contrast with the black head and body. There are no legs, nor even any indication of legs, the body being little more than a block of wood, with a hole at the top for the insertion of the neck, and a smaller hole at each shoulder for the insertion of the arms.

Whatever artistic power the maker possessed has been given to the head, and it must be acknowledged that he has carried out his idea most vigorously. The long dress worn by this idol is not stained black, like that which covers the face, head, and body, but is white, and without even a pattern.

For this interesting specimen I am indebted to E. Randell, Esq., who has furnished me with many of the objects which have been figured in this work.

CHAPTER CXIII.

THE CAROLINE ARCHIPELAGO.

DRESS — ARCHITECTURE — AMUSEMENTS — WAR.

DISCOVERY AND NAMING OF THE ISLANDS — THEIR GEOGRAPHICAL EXTENT — THE MARSHALL AND GILBERT GROUPS — INHABITANTS OF ROMANZOFF ISLAND — THE ISLAND OF BORNABI AND ITS INHABITANTS — TATTOOING AND HAIR DRESSING — A MAN OF FASHION IN BORNABI — ARCHITECTURE AND ANCIENT RUINS — LOVE OF COAST — THE PELEW ISLANDS — SHIPWRECK OF CAPTAIN WILSON — COMPLEXION AND GENERAL APPEARANCE OF THE NATIVES — THE TATTOO — CURIOUS COMBINATION OF NAKEDNESS AND MODESTY — USE OF THE BETEL-NUT — THE RUPACKS AND THE BONE BRACELET — MODE OF INVESTITURE — SPEAR THROWING — MODE OF CONDUCTING SEA FIGHTS — ARCHITECTURE OF THE PELEW ISLANDS — MANUFACTURE OF DOMESTIC IMPLEMENTS — DANCE OF THE WARRIORS — IDEA OF RELIGION — A FUNERAL IN THE PELEW ISLANDS — STORY OF LEE BOO.

PASSING in a south-westerly direction from the Sandwich Islands we come to a very large group called the Caroline Archipelago. These islands were discovered — as far as is known — in 1526, by the Portuguese, who in those days were the most enterprising navigators in the world. About fifty years afterward they were visited by Drake, but they did not receive the name by which they are known until more than a hundred years after Drake's voyage, when they were named by the Spanish the Carolines, in honor of Charles the Second, the then king of Spain.

These islands extend over a very considerable geographical range, a space of some fifty degrees intervening between the most easterly and westerly of them. Owing to the extensive range of these islands, there is considerable difference between the manners and customs of these natives, and even between their form and complexion. We will therefore take as examples some of the easterly, central, and western islands.

THE most easterly of the group are those which are called the Marshall and Gilbert Islands, the former being those of the north and the latter those of the south. They are sometimes divided into the Eastern and Western Islands, the former being the Radick and the latter the Balick chain, each group comprising about fifteen or sixteen islands.

These islands are all low in the water, being mostly of coralline structure, so that they are not visible from any great distance. In consequence of their lowness, they seem to have escaped the observation of voyagers until 1788, when they were discovered by Marshall and Gilbert, after whom they were named. As is usual in coral islands, the soil is but shallow, having been formed by the decomposition of vegetable matter thrown on the coral reefs by the waves. The vegetation is therefore scanty, and is mostly confined to bananas, cocoa-nut trees, bread-fruit — all of which thrive best on a low situation near water.

As a sample of the Marshall Islanders, I give a portrait of a man and woman of Romanzoff Island, on the next page. They are a rather fine race, taller than the generality of the Caroline Islanders, and possess tolerably good features. They use the tattoo with some profusion, both sexes appearing to be equally addicted to it. They are better clothed than many Polynesians, the men wearing a short mat round their waists, and the women being clad in a very fine and neatly-made mat, falling nearly to the feet. The hair is long, and naturally curling, and is worn long by both sexes. Earrings are in great request, and some of them, as may be seen by reference to the illustration, are enormously large.

From the structure of the island, it is evident that the present inhabitants are not

(1.) ROMANZOFF ISLANDERS. (See page 1100.)

(2.) DYAK WARRIOR AND DUSUM. (See page 1112.)

aborigines, but came from other islands at no very remote period. They have kept up the nautical spirit to which they owe their presence on the island, and make long voyages from one island to another. Their canoes are well made, and are built of bread-fruit wood.

BORNABI is one of the largest and most important of these islands, being about seventy miles in circumference, and having a sufficient variety of soil to be very fertile. Instead of being as low-lying as some of these islands, it is of volcanic origin, shooting up to a considerable height in the middle, and surrounded by flat coral reefs.

In consequence of this structure, it affords excellent harborage, and has become a great place of resort for whaling vessels. Like some parts of America within the same zone, and having a somewhat similar contour, the island is a very wet one, so that the combined heat and moisture produce a wonderful fertility of vegetation. Even on the higher parts of the island, the fresh water nourishes various trees and shrubs, while on the coast the mangrove, which delights in salt water, absolutely grows into the sea, and, by its interlacing roots and branches forms a barrier which cannot be penetrated except through the apertures made by the mouths of rivers and creeks.

The inhabitants are of a fair average stature, the men being about five feet eight inches high, while the women are much shorter. They are, however, well proportioned, and not stumpy or clumsy, as is too often the case with the women of uncivilized races.

Like the Romanzoff Islanders, they tattoo themselves liberally, and both sexes wear their black hair very long, keeping it well oiled and carefully dressed, and, in the case of people of rank, adorning it with wreaths of flowers. They have the same odd passion for turmeric which is found in the Polynesian races generally, anointing themselves profusely with it, and thereby converting their naturally pleasing copper color into a repulsive yellow.

The men dress themselves very carefully, a Bornabi man of fashion spending a vast amount of time on his costume. He must not exhibit a vestige of hair on his face, but must painfully pluck out each individual hair by means of forceps made of a couple of cockle-shells, or a piece of tortoise-shell, bent double. He must wear at least six aprons, one over the other. These aprons are made of strips of the cocoa-nut leaf bleached white and about two feet in length. He must have round his waist a belt or sash made of banana fibre, and dyed scarlet and

yellow. He must have his necklaces, his head-band, and his scarlet tassels in his ears; and he finishes off his costume by a sort of parasol or sunshade made of leaves, which he ties round his head so as to preserve the face from the sun.

This elaborate toilet must be made several times daily, as every native bathes, oils, and paints his skin yellow at least three times every day. The dress of the women bears some resemblance to that of the men, except that, in lieu of the series of apron fringes they wear bark cloth fastened round the waist and reaching to the knee.

In architecture the people of Bornabi are superior to the generality of Polynesians. Like the Marquesans, they begin by building a platform of stones, some four or five feet in height, and upon this they erect the framework of the edifice. The spaces between the upright timbers are filled in with wicker-work, in which are left certain apertures that answer the purpose of windows. The floor is covered with the same kind of wicker-work, except a small space in the centre, in which the fireplace is made. The roof is thatched neatly with pandanus leaves. In all these particulars there is little distinction between the architecture of Bornabi and that of many other islands. The chief point of difference lies, however, in the fact that the timbers are squared, and that, instead of being merely lashed together, they are fastened by tenon and mortise.

It seems probable that the superiority of their architecture, more especially in the squaring of beams and the use of the mortise, is due not so much to themselves as to the remembrance of buildings erected by white men several centuries ago. Near one of the harbors are some ruined buildings, which are evidently not of savage architecture. They are built of cut stones, which have been imported from some other country, and are arranged in streets, looking as if they had formed a portion of a fortification. It has been conjectured that these buildings were the work of the Spanish buccaneers, who used, some centuries ago, to range these seas, and would have found such a harbor and fort invaluable to them.

As far as is known, the inhabitants of Bornabi keep almost entirely to the coast, and never visit the interior. It is certain that the cultivated grounds only extend for a very little distance inland, and, as all the energy of these islanders naturally takes a seaward direction, it is very probable that the natives speak truth when they say that they have never even visited the centre of their island.

THE PELEW ISLANDS.

THE westernmost group of the Carolines is known by the name of the Pelew or Pallo Islands. They were discovered, in 1543, by Villabolo, but have been made known to us principally by means of Captain H. Wilson, who was wrecked there in 1783. The group consists of about twenty small islands, which are surrounded by a reef.

The inhabitants are of a dark copper color, well made, tall, and remarkable for their stately gait. They employ the tattoo in rather a curious manner, pricking the patterns thickly on their legs from the ankles to a few inches above the knees, so that they look as if their legs were darker in color than the rest of their bodies. They are cleanly in their habits, bathing frequently, and rubbing themselves with cocoa-nut oil, so as to give a soft and glossy appearance to the skin.

The hair of the head is fine and black, and is worn long by both sexes, being rolled up in a peculiar fashion close to the back of the head. That of the face and chin is mostly removed, being plucked out by tweezers, only a few men, remarkable for the strength and thickness of their beards, allowing them to grow. The men wear no clothing, not even the king himself having the least vestige of raiment, the tattoo being supposed to answer the purpose of dress.

So unacquainted with real clothing were they when Captain Wilson visited them, that they were utterly perplexed at the garments of the white men, lifting up the flaps of the coats, pinching the sleeves, and then comparing them with their own naked limbs, evidently fancying that these mysterious objects were the skin peculiar to the white man. They also took the blue veins on the seamen's wrists for lines of tattooing, and asked to be allowed to see the whole of the arm, in order to find out whether the blue lines were continued beyond the wrist.

In spite, however, of the absence of dress the deportment of the sexes toward each other is perfectly modest. For example, the men and women will not bathe at the same spot, nor even go near a bathing-place of the opposite sex unless it be deserted. If a man is forced to pass near a women's bathing-place, he is obliged, when he comes within a stipulated distance, to give a loud shout; and, if it be answered by a female voice, he must either pass by a circuitous route, or turn back and wait until the women have left the spot.

Their features are tolerably good, the nose rather prominent, and the mouth moderately large. They would look a tolerably handsome people but for their custom of chewing the betel-nut, which stains the mouth red and the teeth black. The chiefs and all the principal men are so devoted to

the betel that they always carry with them a little basket containing the nuts, and a small bamboo vessel in which they keep the quicklime which is mixed with the betel when chewed.

Although they care nothing for dress, and comparatively little for ornament, the very great chiefs wear one decoration which is prized by them much as is the Garter in England, or the Golden Fleece in Spain. This is a bone bracelet, worn on the left wrist and denoting the very highest rank next to that of the king himself. Those who are privileged to wear it are called Rupacks, and, as will presently be seen, the rank is not necessarily hereditary, but is conferred at the pleasure of the king.

It seems strange to us that distinctions of rank should be thus sharply defined among a people like the Pelew Islanders, and that "naked savages" should have their various gradations of social position. That a definite scale of rank should exist at all is an evidence of some civilization, and that so complete a system should be found among these islanders appears a perfect enigma to those who have been accustomed to associate clothing and civilization as inseparable conditions. Yet here we have the singular fact that there is a distinct division of ranks into king, nobles, gentry, and peasantry; and that, although these ranks are perfectly well defined and acknowledged, not a man, from the almost despotic king to the lowest subject, wears the slightest article of clothing.

Not only are these distinctions jealously observed, but we find also that the nobles are divided into several ranks, as is the case in civilized lands, and that the highest rank is denoted by a symbolical badge. This badge is conferred only by the sovereign himself, and the investiture with the Rupack's-bone is conducted with a ceremonious solemnity that denotes the estimation in which it is held. So deeply are the Rupacks attached to this symbol of their rank, that a rebel Rupack, who had made war against the king, and was taken alive, resisted every attempt to deprive him of his bracelet, and did not part with it until he had sacrificed his life in its defence. In shape the bone bears a curious resemblance to the open jaws of a skate, and is probably made on that model.

The mode of investiture is a very ceremonious one, and is illustrated on the following page. The Rupacks are assembled together in a sort of chapter of their order, and the Rupack elect is seated at a little distance from them. The king, or a Rupack appointed by him, then takes the bracelet, and directs the candidate to throw a stone as far as he can. This is done in order to ascer-

(1.) INVESTITURE OF THE RUPACK. (See page 1104.)

(2.) THE WARRIORS' DANCE. (See page 1108.)

tain which hand he habitually uses, so that if he be a right-handed man the bracelet goes on the left wrist, and if a left-handed man on the right wrist.

A string is then tied to each finger of the hand; the strings are passed through the bracelet, which, together with the hand, is plentifully anointed with cocoa-nut oil. The principal Rupack then places himself behind the candidate, and holds him firmly by the shoulders, while another hauls at the strings. The king, in the meantime, squeezes together the fingers of the hand, and by degrees draws the bracelet firmly on the wrist. He then makes a speech to the new Rupack, telling him to polish the bracelet daily, and keep it bright; never to suffer its honor to be tarnished, and never to part from it but with his life.

Captain Wilson, who was himself invested with the Rupack's bone, writes thus of the ceremony and its object:—"This mark of distinction is given and received in these regions as a reward of valor and fidelity, and held out as the prize of merit.

"In this light such public honors were originally considered, and still ought to be so, in every state, from Pelew to Britain. And while they continue to be thus regarded they will operate on the human passions—excite emulation, inspire courage, promote virtue, and challenge respect. The decoration, indeed, derives all its splendor from the combined ideas of the mind whilst viewing it; and the imagination is equally impressed with the same sentiment, whether the badge of honor be a strip of velvet tied round the knee, a tuft of riband and a cross dangling at the button-hole, a star embroidered on the coat, or a *bone* upon the arm."

He might have added that the intrinsic value of the decoration bears no comparison with the honor which it denotes, and that the bone of the naked Pelew Islander, the laurel or parsley crown of the ancient warrior, or the Victoria Cross of the modern hero, are alike valueless and priceless. It is remarkable that the king does not wear the bone, so that he has no external sign to distinguish him from the meanest peasant.

The Pelew Islanders are not a very warlike people, and their weapons are, therefore, simple and few. They have two kinds of spears, one used as a missile, and the other as a pike. The missile spear is thrown by a very remarkable instrument, reminding the observer of the Australian *wumme-rah*, or throw-stick.

It consists of a piece of wood about two feet in length, and having a notch at one end. When the warrior wishes to throw his spear, he places the butt in the notch of the throwing-stick, and with his left hand bends the elastic bamboo shaft until it is nearly doubled. The hold of the left hand is then loosed, and the spear projects itself to a con-

siderable distance by means of its own elasticity. To an European nothing can be more awkward than this mode of throwing the spear; but the Pelew Islanders can send the weapon to a considerable distance, and aim it well besides.

Even without the aid of the throwing-stick, they are no mean adepts at hurling the spear. When Lee Boo, the son of the king, was at Canton, some gentlemen who were skilled in spear throwing asked him to exhibit the manner in which his own people managed the weapon. He took the spear, and, not thinking that it was to be thrown, merely quivered and poised it according to the usual preliminaries. He was then requested to throw it at a gauze cage, with a bird painted on it. The cage was at such a distance that the gentlemen could seldom strike it. Lee Boo, however, took up the spear carelessly, poised it for a moment, hurled it, and not only hit the cage, but struck the bird through the head.

The Rupacks mostly carry swords and daggers. The former are made of a very heavy wood, and nearly three feet in length. They are inlaid with pieces of white shell, and are strong and heavy enough to kill a man with a single blow. The daggers are made of the tail-bone of the sting-ray, and, when not in use, are carried in a sheath made of a single joint of bamboo, just as is the case with the small knives of Borneo.

Land battles are seldom fought in these islands, the natives trusting chiefly to their canoes, which are of large size and well built. Their hulls are cut out of tree trunks, and then are carved, painted, and inlaid with the patient care which distinguishes savage art. When the king goes out in state, the canoes are further adorned with bunches of shells, strung on cords and hung to the bows and stern-posts. The out-rigger is used, and the sails are of the "latine" form. Despite, however, of the care bestowed upon their vessels, the Pelew Islanders are not good sailors, and seldom venture outside the chain of reefs which encircle their group of islands. Even within it when the sea ran at all high, they would not venture into their canoes.

In consequence of their mode of fighting, the capture of an enemy's canoe is thought of much more consequence than the slaughter of his soldiers, and is looked upon much in the same light as we consider the capture of an enemy's gun or flag. Therefore when one party finds that the battle is going against them, they turn their canoes landward, and drive them ashore with all their might, and, if possible, drag them so high on the beach that they cannot be floated without exposing the invaders to almost certain death.

The principal tool used in making the canoe is the *adze*, or axe. In form the weapon is almost identical with the Polyne-

sian adzes which have been already described in this work. The blade is made of the thick and strong shell of the giant clam, and the most curious point of the instrument is that the head revolves in a groove, so that it can be used as an adze or an axe at pleasure. The Dyak boat builder has a precisely similar instrument, as will be seen in the course of a few pages.

Their smaller tools and implements—such as stone knives, comb, and string—they carry in the basket which holds their betel; and as they have no dress, and consequently no pockets, a man never walks to any distance from his home without carrying the basket with him.

The architecture of the Pelew Islanders is very good. The houses are raised about three feet from the ground by means of stone posts, upon which are laid the beams which support the flooring and side-posts. The walls are made of thick matting, which extends from post to post, and the floors are generally of plank, having an inch or so of space between the boards. Sometimes they are made of split bamboos, which become polished and very slippery by the constant tread of naked feet.

Each house has in the centre its fireplace, sunk lower than the flooring, and formed of stones and earth. The fire is kept burning all night, not for the purpose of warmth, but that the smoke may fill the house, and drive away mosquitoes. When the house is a very large one, and employed for the general use, there are two fireplaces, one at each end. Along the sides of the house are arranged certain apertures which answer equally the purposes of windows or doors, and are furnished with sliding shutters, by which they can be closed at pleasure. Each of these apertures is furnished with stepping stones, by means of which the inhabitants can enter or leave the house without having to clamber from the ground to the raised floor. The large houses are employed for public uses, the councils being held in front of them, or the people assembling in them for social talk, in which the women bear their full share. Some of these houses are from sixty to eighty feet in length.

Being a cleanly people, the Pelew Islanders keep their houses neatly swept, the broom being a bundle of cocoa-nut husks tied together. The vessels which contain fresh water are simply joints of the bamboo, the open ends of which are furnished with a sort of spout or lip, by means of which the water can be poured without danger of being spilt.

The cooking vessels are made of earthenware, and are mostly of an oval shape. They are not, however, very good potters, their pots and pans being rather fragile, and so badly burnt that the natives dare not put them at once on the fire, but set them first at a little distance, and, as they become

warmer, bring them nearer, turning them continually, so as to heat each part equally.

When Captain Wilson was at the Pelew Islands, the king had a vessel of which he was very proud. It was carved out of a block of wood, plentifully inlaid with pieces of white shell, and, when the cover was upon it, formed a tolerably fair representation of a bird. This vessel held about nine gallons, and on occasions of great ceremony, was brought out and filled with sweet drink for the use of the king and his Rupaeks.

Of the amusements of the Pelew Islanders Captain Wilson says little, and gives but a brief description of the very odd dance in which they delight. This description will be better understood by reference to the illustration on the 1105th page. "In the evening our people were entertained with a dance of the warriors, who were just then returned, which was performed in the following manner:—

"The dancers have a quantity of plantain leaves brought to them, which they split and shiver into the form of ribands. These they twine and fix round their heads, wrists, waists, ankles, and knees; and the leaves being of a yellowish hue, so prepared, have not an inelegant effect when applied to their dark copper skin. They make also bunches or tassels of the same, which they hold in their hands.

"When drawn out, they form themselves into circles of two or three deep, one within another. In general, an elderly man amongst them begins in a very solemn tone something like a song, or long sentence—for our countrymen could not discriminate which it was—and when he comes to a pause, or what we should call the end of a stanza, a chorus is struck up, and the dancers all join in concert, still continuing their figure.

"Their dancing does not so much consist in capering or agility as in a particular method they have of balancing themselves, and this frequently very low sideways, singing together all the while; during which they will flatten their circles, so as to bring themselves face to face to each other, lifting up the tassels they hold in their hands, and giving them a clashing or tremulous motion. After this there will be a sudden pause, and an exclamation from every one of 'Weel!' Then a new sentence or stanza is repeated, and danced to as before, and the same ceremony continued till every man who is engaged in the dance has in his turn had his repetition and chorus."

As far as was ascertained by Captain Wilson, the Pelew Islanders have some notions of religion, and certainly believed in a life after death. They had several superstitions, one of which was that the wood of a certain tree was unlucky, and always brought harm wherever it was used. When Captain

Wilson was building his new vessel, he used some planks of this tree, much to the dismay of the king, Abba Thulle, who begged him to remove them. Captain Wilson explained to him that as in his own country any kind of suitable wood was employed for ship building without producing disastrous results, the same impunity was to be expected in the Pelew Islands. As it happened, shortly after the obnoxious planks had been inserted, one of the carpenters fell from the side of the vessel, and hurt himself severely, thus confirming the natives in their belief.

Their funeral ceremonies are very short and simple, and even in one instance witnessed by Captain Wilson, when the son of the principal chief was buried, there was scarcely any ceremony. The corpse was wrapped up in mats, and borne by four men on a bier, no men except the actual bearers attending. A number of women followed the bier, and poured out loud lamentations as they walked. When they arrived at the place of burial, the body was laid in the grave, and the earth immediately filled in by the four bearers, while the women knelt round, and renewed their lamentations, marking as if they would tear up the body from the ground.

Next day, however, Raa Kook, the father of the deceased, went to the burial-place, and performed a curious ceremony. He took two *old* cocoa-nuts (young nuts being always gathered for consumption) and some red ochre, with which he drew transverse stripes across the nuts. He then laid the painted nuts by his side, and repeated, in an undertone, some words which were supposed to be an incantation or prayer of some

kind. A bundle of betel leaves was treated in the same way, and the whole were then delivered to an old woman, who went with them toward the grave; but the precise termination of the ceremony was not ascertained.

ON page 1107 mention was made of Lee Boo. As this young man was the first Pelew Islander who ever visited England, and was besides a very remarkable character, I will conclude this account with a short memoir of him,

He was the second son of the king, Abba Thulle, who was no common man, and well deserving of the power which he held. He possessed great energy, wonderful liberality of mind, and an innate nobility of disposition. The visit of the white men taught him their infinite superiority, and when Captain Wilson had built his new ship, and was about to start, Abba Thulle begged him to take Lee Boo to England, to have him instructed in the arts of civilization, and to send him back again so that he might be the teacher of his future people. The request was granted, and Lee Boo accompanied Captain Wilson to England, where he lived for five months, winning the esteem and affection of all whom he met, by his intelligent, modest, and affectionate nature. Unfortunately for his father's hopes, he was attacked with small-pox, of which he died, his last wish being that all presents that been given him should be sent to his father. He died on Dec. 27, 1784, and was buried in Rotherhithe Church, where a tomb was erected to his memory by the India Company.

CHAPTER CXIV.

BORNEO.

THE DYAKS, THEIR APPEARANCE AND DRESS.

SUPPOSED ORIGIN OF THE DYAKS—NUMBER OF TRIBES—THE SEA AND LAND DYAKS—GENERAL APPEARANCE OF THE NATIVES—TATTOOING MOST PREVALENT AMONG THE LEAST CIVILIZED TRIBES—DRESS AND ORNAMENT—EXTRAORDINARY EARRINGS—FILING AND BLACKENING THE TEETH—A DYAK WARRIOR IN FULL DRESS—A DUSUM WARRIOR IN ORDINARY COSTUME—THE ILLINOAN PIRATES, THEIR ARMAMENTS AND FEROCITY—A SAGHAI DYAK AND HIS STRANGE HEADDRESS—STRENGTH AND ACTIVITY OF THE DYAKS—"BATANG" WALKING—AN OBLIGING DYAK—THEIR ABILITY TO PENETRATE JUNGLES—THE CHAWAT AND SARONG—A DYAK DANDY—DRESS OF THE WOMEN—THE BEDANG AND SLEEVELESS JACKET—THE BEAUTIFUL HAIR OF DYAK WOMEN—THE METALLIC BODICES—A SAIBAS GIRL IN FULL DRESS—DYAK BELLS—TREATMENT OF THE WOMEN.

WITH the exception of Australia, which may take rank as a continent, BORNEO is the largest island in the world. It is situated in the tropics, the equator passing nearly through the centre of it, and forms the centre of the Indian Archipelago.

Until late years, scarcely anything was known of Borneo; but since the late Sir James Brooke accomplished his wonderful series of exploits against the piratical tribes that infested the coast for more than a thousand miles, and destroyed all commerce, the country has been tolerably explored, and the manners and customs of its inhabitants investigated. Following the plan on which this work has been formed, we will only concern ourselves about the natives of Borneo who live to a degree the life of savages, and only possess that amount of civilization which is compatible with savage existence.

PUTTING aside the Malay Mahometans who have settled in Borneo, we may roughly divide the native tribes into the Land and Sea Dyaks. The former of these divisions seldom go to sea, either for piracy or trade, and in this respect are very different from the Sea Dyaks, whose existence is essentially a naval one.

Mr. Brooke believes that the Land Dyaks have emigrated from a country in which they would be brought in contact with Hindooism, inasmuch as they possess sundry relics of that religion. "The remains of

Hindooism found among them, such as stone-shaped bulls and other stone utensils, and the refusal among them to touch the flesh of cattle or deer—and so particular are they that they will fine a man for even spilling the blood of these animals on their premises; the name of their deity being Juwata—these testifying points support a fair conjecture that they must have gained a fair notion of Hindoo worship from people coming into the Kappas River from the island of Java, which is only distant from some of the outstretching points of Borneo two hundred miles, and fair winds generally prevail between."

In confirmation of this opinion, Mr. Brooke mentions that the expression, "in the days of the Hindoos," was formerly employed when any ancient date was signified. There are about nine or ten branches of the Land Dyaks, each of which branches is divided into a considerable number of tribes. It is impossible to give the names and description of the individual tribes on account of their fluctuating character. The people are continually shifting their place in search of new lands for cultivation, and the result is that they quarrel with each other, fight, are dispersed, and thus form new tribes in the spots on which they settle.

It is thought that their number does not exceed forty thousand, many tribes of which have never been near the sea.

Next come the Sea Dyaks, a fairer, a finer,

and a more interesting people. They are about three times as numerous as the Land Dyaks, and are at the present day much what the old sea-kings were in days gone by. They are essentially a nation of rovers, living by piracy, and carrying out to the fullest extent the abominable practice of head-hunting, of which we shall see something in the course of a few pages.

They are taller than the Land Dyaks, who seldom exceed five feet six inches in height, and much fairer in complexion. The skin of the Land Dyak is brown, whereas that of the Sea Dyak is many shades lighter, and has been compared to the color of a new saddle—a hue which admirably suits the well-developed forms of these people. They are very proud of their complexion, and the women are fond of an excuse for throwing off the jackets which they wear, in order to exhibit their smooth satiny skins, polished and shining as if of new bronze.

Their various customs in peace and war will be described in their proper places, and we will content ourselves at present with their appearance and dress.

The Dyaks, as a rule, are nearly beardless, and have a cast of countenance which might almost be called effeminate. Occasionally, however, a man does possess a few hairs on his upper lip, of which he is inordinately proud, and one or two instances have been known where a man has possessed a well-developed beard.

Tattooing is practised among many of the tribes, and prevails in inverse ratio to their civilization, those who are furthest from civilization being most profusely tattooed, and those who are brought in contact with it having almost entirely abandoned the practice. The men of some tribes are nearly covered with tattooed patterns, while those of other tribes have stars on their breasts and armlets and bracelets on their legs and arms. The Kanowit Dyaks, who belong to the great Malanau tribe, are tattooed from the breast to the knees with a pattern that has the effect of scale armor, and many of them tattoo their chins and chests so as to look as if they had real beards and moustaches. The tattoo of the women is often more elaborate than that of the men, as we shall presently see.

It is worthy of notice that, as a rule, the Sea Dyaks do not use the tattoo. They have an idea that it is a sign of cowardice, and are very much surprised that English sailors, whose courage they can but respect, will allow themselves to be tattooed with the anchors, true lovers' knots, ships in full sail, entwined initials, and other figures with which a British sailor loves to disfigure himself. In consequence of this feeling many verbal skirmishes have been waged between the Sea Dyaks and the English seamen. The tribes among whom tattooing reaches its greatest development are mostly those

of the Malaccan division, such as the Kanowits; who are mightily despised by the regular Land and Sea Dyaks, and are only tolerated by them as being the means of affording a constant supply of heads.

The Dyaks are exceedingly fertile in their invention of ear ornaments. Most savages content themselves with making one hole in the lobe of the ear, and often enlarge it so that a man's hand could be passed through the orifice. But the Dyaks go much further in their ideas of adornment.

In common with other savages, they make an enormous hole in the lobe of the ear, increase it by inserting a series of gradually enlarged plugs, and drag it down as far as the shoulder by hanging leaden weights to it. But they also bore a series of holes all round the edge of the ear, and fill them with various ornaments. The favorite plan is, to have a series of brass rings, and to insert them in the holes of the ear, the smallest being at the top, and the lowest, which is large enough to be a bracelet, at the bottom. This decoration prevails chiefly among the Sea Dyaks, and there is a sort of proverb which warns the hearer to beware of a man who wears many earrings.

Often the Dyaks do not content themselves with wearing rings in their ears, but fill the apertures with such a miscellany of objects that they have been described as "châtelaines," rather than earrings. One young man, the son of a chief, wore only one large ring in each ear, but from this ring depended a number of brass chains, to which were suspended various ornaments. To one ear were thus hung two boar's tusks, one alligator's tooth, part of a hornbill's beak, three small brass rings, and two little bells.

Many of the men wear one large earring in the lobe, and bore a hole in the top of the ear, through which is passed a canine tooth of the tiger-cat.

These ornaments are only worn when the Dyak puts on his dress of ceremony, and at other times the holes in the ears are kept from closing by plugs of wood. And, as the effect of the brass is always to cause ulcerating sores, the ordinary appearance of a Dyak's ears is not very pleasing. Some of them have a curious fashion of boring one hole at the top of the ear and another at the bottom, and tying to it a brass plate, to which are suspended the jingling ornaments of which these savages are so fond.

The Dyaks are so fully impressed with the idea that nature is meant to be improved by art, that they cannot even allow their teeth to retain their natural shape and color. As a general rule, the men file their front teeth into sharp points, while others improve upon nature still farther by scooping out the front face of each tooth and rendering it concave.

Having thus rendered the shape of the

tooth as unlike its natural form as possible, the next process is evidently to change the color as completely as the shape, and to turn them from white to black. The habit of betel-eating has much to do with the darkening of the teeth, but besides, there is a mode by which the Dyaks deliberately stain their teeth black. The method by which the dye is produced and applied is well told by Mr. Boyle, in his "Adventures among the Dyaks":—

"We made inquiries about the means employed for blackening the teeth, a custom which is universal in the far East. The old medicine man was finally persuaded to show us the process, and very curious it appeared.

"He produced from his stores a piece of dry wood of the kind called sinka: this was set on fire, and held over the blade of a parang (or sword), on which a few drops of water had been poured. As the stick blazed, a black sap oozed from it, and dropped upon the metal, where it mingled with the water, and in a few moments formed a pool of thick, jetty liquid. With this the teeth are stained in childhood, and one application, we are told, will suffice to preserve them black for ever, nor are there any means of removing the color.

"The process seems peculiar, because the wood from which exuded the sap appears to be as dry as dust, and because the dye will not affect any substance except the teeth, not even bone or horn. This is the more curious since some of the Malays file the enamel carefully from their teeth before applying the sinka. Many, indeed, file them to a point as sharp as a needle, as do some of the Dyak tribes." The reader will remember that several of the West African tribes file their teeth in like manner.

Illustration No. 2, on the 1101st page, represents two Dyak warriors, one in full costume, and the other a Dusum Dyak in ordinary dress. The former of these men carries in his right hand the sumpitan, with its spear head, and the other rests on his wooden shield covered with tufts of human hair. His parang-ihlang or war sword is on his left side, with its tufts of human hair depending from the handle. His ankles, legs, and arms are covered with multitudes of brass rings, he wears a sort of jacket formed from the skin of the orang-outan, and on his head is a kind of coronal made from the feathers of the Argus pheasant. This figure is taken from a photograph.

The next figure represents a man in ordinary costume. He belongs to the tribe of Dusums, who live on the northern coast of Borneo, and who wear less clothing than any of the tribes of the island, their whole dress consisting of the chawat and a number of large metal rings round their necks and hips. The Dusum warriors wear their hair long, merely bound with a piece of

cotton cloth, and their spears are as simple as their clothing, being nothing more than a metal head lashed to a shaft of bamboo.

In order to show at a glance the appearance of various tribes of Borneans, two more Dyaks are represented in the engraving No. 1 on the following page. The left-hand figure represents an Illinoan pirate. These men are found at Tampassook or Tampasuk as the name is sometimes spelt, a place on the north-western coast of Borneo, not very much above the island of Labuan.

The Illinoans possess many large and formidable war boats, which are armed in the bows with a very long gun, and have, after the fashion of Bornean boats, an upper deck, which serves as a platform for the combatants and a shelter for the rowers, who sit beneath. There is a small cabin astern for the captain, about the size of a dog kennel, but the boats have no other sleeping accommodation.

The paddles with which the rowers propel the vessel are shaped rather curiously, looking at a distance like mere sticks with flat discs of wood fastened to their ends. The boats are steered by an oar rudder at the starboard side of the stern, and each is furnished with a mast and huge sail, which can be raised in a few minutes, and struck in almost as many seconds. Although the Illinoans are wealthy tribes, and possess quantities of fire-arms, they are rather afraid to use these weapons, and trust in preference to the spear and parang.

The Illinoans were instrumental in the murder of two native chiefs who were friendly to the English, and who had been suspected of aiding the cession of Labuan. One of them, named Bud-ruddeen, a man of celebrity as a warrior, did not fall unavenged. When the enemy approached, he retired to his house, together with his favorite wife and his sister, neither of whom would leave him. By the aid of his followers, he fought desperately to the very last, until nearly all his men were killed, and he himself was dangerously wounded.

He then retired with his wife and sister into an inner chamber, while the enemy crowded into the house in search of him, and then, firing his pistol into a barrel of gunpowder which he had placed there in readiness, blew to pieces himself, his two relatives, and his enemies.

The other figure represents a Saghai Dyak.

This tribe lives on the south-eastern coast of Borneo, and is remarkable for the superb costumes of the men, who have about them an air of barbaric splendor, which they are exceedingly fond of displaying. Wearing, in common with all Dyaks, the chawat or waist cloth, they take a pride in adorning themselves with short tunics made of tiger or leopard skin, or rich and embroidered

(1.) ILLINOAN PIRAJTE AND SAGHAI DYAK. (See page 1112.)

(2.) DYAK WOMEN. (See page 1116.)

cloth; while on their heads they wear magnificent caps made of monkey-skin, and decorated with the beautiful feathers of the Argus pheasant, two of the largest feathers being placed so that one droops over each ear. All these Dyaks have a very singular profile, in consequence of their habit of filing the teeth and so reducing their bulk, those who have concave teeth presenting the most curious outline.

Comparatively slight and feeble as the Dyaks look by the side of the stalwart and muscular European, their strength is really wonderful, and enables them to perform tasks which the powerful white man could not by any possibility achieve. On a journey, when an European has fallen from sheer fatigue, a Dyak has taken the burden with which the fallen man was laden, and added it to his own, without seeming to display any particular sense of having increased his own labor; and when the stranger, in spite of the relief, has lain down in absolute inability to move, a little wiry Dyak has picked him up, put him on his back, and proceeded on his journey with perfect ease.

The Dyaks are in the habit of crossing the swamps with which Borneo abounds by means of primitive bridges, called batangs. These are the very simplest form in which the principle of the bridge can be carried out. If the reader wishes to obtain a correct idea of a batang, he can do so easily enough. Two bamboo poles are driven into the ground so as to cross one another near the top, like an X with the lower limbs much developed. They are then lashed together at the intersection, just like the supports between which a modern rope dancer stretches his cord. At about thirty feet distance, another pair of poles are fixed in a similar way, and a horizontal bamboo laid upon them.

In fact, the whole apparatus looks just like a rope dancer's apparatus, a bamboo taking the place of the rope. Beyond the second supports others are added and connected by horizontal bamboos as far as the marsh extends; and so fond are the natives of these very primitive bridges that they will make them a mile or more in length, and extend them over gorges of terrible depth.

To tread these extraordinary bridges is a task that would tax the powers of a professional rope dancer, and yet a Dyak has been known to take a heavy white man on his back, and carry him a mile or more over these slippery batangs, when, in many places, a false step would be certain destruction for both. He does not seem at all fatigued by this extraordinary feat of muscular power, but rather has a sort of boyish exultation in his strength, and a decided delight that he is able at all events in one respect to prove himself the superior of the white man, whom he regards with the most

profound respect as a being of supernatural wisdom and power.

The Dyaks are able, in some astonishing manner, to penetrate with comparative ease through jungles which are absolutely impenetrable to Europeans. One of these men, while on the march with some English soldiers, exhibited his strength in a very unexpected manner. The path was a terrible one, all up and down steep and slippery hills, so that the Chinese coolies who accompanied the party first threw away their rice, and lastly sat down and wept like children. The English sergeant, a veteran, accustomed to hard marching both in China and India, broke down at the first hill, and declared his inability to move another step under the load which he carried. Mr. Brooke, who was in command of the party, asked one of the Dyaks to carry the sergeant's burden, and promised him an additional piece of tobacco.

The man was delighted with the proposal, and accepted it. He was already carrying food for three weeks, his whole store of clothes, one twelve-pound shot, two twelve-pound cartridges, a double-barrelled gun, a hundred rounds of ball cartridge, and his own heavy sword and spear. Such a load as this; which would be almost too great even for a man walking on good roads, seemed a mere trifle to the agile Dyak, who went lightly and easily up and down paths which the foreigners could hardly traverse even without having to carry anything except their own weight.

So little, indeed, was he incommoded, that he strapped the whole of the sergeant's kit on his back, and walked off as easily as if the whole load were but a feather weight. No one who has not actually traversed those paths can form an idea of the miseries attending the journey. The paths themselves are bad enough, but, in addition to the terribly severe labor of walking, the traveller has to endure mosquitoes, sand-flies, intense heat at mid-day, and intense cold at night, thirst, wet, and every imaginable discomfort.

Yet the native seems quite easy in the journey, and gets over the ground in a manner that is absolutely exasperating to the Europeans who accompany him. He is able to push his way through prickly thickets and morasses in a way which seems almost impenetrable. Indeed, he says himself that it is impenetrable, and that he achieves these feats by means of certain charms which he carries about with him. On one occasion it happened that at the end of a hard five hours' journey, a number of sketching materials and other necessities had been forgotten, and a Dyak was sent to the boats to fetch them, being promised a pocket-knife for his trouble. He started about two P.M. and arrived with the parcels before sunset, having thus, in addition

to his first journey with the travellers, and the heavy parcels which he had to carry, twice traversed the distance which had occupied them five hours in the transit.

When questioned about the manner in which he performed the journey, he said that it was owing to the virtues of a charm which he carried, and which he produced. It was a small misshapen horn, which he said that he had cut from the head of an antelope, and that its fellow horn was brass. He further offered to sell it for fifteen dollars, averring that its powers were unfailing, and that even any one who borrowed it was able to traverse the country at the same speed which he had exhibited.

The ordinary dress of the men is simple enough, consisting merely of the "chawat," or slight strip of cloth, which is twisted round the loins in such a manner that one end falls in front and the other behind. The chawat is often very gaily colored. Sometimes the Dyak wears a sarong, or short petticoat of cotton cloth, which reaches from the waist to a little above the knees. It is simply a strip of cloth, with the two ends sewed together, and is almost large enough to encircle two ordinary men. When it is put on the wearer steps into it, draws it up to his waist, pulls it out in front as far as it will go and then doubles back the fold and turns the edges inward, in such a manner that it is held tight in its place, while the folds caused by its large diameter allow the limbs full play.

One of these chawats in my collection is woven in a sort of plaid pattern, the ground hue being a bright and rather peculiar red, and the cross-lines being nearly white. The texture is rather coarse, and the whole fabric has a stiffness which is characteristic of native fabrics made of this material.

Those young men who are proud of their personal appearance, and are able to afford the expense do not content themselves with the plain chawat, but adorn it with all kinds of strange decorations. One of these young dandies is well described by Mr. Boyle:—"The young man did not dress in Malay trousers like his father, probably because one pair alone of such articles existed in the house; but his chawat was parti-colored, and his ornaments numerous. He was about five feet four inches in height, very fair complexioned, and his face, though Tartar like in character, had a pleasant expression. From the elbow to the knuckles, both his arms were covered with rings of brass, and above the joint were two broad armlets of snowy shells, which contrasted admirably with his yellow-brown skin.

"But the marvel and glory of his array hung behind. To the end of his chawat was attached a long network of agate beads and bugles, which jingled merrily whenever he moved. Round his neck were strings of bright beads, and his knees were encircled

by brazen wire. A profusion of dried scalps fluttered from the parang by his side; and in walking before us through the sunny glades of the jungle, his brazen gauntlet flashing in the light, and his beads of agate tinkling behind, he presented the very ideal of a barbaric dandy."

One chief, desirous of outdoing his fellows, had taken a gong and beaten it out into a belt of solid metal a foot in width. In consequence of the extraordinary value which the Dyaks set upon gongs, this belt was a mark of wealth which no one could venture to challenge. Beside the chawat, the well-to-do man wears a sort of shawl mantle, much like a Scotch plaid, and capable of being disposed after as many different fashions. They display great taste in the graceful folds which they give to it, and seem to take a pride in the variety which they can produce by the different modes of folding this simple garment.

THE women dress in a manner somewhat like that of the men; but, in lieu of the sarong, they mostly wear a rather longer petticoat, called a bedang. When obliged to go out in the sun, they also wear a jacket, without sleeves and open in front; but as this jacket hides the glossy brown skin on which they pride themselves, they generally lay it aside when in the house.

In youth they are remarkable for their slender and graceful forms; but, unfortunately, after a woman has passed the age of twenty, she begins to deteriorate, and at thirty is an old woman. The face is pleasing in expression, despite of the artificial means whereby the women do their best to make themselves hideous. The eyes are black, clear, and expressive, and the lashes singularly long. The nose is rather disposed to turn upward than downward, and the mouth is terribly disfigured with the continual chewing of betel and the mode in which the teeth are filed and blackened.

The chief point in a Dyak woman's beauty is her hair, which is black, wonderfully thick, and shining, and so long that when allowed to flow over the back it nearly touches the ground. Of this ornament the women are inordinately vain, and, when engaged in conversation, are fond of flinging their shining tresses from side to side by coquettish tossings of the head. Unfortunately, the fever which is so prevalent in many parts of Borneo has the effect of bringing off all the hair, so that many a young girl is thus deprived of her chief ornament.

The women belonging to some of the tribes wear a most singular bodice, composed of bark and bamboo, and kept together by successive rings of brass wire, which form a strong and weighty bodice, to the lower part of which is attached the bedang, or petticoat.

Mr. Boyle seems to have taken a strong aversion to these bodices. "When a Dyak lover attempts to pass a tender arm round his sweetheart's waist, instead of the soft flesh, he fluds himself claspings a cuirass of solid metal. Nor is this all; for fashion ordains that the Dyak heiress shall invest her available means in the purchase of long gauntlets of twisted brass wire, reaching from the knuckles to the elbow; and if, in her turn, she encircles her lover's neck with a responsive arm, the wretched man finds himself clasped by a horrible fetter, which draws a little bit of his flesh between each of its links, and pinches him fearfully. For these reasons, caresses are not common among Dyak lovers; after all, perhaps, they are only a habit.

"But, apart from their inconvenience, these brazen ornaments are decidedly tasteful and pretty. The ordinary color of a Dyak girl, when she does not stain her body with turmeric, is a dull brownish yellow, and the sparkling brass rings are a great relief to this complexion. They are not removed at night, nor, in fact, during the wearer's lifetime, unless she outgrow them."

More than once the possession of these strange ornaments has proved fatal to the wearer, the woman having fallen overboard from a canoe, and drowned by the enormous weight of her brass ornaments. In some parts of Borneo the girls are not content with their brass bodices, bracelets, and anklets, but must needs encircle their throats with the same material. They take a long piece of stout brass wire, and twist it spirally round their necks, so that the lower part of the coil rests on the shoulders, and the upper part comes just under the chin, causing the wearer to hold her head upright, and having a most inelegant and awkward effect.

The Kayan women are exceedingly fond of a peculiar bead which is of several colors, looking as if it were a black bead into which pieces of green, yellow, blue, and gray material had been carefully let. A rich woman will sometimes wear several strings of such beads just above the hips. The different strings are connected with each other so as to form a single ornament. For one such hip-lace (as Mr. St. John calls it) a woman has given property equal to thirty-five pounds of our money; and the same woman had several others for which she had given scarcely less, together with a great number of inferior value.

The Kayan women carry the tattoo to a great extent, and follow exactly the same plan as the Samoan warriors, *i. e.* being completely tattooed from the waist to the knees. They are very fond of this ornament, and are apt to wear their dress open at the side so as to exhibit it. When the women bathe, they think that the tattoo is quite sufficient dress, and at a little dis-

tance they really look as if they were wearing short trousers.

As has been already mentioned, the Sea Dyaks do not, as a rule, care for the tattoo, and in this respect the women follow the example of the men. They are, however, equally fond of ornament with their sisters of the land, and adorn themselves with most scrupulous care on festive occasions. Mr. Boyle gives an animated description of the gala-dress worn by the Saibas Dyak girls and women during a great feast given by the chief.

"Meanwhile the female portion of the community had been preparing for their part in the proceedings. At this moment they came from the interior of the house, and the stately magnificence of their appearance showed that time and labor had not been spared in arraying themselves for this great occasion. From the neck to the hips they were covered over with large agate beads; string of them was heaped on string, till many of the women were cuirassed an inch thick in solid stone before and behind.

"Upon their heads was placed a piece of bead-embroidered cloth, in which were arranged thin skewers of painted wood about five inches long: there were about twenty of these bits of wood disposed about their heads, and each was attached to the other by strings of brilliant glass beads. Five or six of these many-colored loops hung from each skewer, and they were entwined into a graceful network. The effect was very pretty, though barbarous, and the solemnity of the ceremonies was much enhanced by the stately uprightness which the women were compelled to observe in moving, on peril of disarrangement of this delicate structure."

They also wear conical hats, made of split rattan. These hats are very light, and last for a wonderful time. A specimen was presented to me by a lady who had worn it for four years, and had certainly not treated it with any consideration. Yet it is as strong and good as ever, and the colors are as fresh and bright as when the hat was first made. The rattan has been split into very narrow strips, and stained red, yellow, and black, while some of the strips have had the natural color discharged, so as to make them nearly white.

The hat is fixed on the head by a broad loop of plaited palm leaf, which is fastened to the side. Hats made on this principle are prevalent throughout the whole Archipelago.

Among the ornaments which are worn by the Dyaks are the little bells which have already been mentioned as forming part of the appendages of an earring. These ornaments called "garunongs," and mostly worn by the women on the edges of the *bedang* or *petticoat*, are almost exactly like our hawk-bells, being nothing more than

little hollow spheres of brass or bronze about the size of a boy's playing marble, with a small metal ball in the interior by way of a clapper, and a moderately wide slit at the bottom. To some of the bells the remarkable beads are attached. These bells keep up a musical chime or jingle as the wearer walks, and are therefore used in dances and on great occasions.

The general treatment of the Dyak women is good. They certainly have to work hard, but so have their husbands, and, as we shall presently see, they are not the abject slaves such as are too often found among savage nations, but maintain their share of influence in the family, and are perfectly capable of assisting themselves when the occasion requires it. They are accustomed to work in the fields, and the universal chopping-knife or parang is seldom out of their hands. The constant use of this weapon hardens their hands and often deforms the fingers.

When they come home from their work in the field, they have the heaviest portion of their work before them, their evening task being the husking and winnowing of the rice for supper and for the meals of the following day. The rice is first pounded in large troughs by means of long and heavy wooden poles, which are held perpendicularly, lifted up, and then allowed to fall on the grain, and, as a rule each trough occupies three women, who work for about half an hour. This pounding separates the husk from the grain, and the next process is to winnow the rice by means of a shovel and a fan.

The evening meal is then cooked and eaten, the children fed, the bronze dishes put away, and then the women can sit quietly in the veranda, and eat their betel in peace. Although this mode of life seems rather hard, and the husbands appear to be acting harshly toward their partners in letting them work in this manner while they sit in their houses, chew betel, and talk over the gossip of the day, there is really a

very fair reciprocity of labor. While the wives have been working in the fields, the husbands have been fishing, and in so doing have repeatedly exposed their lives to danger, the rollers being at certain seasons of the year exceedingly dangerous. At Mukah, as at other places, the wives insist upon being furnished with fish by their husbands, and, in case the men should come home unsuccessful, the women fasten their doors and bar them out. Indeed, so long as the marriage holds good, the relation of husband and wife seems to be conducted in a manner similar to that which is so graphically depicted by Scott in his "Antiquary."

In order to show the appearance of the Dyak women in their ordinary and gala costumes, two figures are introduced into illustration No. 2 on page 1113. One represents a Dyak girl before arraying herself in the mass of ornaments with which she loves to decorate herself on festivals. She wears, as usual, the *bedang*, or petticoat, which, if she be of ordinary condition, is made of cotton, but if she be rich, of silk. It is twisted round the waist in the manner practised by the men, but, in addition, is fastened to the brass belts which surround her waist. Her long glossy hair is flowing to the full extent, before the owner gathers up its massive tresses preparatory to adorning her head with the complicated decorations, of full dress.

The other figure represents her as she appears in all the glory of full gala costume. As far as absolute dress goes, she wears no more than she did before, the only alteration being that her *bedang* is the best which she has, and is sometimes beautifully embroidered. On her arms are several thick rings of brass, and the singularly uncomfortable brass gauntlet extends from the wrist to the elbow. Her neck and bust are nearly covered with the heavy agate beads, and on her head is the complicated cap, with its curious arrangement of wooden spikes and glass beads.

CHAPTER CXV.

BORNEO — *Continued.*

WAR.

DYAK WEAPONS — THE SUMPITAN, OR BLOW GUN — CONSTRUCTION OF THE WEAPON — THE INLAID OR METAL BUTT — THE SPEAR HEAD, OR BAYONET — THE SUMPIT ARROW — THE UPAS POISON AND ITS EFFECTS — DESCRIPTION OF THE TREE — THE QUIVER — THE PARANG, OR SWORD, AND ITS VARIETIES — THE PARANG-LATOK, AND ITS CURIOUS HANDLE — POWER OF ITS BLOW — TWO BLOWS OF AN EXECUTIONER — THE PARANG-IHLANG: ITS CURIOUSLY FORMED BLADE — AN AWKWARD WEAPON — POWER OF THE PARANG-IHLANG, AND ITS VALUE — THE SHEATH AND ITS ADDITIONAL KNIFE — DOUBLE-EDGED PARANG, WITH CHARMS — A SINGULAR ORNAMENT — THE KRIS AND ITS VARIETIES — ITS WAVED AND LAMINATED BLADE — EFFECT OF THE LIME JUICE — THE EXECUTIONER'S KRIS.

WE now come to the subject of Warfare, which forms perhaps the most important branch of Dyak history. Whether the Dyaks belong to the Land or Sea division, they are always warlike, though the latter are fiercer, perhaps braver, and certainly more enterprising than the former. In order to understand the system by which they wage war, we must first examine their weapons. I will take that which is the most characteristic; namely, the sumpitan, or blow gun.

We have here a weapon, the like of which we have not seen in any country that we have hitherto investigated; namely, an instrument by means of which missiles are projected by means of compressed air. The principle on which the sumpitan acts is precisely similar to that of fire-arms, though the propelling power is obtained in a different and more simple manner. In fact, the sumpitan is nothing but the "pea-shooter" of boys, very much enlarged, and carrying an arrow instead of a pea or clay ball.

This curious weapon is about eight feet in length, and not quite an inch in diameter, and is bored with the greatest accuracy, a task that occupies a very long time, the wood being very hard, and the interior of the sumpitan smooth and even polished. It is not always made of the same wood, the specimens in my own collection being of different material, one of very dark and the other of very light wood. The surface is of equal thickness from end to end, and, as it generally has to enact the part of a spear as

well as of a sumpitan, it is very strong and heavy.

One of these weapons, brought to England by the late Admiral Young, is of a beautiful colored wood, and is beautifully inlaid, both at the butt and the point, with metal. The last few inches of the butt are entirely made of metal, the weight of which causes the weapon to balance itself easily when held to the lips. The pattern of the inlaying may be seen in fig. 1, of the illustration entitled "Sumpitans," on the 1122nd page.

The other sumpitan, fig. 2, is of a very dark, almost black wood, which is brightly polished on the exterior as well as in the interior, and is not inlaid. The butt, however, is encased with brass for five inches, the brass being very thick and heavy at the end, and deeply ridged, so as to look at a little distance as if it were a spiral brass wire coiled round the butt of the sumpitan.

At the tip of this weapon is a spear head, very thick, broad, and strong, sharply edged and pointed, and decorated with engraved patterns after the manner employed by Dyak smiths. It is firmly bound to the sumpitan by brass wire or rattan, and is an exact analogue of the bayonet, the spear head being fastened to the side of the weapon, and not interfering with the flight of the missile. The bore of the weapon is very small, not quite half an inch in diameter, and it is really wonderful that the maker could contrive to hollow it with the perfect

precision which is necessary for the accurate flight of the arrow.

We next come to the missile which is projected through the sumpitan. This is a very tiny arrow, made of the thorn of the sago palm, about seven or eight inches long, equally thick from base to point, and not thicker than a large steel knitting-needle. In order to make it fit the bore so that it can be propelled by the breath, it is furnished at the butt with a conical piece of pith or soft wood, so that it exactly fits the bore. In some of the arrows, the cone is hollow, and a few of them are furnished with wing-like appendages along the shaft. As a rule, however, the solid cone is in most general use.

These arrows are so small that the wound which they inflict is in itself insignificant, and would not be sufficient to kill any animal larger than a rat. They are, however, converted into weapons of the most formidable character by being smeared at the tip with poison obtained from the upas-tree.

The reader is probably aware of the many tales that are told of this tree—how that it poisons the country for a mile round, and how that the deadly juice can only be obtained by means of condemned criminals, who earn their pardon in case they can bring off a bottle of the juice. Even in more recent days the upas-tree has not lost all its legends, and many persons still believe that actual contact with the tree or its leaves produces a sensation of faintness. This, however, is not the case; neither is the actual juice of the tree so deadly as is supposed.

A wound made by an arrow poisoned with upas juice is sure to be fatal, provided that the poison be quite fresh; but it loses its power very rapidly, and after it has been exposed to the air for two hours it is useless, and must be renewed. When fresh, it is fatal in a very short time; as was found by Mr. Johnson, who led an attack on the Kanowit Dyaks in 1859. He lost thirty men in the attack, every one of them being killed by the tiny sumpitan arrow, and not one having a mark on him, except the little wound made by the arrow's point.

Should the poison have been exposed to the air, the wounded man has a chance of recovery; and it has been found that a large dose of spirits, sucking the wound, and keeping the sufferer continually in motion will generally overcome the virulence of the poison. Indeed, the sumpitan arrow seems to have much the same effect as the bite of the cobra, and the treatment which is efficacious for the snake bite answers equally well for the arrow wound.

The juice of the upas-tree is procured simply by boring a hole in the trunk, from which the juice issues in a white, cream-like state. It is received in little flasks made of bamboo, which are closed in the most care-

ful manner, in order to exclude the air. One of these flasks in my possession is five inches in length, and about half an inch in diameter. One end is naturally closed by a knot, and the other is sealed with the most scrupulous care. First, a plug of soft wood has been inserted into the end, after the manner of a cork. Over the plug a lump of beeswax has been firmly kneaded, and over the wax a piece of membrane has been tied when wet. Although the upas juice is white when it first issues from the tree, it speedily becomes black when exposed to the air.

The upas-tree is called scientifically *Antiaris toxicaria*, and it belongs to the natural order *Astocarpacee*, the best known species of which order is the well-known bread-fruit tree. All the plants of this order produce a white milky juice, which is always acrid and deleterious, and in many instances is exceedingly poisonous. Yet those parts of the plant, such as the fruit, in which the milk is replaced by sugar in the process of ripening, are not only harmless, but even nutritious. The tree grows to a considerable size, and the bark of the trunk has a reddish hue.

The reader will at once understand how formidable is this weapon. It is greatly to be dreaded even when the Dyak warriors are met in open battle, and in naval engagements the showers of poisoned arrows that are continually shot through the port-holes render the gunners' task a most unpleasant one. But the sumpitan is much more to be dreaded by land than by sea; and when it is employed in bush warfare, the boldest soldier shrinks from the encounter. The Dyak who wields it lies hidden in the thick foliage, sure that, even in case of discovery, he can glide through the tangled thickets into a place of security. The sumpitan makes no report, and gives out no smoke as an indication of its position, but the deadly arrow flies silently on its errand, and the only intimation of the presence of an adversary is the slight tap with which the arrow strikes its mark.

The only disadvantage of the sumpitan is that its range is a short one, the light arrow being seldom used at a distance exceeding forty yards, though a man who is accustomed to its use can propel an arrow for seventy or eighty yards. At this distance, however, it is not to be dreaded, as its force is so expended that it can scarcely break the human skin. Some of these arrows have their heads made of the barbed bone of the sting-ray, which snaps off at a touch, and remains in the wound if the man tries to draw out the weapon. Others have separate heads made of wood, which become detached as soon as the shaft is pulled. The native name of the head is *jowing*.

The Dyak generally carries thirty or forty of these arrows in a peculiar-shaped quiver. It is made of the ever useful bamboo, and is

(3.) PARANG IHLANG.
(See page 1124.)

(1.) PARANG LATOK.
(See page 1123.)

(2.) DYAK SUMPITANS.
(See page 1119.)

furnished with an appendage by which it can be stuck into the belt and carried at the side. This appendage is made of hard wood, and is lashed to the quiver by a broad belt of rattan, most beautifully plaited. The quiver is closed by a conical wooden cover, which is always secured by a string so that it shall not be lost. Some of the Dyak quivers are highly polished, covered with carvings, and are almost to be ranked with works of art. Many of these quivers have an inner case or lining of dried skin or membrane, so as to exclude the air, and preserve the poison of the arrow as long as possible.

When the Dyak uses the sumpitan, he holds the mouthpiece to his lips between the two first fingers of his left hand, while with his right he supports and aims the heavy weapon, which requires a strong as well as a practised man to direct it steadily.

THE weapon which comes next in importance to the sumpitan is the parang or sword, of which there are several varieties. The Dyaks pride themselves greatly on their swords, and the excellence of their workmanship is so great that they have good reason for pride. Their forges are of excellent quality, and some of the tribes are able not only to forge their own weapons but to smelt their own iron.

The commonest of all the Dyak weapons is the sword called parang-latok, which is carried by every man and nearly every woman. It is used not only as a sword, but as an axe, and is indifferently employed for cutting through the jungle or cutting down the enemy. The shape of this sword is very peculiar, as may be seen from illustration No. 1, on the preceding page, which represents a specimen in my collection.

The blade is formed after a very curious pattern. Toward the hilt it is squared, and is in fact nothing but a square bar of steel nearly half an inch in thickness, and three quarters of an inch in width. From the hilt to the point the blade becomes gradually wider and thinner, so that the broad point, two inches in width, contains just the same amount of metal as the half-inch square hilt. It is evident that the sword is first forged into a square bar of equable size, and is then beaten out flatter and flatter toward the point.

The illustration shows that the blade of the sword is bent at a considerable angle toward the hilt. This curious shape, awkward as it is to an unaccustomed hand, forms the principal value of the sword. When the parang-latok is used for cutting down branches or chopping a path through the jungle, it is grasped at the squared portion of the blade, and is used just as we use the common bill-hook in this country. But when the object which is to be chopped lies on the ground, the parang is held by the handle, so that the angular shape allows the

blade to be used with full force. It is the habit of holding the parang by the squared portion of the blade, that disfigures and even deforms the fingers of the women, as has already been mentioned on page 1118.

The ordinary parangs have no attempt at ornament upon them, but those of better construction are covered with patterns engraved upon the blade, of which we shall see some examples.

In war, this sword is a most formidable weapon. It is so heavy, weighing on an average two pounds, that a blow from it is sufficient to crush the skull or break the limb of a man, and, even if it had no edge, it would equal in efficacy the merai of the New Zealander. But the parang-latok has a very sharp edge, which is kept in the best order, and, when a blow is delivered with it, the very form of the weapon causes it to make the terrible "drawing out," the blade being drawn through the wound nearly from hilt to point. In consequence of this peculiarity, the wounds made by the parang-latok are very severe, and the natives pride themselves greatly on the depth of the wound which they can inflict.

One of the modes by which they try their skill is killing a pig with a single blow of a parang-latok, a good swordsman being able to sever the animal completely, and to drive the point of his weapon into the earth. If the reader has been accustomed to use the sword, he will see that to strike downward at an object so near the ground is by no means an easy task.

When an English swordsman performs the feat of severing a sheep at a single blow, he has several advantages which are denied to the Dyak. In the first place, the sheep is already dead, so that he can take his aim in quiet, whereas the pig is alive, so that the Dyak must aim his blow as he can. Then the sheep has been skinned and cleaned, so that the sword has not so much resistance to overcome. Lastly, the sheep is suspended, so that the swordsman can use the most effective blow, namely, "Cut 6," *i. e.* a sweeping, horizontal cut from left to right, which can be delivered with the full swing of the arm.

Were it not for the peculiar form of the parang-latok the feat of severing a pig could not be accomplished, but the angular shape of the blade and its gradually increasing width combine the power of the drawing cut with the chopping force gained by the weight of the weapon.

The sheath of this parang is neatly made of two flat pieces of wood, neatly hollowed inside to receive the blade, and bound together in the most elaborate manner by a series of belts, twelve or fourteen in number. These belts are made of very narrow strips of dark rattan, and are twined into an endless four-plait. In my own specimen,

there are thirteen of these belts. Attached to the upper end of the sheath is the cord by which the weapon is hung to the side. This cord is doubled, is made of scarlet and yellow cotton plaited square, and is ornamented at the ends with two large tassels, the strings of which are yellow tipped with scarlet tufts.

The parang-latok is more a Malayan than a Dyak weapon, but it is in favor with the Dyaks, and, as has been mentioned, has come into general use.

The Malays use it in execution, and are able to decapitate a man at a single blow, the executioner standing at his side and a little behind him. On one occasion, an executioner, who was distinguished for the skill with which he wielded a very heavy parang which he possessed, stood between two criminals as they knelt on the ground, and with a right and left hand blow struck off both their heads. The same man, who was one of the police, being annoyed by the howling of some dogs in the street, rushed out with his parang, and with one blow cut in two the first animal which he met.

We now come to another weapon, the parang-ihlang, which is one of the most extraordinary swords in the world, and more troublesome and even dangerous to strangers than can well be conceived. This is a smaller, shorter, and lighter weapon than the parang-latok. From point to hilt it measures nineteen inches, and in extreme breadth of blade is rather under an inch and a half. It weighs rather less than one pound six ounces, and altogether appears to be quite insignificant when compared with the parang-latok. We shall see, however, that in the hands of an experienced swordsman it is even superior to that weapon on account of a strange peculiarity in construction. The general shape of the blade of the parang-ihlang can be seen in illustration No. 3, on page 1122. It is very thick and heavy toward the hilt, where it is nearly squared, like the parang-latok, but becomes gradually thinner toward the point, which is finished off in a series of scooped patterns that look at a little distance as if the sword had been broken. The back is quite straight, and along it and on either side of the blade is a series of small patterns engraved with much neatness and freedom of execution.

But the most remarkable thing about the blade is, that instead of being nearly flat as are European sword blades, it is convex on one side, and concave on the other, as is shown at the section, fig. 5. Owing to this form, it can only be used for two cuts, one downward and one upward; and if used in the wrong direction, it flies off at an angle, and is nearly certain to inflict a wound on the man who wields it. These swords are made either for the right or left hand, so that a man who is not acquainted with the peculiarities of

any parang is afraid to use it without a careful trial, lest he should make the wrong cut with it, and so wound himself.

Small and insignificant as this weapon looks, it is capable of inflicting the most dreadful wounds, the peculiar concavity of the blade aiding it in a most remarkable manner. Like the parang-latok, it is used as a chopper as well as a sword, and in experienced hands is a most effective tool. One man, described by Mr. Brooke, was a celebrated swordsman, and has been known to sever at a single blow a log of tolerably hard wood as thick as a man's leg.

Even English officers have been so much impressed with the value of this weapon, that they have only carried the regulation sword for show, preferring the parang-ihlang for use. The Sea Dyaks, who have been already mentioned as essentially warriors, prefer this sword to any other weapon, though the real inventors and principal makers of it are the Kayans, who belong to the Malanau division of the Land Dyaks. As a rule, the ordinary Land Dyaks use the parang-ihlang but little, and when they do use it are apt to hurt themselves. Mr. Boyle mentions an instance where the eldest son of a chief had cut himself seriously on both shins through his incautious use of this weapon.

"The finest parangs," writes Mr. Boyle, "or those esteemed so, are found in the graves of Kayan warriors, which are consequently rifled by Dyaks and Malays on every possible occasion. I have one, purchased at Kennowit, which I was told had been obtained from a sepulchre, three hundred years old—a rather improbable assertion, though I believe the weapon was really found in a Kayan grave, for it was strangely stained and rusted when I bought it."

The Dyaks are very proud of the quality of their blades, and hold even the best European steel in utter contempt. It is said that their swords are made of old files, which are imported in large quantities; but, whatever may be the material, the temper of their blades is marvellously excellent. These parangs not only take a razor-like edge, but are exceedingly tough, and when used for bush-work beat the very best English implements. Mr. Boyle remarks, that whereas his own hunting-knives, which professed to be the finest steel possible, broke and gapped, the Dyak parangs were not in the least injured.

Such a blade as has been described is exceedingly valuable, even in its own country, and one of the best quality cannot be purchased under ten pounds sterling. It may be easily imagined that when a Dyak is fortunate enough to possess one of these valuable blades he will not be content with an ordinary handle and sheath, but will lavish upon his weapon all the powers of his na-

tive art. The handle, instead of being of simple wood, is of bone, carved deeply and boldly into patterns, and is always bent at right angles to the line of the blade. It is further ornamented by sundry tufts of human hair, dyed of various colors, of which deep red, yellow, and green are the favorites. The hilt is generally bound with brass wire, and, for a small-handed race like the Dyaks, affords an excellent hold. An European generally finds that the narrow handle is very awkward and cramped, and is not sufficient for his grasp.

The scabbard of this weapon is covered with ornaments. Instead of being a plain and simple sheath, like that of the parang-latok, it is made of a hard wood, of a dark, rich, mahogany color, which takes a very high polish. This is carved in elaborate and really artistic patterns, the carving being confined to the front of the scabbard.

In the middle, just under the carved part, is a piece of fur, and below the fur is a tuft of human hair dyed red. In most cases of swords made by uncivilized races, there is some danger to the hand in drawing them, the edge of the sword being apt to project between the two flat pieces of which the sheath is made. In order, however, to guard against such an accident, the maker of the parang-ihlang places a piece of rattan against each edge of the scabbard, so that the blade cannot by any possibility cut the fingers, even if the hand should grasp the sheath. The various parts of this sheath are bound together by six belts of plaited rattan and three belts of brass wire, plaited most beautifully, in that form which is known to sailors as the Turk's head.

The belt by which the sword is attached to the wearer is made of rattan, cut into very narrow strips and plaited into thongs, three of which thongs are again plaited together to form the belt. On the opposite side of the scabbard is a second sheath, of the same length as that to which it is fastened, but small and cylindrical. This sheath is made of red and yellow cloth, is lined with bark, and is intended for the reception of a knife which is peculiar to the Dyaks. One of these knives may be seen at fig. 3, in the illustration of the parang on page 1129. The handle of this knife is made of the same hard wood as that of which the sheath is formed. It is nearly cylindrical, about half an inch in diameter, and fourteen inches in length, the blade being short, pointed, and barely two inches in length. This curious knife is used by the Dyaks for splitting rattan, and similar purposes, the long handle being held under the left arm, while the rattan is drawn with both hands across the edge of the blade.

The natives are singularly averse to parting with this knife. They will sell the sword, if a sufficient price be offered, but will always endeavor surreptitiously to withdraw the

knife, so that, out of many parangs which have been brought to Europe, comparatively few have the knife attached to them. In one specimen in my collection, the weapon appears to be quite perfect, but, on withdrawing the knife from its sheath, it is seen that the Dyak has cleverly substituted a bladeless handle for the real knife.

Both the weapons which have been described were presented to me by C. T. C. Grant, Esq.

There is also in my collection a third kind of parang, which at first sight looks almost exactly like the old Roman sword. It is thick, massive, weighty, and at first sight looks more like an ancient than a modern weapon. On a closer examination, however, the peculiar Dyak workmanship is evident. Though it is not like the preceding weapon, convex on one side, and concave on the other, the two sides are entirely distinct. The blade is double-edged, very thick in the middle, and sloped off rather abruptly to the edge on either side.

The handle is only made of wood, but is profusely decorated with human hair of different colors and considerable length, and it is bound with a broad belt of plaited rattan. The sheath for the knife is entirely made of bark, and the knife itself is shown at fig. 2. Like the scabbard of the parang-ihlang already described, that of this weapon is richly carved, and adorned with fur and long tufts of human hair.

The belt by which it is suspended is made of rattan split very fine, and plaited so as to form a strap nearly an inch in width, and the sixth of an inch in thickness. It is rounded at the edges, and at the upper part it is ingeniously separated into two portions, so as to form a loop.

The chief peculiarity of this weapon lies in the number of charms which are attached to it. First come two teeth, and then there is a beautifully plaited little case, something like the cocoon of an insect, containing several little pieces of wood. Next comes a small bag of netted string, about an inch and a half in length, in which is a stone, and then come three little flattish baskets, with covers, which are empty. Fastened to the belt by several thongs is a curiously shaped piece of wood which I believe to be used for sharpening the edges of the sword, and to the end of the sheath is hung by a string of beads a feather, the quill of which has been carefully wrapped with red and black string.

This weapon is in all ways a most formidable one, and to European travellers is by far the best for practical purposes. The handle is rather larger than is the case with either of the preceding weapons; the blade has not that curvature which renders it so perilous a weapon in unpractised hands; it is double-edged, and either edge can be used with equal facility; and lastly, it pos-

sesses a point, which is not the case with the other forms of the sword.

One Dyak chief had an ornament attached to his sword of which he was exceedingly proud. It was an enormous tuft of hair, being nothing more nor less than the pigtailed of ten Chinese whom he had killed, and whose hair he had fastened to the scabbard of his sword. This ornament must have been singularly inconvenient to him. There is in my collection an average specimen of a Chinese pigtail. It weighs nine ounces, so that the weight of the ten must rather exceed five pounds and a half, while the length is five feet, so that ten tufts of hair, each five feet in length, must have given the wearer an infinity of trouble as he walked.

THE reader will already have noticed how the various forms of sword are used alike by the Malays and the Dyak tribes. There is another weapon, which, though strictly a Malay invention, is used by the Dyaks, and indeed, with some variations, throughout the whole of the Malay Archipelago. It is called the kris, sometimes, but wrongly, spelt *creese*, and is so common that any ordinary collection of weapons is sure to contain several specimens of the kris. It is remarkable for three points. In the first place, the handle is not set in a line with the blade, as in ordinary daggers, but is bent at a right angle; next, the blade is almost always waved in form, like the flaming sword with which the old painters armed the angels who kept the gates of Paradise; and thirdly, the blade is never smooth, but dull, rough, and indented with curved grooves much resembling in form the marks on a "browned" gun-barrel. By referring to the illustration "Kris" on page 1129, the reader will better understand its peculiarities.

There are few weapons which vary more in value, or in which the price set upon them is so apparently excessive. A first-rate blade, even without the handle and sheath, will cost from eighteen to twenty pounds, and an ordinary one can scarcely be purchased under two pounds. They have by no means the appearance of being valuable weapons, the steel of the blade being not only rough and corroded, but looking as if it were composed of successive laminae which are on the point of being separated. This effect is produced by steeping the blade in lime juice, thus causing a partial corrosion of the metal, which is made of small pieces of steel twisted and welded together in such a manner as to produce exceeding toughness.

One of these weapons in my collection is worn away almost to a mere ribbon of steel by the action of the acid, and, strange as it may seem, weapons of this kind, which look much as if they were mere pieces of rusty iron-hooping, are the most valued by connoisseurs. The length of grain in this weapon is wonderful, the corrosion of the

lime juice showing it in the most perfect manner. The long grooves can be traced from one end of the blade to the other, following the waved form of the narrower portion, and curling round in the wider part near the hilt, as if the whole of the blade had been forged out of steel wires laid parallel to each other and then welded together.

The lime juice takes off from the edge that razor-like smoothness which is so much admired in European blades, and gives it a ragged, saw-like appearance that is peculiar to the instrument. This edge, however, is a terrible one for penetration into human flesh, and answers the purpose even better than a plain and sharp edge could do.

The form of the kris is sufficient to tell the reader the mode of handling it, the weapon being thrust forward just as a man points with his extended forefinger, and not grasped according to the conventional ideas of painters. Spaniards, who are proverbially expert in the use of their long knives, hold and use them in nearly the same manner, laying the extended forefinger along the blade as a guide, and thrusting forward instead of striking downward. The average length of a kris blade is about a foot, but some are nearly as long as ordinary swords, while others are only six or seven inches in length.

Very great pride is taken in an old family kris, the owner regarding it with a veneration that is almost superstitious. Generally, the handle is quite plain, but the more wealthy have it made of gold, and encrusted with precious stones. This weapon is seldom used in war. It is carried more as the symbol of a gentleman than as a weapon to be used in actual fight, and plays the part that the sword used to play in the last century.

The kris is much used in executions, the weapon being one made expressly for the purpose, quite straight, thin, and narrow. In all cases it is used in the same manner, though there are some variations in detail. Generally, the man who is to suffer walks quietly and unbound to a chair, in which he seats himself, mostly solacing his last moments by chewing the betel-nut. His arms are then extended, and held by two men, while the executioner, standing behind him, places the point of the kris just above the left collar-bone, and strikes it downward into the heart, so that death is instantaneous.

In some places the execution kris is very narrow, thin, and sharp on both edges, like a lancet. The executioner takes a small tuft of cotton wool, and twists it lightly round the blade of the kris, just above the point. He then holds the cotton wool between the finger and thumb of his left hand, so as to keep the kris upright. After placing the point of the weapon on the right spot

above the left collar-bone, he drives it downward into the heart with his right hand, and the man is dead. Still holding the cotton wool between the finger and thumb, he draws out the kris, and, as the point is withdrawn, presses the cotton wool into the small wound which it has made, so that the weapon is quite clean and bright, and not a drop of blood is allowed to be seen. There is no doubt that this mode of execution is as certain, swift and merciful as any that can be devised. It is equal in these respects to the guillotine, and has the great advantage of being absolutely bloodless, and requiring no scaffold or visible apparatus. A traveller might pass within two yards of the fatal spot, and not know that anything out of the ordinary way was being done.

Some of these weapons have been used for many successive generations, and are highly prized, some being valued at sums which to Europeans seem almost fabulous. One of these execution crises was shown at

the Great Exhibition in London, but was lost, together with many other weapons of great value.

The spear is a weapon much favored by many Dyak tribes, but little employed by others, the spear head at the end of the sumpitan answering every practical purpose. In fact it is used, like the club of the Fiji Islander, as a summons to battle, and serves the same purpose as the fiery cross of the Scotch Highlands. This symbol is instantaneously obeyed, and, as it runs through a country with almost magical speed, a chief can raise a large force within a very short time. On one occasion, during the rajahship of Sir James Brooke, an incipient rebellion was ingeniously stopped by finding the "calling-out spear" as it lay hidden in a canoe, and taking possession of it. The people strenuously denied that such an article ever existed; but when it was taken from its hiding-place, the projected rising instantly collapsed.

CHAPTER CXVI.

BORNEO — *Continued.*

WAR — *Concluded.*

THE BORNEAN SHIELD, ITS USUAL SHAPE AND DECORATIONS — MODE OF USING IT — A CURIOUS SHIELD IN MY COLLECTION — HEAD HUNTING AND ITS ACCOMPANYING HORRORS — OBJECTS OF SIR JAMES BROOKE'S MISSION — HIS MODE OF SUPPRESSING THE PRACTICE — "OPENING MOURNING" — THE FISH SPEARING AND THE FEAST — VALUE OF HEADS — TREACHERY AND CUNNING — THE RAFFLED HEAD HUNTERS — DYEING AND PRESERVING THE HEADS — THE HEAD HOUSES — COURAGE IN WAR — STORMING A NATIVE FORT — A NAVAL BATTLE — TRAPS AND PITFALLS — MAKING PEACE.

By way of defensive weapons, the Dyaks use the shield, which is made of wood, and is generally of an oblong form. Like the parang, it is decorated with various ornaments, the chief of which are hair, beads, and feathers. The hair is made into flat tufts, and fastened at regular intervals all over the shield, as is seen in an illustration at the foot of next page, which represents a fine specimen in the magnificent collection of the late Mr. Christy. In the centre of this shield there is a rude and evidently conventional representation of the human face, the eye being circular, of very great size, and painted white in the centre. At the top and bottom of the shield are similar figures, but of smaller size. Some shields, which are now very seldom seen, have the entire human form painted on them, the legs issuing from the chest, and the neck being entirely dispensed with. The tufts of hair on this shield are black.

The mode of using the shield and sword is shown in their sword dances, and Mr. Brooke, who had great experience in the Dyak weapons, gives the following opinion of their value:— Sword dances with shields were going on. Each tribe has a peculiar step and code of its own; but as an attack and defence in earnest they all seemed to be equally ridiculous.

"However, in the event of an opponent using a shield, I feel convinced that an European could not stand against them, as they are able to crouch their bodies entirely behind it, and can spring immediately from such an attitude behind it without losing

their balance. But without a shield a man with a rapier would be more than a match for any of them, unless, as is possible, a heavy Dyak weapon were to cut a light sword in two. This, however, no dexterous fencer would be likely to allow, and, after the first blow from a heavy weapon had fallen, the opponent would be at the mercy of a light swordsman."

With due respect to the opinion of so competent an authority, I cannot but think that, even when furnished with this shield, the Dyak ought not to overcome a good fencer. The very fact that he is obliged to hold his shield before him, and consequently to stand either with his left side or at least his breast fronting his adversary, shows that he can have but a very short reach with his weapon, while his opponent, armed with a small sword, and using only the point, can remain entirely out of reach of the parang's edge, while he himself is within easy distance of the Dyak, and ready to bring in the fatal point of his weapon at the slightest opening made by his opponent.

The reader may remember that the parang described on page 1125 has attached to it, among other ornaments, a single feather. This feather has been taken from the rhinoceros hornbill, a bird which the Dyaks hold in much respect, and which they will not eat, however hungry they may be. The quill feathers of the wing and tail are black, with a band of white, and by both Malays and Dyaks they are thought to possess certain virtues, and are used as talismans. The bird is considered to be an emblem of war,

and for this reason the sword sheaths, shields, and cloaks worn in war time are decorated with its feathers; and the huge horny beak of the bird is scraped thin, polished, and made into earrings.

I insert also on page 1129, a figure of a shield in my collection, which I believe to be of Bornean make, the materials and mode of employing them being evidently Bornean. In shape it exactly resembles the small shields used by horsemen in the early age of English history, and, small as it is, it forms a very efficient defence. It is twenty inches in length, and thirteen inches in width, and it is welded by means of a separate handle, firmly lashed to the body of the shield by strips of rattan. The characteristic feature of the shield is the manner in which it is built up of a number of pieces, the whole, though merely bound together by rattan, being as firm as if it were cut out of one piece of wood.

If the reader will look at figure 2, which shows the back of the shield, he will see that it is made of four flat pieces of wood, which are laid side by side. These pieces are of a lightish colored wood, and are but slightly smoothed. The handle is cut from a separate piece of wood, which runs the whole length of the shield. As is usual with Bornean weapons, the handle is much too small for the grasp of a European.

The front of the shield is made of a single flat piece of wood, to which the others are lashed, or rather sewed, by means of rattan passing through holes. In order to hold all these cross-pieces more firmly together, a deep groove has been cut in a thick rattan, which has been bound round the shield so as to receive the edges of the wood in the groove, and has been sewed to them by rattan at regular intervals.

The shield is further strengthened by an upright piece of wood, which runs along the front, and to which the handle at the back is lashed by rattan, so that the handle and the corresponding piece in front actually strengthen the shield instead of being a strain upon it. The materials have been chosen with the eye for color which the Dyak usually possesses. The thin flat wooden plate which forms the front of the shield is nearly black, the central piece is yellowish white, and the rattans with which it is edged and sewed are of a bright yellow. The weight of the shield is exactly a pound and a half. Besides the centre ornament on the front, a section of the shield is also given, so as to show the form of the handle, and the slight curvature of the whole implement.

The perpetual feuds that rage among the Dyak tribes are mostly caused by the practice of "head hunting," which is exactly analogous to the scalp hunting propensities of the North American tribes. Mr. Boyle has sketched the outlines of this horrid cus-

tom in a few nervous words, which will afterward be examined in detail. "The great tribes of Sakarrang and Saribas have never been more than nominally subject to the Malays of Kuching or Bruni, and Sir James Brooke is the first master whom they have really obeyed. Every year a cloud of murderous pirates issued from their rivers and swept the adjacent coasts. No man was safe by reason of his poverty or insignificance, for human heads were the booty sought by these rovers, and not wealth alone. Villages were attacked in the dead of the night, and every adult cut off; the women and grown girls were frequently slaughtered with the men, and children alone were preserved to be the slaves of the conquerors.

"Never was warfare so terrible as this. Head hunting, a fashion of comparatively modern growth, became a mania, which spread like a horrible disease over the whole land. No longer were the trophies regarded as proofs of individual valor; they became the indiscriminate property of the clan, and were valued for their number alone. Murder lurked in the jungle and on the river; the aged of the people were no longer safe among their own kindred, and corpses were secretly disinterred to increase the grisly store.

"Superstition soon added its ready impulse to the general movement. The aged warrior could not rest in his grave till his relations had taken a head in his name; the maiden disdained the weak-hearted suitor whose hand was not yet stained with some cowardly murder.

"Bitterly did the Malay Pangerans of Kuching regret the folly which had disseminated this frenzy. They themselves had fostered the bloodthirsty superstition in furtherance of their political ends, but it had grown beyond their control, and the country was one red field of battle and murder. Pretexts for war were neither sought nor expected; the possession of a human head, no matter how obtained, was the sole happiness coveted throughout the land."

If was in order to stop this terrible custom that Sir James Brooke undertook his rule. The sultan of Bruni, in despair at the state of things, and utterly unable to check the increasing rage for head hunting, ceded the territory to him, hoping that the Englishman, with his small forces, would succeed where he himself with all his soldiers had failed. Although these tribes were nominally his subjects, they never thought of obeying him, and the only sign of their subjection was a small tribute very irregularly paid. The sultan was right in his conjecture, and we know how the Englishman, with his steady, unflinching rule, succeeded in abolishing head hunting as an acknowledged practice, and, by his system of inflicting heavy fines on any one who took a head, gradually and steadily put an end to the

practice. For several years the Dyaks could not understand the prohibition, and the English rajah and his officers were continually pestered with requests from Dyaks to be allowed to go and take heads. An old man, for example, had lost his wife, and begged piteously to be allowed to take just one head, so that she might rest quietly in her grave. Then a young man would come, who had been rejected by a Dyak damsel, lay his case before the authorities, and beseech them to permit him to take a head, and so to win the hand of the disdainful lady. One man, after meeting with the usual refusal, proposed a compromise, and asked whether he might not go and take the head of a Pakarran, because Pakarrans really could not be considered as men. In fact, as Mr. Brooke well remarks, the Dyaks behaved just like children crying after sugar-plums. No plan could have been devised which was more effective than that which was carried out by the English rajah. Whenever a party of Dyaks started surreptitiously off on a head hunting expedition, a force was always despatched after them, in order to cut them off and bring them to justice, when they were fined heavily. If they succeeded in procuring heads, their trophies were taken away from them, and they were fined still more heavily. Those who refused to submit to the punishment were declared to be enemies to the government; and their houses were burnt down. Dyaks of more peaceful tribes were always employed in such expeditions, as, owing to the feuds which had existed for so long, they had been exasperated by the numerous murders which had been perpetrated by the more warlike tribes. The English rule, unlike that of the Malay sultan, was irrespective of persons, and the highest chiefs were punished as swiftly and surely as the lowest of the people. On one occasion, a quarrel arose between two parties of Dyaks, one of which, commanded by a chief named Jannah, was entirely in the wrong, having first trespassed on the property of the other party, and then got up a quarrel because they had hurt themselves against the spiked bamboos, which were planted by way of fences. In the fight that ensued Jannah himself shot the other chief; but he gained little by his act. As soon as the facts were known, Mr. Brooke sent a large force against him, and he was fined nearly two hundred pounds. He and his party took to the bush, but they were soon starved out, and had to submit. The other chiefs were delighted at the result, and were accustomed ever afterward to check those who wished to go head hunting by telling them to remember Jannah and his two hundred pounds. It is rather curious that this high-handed proceeding inspired Jannah with the greatest respect and affection for Mr. Brooke, for whom he afterward entertained a sincere friendship. He

asserted that the three years subsequent to this episode in his life had been marked by very much better harvests than he had before obtained from his land, and attributed his prosperity to his friendship for the white man.

One ingenious portion of the system was, that a large share of the fines was distributed among chiefs who had abstained from head-hunting. This plan had a double effect; it proved to the Dyaks that they were not fined for the benefit of the English, and it induced them to be always on the look-out for those who were going to hunt after heads.

It has been mentioned that the heads are wanted to "open the mourning" after the death of any person. This phrase requires some little explanation. When a chief loses a relative, he closes some stream during the time of mourning. This is done by driving spears into the bank, on either side, and fastening bamboos to them across the stream. No one is allowed to pass this obstruction until the mourning is over, an event which cannot take place, according to Dyak custom, until a head had been obtained.

When he has brought home the required trophy, he leaves it at the head house to be prepared, while he makes ready for the feast with which a new head is received. He takes some plants, the juice of which has a stupifying quality, pounds them, and throws them into the river. The fish come floating to the surface, and are then captured by means of barbed spears, which are flung at them from the bank. The spears are very light, their shafts being made of bamboo, so that they always float, and enable the thrower to recover both the spear and the fish which it has struck. The spears and poles which closed the stream are removed in order to allow the fishermen to use their weapons, and thus, by the arrival of the coveted head, the stream is again thrown open.

One of these fish spears is shown on page 1129. It is five feet in length, and the shaft, which is three-quarters of an inch in diameter, is made of hollow bamboo, and is exceedingly light. The four prongs are made of iron, and very slightly barbed. Owing to the manner in which they are lashed to the shaft, they are very elastic, so that their slight barbs are perfectly capable of retaining the fish. With the natural love of ornament which distinguishes the Dyaks, the owner of this spear has decorated it with several broad belts of split rattan, plaited in a very artistic manner. One was placed just below the head of the spear, another was placed at the centre of gravity, so as to guide the hand at once to the "balance" of the weapon, and the third was near the butt. Of the three, however, only the central belt remained when the spear reached me.

Owing to the enormous demand for heads, quantity rather than quality was the chief requisite, so that at the time when Sir James Brooke undertook the task of putting down the practice of head hunting, no practical distinction was made between the head of a stalwart warrior and that of a tender girl. A head was a head; the body to which it belonged was of no consequence.

The rage for heads was so great that in one head house an Englishman, who happened to know something of comparative anatomy, espied a head which seemed scarcely human, and which, on examination, turned out to be that of an orang-outan. The proprietors of the head house at first indignantly denied that any imposture had been practised, and adhered to the human origin of the head. At last, however, they were obliged to yield to a certain degree, but they only said that the head in question was that of an Antu or goblin, which had infested the village for a considerable time, and had at last been killed.

One exception was made in the value of these trophies, the head of a white man being beyond all price, and being so valued that a Dyak who had obtained one would not place it in the common head house, but would build a special house to contain it. One of these Dyak warriors was seen exposing himself to great danger in his anxiety to secure a white man's head. A boatman had been killed, and one of the Dyak murderers was observed dragging up the hill the body of the slain man, hacking with his knife at the neck so as to secure the head, regardless of the fact that he was likely to be shot in the endeavor.

As the possession of a head is the height of a Dyak's ambition, it is not extraordinary that the natives should use all their powers of force or craft to secure the trophy. One example of treachery is narrated by Mr. Brooke (the present Rajah).

"Five years ago the Saribas Malays were living at the mouth of their river, and, with very few exceptions, were hostile to us. Still they were on friendly terms so far as gaining trade, and making use of the merchandise they could only get by communication with Sarawak. A party of five people, three men and two women, left Sakarrang to go to Saribas for the purpose of meeting some of their relatives. After they had been absent a considerable time, the news was brought back that they had been beheaded by Dyaks in the river.

"It happened thus: They met a boat's crew of Dyaks while in Saribas, and spoke together, saying they were traders, and were also seeking for fish. When the Malays were leaving Saribas to return, the Dyak boat followed in their wake, entered this river together, and on the following day proceeded to carry out their sly and murderous design.

"In the morning they offered their swords for sale, and sold or exchanged one, suffering the Malays to make an exceedingly profitable bargain. They then proposed fishing with a hand net on the mud bank, and persuaded a Malay named Limin (who was well known, and considered a brave man) to separate from the others and cast the net. This was done, and for some time they were successful in bagging fish, and were going further and further from the boats.

"At length the net fouled on a stump at the bottom, and one of the Dyaks immediately took off his sword and dived down, as poor Limin thought, to clear it, but, instead of doing so, the wily rascal twisted it firmly round and round, came up to take breath, and then again dived, and again twisted it in various ways round the stumps; he then rose, and said he could not clear it, but asked Limin to try. Limin unsuspectingly took off his sword, dived, and, on approaching the surface breathless, the two Dyaks struck and decapitated him without a sound. They then took his head and returned to their boat.

"A third Malay was persuaded to administer some cure to a Dyak's foot, which was bleeding slightly. While the Malay was leaning over and looking to the wound, one of them chopped off his head from behind. After this, the woman was decapitated. They lost one head, which tumbled into the water, but the other four, with all the property belonging to the Malay party, were taken and carried away to Sadok."

On another occasion, a party of Dyaks in a canoe met a boat containing a man, his wife, and their young daughter. They stopped the boat, and offered betel-nut for sale. As soon as they came within reach, they drew their swords, struck off the woman's head, and took the girl prisoner, but the father had just time to jump overboard and swim ashore.

This occurred in the Saribas River, and, strangely enough, the murderer, whose name was Sadji, nearly came in contact with Mr. Brooke, who had gone out expressly to check his head hunting propensities. Mr. Brooke passed him on the river, but, not being acquainted with him, did not arrest him. This, as was afterward learned, was fortunate for Sadji sat in the boat with his sword drawn, and if the captive girl had called for help, or if the English had shown any signs of arresting him, he would have struck off her head, jumped with it into the river, swum ashore, and escaped together with his followers through the jungle.

The same author gives another example of head hunting, which is a curious mixture of the terrible and the ludicrous. A young man named Achang was brought before Mr. Brooke in irons. He was only nineteen years of age, and yet he had gray hair, the natural color having vanished in conse-

quence of his troubles. Some time previously, he had fallen in love with a young Dyak girl, who spurned all his advances because he had never taken a head, and so proved himself to be a warrior. She was evidently a girl of energy, for she proposed that he should go to the Saribas fort, and take the head of Bakir, the Dyak chief, or of the Tuan Hassan, *i. e.* Mr. Watson.

Being thus pressed, Achang, with another lad of his own age, set off for the fort, and on the way suffered the usual drawbacks of bad birds, bad dreams, and missing the path, so that when they came within sight of the fort they thought they had better change their plans. They determined on going to a Chinaman's house under pretext of purchasing his goods, and taking his head while he was off his guard. When well cooked and dried, one head would do as well as another, and they thought that they would have no difficulty in passing off the Chinaman's head for that of the white man.

Accordingly, they went to a Chinaman's house, had their supper with him very amicably, and then retired to rest, after agreeing that at midnight they would strike the fatal blow. Now it happened that Achang overslept himself, and his friend thought that he might as well take advantage of his drowsiness, and secure the head for himself. Accordingly, at midnight, hideous yells were heard from the Chinaman's house, and when the people rushed into the room, they found the unfortunate owner with his face gashed all down one side, the Dyak youth having missed his blow in his haste. The actual perpetrator escaped, but Achang was found still fast asleep, and was instantly put in irons.

Next day he was brought down to Sakarang, with a chain round his waist, and on the way he was followed by a body of Dyaks, who were trying to bribe his keepers to let them take his head. They actually held an auction for his head as they went along, each bidding higher than the other, and the horrors of that twelve-mile march were such that the poor lad became gray before the next morning.

After all, Achang was really a most gentle and innocent lad, and was only following the habits of his country in obeying the behests of his mistress. He was kept in irons for about a month, and then released, after which he attached himself to the service of the white men, worked in the garden, and, as the saying is, made himself generally useful.

The heads are subjected to a sort of drying process, called "cooking," which is tolerably effectual, but is far inferior to that which is employed by the New Zealanders, and, for a considerable time after the heads are cooked, they are very offensive to European nostrils, though Dyaks seem to be quite unconscious of the evil odor. They

are always kept in the pangarangs, or head houses, which are very unlike the ordinary dwelling-houses of the Dyaks. A very good account of a head house is given by Mr. F. S. Marryat:—

"We were escorted, through a crowd of wandering Dyaks, to a house in the centre of the village, which was very different in construction from the others. It was perfectly round, and well ventilated by numerous port-holes in the roof, which was pointed. We ascended to the room above by means of a rough ladder, and when we entered, we were rather taken aback by finding that we were in the head house, as it is termed, and that the beams were lined with human heads, all hanging by a small line passed through the top of the skull.

"They were painted in the most fantastic and hideous manner. Pieces of wood painted to imitate the eyes were inserted in the sockets, and added not a little to their ghastly, grinning appearance. The strangest part of the story, and which added very much to the effect of the scene, was, that these skulls were perpetually moving to and fro, and knocking against each other. This, I presume, was occasioned by the different currents of air blowing in at the port-holes cut in the roof; but what with their continual motion, their nodding their chins when they hit each other, and their grinning teeth, they really appeared to be endowed with new life, and to be a very merry set of fellows.

"However, whatever might be the first impression occasioned by this very unusual sight, it very soon wore off, and we amused ourselves with their motions, which were not life, as Byron says; and in the course of the day we succeeded in making a very excellent dinner in company with these gentlemen, although we were none of us sufficiently Don Giovannistic to invite our friends above to supper."

These head houses are, as we have just seen, the places wherein guests are received, and we can therefore understand that the natives of any village would have a pride in showing to their visitors the trophies won by themselves. One of these houses scantily furnished with heads would be held as a scandal to the village, so that the three emotions of pride, love, and sorrow have all their effect in aiding the custom of head hunting.

In these head houses, the unmarried men of the village sleep. The reason for this custom is two-fold. In the first place, the bachelors are kept out of mischief; and in the next, they are always ready with their arms at hand to turn out in defence of the village should it be attacked. In such expeditions, the head house is always the central object of attack, and by having the young warriors at hand the Dyaks ensure the security of their cherished trophies.

Some of the horrors of the head hunting custom are well described by Mr. St. John:—"About thirteen years ago, I heard the Natuna people give an account of a horrible transaction that took place in one of their islands. A party of Saribas Dyaks were cruising about among the little isles near, and had destroyed several women and many fishermen, when they were observed, toward evening, creeping into a deep and narrow inlet to remain during the night.

"The islanders quietly assembled and surprised their enemies, killing all but seven, who were taken prisoners—six men and one lad. The former they roasted over a slow fire, and they declared that the bold fellows died without uttering a cry of pain, but defying them to the last; the lad, who stood trembling by, uncertain of his fate, was sent back to the coast, with a message to his countrymen that, if ever they came there again, they would all be treated in the same way. This fearful warning was sufficient to deter their seeking heads again in that direction.

"Parties of two and three sometimes went away for months on an inland incursion, taking nothing with them but salt wrapped up in their waist-cloths, with which they seasoned the young shoots and leaves, and palm cabbages found in the forests; and when they returned home, they were as thin as scare-crows.

"It is this kind of cat-like warfare which causes them to be formidable enemies both to the Chinese and the Malays, who never felt themselves safe from a Dyak enemy. They have been known to keep watch in a well up to their chins in water, with a covering of a few leaves over their heads, to endeavor to cut off the first person who might come to draw water. At night they would drift down on a log, and cut the rattan cable of trading prahus, while others of their party would keep watch on the bank, knowing well where the stream would take the boat ashore; and when aground they kill the men and plunder the goods."

In war Dyaks have often proved themselves to be valiant soldiers. Mr. Brooke relates that when he was attacking the fort of a hostile chief having with him a mixed force of Malays and Dyaks, the latter were by far the better soldiers. The former advanced to thirty or forty yards of the house, *i. e.* just beyond the range of the Sumpitan arrows, which were being blown from the fort, and ensconced themselves behind trees and stumps, where they could fire without exposing themselves to the deadly darts. The Dyaks, however, dashed boldly at the house, clambering up the posts on which it was built, carrying their weapons with them, hacking at the breaches which had previously been made with shot, and trying to force their way into the fort.

At last, one Dyak succeeded in getting into

the house, and remained there for about five minutes, when he was obliged to retreat and slide to the ground down the post. After much fighting, the Dyaks managed to set fire to the building at both ends, thus forcing the inmates to rush out among their enemies. Scarcely any of them escaped, some perishing in the flames, others being badly wounded, and the rest being taken prisoners.

The victorious Dyaks were mad with excitement, and rushed about with furious shouts, carrying heads in their hands, and insensible to the wounds which many of them had received. One lad came yelling by, having a head in one hand, and with the other holding on one side of his face. An enemy's sword had nearly sliced off the whole of that side of his face, but he was almost unconscious of the fact, and his excitement prevented him from feeling any pain. In a few minutes, however, he fainted from loss of blood, and, in spite of the terrible wound which he had received, eventually recovered.

Sometimes the Dyaks are exceedingly cruel to their captives, not being content with merely taking their heads, but killing them slowly by torture. Generally, however, the competition for heads is so keen that a man who has overcome an enemy has no time for torturing him, and is obliged to content himself with getting off the head as fast as he can.

Some of these forts are most perilous places to attack. The approaches are guarded with "ranjows," *i. e.* slips of bamboo sharpened at the end and stuck in the ground. Ranjows are troublesome enough on open ground, but when they are stuck among leaves, grass, and herbage, they become terrible weapons, and impede very effectually the advance of the attacking force.

Then the Dyaks set various ingenious traps. They place bent bows near the path, so constructed that as soon as a man comes opposite them, the string is liberated, and an arrow is tolerably sure to transfix both his legs. Sometimes they bend a young tree down, and lay a javelin, so that when the tree is freed, it strikes the end of the javelin and urges it onward with terrific violence, just like the mangonel of olden times. They dig numberless pitfalls of no very great size in depth, but each having a sharp bamboo stuck upright in the centre, so that any one who falls into the pit must inevitably be impaled.

The forts themselves have been much modified since the introduction of fire-arms, the stockades which surround them being made of the hardest wood, about two feet in thickness, and capable of resisting the fire of any small arms. In fact, nothing but artillery is of much use against one of these forts. Many of them are furnished with a sally-port through which, when the place becomes untenable, the defenders quietly

escape, just as is done with the pahs of New Zealand.

The Sea Dyaks, as their name implies, are a maritime set of tribes, and fight chiefly in canoes. They have some ideas of tactics, and can arrange their canoes in regular array when they meet with an enemy. One of their favorite tactics is to conceal some of their larger boats, and then to send some small and badly-manned canoes forward to attack the enemy. They are, of course, soon repulsed, and obliged to retreat. The enemy, thinking himself victorious, follows them exultingly, and, as soon as he passes the spot where the larger canoes are hidden, he is attacked by them in the rear, while the smaller canoes, which have acted as decoys, turn and join in the onslaught. The rivers are almost invariably chosen for this kind of attack, the overhanging branches of trees and the dense foliage of the bank affording excellent hiding-places for the canoes. An illustration of a "Canoe fight" is given on page 1139.

When peace is declared, or when people desire to renew friendship to each other, they declare themselves friends by a ceremony which is identical in principle with that which is practised in many parts of Africa, each of the contracting parties partaking of the blood of the other. Sometimes the blood is actually drunk, but generally it is taken by mixing it with tobacco and smoking it. Mr. St. John, in his "Forests of the Far East," describes this ceremony with much force:—

"Siŋganding sent on board to request me to become his brother by going through the sacred custom of imbibing each other's blood. I say imbibing, because it is either mixed with water and drunk, or else it is placed within a native cigar, and drawn in with the smoke. I agreed to do so, and the following day was fixed for the ceremony, which is called Berbiang by the Kayans, Bersabibah by the Borneans.

"I landed with our party of Malays, and after a preliminary talk, to give time for the population to assemble, the affair com-

menced. We sat in the broad veranda of a long house, surrounded by hundreds of men, women, and children, all looking eagerly at the white stranger who was about to enter their tribe. Stripping my left arm, Kum-Lia took a small piece of wood shaped like a knife-blade, and, slightly piercing the skin, brought the blood to the surface; this he carefully scraped off. Then one of my Malays drew blood in the same way from Siŋganding, and a small cigarette being produced, the blood on the wooden blade was spread on the tobacco.

"A chief then arose, and, walking to an open place, looked forth upon the river, and invoked their god and all the spirits of good and evil to be witness of this tie of brotherhood. The cigarette was then lighted, and each of us took several puffs, and the ceremony was concluded. I was glad to find that they had chosen the form of inhaling the blood in smoke, as to have swallowed even a drop would have been unpleasant, though the disgust would only arise from the imagination.

"They sometimes vary the custom, though the variation may be confined to the Kiniahs, who live further up the river, and are intermarried with the Kayans. There a pig is brought and placed between the two who are to be joined in brotherhood. A chief offers an invocation to the gods, and marks with a lighted brand the pig's shoulder. The beast is then killed, and, after an exchange of jackets, a sword is thrust into the wound, and the two are marked with the blood of the pig."

The stranger thus admitted into membership with the Kayans is called Niau, or friend, and in some cases the experiment proves to be successful. Generally, however, the honor, such as it is, is greater than the profit, the Kayans assuming that their newly-admitted member ought to make plenty of rich presents to his tribe, in order to show his sense of the privileges that have been conferred upon him.

CHAPTER CXVII.

BORNEO — *Continued.*

SOCIAL LIFE.

MARRIAGE AMONG THE DYAKS — COURTSHIP, ACCEPTANCE OR REJECTION — A SIBUYAN WEDDING — CURIOUS DOMESTIC ARRANGEMENTS — PRIDE OF BIRTH — STATE OF MORALITY — FACILITIES OF DIVORCE — JEALOUSY, AND ITS RESULTS — HOW TO TREAT A RIVAL — FORBIDDEN DEGREES — SPORTS AND GAMES — BEE HUNTING — THE BORNEAN SWING — TRIALS OF STRENGTH AND EQUILIBRIUM — TRICKS WITH STRING — COCK FIGHTING — THE SWORD DANCE — A DYAK WAR DANCE WITH HEADS — THE CAT-O'-NINE TAILS — DYAK FESTIVALS — STRANGE COOKERY — THE DURIAN FRUIT — THE NATIONAL DRINK, ITS ODOR AND TASTE — HABIT OF INTOXICATION — A DYAK CIRCE — STOUT DRINKERS AND STRONG HEADS — THE FORCE OF RIDICULE.

PASSING from war to peace, we will begin with marriage as practised among the Dyaks.

In some parts of the country marriage is a very simple business, the two parties living together as long as they like each other, and separating if either feels dissatisfied. In any case, as we shall see, the facilities for divorce are extreme, and the bonds of matrimony are worn with marvellous looseness.

The reader cannot but have remembered the singular coincidence that often exists between customs of savage and of civilized life.

Among the Sinambau Dyaks there is a mode of courtship which still prevails in some parts of Europe, though it is generally falling into disuse. A young Sinambau Dyak, when struck with the charms of a girl, shows his preference in various ways, such as helping her in her daily labor, carrying home her load of wood for her, and making her such presents as are in his power to give.

After he has carried on these attentions for some time, he thinks that he may proceed to a more explicit declaration. At night, when the family is supposed to be asleep, he quietly slides back the bolt of the door, steals to the spot where his beloved is sleeping under her mosquito curtains, and gently awakes her. He always brings with him an abundant supply of betel-nut and sirih leaf, and the two sit talking together

throughout the greater part of the night. It cannot be expected that the parents of the girl, who sleep in the same room, should be wholly ignorant of the proceeding, but they are conventionally supposed to be so, and if they approve of the young man they take no notice, while if they do not, they use their influence with the girl to induce her to dismiss him.

The mode of rejection is in keeping with the rest of the proceedings. Should the girl dislike the too adventurous suitor, she declines accepting the betel-nut, and merely asks him to blow up the fire or light the lamp, a request which is tantamount to instant dismissal.

When the marriage takes place a feast is made, and then the parties are made man and wife without any more ceremony. It is very seldom that the young couple begin housekeeping on their own account, and, as a general rule, the bridegroom enters the household of his father-in-law, or, at all events, of some of his wife's relations, and so becomes one of the family, laboring for the common stock, and taking his share when the head of the household dies. Occasionally this plan is reversed, and when the bride is one of a large family of brothers and sisters, or if the bridegroom is the sole support of his parents, she accompanies her husband, and becomes part of his household.

The ceremony of marriage among the Sibuyan Dyaks of Lundu is worthy of no-

tice. The artist has given an admirable representation of this unique ceremony on the following page. Two bars of iron are laid on the ground in the spot appointed for the ceremony, and the young couple are brought from opposite ends of the village. The first part of the ceremony consists in seating them on the bars of iron, as token that the blessings of their married life are to be as strong as iron. The priest gives to each of the pair a cigar and some betel-nut and sirih leaf, which they hold in their hand until the next part of the ceremony is completed. Taking two fowls in his hands, the priest waves them over the heads of the couple, and, in the course of a long address, invokes every blessing upon them. He then solemnly knocks their heads together three times, after which the bridegroom places the betel-nut in the mouth of his bride, and inserts the cheroot between her lips, she afterward doing the same by him, this ceremony being the public acknowledgment of accepting each other as husband and wife.

After they have thus declared their acceptance of each other, the fowls are killed, and their blood received in two cups, the color of the blood being carefully inspected by the priest, and its hue being held as an omen of the future well-being or misery of the newly married pair. One of the feasts which will presently be described closes the ceremonies.

It has already been mentioned that in most cases the bridegroom enters the family of his wife. But in any case he is bound to honor the father of his wife even above his own father. The young husband may never even pronounce the name of his father-in-law, he may not eat from the same dish, drink from the same cup, or rest on the same mat.

Among another tribe of Dyaks, the Balaus of Lingga, the ceremonies of marriage are rather different. By way of a propitiatory offering, the mother of the bridegroom gives to the relatives of the bride some domestic utensil, such as a plate or a basin, and three days afterward the very simple ceremony is performed.

The bridegroom's mother takes a quantity of the areca-nut prepared for chewing, divides it into three portions, places them in a basket, and sets them on a sort of altar in front of the bride's house. The friends of both parties then assemble, and chew the nuts while they discuss the future prospects of the young couple, and they decide as to the amount of fine which the husband shall pay to his wife in case he separates from her after she is a mother, or when she is likely to be so. In fact, in their own rough-and-ready way, these Dyaks have contrived to organize a tolerably complete code of marriage settlements, which, in consequence of the very easy system of divorce, is abso-

lutely necessary for the protection of the women.

These Sea Dyaks of Lingga have, in common with all the sea tribes, the greatest pride of birth; and if a girl were to listen to the addresses of a man of much inferior rank, her parents would prohibit the match. In one such case the two lovers fled into the jungle, poisoned themselves with the juice of the tuba plant, and were found dead next morning in each other's arms. So full are they of their family pride, that they look upon any mixture of their noble blood as a dire disgrace, and this is carried to so great an extent that, although within their own degree their morals are of the laxest order, the men would scorn an intrigue with a woman of low condition.

The Dyaks of Sibuyan are remarkable for the superiority of their morals when compared with the generality of the Dyak tribes, believing that immorality is an offence against the higher powers, and that, if a girl becomes a mother before she is married, she angers the deities of the tribe, who show their wrath by visitations upon the whole of the tribe. If, therefore, such a case be discovered, both the erring lovers are heavily fined, and a pig is sacrificed in order to avert the anger of the offended deities. Nor do the delinquents always escape the fine even after the sacrifice of the pig, for every one who was smitten with sickness, or met with an accident, within a month of the sacrifice, has a claim on them for damages, as having been the cause of the misfortune, while, if any one has died, the survivors claim compensation for the loss of their relative.

The reader will remember that the young people of both sexes live with their parents, contributing their labor to the common stock, and being therefore incapable of possessing property of their own. In consequence of this arrangement, the fines which are levied upon the lovers practically fall upon the parents, who therefore take care to look after their daughters, while the young men are partly kept out of mischief by being obliged to sleep together at the head house.

The Dyaks of the Batang Lupar are more lax in their notion of morality than the Sibuyans, and it is seldom that a girl is married until she is likely to become a mother. When this is the case, the lover marries her as a matter of course, but in those cases where a man denies his complicity, and the girl is unable to prove it, she is so bitterly scorned and reproached by her kindred that she generally runs away from the village. Some such delinquents have been known to take poison in order to escape the contempt of their relatives and acquaintances. They are thought to have brought such a disgrace on their family, that the parents sacrifice a pig to the higher powers, and wash the door

(1.) A CANOE FIGHT. (See page 1136.)

(2.) A DYAK WEDDING. (See page 1138.)

of the house with its blood, in order to propitiate the offended deities.

When the pair are married, they almost invariably remain faithful to each other. There is, however, small credit to them for it, inasmuch as they can be divorced on the slightest pretext. An evil omen in the night, such as a "bad bird," will frighten both parties so much that they will separate by mutual consent on the next day. Mr. St. John mentions that many men and women are married seven or eight times before they finally fix upon a partner with whom they mean to spend the rest of their lives, and as an example of the exceeding facility for divorce which exists among the Dyaks, states that he saw a young girl of seventeen who had already had three husbands.

Still, it is very seldom that married couples part after they are parents; and if they do so, the family of the women expect a heavy fine from the fickle husband. Now and then, a married pair are really so attached to each other that they do not like to part, even when they hear the voice of a "bad bird." In such a case they avert the anger of the superior powers by sacrificing a pig, and are then able to remain together without fear. It often happens that a man and wife quarrel, and divorce themselves. After a while, however, they begin to think that they have made a mistake, and are allowed to renew their matrimonial relations without any ceremony or fresh rites of marriage.

Mr. St. John mentions a curious case of jealousy after a divorce, and its consequences.

The Paŋgeran Mumein took a Murout girl, and paid her father as a marriage portion a heavy weight of brass guns—a curious sort of currency which is much valued by the Dyaks, and perfectly useless for any practical purposes. He left her for some time, and then, after she had borne him a child, repudiated her, telling her father that he did not want her any more, unless she liked to follow him to Brunei. This, however, the girl refused to do, so the Paŋgeran made her father refund the brass guns, and besides pay a fine of double the amount, as a penalty for not allowing the girl to go to Brunei, where he meant to have sold her as a slave. The father paid the fine, and was told that the girl might then go where she liked, and marry whom she chose, as was only just after the previous event.

Accordingly, some little time afterward, she did marry one of her countrymen, whereupon the Paŋgeran flew into a fit of jealousy, and ordered the head man or Orang-Kaya of the village to seize them and bring them to him. The Orang-Kaya was afraid, and hid himself, so that the Paŋgeran had to employ the Bisayas, who captured the husband and brought him to their employer. The unfortunate man was then tied up to the Orang-Kaya's landing place, and the Paŋgeran cut him to pieces with his own hand,

finishing by making a present of his head to the Gadong Murut Dyaks. Having thus wreaked his vengeance on the man who excited his jealousy, he allowed the girl and her father to go unharmed. Dyak history is full of similar tales.

Jealousy is by no means confined to the men, the women being far more jealous of the men than they of their wives, and with good reason. There is a tacit law that, whenever a wife detects her husband in flirting, she may beat her rival to her heart's content, provided that she use nothing except a stick, and, if the woman be married, her husband may beat the disturber of his domestic peace, if he can. The usual result of discovery in such cases is, that the man goes off into the bush under the pretext of head hunting, and stays there until he thinks his wife's anger has cooled down. If he is fortunate enough to return with a head, his success as a warrior ensures a condonation for his shortcomings as a husband.

The Dyaks have a code of forbidden degrees for marriages, differing slightly in the various tribes, but tolerably uniform on the whole. Marriage with first cousins is not permitted, they being looked upon as brother and sister; neither, as a general rule, is an uncle allowed to marry his niece. To this latter rule, however, there are exceptions. Marriage with a deceased wife's sister is almost universally permitted, and, in fact, encouraged, provided that the parents of the woman approve of the match, because in that case all the children belong to one family.

Of sport, as we understand the word, the Dyaks have no idea, though they possess all the capabilities for it, being active, daring, and quick sighted. All these characteristics are shown in the mode by which they supply themselves with honey. They do not keep hives in or near their houses, but seldom fail to see a bees' nest in a tree, though the unaccustomed eyes of an European can see nothing of the bees at the great height at which the nests are usually found.

Sometimes the stem of the tree rises for a hundred feet without a branch, and is from fifteen to twenty-five feet in circumference. The Dyaks, however, ascend such a tree with ease. They bore holes in the trunk of the tree as high as they can reach, and drive into them wooden pegs rather more than a foot in length. A stout rattan or a bamboo is then driven into the ground, and the ends of the wooden pegs are lashed to it so as to form a sort of ladder, of which the bamboo forms one side, and the trunk of the tree the other. On this slender ladder they ascend, drive in more pegs, and lash them to the bamboo, adding one bamboo after another until the nest is reached.

Nothing looks more insecure than this primitive ladder, which sways fearfully as the

man ascends, the rattan lashings cracking and creaking as if the whole structure were coming to pieces. It is, however, perfectly adapted for its purpose, and, armed with a flaming torch, the almost naked Dyak ascends, and fearlessly takes the nest, which he lowers down by means of a rattan.

The nest is generally attacked at night, the Dyaks saying the bees always fly after the sparks that fall from the torch, believing them to be the enemy that is disturbing the nest, the man himself escaping unhurt. Some of the tribes have another plan, and before they ascend the tree light beneath it a large fire in which they throw a quantity of green branches. The smoke from these branches drives the bees out of their nest, and stupefies them for a time, so that the combs can be taken without danger.

Of games which are, in fact, an imitation of war, the Dyaks are equally ignorant, and, although so warlike a people, they do not wrestle, nor box, nor race. It would be expected that a people who trust so much to the sword would exercise with sham weapons, for the purpose of accustoming themselves to the proper management of the sword and shield. This, however, they never do, thinking that all such exercises are unlucky.

They have one game which somewhat resembles our swing, but which partakes in some degree of the nature of a religious ceremony. A strong derrick is erected some forty or fifty feet high, and to this is suspended a stout single rattan, which reaches within a few feet of the ground. The derrick is strengthened by rattan stays lashed to a neighboring tree. The end of the rattan is formed into a large loop.

At some distance from the derrick, just where the end of the rattan describes its circle, a slight bamboo stage is erected. One of the swingers mounts on the stage, draws the rattan to him by means of a string, places his foot in the loop, and swings off with as much impetus as he can give himself. As he returns, another leaps on the swing, and sometimes two at a time will do so, until ten or twelve are all swinging away at the same time. Of course, they cannot all put their feet in the loop, but content themselves with clinging to the arms and legs of those who have done so. As they swing, they strike up a monotonous song, which sounds like a dirge. It is, however, merely an invocation to the deities for a plentiful harvest and a good fishing season. As may be imagined, they often get bad falls from those swings.

The boys and youths have a game which is familiar to all gymnasts. The two competitors sit opposite each other on the ground, the soles of their feet being placed in contact. They then grasp a short stick, and each tries to pull the other on his face or to raise him off the ground. There is also a

game which bears a close resemblance to our "prisoners' base," twenty or thirty players joining in the game; and there is another game, which is very much like the "cock fighting" of English school-boys. The players stand on one foot, holding the other foot in one hand and try to upset each other, or at least to make their antagonists put both feet to the ground.

In "cat's cradle" they are wonderful proficient. Mr. Wallace thought that he could instruct them in the game but found that they knew much more about it than he did. They were acquainted with all the mysteries of the English modification of the game, and produced a vast number of additional changes from the string. Indeed, the Dyaks can do almost anything with a piece of string, and they could well instruct our own conjurers in this branch of legerdemain.

Cock fighting is an amusement of which the Dyaks are very fond, though they do not indulge in that amusement with the reckless enthusiasm of the Malays. Mr. St. John writes of the birds used for this purpose: "We did not see more than a few of these birds in Dyak houses, but since they are usually kept, when not in training or exercise, closely wrapped in linen bands and hung on nails in a dry place, they might easily escape our notice.

"Not having the fear of police magistrates and Humane Society prosecutions before our eyes, we assisted at one or two brief combats, evidently mere trial matches to assist the calculations of the 'bookmakers,' by testing each bird's pluck and skill. When this object was attained by a few minutes' struggle, held with much secrecy in the veranda by the gray light of early morning, the cocks were picked up before any injury was inflicted, and carefully swathed in their bandages, from the midst of which they soothed their ruffled feelings with an occasional crow of defiance."

Allusion has already been made to the feasts held by the Dyaks on several occasions, and it is only on such festivities that the men ever use their weapons in sham fight. Even in those cases, they do not so employ them by way of practising themselves, but merely because they form part of the movements of the dance. In one of these dances, described by Mr. Keppel, two swords are laid on a mat in the middle of the room, and two men advance toward them from opposite sides, waving their arms, revolving on their toes, and performing various manoeuvres with their legs.

As soon as they come to the mat, they suddenly stoop, seize the swords, and go through the movements of actual combat, crossing swords, advancing, retiring, cutting at each other, kneeling at one moment as if to collect force, and then springing up with renewed energy. Both dancers have previously studied and practised the various

movements, each of which they make simultaneously.

Sometimes the sword dance is performed with the shield as well as the sword, and of this dance Mr. Marryat has written so graphic an account that his own words must be used. The guests were asked if they wished for a specimen of the war dance.

"Having expressed our wishes in the affirmative, the music struck up; it consisted of gongs and tom-toms. The Malay gong, which the Dyaks also make use of, is like the Javanese, thick with a broad rim, and very different from the gong of the Chinese. Instead of the clanging noise of the latter, it gives out a muffled sound of a deep tone. The gong and tom-tom are used by the Dyaks and Malays in war, and for signals at night, and the Dyaks procure them from the Malays. I said that the music struck up, for, rude as the instruments were, they modulate the sound, and keep time so admirably, that it was anything but inharmonious.

"A space was now cleared in the centre of the house, and two of the oldest warriors stepped into it. They were dressed in turbans, long loose jackets, sashes round their waists descending to their feet, and small bells were attached to their ankles. They commenced by first shaking hands with the rajah, and then with all the Europeans present, thereby giving us to understand, as was explained to us, that the dance was to be considered only as a spectacle, and not to be taken in its literal sense, as preparatory to an attack upon us, a view of the case in which we fully coincided with them.

"This ceremony being over, they rushed into the centre and gave a most unearthly scream, then poising themselves on one foot they described a circle with the other, at the same time extending their arms like the wings of a bird, and then meeting their hands, clapping them and keeping time with the music. After a little while the music became louder, and suddenly our ears were pierced with the whole of the natives present joining in the hideous war cry. Then the motions and the screams of the dancers became more violent, and everything was working up to a state of excitement by which even we were influenced.

"Suddenly a very unpleasant odor pervaded the room, already too warm from the numbers it contained. Involuntarily we held our noses, wondering what might be the cause, when we perceived that one of the warriors had stepped into the centre, and suspended round the shoulders of each dancer a human head in a wide-meshed basket of rattan. These heads had been taken in the late Sakarran business, and were therefore but a fortnight old. They were encased in a wide network of rattan, and were ornamented with beads. Their stench was intolerable, although, as we dis-

covered upon after-examination, when they were suspended against the wall, they had been partially baked, and were quite black. The teeth and hair were quite perfect, the features somewhat shrunk, and they were altogether very fair specimens of pickled heads; but our worthy friends required a lesson from the New Zealanders in the art of preserving.

"The appearance of the heads was a sign for the music to play louder, for the war cry of the natives to be more energetic, and for the screams of the dancers to be more piercing. Their motions now became more rapid, and the excitement in proportion. Their eyes glistened with unwonted brightness, the perspiration dropped down their faces; and thus did yelling, dancing, gongs, and tom-toms become more rapid and more violent every minute, till the dancing warriors were ready to drop. A farewell yell, with emphasis, was given by the surrounding warriors; immediately the music ceased, the dancers disappeared, and the tumultuous excitement and noise were succeeded by a dead silence.

"Such was the excitement communicated, that when it was all over we ourselves remained for some time panting to recover our breath. Again we lighted our cheroots, and smoked for awhile the pipe of peace.

"A quarter of an hour elapsed, and the preparations were made for another martial dance. This was performed by two of the Rajah's sons, the same young men I have previously made mention of. They came forward each having on his arm one of the large Dyak shields, and in the centre of the cleared space were two long swords lying on the floor. The ceremony of shaking hands, as described, preparatory to the former dance, was gone through; the music then struck up, and they entered the arena.

"At first they confined themselves to evolutions of defence, springing from one side to the other with wonderful quickness, keeping their shields in front of them, falling on one knee, and performing various feats of agility. After a short time, they each seized a sword and then the display was very remarkable, and proved what ugly customers they must be in single conflict. Blows in every direction, feints of every description, were made by both, but invariably received upon the shield. Cumbersome as these shields were, no opening was left; retreating, pursuing, dodging, and striking, the body was never exposed.

"Occasionally, during this performance, the war cry was given by the surrounding warriors, but the combatants held their peace; in fact, they could not afford to open their mouths, lest an opening should be made. It was a most masterly performance, and we were delighted with it."

A rather curious dance was witnessed by Mr. Boyle at a feast of which an account will

presently be given. First two chiefs each took a sword, and began a maniacal sort of dance, which was intended to be very imposing, but only succeeded in being very ludicrous, owing to the fact that both were too much intoxicated to preserve their balance, and, being of opposite tempers in their cups, one was merry and the other was sulky.

After this performance was over, a tall chief stepped forward with a whip, much like a cat-o'-nine-tails, another produced a human head, and the two began to chase each other round the veranda of the building. Presently, the chief with the head stopped, and with one foot in the air began to pirouette slowly, while he swung the head backward and forward, the chief with the whip lashing vigorously at the spectators, and laughing derisively at each cut.

After a while these performers became too tired to proceed without refreshment, and their place was taken by four or five others carrying blocks of wood having a feather at each end. The foreign guests took these objects to represent canoes, but were told that they were rhinoceros hornbills, and were thought by all competent judges to be fine works of art. Suddenly a number of gongs were beaten, and over the mass of human beings arose swords, heads, rhinoceros hornbills, and cat-o'-nine-tails in profusion, the Dyaks being for the time half mad with excitement.

It was remarkable that in this wild scene no harm was done, no blow was struck in anger, and no quarrel took place. Decorum was maintained throughout the whole of the festival, though not one of the revellers was sober, and then, as Mr. Boyle remarks, "a scene which, according to all precedent, should have been disgusting, turned out to be pleasantly amusing."

This feast was a very good example of a Dyak revel. It was given by the chief Gasing, who was gorgeously attired for the occasion in an old consular uniform coat, covered with gold lace, the top of a dragoon's helmet tied on his head with a handkerchief, a brass regimental breastplate on his forehead, and a plated tureen cover on his breast. This tureen cover, by the way, was the most valued of Gasing's possessions, and one which was madly envied by all the neighboring chiefs. Being a tall, thin man, the effect of his naked, lean, yellow legs, appearing from beneath all this splendor, was remarkable.

He had prepared his long house carefully for the festival. He had erected a bamboo railing on the edge of the veranda, as a necessary precaution against accidents, for the veranda was at a considerable height from the ground, and the guests are all expected to be very unsteady on their feet, even if they can stand at all. From the top of the rail to the eaves of the veranda he

had thrown a quantity of cloths, so as to allow the chiefs who sat under them to be sheltered from the rays of the sun.

For this festival Gasing had been making preparations for months past, half-starving himself in order to collect the requisite amount of provisions, and being likely to find himself rather deeply in debt before the preparations were completed. Unfortunately for the English guests, the smell of Dyak cookery is anything but agreeable, and one of their favorite articles of food, the fruit called the durian, exhales a most intolerable odor, so that, if they had not been furnished with plenty of tobacco, they would have been obliged to retire from the scene.

The Dyaks roast fowls without removing the feathers, tear them joint from joint, and so eat them. They have a most extraordinary liking for viands in a nearly putrid state, such as fish or molluscs in a very advanced state of decomposition, eggs black from age, and rotten fruit, the chief being the durian, which smells like all the other dishes put together, but with a sort of peculiar fragrance of its own. Even foreigners have learned to like the durian, but they have not found that it acclimatizes them to the bad eggs, burnt feathers, and very high fish.

This very remarkable fruit is about as large as a cocoa-nut, slightly oval, and is covered with a thick, tough skin, armed with sharp, short, and stout spines, the bases of which touch each other. The skin is so strong, that even when it falls, as it always does when ripe, from a considerable height, it does not break, and the spines are so sharp and hard, that, if a durian falls on a man, it inflicts a very severe wound, and causes great loss of blood.

When possible it is eaten fresh, as it falls ripe from the tree, but it is often cooked while still green, and, when especially plentiful, is preserved in jars by means of salt. In this state its natural odor is very greatly increased, and the very opening of a jar of preserved durians is enough to drive a stranger to the country out of the room.

Mr. Wallace gives a very interesting account of the durian, mentioning that, although for some time the odor of the fruit completely deterred him from tasting it, he once found a ripe durian just fallen from the tree, overcame his repugnance to the fruit, tried it, ate it, and became from that moment a confirmed durian eater. The following passage contains his description of the peculiar flavor of the durian:—

"The five cells are satiny white within, and are each filled with an oval mass of cream-colored pulp, embedded in which are two or three seeds about the size of chestnuts. This pulp is the eatable part, and its consistence and flavor are indescribable. A rich, butter-like custard, highly flavored

with almonds, gives the best general idea of it, but intermingled with it come wafts of flavor that call to mind cream cheese, onion sauce, brown sherry, and other incongruities.

"Then there is a rich glutinous smoothness in the pulp which nothing else possesses, but which adds to its delicacy. It is neither acid, nor sweet, nor juicy, yet one feels the want of none of these qualities, for it is perfect as it is. It produces no nausea or other bad effect, and the more you eat of it the less you feel inclined to stop. In fact, to eat durians is a new sensation, worth a voyage to the East to experience."

Mr. Wallace, in summing up the merits of the various fruits with which we are acquainted, says that if he had to fix on two only, which would represent the very perfection of flavor and refreshing qualities, he would choose the durian and the orange, which he terms the king and queen of fruits.

Their national drink, called "tuak," is worthily matched with the viands. It is in color like thin milk, and its odor has been forcibly compared to that of five hundred negroes drunk in a slave-pen. The same traveller, having fortified his palate with the strongest tobacco, drank some of the liquid in honor of his host, and gives a very vivid description of its flavor. When first taken into the mouth, it gives the idea of cocoa-nut milk gone very sour, and holding in solution a considerable quantity of brown sugar and old cheese. When it is swallowed, the victim is conscious of a suffocating sensation, as if the liquid were thickened with starch and a great quantity of the strongest cayenne pepper, the general effect produced on the novice being comparable to nothing but a very bad attack of sea sickness.

Strange to say, this abominable liquid retains the strongest hold on three millions of human beings, who can conceive no greater luxury than the privilege of drinking it without stint. At their feasts it is kept in huge bathing jars, and is handed about in all kinds of vessels, which are continually emptied and sent back to be replenished, so that a continual stream of full and empty vessels passes from and to the large jars.

Even if the warriors who are invited to the festival were to feel inclined to sobriety, they would be forced to drink by the women, who seem to think themselves bound to make every man completely intoxicated. "No Delilah of Europe better knows her power to make a fool of a strong man than one of these Dyak syrens, nor is more inclined to exert her fascinations.

"The presence of the female element was soon felt in the noise and confusion, which absolutely seemed to increase. Several of the girls were so charming as to excuse the

infatuation of their victims, and I need scarcely say that the prettiest were the most culpable. But ugly or beautiful, old or young, all instantly employed their most cunning arts in enticing the bravest and most famous warriors to drink and drink again.

"We saw a little beauty seat herself lovingly beside a tall fellow with a simple face and honest eyes, whom she coaxed to toast her from a large jar which she offered to his lips, until he fairly fell backward upon the floor. This satisfactory conclusion attained, his tormentor, who, we heard, was affianced to him, ran screaming with laughter to bring seven other wretches as mischievous as herself to jeer at the vanquished lover. Raising her hopes to sport of a higher order, she shortly after brought her jar to the spot where we sat, in the hope, no doubt, of beguiling the white men into the same condition as her other admirers; but in Europe we are accustomed to run the gauntlet of more dangerous fascinations, and she relinquished the attempt in despair."

Mr. St. John mentions that the men are in no way behind the women in their efforts to seduce their guests to intoxication, and it is their greatest pride to have as much tuak drunk as possible, to drink their own share and remain comparatively sober, while all their guests are laid prostrate and insensible. In fact, if we substitute punch and port for tuak, and an open veranda for a closed dining-room, there is little difference between the hospitality of the present Dyak chief and that of the average English squire of the last century.

A chief, for example, who prides himself on his strong head, will sit before a huge jar of tuak, and pledge every one around. For every one whom he serves he drinks one cup himself, and it is his ambition to keep his seat after all his companions are insensible. Of course, it is impossible that any man can drink an equal amount with ten or twelve others, and it is most likely that he forces the tuak on them so fast that they are soon rendered incapable of seeing whether their host drinks or not. They are very proud of being fresh on the following morning, and boast that although their guests, who belonged to another tribe, had severe headaches, they themselves suffered nothing at all.

It is partly by means of appealing to this pride that the girls are able to make the men drink to the extent which has been mentioned, and they derive so much amusement from exercising their power that they lose no opportunity that falls in their way, and essay their blandishments even when there is no definite feast.

Once, when Mr. St. John had travelled from the Sibuyan Dyaks to the Bukars, he and his guides were received, as usual, in

the head house. While the English guests were making their toilet, two young Dyak girls came very gently up the ladder and slipped into the chamber. Now the head house is, as the reader may remember, the bachelors' hall, and consequently the girls had no business there. So, pretending not to see them, the white men proceeded with their toilets, and quietly watched their proceedings.

The two girls, after glancing cautiously at the strangers, and thinking themselves unobserved, made their way to the Dyak guides, each having in her hands a vast bowl of fresh tuak, which they offered to the visitors. The young men, knowing their object, declined to drink, and thereby drew on themselves a battery of mixed blandishments and reproaches. Above all, they were entreated not to inflict on the girls the shame of refusing their gift, and making them take it back, to be laughed at by all their friends.

Cajolery, honied words, and caresses, having been resisted, they tried the effect of ridicule, and their taunts succeeded where their coaxings failed. "What!" said they, "are the Sibuyans so weak-headed as to be afraid of drinking Bukar tuak?" This touched the visitors on a very tender point. The Sibuyans specially pride themselves on the strength of their heads and of their tuak, and a refusal to drink was thus made tantamount to a confession of inferiority in both respects. So they raised the huge bowls to their lips, and were allowed no

peace until they had drained the last drops, when their tempters ran away laughing, knowing that in a very short time their two victims would be senseless.

It is a most extraordinary thing that the Dyak women, most of whom do not drink at all, and very few drink even moderately, take such a delight in forcing the men into intoxication. The young girls are the most successful temptresses. They take advantage of their youth and beauty, and employ all their fascinations to inveigle the men into drinking. No man is safe from them.

Their brothers, friends, and even their betrothed, fall, as we have seen, victims to their blandishments. They will make up to perfect strangers, get up a flirtation, and lavish all their enchantments upon them like Circe of old, until they have reduced their helpless admirers to a state little better than that of the mythological swine. Even after the men have sunk on the ground, and are incapable of raising the cup to their lips, the women think their task not quite completed, and pour the tuak down the throats of the helpless men. In the "Dyak Feast," which the artist has so finely drawn on the opposite page, the appeal and dresses of these Eastern syrens are illustrated.

Yet, although on such occasions they give themselves over to utter drunkenness, the Dyaks are a sober race, and except at these feasts, or when beset by women, they are singularly temperate, the betel-nut supplying the place of all intoxicating liquor.

A DYAK FEAST.
(See pages 1145, 1146.)

CHAPTER CXVIII.

BORNEO. — *Continued.*

ARCHITECTURE — MANUFACTURES.

AERIAL HOUSES — THE LONG HOUSE AND ITS ARRANGEMENTS — THE ORANG-KAYA'S ROOM — STRUCTURE OF THE FLOORING — REASONS FOR THE DYAK ARCHITECTURE — THE NIPA PALM AND ITS USES — THE ATAPS — SALT AND SUGAR MANUFACTURE — ERECTION OF THE FIRST POST — VARIOUS MODES OF PROCURING FIRE — CONSTRUCTION OF THE DYAK BRIDGE — A NARROW ESCAPE. — MANUFACTURES — THE ADZE AXE OF THE DYAKS — ITS ANALOGY WITH THE BANYAI AXE — SMELTING AND FORGING IRON — BASKET MAKING — THE DYAK MAT — SPLITTING THE RATTAN — THE BORNEAN KNIFE, AND MODE OF USING IT — THE SACRED JARS AND THEIR PROPERTIES.

THE architecture of the Dyaks is very peculiar. The reader may find a Dyak village represented on page 1153.

In the first place, the houses are all built on posts, some of them twenty feet in height, and the mode of access to them is by climbing up a notched pole, which answers the purpose of a ladder. The chief dwelling in every village, and indeed practically the village itself, is the long house, which is of wonderfully large dimensions. One of these houses, measured by Mr. St. John, was more than five hundred and thirty feet long, and was inhabited by nearly five hundred people.

Throughout the entire length of the house runs the broad veranda or common room, which is open to all the members, and at the side are rooms partitioned off for the different families, as many as sixty or seventy such rooms being sometimes seen in one long house. Although the veranda is common ground to all the tribe, and in it the members go through their various sedentary occupations, each family occupies by tacit consent the portion of the veranda opposite their own rooms.

These rooms are strictly private, and none except the members of the family, or their intimate friends, would think of entering them. The chief or Orang-kaya of the long house has a much larger room than the others, and the space in front of his room is considered to be devoted to the use of the lesser chiefs and councillors, and, although

free to all the inhabitants, is frequented almost entirely by the old men and warriors of known courage.

One of the rooms inhabited by the Orang-kaya was visited by Mr. Boyle, and was not an attractive apartment. On each side of the entrance there was a piece of furniture somewhat resembling an old English plate-rack, upon the lower shelf of which was placed a flat stone. In spite of the heat, which was terrific, a large fire was burning on the stone, and on the range above were wood, rice, pots, and other utensils. There was no chimney to the house, but a sort of flap in the roof was lifted up, and kept open by a notched stick. This flap answered both for window and chimney, and when it was closed the room was in total darkness, beside being at once filled with smoke.

The height of the chamber was barely seven feet, and the space was rendered still more limited by the weapons, girdles, mats, mosquito curtains, strings of boars' tusks, aprons, and other property, that hung from the rafters. The sides were adorned with a quantity of English and Dutch crockery, each piece being in a separate rattan basket and suspended from the wall. The house being an old one, the smell was abominable; and the Orang-kaya's chamber was, on the whole, a singularly uncomfortable residence.

A number of fire-places, varying according to the population of the house, are arranged along the veranda, and, as a general rule, one of the primitive ladders already

mentioned is placed at either end, so that when a visitor enters the house, he sees throughout its entire length, the range of his eye being only interrupted by the posts, which after supporting the floor pass upward and serve also to support the roof. Outside this veranda extends another, called the outer veranda. It has no roof, and is exposed to the blazing sunbeams. It is used, not as a habitation, but as a kind of store-house and drying ground.

As the flooring is made of bamboo, the Dyaks can easily, if they choose, keep the interior of their rooms clean. This, however, they seldom choose to do, limiting their cleanliness to the simple process of sweeping any offal through the floor so as to fall under the house. They never think of removing it after it has fallen, so that by degrees the heaps of refuse become higher and higher, and gradually diminish the distance between the floor of the house and the soil beneath. In some of the older houses, these heaps of rubbish have increased to such an extent that when the pigs are grubbing in them their backs touch the bamboo flooring of the house.

The reason for building the Dyak houses on piles are several, the chief being that such a house acts as a fort in case of attack. The custom of building on piles is universal, but only those tribes that are liable to invasion employ piles of the height which have been mentioned. This mode of architecture also protects the inhabitants from floods and from the intrusion of reptiles. The Dyaks do not use the bow and arrow, and before they learned the use of fire-arms, a house built on piles some twenty or thirty feet in height made a very secure fort, which could not be fired, and which exposed the storming party to certain and heavy loss. Even since the English have taken up their residence in Borneo, some of these houses, belonging to revolted chiefs, have given great trouble before they could be taken, artillery appearing to be the only weapon to which they at once succumb.

The piles are made of the hardest iron-wood, and are very thick, much thicker than is needed for the support of the house. The reason for this strength and thickness is, that in case of attack, the assailing party dash under the house, protecting themselves from missiles by a canoe which they turn keel upward, and hold over their heads while they chop at the posts, so as to bring the house and its defenders down together. If the posts are but moderately stout, they will sometimes succeed; but if they are very thick and strong, the defenders can remove part of the floor, and throw on the attacking party weights sufficiently heavy to break through their roof and kill them.

It is probable that the custom of building houses on piles is partly derived from the Malay fashion of erecting buildings over the

water. The Dyaks copied this plan, and became so used to it that when they built inland they still continued the practice. The same theory accounts for the habit already mentioned of throwing all kinds of offal through the open bamboo flooring. This custom was clean enough when the houses were built over the water, but became a source of utter pollution when they were erected on land, and the offal was allowed to accumulate below, undisturbed except by the dogs and pigs.

Most of these houses are built rather high up the rivers, especially upon the tributary streams; and booms, composed of bamboos and rattans, are fastened across the stream below them, so as to hinder the advance of the enemy's canoes. The thatch, as well as a considerable portion of the material, is obtained from the nipa palm, a tree which to the Borneans is almost a necessity of existence, and supplies a vast number of their wants. It grows in large numbers at the water's edge; its huge leaves, fifteen or twenty feet in length, projecting like the fronds of vast ferns.

When dried, the leaves are woven into a sort of matted fabric called "ataps," which is used sometimes as thatch, sometimes as the indispensable covering of boats, and sometimes even as walls of houses, the mats being fastened from post to post. By the use of these ataps certain portions of the roof can be raised on sticks in trap-door fashion, so as to answer the double purpose of admitting light and securing ventilation.

Various other mats are made of the nipa palm leaf, and so are hats and similar articles. The entire leaf is often used in canoes as an extemporized sail, the leaf being fastened upright, and driving the boat onward at a very fair pace. Besides these uses the nipa leaves, when young, are dressed as vegetables, and are both agreeable and nutritious, and the fine inner leaves, when dried, are rolled round tobacco so as to form cigars.

From the root and stem a coarse sugar is made, which is used for all general purposes; for, although the sugar-cane grows magnificently in Borneo, the natives only consider it in the light of a sweetmeat. It seems rather strange that sugar and salt should be extracted from the same plant, but such is really the case, and salt-making is one of the principal occupations of some of the tribes.

They gather great quantities of the nipa root, and burn them. The ashes are then swept together, and thrown into shallow pans half filled with water, so that the salt is dissolved and remains in the water, while the charcoal and woody particles float at the surface, and can be skimmed off. When the water is clear, the pans are placed over the fire and the water driven off by evaporation, after which the salt, which remains on the bottom and sides of the pans, is scraped off.

It is of a coarse and decidedly bitter character, but it is much liked by the natives, and even the European settlers soon become accustomed to it. Salt is imported largely from Siam, but the Borneans prefer that of their own manufacture for home use, reserving the Siamese salt for preserving fish.

The nipa and the mangrove grow in similar localities and on the same streams, and are useful to those who are engaged in ascending rivers, as they know that the water is always shallow where the mangrove grows, and deep near the nipa.

In the olden times, when a long house was projected, the erection of the first post was always accompanied by a human sacrifice, precisely as has been mentioned of several other parts of the world. Mr. St. John saw one of these houses where a human sacrifice had been made. A deep hole was dug in the ground, and the huge post, which, as the reader may remember, is cut from the trunk of the hardest and heaviest wood which can be found, was suspended over it by rattan lashings. A girl was laid at the bottom of the hole, and at a given signal the lashings were cut, permitting the post to drop into the hole, and crush the girl to atoms.

The same traveller saw a ceremony among the Quop Dyaks, which showed that the principle of sacrifice still remained, though the victim was of a different character. The builder wanted to raise a flag-staff near his house, and proceeded on exactly the same plan. The excavation was made, the pole was suspended by a rattan, but, instead of a human being, a fowl was bound and laid at the bottom of the hole, so as to be crushed to death when the lashings were cut.

These houses are often approached by bridges, which are very curious structures, so apparently fragile that they seem unable to sustain the weight of a human being, and of so slight a character that to traverse them seems to imply the skill of a rope dancer. As these houses are often built on the side of a steep hill, a pole is laid from the platform to the hill, and, if it be a tolerably long one, supported by several rattan ropes fastened to trees. A very slight bamboo handrail is fastened a little above it, and the bridge is considered as complete.

One of these simple bridges is shown in illustration No. 2, on the 1153d page, which gives a good idea of the height of the house and its general style of architecture. Near the foreground is a man engaged in making fire by means of twirling one stick upon another, precisely as is done by the Kaffirs and other savage tribes. There is, however, one improvement on the usual mode. Instead of merely causing a pointed stick to revolve upon another, the Dyaks use instead of the lower stick a thick slab of very dry wood, with a deep groove cut on

one side of it, and a small hole on the other, bored down to the groove.

When the Dyak wishes to procure fire, he places the wooden slab on the ground with the groove undermost, and inserts his pointed stick in the little hole and twirls it rapidly between his hands. The revolution of the stick soon causes a current of air to pass through the groove, and in consequence the fire is rapidly blown up as soon as the wood is heated to the proper extent. In consequence of this arrangement, much labor is saved, as the firemaker is not obliged to stop at intervals to blow upon the just kindled dust which collects in the little hole around the firestick. Some tribes merely cut two cross grooves on the lower piece of wood, and insert the point of the firestick at their intersection.

The Saribas and Sakarrang Dyaks have a very remarkable instrument for obtaining fire, called by them "besi-api." It consists of a metal tube, about three inches in length, with a piston working nearly air-tight in it. A piece of dry stuff by way of tinder is introduced into the tube, the piston rod is slapped smartly down and withdrawn with a jerk, when the tinder is seen to be on fire. Europeans find that to manage the besi-api is as difficult a task as to procure fire by two sticks. The reader may remember that a machine of similar construction is sold at the philosophical instrument makers, and that a piece of German tinder is lighted by the sudden compression of the air.

Another form of the besi-api is thus described by Mr. Boyle:—"Among some of the Dyak tribes there is a manner of striking fire much more extraordinary. The instrument used is a slender cube of lead, which fits tightly in a case of bamboo. The top of the cube is hollowed into a cup, and when fire is required this cup is filled with tinder, the leaden piston is held upright in the left hand, the bamboo case is thrust sharply down over it, as quickly withdrawn, and the tinder is found to be lighted. The natives say that no metal but lead will produce the effect."

The same traveller gives an account of another mode of obtaining fire:—"Another interesting phenomenon these natives showed us, which, though no doubt easily explained on scientific principles, appeared very remarkable. As we sat in the veranda my cheroot went out, and I asked one of the Dyaks squatted at our side to give me a light.

"He took from his box of bamboo a piece of pitcher and a little tinder; put the latter upon the pitcher and held it under his thumb, struck sharply against the bamboo, and instantly offered me the tinder lighted. Several times subsequently we watched them obtain fire by this means, but failed to make out a reasonable theory for the result."

Even rivers are bridged over in the same simple, but really efficacious manner, as the approaches to the houses. The mountain streams alternate greatly in depth and rapidity, and it is no uncommon occurrence for a heavy rain to raise a river some forty feet in its deep and rocky channel, and even after a single heavy shower the fords are rendered impassable. In consequence of this uncertainty, the Dyaks throw across the chasms such bridges as are described by Mr. St. John:—

“How light and elegant do these suspension-bridges look! One, in particular, I will attempt to describe. It was a broad part of the stream, and two fine old trees hung over the water opposite to each other. Long bamboos lashed together formed the main portion, and were fastened by smaller ones to the branches above; railings on either side were added to give greater strength and security, yet the whole affair appeared so flimsy, and was so far above the stream, that when we saw a woman and child pass over it we drew our breath until they were safe on the other side. And yet we knew that they were secure.

“I have often passed over them myself; they are of the width of one bamboo, but the side railings give one confidence. Accidents do happen from carelessly allowing the rattan lashings to rot. Once, when pressed for time, I was passing rapidly across with many men following close behind me, when it began to sway most unpleasantly, and crack! crack! was heard as several of the supports gave way. Most of my men were fortunately not near the centre, and relieved the bridge of their weight by clinging to the branches, otherwise those who were with me in the middle would have been precipitated on the rocks below. After that, we always passed singly over such neglected bridges.”

THE domestic manufactures of the Dyaks are of a very high order, and display a wonderful amount of artistic taste. The mode of building canoes has already been mentioned, but the principal tool of the canoe maker is too curious to be passed over. The implement in question is singularly ingenious, combining within itself a number of qualifications. The general appearance of it can be seen by reference to the illustration, which is drawn from a specimen presented to me by C. T. C. Grant, Esq.

It is apparently a most insignificant tool, hardly worthy the hands of a child; and yet, when wielded by a Dyak, it produces the most remarkable results. The handle is only ten inches in length, and the blade measures barely an inch and a quarter across the widest part. The handle is made of two portions, united with a strong lashing of rattan, backed up by cement. The lower portion, which is curved exactly

like the hilts of the Dyak swords, is made of a soft and light wood, while the upper part, which carries the head, is made of a hard, strong, and moderately elastic wood.

ADZE-AXE.

The head is made of iron, mostly imported, and is in all probability formed on the model of a stone implement that was formerly in use. As the reader may see, it is fastened to the wood by rattan, exactly as the stone heads of the Polynesian axes are held in their places by lashings of plaited sinnet.

But here the resemblance ends. The head of the Polynesian axe is immovable, whereas the essence of the Bornean axe is that the head can be shifted at will, by taking it out of the rattan lashing, reversing and replacing it, so that it forms an axe or an adze, as the user desires. The reader may remember that the Banyai tribe of Southern Africa have an axe made on a similar principle, though in their case the reversal is accomplished by cutting holes at right angles to each other, through which the shank of the iron head can be passed. (See p. 364, figs. 4, 5.)

With this tiny instrument the Dyaks not only shape their planks, but cut down the largest trees with a rapidity that an English workman could scarcely equal, in spite of the superiority of his axe. They have a very curious method of clearing away timber from a space of ground. They first cut away all the underwood with their parangs, or choppers, and then, with their little axes, cut the larger trees rather more than half through, leaving the largest to the last. This tree is then felled, and, as all the trees are bound together with rattans and other creepers, it brings down all the others in its fall.

Although the iron which the Dyaks use is mostly imported, they are capable of smelting their own metal by a very simple proc-

(1.) A DYAK VILLAGE.

(See page 1149.)

(2.) A DYAK HOUSE.

(See page 1151.)

ess. By way of a crucible, they dig a small pit in the ground, and perforate the sides with holes, through which currents of air can be passed by means of the native bellows. Charcoal is first placed in the pit, and then the ore, well broken, is laid on the charcoal; and so the Dyak workmen proceed to fill the pit with alternate layers of charcoal and ore. A light is then introduced by means of a hole, the bellows are worked, and in a short time the metal is smelted. Although each man is generally capable of making his own tools on a pinch, there is generally a man in each village who is a professional blacksmith, and makes his living by forging spear heads and parang blades, as well as by keeping the weapons of the villagers in repair.

The basket work of the Dyaks is exceedingly good, color as well as form being studied in the manufacture. The basket called tambok is made of the nipa palm leaf, cut into strips not quite the twelfth of an inch wide, and stained alternately yellow and red. These are interwoven so as to produce a considerable variety of pattern, somewhat resembling that which is used in the sarongs and other woven fabrics. These patterns are nearly all combinations of the square, the zigzag, and the diamond; the last form, however, being nothing more than the square turned diagonally.

Although made in cylindrical form, the tambok is slightly squared by means of four strips of hard red wood, which are tightly fastened to the basket by rattan lashing. The bottom of the basket is squared in a similar manner, so as to flatten it and enable it to stand upright, and is defended by thicker strips of wood than those which run up the sides. The lid is guarded by two cross-strips of wood, and both the lid and the top of the basket are strengthened by two similar strips bound firmly round their edges. This basket is exceedingly light, elastic, strong, easily carried, and fully warrants the estimation in which it is held. Tamboks are made of almost all sizes, and are extensively used by the Dyaks, the Malays, and the European colonists.

Mats of various kinds are made by this ingenious people. One of these mats, which is in my possession, is a wonderful specimen of Dyak work. It is nine feet long and five wide, and is made of rattan, cut into very narrow strips—not wider, indeed, than those of the enlarged patterns of the tambok basket. These strips are interwoven with such skill as to form an intricate and artistic pattern. The centre of the mat is occupied by a number of spiral patterns, two inches in diameter, the spiral being produced by extensions of the zigzag already mentioned.

Around the spirals are three distinct borders, each with a definite pattern, and the whole is edged by a sort of selvage, which

gives strength to the fabric, and prevents it from being torn. This kind of mat is exceedingly durable, the specimen in question having been long used in Borneo, then brought over to England, and employed as a floor-cloth; and, although cut in one or two places by chair-legs, is on the whole as firm as when it was made. As the rattan has not been dyed, the color of the mat is a pale yellow; but the pattern comes out with wonderful distinctness, just as is the case with good English table linen.

Like all uncivilized people, the Dyaks never hurry themselves about their manufactures. Time is no object to them; there is none of the competition which hurries European workmen through life. The women, who make these beautiful mats, go about their work in a very leisurely way, interweaving the slender rattan strips with infinite care, and certainly producing work that is thorough and sound.

The rattan is split in rather a curious manner. On account of the direction and length of its fibre, it will split almost *ad infinitum* into perfectly straight strips of very great length, so that the only difficulty is to cut the slips of precisely the same width. The knives with which this task is performed are rather peculiar. One of them has already been described on page 1125, as an appendage to the Bornean sword; but there is another which is so remarkable that it deserves a separate description.

The handle is bent at an angle like that of the parang-latok, described and figured on the page to which reference was just made. In order to produce this effect, the handle is made of two pieces of wood, the ends of which are bevelled off, so that when they are placed together they produce the angular form which is desired. The two pieces are fitted very neatly together, and the joint is strengthened by a thick coating of cement. The handle is further ornamented by having a long piece of brass wire coiled tightly round it, and is finished off at the end with the same kind of cement as that which is used at the joint.

Not only does the handle resemble that of the parang, but there is a great resemblance between the blades of the sword and the knife. The blade of this knife has been forged out of a square bar of steel, which has been first flattened, and then beaten out into the slightly curved form which is so largely used throughout the whole of this part of the world.

As is the case with the sword knife already described, this implement is used by putting the handle under the left arm and holding the blade firmly in front of the body, while both hands are at liberty to press the end of the rattan against the edge of the knife, and so to split it into as many strips as are needed. In spite of the comparative roughness of the manufacture, which dispenses with a finish

and polish, the knife can take a very fine edge; and my own specimen, after having suffered rather rough usage, is so sharp that I have just mended a pen with it, and cut a piece of note paper edgewise. The blade of this knife is eleven inches in length.

In order to preserve the sharpness of the edge, the Dyak carries the knife in a sheath made simply of a small joint of bamboo, closed at the lower end of the natural knot, and carefully wrapped at each end with rattan to prevent it from splitting.

The cotton fabrics are entirely made by the women, from the preparation of the thread to the weaving of the stuff. They beat out the cotton with small sticks, and, by means of a rude sort of wheel, spin it out into thread very rapidly. They cannot compete with the English manufacturer in fineness of thread, but in durability there is no comparison between the two, the Dyak thread being stronger than that made in England, and the dye with which it is stained being so permanent that no fabric wears so well as that which is of native manufacture.

Although we can hardly rank the Dyak jars among native manufactures, they play so important a part in the domestic life of these tribes that they cannot be passed over without some notice.

The Dyaks have no real currency, and can scarcely be made to understand it. They perfectly comprehend direct barter, but the secondary barter by means of a circulating medium is, as a rule, beyond an ordinary Dyak. He will take some goods to the market for the purpose of exchanging them for some article which he wants; but he has no idea of selling his goods for money, and buying with that money the needed article.

The reader may remember that brass guns have already been mentioned as a sort of currency. These are nothing more or less than cannon of various sizes, which are valued by weight, and form a sort of standard by which prices are measured, like the English pound or the French franc. They are bored to carry balls from one to two pounds weight, and, though regarded chiefly in the light of money, are serviceable weapons, and can throw a ball to a considerable distance. There is an advantage about this kind of currency. It is not easily stolen, and outside the chiefs' houses may be seen rows of brass guns lying on the ground unmounted and owing their safety to their weight.

There is also a second standard of value among the Dyaks. This is the Jar, an in-

stitution which, I believe, is unique. These jars are of earthenware, and as far as can be judged by appearance, must have been of Chinese manufacture. They are of different descriptions, and vary greatly in value. The commonest jars, called Naga or Dragon jars, are worth about seven or eight pounds, and derive their name from figures of dragons rudely scrawled on them. They are about two feet in height. The Rusa jar, which is next higher in value, is worth from ten to fifteen pounds, according to its quality, and is known by the figures of the Rusa deer which are drawn upon it.

But the most costly is the Gusi, which is worth almost any sum that the owner chooses to demand for it. The Gusi jar is neither large nor pretty. It is of a dark olive green color, and about two feet in height. These jars are very scarce, and are considered as being worth on an average about five hundred pounds. Seven or eight hundred pounds have been paid for a Gusi jar, and there have been one or two so valuable that many thousands pounds have been offered and refused for them.

Mr. St. John mentions a jar of this kind belonging to the Sultan of Brunei, which derived its chief value from the fact that it spoke on certain great occasions. For example, the Sultan declared that on the night before his wife died the jar uttered hollow moaning sounds, and that it never failed to apprise him of any coming misfortune by wailing pitifully. This jar is kept in the women's apartments, and is always covered with gold brocade, except when wanted for consultation, or to exhibit its medicinal properties. Water poured into a Gusi jar is thought by the Dyaks and by the Malays to be the best possible medicine for all kinds of diseases, and, when sprinkled over the fields, to be a certain means of procuring a good crop. As the people are willing to pay highly for this medicated water, there is some reason for the enormous cost of these jars.

One of them is said to possess a quality which belongs to itself. It increased everything that was put into it. If, for example, it were half filled with rice in the evening it would be nearly full in the morning; and if water was poured into it, a few hours would increase the depth of water by several inches. It is remarkable that the art of making these jars is lost. The Chinese, admirable imitators as they are, have always failed when they have endeavored to palm off upon a Dyak a jar manufactured by themselves.

CHAPTER CXIX.

BORNEO.—*Concluded.*

RELIGION — OMENS — FUNERALS.

THE STATE OF RELIGION AMONG THE DYAKS—THEIR BELIEF IN A SUPREME BEING—THE VARIOUS SUBORDINATE GODS—THE ANTUS, AND THEIR FORMS—CATCHING A RUNAWAY SOUL—THE BUAU AND HIS NATURE—ORIGIN OF LAND LEECHES—CHARMS, AND THEIR VALUE—OMENS—THE GOOD AND EVIL BIRDS—A SIMPLE CAUSE OF DIVORCE—THE ENCHANTED LEAF—THE ORDEALS OF DIVING, BOILING WATER, SALT, AND SNAILS—THE ENCHANTED WATER—A CURIOUS CEREMONY—DYAK FUNERALS—THE OFFICE OF SEKTON.

THE religion of the Dyaks is a very difficult subject, as the people themselves seem to have an exceedingly vague idea of it, and to be rather unwilling to impart the little knowledge which they have. It is tolerably clear that they have an idea of a Supreme Being, whom they call by different names, according to their tribes; the Sea Dyaks, for example, calling him Batara, and the land Dyaks Tapa. Next to the Supreme, by whom mankind was created, were some very powerful though inferior deities, such as Tenabi, who made the earth and the lower animals; Iang, who taught religion to the Dyaks, and still inspires them with holiness; and Jirong, the lord of life and death.

Besides those chief deities there are innumerable Antus or minor gods, which correspond in some degree to the fauns and satyrs of the ancients. They are called by many names, and as, according to Dyak ideas, there is scarcely a square rod of forest that does not contain its Antu, the people live as it were in a world peopled with supernatural beings. Some of them even declare that they have seen the Antus, the chief distinction of whom seems to be that they have no heads, the neck being terminated in a sharp point. They are capable of assuming the form of a human being or of any animal at will, but always without heads, so that they can be at once recognized.

The story of one of these Antu-seers is a very strange one. He declared that he saw a squirrel in a tree, threw a spear at it, and

brought it to the ground. When he went to pick it up, it suddenly rose, faced him, and changed itself into a dog. The dog walked a few paces, changed again into a human being, and sat slowly down on the trunk of a fallen tree. The body of the spectre was parti-colored, and instead of a head it had a pointed neck.

The Dyak ran off in terror, and was immediately smitten with a violent fever, his soul having been drawn from the body by the Antu, and about to journey toward the spirit world. The doctor, however, went off to the spot where the Antu appeared, captured the fugitive soul, brought it back, and restored it to the body by means of the invisible hole in the head through which the Antu had summoned it. Next morning the fever was gone, and the man was quite well.

They tell another story of one of these inimical beings, who are supposed to be ghosts of persons killed in battle, and called Buaus. A Buau pounced upon a woman named Temunyan during her husband's absence, carried her off, and by his magic arts fixed her against a rock from which she could not move. When the husband returned, he went in search of his wife, and, having found her, concocted a scheme by which the Buau was induced to release her. By stratagem the husband contrived to destroy the Buau, and took his wife home.

She had, however, scarcely reached her home when she gave birth to a horrible being, of which the Buau was the father. Her husband instantly chopped it into a thousand pieces with his parang, and flung

it into the jungle, when each fragment took life, and assumed the blood-sucking character of the demon parent. And thus the Bauu was the original parent of land-leeches.

In order to propitiate these beings, the Dyaks are in the habit of making offerings of food, drink, and flowers to them before they undertake any great task, mostly putting the food into dishes or baskets, and laying it in the jungle for the use of the Antus.

Satisfied apparently with the multitude of their deities, the Dyaks possess no idols, a fact which is really remarkable, as showing the character of their minds. Charms, however, they have in plenty, and place the greatest reliance on them. Some charms are credited as rendering the wearer invulnerable, and it is likely that those attached to the parang described on page 1125 are of that character.

Mr. St. John mentions an amusing example of the value set upon these charms. There was a chief of very high rank, who possessed some exceedingly potent charms, which had been in his family for many generations, and had been handed down from father to son. They consisted of two round pebbles, one flat pebble, a little stone which had been found in a bauana, and some sand. All these valuables were sewed up together and fastened to a string, by which they could be attached to the waist in times of peril.

Unfortunately, the chief lent these charms to a man who lost them, and was sued by the aggrieved owner before the English court. He gained his case, but was nearly as much dissatisfied with the court as with the defendant, inasmuch as he estimated the value of the charms at a Rusa jar, *i. e.* about thirty dollars, or seven pounds, whereas the value set on them by the court, and paid by the defendant, was fivepence.

Allusion has been already made to the birds on which the Dyaks so much rely as omens. These are three in number, the Kushah, the Kariak, and the Katupung. When a Dyak is about to start on an expedition, he goes to the place near the village where the feasting sheds are built, and there waits until he hears the cry of one of these birds. Should either the kushah or the katupung cry in the front, or on either side, and not be answered, the omen is bad, and the man gives up his expedition. It is a good sign, however, if the bird should first cry on one side and then be answered on the other. The most important bird is the kariak. If the cry of the kariak be heard on the right, the omen is good; if on the left, it is doubtful. But if the cry be heard behind the diviner, the omen is as bad as it can be, and portends at least sickness, if not death.

The Dyaks scarcely engage in any undertaking without consulting the birds, whom

they believe to be half Dyaks, all birds having proceeded from the union of an Antu with a Dyak woman.

Mr. Brooke, in treating of this subject, has the following forcible remarks:—"Some of our party of Dyaks had proceeded, but most were yet behind, and will be sweeping down for the next week or more. Many go through the forms of their forefathers in listening to the sounds of omens; but the ceremony is now very curtailed, compared with what it was a few years ago, when I have known a chief live in a hut for six weeks, partly waiting for the twittering of birds to be in a proper direction, and partly detained by his followers. Besides, the whole way in advancing, their dreams are religiously interpreted and adhered to; but, as in all such matters, interpretations are liable to a double construction. The finale is, that inclination, or often fear, is most powerful. A fearful heart produces a disagreeable dream, or a bad omen in imagined sounds from birds or deer, and this always makes a force return. But they often loiter about so long, that the enemy gains intelligence of their intended attack, and is on the alert.

"However absurdly these omens lead the human race, they steadily continue to follow and believe in such practices. Faith predominates, and hugs huge wonders, and tenaciously lives in the minds of the ignorant. Some of the Dyaks are somewhat shaken in the belief in hereditary omens, and a few follow the Malay custom of using a particular day, which has a strange effect on European imaginations. The white man who commands the force is supposed to have an express bird and lucky charm to guide him onward; and to these the Dyaks trust considerably. 'You are our bird, we follow you.' I well know the names, and can distinguish the sounds of their birds, and the different hands on which the good and bad omens are interpreted.

"The effect of these signs on myself was often very marked, and no Dyak could feel an adverse omen more than myself when away in the jungle, surrounded by these superstitious people. Still, I could sympathize with the multitude, and the difficulty lay in the question, whether any influence would be sufficient to counteract such phantoms. It must not be thought I ever attempted to lead the Dyaks to believe that I was the owner of charms and such absurdities, which could not have lasted above a season, and could never be successful for a length of time. A maias' (orang-outan's) head was hanging in my room, and this they thought to be my director to successful expeditions."

The cries of various animals are all interpreted by the Dyaks, those which have evil significations far outnumbering the good-omened cries. The worst of all omens is the cry of a deer, which will make a Dyak

abandon any project on which he is engaged, no matter how deeply his heart may be set on it.

On one occasion, a Dyak had married a young girl for whom he had a very strong attachment, which was returned. On the third day after the marriage, the English missionary entered the head house and was surprised to see the young husband sitting in it hard at work on some brass wire. This was a very strong circumstance, as the head house is tenanted only by the bachelors. The missionary naturally asked him what he was doing there, and what had become of his wife, to which he answered sorrowfully that he had no wife, a deer having cried on the preceding night, so that they were obliged to dissolve the marriage at once.

"But," said his interrogator, "are you not sorry for this?"

"Very sorry!"

"What are you doing with the wire?"

"Making ornaments for the girl whom I want for my new wife."

It seems that the belief in the Antus is so ingrained in the minds of the Dyaks, that whenever any one meets with an accident, some Antu or other is presumed to have been the author of the injury, and to require appeal. Mr. Brooke mentions that he once found the leaf of a palm tree folded in a peculiar manner, lying near his house. This was an offering to the Antu, because a man had fallen down there and injured himself.

The leaf was supposed to be possessed by the Antu, who would avenge himself if his leaf were disturbed by causing the arm of the offender to swell. However, Mr. Brooke picked up the leaf and threw it away, and within two days his arm became swollen and inflamed, and remained in that state for nearly a fortnight afterward.

In connection with this subject must be mentioned the ordeals by which disputes are often settled. These are of various kinds, but the favorite plan is the ordeal of diving. The two disputants are taken to the river and wade into the water up to the chin. At a given signal they plunge beneath the surface, and the one who can remain longest under water wins the case. There was a very curious instance of such an ordeal where the honor of a family was involved. The daughter of a chief was found to have disgraced herself, and laid the blame upon a young man of rank. He, however, utterly contradicted her story, and at last the dispute was brought to an end by the ordeal of diving. The young chief won his cause, and the result was that the offending girl had to leave the village, and her father was deserted by his followers, so that he was also obliged to seek another home.

Then there is the salt ordeal. Each litigant is provided with a lump of salt of precisely the same weight, and he whose salt retains its shape longest in water is held to

be the winner. There is also the boiling-water test, which is exactly the same as that which was practised in England in former days, the hand being dipped into the hot liquid, and coming out uninjured if the appellant be innocent. Lastly, there is the snail ordeal. Each party takes a snail and puts it on a plate, and lime juice is poured over them, when the snail that first moves is considered to have indicated that its owner is in the wrong.

The reader may remember that the Dyaks are in the habit of purchasing water that has been poured into the sacred jars, and sprinkling it over their fields by way of ensuring fertility. They believe that water which has touched the person of a white man will have the same effect, especially if he be a man of some rank. So as soon as English officers arrive at a Dyak village, the natives have a custom of seizing them, pulling off their shoes and stockings, and washing their feet, the water being preserved as an infallible charm for promoting the growth of their crops.

They carry this principle to an extent which to us seems exceedingly disgusting. Long bamboos filled with dressed rice are brought to the visitors, who are requested to spit in them. The rice thus medicated is distributed among the assembled crowd, who press eagerly round, each attempting to secure a portion of the health-giving food. Some of the more cunning among the people try to secure a second and some a third supply, and Mr. St. John mentions an instance when one horrid old woman managed to be helped six times.

The same traveller mentions that the blood of fowls is thought to be a very powerful charm, and the Dyaks have a ceremony connected with the shedding of blood which is almost identical with the Jewish Passover. (See Exod. xii. 22.) A festival had been given in honor of the visitors. Their feet had been washed, and the water put aside. Their rice had been duly medicated, and the Orang-kaya began some curious ceremonies, flinging rice out of the windows, and accompanying the act with a prayer for fertility to the fields and prosperity to the village. He was evidently repeating a well-learned lesson, and it was ascertained that the words which he used were not understood by himself, so that we find among the Dyaks the relics of an expired language, the few remnants of which are preserved by religion, just as is the case with the inhabitants of New Zealand and other islands.

This portion of the ceremony being ended a sort of sacred dance was performed, the Orang-kaya and the elders going successively to the white visitors, passing their hands over their arms, and going off in a slow, measured tread, "moving their arms and hands in unison with their feet until they reached the end of the house, and came

back to where we sat. Then came another pressure of the palm, a few more passes to draw virtue out of us, another yell, and off they went again — at one time there were at least a hundred dancing.

“For three nights we had had little sleep, on account of these ceremonies, but at length, notwithstanding clash of gong and beat of drum, we sank back in our beds, and were soon fast asleep. In perhaps a couple of hours I awoke, my companion was still sleeping uneasily, the din was deafening, and I sat up to look around.

Unfortunate moment! I was instantly seized by the hands of two priests, and led up to the Orang-kaya, who was himself cutting a fowl's throat. He wanted Captain Brooke to perform the following ceremony, but I objected to his being awakened, and offered to do it for him. I was taken to the very end of the house, and the bleeding fowl put in my hands. Holding him by his legs I had to strike the lintel of the doors, sprinkling a little blood over each. When this was over, I had to wave the fowl over the heads of the women and wish them fertility; over the children, and wish them health; over all the people, and wish them prosperity; out of the window, and invoke good crops for them.”

FUNERALS among the Dyaks differ slightly in the various tribes. The common people are buried or even burned with scarcely any ceremony, but the bodies of chiefs and their relatives are treated with a whole series of rites.

As soon as a chief dies, the corpse is dressed in his finest clothes, every ornament that he possessed is hung upon him, and his favorite swords and other weapons are laid by his side. The body is then placed on an elevated platform, and is watched and tended as if the dead man were still alive, food, drink, tobacco, and sirih being continually

offered him, and the air kept cool by constant fanning. The men assemble on one side of the corpse, and the women on the other, and romp with each other as if the occasion were of a joyful rather than a sorrowful character. These games are continued until the corpse is far gone in decomposition, when it is placed in a coffin made of a hollowed tree trunk, and buried in a grave which must not be more than five feet deep.

Knowing the customs of the people, the Malays are apt to rifle the graves of dead chiefs, for the sake of obtaining the swords and other valuables that are buried with them. Formerly, after the body was laid in the grave, the sword, a jar or two, clothes, ornaments, and a female slave were placed in a canoe, the woman being firmly chained to it. When the tide was ebbing the boat was sent adrift, and was supposed to supply the spirit of the departed with all the goods that were on board. This custom, however, has been long discontinued, as the Dyaks found that the canoe and its contents almost invariably fell into the hands of the Malays, who thus procured slaves without paying for them, and enriched themselves besides with the swords, gold, and clothing.

The sexton's office is hereditary, and whenever the line fails the Dyaks have great difficulty in finding some one who will not only take the office upon himself, but must also entail it upon his descendants. The office, however, is a very lucrative one, varying from a rupee to two dollars, a sum of money which can procure for a Dyak all the necessaries and most of the luxuries of life for several weeks.

The Kayan Dyaks do not bury their dead, but place the body in a very stout coffin made of a hollowed tree, and elevate it on two stout carved posts, with woodwork projecting from each corner, like the roofs of Siamese houses.

CHAPTER CXX.

TIERRA DEL FUEGO.

AT the extreme southern point of America is a large island, or rather a collection of islands separated by very narrow armlets of the sea. It is separated from the mainland by the strange tortuous Magellan's Strait, which is in no place wide enough to permit a ship to be out of sight of land, and in some points is exceedingly narrow. As Magellan sailed through this channel by night, he saw that the southern shore was studded with innumerable fires, and he therefore called the country TIERRA DEL FUEGO, or Land of Fire. These fires were probably beacons lighted by the natives in order to warn each other of the approach of strangers, to whom the Fuegians have at times evinced the most bitter hostility, while at others they have been kind and hospitable in their way.

The country is a singularly unpromising one, and Tierra del Fuego on the south and the Esquimaux country on the north seem to be exactly the lands in which human beings could not live. Yet both are populated, and the natives of both extremities of this vast continent are fully impressed with the superiority of their country over all others.

Tierra del Fuego is, as its proximity to the South Pole infers, a miserably cold country, and even in the summer time the place is so cold that in comparison England

would seem to be quite a tropical island. In consequence of this extreme cold neither animal nor vegetable life can be luxuriant. The forests are small, and the trees short, stumpy, and ceasing to exist at all at some fifteen hundred feet above the level of the sea. There is a sort of evergreen beech (*Fagus betuloides*).

There is only one redeeming point in the climate of Tierra del Fuego. The mosquito that haunts alike the hottest and coldest countries, and equally a terror in tropical and Arctic America, cannot live in Tierra del Fuego, the damp, as well as the cold, being fatal to it. Indeed, there are very few insects in this strange land, and reptiles are altogether absent.

Absence of vegetable life naturally results in absence of animal life, the herbivorous animals being starved out for want of their proper food, and the carnivora being equally unable to live, as finding no animals on which to feed. Man being omnivorous, has a slightly better chance of living, but even he could not multiply and fill the country when food is so limited, provided he were limited to the land, but, as he is master of the waters as well as of the earth, he can draw his living from the sea and rivers when the land refuses to supply him with food. Such is the case with the Fuegians, who are essentially people of the sea and its shore,

and who draw nearly the whole of their subsistence from its waters, as we shall see in a future page.

Perhaps in consequence of the scantiness, the irregularity, and the quality of their food, the Fuegians are a very short race of men, often shorter than the average Bosjesman of Southern Africa, and even lower in the social scale. They ought not to be called dwarfs, as is too often the case, their bodies being tolerably proportioned, and their figures not stunted, but simply smaller than the average of Europeans, while the muscular development of the upper part of the body is really wonderful. As a rule, the average height of the Fuegian men is about five feet, and that of the women four feet six inches. In some parts of the islands there are natives of much larger size, but these are evidently immigrants from the adjacent country of Patagonia, where the stature is as much above the average of Europeans as that of the Fuegians is below it.

The color of the natives is a dark coppery brown, the reddish hue being only perceptible in spots where they happen accidentally to be clean. The limbs are generally slight, so that the knees and elbows seem to be disproportionately large, and their heads are covered with masses of black hair, that possesses no curl, and falls in long, wild tangled locks over their shoulders. The men are almost entirely beardless.

An illustration on the opposite page of a Fuegian man and woman gives a correct representation of the ugliness of feature and want of intelligence which characterize this people.

Both sexes allow their hair to run to its full length, except over the forehead, where it is roughly cut with a shell to prevent it from falling into the eyes. The people have a strange superstitious reverence for hair, and that portion which is cut off is deposited in a basket, and afterward carefully disposed of. Once, when the captain had snipped off a little hair from a Fuegian's head, he found that he had given great offence, and was obliged to restore the severed hair and put away the scissors before the angry feelings of the native could be smoothed. On another occasion, the only mode of pacifying the offended native was by restoring the lock of hair, together with a similar lock from the head of the white man. The cut hair is generally burned.

Captain King's account of the Fuegian women is not attractive.

"The hair of the women is longer, less coarse, and certainly clearer than that of the men. It is combed with the jaw of a porpoise, but neither plaited nor tied; and none is cut away, except from over their eyes. They are short, with bodies largely out of proportion to their height; their features, especially those of the old, are scarcely less disagreeable than the repulsive ones of

the men. About four feet and some inches is the stature of these she-Fuegians, by courtesy called women. They never walk upright; a stooping posture and awkward movement is their natural gait. They may be fit mates for such uncouth men; but to civilized people their appearance is disgusting. Very few exceptions were noticed.

"The color of the women is similar to that of the men. As they are just as much exposed, and do harder work, this is a natural consequence. Besides, while children they run about quite naked, picking up shell-fish, carrying wood, or bringing water. In the color of the older people there is a tinge of yellow, which is not noticed in the middle-aged or young."

As is the case with many savage tribes, the teeth of the Fuegians are ground down to an almost flat surface. This is most conspicuous in the front teeth. There is little apparent distinction between the canine and the incisor teeth, both being ground down to such an extent that the only remains of the enamel are on the sides, and, as Captain King graphically remarks, "the front teeth are solid, and often flat-topped like those of a horse eight years old. . . . the interior substance of each tooth is then seen as plainly in proportion to its size as that of a horse."

The mouth is large, and very coarsely formed, and as there is not a vestige of beard its full ugliness is shown to the best advantage.

One of the strangest phenomena connected with the Fuegians is their lack of clothing. In a climate so cold that in the middle of summer people have been frozen to death at no great elevation above the level of the sea, it might well be imagined that the natives would follow the same course as that adopted by the Esquimaux, and make for themselves garments out of the thickest and warmest furs that can be procured.

They might do so if they chose. In some parts of their country they have the thick-wooled guanaco (probably an importation from the mainland), and in others are deer and foxes, not to mention the dogs which they keep in a domesticated state. Besides, there are few furs warmer than those of the seal, and seals of various kinds abound on the Fuegian coasts, some, such as the sea-lion, being of very large size. Then there are various water birds, whose skins would make dresses equally light and warm, such as the penguin, the duck, the albatross, and the like.

It is evident, therefore, that if the Fuegian is not warmly and thickly clothed, it is not from want of material, and that he is naked not from necessity but choice. And he chooses nudity, neither sex wearing any description of clothes except a piece of seal or deer skin about eighteen inches square

(1.) FUEGIANS.
(See page 1162.)

(2.) PATAGONIANS.
(See page 1173.)

hung over one shoulder. No other covering is worn except this patch of skin, which is shifted about from one side of the body to the other according to the direction of the wind, the Fuegian appearing to be perfectly indifferent to frost, rain, or snow. For example, a Fuegian mother has been seen with her child in her arms, wearing nothing but the little patch of seal-skin on the windward side, and yet standing unconcernedly in the snow, which not only fell on her naked shoulder, but was heaped between her child and her breast, neither mother nor infant seeming to be more than ordinarily cold. During mild weather, or when the Fuegian is paddling or otherwise engaged in work, he thinks that even the piece of seal-skin is too much for him, and throws it off.

Though careless about clothing, he is not indifferent to ornament, and decorates his copper-colored body in various ways. He uses paint in profusion, generally laying on a white ground made of a chalky clay, and drawing patterns upon it of black or dull brick-red. The black is simply charcoal reduced to powder. He likes necklaces, which are mostly white, and are made of the teeth of fishes and seals, or of pieces of bone. Ornaments of the same character are worn upon the wrists and ankles, so that, although the Fuegian has no clothes, he has plenty of savage jewelry.

Both sexes keep their long, straggling locks out of their eyes by means of a small fillet made of sinews, or the hair of the guanaco, twined round the forehead. Feathers and similar ornaments are stuck into this fillet; but if they be white, the spectator must be on his guard, for white down and feathers on the head are signs of war. Red, on the contrary, denotes peace; so that these people entirely reverse the symbolism of color which is accepted almost over the entire world. Sometimes a native may be seen so covered with black paint that the copper color of the skin is entirely lost, and the complexion is as black as that of a negro. This is a sign of mourning, and is used on the death of a relation or friend.

The houses of the Fuegians are as simple as their dress, and practically are little but rude shelters from the wind. Any boy can make a Fuegian house in half an hour. He has only to cut a number of long branches, sharpen the thicker ends, and stick them into the ground, so as to occupy seven-eighths or so of a circle. Let him then tie the sticks together at the top, and the framework of the house is completed. The walls and roof are made by twisting smaller boughs among the uprights and throwing long coarse grass on them, and the entire furniture of the hut is comprised in a few armfuls of the same grass thrown on the ground.

The opening at the side is always made in the direction opposite the wind, and there is no attempt at a door; so that, in

fact, as has been said, the Fuegian's only idea of a house is a shelter from the wind, so that the natives have no idea of a home or even of a dwelling-place. This is the form of hut used by the Tekeenika tribes of south-eastern Fuegia. A Fuegian settlement, with houses and surrounding scenery, is well represented on the 1169th page.

That which is generally employed in other parts of Fuegia is even more simple. It is barely half the height of the Tekeenika hut, and looks something like a large bee-hive. It seldom, if ever, exceeds five feet in height, but, as the earth is scraped away within, another foot in height is given to the interior. It is made simply by digging a circular hole a foot or so in depth, planting green boughs around the excavation, bending them over, and tying their tops together. Upon this rude framework are fastened bunches of grass, sheets of bark, and skins; so that, on the whole, a habitation is formed which is equal in point of accommodation to a gipsy's tent. These huts vary much in diameter, though not in height; for, while a number of huts are from four to five feet in height, their diameter will vary from six to twenty feet.

The Fuegians are a quarrelsome people, and the different tribes are constantly at war with each other; and, although they can scarcely be divided into definite tribes, the spirit of local jealousy is sufficiently strong within them to keep the inhabitants of one district at perpetual feud with those of another. The conformation of the country aids this feeling of jealousy, the land being divided by numerous ravines, armlets of the sea, and precipitous mountains; but, fortunately for the Fuegians, this very structure prevents destruction in war, although it encourages the ill-feeling which leads to war; and the battles of the Fuegians are, at the best, nothing but detached skirmishes, without producing the least political effect.

Their weapons are the bow and arrow, the spear, and the sling. These weapons are primarily intended for hunting, and are much more used for killing seals, guanacos, deer, fish, and birds than in slaying men. In the use of them the Fuegians are wonderfully expert. Capt. Parker Snow mentions a case where a number of Fuegians had assembled in their canoes round his vessel. A large fish happened to pass, whereupon the natives instantly speared it, and pitched it on board the ship.

The shafts of the spears sometimes reach the length of ten feet, and, instead of being rounded, as is mostly the case with spear shafts, are octagonal. The heads are made of bone, about seven inches in length, and have a single barb about four inches from the point. The Patagonians use a very similar weapon, as we shall presently see.

There is another kind of spear head, which has a whole row of small barbs down one side. This weapon is used as a javelin, and is thrown with great force and accuracy, the native grasping it near the middle, poisoning for a moment, so as to look along it, and then hurling it.

The bow and arrow are mostly used for killing birds, the arrows being made of hard wood, about two feet long. They are headed with pieces of flint or obsidian, which are merely stuck in a notch at the end of the arrow, so that, when the shaft is withdrawn, the head remains in the wound. The bow is strung with twisted sinews. Birds are also killed by stones, some thrown by hand, and others with the sling, the wonderful strength of these strange people enabling them to use their missiles with terrible effect.

Although not tall, the Fuegians are very thick-set and enormously powerful. One of them, named by the sailors York Minster, was a match in point of muscular strength for any two of the men belonging to the ship. The women are as strong as the men. On one occasion, when three Fuegians, a man and two women, had treacherously attacked a white sailor, and were trying to beat out his brains with stones, they were interrupted, and the sailor rescued. The man was shot. One of the women tried to conceal herself under the bank, and the other was seized by the captain and his coxswain, who tried to pinion her arms. She struggled and fought so stoutly that they could scarcely achieve their object, and had no idea that they were contending with a woman until they heard some one announce the sex of their captive. As to the other woman, who was the oldest of the party, she clung so tightly to the bank that two of the strongest sailors could scarcely remove her.

The fate of the man was very curious, and illustrates the reckless, not to say senseless, courage of these people. He was mortally wounded, and fell back for a moment, allowing the maltreated sailor to escape. However, he instantly recovered himself, and, snatching stones from the bed of the stream in which he was standing, began to hurl them with astounding force and quickness. He used both hands, and flung stones with such truth of aim that the first struck the master, smashed his powder-horn to pieces, and nearly knocked him down. The two next were hurled at the heads of the nearest seamen, who just escaped by stooping as the missiles were thrown. All this passed in a second or two, and with an attempt to hurl a fourth stone the man fell dead.

Some time before this event the sailors had been astonished at the stone-throwing powers of the Fuegians, who nearly struck them with stones thrown by hand when

they thought themselves even beyond musket shot. They generally carry a store of pebbles ready for use in the corner of their little skin mantles.

The sling is made of a cup of seal or guanaco skin, to which are attached two cords similar in material to the bow-strings, thus combining apparent delicacy with great strength. The cords of the sling are more than three feet in length. The skill which the Fuegians possess with this weapon is worthy of the reputation attained by the Balearic islanders. Captain King has seen them strike with a sling-stone a cap placed on a stump at fifty or sixty yards' distance, and on one occasion he witnessed a really wonderful display of dexterity. He asked a Fuegian to show him the use of the weapon. The man immediately picked up a stone about as large as a pigeon's egg, placed it in the sling, and pointed to a canoe as his mark. He then turned his back, and flung the stone in exactly the opposite direction, so that it struck the trunk of a tree, and rebounded to the canoe. The men seem to think the sling a necessity of life, and it is very seldom that a Fuegian is seen without it either hung over his neck or tied round his waist.

It is rather a curious fact that the Fuegians always devote themselves to one particular weapon. One, for example, will be pre-eminent in the use of the bow, another will excel in throwing stones with the hand, and a third will give all his energies to the sling. Yet, although each man selects some particular arm in the use of which he excels, they all are tolerable masters of the other weapons, and it sometimes happens that a Fuegian crosses over to the Patagonian coast, procures the singular weapon called the "bolas," of which the reader will learn more presently, and becomes almost as expert in its use as the man from whom he obtained it.

As for the food of the Fuegians, it is, as I have already mentioned, chiefly drawn from the sea. He is an excellent fisherman, and manages to capture his prey without even a hook. He ties a bait on the end of the line, dangles it before the fish, and gradually coaxes it toward the surface of the water. He then allows it to bite, and, before it can detach its teeth from the bait, jerks it out of the water with his right hand, while with the left he catches or strikes it into the canoe. It is evident that by this manner of angling it is impossible to catch fish of any great size. As soon as he has caught the fish, the Fuegian opens it by the simple plan of biting a piece out of its under surface, cleans it, and hangs it on a stick.

Molluscs, especially the mussels and limpets which are found on the sea-shores, form a very considerable portion of the Fuegian's diet; and it is a curious fact that these natives never throw the empty shells about,

but carefully lay them in heaps. They are especially careful not to throw them back into the sea, thinking that the molluscs would take warning by seeing the shells of their comrades, and would forsake the coast. Every woman is furnished with a short pointed stick of hard wood, with which she knocks the limpets off the rocks.

There is a very large species of mussel found on these shores, which is particularly useful to the Fuegian, who employs its shell as a knife. These tools are made in a very simple manner. The Fuegian first knocks off the original edge of the shell, which is brittle and rather fragile, and, by grinding it against the rocks, produces a new edge, which is sharp enough to cut wood and even bone.

By means of the spear and arrows, the Fuegian contrives even to capture seals and sea-otters, but the pursuit in which he shows his greatest ingenuity is the capture of fish by means of dogs. These dogs are little, fox-like looking dogs, which appear utterly incapable of aiding their masters in hunting. Yet they are singularly intelligent in their own way, and have learned a most curious fashion of taking fish. When a shoal of fish approaches the land, the dogs swim out and enclose them, splashing and diving until they drive the shoal into a net, or into some creek when the water is sufficiently shallow for the spear and arrow to be used. The dogs are also taught to catch the birds while sleeping. They creep up to the birds quietly, pounce upon them, carry them to their masters, and return for more, and all so silently that the birds around are not disturbed.

These animals are regarded with very mingled feelings. The Fuegian neglects them and illtreats them, scarcely ever taking the trouble to feed them, so that if they depended on the food given them by their masters they would starve. However, their aquatic training gives them the power of foraging for themselves, and, when not required by their masters, they can catch fish on their own account. They are odd, sharp nosed, bushy tailed animals, with large, pointed, erect ears, and usually with dark rough hair, though a few among them have the fur nearly white. They are watchful and faithful to their masters, and the sight of a stranger, much more of a clothed stranger, sets them barking furiously.

Although the Fuegian neglects his dog, he has a great respect and even affection for the animal. It often happens that the mussels and limpets fail, that the weather is too tempestuous for fishing, and that in consequence the people are reduced to the brink of starvation. It might be presumed that, having their dogs at hand, they would avail themselves of so obvious a source of food. This, however, they never do, except when reduced to the last extremity, and, instead of

eating their dogs, they eat their old women, who, as they think, are worn out and can do no good, while the dogs, if suffered to live, will assist in catching fish and guanacos.

When they have determined on killing an old woman, they put a quantity of green wood on their fire, so as to cause a thick, suffocating smoke, and in this smoke they hold the poor creature's head until she is stifled. Unless there is very great distress, the women eat the upper part of the victim and the men the lower, the trunk being thrown into the sea.

Several species of echinus, or sea urchins, are eaten by the Fuegians, who dive for them and bring them to the surface, in spite of the sharp prickles with which the entire surface is beset.

The Fuegian's great feast, however, takes place when a whale is stranded on the shore. All the people within reach flock to the spot, while fleets of canoes surround the stranded monster, and its body is covered with little copper-colored men carving away the blubber with their shell knives. Each cuts as much as he can get, and when he has torn and carved off a large piece of blubber, he makes a hole in the middle, puts his head through the aperture, and thus leaves his hands free to carry more of the dainty food. Besides this animal food, the Fuegian eats a remarkable kind of fungus, which is found on the antarctic beech, the tree which has already been mentioned. Mr. Webster gives the following description of it:—

"The antarctic beech is the common and prevailing tree. It is an elegant evergreen. It grows to the height of thirty or forty feet, with a girth of from three to five feet, and sometimes, doubling these dimensions, it forms a majestic tree. In December it puts forth a profusion of blossoms, with anthers of bright pink, large and pendent. This evergreen beech frequently has round the upper part of the trunk, or on some of the larger branches, large clusters of globular fungi of a bright orange color. Each fungus is about the size of a small apple, of a soft pulpy nature, with a smooth yellow skin. As it approaches maturity it becomes cellular and latticed on its surface, and when it drops from the tree, dries, and shrivels into a brown mass resembling a morel.

"The Fuegians eat this fungus with avidity. The gelatinous mass is pale, without taste or odor; at the part in contact with the tree are two germs or processes. From twenty to thirty of these fungi are clustered together, and encircle the tree. They form a very conspicuous object, and wherever they are attached they produce a hard knot, or woody tumor, of considerable density. I did not observe them on any other tree than the evergreen beech."

Passing so much of his time on the sea, the Fuegian needs a boat of some kind, and,

debased as he is in many points, he is capable of constructing a vessel that answers every purpose he requires. There are several kinds of Fuegian canoes. The simplest form is made of the bark of a sort of birch, and is in fact formed much like the primitive canoes of the Australians. It is a single sheet of bark stripped from the tree, and tied firmly together at each end. Several sticks placed crosswise in the middle serve to keep it open; and if any part has a tendency to bulge in the opposite direction, a skin thong is passed across the boat and keeps it in shape. The ends of the canoe, as well as any cracks or holes in the bark, are caulked with dry rushes and a pitchy resin procured from trees.

Like the Australian, the Fuegian carries fire in these tiny canoes, placing a lump of clay in the bottom of the boat, building the fire on it, and so being able to remain at sea for a considerable time, cooking and eating the fish as fast as he catches them. Such a boat as this, however, is too frail to be taken far from land, or indeed to be used at all when the weather is tempestuous. Moreover, it only holds one or two persons, and is therefore unfitted for many purposes for which a Fuegian requires a canoe. A much larger and better kind of canoe is therefore made, which has the useful property of being made in separate parts, so that the canoe can be taken to pieces, and the various portions carried overland to any spot where the canoe may be wanted. Such a vessel as this is about fifteen feet in length and a yard in width, and, being very buoyant, is capable of holding a whole family, together with their house, and weapons, and utensils. It is considerably raised both at the bow and the stern, and the various pieces of which it is made are sewed together with thongs of raw hide.

The very character of a Fuegian's life shows that he must, to a certain degree, be a nomad. He never cultivates the soil, he never builds a real house, he never stores up food for the future, and so it necessarily follows that when he has eaten all the mussels, limpets, oysters, and fungi in one spot, he must move to another. And, the demands of hunger being imperious, he cannot wait, but, even if the weather be too stormy to allow him to take his canoe from one part of the coast to another, he is still forced to go, and has therefore hit upon the ingenious plan of taking his canoe to pieces, and making the journey by land and not by sea. An illustration on the following page shows him shifting quarters.

All he has to do in this case is to unlace the hide thongs that lash the canoe together, take it to pieces, and give each piece to some member of the family to carry, the strongest taking the most cumbersome pieces, such as the sides and bottom planks, while the smaller portions are borne by the children. When

the snow lies deep, the smaller canoe is generally used as a sledge, on which the heavier articles are placed. As to the hut, in some cases the Fuegians carry the upright rods with them; but they often do not trouble themselves with the burden, but leave the hut to perish, and cut down fresh sticks when they arrive at the spot on which they mean to settle for a time.

The Fuegians are good fire makers, and do not go through the troublesome process of rubbing two sticks upon each other. They have learned the value of iron pyrites (the same mineral which was used in the "wheel-lock" fire-arm of Elizabeth's time), and obtain it from the mountains of their islands. The tinder is made either of a dried fungus or moss, and when the pyrites and a pebble are struck together by a skilful hand, a spark is produced of sufficient intensity to set fire to the tinder. As soon as the spark has taken hold of the tinder, the Fuegian blows it until it spreads, and then wraps it up in a ball of dry grass. He rapidly whirls the grass ball round his head, when the dry foliage bursts into flames, and the fire is complete.

Still, the process of fire making is not a very easy one, and the Fuegians never use their pyrites except when forced to do so, preferring to keep a fire always lighted, and to carry a firestick with them when they travel. Fire is, indeed, a necessary of life to the Fuegians, not so much for cooking as for warming purposes. Those who have visited them say that the natives always look cold and shivering, as indeed they are likely to do, considering that they wear no clothes, and that even in their houses they can but obtain a very partial shelter from the elements.

Their cookery is of the rudest description, and generally consists in putting the food into the hot ashes, and allowing it to remain there until it is sufficiently done for their taste — or, in other words, until it is fairly warmed through. Cooking in vessels of any kind is unknown to them, and the first lessons given them in cooking mussels in a tin pan were scarcely more successful than those in sewing, when the women invariably made a hole in the stuff with the needle, pulled the thread out of the eye, and then insinuated it through the hole made by the needle. They were repeatedly taught the use of the eye in carrying the thread, but to little purpose, as they invariably returned to the old fashion which they had learned with a fish-bone and fibre of sinew.

Though so constantly in the water, the Fuegians have not the most distant idea of washing themselves. Such a notion never occurs to them, and when Europeans first came among them, the sight of a man washing his face seemed to them so irresistibly ludicrous that they burst into shouts of laughter. In consequence of this utter

(1.) A FUEGIAN SETTLEMENT. (See page 1165.)

(2.) FUEGIANS SHIFTING QUARTERS. (See page 1168.)

neglect of cleanliness, and the habit of bedaubing themselves with grease and clay, they are very offensive to the nostrils, and any one who wishes to cultivate an acquaintance with them must make up his mind to a singular variety of evil odors. Moreover, they swarm with parasites, and, as they will persist in demonstrating friendly feelings by embracing their guest with a succession of violently affectionate hugs, the cautious visitor provides himself either with an oil-skin suit, or with some very old clothes, which he can give away to the natives as soon as he regains his vessel.

Although the Fuegians are often ill-disposed toward strangers, and indeed have murdered many boats' crews, Captain Parker Snow contrived to be on very friendly terms with them, going on shore and visiting them in their huts, so as to place himself entirely in their power, and allowing them to come on board his ship. He was fortunate in obtaining the services of a native, called Jemmy Button, who had been partially educated in England, with the hope that he might civilize his countrymen. However, as mostly happened in such cases, he was soon stripped of all his goods; and when Captain Snow visited Tierra del Fuego, twenty-three years afterward, he found Jemmy Button as naked and dirty as any of his countrymen, as were his wife and daughter.

The man, however, retained much of his knowledge of English, a few words of which he had engrafted upon his native language. When first he arrived on board, the English words came with difficulty; but he soon recovered his fluency, and had not forgotten his manners, touching his forehead as he stepped on the quarter-deck, and making his bow in sailor fashion when he addressed the captain, to the entire consternation of the sailors, who could not understand an absolutely naked savage speaking English, and being as well-mannered as themselves.

The faculty of acquiring language is singularly developed in the Fuegian. Generally, the inhabitants of one country find great difficulty in mastering the pronunciation, and especially the intonation, of a foreign land; but a Fuegian can repeat almost

any sentence after hearing it once, though of course he has not the slightest idea of its meaning.

A very absurd example of this curious facility of tongue occurred to some sailors who went ashore, and taught the natives to drink coffee. One of the Fuegians, after drinking his coffee, contrived to conceal the tin pot, with the intention of stealing it. The sailor demanded the restoration of his property, and was greatly annoyed that every word which he uttered was instantly repeated by the Fuegian. Thinking at last, that the man must be mocking him, and forgetting for the instant that he did not understand one word of English, the sailor assumed a menacing attitude, and bawled out, "You copper-colored rascal, where is my tin pot?" The Fuegian, nowise disconcerted, assumed precisely the same attitude, and exclaimed in exactly the same manner, "You copper-colored rascal, where is my tin pot?" As it turned out, "the copper-colored rascal" had the pot tucked under his arm.

The natives evidently seemed to think that their white visitors were very foolish for failing to comprehend their language, and tried to make them understand by bawling at the top of their voice. On one or two occasions, when a number of them came on board, they much annoyed Captain Snow by the noise which they made, until a bright thought struck him. He snatched up a speaking trumpet, and, bellowed at his visitors through it with such a stunning effect that their voices dropped into respectful silence, and they began to laugh at the manner in which they had been outbawled by a single man.

As far as can be ascertained, the Fuegians have no form of government. They live in small communities, not worthy of the name of tribes, and having no particular leader, except that the oldest man among them, so long as he retains his strength, is looked up to as a sort of authority. Their ideas of religion appear to be as ill-defined as those of government, the only representative of religion being the conjuror, who, however, exercises but very slight influence upon his fellow countrymen.

CHAPTER CXXI.

THE PATAGONIANS.

APPEARANCE — WEAPONS — HORSEMANSHIP.

POSITION OF PATAGONIA — STATURE OF THE INHABITANTS — SIGNIFICATION OF THE NAME — HORSE FURNITURE — THE STIRRUP AND BOOT — AN INGENIOUS SPUR — THE GIRTH AND ITS CONSTRUCTION — PRIMITIVE BUCKLES — THE BRIDLE AND ITS ACCOMPANYING WHIP — THE PATAGONIAN AND SPANISH BITS — SIZE AND STRENGTH OF THEIR HORSES — HORSE-RACING — THE BOLAS, THEIR CONSTRUCTION, AND DIFFERENT VARIETIES OF FORM — WAR IN PATAGONIA — THE SPARE HORSES AND THEIR USE — THE RETURN FROM BATTLE — A HUNTING EXPEDITION — CHASING THE GUANACO — A TERRIFIED HERD — THE DISADVANTAGE OF CURIOSITY — DECOY GUANACOS — PARTRIDGE CATCHING — THE POWER OF FASCINATION.

SEPARATED from Tierra del Fuego by a strait so narrow that in certain spots human beings might converse across the water, is the land called Patagonia.

It derives this now familiar title from a nickname given to the inhabitants by Magellan's sailors. As we shall presently see when treating of their costume, the Patagonians wear a sort of gaiter to protect their ankles against thorns. These gaiters are made of the furry skin of the guanaco, the long hair spreading out on either side of the foot. The sailors, ever ready to ridicule any custom new to them, remarked this conspicuous part of the dress, and nicknamed the natives Patagonés, *i. e.* duck-feet, a name which has ever since adhered to them, and even been applied to their country.

The narrow armlet of sea, to which reference has been made, divides two lands utterly opposed to each other, and inhabited by people totally distinct in appearance and habits. Tierra del Fuego has scarcely a level spot in it, but is composed of even set ravines clothed with trees, and precipitous, snow-clad mountains. Patagonia, on the contrary, abounds in vast level plains, unfertile and without a tree on them.

The human inhabitants of these countries are as different as the lands themselves, the Fuegians being below the average height, and the Patagonians above it. Yet, just as the Fuegian is not such an absolute dwarf, as has often been stated, the Patagonian is not

such an absolute giant, a regiment of English Lifeguards being as tall as an equal number of Patagonians. It is true that if a Patagonian regiment of picked men were raised they would overtop even the Guardsmen, but the old tales about an average of seven or even eight feet are unworthy of credit. Some of the older voyagers even attribute to the Patagonians a much loftier stature, saying that some of them were twelve feet in height, and that when one of them stood with his legs apart, an ordinary man could walk between them without stooping.

The color of the Patagonians is somewhat like that of the Fuegians, being a dark copper brown, the reddish hue coming out well on any part of the skin that happens to be less dirty than others. The hair is coarse, long and black, and is allowed to hang loosely about their faces, being merely kept out of their eyes by a small fillet of guanaco hair. There is scarcely any eyebrow, a deficiency which always gives an unpleasant expression to the eyes, and indeed, even in the old men, the face is almost devoid of hair. The face is roundish, the width being increased by the great projection of the cheek-bones, and the chin is rather broad and prominent. The small, restless eyes, are black, as is the hair, and rather hidden under the prominent brows. The nose is narrow between the eyes, but the nostrils are broad and fleshy. The mouth is large, and the lips rather thick, but altogether the

face is not a bad one. The illustration on the 1163d page, of a Patagonian man and woman furnishes a striking contrast with the Fuegians, their neighbors.

The dress of the Patagonians is simple, but sufficient, and in this respect they form a great contrast to the absolutely naked Fuegians of the opposite shores. The chief part of the costume consists of a large mantle made of guanaco skins. The guanaco is, as the reader may possibly be aware, one of the llama tribe, and is about the size of a deer. It is covered with a thick woolly coat, the long hair of which is valuable, not only to the Patagonians, but to Europeans, by whom it is made into various fabrics.

It is very plentiful in this country, fortunately for the Patagonians, to whom the guanaco is the very staff of life, the creature that supplies him with food, clothes, and dwelling. Sometimes it is seen in great droves of several hundreds in number, but it generally associates in smaller herds of twenty or thirty individuals. It is a shy animal, as well it may be, considering the many foes that are always ready to fall upon it; and as it is swift as well as shy, great skill is required in capturing it, as will presently be seen.

The guanaco-skin mantle is very large, and when folded round the body and clasped by the arms, falls as low as the feet; and when a tall Patagonian is seen in this mantle, which adds apparently to his height, he presents a very imposing appearance. Generally, the mantle is confined round the waist by a belt, so that when the wearer chooses, he can throw off the upper part of it, his hands remaining at liberty for action. Under the mantle he wears a small apron.

Next come the curious gaiters, which have been already mentioned. At first sight they look like boots reaching from the knee downward, but when examined more closely, they are seen to be devoid of sole, having only a strap that passes under the middle of the foot, so that the heel and toes and great part of the sole are left unprotected. The reason of this structure is, that the Patagonian is nearly always on horseback, and the toe is made to project beyond the gaiter in order to be placed in the stirrup, which is very small and triangular.

As the Patagonians are so devoted to horsemanship no sketch of this people would be adequate without an account of their horse accoutrements. I have a complete set in my possession. The saddle is made of four pieces of wood, firmly lashed together with raw-hide thongs, and both the front and back of the saddle are alike. From the sides depend the stirrups, which are appended to leathern thongs, and are made in a very simple manner. A hole is made at each end of a stout leathern strap, and a short piece of stick about half an inch in diameter is thrust through them, being re-

tained in its place by a groove near each end. The strap being attached by its middle to the thongs which act as stirrup-leathers, the article is complete.

As the space between the grooves is rather less than three inches, it necessarily follows that the Patagonian horseman can only insert his great toe in the stirrup. This, however, is sufficient hold for him, as he is an admirable though careless looking rider, the greater part of his life, from childhood upward, having been spent on horseback.

The spur is as primitive as the stirrup, and exactly resembles in principle the prick-spurs of the ancient knights. It consists of two pieces of stick, exactly like those employed for the stirrups, and two short straps of cowhide. A hole is made at each end of the strap, and the sticks are pushed through them, being held in their places, like those of the stirrups, by a groove cut half an inch from their ends, so that the two sticks are held parallel to each other.

To the upper ends of each stick a leathern thong is applied, and these thongs, being tied over the instep, hold the spur in its place. At the other ends of the sticks holes are bored, into each of which a sharp iron spike is inserted. In my own specimen, the maker has been economical of his iron, and has only inserted spikes in one of the sticks, so that when the spurs are worn with the spiked stick inward, they are quite as effective as if both sticks were armed. Still, the hole for the reception of the spikes has been bored in all the sticks, and there is no doubt that the Patagonian who made the spurs would have inserted the spikes at some time or other.

The spur is worn as follows: The armed sticks come on either side of the foot, the strap which is next to the spiked ends goes round the heel, the other strap passes under the hollow of the foot, and the hide thongs are tied over the instep. Such a spur as this is not only an effective but a cruel instrument, really as bad as the huge metal spurs, with rowels four inches in diameter, which the Guachos wear. It is impossible to see this simple form of spur without recalling the old story of "Sandford and Merton," and referring to the adventure of Tommy Merton, who, on being forbidden to use spurs, stuck pins into the heels of his boots, and was run away with in consequence.

The girth is a singularly ingenious piece of work. The strength of the girth itself is prodigious. At first sight it looks as if it were a single broad belt of leather, but a nearer inspection shows that it is made of twenty-two separate cords, each about the eighth of an inch in thickness, laid side by side, and united at intervals by several rows of similar cords of strings. Each of these cords is made of two strands of raw hide, probably that of guanaco, and looks as strong as ordi-

nary catgut. Buckles are unknown to the Patagonian, who has invented in their stead a mode of tightening the girth by passing straps through holes, hauling upon them, and fastening off the ends.

The bit and bridle are equally ingenious. It consists of a squared bar of iron four and a half inches long, the ends of which are passed through holes in doubled pieces of hide, and hammered when cold into a sort of rivet-like shape, so as to retain the leather in its place. To the lower part of the leathers are attached a couple of stout thongs, which are passed under the lower jaw of the horse, and then tied, so that they keep the bit in its place, and at the same time act as a sort of curb.

To the upper part of the leathers are fixed the long plaited thongs which are used as reins, and which seem strong enough to hold an elephant, much more a horse. The Patagonian uses no separate whip, but has a long double strap of stout hide, which is fixed to the junction of the reins, so that there is no danger of losing it.

This is the ordinary bit of a Patagonian hunter, but those who can obtain it like to use the cruel Spanish bit, which they fit up in their own way with thongs of plaited hide. One of these bits is shown in illustration No. 4 on the following page. The principal distinguishing point about these bits is the large iron ring, which passes over the horse's jaw, and gives to the rider a leverage so powerful that he could break the jaw of any horse without making any very great exertion. By the use of this bit, the horse is soon taught to stop almost suddenly, to wheel in a very limited area, and to perform the various evolutions which are needed in carrying out the pursuit in which the Patagonian depends for much of his livelihood.

The reins which are attached to this bit are of enormous strength, and are plaited in a square form, so that no amount of pulling which any horse could accomplish would endanger them. The whip is attached to these reins like that of the last mentioned apparatus, but is more severe, thicker, and heavier, and is made of a long and broad belt of hide, cut into four strips, which are plaited together, flat and narrow strips about four inches long answering as the lash. It will be seen that the Patagonian is by no means merciful to his beast, but that he uses a bit, spur, and whip which are, though so simple in appearance, more severe in practice than those which have a far more formidable aspect.

The horses which he rides are descended from those which were introduced by the Spaniards, and which have multiplied so rapidly as almost to deserve the name of indigenous animals. They are of no great size, being under fifteen hands high, and belonging to that well-known mustang breed

which is more celebrated for strength and endurance than for speed, qualities which are indispensable in an animal that has to carry so heavy a rider after creatures so fleet as the guanaco or the rhea.

The Patagonians are fond of racing, but never make their courses longer than a quarter of a mile. The reason for these short races is, that their horses are not required to run for any length of time at full speed, but to make quick and sudden dashes, so as to enable the rider to reach his prey, and hurl the singular missiles with which he is armed.

There is yet an article needed to complete the equipment of a Patagonian. This is the celebrated "bolas," a weapon which looks almost contemptible, but in practised hands is exceptionally formidable. It consists of two or sometimes three balls at the end of hide thongs. The form most in use is that which is represented in illustration No. 3 on the next page. The native name for the two-ball bolas is *somai*, and that for the three-ball weapon is *achico*.

The first point in making the bolas is to procure the proper balls, and the second to prepare the proper rope to which they are fastened. The ordinary balls are made of stone, and are nearly as large as cricket balls. They are made by the women, who pass much of their time in supplying the men with these necessaries of life. To cut and grind one of these stones is a good day's work, even for an accomplished workwoman.

A still more valuable ball is made of iron, which has the advantage of being so much heavier than stone that the ball is considerably smaller, and therefore experiences less resistance from the air, a quality which is of the first consequence in a missile weapon. The most valuable are those which are made of copper, as is the case with the specimen from which the illustration is taken. Each of these balls weighs eighteen ounces, in spite of its small size, so that the weapon is a very formidable one.

The thong to which the balls are attached is nine feet in length, and is made in the following manner: two pairs of thongs of raw hide are cut, and, while they are still fresh and wet, each pair is twisted together so as to form a two-stranded rope. These ropes are again twisted into one, so that the aggregate strength of the four is enormous.

Round each of the balls is then laid a circular piece of guanaco hide, with holes bored all round the edge. The ends of the thongs being passed through the holes and laced tightly, the raw hide is drawn over the balls, and encloses them in a sort of pocket, as is seen by the enlarged figure in the illustration. This specimen is one of the three-ball weapons. In this case a third thong five feet six inches in length has been twisted, one end fastened to a ball, and the other interlaced with the strands of the first

thong exactly at its centre. We have now the three-ball bolas, which is made in such a manner that, when the thongs are grasped at their points of junction, two of the balls hang at equal depths from the hand, and the third is just a foot below them.

The bolas is to the Patagonian what the kris is to the Malay, the boomerang to the Australian, the lasso to the Gaucho, the club to the Fijian, and the bow to the Andamaner. From early childhood upward no Patagonian is without this weapon, which seems to him an absolute necessity of existence. Generally he carries it twisted round his waist, like an officer's sash of the olden days, the balls dangling at the side like the tassels of the sash.

It is, however, coiled on the body with such consummate skill that it can be cast loose with a turn of the hand, the eye being fixed on the object of attack, and in a moment the Patagonian is fully armed. Putting aside warfare, which in Patagonia is scarcely known, the tribes, or rather the families, not being strong enough to wage real war upon each other, the so-called battles are unworthy of any name except that of skirmishes, which among themselves seem to do no great harm, however formidable they may be to opponents who happen to be unacquainted with the mode of fighting practised by the Patagonians.

For example, a dozen trained riflemen, on foot, who could thoroughly depend on each other, would overmatch ten times their number of mounted Patagonians, who, every whit as brave as themselves, are ignorant of discipline, and fight every man for his own hand.

Let the riflemen once allow the Patagonians to come within thirty yards, and they would be annihilated; but as long as the foe could be kept out of throwing distance, they are comparatively harmless.

When a Patagonian intends to attack either a human enemy, or some animal of chase, or even, as often happens, some wild beast or bird, he slips the ever-ready bolas from his waist, grasps the thongs at their point of union, drives his primitive spurs into the flanks of his rough-coated steed, and dashes off at full gallop, whirling the bolas round his head by a dexterous movement of his flexible wrist.

As soon as he comes within throwing distance, which materially varies according to the strength of the thrower and the structure of the bolas, he hurls his singular weapon with unerring skill. No sooner does it leave his hand than the centrifugal force causes the balls to diverge, and they fly round and round in the air with a motion exactly resembling that which an English street acrobat imparts to a couple of padded balls at the ends of a string, when he wants to clear the ground.

Urged by the stalwart arm of the Patagonian, the bolas flies straight to its mark, and no sooner does it strike it, than the impetus communicated to the balls causes the thongs to twist round the unfortunate victim, and bring him at once to a halt. Indeed, should a man be struck by the bolas, he may congratulate himself if in three minutes afterwards he finds himself alive, neither having been strangled by the cords twisting round his neck, nor brained by the heavy balls coming in contact with his skull.

The skill which the Patagonians attain is really marvellous. At any distance short of fifty yards a victim marked is a victim slain. So terrific is the gripe of the bolas thong, that Europeans who have been struck with it have been found to suffer from weals as well marked as if they had been made by the stroke of a "cow-hide" whip upon the bare flesh.

An excellent description of the various kinds of bolas is given by Captain King:—

"Sometimes two balls, each of which has a cord about a yard in length, are fastened to the thong of the larger set. This is to entangle the victim more effectually. They do not try to strike objects with these balls, but endeavor to throw them so that the thong shall hit a prominent part; and then, of course, the balls swing round in different directions, and the thongs become so 'laid up' (or twisted), that struggling only makes the captive more secure.

"They can throw them so dexterously as to fasten a man to his horse, or catch a horse without harming him. If an animal is to be caught without being thrown down suddenly—an inevitable consequence of these balls swinging round his legs while at full speed—a *somai* is thrown upon his neck. The two balls hang down, and perplex him so much by dangling about his fore-legs that his speed is much checked, and another set of balls or a lasso may be used to secure without throwing him down. The lasso is not much used, so adroit are they with the balls.

"A formidable missile weapon is the single ball, called by the Spaniards 'bola perdida.' This is similar to the other in size and substance, but attached to a slighter rope about a yard long. Whirling this ball, about a pound in weight, with the utmost swiftness around their heads, they dash it at their adversary with almost the force of a shot. At close quarters it is used, with a shorter scope of cord, as an efficient head-breaker. Several of these original and not trifling offensive weapons are kept in readiness by each individual, and many a Spaniard, armed with steel and gunpowder, has acknowledged their effect."

The raids which are dignified by the name of warfare are more for plunder than conquest, inasmuch as the Patagonian cares nothing for territory, of which he has

enough and to spare, and almost nothing for military fame. Sometimes he wants plunder; sometimes he means to make a hunting expedition into a district held by another tribe; and sometimes he prepares a short campaign against an inimical tribe in revenge for a real or fancied insult.

When preparing for such an excursion, or while expecting the attack of another tribe, the Patagonians keep themselves in constant preparation for war. They put on three of their thickest mantles in order to deaden the blow of the bolas, or withstand the point of the spear and arrow. These mantles are not wrapped round them in the ordinary fashion of peace, but are worn like ponchos, the head being thrust through a hole in the middle. The innermost mantle is of guanaco skin, with the hairy side inward, while the others are simple leather, without hair, the place of which is taken by paint. Their heads are guarded by conical caps, made of hide, and often adorned by a tuft of feathers from the rhea.

Those who are wealthy enough purchase a sort of armor composed of a thick hide tunic, with a high collar and short sleeves, and a hat or helmet made of double bull's hide. This garment is very heavy and clumsy, but it will resist every weapon except bullets, and will make even the blow of the "bola perdida" fall harmless. Those who are too poor to possess a horse, and are obliged to fight on foot, carry shields made of several layers of hide sewed together.

Sometimes they come unexpectedly upon enemies, and a skirmish is the immediate result. In this case they mostly fling aside their cumbersome mantles, and fight without any clothing except the girdle and their spurs. When they make expeditions against inimical districts, they take spare horses with them, one of which is intended to bear the plunder as they return, and to take its share in carrying the warrior to battle. As soon as the Patagonian finds that his weight is beginning to tell upon the horse which he rides, he vaults upon the other without checking them in their gallop, and thus makes sure of a fresh and unweariéd horse upon going into action. The second horse is afterward used for the conveyance of slaves, skins, weapons, and other booty.

As they return, they fling off the cumbersome armor of coats and mantles, and ride, according to their fashion, naked to the waist, the innermost mantle being retained in its place by a leathern thong, which acts as a belt. In some of these expeditions a whole troop of loose horses is driven in front of the warriors, and when a man feels his own horse becoming wearied, he rides alongside one of the loose horses, shifts the bit, and leaps on the fresh animal, not troubling himself about the saddle.

When the Patagonian goes out hunting, he carries no weapon except the bolas and a

knife, the latter being considered rather as a tool than a weapon. Should he see a herd of guanacos, he makes silently toward them, imitating the cry of the young one in distress, and doing all in his power to attract the animals. Anything very strange is sure to attract them, just as it attracts cows, which are horribly afraid of the new object, but, victims of a sort of fascination, are led nearer and nearer by a spirit of curiosity, for which they pay with their lives. When a small herd — say six or eight — of guanacos is seen, they can generally be enticed within range of the bolas by a hunter on foot, who steals as near them as he can manage to do without alarming them, and then plays various antics, such as lying on his back and kicking his legs in the air, tying a strip of hide or a bunch of feathers to a stick, and waving it about. The inquisitive creatures seem unable to resist the promptings of their curiosity, and, though they are really afraid of the strange object, come closer and closer, until the hunter is able to hurl the terrible bolas at them.

When, however, the herd is a large one, the guanacos are much more timid, and, until the introduction of the horse, the Patagonians could seldom do much with them. Now, however, the possession of the horse, together with their knowledge of the guanaco's disposition, enables them to capture and kill great numbers of the animals.

In this mode of chase the Patagonians make use of two characteristics which belong to the guanaco. In the first place, it is a hill-loving animal, and when pursued, or even afraid of pursuit, leaves the plains and makes for some eminence. Like all gregarious animals, the guanacos invariably have sentinels posted on the most elevated points, and trust their safety to their watchfulness, the squeal of alarm being instantly followed by the flight of the herd. Knowing this peculiarity, the hunters are sure that if a herd of guanacos be in the plain, and a hill be near them, the animals will be almost certain to take to it.

The second characteristic is, that the guanacos, when thrown into confusion, entirely lose their presence of mind, running a few steps in one way and then a few steps in another, being quite unable to fix upon any definite plan of escape.

A large party of hunters, sometimes nearly a hundred in number, arm themselves with their long, light, cane-shafted spears, called chuzos, summon their dogs, and set off toward the spot where a herd of guanacos is known to be. Having fixed upon some grassy hill, half of the hunters push forward and take up a position on the further side, while the others drive the guanacos gently toward their well-known grazing place.

As soon as the animals are fairly on the hill, the hunters spread out so as to enclose

PATAGONIANS HUNTING GAME.

(See page 1181.)

them in a semicircle, and then dash forward, driving the herd up the hill. The detached band on the other side, as soon as they hear the shouts, spread themselves out in a similar manner, the two bodies completely surrounding the hill, so that when the guanacos reach the summit they find themselves environed by enemies.

After the usual custom in such cases, the guanacos lose all presence of mind, some running one way, some another, mutually hindering each other's escape, so that the hunters are able to pierce with their long spears the finest animals, and thus secure in a very short space of time so great a number, that they are amply supplied with skins and meat.

Although they carry the spear on these occasions, they are not without the bolas, it being used for capturing the young guanacos, which are kept in a domesticated state like sheep. Now and then a guanaco, which possesses more sense than its comrades, takes a line of its own, and dashes through the circle of its enemies. Still it has but little chance of escaping, for round the circle of horsemen there is another circle of men on foot, accompanied by dogs. As soon as a guanaco breaks through the first circle, it is instantly seized by the dogs, which terrify it to such an extent that it is unable to move, and neither tries to escape nor resist.

On the preceding page is a spirited engraving which represents Patagonian scenery, and the natives in their favorite pursuit of hunting game. The hot chase, the flying bolas, the bewildered guanacos are vividly pictured.

The young guanacos which have been mentioned as being domesticated are not solely intended to furnish food, or even bred merely for the sake of their skins. They are employed for the sake of decoying the adult animals. Taking the young guanaco to the feeding grounds, the hunter ties it to a bush, and then conceals himself behind it. By imitating the mother's cry, he induces the captive to utter the plaintive bleating sound by which a young one calls for its mother. This is a sound which the adult guanacos cannot resist, and as soon as they come within twenty yards or so of the bush, the bolas is launched, and the animal at which it is aimed falls to the ground, enveloped in the fatal coils.

The power of the bolas is eminently shown in the chase of the rhea, or American ostrich. This bird is as swift and wary as the true African ostrich, and, but for the bolas, the hunters would scarcely be able to secure it. In the chase of this bird the Patagonians employ the same device which is used in capturing the guanacos. They know that the rhea shares with the guanaco the tendency to become confused and uncertain in its movements when it is pressed simultaneously from opposite directions. They

therefore try to surround the herd and converge upon it, or, at all events, two or three of them attack it from opposite quarters, driving it first one way and then another, so that the bird becomes so perplexed that it cannot make up its mind to run in one direction, and escape its foes by its superior speed, but allows them to come within range of the bolas, when its fate is sealed.

The hunters also know that, in common with all the ostrich tribe, and, indeed, with many wild animal of chase, the rhea always runs against the wind. It is therefore easy for them to ascertain the direction which the bird will take, and by sending two or three horsemen several miles windward the retreat of the bird is easily cut off. The Patagonian can even kill the little cavies with the bolas, so accurate is his aim.

The reader may easily imagine that such a weapon as this would be serviceable in warfare. When the Patagonian uses it in battle, he does not always fling it, apparently because he does not like to deprive himself of his weapon. Sometimes he dashes alongside of a foe, and throws one of the balls at him, just as if he were throwing a stone, retaining the other ball in his hand, so as to recover the weapon after the blow has sped. When the Patagonian carries the three-ball bolas, which has already been described, he uses the third ball, which, as may be remembered, is attached to the longest thong, as an English robber uses his "life-preserver," or an American his "slung-shot."

Another mode of procuring game is practised by the Patagonians, and is identical with that which is used by the North Africans in taking the partridge, the South Africans in killing the bustard, as well as by the inhabitants of other parts of the earth. There is a sort of partridge which is common on the plains, and is called the Pampas partridge. Its scientific name is *Nothuria major*. The weapon, or rather implement, required for this sport is a very simple one. It is nothing more than a light reed, some eight feet in length, at the end of which is a noose composed of a strip cut from the side of a long feather. This noose has sufficient pliability to be drawn tight when pulled and sufficient elasticity to keep itself open.

Furnished with this implement, the Patagonian looks out for a partridge on the ground and, when he finds one, begins riding round and round it in an ever decreasing circle. The bird is much perplexed by this conduct, and, instead of flying away, it simply crouches closely to the ground. By degrees, the young hunter — this sport being only practised by boys — comes so close to the bird that he slips the noose over its neck, and, before it can spread its wings for flight, jerks it into the air.

An expert bird catcher will secure three or four birds in an hour by this curious mode

of hunting, which may be pursued on foot as well as on horseback. The only drawback to it lies in the very limited time during which it can be attempted. It has been found that, if the shadow of the hunter should fall upon the partridge, the bird seems to shake off the strange feeling which paralyzes its energies, and flies away before it can be captured. Consequently, the sport can only be pursued so long as the sun is toward the meridian; and as soon as the shadows lengthen sufficiently to throw them on the bird, the young hunter abandons his sport. All practical naturalists are aware of the alarm caused by a shadow falling on some animal which they are watching or trying to capture; and entomologists in particular have learned that, to approach most insects,

it is necessary to keep the insect between themselves and the sun.

As to the strange sort of fascination which forces the bird to crouch instead of flying away, it exists in very many birds, of which the domestic poultry or any of the common cage-birds are familiar examples. Any one who is accustomed to deal with these birds can take one, stand it or lay it on a table, go away, and return after an absence of hours, knowing that the bird will not dare to move. During the time that I kept and bred canaries, I used to free them from the dreaded red mite by sprinkling insect powder under their feathers, laying them on a piece of paper covered with insect powder, and leaving them there for an hour or two, until the powder had destroyed all the parasites.

CHAPTER CXXIII.

THE PATAGONIANS — *Concluded.*

DOMESTIC LIFE.

PATAGONIAN MARRIAGE — APPEAL OF A SUITOR — REJECTION OF THE OFFER, AND RESULT OF THE NEGOTIATION — CURIOUS MODE OF SMOKING — PRESCRIPTION FOR A SICK CHILD — PATAGONIANS AT HOME — NATIVE COOKERY — PATAGONIAN ARCHITECTURE — TREATMENT OF WOMEN, CHILDREN, AND SLAVES — MODE OF GOVERNMENT — POWER OF THE CACIQUE — NOTIONS OF RELIGION — OFFERINGS AND LIBATIONS — FUNERALS IN PATAGONIA — SECLUSION OF WIDOWS — VISITS OF CONDOLENCE.

WE will now glance at the domestic life of the Patagonians, if the word "domestic" can be rightly applied to people who have no settled home or *domus*.

How marriage is conducted among them is described by Captain Bourne, who was kept a prisoner for a considerable time, and had every opportunity of studying their manners and customs. It appeared that in the house of the chief to whom he belonged there was a daughter—a widow, with a young child. One evening, the tramp of many feet was heard on the outside of the hut, together with the mutterings of voices. Presently, one voice was heard louder than the rest, evidently addressed to some one within the hut. It was the voice of a suitor come to ask the hand of the young widow. The chief scornfully refused the offer, saying that he was not worthy to be her husband, having no horses or other property. The man admitted that at the present time he did not happen to have any horses, but that he was a remarkably good thief, and that, if the lady would only accept him, he would steal horses, catch guanacos, and give her plenty of grease.

These overtures being rejected as contemptuously as the last, the suitor addressed himself to the lady, who was very willing to accept him, and entirely yielded when he repeatedly promised to bring home plenty of grease for her. She then besought her father to listen to the suitor's application, but was angrily refused. Her mother then tried to pacify the angry father, saying that the young man might fulfil his promises,

catch plenty of horses, and become a great chief.

This was too much for the old man. He jumped up in a towering passion, seized the cradle in which his little grandchild was lying, flung it out of the hut, snatched up every article which his daughter possessed, threw them after the cradle, and then ordered her to follow her goods. This was exactly what she wanted; so, accompanied by her mother, she left the hut, and was joined by her intended husband.

A curious mode of smoking is practised among the Patagonians, which somewhat resembles that which is used by the Damaras, as recorded on a preceding page.

When one of these smoking parties is organized, the guests assemble together, sometimes in a hut, and sometimes in the open air. They gravely seat themselves in a circle, round a vessel of water,—sometimes an ox-horn stuck in the ground, and sometimes a sort of basin made of raw hide. All being assembled, one of them takes a stone pipe, and fills it with a mixture of tobacco and the shavings of some yellow wood.

The pipe being prepared, all the company lie flat on their faces, with their mantles drawn up to the top of their heads. The pipe is then lighted and passed round, each drawing into his lungs as much smoke as he can swallow, and retains it as long as he can exist without breathing. As soon as the smoke is expelled, the men begin a series of groanings and gruntings, which become louder and louder, until they are absolutely deafening. By degrees they die

away; and when quiet has been restored, each takes a draught of water, sits silently for a space, and then slowly rises and moves away.

Captain Bourne is of opinion that this ceremony has in it something of a religious element. The groaning and grunting might be due to the tobacco, or the substance which is mixed with it, but the sounds seemed to him to be louder and more emphatic than they would have been if entirely involuntary; and the breathings, writhings, and other accompaniments, the profound gravity, and the abstinence from speech, all appeared to have some religious significance.

The same traveller gives a very amusing account of a visit paid by a Patagonian physician to the hut of a chief. The party were just preparing to shift their quarters, after the Patagonian fashion, when one of the daughters came in, carrying a child who was crying loudly, and who was supposed in consequence to be very ill. The journey was stopped, and a messenger despatched for the wise man, who soon came, and brought with him his magic medicines, rolled up in two pieces of skin.

These were laid on the ground, and the doctor squatted by the side of them, fixing a steady gaze on the child, who presently ceased crying. Encouraged by this success, the wise man ordered a clay plaster to be applied. This was done. Some yellow clay was brought, moistened until it was like paint, and with this substance the child was anointed from head to foot. The clay seemed to have but little good effect, for the child began to cry as badly as ever.

The two mysterious packages were now untied, and out of one the doctor took a bunch of rhea sinews, and from the other a rattle. The doctor then fingered all the sinews successively, muttering something in a very low tone of voice, and after he had muttered for some five minutes or so, he seized his rattle and shook it violently. He next sat in front of the patient, and stared at him as he had done before. After an interval of silent staring, he turned to the chief and asked whether he did not think that the child was better. A nod and a grunt expressed assent, and the mother on being asked the same question gave a similar response.

The same process was then repeated—the silent stare, the painting with clay, the fingering of the sinews, the muttering of inaudible words, the shaking of the rattle, and the concluding stare. The treatment of the patient was then considered to be complete. The chief gave the doctor two pipefuls of tobacco by way of fee. This was received gratefully by the man of skill, who gave his rattle a final shake by way of expressing his appreciation of the chief's liberality, and went his way. As soon as he

had gone, the child resumed its crying, but the parents were satisfied that it was better, and, as Captain Bourne testifies, it soon became quite composed, and thrived well afterward.

The general mode of life among the Patagonians is not particularly alluring to persons of civilized habits, if we may judge from the graphic picture drawn by Captain Bourne:—

“A few dry sticks and a bunch of dry grass were brought; mine host drew from a convenient repository a brass tinder-box with a stone and a piece of steel, and soon produced a blaze that brilliantly illuminated the scene. By its light I was enabled to survey the first specimen of Patagonian architecture that had blessed my vision. It was constructed in a ‘pointed’ style, though not very aspiring, consisting of a row of stakes about eight feet high, each terminating in a crutch or fork, with a pole laid across them; two parallel rows of stakes on either side about two feet high, with similar terminations and a similar horizontal fixture; and a covering composed of skins of the guanaco sewed together with the sinews of the ostrich, the only thread used by the people. This covering is thrown over the framework and fastened by stakes driven through it into the ground. For purposes of ventilation, some interstices are left; but these again are half closed by skins attached to the outside, so that the air from without and the smoke from within (in default of a chimney) must insinuate themselves through these apertures in great quantities.

“In truth, my first survey was rather hurried; the first cheerful gleam had scarcely set my eyes on the look-out, when I was fain to shut them against an intolerable smoke. In no long time I felt as bacon, if conscious, might be supposed to feel in the process of curing. No lapse of time was sufficient to reconcile the eyes, nostrils, and lungs to the nuisance. Often have I been more than half strangled by it, and compelled to lie with my face to the ground as the only endurable position. ‘Talk that is worse than a smoky house’ must be something out of date, or Shakespeare’s imagination never comprehended anything so detestable as a Patagonian hut. The chief and his numerous household, however, seemed to enjoy immense satisfaction, and jabbered and grunted and played their antics and exchanged grimaces as complacently as if they breathed a highly exhilarating atmosphere.

“My meditations and observations were shortly interrupted by preparations for a meal. The chief’s better-half—or rather fifth-part, for he had four wives—superintended the culinary operations, which were as rude and simple as the hut where they were carried on. And now my fancy began to conjure up visions of the beef, fowls, and

eggs, the promise of which had lured my men from the boat, had proved stronger than suggestions of prudence, and had made me a prisoner. But these dainties, if they existed anywhere within the chief's jurisdiction, were just at present reserved.

"The old hag threw down from the top of one of the stakes that supported the tent the quarter of some animal, whether dog or guanaco was past imagining. She slashed right and left with an old copper knife with might and main, till it was divided into several pieces. Then taking a number of crotched sticks about two feet long, and sharpened at the points, she inserted the forked ends into pieces of the meat, and drove the opposite points into the ground near the fire, which, though sufficient to smoke and comfortably warm the mess, was too feeble to roast it. At all events, time was too precious, or their unsophisticated appetites were too craving, to wait for such an operation, and the raw morsels were quickly snatched from the smoke, torn into bits by their dirty hands, and thrown upon the ground before us.

"The Indians seized them with avidity, and tossed a bit to me; but what could I do with it? I should have no appetite for the dinner of an alderman at such a time and place, but as for tasting meat that came in such a questionable shape, there was no bringing my teeth or resolution to it. While eyeing it with ill-suppressed disgust, I observed the savages, like a horde of half-starved dogs, devouring their portions with the greatest relish, seizing the fragment with their fine white teeth, giving every sign of enjoyment, except what one is accustomed to see in human beings.

"The old chief remarked the slight I was putting upon his hospitality. 'Why don't you eat, man? This meat very good to eat — very good to eat. Eat, man, eat.'

"Seeing him so much excited, and not knowing what deeds might follow his words if I refused, I thought it expedient to try to 'eat what was set before me, asking no questions,' — thinking, moreover, that if there were any evil spirit in it that the fire had failed to expel, it could not possibly have resisted the smoke. So, being sorely divided between aversion to the strange flesh and fear of showing it, I forced a morsel into my mouth. Its taste was by no means as offensive as its appearance, and I swallowed it with less disgust than I had feared. This was my first meal with the savages, and a sample of many others, though better viands afterward varied their monotony now and then."

It is most probable that the meat which was so rapidly cooked and eaten was that of the guanaco. The Patagonians are in no way fastidious as to their diet, and eat almost every animal which they kill, whether it be guanaco, rhea, or cavy. They have a

repugnance to the flesh of dogs, though they cannot, like the Fuegians, be accused of eating the flesh of human beings rather than that of dogs.

Their chief dainty is the flesh of a young mare, and it is rather curious that these strange people will not, if they can help themselves, eat that of a horse, unless it be disabled by an accident. They are fond of the fat of mares and rheas, separating it from the flesh by boiling, and pouring it into bladders, much as lard is treated in this country. Yet the fat obtained from the guanaco is not stored like that of the mare and rhea, but is eaten raw. As is the case with the Fuegians, the Patagonians obtain a considerable amount of food from the seashore, great quantities of limpets, mussels, and similar creatures being gathered by the women and children.

Besides animal food, vegetables are consumed, though rather sparingly, by the Patagonians. Two roots form part of their ordinary diet. One is called "tus," and looks something like a yam or potato. It is bulbous, and when cleaned and properly cooked bears a strong resemblance to a baked potato. The second root is called "chalias," and is a long, slender root, scarcely so thick as an ordinary pencil.

It is rather remarkable that the Patagonians do not seem to have invented any intoxicating drink. They soon learn to appreciate rum and other spirits, and will intoxicate themselves whenever they can procure the means, but they obtain all fermented and distilled liquors from the white traders, and not from their own manufacture. They have a sort of cooling drink made of the juice of barberries mixed with water, but it is drunk in its natural state, and is not fermented.

The dwellings of the Patagonians are worthy of a brief description, inasmuch as they show the distinction between the Patagonian and Fuegian ideas of architecture. The reader will remember that the principal portion of the Fuegian hut consists of sticks and branches, whereas the Patagonian only uses the sticks and poles by way of a framework whereupon he can spread his tent of skins.

These huts, called by the Spanish "toldos," and by the Patagonians "cows," are of variable dimensions. Generally they are little more than sloping sheds, six or seven feet high in front, and only two feet high at the back. The length of each toldo is about twelve feet, and its width about nine feet. As east winds are hardly ever known in Patagonia, the opening of the hut is always to the east, the skin covering of this simple tent being impervious to wind and rain. A Patagonian village, showing the form of these huts, is represented on the 1187th page.

This is the ordinary kind of dwelling, but

in some places a much larger description of hut is erected for the chief or the medicine man. These houses are gabled, being eight feet or so in height in the middle, and sloping on either side to the wall, which is five feet or so in height. Huts of this kind are nearly square, their depth rather exceeding their length.

The sleeping accommodation of these habitations is very simple, and consists of skins, which are spread on the floor. Other skins rolled up are laid along the side of the hut, and serve as pillows, the children lying in a corner by themselves, and the dogs sleeping at the feet of their owners. Those children who are unable to walk are laid in simple cradles made of square pieces of guanaco skin, hung hammockwise by four ends to the rafters of the hut.

During the daytime the infants are kept, or rather packed, in cradles made of flat pieces of board, over which some pliable sticks are bent in a semicircular form. The child is placed between two pieces of guanaco skin, fastened in the cradle, and can then be carried about without trouble. Even when the family is shifting quarters, the cradle can be hung on the saddle-bow of the mother's horse, the little occupant being perfectly contented with its situation.

It might seem from this statement that children are treated with neglect. Such, however, is not the case, the Patagonians being remarkable for their parental affection, and being much more inclined to spoil their children by over-indulgence than to behave unkindly toward them. Indeed, when a Patagonian chief wishes to change his quarters, and the people do not wish to part with him, they take one of his children, indulge it in every way, and declare that he must leave it behind him. The affectionate parent cannot bring himself either to leave his child, or to deprive it of the society of those who are kind to it, and in consequence he remains with his people.

The condition of the women is a very tolerable one. They certainly have to work hard all their lives unless their husband be rich enough to purchase slaves, or be fortunate enough to procure them by a raid on some other tribe. Many such slaves are obtained from the Fuegians, who do not scruple even to sell their own relatives when they can procure a good price for them. Even the wives of the chief men are not exempt from labor unless their husbands happen to possess slaves.

Generally the wives are faithful to their husbands, but there are cases where the woman has thought herself ill-treated, and has betaken herself to another protector. Should he be an inferior, the aggrieved husband makes him pay for his offence; but if a superior, he is obliged to put up with his loss. Generally, however, the husband and

wife live happily together, and the husband thinks it a point of honor to take his wife's part if she should fall into a dispute, no matter whether she be right or wrong. He will scold her severely in private, and even inflict corporal punishment on her, for involving him in such a dispute, but he will make a point of upholding her in public.

The mode of punishment of the Patagonians is rather variable, but is generally a modification of the patriarchal system. The heads of families or tribes possess hereditary rank, and take the lead in all important events of peace or war. Their power is, however, not very great, and they are not able to raise taxes, nor enforce compulsory labor without payment. These chiefs, or caciques, as they are termed, can, if they choose, refuse the rank, and many do so, preferring to become subjects of some other cacique to the trouble and responsibility which accompany the post.

According to Falkner, "the cacique has the power of protecting as many as apply to him; of composing or silencing any difference; or delivering over the offending party to be punished with death, without being accountable for it. In these respects his will is the law. He is generally too apt to take bribes, delivering up his vassals, and even his relations, when well paid for it.

"According to his orders the Indians encamp, march, or travel from one place to another to hunt or to make war. He frequently summons them to his tent, and harangues them upon their behavior, the exigencies of the time, the injuries they have received, the measures to be taken, &c. In these harangues he always extols his own prowess and personal merit. When eloquent he is greatly esteemed; and when a cacique is not endowed with that accomplishment, he generally has an orator who supplies his place."

The religion of the Patagonian is a polytheism, the natives believing that there are great numbers of deities, some good and some evil. Each family is under the guardianship of one of the good deities, and all the members of that family join him when they die. Beside these gods there are subordinate demons, good to their own friends, but bad toward all others, so that on the whole the bad predominates in them. They are called by the name of Valichu.

Yet among some of the Patagonian tribes there is even an approach to personal religion. It has been thought that the Patagonians are totally destitute of such religion. This, however, is certainly not the case, as even our limited knowledge of these people, their language, and their habits shows that, even though they may not possess any definite system of religion, they are still impressed with the idea of some Being infinitely greater than themselves, who knows everything that they do. Thus they believe

(1.) PATAGONIAN VILLAGE. (See page 1185.)

(2.) PATAGONIAN BURIAL GROUND. (See page 1189.)

in an omniscient Being; and such a belief as this, limited and imperfect though it may be, is yet a step toward true religion.

To this unknown Being they return thanks when they have obtained a supply of food after long famine, so that we find them acknowledging that the great Being, who knows all their deeds, watches over them, and is the Giver of all good things. When, for example, they have procured a seal after having been half-starved for months, they assemble round a fire, and the oldest man present cuts for each person a piece of the seal, uttering over each portion a sort of prayer, and looking upward in devotion to the unseen God, who had sent them meat in their need. Undisciplined as are the Patagonians, totally unaccustomed to self-denial, and mad with hunger, not one of them will touch the food until this invocation has been repeated.

The mode of burial among the Patagonians varies in detail according to the particular tribe, but there is a general resemblance in the ceremonies throughout the country. When a man dies, his body is wrapped in his best mantle, placed on his favorite horse, and conveyed to the place of burial, where a square pit has already been dug, some six feet in depth and two or three feet in width. In this pit the body of the deceased is placed in a sitting position, his bolas, spears, and other property laid beside him, and the pit is then covered with branches, on which a quantity of earth is thrown. The horse is next sacrificed. It is held at the grave by one man, while another kills it by a blow on the head from the bolas, and the skin is then removed, stuffed, and supported at the grave on four posts. At the grave of a cacique four horses are sacrificed. The clothing which is not buried with the deceased is burned, and a feast on the body of the horse closes the proceedings. On page 1187 the reader may find an engraving of a Patagonian burial ground.

The widows are obliged to remain in a state of the strictest privacy for an entire year, keeping themselves within their huts, never mixing in society, and not even showing themselves unless absolutely obliged to do so. They must blacken themselves with soot, and not eat the flesh of the guanaco, the mare, or the rhea. Should a woman break the rule of seclusion, and be detected in an intrigue, she would at once lose her life at the hands of her dead husband's relations.

Among some of the tribes the tomb is periodically opened, and the skeleton of the deceased, which has been prepared with the greatest care, is washed and clothed in new robes. This office belongs to an old matron, who is specially selected for the task, which becomes in process of time a long and tedious one, as the warriors are placed side by side in the grave, each year gradually adding to the number of those who have to be washed and clothed annually.

Among some of the tribes the skeletons are prepared by laying the bodies on platforms woven from canes and twigs, and during the time that is occupied in cleaning and bleaching the skeleton the platform is guarded by the friends of the dead man, draped in long mantles, and bearing spears or staves with which they strike the ground, while they sing mournful strains in order to drive away the Valichus or spirits, who may possibly be well disposed toward the dead man, but are more likely to be unfriendly.

Should the deceased have been a wealthy man, many visits of condolence are paid to the relatives, the mourners weeping loudly, and pricking their arms and legs with thorns in order to prove their affection by the effusion of their blood. For these tokens of respect they are rewarded with beads, brass ornaments, and other presents; and it need scarcely be said that the sorrow felt for the deceased and the sympathy excited for his friends depend very much on the amount of property at the disposal of the relatives.

CHAPTER CXXIV.

THE ARAUCANIANS.

DRESS — ETIQUETTE — GOVERNMENT.

DIVISION OF THE NATION INTO TRIBES — THE MAPUCHÉS — PECULIAR STRUCTURE OF THE HEAD — THE CHERIPA, PONCHO, AND BOOTS — MODE OF SHAVING — DRESSING THE HAIR — THE "PULLING HAIR" FIGHT — DRESS OF THE WOMEN — THE ENORMOUS BREASTPIN — SINGULAR USE OF THIMBLES — ELABORATE HEADRESS — PAINT — EXHIBITION OF FEMALE VANITY — DRESS OF THE CHILDREN — ARCHITECTURE OF THE ARAUCANIANS — THE CHIEF'S HOUSE AND ITS FURNITURE — LONG HOUSE OF THE MAPUCHÉS — NUMBER OF FIRES — CODE OF ETIQUETTE — THE SPEECH OF CEREMONY — VALUE OF ORATORY — DEMAND OF TRIBUTE — MODE OF GOVERNMENT — THE GRAND TOQUI — THE COUNCILS OF PEACE AND WAR.

PASSING northward from Patagonia, and taking a westerly direction, we come to the ARAUCANIAN nation. This title was given to them by the Spaniards, just as was the name of Patagonians to their southern neighbors, and, although it is an incorrect one, it has been accepted for so many years that it cannot be conveniently exchanged for the more correct designation.

The aborigines of Chili and a part of the territory now occupied by the Argentine Republic were formerly one great people, extending over a very considerable portion of the land, and necessarily modified in manners and customs by the influence of climate and geographical position. Their general title was Alapu-ché, or People of the Land, but they were separated into three great divisions, namely, Pehuen-ché, or People of the East; Mara-ché, or People of the West; and Huili-ché, or Far-off People, being those nearest to the Patagonians. Passing over the wars with the Spaniards, as foreign to the object of this work, we will describe the Mapuchés, or People of the Country, as they call themselves.

THESE people are rather below the middle height, strong, thick-set, broad-chested, and much inferior in point of form to the North American tribes. The head is narrow, and low in front, broad and high behind, and the back of the head falls in almost a direct line with the nape of the neck, a peculiarity by

which an Araucanian may almost invariably be distinguished. The foot is as remarkable as the head. It is very short and broad, and rises straight from the toes to the ankle with scarcely any curve, so as to produce a very high but very clumsy looking instep.

The ordinary dress of the Mapuché men is mostly composed of two garments, namely, the "cheripa" (pronounced *chêreepah*) and the poncho. The cheripa is a sort of compromise between a kilt and trousers. It is a piece of stuff, mostly cotton, which is fastened to the back of a girdle, passed between the legs, drawn up in front there, and tucked then into the girdle. The poncho is nothing but a large circular piece of stuff, with a hole in the centre, through which the head passes. It is exactly similar in principle to the cloak of Polynesia, and is at once a primitive, efficient, and graceful robe, assuming with every change of attitude folds which delight the eye of an artist.

Beside the poncho and cheripa, the Mapuché generally wears a pair of boots, similar to those of the Patagonians, and made of similar materials, the skin from the hind legs of a horse being drawn over the foot while still fresh, so that it moulds itself to the leg of the wearer. As with the Patagonians, it is open in front, so as to allow the two first toes to pass through and grasp the small triangular stirrup. The elaborate

horse-accoutrements in which the Mapuchés delight will be described when we come to the manners and customs of the people. Men of rank wear woollen bracelets and anklets as marks of their superior position.

Like most of the Araucanian tribes, the Mapuchés have but little beard, and what they have they eradicate after the usual fashion of savages, plucking out the individual hairs instead of shaving. Mr. R. E. Smith had the opportunity of seeing the operation performed:— "At one house where we stopped I saw an Indian, who at first sight seemed to be a white man, from the fact that his beard was grown as though unshaven for a week. He looked red and blotched, and was continually raising his hand to some part of his face, wearing all the while an expression of patient endurance. A close scrutiny showed that he was engaged in shaving.

"These Indians pull out or nip off the beard with small steel tweezers. This instrument was originally, as the Mapuché name signifies, a clam shell, but, by intercourse with the whites, they have been able to procure a more elegant article. Every dandy carries his tweezers hanging from his neck, and at leisure moments amuses himself by smoothing his face to the taste of his painted mistress. The arguments they use in defence of their treatment of the beard are precisely those used by shavelings the world over."

They do not content themselves with merely removing the hair from the chin, cheeks, and upper lip, but pull out the eyelashes and eyebrows, substituting instead of the latter a slender curved line of black paint. They say that the presence of the eyelashes hinders them in the pursuit of bee hunting, a sport of which they are very fond, and on which they pride themselves greatly. Some of the younger warriors have allowed a very slight fringe of hair to remain on the upper lip, but the older chiefs think that it is an innovation on the ancient customs, and discountenance it as far as they can.

The hair of the head is cut short at the top, but is allowed to grow long at the sides, in order that it may be easily grasped, just as the North American tribes leave one long lock on the crown of the head so as to assist the enemy who slays them in getting off the scalp.

When two lads quarrel, they settle the dispute with a fight, which is conducted, not by blows with the fist or with a weapon, but by pulling the hair. "Let us pull hair, if you are not afraid," cries one of the disputants to the other. The challenge is never refused. Off goes the poncho, if they happen to be wearing it, the cheripa is tucked tightly into the belt, the combatants allow each other to take a fair grasp of the long locks,

and the struggle begins. Each tries to twist the head of his opponent so as to bring him to the ground, and when he has once fallen, they loosen their grasp, rub the backs of their heads, take a fresh grasp, and repeat the struggle until one of them yields. The combat over, all animosity vanishes, and they are good friends again.

The dress of the women is, like that of the men, composed of two garments, though they are differently put on. One is an enlarged cheripa, and made of the same material. It is first wrapped round the body close under the arms, and then pinned together over each shoulder, so that the arms are left bare. It is confined at the waist by a very broad belt, and falls nearly to the ankle. This alone is a very sufficient dress, but over it is thrown a second piece of stuff which acts as a shawl or mantle, being fastened in front with a pin having a most enormously flat head, about the size of a cheese plate. Sometimes the head is globular, but the flat form is the favorite, and it is adorned with engraved figures. The cloth is mostly of native manufacture, and is either black or a very dark indigo blue.

Like that of the men, the hair of the women is divided into two long tails, one of which hangs over each shoulder. The tails are wound round with spiral strings of blue beads, and their ends are connected by a string of twelve or fourteen brass thimbles, which hang side by side, like a peal of bells. Besides these ornaments, the women wear a sort of cap, made entirely of beads, and falling over the back of the head as far as the shoulders. Its lower edge is decorated with a row of brass thimbles, like that which connects the two queues of the hair. This elaborate headdress is only worn on great occasions, while ordinarily the queues are wound round the head, the two ends projecting in front like horns, a fillet, usually studded with beads, being employed to keep the hair in its place. These peculiarities of dress are shown in the illustration of a Mapuché family on page 1201.

Ornaments are worn according to the wealth of the owners. Strings of beads, silver dollars, and brass thimbles are hung in profusion round the neck, which is further decorated with a collar made of leather and inlaid with silver. Wide bracelets and anklets are also worn, similar to those of the men, but made of variously colored beads instead of wool.

Paint is worn by both sexes, but chiefly by the women, and is anything but ornamental. It is invariably of two colors, red and black, which are mixed with grease, so that they can be applied and removed at pleasure. The usual plan is to have a broad red belt from ear to ear, taking in the cheeks, eyelids, and nose, the lower edge of the belt being sometimes edged and scalloped with black. The eyelids and lashes

are also edged with black, and a thin line of the same hue takes the place of the eyebrows, which are all removed except a very fine row of hairs in the centre. Some of the women further decorate their faces by spots of black paint. The women are exceedingly proud of these ornaments; and an amusing instance of their vanity is related by Mr. Smith:—"Our conversation turned upon female dress; and, without intending any disparagement to our fair entertainers, we compared them to the women whom we had seen at the house of Chancay. The women, who were at work near by, did not understand half-a-dozen words of Spanish; but, with that intuitive perception which belongs to the sex, they were not long in discovering that our conversation related to themselves and their dresses.

"Immediately they held a council of war; and, entering the house, they presently returned, each with a bag of trinkets. There were coverings for the head and breast, composed of strings of beads of all colors and designs, with brass thimbles and silver coins. There were rings and pendants for ears and nose; bracelets and anklets, collars and breastpins of colossal proportions. These were held up for our admiration; and that we might more fully realize their wealth, the ladies proceeded to deck themselves with all their finery. They were at the same time jabbering at the top of their lungs, praising their own superiority to all other women, and appealing to us for a confirmation of their own good opinions.

"Finally, the belle of the lot, having ornamented her head, breast, and arms to their fullest capacity, stepped in advance of the others, and, raising her dress as high as the knee, displayed to our astonished gaze a remarkably well-rounded piece of flesh and blood. Patting the calf with honest pride, and turning it about for our inspection, she hung it round with beads, adjusted the many-colored anklets, and, snapping her fingers contemptuously, poured out a perfect torrent of Mapuché.

"Unfortunately, there was no one near to interpret this language; but from her action, and the frequent repetition of the name 'Chancay,' we gathered her meaning to be pretty much that, in whatever else the wives of Chancay might excel, she would defy them or any one else to produce a finer leg than the one in question."

The dress of the children is simple enough. As long as they are infants, and not able to walk, they are tightly rolled up in bandages, so as to be unable to move. In this helpless condition they are put into bamboo cradles, and hung up on pegs driven into the walls of the house, or laid in baskets suspended from the roof, so that they can be swung about by a cord tied to the cradle. The infants are perfect models of behavior, never crying, and allowing themselves to be hung

on pegs without betraying any signs of life, except the movement of the eyes. As soon as they can walk, they are allowed to run about without the incumbrance of any clothing, which is not worn until they become boys and girls of seven or eight years old.

The architecture of the Araucanians is very simple, but differs slightly according to the district, and the position of the owner of the house. The ordinary house of a common man is a mere hut, built of wicker-work, about twelve feet by ten, carelessly made, and ill calculated to withstand the elements. On a wet day the rain pours into the hut on all sides, a circumstance which has its advantages to counterbalance its discomforts. On rainy days all cooking has to be done within the house, which would be absolutely unbearable if the apertures which let the rain in did not let the smoke out. At night, moreover, these huts are overcrowded with sleepers.

In one of these huts there were three rude bedsteads, for the accommodation of two married couples and a pair of grown-up girls, while on the ground lay sixteen or seventeen young men and children, packed together like herrings in a barrel. Moreover, a whole troop of dogs came sneaking into the house as soon as the inmates closed their eyes; so that within this limited space some thirty living beings were contained during the night. It is evident that, if the hut had been weather-proof, the whole party would have been suffocated before the morning.

A better kind of habitation, visited by Mr. Smith, deserved the name of house. It was rectangular instead of rounded, and measured thirty feet in length by fifteen in breadth. In the middle of the roof was a hole, by way of chimney, the fire being made directly beneath it. There was no window, the hole and the door being the only apertures for the admission of light and air.

There was only one room, though a sort of loft was made in the roof. This was used as a storehouse, where sacks of beans and similar luxuries were kept. As might be supposed, the whole upper part of the house was thickly encrusted with soot. One of the corners was partitioned off with a sort of wicker-work wall, and served as a granary, in which the wheat was stored.

From the sooty, cobwebbed rafters hung bunches of maize, pumpkins, joints of meat, nets full of potatoes, strings of capsicum pods, and similar articles; while earthenware pots, dishes, and spears were scattered in profusion over the floor. In the middle of all these articles hung two long lances, with their points toward the door; but, although their heads were protected by being stuck into lumps of fat, they were rusty, and had evidently been long out of use.

Two of the corners were occupied with the

ordinary bedstead of the country, *i. e.* a framework of cane, with a bull's hide stretched tightly over it; and near the beds hung the stock of finery belonging to the owner, namely, spurs, stirrups, and bits, all of solid silver, belonging to the men, and breastpins, necklaces, earrings, strings of thimbles, and other adornments of the women. The usual basket cradle, containing a swathed baby, was suspended from one of the rafters.

The house of a cacique, or chief, is very much larger than either of those which have been described, and somewhat resembles the "long house" of Borneo. One of these houses, belonging to a cacique named Ayllal, looked at a distance something between a very long boat and a haystack. Its height was about fifteen feet, its width thirty, and its length about one hundred and forty.

The middle of the house was common to all the inhabitants, but the sides were partitioned off so as to form a series of chambers, each of which belonged to a married son of the proprietor, or to one of his own wives. In cases where the family is not a very large one, each wife has her own fireplace; but when the number of families under one roof is considerable, one fire is common to two or three of them. In Ayllal's house there were six fireplaces, and over each was a hole in the roof. The fireplaces are nothing more than a few stones, so arranged that the pots can be kept clear of the burning wood; and, as the ashes are allowed to accumulate where they fall, or to be blown about by every current of air, it is evident that the interior of such a house is not a model of cleanliness.

In consequence of the custom of appropriating a separate fire to each wife, the one is conventionally accepted as a metaphor for the other. It is not considered polite to ask a man how many wives he has, but etiquette permits any one to ask another how many fires he burns. In front of the door hangs a cross-bar, beyond which no one ventures to pass without a special invitation, unless he be an inmate of the house, or an intimate friend of the family.

The Mapuchés exhibit in perfection that curious mixture of the savage and the gentleman that is so often found among uncivilized people. They have a most elaborate code of etiquette, which to a stranger is often irksome, on account of the time which is consumed in going through the requisite formalities. When two persons meet, it is necessary that they should go through a set course of complimentary remarks, the omission of which, except between relatives or very intimate friends, would be held as an unpardonable offence. Let us take Mr. E. R. Smith's account of the ceremonial:—

"If the guest be a stranger, the host begins by addressing him with 'I do not know you, brother,' or 'I have never seen you before.'

Thereupon the stranger mentions his own name and residence, and goes on to ask the host about himself, his health, and that of his father, mother, wives, and children; about his lands, crops, cattle, and flocks; the chiefs of the district, the neighbors, *their* wives, children, crops, &c., are next inquired about; and whether there have been any disturbances, diseases, deaths, or accidents.

"If the responses given are favorable, the questioner goes on to express his happiness, and moralizes to the effect that health, wealth, and friendship are great blessings, for which God should be thanked. If, on the contrary, the answers should convey bad news, he concedes with the afflicted, and philosophizes that misfortunes should be borne with equanimity, since men cannot always avoid evil. The guest having finished, the host commences in turn to ask all the same questions, making such comments as the answers received may demand.

"This formality occupies ten or fifteen minutes. The questions and answers are recited (by rote) in a low monotonous voice, with a sing-song tone, not unlike the saying of the rosary or the chanting of friars. At the end of each sentence, if the last word end with a vowel, the voice is raised to a shout; but should the final letter be a consonant, it is rounded off with a nasal grunt. The listener expresses his satisfaction occasionally by a sound between a grunt and a groan, or indicates surprise by a long-drawn "Huc! With these exceptions, he never interrupts until the speaker has given notice, by a peculiar cadence of the voice, that he has said his say. During this palaver, the speakers often do not look at each other, and frequently even sit with their backs turned to one another."

As soon as etiquette has been satisfied by these formalities, the speakers assume their ordinary tone of voice, and converse freely on subjects respecting which they really take an interest.

Oratory is highly valued by the Mapuchés, and should a young man have some power of speech, and train it into eloquence, he is on the high road to distinction, and will probably end by becoming a chief, though originally of inferior rank. Such young men are always eagerly sought by the chiefs as their messengers, inasmuch as etiquette requires that such messengers should not only possess a retentive memory, so as to insure the transmission of the message correctly, but should also be fluent of speech and choice of diction, the latter being a point in which the Mapuchés are exceedingly fastidious.

A young man who shows himself to be a proficient in these three requisites is sure to be taken into the service of an important chief, and indeed he knows his own value too well to damage his prospects by serving any except a man of very high rank. Acting as messenger, he practically becomes a sort of

ambassador, on whom the reputation of his principal is reflected, and by associating with the chief men, and speaking at their assemblies, he soon gains for himself that importance which was formerly only accorded to his official capacity. Men of this stamp have frequently become the masters of those whom they formerly served, their abilities having raised them to their appropriate station.

To a stranger the eloquence of these men is utterly unintelligible. They deliver their message in a sort of monotone, varied with inflections, but without the least spirit or action. In fact, they very much resemble schoolboys reciting a piece of poetry which they have learned by rote without taking the trouble to understand it. Yet the Mapuchés are held entranced during the delivery of such a discourse by an accomplished orator, the purity of whose diction excites the respectful admiration of his hearers.

Etiquette is so highly valued among the Araucanians that on one occasion an English gentleman nearly lost his life by neglecting a ceremonial. It seems that every chief, no matter how petty may be his domain, expects that every stranger who passes through his territory shall pay him a tribute. The amount of the tribute is of little consequence, so that something is given as an acknowledgment of rank.

Being new to the country, the gentleman in question was passing through the territory of a chief, when he was stopped and asked for tribute, a demand which he refused to pay, on the ground that he was only a traveller and not a trader. Thereupon a young man leaped into a cabin, brought out a trumpet made of a horn, and blew a blast upon it. The signal was answered in all directions, and from every side there poured in a number of mounted and armed warriors. The traveller was not daunted, in spite of the martial array, cocked his pistols, and awaited the attack, when his guide ran up to him, and begged him to give them something, *if it were only a pocket-handkerchief*.

The traveller saw at once, from the smallness of the suggested present, that it was a mere question of etiquette, and munificently presented the chief with a jack-knife. Enmity at once gave way to enthusiastic friendship. The old chief was quite overcome by the splendor of the gift, swore eternal friendship with the traveller, and sent a guard of honor to accompany him for several miles on his way.

WE naturally come to the mode of government employed by the Araucanians.

The four great divisions are subdivided into provinces, and these into smaller districts, each of which is presided over by a chief, who exercises a kind of patriarchal authority over his clansmen. He is the judge and arbiter of the clan, and there is

no appeal from his decision. Yet he levies no taxes, and cannot force even the lowest of his people to work for him. He can require the services of the men for war or for business of state, but there his authority ends. No land can be sold except by the chief, to whom it is by a sort of legal fiction supposed to belong, and even he cannot sell it to any except a native Araucanian, under penalty of death.

All these chiefs, or caciques, as they are often called, are considered to be equals in point of rank, and independent of each other, though one is chosen on account of his personal abilities to be the head chief of the district, but merely as *primus inter pares*. The office of chief is generally but not always hereditary. It mostly descends to the eldest son, but the actual holder of the office may bequeath it even to one who belongs to another family. Should a chief die without sons, brother, or a recognized successor, the people have the power of electing a chief for themselves, and it is on such occasions as these that the eloquent messengers lately described find their opportunity of being raised to the rank of cacique.

Up to this point the details of the government are simple enough. We now have to consider a most singular arrangement, unlike that of any other known nation. From the head chiefs of the various districts one is chosen as the Toqui, or head of the province, and these Toquis form the supreme council by whom the affairs of the nation are managed. From among them one is selected as president of the council, and is called by a title which signifies the Grand Toqui. He is the highest personage in the state. He can summon councils whenever he sees occasion, he watches over the welfare of the state, lays before his colleagues any information that he considers important, and on special occasions he can act on his own authority.

When Mr. E. R. Smith travelled in Araucania, the Grand Toqui was an old chief named Mañin, who seems to have been worthy of the position which he held. Mañin Huenó ("the Grass of Heaven"), as he was called by his compatriots, or Mañin Bueno ("Mañin the Good"), as the Chilenos termed him, was a very old man, his age being estimated as falling little short of a century, though his general bearing was such that he might have been taken for little more than sixty. His long black hair was but slightly sprinkled with silver, his eye retained its brightness, and his mien its uprightness; and though his many years had diminished his strength, they had not affected his intellect.

He was held in the very highest respect, as indeed was due to his acknowledged wisdom, by means of which war had many a time been averted. Yet he was not a rich man, and in point of wealth the greater

number of the lesser chiefs were far richer than Mañin Hueno. His only marks of wealth were the solid silver horse accoutrements — but even these were not worth fifty pounds of our money ; while his apparel was of the simplest kind, a red and yellow handkerchief tied round his head being the most costly article of his apparel.

When a council of Toquis is assembled, the members generally endeavor to outshine each other in the magnificence of their appointments ; and after the day's labor is over, they join in a general debauch, which sometimes lasts for the whole of the next day, and prevents the councillors from resuming their business until they have become sufficiently sober.

Now comes the curious part of Arauca-

nian government. The Supreme Council treats only of the internal management of the nation, and is technically called the Council of Peace. As soon as war is declared, the Council of Peace falls into abeyance, and its place is taken by the Council of War. This is headed by the Toqui of War, who, as long as the war lasts, has unlimited power, except over life. He appoints the officers, settles the number of warriors required, orders a conscription to be set in operation in each district, and lays upon each cacique the duty of levying a certain number of men, and raising a certain amount of supplies. As soon as peace is concluded, he and all his council retire from office, and the Council of Peace reassumes its sway.

CHAPTER CXXV.

THE ARAUCANIANS — *Continued.*

DOMESTIC LIFE.

LOVE OF THE HORSE—THE STIRRUP, BIT, AND SPUR OF THE ARAUCANIANS—MODE OF FASTENING THE SPUR ON THE HEEL—TRAINING OF THE HORSES—VALUE OF THE HORSE ACCOUTREMENTS—HATRED OF SHAMS—LOVE FOR SILVER AND CARELESSNESS OF GOLD—HOW THE ARAUCANIANS RIDE—THE BOLAS OR LAQUI, AND THE LASSO—MODE OF MAKING AND THROWING THE LASSO—CAPTURE OF A SAVAGE BULL—COURAGE OF THE ARAUCANIANS—THEIR SUCCESSFUL STRUGGLE FOR LIBERTY—CAREER OF A YOUNG HERO—MARRIAGE AMONG THE ARAUCANIANS—ABDUCTION OF THE BRIDE—RECONCILIATION WITH THE PARENTS—ARAUCANIAN COOKERY—PREPARING NACHI, CHICA, AND MUDAI—THRESHING CORN.

WE now come to the ordinary life of the Araucanians.

Like the American tribes in general, they have become wonderful adepts in the use of the horse, the climate, the natives, and the horse seeming to agree with each other in a way which is really remarkable, considering that the animal is of comparatively late introduction into America. Unlike the Patagonians, they pride themselves on the massive solidity of the accoutrements with which they bedizen their horses; and, although they care little about the individual animals, and are rather hard masters to them, they bedeck the horses in the most lavish manner.

Their saddles are made very much after the fashion employed by the Patagonians, being little more than rude wooden frames. A few skins are laid on the back of the horse, the saddle is placed on them, a saddle cloth of thick leather is thrown over it, and the whole apparatus is complete. The bridle is made, like that of the Patagonians, of twisted hide, or sometimes of a number of strips of horse-skin plaited together, a few threads of silver being mingled with them. The bit is generally the ordinary Spanish bit, with its cruelly powerful arrangement of curb and ring.

The stirrups are generally nothing more than a piece of cane twisted into a triangular form, and hung to the saddle by leathern cords; but the wealthy Araucanians

pride themselves in having these articles of solid silver. The shape of these stirrups varies in some degree, the usual form resembling that of the English stirrup, but very much larger and heavier, the sides being from one to two inches wide, and pierced in ornamental patterns, while the cross-bar on which the foot rests is fully two inches in width.

The form of stirrup to which they are most partial resembles the other, as far as the side pieces are concerned; but the foot-bar is developed into a large plate of silver, which comes over the front of the stirrup, and protects the toes and instep from the thorns which are plentiful in the country. The back of this plate projects behind in a sharp point, which is used as a spur.

About the spurs themselves the Araucanian is very fastidious. They are of enormous size, and armed with rowels measuring from two to three inches in diameter, and sometimes even exceeding that measurement. It may be imagined that spurs of this size, which are exceedingly weighty, must be buckled on the feet very tightly, so as to keep them in their places.

This, however, is not the case. On the contrary, the strap by which they are fastened is quite loose, so that when the wearer walks the rowels trail on the ground, and when he is mounted they hang nearly perpendicularly from his heels. The Araucanian cares little for the impediment in walk-

ing, as he never walks twenty yards if he can help himself; while the position of the spurs when he is mounted is a real necessity. An illustration of stirrups and spurs is given on the 1175th page.

The horses are never more than half trained. They are taught to wheel within a very small circle, to stop suddenly and throw themselves on their haunches, and to dash off at full gallop; but that is the extent of their accomplishments. Many of them are young, spirited, and nervous steeds, and if, in the course of the struggles for victory which they occasionally attempt, the spurs were to come against their sides, they would be greatly alarmed, and their struggles would only be increased. But as the spurs hang down almost below the rider's feet, they swing clear of the horse's flanks, while at any time, if they are needed for use, the wearer has only to bend his feet, which brings them into position.

The Araucanians have a very wholesome contempt for shams, and will have nothing that has any pretence about it. The poorest peasant, who can only afford an iron spur, or possibly not even a spur of any kind, would scorn to wear either spur or stirrups of plated metal, or of any imitation of silver, however good.

They are so fastidious in this matter that they will not use articles that have been made abroad; and even if a spur is made of solid silver in imitation of their own patterns, they will be nearly certain to reject it, the workmanship being sure to betray itself to their experienced eyes. A high polish always excites their suspicions, inasmuch as the native artificers are incapable of imparting it. All these articles are made from the silver currency of the country, and the wealthy Araucanian always carries with him a pair of balances, and a number of dollars which serve as standard weights.

It may be imagined that the purchase of a pair of spurs or stirrups is a matter of importance with these people. The buyer sits in silence on the ground, takes the spurs, and examines every part with the minutest attention, scrutinizing every joint, smelling the metal, tasting it, and ringing it, in order to judge whether it has been debased by the mixture of any inferior material. Not only spurs and stirrups, but pendants for the bridle, and ornaments for the headstalls and saddles, are made of silver; so that the accoutrements of a wealthy Araucanian will sometimes be worth a hundred and fifty pounds, merely as silver, without regard to the value of the workmanship.

The men who make these highly prized ornaments use the very rudest of tools, and their workshops are but rough hovels, quite out of keeping with the barbaric magnificence of their wares. Sometimes the artificer makes the ornaments for sale; but in the case of large articles, such as spurs or

stirrups, which weigh several pounds, and consume a great number of dollars, he prefers to wait for the order, and make the required article out of the bag of dollars with which it is accompanied.

It is remarkable that the Araucanians, fond as they are of silver, will have nothing to do with gold. Besides these horse accoutrements, they wear earrings, breast-pins, and other ornaments of silver, but none of gold. Some travellers think that their reason for the rejection of gold is their wish to conceal its presence in the country from the knowledge of the foreigner, remembering that it was the cause of the disastrous war with the Spanish invader. The real cause is, probably, that it cannot be procured in sufficient quantities without more labor than they choose to bestow, and that they have not learned to work gold as they do silver.

The Araucanians are admirable riders, though their seat would not please an European riding master. They depend entirely on balance for retaining their seat, and seem rather to hang on the horse's back than to hold by any grip of the knee. Indeed, a stranger to the country always thinks that an Araucanian rider is on the point of being thrown, so loose is his seat, whereas the very idea that he can by any possibility be thrown never enters his mind. He and his horse seem one being, actuated by one mind. A traveller once saw a horse take fright, and leap sideways from the object of terror. He thought that the rider must be flung by the suddenness of the movement; but, to all appearance, the man took fright and shied at the same moment with his horse.

The Araucanians use the bolas in common with their southern neighbors, the Patagonians, and are never seen without the "laqui," as they term the weapon, hanging at their waists. Some of them have a way of leaving one of the balls without its covering of leather, saying that the covered bolas is used when they fight with friends, but the bare bolas when they fight with an enemy.

They also use the lasso, that terrible weapon which extends over so vast a territory, and which supersedes the bolas as it proceeds northward.

This terrible weapon is simple enough in principle, being nothing more than a leathern rope, forty feet in length, with a noose at the end. As, however, the construction is rather ingenious, I have given an illustration on the 1175th page, taken from specimens in my possession. Fig. 1 shows the lasso coiled through the strap by which it is attached to the saddle of the rider. It is made of a number of thongs of raw hide, plaited into a round rope, about three-eighths of an inch in diameter; so that, although it appears very slender, it really possesses enormous strength, and an elephant could

scarcely break it. This part of the rope is shown at fig. 5.

For the last ten feet of its length the rope is much thicker, is composed of more strips of hide, and is plaited into a square form. At the extreme end the various strands are plaited round an iron ring, as seen at fig. 4. Through this ring the lasso passes, so as to form a running noose. The change from the round to the square plait is seen at fig. 3, and fig. 2 shows the peculiar knot which keeps the lasso from slipping from the saddle.

Fig. 6 shows the end of another sort of lasso, made of the silk-grass fibre, *i. e.* the long fibres from the leaves of a species of agave. These fibres are wonderfully strong, and the lasso is remarkable, not only for its strength, but its elasticity. Instead of an iron ring being placed at the end, the rope is brought round so as to form a loop, the interior of which is lined with stout leather, and the exterior adorned with colored wools.

When the lasso is to be used, the thrower takes the ring in his left hand, and the lasso in the right, and separates his arms so as to make a running noose nearly six feet in length. Grasping the ring and the cord with his left hand, he slips his right hand along the rope so as to double it, and there holds it. When he throws it, he whirls it round his head until the noose becomes quite circular, and then hurls it at the object, throwing after it the remainder of the rope, which has hung in coils on his left arm. As it passes through the air, the noose becomes gradually smaller, so that the thrower can always graduate the diameter of the noose to the object which it is intended to secure.

The skill with which they fling this noose is wonderful, as may be seen from Mr. Smith's account of a struggle with an infuriated bull.—

"The capture of a particular animal from a herd, within a range of pasture utterly unbounded except by mountains and rivers, is often difficult, and gives rise to many exciting cases and ludicrous scenes. Even when taken, the captives are not easy of management, their attachment for old associates manifesting itself in frequent attempts to return.

"One particular bull gave great trouble. He was a noble fellow, of spotless white.—such an one as bore the beautiful Europa through the waters of the Phœnician deep, or such an one as might be worshipped on the shores of the Ganges.

"After a long time he was lassoed, and the horseman, who had literally taken the bull by the horns, started off complacently to lead him to the place of gathering. But his bullship did not take the going as a matter of course; for, with a mad bellow, he charged upon his captor, who, seeing a very

formidable pair of horns dashing toward him, started at full gallop, still holding fast the lasso, which he in vain tried to keep taut. The horse was jaded, and old Whitey was fast gaining. Another Indian bounded forward, and, dexterously throwing his lasso, caught the unoccupied horn, bringing up the prisoner with a round turn.

"The bull was not yet conquered. After plunging, pawing, bellowing, and tossing for a while, he changed his tactics. Making a rush and a feint at one of his annoyers, he wheeled about suddenly, and nearly succeeded in catching the other on his horns. Things were becoming more complicated than ever, when, as the infuriated animal stood head down, with his tail stuck out at an angle of fifty-five degrees, a third horseman came to the attack, and, whirling his lasso with a jerk, caught the caudal extremity in a running knot.

"Thus the two men at the sides were safe, provided that the man behind kept his lasso strained. But a question in the rule of three now arose. If three men catch a bull, one by each horn, and one by the tail, and all pull in different directions, which way can the bull go?

"No one seemed able to work out the answer; but Katrilas was a man ready for all emergencies, and, dismounting, he started to the assistance of his companions, armed with a long lance and an old poncho. Running before the bull, he threw the poncho on the ground, a few paces in front, the man behind slackened a little, and the bellowing captive made a desperate plunge at the red cloth. A jerk on the tail stopped further progress, till Katrilas, picking up the poncho on the tip of the lance, tossed it several yards in advance. There was another slackening, another plunge, another jerk, and so on, until the 'critter' was brought to the desired spot.

"The next trouble was to loose the captive. Sundry scientific pulls brought him to the ground, and Katrilas, springing forward, stripped the lassos from his horns. But another remained on the tail: That no one would venture to untie, for the bull had risen, and stood glaring frantically around. An Indian, unsheathing his long knife, ran full tilt at the extended tail, and with one blow severed the greater part of that useful member from the body.

"The last was literally the 'unkindest cut of all.' The poor brute was fairly conquered. He stood with head hanging, eyes glaring, the tongue lolling from his frothing mouth, his once spotless coat defiled with foam and dirt, while the drip, drip, drip, of the warm blood upon his heels rendered the abjectness of his misery complete."

That the Araucanians are a courageous race is evident from their struggles with the Spaniards. Though vanquished again and again by the superior arms and disci-

pline of the Spaniards, they were never conquered, and when repulsed, only retired to gather fresh forces. Toqui after Toqui fell in the struggle, the most remarkable of these warriors being a mere youth named Lautaro, who was unanimously elected to the post in consequence of his conduct when the Araucanians attacked the Spaniards at Tucapel. He was a captive and a servant in the family of Valdivia, when the place was attacked. The Spanish musketry told so terribly upon the Araucanians, that they were on the point of retreating, when Lautaro dashed forward, rallied his countrymen, and led them to the attack with such spirit that the whole Spanish force was destroyed with the exception of two, who escaped to Concepcion with the news of the defeat. Valdivia himself was captured, and it is said that Lautaro desired to save the life of his former master, when an old chief seized an axe and dashed out the brains of the captive general.

Foreseeing that General F. de Villa Gran, who was at Concepcion, would march at once to avenge the destruction of Tucapel, Lautaro assembled the troops, pushed forward, and concealed half of them in the sides of a defile through which the road led, while the other half were also concealed at the summit of the mountain. The battle began in the defile, and, after causing great destruction among the enemy, the Araucanians had to retire.

Fancying that the enemy were beaten, the Spaniards pressed on, and arriving wearied at the summit, found a second and fresh army opposed to them. They fought with the utmost courage, and their artillery nearly turned the day in their favor, when Lautaro told off one of his bravest officers with orders to capture the cannon, while he attacked Villa Gran on the flank. So furiously was the charge made, that the guns were taken, and the Spaniards had to retreat, Villa Gran barely escaping with his life.

When they entered the pass through which they had come, they found the outlet blocked with fallen trees, and the sides filled with warriors, whom the far-seeing Lautaro had despatched for that purpose at the beginning of the conflict. The slaughter was terrific, and only a few of the Spaniards escaped, led by Villa Gran, who at last forced his way through the barriers.

Lautaro showed his splendid generalship, by pushing on at once to the headquarters at Concepcion, which he took, pillaged, and burned. Orders were received from Lima to rebuild Concepcion, and no sooner was it done than Lautaro captured and burned it again. He then conceived the bold project of attacking Santiago itself, and in a wonderfully short time appeared before the place.

Here he committed his only error in gen-

eralship. He had to pass through the territory of the Purumancians, who had become allies of the Spaniards, thinking them invincible. Lautaro should have remembered that the late defeats must have altered the opinions of the Purumancians, who could have been easily induced to act against their former allies. But his indignation at their treachery was so great, that he stopped to ravage their territory and destroy their crops.

Villa Gran, who was then the governor of Santiago, knew his enemy well, and employed the time in fortifying the city, which would have fallen at once had Lautaro pushed on without stopping to punish his traitorous countrymen. Three times Villa Gran sent a force against the Araucanians, the last being commanded by his own son, but all were routed and driven back.

At last Villa Gran, stung by these repeated defeats, determined himself to conduct an expedition against his foes, and with a mixed force of Spaniards and Purumancians came stealthily upon the Araucanian camp. Born general though he was, Lautaro did not know the use of outposts, and the consequence was, that Villa Gran surprised his camp, and as he rushed to the front to rally his followers, he was pierced by a dart flung by one of the Purumancians, and fell dead on the spot.

Thus fell Lautaro, a youth worthy to be named with the greatest heroes of antiquity. Chosen commander at the age of seventeen, he opposed for two years the best soldiers of Europe, armed with infinitely superior weapons, and accustomed to military discipline. Though a mere boy, he displayed a military skill and a fertility of resource worthy of the most accomplished generals, and by sheer force of intellect and courage won every battle except that in which he fell.

A nation which could produce men such as Lautaro, or the troops who fought and conquered under his command, is evidently capable of great things, and, at all events, worthy of the liberty which it won from the Spaniards, and which has never again been threatened.

MARRIAGE among the Araucanians is an odd mixture of ceremonies. Theoretically, the bridegroom is supposed to steal his wife against her own will and in opposition to the wishes of her parents; practically, he buys her from her parents, who have long looked upon their daughter as a valuable article, to be sold to the first purchaser who will give a sufficient price.

Sometimes the match is one of affection, the two young people understanding each other perfectly well. Music is the usual mode by which an Araucanian expresses his feelings, and the usual instrument is the jews-harp. The Mapuché lover is never

seen without his jews-harp hanging from his neck, tied upon a little block of wood to prevent it from being injured, and decorated with strings of many-colored beads. Furnished with this indispensable instrument, the lover seats himself at a little distance from the object of his choice, and produces a series of most dolorous sounds, his glances and gestures denoting the individual for whom they are meant.

After a little while, the lover thinks that he had better proceed to the marriage. Should he be a wealthy man, he has no trouble in the matter; but if not, he goes among his friends and asks contributions from them. One gives an ox, another a horse, another a pair of silver spurs, and so on. It is a point of honor to make these contributions, and equally so to return them at some time or other, even if the intending bridegroom has to wait until in his turn he can sell his eldest girl.

The next process is, that the friends of the young man assemble, all mounted on their best horses, and proceed in a body to the house of the girl's father. Five or six of the best speakers dismount and ask permission for the marriage, extolling to the utmost the merits of the bridegroom, and expatiating on the happiness of his daughter in being married to such a man. The father, treating the matter as gravely as if he had not done exactly the same thing himself, makes a speech in his turn.

All this ceremony is intended to give time to the young man to hunt for his intended bride, and, until he has found her, they will go on with their speeches. As soon as the young man discovers the girl, he seizes her and drags her to the door, while on her part she screams and shrieks for protection. At the sound of her voice all the women turn out, armed with sticks, stones, and any other weapons which come to hand, and rush to her help. The friends of the bridegroom in their turn run to help their friend, and for some time there is a furious combat, none of the men escaping without some sharp bruises, and the girl screaming at the top of her voice.

At last the bridegroom dashes at the girl, seizes her as he can, by the hand, the hair, or the heels, as the case may be, drags her to his horse, leaps on its back, pulls her up after him, and dashes off at full speed, followed by his friends. The relatives of the girl go off in pursuit, but are constantly checked by the friends of the bridegroom, who keep them back until he has dashed into the forest with his bride. They halt at the skirts of the forest, wait until the sounds of the girl's screams and the galloping of the horse have died away, and then disperse. This Araucanian ceremony of marriage is represented on the following page.

The young couple are now left alone until they emerge from the wood on the second

day after the abduction, when they are supposed to be man and wife. That all the fighting and screaming are a mere farce is evident from the fact that, if a mau should offer himself who is not acceptable to the parents of the girl, and should proceed to carry her off, one of her relatives blows the horn of alarm, as has already been mentioned, and all the male relations turn out and drive off the intruder. Sometimes, however, he succeeds in gaining the bush before he is caught, and in that case the marriage holds good.

Some few days after the marriage, the friends call on the newly-married couple, and bring the contributions which they had promised. The whole party then proceed to the house of the girl's father, and offer him these goods, which are taken as if they were merely offerings, and not the price for which the girl was sold. Being satisfied with the presents, he expresses himself pleased with the marriage, and congratulates the young couple and their friends.

But the mother is not so easily to be satisfied. With her it is a point of honor that she is *not* satisfied, but, on the contrary, is highly outraged at the abduction of her child. So she will neither speak to nor look at the bridegroom, but sits down with her back turned to him.

Now comes a difficult point. She is bound, in accordance with the laws of hospitality, to entertain the guests, and as the offending son-in-law is the most important person, he must be consulted first. So she addresses the bride, "My daughter, ask your husband if he is hungry." The conversation thus begun is carried on in a similar manner, and ends with an entertainment on which the mother of the bride exhausts all her culinary knowledge. Sometimes the husband never addresses his mother-in-law for years, except with her back turned to him, or with a fence intervening between them. The reader may remember that a similar custom is followed by the Kaffir tribes of Southern Africa. See page 88.

THE cookery of the Araucanians is at first anything but agreeable to European taste.

Mutton is largely consumed in the country, and is killed, dressed, and cooked in a speedy and simple manner. The sheep being hung by its hind legs to a tree, its throat is cut, and the blood is received into a bowl and mixed with salt, in which state it is thought to be a very great delicacy. The sheep is then opened, and the whole of the interior removed to be cleaned and cooked, this being held as the best part of the animal. The skin is then removed, the body is split along the spine from head to tail, and each half is transfixed with a stick, and set over the fire.

The greatest delicacy, however, that can be placed before a guest is called "nachi."

(1.) ARAUCANIAN MARRIAGE. (See page 1200.)

(2.) MAPUCHE FAMILY. (See page 1191.)

The mode of preparing this dish is a good example of the total disregard of inflicting pain which is common to all uncivilized people.

A sheep is hung up by the fore-legs, a quantity of cayenne pepper and salt is mixed in a bowl, and the throat of the sheep is cut so as to open the windpipe, down which the operator stuffs the salt and pepper as fast as he can. He then draws out the jugular vein, cuts it, and turns the end into the severed windpipe, down which the blood flows, so as to mix with the pepper and salt, and carry them into the lungs. The unfortunate sheep swells up and dies in horrible agony, which is totally disregarded by the spectators, not from intentional cruelty, but utter want of thought. The sheep is then opened, and the lungs are found distended with a mixture of salt, pepper, and blood. This is the nachí, which is served up by being cut in slices and handed to the guests while still warm.

There are two national drinks, namely, *chica* and *mudai*. The former is a sort of cider, and prepared as follows. A sheepskin is laid on the ground, with the woolly side downward, and a ponchoful of green apples is emptied on it. Two or three men sit round it armed with switches, with which they beat the apples, and in a short time convert them into a pulp. Water is next poured upon them, and the *chica* is ready for use. The men take up large handfuls of the pulp, and squeeze them into jars, this being all the preparation which the *chica* receives.

This drink is at first hated by foreigners, and afterward liked by them. See, for example, two extracts from the journal of the same traveller. "After riding for a long time in the hot sun without meeting any running stream, we spied a farmhouse in the distance, and, going to it asked for a glass of water.

"There is not a drop of water within a mile of the house," said an old woman who came to the door, "but we can give you some *chica de manzanos* (cider) that is very nice," producing at the word a huge glass of a green, muddy liquid. To call it vinegar would be too high a compliment, and to add that it was flavored with gall would convey no adequate idea of this abominable stuff, which had been made from the very greenest of green apples. One mouthful sufficed for me, and my first impressions of *chica de manzanos* were not favorable; but our guide tossed it off with infinite relish."

This description was written immediately after entering the country for the first time. Here is another description of the same liquid. After describing the mode of its manufacture, he proceeds to say: "Such cider is somewhat coffee colored, and rather sour, but I soon became fond of it, especially with the addition of a little toasted meal, which makes it much more palatable."

Mudai is a drink which resembles almost

exactly the *kava* of Polynesia, and is prepared in the same manner, meal being substituted for the *kava* root. A bushel or so of wheat is slowly boiled for several hours, after which the decoction is strained off and set to cool. In order to hasten fermentation, a quantity of meal is masticated and added to the liquid. The effect is very rapid, and when fermentation has fairly begun, the *mudai* is fit for use, and is strained off into jars. It has a muddy look, but possesses a pleasant and slightly acid flavor, which is very agreeable in a hot country if the mode of preparation be not known.

Wheat is prepared in a rather peculiar, not to say poetical and romantic, manner. The sickle is not employed, but the ears are plucked by hand. The wheat gatherers separate themselves into pairs, a young man and a girl taking a basket between them, and walking slowly through the cornfield. As they pass along, they gather the ears, rubbing them on the back of their companion's hand, so that the ripe grains fall into the basket. They accompany the light toil with songs, which mostly treat of love, and as the tendency of each pair is naturally to diverge from the others, it happens that in this way is originated many a love-match, which afterward finds its issue in the marriage ceremonies above described.

This plan is, however, only employed when corn has to be gathered and threshed on a small scale. When a large quantity is prepared the horse is brought into requisition, the ears being thrown into a circular shallow pit, round and round which six or seven horsemen urge their steeds, shouting and yelling as if mad. When they think that the grain is sufficiently released from the ears, they leap out of the ring, and a number of women and children enter, who sweep up the corn and chaff to the edge of the ring with bunches of twigs which serve as brooms.

This operation, however, is a very imperfect one, and before the corn can be taken to the mill a further husking has to be performed. This is done by placing the wheat in shallow wooden dishes, getting into them barefooted, and keeping up a sort of shuffling dance, throwing up the grain with each foot alternately, and rubbing it with the other.

The winnowing is simply accomplished by flinging the wheat into the air, so that the chaff is blown away by the wind. As to the grinding, it is exactly similar to that mode which is practised by the Kaffirs, the women placing the corn on the top of a flat, sloping stone, and rubbing it with another stone shaped like a rolling-pin. The mill being placed on a sheepskin, the meal falls upon the skin as it is ground. This is very hard work indeed, and even the skilled Araucanians are bathed in perspiration before they have ground enough corn for a meal.

CHAPTER CXXVI.

THE ARAUCANIANS — *Concluded.*

GAMES AND SOCIAL CUSTOMS.

THE GAME OF PELICAN, AND ITS CLOSE RESEMBLANCE TO HOCKEY—AVAS, OR THE EIGHT BEANS GAME—MANUFACTURES—MAKING BROTHERHOOD, AND EXCHANGING NAMES—AN IRRUPTION OF NEW RELATIVES—STATE OF THE HEALING ART—THE MACHIS OR DOCTORS—THEIR MODE OF WORKING CURES—A WEIRD-LIKE SCENE—THE FEMALE DOCTOR AT HER INCANTATION—FEAR OF ALLOWING THE NAME TO BE KNOWN—BELIEF IN OMENS—THE LUCKY BIRDS—HUMAN SACRIFICE—FUNERAL OF A CHIEF.

THE games of the Araucanians are tolerably numerous, and one or two of them resemble some of our own games. There is one, for example, called Pelican, which is almost identical with the well-known game of hockey. An animated description of this game is given by Mr. E. R. Smith:—

“Early in the morning we saw a number of boys engaged upon the fine lawn in front of the house in planting out twigs at short intervals, thus forming an alley about forty feet wide, and some three hundred long. They were preparing for a game of Pelican. Others were blowing a long horn (formed by the insertion of a cow’s horn in a hollow cane), to the tones of which came back answering notes, as though a rival band were approaching over the hills. The night before, we had heard the same challenge to the neighboring youths, and the same echoing reply, but more faint and distant. At last the enemy were seen emerging from the woods; a shout of welcome arose; there were many salutations, a ‘big talk,’ and all put themselves in readiness for the great trial of skill.

“The game of Pelican . . . is played with a small wooden ball, propelled along the ground by sticks curved at the lower end. The two sides have their bases at opposite extremities of the alley. The ball is placed in a hole half-way between the bases, and over it two boys are stationed, while the other players are scattered along the alley, each armed with a stick. When all is ready, the two boys strike their sticks together in the air, and commence a struggle for the ball,

each striving to knock it toward the opposite party.

“The object of every one is to drive the ball through his opponent’s base, or, in defence of his own, to knock it sideways beyond the bordering line of twigs, in which case the trial is put down as drawn, and recommences. Each game is duly notched on a stick, and the party first tallying a certain number gains the victory.

“There was much shouting and shuffling, many a cracked shin and an occasional tumble, but the greatest goodwill reigned throughout. Some thirty players were engaged in the game, mostly naked, with the exception of a poncho about the loins. I was much disappointed with their physical development, which was not as I expected to see. They struck me as inferior to the laboring classes in Chili, both in muscle and symmetry, though possessing the same general features. Neither was their playing remarkable either for skill or activity; and if they were a fair sample, it would be an easy matter to select from many of our schools or colleges a party of young men more than a match for the same number of picked Araucanians, even at their own national game of Pelican.

When the sun is too high to allow this game to proceed, the players generally abandon it in favor of another game called *Avas*. This is purely a game of chance. It is played with eight beans, each having a mark on one side, and ten sticks, which are used in reckoning the game. Spreading a poncho on the ground, the players sit at

opposite sides, and each in turn takes the beans, shakes them in his hands, and flings them on the poncho. For each bean that falls with the marked side upward one point is scored, a hundred completing the game.

The interest displayed in this game is extraordinary. The players shout to the beans, talk to them, kiss them, press them to their breasts, and rub them on the ground, imploring them to send good luck to themselves, and evil fortune to their antagonists, and treating them exactly as if they were living creatures. At this game they stake all the property that they can muster, and ponchos, bolas, lassos, knives, ornaments, and dollars when they can be got, change hands with great rapidity amid the excited yells of the players and spectators. At this game the Araucanians frequently lose every article of property which they possess, and it is not at all uncommon to see a well-dressed and well-armed player go disconsolately home without his weapons, his ornaments, and his clothes, except a ragged *cheripa*.

The fate of prisoners of war often depends on the turn of a bean, and sometimes, when the national council have been unable to decide on a subject, they have settled the point by the result of a game at *avas*. Even the pelican game has sometimes been entrusted with the decision of a knotty point of policy.

The manufactures of the Araucanians are but few. The art of the silversmith has already been described, as has also that of the bolas maker, while the manufacture of the lasso will be described in another place. The native cloths are made of cotton or wool, and are woven in very rude looms. The principal dye employed by the Araucanians is indigo, and the bright scarlet patterns which are introduced into the best cloths are obtained by interweaving threads unravelled from European manufactures.

Among their social customs, the mode of making brotherhood ought to be mentioned, inasmuch as it resembles in some respects that which has already been described as practised in the Malay Archipelago and in Africa, and in others. The ceremony is called *Lacu*, and is performed after the following manner.

One individual is selected from the family into which the honored guest is to be received, and to him a present is made. He then fetches a lamb, kills it, cuts it into two pieces, and boils one-half of the animal. The meat is then placed in a huge wooden bowl, and brought to the new brother in *Lacu*, who is supposed to eat the whole of it, and if he should leave a single mouthful would grievously insult the family into which he was to be received.

Fortunately, he is allowed by the laws of etiquette to take advantage of the adage, *qui facit per alium facit per se*; and though he

cannot by any possibility consume half a lamb, he is allowed to eat as much as he can manage and to distribute the remainder among the family, who are only too happy to take their share in fulfilling the required conditions. From that time the two *Lacus* exchange names.

Mr. E. R. Smith went through the ceremony of *Lacu*, and became a member of the *Mapuché* tribe, under the name of *Namuculan*, an abbreviation of *Namcu-Lanquen*, *i. e.* Eaglet of the Sea. Sometime afterward he found that his relations were strangely numerous.

"After the usual meal, the usual distribution of presents was made, and as the family was small we were just congratulating ourselves on escaping cheaply, when in sauntered a neighbor, who was presented as my brother. He had hardly settled down to the enjoyment of his share of the booty, when in dropped a blear-eyed old woman, who proved to be my aunt. Next followed a stately dowager, fair, fat, and forty, radiant with paint and silver ornaments, looking as innocent as though she had dropped in by the merest accident in the world. She was my sister, and so it went on until we began to think that our host's relations were innumerable."

THE Araucanians know a little about medicine, and much more about surgery, though the mixture of superstition with practice lessens the former, and the absence of a written language hinders the latter. Their medicines are almost entirely vegetable, the chief of which is the well-known *sarsaparilla* root. Bleeding is performed by means of sharp flakes of *obsidian*, which are sharper than any knife of native manufacture, and blisters are in great favor.

The *Mapuché* mode of blistering is the very simple one of the actual cautery, and is performed by means of a *moxa* made of dried pith. This material is rolled up in little balls and applied to the skin, where it is allowed to remain until entirely consumed, being pressed down so as to ensure its full effect. This is horribly painful, but in spite of that drawback — perhaps in consequence of it — is very much in favor with the people.

Beside these material medicines they have others of a different character, which are employed when the disease is beyond the reach of their simple medicines. The wise men who practise this advanced system of healing are but few in number, and are called by the title of *Machi*, their mode of practice receiving the name of *machilun*.

Going on the principle that a disease which cannot be expelled by medicine must be caused by an evil spirit, the *Machi* proceeds to drive it out after his own fashion. The hut is cleared of inhabitants, and the patient laid on his back in the middle of the floor. The *Machi*, having in the meanwhile re-

moved nearly the whole of his clothes, and made himself as horrible as he can by paint, enters the dwelling, taking with him his magic drum, *i. e.* a wooden bowl with a cover of sheepskin strained tightly over it. After examining the patient, the Machi begins a long-drawn monotonous incantation, accompanied by continual beating of the drum, until he has worked himself up to a pitch of frenzy, and falls backward on the ground, with breast jerking convulsively, eyes rolling, and mouth foaming.

As soon as he falls, a number of young men, who have been waiting close to the hut, leap on their horses, and dash at full speed round the house, yelling defiantly, waving lighted torches over their heads, and brandishing their long lances by way of frightening the evil spirit, and warning him not to come near the place again. Like the Machi, they are all nearly naked, and painted in the most hideous fashion, so as to strike terror, not only into the spirit that has possession of the man, but into those who are hovering round the house, and trying to gain admission. In the first engraving on the next page the artist has furnished a strange, weird scene, illustrating the Mapuché mode of healing the sick.

After a while the Machi recovers from his trance, and then announces the seat and immediate cause of the malady. For the latter he carefully searches the patient, and after a time produces it in the shape of a spider, a toad, a stone, an arrow head, or similar object. Were he to do more than this, no harm would accrue, and if the patient should recover no harm is done.

But, should he die, the Machi is forced by public opinion to declare that the evil spirit has been sent to the dead man by means of witchcraft.

The body is opened, the gall removed, and placed in the wooden bowl of the magic drum, where it undergoes a series of incantations. After they are over, it is put into a closely covered pot and placed on the fire until it is dried up. The sign of witchcraft is a stone found at the bottom of the pot, and it is needless to say that such a stone is never wanting. By means of this proof of witchcraft, the Machi again throws himself into a trance, in the course of which he designates the culprit who has caused the illness of the deceased.

No one ever disbelieves a Machi, and the relatives of the dead man seek out the accused and murder him. It naturally follows that the Machis are too prone to abuse this terrible power of their position by accusing persons against whom they have enmity, or whom they have been bribed to condemn. No counter proof is admitted in the face of a Machi's accusation; and if the alleged culprit should be in another district, the cacique is requested to deliver him up to justice. The unfortunate wretch is sure to suffer tor-

ture for the sake of extracting a confession of his guilt, and, whether he confess or not, he is sure to be killed; so that a wise man admits his guilt at once, and thereby escapes the tortures which he would otherwise have suffered.

Sometimes, though rarely, the Machi is a woman. In this case she assumes the male dress, mimics as far as she can the masculine tone of voice and mode of walking, and is always a very disagreeable individual, being mostly crabbed, ill-tempered, petulant, and irritable.

As the Machi always operates at night, the scene is most wild and picturesque, as may be seen from the account of Mr. E. R. Smith, who witnessed (at a distance) the operations of a female Machi.

"One of the neighbors was dangerously ill, and during the night there was a grand *machilun* performed by the grand exorcist, the medicine woman of Boroa herself. I wished to be present, but Sancho would not listen to the proposal, insisting that we might expose ourselves to violence by appearing to interfere with this witch, whose hatred of the whites and influence over the natives were alike unbounded.

"The night was black and threatening, well suited to her machinations. We could plainly hear the monotonous tap of the Indian drum, and the discordant song occasionally rising with the frenzy of the moment into a shrill scream, then sinking to a low, guttural cadence, while all else was hushed for very dread of the unhallowed rites. Suddenly the singing stopped, and there was a long silence, broken by the eruption of a troop of naked savages rushing round the house on horse and afoot, brandishing fiercely lance, and sword, and burning fagot and blazing torch, and making night hideous with their demoniac cries. The frightened dogs howled in dismal concert, and again all was still. The evil spirit had been cast out and driven away. It only remained for the sick man to recover or die."

The witch who presided over this extraordinary scene was a *mestizo*; *i. e.* a half-breed between the negro and the native. She was a singularly unprepossessing personage, hideously ugly, and turning her ugliness of features to account by her shrewdness of intellect. Ugliness is not, however, a necessary accompaniment of this particular caste. There is now before me a photograph of a young mestizo woman, whose features, although they partake somewhat of the negro character, are good and intelligent, her color is comparatively pale, and her hair retains the length and thickness of the Araucanian, together with a crispness which has been inherited from the negro race.

Like many other uncivilized nations, the Araucanians have a great objection to allow

(1.) MAPUCHE MEDICINE. (See page 1206.)

(2.) MAPUCHE FUNERAL. (See page 1210.)

a stranger to learn their names, thinking that by means of such knowledge the wizards may be able to practise upon them. When they are brought into contact with the white man, and are asked their names, the Araucanians flatly deny that they have any. They will take service under him, and allow him to call them by any name that he likes, but their own name they will never tell, nor do they like even to invent one on the spur of the moment. The reader will doubtless recall many similar instances that have been recorded in the course of this work. They have a similar objection to their portraits being taken, thinking that the possessor will be able to exercise magical influence upon them by means of the simulated features.

This terror has been increased by the use of books by the white travellers. Nothing is more inexplicable to an Araucanian than to see a white man, evidently ignorant of the language, refer to a book and then say the word which he wants. How such a mystery can be achieved is beyond his comprehension, and he regards the book and its owner as equally supernatural beings.

In one case, an Indian of more than usually inquisitive mind pointed to various objects, in order to see whether his white visitor could find out their names by looking at a book. Being convinced that the feat really was performed, he peered into the book, vainly trying to detect some resemblance between the word and the object which it signified. As he did not gain much information from his eyes, his white friend pointed out the word, on which he laid his hand as if to feel it. Just at that moment, a slight breeze ruffled the leaves of the book. The man drew back as if a snake had bitten him. The mysterious voice of the white man's oracle had spoken to him, and, what was worse, upon his left hand. He said nothing, but silently withdrew, and, wrapping his poncho round his head, sat for several hours without speaking a word.

In consequence of this superstition, a traveller dares not use his note book openly. He is obliged to write his remarks surreptitiously, and, so great is the fear inspired by the very fact of writing, that even if the traveller be out of sight for any lengthened time, the people are nervous and suspicious.

The Araucanians have a firm belief in omens, and will address prayers after their own fashion to any of the creatures that are supposed to have supernatural power. On one occasion, when Mr. E. R. Smith was travelling with his native friends, one of the mules fell and broke its back. This was a sinister omen, and the Araucanians were correspondingly depressed at it. Fortunately, an omen so good followed it that their fears were dispelled and confidence restored.

The reader may remember that Mr. Smith had just exchanged names with a Mapuché

lad, and was called Namcu-lanquen, *i. e.* Eagle of the Sea. Just after the unlucky mule had injured itself, a sea eagle rose suddenly from its perch, circled around the party, and sailed off southward. This was indeed a fortunate omen. In the first place, the bird was the emblem of the white man who had recently become a Mapuché, and in the next, the eagle was on the right hand of the travellers.

The native guide Traque put spurs to his horse, dashed forward at full gallop, shouting and yelling with excitement at the piece of good fortune that had befallen them. Presently he halted, and addressed a prayer to the eagle: "O Namcu! Great being! Look not upon us with thy left but with thy right eye, for thou knowest that we are poor! Watch over our children and brothers; and grant us happiness, and allow us to return in safety from our journey."

Every circumstance combined to make the omen propitious. The Namcu is the being most venerated by the Araucanians, who think that it is a sort of heavenly messenger in direct communication with the Superior Being. The reader will doubtless be struck with the coincidence between the bird divinations of the Araucanians and those of the Dyaks of Borneo, as well as by their identity with the auguries of ancient Greece and Rome.

With the exception of the wise men above mentioned, the Araucanians have no priests, and as a necessary consequence they have no temples and no religious ceremonies. There is a general though vague belief in a good and evil principle, which may be manifested by a host of inferior deities or demons. They have not even an idol, nor is there any definite system of worship, the only prayers which a native makes being invocations such as that which has just been described as made to the eagle.

Sacrifices are made at their great national councils. An animal is killed, its blood is poured on the ground as a libation, and the heart, laid on a green branch, is borne round the assembly, accompanied with dances and songs. The flesh is then cooked and eaten, and the bones collected and thrown into the nearest river, so that they shall not be polluted by being eaten by the dogs.

Sometimes in war time, a prisoner is sacrificed. He is placed on a horse whose tail and ears have been cropped by way of deriding the rider, and is thus taken to the place of execution. Here he dismounts, and is forced to dig a hole, into which he throws a number of sticks, calling each after the name of some celebrated warrior of his tribe. He is then made to fill up the hole, thus symbolically burying the fame of his countrymen, and as soon as he has done so, his brains are dashed out with a club, care being taken to inflict as little damage as possible on the skull.

As soon as he falls, the heart is torn from

the breast and handed to the Toqui, who sucks a few drops of the blood, and passes it to his officers, who follow his example. The large bones of the arms and legs are made into flutes, the head is placed on a spear and carried round in triumph, and the skull is made into a drinking-cup to be used at the principal feasts. Such a sacrifice, however, is not to be considered as an act of worship, but merely as a mode of propitiating the manes of deceased warriors.

The similitude between the bird omens of the ancient Greeks and Romans and those of modern Araucanians has already been mentioned. There is another semi-religious practice which also recalls the customs of classic times, namely, the making of libations and offerings of food at every meal. When the Araucanian takes his broth or wine, he pours a few drops upon the ground as a thank offering to the higher powers, and with the same motive he scatters around a few morsels of food.

THE mode of burial differs slightly according to the locality and the tribe.

When a Mapuché chief dies, the body is exposed on an open bier for several days, during which time the friends and neighbors pay their respects and offer their condolence to the family. On the day of the funeral a procession is formed, led by a company of young men on horseback, who dash forward at full speed to the place of interment. After them the body, borne by the principal relatives, and behind them come the women, who wail aloud and fill the air with their cries of sorrow. Last of all comes a woman who scatters ashes on the ground, so that the deceased may not return by the path along which he was borne. The illustration No. 2, on page 1207, represents this part of a Mapuché funeral.

The body is then bound with the knees to the breast, and lowered into the grave, with the face toward the west, the direction of the Mapuché spirit-land. The saddle, bit, spurs, and stirrups of the deceased are laid by his side, together with some provisions for the journey, a few beads, and a piece of money, and the grave is then filled up. As, however, the horse accoutrements of a chief are of silver, and exceedingly valuable, they are represented by wooden copies, which are supposed to serve the purposes of the deceased as well as the more costly articles, which become the property of his successors.

At the head of the grave is planted the dead man's lance, the steel head of which is replaced by a wooden imitation. It is also necessary that a horse should be provided for the dead chief, and this is done by sacrificing his favorite steed, and hanging its skin over the grave by means of a pole placed across two forked props. Mr. E. R. Smith shrewdly remarks that in all probability the

deceased would be put off with a wooden horse to ride, were it not that the Mapuchés are exceedingly fond of horseflesh, and take the opportunity of holding a great banquet on the flesh of the slaughtered animal, the skin and spirit going to the share of the dead man.

Such ceremonies as these are only for a chief, a common man not being supposed to need a horse, and consequently being buried with slight and simple ceremonies. For the funerals of women the rites are of a similar character, the chief distinction being that, instead of the saddle and weapons, some cooking vessels, a distaff, and similar objects are laid in the grave.

Some travellers have asserted that when a powerful chief dies, his favorite wife is also killed and placed in the tomb with him. This statement is, however, very doubtful, and was flatly contradicted by every one of whom Mr. Smith inquired. The Mapuchés seem to have a vague notion that the dead are able to return to earth and watch over the living; and when the dark thunder-clouds lower over the distant Cordilleras, they imagine that the deceased warriors of their tribe are chasing away the invisible foes of their country, and utter loud shouts of encouragement to the supernatural warriors.

In some parts of the Mapuché territory the graves are surrounded with a rude fence of upright boards, from the midst of which rises the long quivering lance with its slight pennon fluttering in the wind. (See background of illustration).

The Huilichés, however, have a much more elaborate mode of decorating the graves of their chiefs, resembling in some degree that which is employed by the New Zealanders. Figures supposed to represent the deceased chief and his wives are set round the grave, just as the New Zealanders plant their "tikis" round the graves of their friends. (See page 861.)

One such memorial, seen by Mr. Smith, had a very singular, not to say ludicrous, appearance. Each figure was cut out of a huge log of wood, some ten or twelve feet in height. In the middle stood the chief himself, wearing no clothing, but having a hat on his head and a sword in his hand. Round him were stationed his wives, equally without clothing, the great object of the artist being to leave no doubt which is the chief and which are his wives, without troubling himself as to details of drapery. Rude as these figures are, only very few natives can carve them, and these sculptors make a large income by the exercise of their skill. Each figure is purchased with a fat ox, or even at a higher price, according to its size and the amount of labor bestowed upon it, and no grandee can be considered as buried respectably unless the grave be decorated with a figure of the deceased.

CHAPTER CXXVII.

THE GRAN CHACO.

APPEARANCE — WEAPONS — CHARACTER.

THE GRAN CHACO AND ITS INHABITANTS—THEIR LOVE OF FREEDOM—CONTRAST OF THE TWO RACES IN SOUTH AMERICA—THE VARIOUS TRIBES IN THE COUNTRY—APPEARANCE OF THE INHABITANTS—ERADICATION OF THE EYEBROWS AND EYELASHES—HAIR DRESSING—COSTUME OF THE SEXES—EQUESTRIAN HABITS—THE NAKED MAN ON THE NAKED HORSE—WEAPONS—THE MACANA CLUB, AND MODE OF USING IT—THE LONG SPEAR—CURIOUS ARMOR—THE FOOT-BOW—ATTACKING A VILLAGE—HUTS OF THE GRAN CHACO INDIANS—CROSSING A RIVER—CHARACTER OF THE PEOPLE.

To the east of the Araucanian territory, and extending to the Paraguay and Panama rivers, lies a tract of mountain country, of indeterminate northern and southern boundaries, called the Gran Chaco. This great district is inhabited by a series of tribes who deserve a short notice.

Not the least remarkable point in their history is the manner in which they have preserved the freedom of their own land, despite the attacks of various white nations. Both the Spaniards and the Portuguese have, at different times, seized on a few positions in the Gran Chaco, but have not been able to retain them except on the indefinite western frontier line. On the east, where the great Paraguay River forms the natural boundary, the native is left unmolested in his freedom.

In the eloquent words of Captain Mayne Reid: "On its eastern side, coinciding almost with a meridian of longitude, the Indian of the Gran Chaco does not roam; the well-settled provinces of Corrientes, and the dictatorial government of Paraguay, presenting a firmer front of resistance. But neither does the colonist of these countries think of crossing to the western bank of the boundary river to form an establishment there.

"He dares not even set his foot upon the Chaco. For a thousand miles, up and down, the two races, European and American, hold the opposite banks of this great stream. They gaze across at each other—the one

from the portico of his well-built mansion, or perhaps from the street of his town—the other standing by his humble 'toldo,' or mat-covered tent, more probably on the back of his half-wild horse, reined up for a moment on some projecting promontory that commands a view of the river. And thus have these two races gazed at each other for three centuries, with little other intercourse passing between them than that of a deadly hostility."

As the territory of the Gran Chaco is very extensive, being about three times as large as that of Great Britain, and extends north and south through eleven degrees of latitude, it naturally follows that the tribes which inhabit it differ from each other in many details, those of the warm north and cold south being in many points strongly contrasted with each other. Still, there are many points of similarity, and these we will select in the following brief account of the Gran Chaco tribe, omitting, from want of space, those wherein they differ from each other.

In the first place, the aborigines of the Gran Chaco are of a much paler complexion than those of the more northern tribes, known from their color by the name of Red Men, and more nearly resemble the rich olive of the inhabitants of Southern Europe. The nose is rather aquiline, the mouth well formed, the cheek-bones high, and the eyes and hair jetty black. The latter is singularly abundant, and though coarse and with-

out curl is smooth and glossy when properly dressed.

The men have but little beard, and the scanty hairs which grow upon the chin and face they completely eradicate, using for that purpose a pair of shells until they are rich enough to purchase iron tweezers. Even the eyebrows and lashes are pulled out, the natives saying that they only hinder the sight, and comparing those who wear them to the ostrich—*i. e.* the rhea, or American ostrich, which is plentiful in their country.

To an European, the loss of these appendages to the eyes has a very unsightly effect; but the native takes a very different view of the case, and looks upon a countenance wherein the eyebrows and lashes are permitted to grow much as a gentleman of George the Second's time would have regarded a head which was decorated by its own hair, and a face from which the beard and moustache had not been removed.

The masculine mode of dressing the hair has some resemblance to that which is practised by the warlike tribes of Northern America. The hair is shaved from the forehead, as well as from a band extending behind the head from one ear to the other. The remainder is allowed to grow to its full length, and carefully cherished and tended.

The Gran Chaco Indians only use paint upon great occasions, when they decorate themselves as fantastically as any savage tribe can do; but, as a rule, their faces and bodies are allowed to retain their normal olive hue. Neither do the men use the tattoo, this being restricted to the women, who mark themselves with a variety of patterns upon their arms, cheeks, and breasts, each having a line of blue dots extending from the corner of each eye to the ears, and a pattern of some kind upon her forehead.

The dress of these people is very simple. In warm and fine weather, it consists merely of a piece of cotton or woollen fabric, woven in the brightest hues of red, white, and blue. It is little more than a mere strip of cloth, and in this respect the dress of the women scarcely differs from that of the men. In cold and stormy weather, both sexes wear a warm cloak made of the skin of the jaguar, or, if so valuable a material cannot be obtained, of that of the nutria, or South American otter. Earrings are worn by both sexes; but the hideous ornaments which so many savage tribes wear in their lips and noses are utterly unknown to them.

The Gran Chaco Indian is essentially a horseman, and no inhabitants of America have made more use of the horse than he has. He differs, however, from those which have been already mentioned in one important particular. He utterly despises the costly spurs, stirrups, and headstalls which have been described in the account of the Araucanians, and, almost naked himself, he

rides upon an entirely naked horse. He uses no saddle, no stirrups, and no bit, guiding his steed by voice and touch, and not by the power of the iron curb. The only representative of a bridle is a slight rope of plaited hide passed round the lower jaw of the horse.

The weapons of the Gran Chaco Indian are very few. He carries the bolas and lasso, but cares little for them in war, preferring, as his most efficient weapon, his spear. This instrument is sometimes fifteen feet in length, and in the hands of a skilful rider, mounted upon a perfectly trained steed, is a most formidable instrument of war. The warrior uses his spear, not only for battle, but as a means for mounting his horse. He stands on the right hand of the animal, places the butt of the spear upon the ground, and, using the shaft as a leaping pole, swings himself upon the back of the horse with scarcely an effort.

A rather peculiar club is also used by these people. This weapon is called "macana," and exists throughout a very large portion of Southern America. It seldom exceeds two feet in length, and in form somewhat resembles a square dice box, being smaller in the middle, and increasing in diameter to each end. It is used both as a missile, and as a hand weapon, and when used is held by the middle. The young warriors pride themselves on the force and accuracy with which they hurl this instrument, and during their leisure time vie with each other in throwing it at a mark. The specimen which is shown in the illustration was presented to me by H. Bernau, Esq., together with several other weapons and implements of South America.

THE MACANA.

Sometimes the macana is armed with a cylindrical piece of hard stone, which projects from one end like the blade of an axe. It is fastened into the wood by a very ingenious process. Having fixed upon a young branch which he thinks will make a good club, the Indian bores a hole in it, and hammers into the hole the stone cylinder which has been previously prepared. He then allows it to remain for two or three years, by which time the wood has grown over the stone, and become so firmly imbedded that it will break to pieces rather than be loosened by any amount of violence.

Another of these weapons in my collection is remarkable for the slight but elaborate carvings with which it is covered, leaving only a small space in the centre devoid of ornament. The patterns are scratched rather than cut, so that they cannot properly be seen unless the weapon is turned from side to side, so as to ensure the light falling properly upon it; but the extreme hardness of the wood makes them retain their integrity in spite of rough usage. The tree from which these clubs are made is one of those which are popularly called iron-wood, on account of the hardness and weight of the timber. It belongs to the gualacums. The Spaniards call the tree by a name which signifies "axe-breaker."

The strangest part of war as waged by these natives is, that when they fight with each other they adopt an elaborate system of defensive armor, while they discard everything of the kind when they match themselves against the fire-arms of the whites, knowing that the shield and costume which will guard them against the club and the spear are useless against a bullet.

The armor is of a most cumbersome description, and looks nearly as awkward as that which is worn by the soldiers of *Begharmi*. (See page 638.)

First of all, the warrior puts on a coat made from the skin of the jaguar, dressed so as to remain soft even after being wetted. Over this dress he wears a complete suit of armor, made from the thick and hard hide of the tapir. Not only the body armor, but the helmet and shield are made of this material, which is capable of resisting the stroke of the lance or the point of the arrow. It interferes, however, with the right management of the horse, and it is very doubtful whether its defensive powers compensate for its exceeding clumsiness. Still, it may have a moral effect upon the enemy; and there is no denying that it gives the warrior a more formidable appearance than he would possess if he rode without armor. To add to the ferocity of his aspect, he employs paint on these occasions, and with scarlet and black pigment makes himself absolutely hideous.

When he goes to attack a village inhabited by white men, he does so in a very ingen-

ious manner. Usually he fights exclusively on horseback, being so admirable a rider that he can even stand on the withers of his horse when at full speed, and feeling himself out of his element when dismounted. But when he has to attack so formidable an enemy as the white man, he begins after a different fashion. He takes with him an enormous bow, far too strong to be drawn in the usual manner, and a number of long arrows. Dismounting at some distance from the village, he creeps to some spot within range of his arrows, and then prepares for action.

He begins by wrapping a quantity of cotton wool round the arrows just behind the head, and when he has treated them all in this way, he strikes a light and sets fire to the cotton wool on one of the arrows. Lying on his back, he holds the bow with the toes of both feet, and, laying the blazing arrow in its place, he is able to use both his hands to draw the powerful weapon. He shoots with a wonderfully good aim and great rapidity, so that when a number of Indians surround a village, and pour their fiery missiles into it from all directions, the houses are sure to take fire.

In the midst of the confusion caused by the flames that arise on all sides, the warriors leap on their horses, dash at the village, kill all whom they can reach, carry off as much plunder as possible, and then gallop back to their own districts, where no one dares to follow.

Retaliation is never feared, as the *Gran Chaco* Indians have no fixed habitation, and nothing that can be called even a village. The hut or rather tent of these people is a very simple affair. Two upright posts are driven firmly into the earth, and another is laid horizontally across them. Over the horizontal pole is hung a large mat, the ends of which are pegged to the ground, and the tent is then complete. The mat is made of the epidermis of young palm leaves. In order to prevent water from flooding the tent in rainy weather, a trench is dug around it. The only furniture is the hammock in which the inhabitant sleeps, and in fine weather, this is much more often slung between two palm trees than between the upright posts of the tent. In fact, the only use of the tent is as a shelter in rainy weather, the whole of the life being passed in the open air.

As may be imagined from this mode of life, the *Gran Chaco* Indian is essentially a rover, passing from one part of the country to another when game begins to be scarce in that district which he temporarily inhabits. Illustration No. 1, on the 1218th page shows the manner in which a community of these natives cross rivers. Swimming with perfect ease themselves, they merely with one hand guide their horses in the water without caring to get on their

ARROWS AND ARROW-CAP.
(See page 1229.)

backs, while with the other hand they paddle themselves across the stream, or hold the spear with its light burden of ornaments.

The children and household goods are conveyed easily enough. Square boats or tubs made of bull's hide are launched, and in them are placed the children, the puppies, of which there are always plenty, and the heavier goods, such as the kettles and cooking vessels. A rope is tied to the "pelota," as this primitive boat is called, and the cargo is towed across the stream either by being attached to the tail of a horse, or held in the mouth of a good swimmer. The lighter articles, such as dress and ornaments, are fastened to the head of the spear, which is held upright, so as to keep them out of the water.

The dogs which have just been mentioned are extremely useful to the Gran Chaco Indians, who employ them in the chase. They give but little trouble to their masters, living for the most part in holes which they scratch in the ground, and feeding contentedly on the offal and scraps of food, which in an uncivilized community are more than scanty. Without the dogs the hunter could scarcely bring to bay the jaguar, the peccary, and similar animals, which are so annoyed by the perpetual and noisy attacks of the little curs that they stop in their flight in order to revenge themselves, and so give the hunter time to come up with them.

Although so essentially a warrior, and living much upon the proceeds of his plunder, the Gran Chaco Indian is in one respect far superior to the North American tribes. He does not torture the prisoners whom he takes in war, and the women and children he treats kindly, and adopts into his own tribe.

CHAPTER CXXVIII.

THE MUNDURUCÚS.

MANUFACTURES — SOCIAL CUSTOMS.

POSITION AND NUMBER OF THE MUNDURUCÚ TRIBE—THEIR GENERAL APPEARANCE—MODE OF TATTOOING—SKILL IN FEATHER WORKING—FEATHER SCEPTRES AND APRONS—HEAD PRESERVING—THE TRIUMPHAL FEAST AND WARRIOR'S PRIDE—TRAINING OF THE WARRIOR—THE ORDEAL OF THE "GLOVES"—INTELLIGENCE OF THE MUNDURUCÚS—THE HEALING ART—ENCHANTED CIGARS—COLLECTING SARSAPARILLA—THE GUARANA TEA—THE PARICA SNUFF AND ITS OPERATION—THE SNUFF TUBE—COOKERY AMONG THE MUNDURUCÚS.

THE largest, most warlike, and most powerful of the Amazonian tribes is that which is known by the name of MUNDURUCÚ.

Formerly, they used to inhabit the country on the southern bank of the great Amazon River; but since their long and valiant struggle with the Portuguese, they have moved considerably southward, having conceded to their new allies the more northern portion of their territory. Since that time, they have been on very good terms with Europeans, and a white man of any nation is sure to find a welcome when he comes among the Mundurucús. This feeling does not extend to the negroes and mulattoes, the dark skin arousing the anger of the Mundurucú as a white skin excites his friendship.

The color of the Mundurucús is warm coppery brown; their hair is thick, black, and straight, and with the men is cut short, except a long fringe, which is allowed to hang over the forehead. Their features are good, the lips being thin, the forehead tolerably high and arched, and the general contour of the face oval. Unfortunately, they disfigure themselves by a tattoo which is just as elaborate as that of the Marquisans, but without its elegance.

The Mundurucú seems to have no idea of a curved or scroll-like pattern, and contents himself with tracing straight lines and angles. One favorite plan is, to cover the whole body with a sort of trellis-like pattern, the lines crossing each other diagonally in some, and at right angles in others. One man, seen by Mr. Bates, had a large black patch on the centre of his face, cover-

ing the bottom of the nose and mouth, while his body was decorated with a blue checkered pattern, and his arms and legs with stripes.

At first it seems strange how the people can draw the lines with such regularity. It is managed, however, easily enough by means of the peculiar form of the tattooing instrument. This, instead of being very small and made of bone, is of considerable size, and is in fact a comb made of the sharp thorns of the pupunha palm set side by side. With this instrument there is no difficulty in producing straight lines, as all that the operator has to do is to lay the points of the comb on the skin, tap it sharply until a row of little holes is made, and then rub into the wounds the charcoal pigment.

Besides the tattoo, they use paint in profusion, and adorn themselves with lovely ornaments made of the feathers of the macaw, the toucan, and other native birds. There are other tribes which use similar decorations, specimens of which we shall presently see. They are perhaps the best savage feather workers in the world, displaying an amount of artistic taste which is really astonishing. Their feather sceptres are beautiful specimens of native art. They are about three feet in length and three inches in diameter, and are made by fastening on a wooden rod the beautiful white and yellow feathers from the breast of the toucan. At the top, the sceptre expands into a wide plume, composed of the long tail-feathers of the trogons, macaws, and other birds. In order to preserve these sceptres in their full beauty, they are kept in cylindrical bamboo cases until they are wanted. These decora-

tions are only used on festival days, which are determined by the will of the Tushaúa or chief of the tribe. On these occasions the women prepare great quantities of "tarobá," which is exactly the same as the mudai of the Araucanians, and they go on drinking, singing, and dancing until all the liquor is exhausted.

The illustration No. 7 on page 1231, gives some idea of the mode of feather working, and the kind of pattern employed by the Amazonian aborigines, though the plain black and white can give no idea of the gorgeous coloring and artistic arrangement of the hues. For this reason, I have been obliged to limit the illustrations of the elaborate feather work of these natives, and only to give a few examples, where form, as well as color, is exemplified.

The body of this apron is made of cotton strings, plaited into a netting, so close that it resembles a woven fabric, while they are allowed at the upper part to be loose, and parallel to each other. Beginning at the bottom of the apron, we have first a row of jetty black feathers, upon which is a tolerably broad band of bright yellow. The ground-work of the rest of the apron as far as the base strings is made of scarlet feathers, crossed by two narrow yellow bands, and the curious double pattern in the middle is yellow above and blue below. The sides and top are edged by a belt of black monkey fur.

Among the upper edge of the base strings are a number of the elytra or wing cases of the gorgeous *Buprestis* beetle. They are loosely strung in a row by their bases, and not only look splendid when the light of the sun shines on them, but rattle at every movement, so as to keep time to the steps of the dancers, for whom such ornaments are chiefly made. These wing cases are used also for children's rattles.

LIKE many other warlike savages, the Mundurucús perpetuate the memory of valiant deeds by preserving a trophy of the slain enemy. Indeed, this is the only way in which it is possible to preserve the accounts of their valor, and the Mundurucús follow in this respect the example of the Dyaks, by cutting off and preserving the head of the dead man. When a Mundurucú has been fortunate enough to kill an enemy, he cuts off the head with his bamboo knife, removes the brain, soaks the whole head in a bitter vegetable oil, called "andiroba," and dries it over a fire or in the sun. When it is quite dry, he puts false eyes into the empty orbits, combs, parts, and plaits the hair, and decorates it with brilliant feathers, and lastly passes a string through the tongue, by means of which it can be suspended to the beams of the malocca or council-house, where it remains except on festival days. When, however, the chief gives

orders for a feast, the proud owner of the head arrys himself in his most magnificent suit of feathers, fetches his prize from the malocca, fixes it upon the point of his spear, and parades himself before his companions in all the glory of an acknowledged brave.

One of these preserved heads is shown on page 203, drawn from a specimen in the possession of A. Franks, Esq., of the British Museum. In order to show the ordinary kind of feather headdress which is worn by the Mundurucús, a portrait of a chief is also given on the same page, so that the contrast between the living and preserved head is well marked.

The value which a Mundurucú attaches to this trophy is simply inestimable. As none except acknowledged warriors are allowed to contend against the enemy, the fact of possessing a head proves that the owner has passed triumphantly through the dreadful ordeal of the gloves. It is very remarkable that we find two totally distinct races of men, the Malay and the Mongol, possessing exactly the same custom, and reckoning the possession of a head as the chief object in life.

It is quite impossible that the Dyak of Borneo and the Mundurucú of Central Southern America could have been geographically connected, and we must infer that the custom took its rise from the love of approbation inherent in human nature. In all countries, whether civilized or not, renown as a warrior is one of the chief objects of ambition. In civilized countries, where a literature exists, this renown is spread and conserved by means of the pen; but in uncivilized lands, some tangible proof of success in war must be required. In this head the necessary proof is obtained, for its existence shows that the owner has killed some man or other, and the form or absence of the tattoo is a proof that the slain man was an enemy and not a friend.

The successful warriors are so proud of their heads that they will often remove them temporarily from the malocca, and place them on the fence which surrounds their crops, so that the women, who are working in the field, may be cheered by the sight of their relative's trophies. Of late years, either this custom has fallen into abeyance, or the people are unwilling to exhibit their trophies to a white man, for Mr. Bates, who spent so much time with them, never even saw a preserved head, or could hear of one being used.

Like many other natives, the Mundurucús have to pass through a horribly painful ordeal before they can be admitted into the rank of men. There is a strange, weird-like character about the whole proceeding.

The reader must know that South America possesses a great number of ants, many of which sting most horribly. There is, for example, the muniri ant, a great black in-

(1.) GRAN CHACO INDIANS ON THE MOVE. (See page 1213.)

(2.) THE GLOVE DANCE OF THE MUNDURUCÚS. (See page 1219.)

sect, as large as a wasp and with as venomous a sting. Then there is the fire ant, whose bite is just like a red-hot needle piercing the flesh, together with many others. These ants are made the instruments by which the courage of the lad is tested.

On the appointed day, the candidate for manhood and the privilege of a warrior, goes to the council-house, accompanied by his friends, who sing and beat drums to encourage him. The old men then proceed to the test. They take two bamboo tubes, closed at one end and open at the other, and place in each tube or "glove" a number of the fiercest ants of the country. Into these tubes the wretched lad thrusts his arms, and has them tied, so that they cannot fall off. The drummers and singers then strike up, and the candidate joins in the song.

Accompanied by the band and his friends, he is taken round the village, and made to execute a dance and a song in front of every house, the least symptom of suffering being fatal to his admission among the men. In spite of the agony which he endures — an agony which increases continually as the venom from the stings circulates through his frame — the lad sings and dances as if he were doing so from sheer joy, and so makes the round of the village. At last he comes in front of the chief's tent, where he sings his song for the last time, and is admitted by acclamation to be a man. His friends crowd round to offer their congratulations, but he dashes through them all, tears off the gloves of torture, and plunges into the nearest stream, to cool his throbbing arms.

This fearful test of manhood, called "The glove dance," is represented on page 1218.

The Mundurucús seem to be an intelligent race of savages, as may be seen from Mr. Bates's account of the interest which they displayed in a book of illustrations.

"To amuse the Tushaúa, I fetched from the canoe the two volumes of Knight's 'Pictorial Museum of Animated Nature.' The engravings quite took his fancy, and he called his wives, of whom, as I afterward heard from Aracú, he had three or four, to look at them: one of them was a handsome girl, decorated with necklace and bracelets of blue beads. In a short time others left their work, and I then had a crowd of women and children around me, who all displayed unusual curiosity for Indians.

"It was no light task to go through the whole of the illustrations, but they would not allow me to miss a page, making me turn back when I tried to skip. The pictures of the elephants, camels, orang-outangs, and tigers seemed most to astonish them, but they were interested in almost everything, down even to the shells and insects. They recognized the portraits of the most striking birds and mammals which are found in their own country; the jaguar, howling monkey, parrots, trogons, and toucans.

"The elephant was settled to be a large kind of tapir; but they made but few remarks, and those in the Mundurucú language, of which I understood only two or three words. Their way of expressing surprise was a clicking sound made with the teeth, similar to the one we ourselves use, or a subdued exclamation, Hm! Hm!

"Before I finished, from fifty to sixty had assembled; there was no pushing, or rudeness, the grown-up women letting the young girls and children stand before them, and all behaved in the most quiet and orderly manner possible."

LIKE other savage tribes the Mundurucús place great faith in their medicine men, or "pajes," as they are termed. These men are supposed to exercise a power over evil spirits, especially those which cause sickness, and which take the visible form of a worm or some such creature.

When a Mundurucú is ill, he sends for the paje, who goes through the gesticulations common to all the tribe of medicine men, until he has fixed upon some spot wherein the evil spirit has located itself. He then makes a huge cigar, by wrapping tobacco in folds of tanari, *i. e.* the inner bark of a tree, which is separated into layers and then beaten out like the bark cloth of Polynesia. Several trees, especially the monkey-root tree (*Lecythis ollaria*), furnish the tanari, the best being able to furnish a hundred layers from one piece of bark.

The smoke from the cigar is blown for some time upon the seat of the malady, and after a while the paje applies his lips to the spot, and sucks violently, producing out of his mouth the worm which has done the mischief. On one occasion, when a paje had operated on a child for a headache, a white man contrived to get possession of the "worm," which turned out to be nothing but a long white air-root of some plant.

These people have, however, some genuine medicines. In the first place, they know the use of sarsaparilla root, and gather it in large quantities for the market. The root, or rather the rhizome, of a species of Smilax is the well-known sarsaparilla of commerce.

The natives collect it during the rainy season, when the roots can be easily torn out of the wet earth. After washing the roots carefully, the gatherers store them under shelter until they are quite dry, and then make them up into bundles of uniform size, for the convenience of packing. These bundles are rather more than three feet in length, and about five inches in diameter. They are tied up very tightly with the sipo, a kind of creeper, and sold to the traders.

Another medicine known to them is the guarana. It is made from the seeds of a climbing plant belonging to the genus Paulinia. The seeds are roasted in their envelopes, and then taken out and pounded between two stones. The powder is mixed

with water so as to form a stiff paste, which is moulded into squares and left to dry. When used, the vegetable brick is scraped into water, about a teaspoonful going to the pint, and the medicine is complete. It has a stimulating effect on the system. Like strong tea, it repels sleep, but is so valuable in the intermittent fever of the country that in the Brazilian settlements it obtains a very high price.

There is another very remarkable medicine, which, though not used by the pure Mundurucú tribe, is in great favor with the Cuparis, a sub-tribe of the same nation. This is a sort of snuff, called *paricá*, which is prepared and used after the following manner. The seeds of a species of *ingá* (a plant belonging to the Leguminous Order) are dried in the sun, pounded in wooden mortars, and the dust put into bambóo tubes.

When the people determine to have a bout of snuff taking, they assemble together and drink various fermented liquors until they are half intoxicated. They then separate into pairs, each having a hollow reed filled with the *paricá* snuff. After dancing about for some time, they blow the snuff into the nostrils of their partners so as to make it produce its full effect.

The action of the *paricá* is very singular. Sometimes it is so violent, that the taker drops on the ground as if shot, and lies insensible for some time. On those who are more used to it the effect is different. It causes for a time the highest excitement, driving off the heaviness of intoxication, and imparting a lightness and exhilaration of spirits, causing the taker to dance and sing as if mad, which indeed he is for a time. The effect soon subsides, and the men drink themselves anew into intoxication.

The Muras, a quarrelsome and savage tribe, with whom the Mundurucús are at perpetual feud, are the most confirmed *paricá* takers. The Mauhés, a neighboring tribe, use it as a means of repelling ague in the months between the wet and dry seasons, when miasma always abounds.

They keep the powder in the state of dried paste, and when they wish to use it, scrape it into a flat shell, spreading it very carefully with a little brush made from the hair of the great ant-eater. They then produce the snuff-taking apparatus. This is made of two eagle quills tied side by side for part of their length, and diverging at one end to such a distance from each other that the extremities will go easily into the possessor's nostrils. The shape of the instrument is very much like that of the letter Y.

Inserting the diverging ends into his nostrils, the Mauhé places the other end on the powder, and draws it through the quills, the end travelling over the shell until every particle of the powder has been taken. Sometimes the snuff taker employs, instead of the quills, the bone of a plover's leg.

This instrument, however, is very rare, and cannot easily be procured, the possessor esteeming it to be a most valuable piece of property. It is remarkable that the *paricá*, under different names, is used in places a thousand miles apart.

The cookery of the Mundurucús is very simple. They make cassava bread and tapioca, after a fashion which will be presently described, and feed on yams, plantains, and similar vegetables. Animal food is obtained by hunting, and chiefly consists of the monkeys with which the South American forests abound. When a monkey is to be eaten, it is cooked in one of two ways. Should there be time, a large fire is made and allowed to burn nearly down, so that there is little or no smoke. Over the red embers a number of green sticks are laid parallel to each other, just like the bars of a gridiron, and on these bars the monkey is placed just as it is killed, the skin never being removed, and the interior seldom cleaned.

There is even a simpler plan than this, which is employed when the Mundurucú has no time to build a large fire. He makes up as large a fire as he can manage, impales the monkey on a stick sharpened at each end, and fixes the stick diagonally in the ground, so that the body of the monkey hangs over the fire, just as a soldier cooks or rather burns his rations by impaling the piece of meat on his ramrod. Very little cooking is required by these people, who are content if the skin is well calcined and the flesh not quite raw.

The Mundurucú can also procure fruits that are capable of preservation, so that he need be in no fear as to suffering from lack of provisions. The chief fruits are the "nuts" of the *Lecythis* and the *Bertholetia*. The fruit of the former tree is popularly known as "monkey-cup," because the hard envelope which encloses the seeds has a movable lid, that falls off when the fruit is ripe, and enables the monkeys to draw the seeds out of their case.

The fruit of the *Bertholetia* is familiarly known as the Brazil nut. A number of these nuts are enclosed within a very thick and hard pericarp, which has no lid, though there is a little hole at the top through which the seeds can be seen. When the fruit is ripe, it falls to the ground with such force that if it were to strike a man on the head it would instantly kill him. One of these fruits in my collection measures exactly a foot in circumference, and, though very dry, weighs nine ounces. The reader may imagine the force with which such a fruit would fall from the height of a hundred feet or so.

To guard themselves against accidents, the Mundurucús always wear thick wooden caps when they go after the Brazil nuts, and are careful to walk very upright, so as not to be struck on the back or the nape of the neck.

CHAPTER CXXIX.

THE TRIBES OF GUIANA.

WEAPONS.

CHANGES OF LANGUAGE—INVERSION OF WORDS AND SENTENCES—THE TALKING PARROT—THE FIVE CHIEF TRIBES OF GUIANA—PECULIARITY OF CLIMATE, AND CONSEQUENT EFFECT ON VEGETABLE AND ANIMAL LIFE—THE HAMMOCK OF GUIANA—THE WEAPONS PECULIAR TO THE COUNTRY—THE TWO KINDS OF BLOW GUN—THE ZARABATANA, AND MODE OF CONSTRUCTION—WEIGHT OF THE WEAPON—THE PUCUNA—ITS DOUBLE TUBE—THE OURAH AND SAMOURAH—THE KURUMANNI WAX—THE INGENIOUS FORE AND BACK SIGHTS—THE BLOW GUN ARROWS—THEIR CONSTRUCTION—MODE OF SHARPENING—THE PIRAI FISH—INGENIOUS MODE OF PACKING THE ARROWS—MODE OF PROPÉLLING THE ARROWS—THE WINGED ARROW—THE QUIVER AND COTTON BASKET.

It is evident that the innumerable tribes which inhabit the neighborhood of the great Amazon River are members of the same family, differing more in language than in appearance or habits. It is natural that families when they become large should separate themselves, and so become founders of fresh tribes, which spread themselves over the country, settling down in those spots which suit them best. They retain the general character of their manners and customs, but, owing to the total want of a literature, their language is continually changing.

This alteration in their language is also due to the native fondness for inverting words and sentences during their conversation with each other, a custom which bears some resemblance to that of punning among ourselves. When these inverted words happen to please the people's fancy, they are retained in the language, so that in a few years after a family has separated itself from the parent tribe the two dialects will have receded so far from each other that the people can hardly understand each other.

To the philologist this fluctuation of language would be exceedingly interesting, but, as we are concerned with manners and customs rather than with language, we will pass northward and eastward to Guiana. Sir R. Schomburgk mentions a fact which is

a singular corroboration of the rapidity with which language changes among these tribes. There was a parrot living in 1800, which spoke well, but many of whose words could not be understood, because it spoke the language of the Atures, a tribe which had passed entirely out of recollection after it had been mastered by the warlike Caribs.

This comparatively small country is especially interesting to ethnologists, in consequence of the perfect manner in which the natives have guarded their individuality. Evidently sprung from one source, they have settled down in different districts and, though alike in color and general conformation, are as widely different in language, and often in manners, as if they belonged to separate quarters of the world.

Five principal nations inhabit Guiana, and are subdivided into a vast number of small tribes. These are the Macoushies, the Arawáks, the Accawaios, the Caribs, and the Waraus. The two first of these will be taken as representatives of the tribes in Guiana, though the others will be mentioned in cases where they present any marks of difference.

Taking broadly the chief points of distinction between these tribes, we may simply define them as follows.

The Macoushies are the largest and most ingenious tribe. They excel in the manu-

facture of the terrible wourali poison, which they exchange for canoes and other necessities from other tribes. They also make the best blow guns. Their huts are closed, and conical like sugar loaves. Their number is somewhere about three thousand.

The Arawaks are rather taller than the Maoushies, being, on an average, five feet six inches in height. Their faces are marked with the tattoo, and, as they are much brought into contact with white men, they approach civilization nearer than do the other tribes.

The Accawaios and Caribs wear no clothing except on occasions of ceremony. The former are distinguished by a wooden ornament in the cartilage of the nose, and the latter by wearing ornaments in the under lip, and by a lump of annatto fastened to the hair of the forehead. The Waraus are darker than the others, and are acknowledged to be the best canoe makers in Guiana. Some of their vessels will carry ninety or a hundred men, and they sell these canoes to the Maoushies for the excellent wourali poison for which that tribe is celebrated.

OWING to the peculiarities of the climate, all these tribes have many customs in common. The climate is a very remarkable one, being exceedingly hot and exceedingly wet. The heat is owing to the geographical position of Guiana, which is close to the equator, and the wet is due to the trade winds and the configuration of the country. Blowing across the Atlantic they absorb a vast quantity of moisture from the ocean, and discharge the greater portion of it before they can reach any distance inland, the moisture being condensed by the secondary mountain chains, which are from five to seven thousand feet in height.

In consequence of this perpetual heat acting on perpetual moisture, vegetation flourishes with a luxuriousness scarcely to be seen in any other part of the world; and so completely is the ground covered with tree and bush, that many trees are unable to find a habitation upon the ground, and are forced to live upon each other. Thus, upon a lofty mora tree a fig tree will grow, and upon the fig an enormous creeper will fasten itself, its long shoots dangling loosely from the enormous height at which they grow, or drooping in graceful and flower-clad festoons from one tree to another. Such a forest as this is often ankle-deep in water for miles together, and the vegetation is so thick that the only way of passing through the tangled mass of vegetation is to cut a path with the axe. And even then, after a week or two has elapsed, the path will have vanished, so rapid is the growth of vegetable life.

It follows from this description that the animals which inhabit Guiana must be chiefly of two kinds, those which inhabit the trees and those which live in the water.

Accordingly, we find that the country is tenanted by a great variety of the monkey tribe, that the arboreal puma and jaguar take the place of the terrestrial lion and tiger, and that the aquatic capybara and tapir flourish where beasts of equal size would perish if they had to live on the land. Birds of the most lovely plumage abound in Guiana, which is also a very paradise of insects.

It is evident that any human beings that live in such a country as this must have many characteristics in common. They need no clothes, no houses, and the woods supply them with food without the trouble of cultivation, so that their chief incentives to labor are taken away. Consequently, they may be called an idle people, though the indolence is rather apparent than real. They will work as long as there is a necessity for it; but, as a man can support existence without doing a real day's work in his life, it is evident that the necessity for work does not often arise.

One habit which they have in common is that of sleeping in the hammock. This article is made by the natives from various vegetable fibres, and is woven in different ways, according to the character of the tribe which makes it. Some of these are made simply by laying a number of strings parallel to each other, and knotting others across at right angles; but the best have no knots at all, the strings interlacing with each other diagonally, so as to yield in every direction to the body of the occupier. When a native has made a particularly fine specimen, he adorns it with feathers, and other brilliantly colored objects.

These hammocks are of various sizes, some being small and used for children, and others large enough to contain an entire family. The specimen in my collection will hold two Guianan natives, but not two Englishmen. It is rather more than sixteen feet in length, and six feet in width.

The hammock is exactly adapted to the wants of the native. It is so light that he can roll it up and tie it round his body, so as to carry it on a journey; so slight in texture as to keep him cool when lying in it; and so yielding in its structure that the bare cords do not hurt his naked skin. On a journey he always carries his hammock with him, and if he wants to rest, he does not sit down, but slings the hammock between two trees and lies in it. Several purposes are fulfilled by this arrangement. In the first place, the ground is usually wet, so that the man is kept dry in the hammock; in the next place, he is safe from the snakes and other unpleasant reptiles that swarm in the forests; and lastly, he would always rather lie down than sit.

Another point which they have in common is the mode in which they destroy the animals on which they live. The reader will

remember that the density of the jungle is so great, that if an animal were able, after it was wounded, to run for a hundred yards or so, or a bird to fly the same distance, it would be lost in the bush without the chance of recovery. It is evident, therefore, that the successful hunter must possess some means of destroying motion, if not life, almost instantaneously, and this he finds in the terrible wourali poison, which has the effect of causing instant stupor when it mixes with the blood. The mode of manufacturing this poison will presently be described, and at present it is sufficient to say that nearly all the missiles used by the Guianan aborigines, whether propelled by the bow or by the breath, are armed with this poison.

We will first take those missiles which are propelled by the breath, and examine the instrument through which they are sent. In principle this is exactly like the sumpitan of Borneo, described on page 1119, but the mode of construction is different, and in the best specimens the Guianan work is far superior to that of Borneo.

Of this singular weapon there are several varieties, the two principal of which are shown over the title "Blow guns" on the 1225th page, both being taken from specimens in my possession. On the right is the zarabatana. This is found throughout a very large tract of country southward of Guiana, when it takes a somewhat modified and improved form.

It is made of two separate pieces of wood, in each of which is cut a semicircular groove, so that when they are placed in contact with each other they form a long wooden rod, pierced with a circular bore. As the natives use nothing but the incisor teeth of rodent animals by way of tools, it may be seen that the labor of making one of these instruments is very great. The bore being carefully smoothed, the two halves are laid together, and bound by means of long, flat strips of jactara wood wound spirally round them.

To the lower end of the weapon is fastened a large mouthpiece, with a conical opening like the mouthpiece of a trumpet, so as to collect the breath for the propulsion of the arrow. A quantity of cement, composed of a black wax made by a wild bee mixed with a pitchy substance obtained from several trees, is then rubbed over the whole weapon, which is considered complete. The zarabatana is exceedingly heavy, and requires not only a strong but a practised arm to hold it steady. The specimen in my collection, which is several feet in length, weighs three pounds twelve ounces.

A far superior weapon, called the "pucuna," larger, lighter, and more easily handled, is made by the natives of many parts of Guiana, that used by the Macoushie tribe being the best. The specimen which is shown on the left of the zarabatana was

brought from Guiana by the late Mr. Waterton, who presented it to me shortly before the accident which caused his death.

The weapon in question (called pucuna) is double, being made of two portions, called ourah and samourah. The essential portion of the blow gun is the ourah. This is a singular reed (*Arundinaria Schomburgkii*), which, as far as is known, only grows on the sandstone ridge of the Upper Orinoco between the rivers Ventuari, Paramu, and Mavaca. Like the bamboo, it grows in clusters, and, though not exceeding half an inch in diameter, the first fourteen or sixteen feet are without a knot. From this point spread the long, slender branches, measuring from thirty to forty feet in length, and waving in graceful curves when moved by the wind.

The portion used for the blowpipe is the first joint, which is uniform in diameter throughout, and is naturally polished within. But it is so thin, the walls being not twice the thickness of a playing card, that it would be too fragile to be used without some protection. Accordingly, the native has recourse to a sort of palm, called by him samourah, its scientific title being *Ireartia setigera*.

This is chosen of a proper size, cut down, and steeped in water, for the purpose of extracting the pulp which fills the interior. When it is quite dry, the reed is inserted into this tube, the native gunmaker having a wonderful talent in getting the slender reed exactly in the centre of the palm-stem, and fixing it in its place with the black wax already mentioned. This wax is called kurumanni by the Macoushies, and is used by them as freely as is the "black-boy" wax by the Australian aborigines. The samourah is then scraped down to the proper thickness, well polished, and the weapon is ready for the accessories which complete it.

One end is chosen to serve as a mouthpiece, and is bound with a string made of silk-grass and the other is tipped with the half of the acuro nut, which is very hard and prevents the end of the weapon from being injured by accidental blows against a tree or the ground. This acuro seed acts as a fore-sight, by which the native hunter can direct his weapon; but, in order to secure a more certain aim, he adds a singularly ingenious back-sight. Taking a lump of kurumanni wax, he presses it on the blowpipe about eighteen inches from the mouthpiece, and by means of the wax fixes upon the tube the two lower incisor teeth of the acouchi, one of the cavies.

Figure 1 shows the weapon itself, and fig. 2 the front view of the tip, guarded with its ring of acuro seed, which forms the fore-sight. Fig. 3 gives an enlarged representation of the back-sight, made of the teeth of the acouchi (*Dasyprocta Acouchi*) fixed in their place by the black kurumanni wax. Fig. 4 is a section taken through the middle of

the back-sight, so as to show the way in which the teeth project from the shaft. Fig. 5 is a front view of the butt, showing the way in which the ourah reed is enclosed within the samourah palm.

Such a weapon as this is exceedingly light and easy to handle, presenting a strong contrast to the heavy and cumbrous zarabatana. The weight of the one in my collection barely exceeds a pound and a half, although it is eleven feet in length. It is held in rather a curious manner. The left hand is turned with the palm upward, and the elbow against the hip. The hand then grasps the blow gun within a hands-breadth of the mouthpiece, and the right hand seizes it, palm downward, in the space left by the other hand. In fact, this mode of holding the weapon is exactly similar in principle to that which is employed by riflemen. The blowpipe is then raised, not by the arms, but by bending back the body; and it is astonishing to see how steady it can be held for a lengthened time—a steadiness which can never be gained if it be held by stretching out the right arm and grasping it at some distance from the mouth.

The natives are most careful respecting the straightness of their blow guns, and never allow them to lean against anything lest they should be warped. When they go hunting, they carry the blow gun upright, like a soldier, "shouldering arms," and when they return to their huts, they suspend the weapon by a loop to the top of the house. Mr. Waterton repeatedly draws attention to this point in his "Wanderings," and when he presented me with the pucuna which he brought from Guiana, the gift was accompanied by a condition that it should never be allowed to lean against a wall, but should be either laid on the ground or suspended by its loop.

WE now come to the arrows which are propelled through the pucuna. They very much resemble in shape and size those which are employed by the Dyaks, but, instead of being made to fit the bore of the pucuna by a piece of pith or soft wood at the butt, a small quantity of wild cotton, taken from the *Bombax ceiba*, is wound upon it, and fastened with a fibre of silk grass. Cultivated cotton is too heavy to serve the purpose, and nothing answers so well as the yellow, stout-fibred cotton of the *Bombax*. Very great art is required in putting on the cotton properly. It must exactly fit the bore, be perfectly regular, so as not to disturb the accuracy of the flight, and must taper gradually in front, so as to offer the least possible resistance to the air. See illustration No. 1, on the next page.

The shaft of the arrow is made of the leaf ribs of the coucourite palm, a species of *areca*. It is about ten inches in length, no thicker than a crow quill, and at one end is brought to a point as sharp as a needle by

scraping it between the teeth of the pirai fish (*Serrasalmus piraya*). The teeth of this fish are flat, pointed, and double-edged, much like those of the shark—and, indeed, the pirai is a veritable fresh-water shark, biting whole mouthfuls from the bodies of animals that enter the water, and even attacking the alligator itself—and when the arrow is drawn between them, delicate shavings are taken off, just as is the case with the double knife-sharpener of the present day. One half of a pirai jaw is always suspended to the quiver of a Macoushie.

Of the poison with which the arrow is armed we will presently treat: we are now only concerned with the manufacture of the weapon. In order to save space, the cotton is not put upon the arrows until just before they are wanted, six or seven finished arrows being left in the quiver for immediate use, and the rest tied in a bundle until needed. The formation of this bundle is singularly ingenious, the native being able to remove any of the arrows without untying it, and to add as many as he likes without disturbing those which already are tied together.

The native takes a rod of hard wood, a little longer than the arrows, and at one end he fixes a little wheel, rather more than two inches in diameter. At two inches from the wheel, and the same distance from the end of the rod, two holes are bored, through each of which are passed two strings made of cotton. When the man wishes to tie up a number of arrows, he lays them successively between the strings, which he twists between each arrow. When the last arrow is laid in its place, the whole are kept firm by a couple of sliding knots, which can be slipped along the strings.

Illustration No. 7 on the following page, will explain the method of stringing the arrows better than can be done by words alone. Two of the arrows are shown as prepared for use, the cotton being on their butts and the poison on their tips. A number more are shown as they appear on the double strings, poisoned, but without the cotton. A hunter will sometimes have as many as five hundred arrows at once upon a string.

In order to keep the weapons compact, so that they can be easily slipped into the quiver, they are rolled round the little rod, and bound firmly together in a cylindrical form, the poisoned points being directed to the wheel, of which the reader will now see the use. It serves as a sort of shield to the hand, so that when the hunter wishes to take the arrows out of the quiver, he can do so without the least danger; and when he desires to remove some arrows to be mounted with cotton, he can push them through the spokes of the wheel, and take them out without having to untie the bundle. See illustration No. 6.

(See page 1224.)

When properly made and mounted, these arrows can be propelled with wonderful force. I have sent one for a distance of a hundred yards, and the natives can propel them to a still greater distance. There is a certain art in using the pucuna, the arrow not being urged by a lengthened breath, but by collecting all the air that the lungs will hold, and giving a short expiration, as if the object were to empty the lungs at one puff. The force comes entirely from the lungs, the cheeks having nothing to do with it. When an arrow is rightly propelled, it flies from the tube with a slight pop, like that which is produced by quickly drawing the cork of a small bottle. It is quite invisible for some little time, so rapid is the motion; and even when fitted with white instead of yellow cotton the eye can scarcely follow its course.

Such an instrument as this is simply invaluable for the purposes to which it is devoted. It is intended to be used almost exclusively for killing birds and small monkeys, both of which creatures live on trees. Now, as the trees of Guiana run to an enormous height, some of them attaining at least a hundred feet before they throw out a branch, it will be seen that the birds are beyond the reach of shot-guns. The foliage is so thick that it does not permit more than one or two shots to reach the bird, and the height is so great that, even if they did strike, they would produce but little effect. But the pucuna can throw an arrow higher than a gun can propel a shot, and if the needle-like point enters any part of the bird the effect is fatal.

There is another advantage which the pucuna possesses over fire-arms. The report of the gun frightens away every bird within sound, whereas the pucuna is practically noiseless. The slight "pop" with which the arrow is expelled does not alarm the birds, and an expert hunter can kill twenty or thirty birds from one tree without alarming the others. The pucuna is particularly useful in the chase of the toucan. The feathers of this bird are much used in the manufacture of the beautiful gala dresses which the natives wear on grand occasions, and are much prized by them. Now, the toucan has a way of sitting on the topmost boughs of the tallest trees, and were it not for the deadly arrow of his pucuna, the native could seldom obtain a specimen.

Just before the arrow is put into the blow-gun, the hunter places it between two of the pirai-teeth already mentioned, and turns it round between his fingers. He thus cuts it through just above the poisoned portion, so as to leave a mere thread of wood attaching the head to the shaft. If, therefore, the bird or monkey, on feeling the smart, should seize the arrow and withdraw it, the poisoned head snaps off and is left in the wound.

In some parts of the country a very ingenious form of arrow is used. Instead of

being made to fit the bore by means of cotton tied on the butt, a flat piece of bark is twisted round the arrow so as to cause it to terminate in a hollow cone. A larger piece of the same material is fixed along the shaft of the arrow, and slightly twisted so as to cause it to revolve when projected through the air. The arrow is tipped with a slight iron blade, instead of being merely sharpened wood. (See illustration No. 2.) This form of hollow base is admirably adapted for its purpose, and has been copied by Messrs. Lang, the well-known gunmakers of Cockspur Street, in their blow gun darts for killing small birds and animals without noise.

Next comes the quiver in which the arrows are kept. This is shown in illustration No. 4, on page 1225. The framework of the quiver is made of the ittritti-reed, and the bottom is closed by a circular plate of wood. In order to keep the poisoned arrows from the damp, which would effectually spoil them, the whole of the quiver is covered with a thick coat of kurumanni wax, which is pressed firmly into the interstices of the wicker-work, and into the junction between the bottom and the sides of the quiver.

Lest the rough basketwork should injure the delicate arrows, the quiver is lined with beautifully made mat-work, of much finer material, and quite smooth to the hand. The cover is made of a piece of skin, sometimes of the tapir, but mostly of the peccary. While fresh and wet it is moulded over a wooden block of the proper size, just as hatters mould their felt into its form. The hairy side is kept inward, and when it is pressed on the top of the quiver, and twisted with a turn of the hand, it holds itself firmly in its place. When the cover is on the quiver, no water can enter, and even if the hunter were to drop it into the river, the arrows would be preserved quite dry in their floating receptacle.

Before the kurumanni wax which covers the quiver is quite dry, a flat plaited belt made of silk grass is secured to it by means of a long string, which encircles the quiver several times. In this cincture is also secured by strings a coil of silk grass, from which can be drawn the fibres by which the cotton is attached to the arrow, together with the halt jaw-bone of the pirai, with which the arrows are sharpened. In my specimen this jaw-bone is two inches in length.

The last article which completes the equipment of the bird hunter is the basket of wild cotton. This, as may be seen from illustration No. 3, has a narrow neck, and bulging body; so that the cotton does not fall out of the basket, though carried with the opening downward. The quantity which it will hold is astonishing. From one of them Mr. Waterton took handful after handful until a large heap was on the table, just as a conjurer takes vast quantities of feathers out of an apparently empty hat.

CHAPTER CXXX.

THE TRIBES OF GUIANA—*Continued.*

WEAPONS—*Concluded.*

THE effect of the poison is instantaneous, provided that it be of good quality and kept dry. There are many varieties of the wourali, but the best, which is made by the Macoushies, is so powerful that one of the tiny arrows brought by Mr. Waterton from Guiana killed a hedgehog at once, though fifty years had elapsed since the poison was made. Death was not instantaneous, for the animal, which was very slightly wounded in the hind leg, breathed for some seconds; but the hedgehog was quite insensible, and, as soon as it had been pricked by the dart, it allowed me to lay it on its back, and place my finger on the ball of its eye, without shrinking.

Many experiments have been made in England with the wourali poison, most of which have tended to prove that its power has been exaggerated, and that a man could not be killed by the small quantity that could be conveyed into a wound on the point of an arrow. I feel certain, however, that in such cases either the poison has not been of good quality, or that it has been carelessly kept, and allowed to become damp, in which case it loses the greater part of its strength. It is very difficult to procure the strongest wourali poison from the natives, who are very unwilling to part with it, and will always try to substitute an inferior kind. The only mode of procuring the best wourali is to do as Mr. Waterton did, *i. e.* live among them, and induce them to part with the little wourali-pots from

which they have poisoned their own arrows. Moreover, he must imitate their example in keeping the poison in a perfectly dry place. The natives are so careful on this point that they frequently remove the covers of their poison pots and put them near the fire.

There is no mistake about the potency of such poison as this. Its effect upon a hedgehog has already been mentioned, but Mr. Waterton tried it on several animals. For example, he had an Ai sloth that he wanted to kill painlessly, and without damaging the skin. How he did it is best told in his own words:—

“Of all animals, not even the toad and the tortoise excepted, this poor animal is the most tenacious of life. It exists long after it has received wounds which would have destroyed any other animal, and it may be said, on seeing a mortally wounded sloth, that life disputes with death every inch of flesh in its body.

“The Ai was wounded in the leg, and put down upon the floor, almost two feet from the table. It contrived to reach the leg of the table, and fastened itself upon it as if wishful to ascend. But this was its last advancing step; life was ebbing fast, though imperceptibly; nor could this singular production of nature, which has been formed of a texture to resist death in a thousand shapes, make any stand against the wourali.

“First one fore-leg let go its hold, and dropped down motionless by its side; the other gradually did the same. The fore-

legs having now lost their strength, the sloth slowly doubled its body, and placed its head betwixt its hind-legs, which still adhered to the table; but when the poison had affected these also, it sank to the ground, but sank so gently that you could not distinguish the movement from an ordinary motion; and had you been ignorant that it was wounded with a poisoned arrow, you would never have suspected that it was dying. Its mouth was shut, nor had any froth or saliva collected there.

"There was no *subsultus tendinum*, nor any visible alteration in its breathing. During the tenth minute from the time it was wounded it stirred, and that was all; and the minute after life's last spark went out. From the time the poison began to operate, you would have conjectured that sleep was overpowering it, and you would have exclaimed —

'Pressitque jacentem
Dulcis et alta quies, placidæque simillima morti.'

The reader will see that this account agrees exactly with my own experiment. In neither case was death instantaneous, but in both cases the power or wish to move seemed to be immediately taken from the animal, though wounded in a limb and not in a mortal spot.

Of course the quantity of poison must be proportioned to the size of the animal. The tales that are told of a mere scratch producing death are manifest exaggerations. It has been mentioned that in Guiana no very large animals are found, the tapir and the jaguar being the largest of the mammalia. For the purpose of killing these, or going to battle where man is to be destroyed, the natives employ a very different weapon, and use a bow and arrow of rather peculiar construction.

They are extremely long, some of them being six feet in total length. The shaft is made of a cylindrical, hollow, and very strong reed (*Gynectum saccharinum*) which runs to some length without a knot or joint. In one end is fixed a long spike of a very hard and heavy wood, called letter wood, because it is covered with red marks like rude attempts at writing, very much like the scribbled marks on a yellow-hammer's egg. In order to guard it from splitting, the shaft of the arrow is bound for some inches with cotton thread. The commoner kinds of arrow are merely wrapped with this thread, but in the better sorts the thread is woven in patterns almost as neat as those employed by the Polynesian islanders. When the native wants to make a peculiarly beautiful arrow, he ornaments it in a most singular manner. Into the thread which wraps the shaft are inserted a quantity of brilliantly colored feathers, mostly those of the various parrots which are so plentiful in Southern America. Only the

smallest and softest feathers are used, and they are worked into the wrapping in a manner which produces the most artistic combinations of color.

The natives have a marvellous eye for color, most likely from having continually before their eyes the gorgeous insects and birds of their luxuriant country, and it is wonderful to see the boldness with which they achieve harmony from a number of hues that scarcely any one would dare to place in opposition with each other. Scarlet, yellow, pink, blue, green, and snowy white are all used in these arrows, and are arranged in a way that would do honor to the best European artist.

Sometimes a cap is made for the arrows, and decorated with feathers in the same brilliant style. Such arrows as these require much care on the part of the owner, who is not content with an ordinary quiver, wherein they might be jolted about and their lovely feathers spoiled, but constructs a special and peculiar quiver for their reception. He takes a number of bamboos, about the thickness of a man's finger, and cuts them into pieces some eighteen inches in length. These he lashes firmly together, and then ties over them a bark cover, neatly wrapped with cotton string.

Each of these tubes contains one arrow, which fits with moderate tightness, the downy feathers keeping it in its place. They are fixed so perfectly, that when the arrow is pushed into its tube the feathers are pressed tightly against the shaft, and when it is withdrawn, they spring out by their own elasticity, and form an elegant colored tuft. As the long arrow shafts are apt to vibrate by their own weight, and might damage the feather tufts in the tubes, a cap is usually slipped over them — in some cases plain, like the covering of the quiver, but in others gorgeously made of feathers. These arrows are tipped with the barbed tail-bone of the sting-ray or are pointed with iron, and not with bone. These arrows and one of the tubes are illustrated on p. 1214.

The heads of the arrows are made in various ways. Sometimes they are simply covered with a series of rather blunt barbs, but the generality of them are constructed after a very elaborate fashion.

The barb of one kind of arrow reminds the observer of the weapon of the Bosjesman, though the arrow is almost a spear in comparison with the tiny weapon of the African savage. The point is tipped with a piece of iron cut into a single barb, and projecting from it and pointing in the opposite direction a curved iron spike is slightly lashed to the shaft with cotton.

A thick layer of wourali poison is laid on the arrow for about three inches, aiding to fasten the iron spike to the shaft. Now, the wourali poison mixes instantaneously with the blood, so that when the arrow penetrates

an animal, the poison dissolves, and allows the spike to escape into the wound, carrying with it a sufficient amount of the poison to cause death, even if in its struggles the animal should succeed in shaking out the arrow itself. If the reader will refer to illustration No. 4, on page 247, he will see in the illustration (fig. 4) the Bosjesman arrow, which is made on the same principle.

Some of these arrows appear to have been much prized by the owners who have covered them with an elaborate ornamentation of cotton thread for a considerable portion of their length — an example of which, drawn from one of my own specimens, may be seen in the illustration. Some of the arrows have long ends of cotton strings hanging from them in lieu of the feather tufts. These dangling cords are often used as ornaments by the natives, who decorate with them their clubs in such a manner that two or three blows must destroy the whole of the work. We shall presently see examples of these clubs.

The arrow head which is most in vogue among the Macoushies, whom we take as the typical tribe of this part of the world, is made in a different fashion. A square groove, about an inch in depth, is cut in the extremity of the letter wood spike which terminates the arrow, and a slight sliver of bamboo is lashed so as to press against the opening along the side. A barbed spike of coucourite wood is then cut. It is about three inches in length, flat toward the point, and squared at the base, so as to slip easily into the groove at the head of the arrow, where it is slightly held by means of the little bamboo spring. This spring enables the head to remain in its place while the archer is fitting the arrow to his bow and taking aim; but as soon as the missile has struck its object, and the animal bounds forward, the poisoned head remains in the wound, and the shaft falls on the ground.

There is considerable art in putting the wourali on this kind of arrow head. It is done in several layers, one being allowed to dry before the other is applied, and being managed so as to cause an edge of the pitch-like wourali to run along each side of the head. In consequence of the movability of the head the native archer does not trouble himself to carry more than one or two shafts, though he has by him a store of ready-poisoned heads. These are kept in a little quiver made of a joint of bamboo fitted with a cover, in order to keep the poison from moisture, and with a cotton belt by which it can be slung over the shoulders.

One of these quivers in my collection, (see illustration No. 6, page 1231,) brought from Guiana by Sir. R. Schomburgk, is only seven inches long by an inch and a half wide, and is capable of containing twelve to fourteen poisoned heads. The native hunter does not require more than this number, as

he rarely shoots without hitting, and when he has struck one animal large enough to require this kind of arrow, he seldom wants more than one specimen. In the course of this account of the Guiana natives the reader will notice the many trouble saving expedients employed by them.

Owing to the generous nature of the country, which supplies food without requiring labor, and the warm, moist character of the climate, the natives are very apathetic, and have the strongest objection to carrying one ounce more weight, or doing one stroke more work, than is absolutely needful. So, instead of carrying a large bundle of arrows, the hunter has one, or at the most two arrows, and a quantity of small poisoned heads, the whole equipment being so light that a child just able to walk could carry the bow, arrows, and quiver without being much inconvenienced.

Knowing the power of this poison, the natives are exceedingly cautious in handling it, and never carry the arrow with its head bare. They always slip over the head a small tube of bamboo, just large enough to be held in its place by the cotton wrapping that passes round the junction of the head and the shaft. This is never removed except when the arrow is to be used, and it is scarcely possible to frighten a native more than by taking off the guard of an arrow and holding the point to him. It is of this kind of arrow that the following story is told in Mr. Waterton's "Wanderings."

"One day . . . an Arawak Indian told an affecting story of what happened to a comrade of his. He was present at his death. As it did not interest the Indian in any point to tell a falsehood, it is very probable that his account was a true one. If so, it appears that there is no certain antidote, or at least an antidote that could be resorted to in a case of urgent need; for the Indian gave up all thoughts of life as soon as he was wounded.

"The Arawak Indian said it was but four years ago that he and his companion were ranging in the forest in quest of game. His companion took a poisoned arrow, and sent it at a red monkey in a tree above him. It was nearly a perpendicular shot. The arrow missed the monkey, and in the descent struck him in the arm, a little above the elbow. He was convinced it was all over with him. 'I shall never,' said he to his companion, in a faltering voice, 'bend this bow again.' And having said that, he took off his little bamboo poison box which hung across his shoulder, and putting it, together with his bow and arrows, on the ground, he laid himself down close by them, bade his companion farewell, and never spoke more."

Mr. Waterton then proceeds to mention the different antidotes, in none of which does he place the least reliance, and in another place remarks that if the natives knew of

(1.) WINGED ARROWS.
(See page 1233.)

(2.) CASSAVA DISH. (See page 1248.)

(3.) QUAKE. (See page 1234.)

(See page 1216.)

From Christy Collection. From my Collection. (See p. 1230.)

(See page 1233.)

any remedy for the poison, they would never be without it.

Before passing to the manufacture of this dreaded poison, we will finish the description of the arrows.

The very long arrows, with their plumed shafts, need no feathers, their great length sufficing to keep them straight during their flight. Were the Guianan native to attempt a "long shot," he would fail. He is not used to long ranges, which for the most part are rendered needless by the conformation of the country and the density of the foliage. He does not expect to shoot at an object distant more than thirty or forty yards, and likes to get much closer if possible. At these short ranges, the great length of the arrow keeps it straight, and is effectual in enabling the hunter to strike an animal, such as a tapir, a capybara, or a monkey, through the masses of vegetation by which it is concealed from most eyes except those of a native.

Most of the arrows, however, are feathered, and there is such ingenuity in the way of putting on the feathers that it deserves mention. In the arrows to which we are accustomed there are three feathers, but in the Guianan arrow there are only two. These are taken from the corresponding feathers of the opposite wings of the bird, so that when they are fixed on the end of the shaft they curve in different directions, like two blades of a steamer's screw, and so communicate a revolving motion to the arrow as it flies through the air. So, if a native has two or three arrows before him to which he wishes to add the feathers, he procures a bird, and for the first arrow takes, we will say, the second primary feather from the right and left wings of the bird, cuts off a portion of the upper part, about three inches in length, strips away the inner half of the feather, and fastens the remainder on the weapon. The next arrow is feathered from the third primary of each wing, and so on. See illustration No. 1, page 1231.

The feathers are lashed to the arrow with cotton thread, and so rudely put on, that they would sadly cut an English archer's hand when the arrow was shot. In order to preserve the nock of the arrow from being split by the bow-string, it is not made in the reed shaft of the arrow itself, but in a piece of letter wood, which is lashed to the butt of the arrow.

The bow is often shorter than the arrows, and is of no great strength, a long range being, as has already been stated, not required. Many kinds of wood furnish the Guianan bow, but those weapons which are most in favor are made of a species of *Lecythis*. They are strung with the silk grass which has been already mentioned.

Besides the ordinary mode of using their bows and arrows, the Guianan natives have another, which exactly resembles that sport of the old English archers, when a garland

was laid on the ground, and the archers, standing in a circle round it, shot their arrows high into the air, so that they should fall into the garland. It sometimes happens that a turtle is lying in the water in such a manner that an arrow, shot at it in the usual manner, would only glance off its hard coat without doing any injury. The hunter, therefore, shoots upward, calculating the course of the descending missile so accurately that it falls upon the turtle's back, and penetrates the shell.

These arrows are heavier than the ordinary kinds, and are furnished with a sharp iron point, made in a very ingenious manner. As may be seen by reference to illustration No. 5, page 1231, the iron point is doubly barbed. Its neck, at first flat, is soon divided into two portions, which diverge from each other, and have their ends sharply pointed, so as to constitute a secondary pair of barbs. A stout double string of silk grass is then fixed to the neck, and cotton cord, strengthened with kurumanni wax, is coiled round the diverging points, so as to form a tube. The end of the piece of hard wood which terminates the arrow is scraped down to a conical point, so that it can easily be slipped into the tube. Lastly, the double cord fastened to the head is carried for a foot or so along the arrow, and made fast by a couple of belts of silk grass.

As soon as this arrow strikes the turtle, it dashes off, shaking the shaft out of the tube, and so preventing the arrow from being worked out of the wound by dragging the upright shaft through the water. Whenever the reptile comes near the surface, the light reed shaft of the arrow rises so as to indicate its presence, and, aided by this mark, the hunter is soon able to secure the reptile. The arrow, a part of which is shown in the illustration, is rather more than five feet in length. It is represented with the shaft separated from the tube. The iron point is thick and solid, and as the hardwood spike is fourteen inches in length, the front part of the missile is comparatively heavy, causing it to descend with great force.

WE now come to the manufacture of the dreaded poison which produces such fatal effects. The natives are very chary of giving information on the subject, and it is very difficult to learn the precise ingredients, the proportionate quantities, or the mode of preparing them. The following account is obtained partly from Mr. Waterton's book, partly from information given by himself, and partly from the words and works of other travellers in the country.

A good many articles are employed, or said to be employed, but I believe that only two are really needed. The native who is about to make wourali sets about his task in a very deliberate manner. He sets off into the woods alone, taking on his back a pecul-

iar kind of basket called a "quake" or "habbah." This is a very ingenious kind of basket, combining the two requisites of lightness and strength. It is generally used when the native wants to carry objects that are not very heavy, and are large enough not to slip through the interstices.

It is made from the ittiritti reed, split into slips about the third of an inch in width. As when filled it swells out toward the bottom and is narrow at the mouth, the objects that are placed in it have no tendency to fall out, which might easily be the case with an ordinary basket, as the bearer is obliged to clamber over fallen trees, to force his way through the dense underwood of a tropical forest, and to subject the quake to such rough treatment that its qualities of form and elasticity are continually brought into operation.

The quake will hold a wonderful amount of goods, being as dilatable as an English carpet-bag. My own specimen (see illustration No. 3, p. 1231,) measures twenty inches in width, and this is the usual average.

The first thing to be sought is the wourali vine (*strychnos toxifera*). It is closely allied to the tree which furnishes the well-known strychnine, in its coarser stages of preparation called *nux vomica*, or ratsbane. The upas tree, which furnishes the poison for the Dyak sumpitan arrows, belongs to the same genus. The wourali (spelt sometimes "oorara" or "curari"), though not very rare, is very local, and not easily discovered. It has a vine-like appearance, with a woody stem about three inches in diameter, covered with rough gray bark. The leaves are dark green, placed opposite each other, and of an oval form. The fruit is nearly as large as an apple, round, and smooth, with seeds imbedded in a bitter gummy pulp.

When the poison maker has found the wourali, he looks after two bulbous plants, containing a green and glutinous juice, and puts some of their stems into the quake. The third vegetable is a bitter root, which I believe to be the hyarri, a papilionaceous plant, which is largely used by the natives in poisoning the water when catching fish on a large scale. All parts of the hyarri are poisonous, but the root is the most powerful part of it. The natives take some of the root in their canoes, bale water over it, and pound it with their clubs. After allowing the water time to mix with the expressed juice, the fisherman throws it overboard, and in a few minutes every fish within a considerable distance comes floating to the surface perfectly helpless. One cubic foot of the hyarri will poison an acre of water, even among rapids, while a much less quantity is needed for creeks and still water. The poison has no effect on the flesh of the fish, which is perfectly wholesome.

The wourali and the hyarri are, in my opinion, the essential parts of the poison,

the bulbous plants probably supplying the glutinous matter needed to make it adhere to the point of the weapon. But the poison maker is not content with vegetable substances, but presses the animal kingdom into his service.

He procures two kinds of ant, one the muniri (*Ponera grandis*), a huge, black creature, sometimes an inch in length, with a sting so venomous that it often produces a fever. One of these ants is in my collection, and its very look is venomous enough to warn any one against it. The other is the fire-ant (*Myrmica scævissima*), a tiny red insect, whose sting is just like the thrust of a red-hot needle. Besides these he takes the poison fangs of the labarri and counacouchi snakes, two of the most venomous serpents of the country. These fangs are kept in store, as the native always kills these reptiles whenever he sees them, and extracts their poison fangs.

That these latter ingredients can have no effect in increasing the power of the poison I never doubted, and some years ago I expressed my opinion that they were not used at all, but merely collected as a blind, to prevent the secret of the poison being known. This opinion is corroborated by the researches of Dr. Herman Beigel, who analyzed some wourali poison taken from the same arrow with which the hedgehog was killed, and who ascertained that there was not a particle of bony or animal matter in the poison, but that it was wholly of a vegetable character. Moreover, there was no trace of red pepper, which is said to be one of the ingredients.

As far as the sense of taste goes, my own experience coincides with that of Dr. Beigel. I have tasted the poison, which is innocuous unless mixed directly with the blood, and found it to be intensely bitter, and rather aromatic. These two qualities are doubtless due to the strychnine of the wourali and to the hyarri. There was not the least flavor of red pepper.

All these ingredients being procured, the poison maker sets to work in a very systematic manner. He will not prepare the wourali in, or even near, his own house, but makes his preparations in the depth of the forest, where he builds a little hut especially for the purpose. His first care is to build a fire, and while it is burning up, he scrapes into a perfectly new pot a sufficient quantity of the wourali wood, adding to it the hyarri in proper proportion, and placing them in a sort of colander. Holding the colander and its contents over the pot, the Indian pours boiling water over them, and allows the decoction to drain into the vessel, when it looks something like coffee. When a sufficient quantity has been obtained, the bulbous roots are bruised and their juice squeezed into the pot, and, lastly, the snakes' fangs and ants are pounded and thrown into the pot.

The vessel is now placed on the fire, which is kept up very gently, so as to allow the contents to simmer, rather than boil, and more wourali juice is added to supply the waste by evaporation. A scum is thrown up during the process, and carefully skimmed with a leaf, the boiling being continued until the poison is reduced to a thick dark brown syrup, about the consistence of treacle. According to some accounts, the seeds of the red pepper are used, not as adding to the strength of the poison, but as a test of its preparation being complete. When the native thinks that the poison is nearly ready, he throws into it a single seed of red pepper, which immediately begins to revolve. He then allows the boiling to proceed a little longer, and throws in another seed, which perhaps revolves, but more slowly; and he repeats this experiment until the seed remains stationary, which is accepted as a proof that the preparation is complete.

The Indian then takes a few arrows, dips them in the poison, and tries their effect upon some animal or bird, and, if satisfied with the effect, pours the poison into a new earthenware pot, ties a couple of leaves over the mouth, and a piece of wet hide over the leaves, so as to exclude both air and moisture, especially the latter. The little pots which are used for holding the wourali are nearly spherical, and about as large as an ordinary orange.

The above account of preparing the wourali poison is that which is furnished by the natives, but, as they have a definite object in keeping the mode of preparation secret, it cannot be absolutely relied upon. That there is a secret connected with its manufacture is evident from the fact that the Maccoushie poison is acknowledged to be better and stronger than that which is manufactured by any other tribe, and that all the Guianan tribes are glad to purchase wourali from the Maccoushies.

It is not every native who knows how to make this wonderful poison. The knowledge is restricted to the conjurers, who keep it in their families and hand it down from father to son. They are so careful to preserve their secret, that not only do they make the wourali at a distance from their houses, but when they have completed the manufacture they burn down the huts, so as to obliterate every trace of the means which have been employed.

They have a sort of superstitious reverence for the wourali. The ostensible reason which is given for burning down the hut is, that it is polluted by the fumes of the poison, and may never again be inhabited, so that it is better to burn it down at once. They allege that during its preparation the Yabahou, or evil spirit, is hovering over, ready to seize upon those who are uninitiated in the mysteries, and so by the aid of superstition

effectually prevent their proceedings from being watched.

In order to carry out this fear of the wourali to its full extent, the professors of poison-manufacture will refuse to make it except when they please, alleging any excuse that may suggest itself. Mr. Waterton narrates an instance where a man who had promised to make some wourali poison declined to do so at the last moment, on the ground that he expected an increase to his family. The maker is always pleased to consider himself ill after he has completed his work, which, in spite of the repeated washing of his face and hands, renders him sufficiently liable to the attacks of the invisible Yabahou to cause indisposition. The manufacturer is not altogether an impostor in this case, but acts from a sort of belief in the mysterious gloom which always surrounds the wourali. Nothing, for example, would induce him to eat while the poison is being prepared; and, however hungry he may be, he will fast until the completed wourali has been poured into its receptacle.

Although the chief poison in Guiana, the wourali is not the only one, the natives having discovered a sort of wood which is sufficiently poisonous in itself to need no other appliance. The wood is that of some endogenous tree, of a pale yellow color. From this wood the natives cut long blade-shaped heads, much resembling those of the Kafir assagais in form. The peculiar shape of the head may be seen in figures 4 and 5 of illustration No. 4, on page 1231, which represents two views of the same arrow head. Sometimes the head is left quite plain, but in some specimens a pattern is rudely scribbled on the outer surface of the blade. Annatto is the coloring matter used, leaving a dusky red dye behind it. I possess specimens of these arrows, both plain and colored.

These flat heads are lashed to the hardwood spike that terminates the arrow by a complicated arrangement of cotton threads, which, though they do not possess the artistic elegance of the Polynesian wrapping, yet are crossed and recrossed so as to produce a series of diamond shaped patterns. Mr. Waterton first called my attention to the venomous properties of this arrow head.

The young men practise diligently with these weapons. The largest, which are intended for the slaughter of tapers, jaguars, and such like animals, are tested by being shot perpendicularly into the air, each archer trying to send his arrow above that of his competitor.

Mr. Brett, in his "Indian Tribes of Guiana," gives an interesting account of the skill of the natives as marksmen, and relates one little episode of the shooting, which shows that the "inevitable dog" accompanies sports in Guiana, just as he does in England.

"After several rounds from each man and

boy, the archery contest closed by a simultaneous discharge of arrows from every bow. More than two hundred shafts flying through the air together presented a novel spectacle, and in an instant demolished the target amid loud shouts from all. A dog which, unheeded, had wandered behind it, was surrounded by the crop of arrows which suddenly stuck in the sand, some even beneath him. He was a lucky dog, however, for with marvellous fortune he escaped unhurt, though bewildered by the adventure and the roar of applause which followed his somewhat hasty retirement, with deprecating look and drooping tail."

Spears are also used by some of the tribes. The same writer describes the mode in which a Warau had practised with the spear. His weapon was made of the same material as the arrow, but of greater size, the shaft being of reed, and the head of hard wood. The young spearman had fixed a mark on the soft stem of a plantain tree. As the missile struck the mark, the hard-wood head remained sticking in the tree, while the elastic shaft bounded back toward the thrower.

The lad said that this javelin was used for killing sundry large fishes, which are induced to rise to the surface of the water by means of scattering seeds and other food of which they are fond, and are then killed by means of this weapon.

Some of the arrows are unpoisoned, and, as an example of the great variety assumed, of the arrow heads of the different tribes three more specimens are given in the three left-hand figures of illustration No. 4, on page 1231, taken from the "Christy" collection. These heads are something of the same form as those which have just been described, but, instead of being flat, they are curved. The reader may remember that a similar form of arrow prevails in New Guinea. The reason is simple enough. The bamboo is covered with a coating of pure flint, which forms a natural edge so sharp, that when the bamboo is split, it can be used as a knife.

Indeed, until the introduction of iron, the bamboo furnished the knife in ordinary use throughout all Polynesia and many other countries where it grew. It is evident, therefore, that an arrow head merely made from a hollow bamboo stem, and retaining the hollow shape, must be a most formidable weapon, and inflict a very dangerous wound. It is brittle, fragile, and would shiver to pieces against a shield or defensive armor of even moderate strength, but against the naked bodies of the Indians it is a most effective weapon.

Great pains have been taken with these arrows, all of which have been ornamented in some peculiar manner. One of them is covered on the convex side with colored patterns, just as is the case with the poison-

wood arrow just described. Another is not only ornamented, but cut into barbs. The third, which is plain, is distinguished by a hollow ball, placed just below the head. The ball is pierced with a hole, so that when the arrow is sent from the bow a whistling sound will be produced. The Chinese use whistling arrows at the present time, and so did our archers in the days when the long-bow was the pride of England. In all these cases, the whistle could be used for amusement in time of peace, but for signals in time of war.

As the thoughtful reader might gather from the elaborate care exercised in ornamenting these weapons, the natives would rather exhibit than use them. It is almost invariably found to be the case, that really warlike people keep their weapons in the highest state of efficiency, but trouble themselves comparatively little about ornamenting them, whereas those who want a reputation for valor, without the trouble and danger of earning it, try to gain their end by having their weapons covered with ornament, and themselves assuming as martial an aspect as possible. If the reader will remember the various peoples that have been described in the course of this work, he will see how completely this rule holds good.

Take, by way of example, the Fijian and the Tongan. The one is celebrated throughout the world for the variety, the beauty, the finish, and the artistic ornamentation of his weapons. He always moves armed, feeling himself at a loss without his club on his shoulder; he bedizens himself in the most extravagant manner for the war dance, and before joining in actual battle he consumes a vast amount of time in boasting of his prowess, and of the use to which he will put the body of his foe.

But the Tongan, who never thinks of boasting before or after battle, whose weapons are simple and unadorned, is so completely the superior of the Fijian that he could, if he chose, make himself the master of the whole Fiji territory. We see the same characteristic in several Eastern lands, in which the men are walking arsenals of weapons inlaid with gold, silver, and precious stones, and yet will take the first opportunity of running away when there is a probability that their ornamental weapons will be used in earnest.

So the experienced anthropologist, as soon as he sees these beautifully carved arms, decorated with the most delicate plumage, and painted with all the colors which native art can supply, at once makes up his mind that such weapons are more for show than use, and that the makers would not have expended such time and trouble upon them, if they had intended them to undergo the rough usage of actual warfare.

CHAPTER CXXXI.

THE TRIBES OF GUIANA — *Continued.*

WAR — SUPERSTITION.

GUIANAN CLUBS—THE SAPAKANA AND POTU—WARFARE—CANNIBALISM—THE SHELL MOUND AND ITS CONTENTS—RISE AND FALL OF THE CARIB TRIBE—BLOOD FEUDS—THE KANAIMA AND ITS RESULTS—A STRANGE SUPERSTITION—THE GUIANAN VAMPIRE—WAR WITH THE ARAWÁKS—INGENIOUS STRATEGY—THE AMBUSH—THE FORT AND THE BOOM—CAPTURE OF THE CHIEF AND END OF THE WAR.

WE will now pass to their clubs, in which, as well as in the arrows, can be read the characteristics of their makers: some of them are wonderful examples of savage art. The specimens which are shown in an illustration on the preceding page are all drawn from examples in the "Christy" collection.

Those on the right are examples of the kind of club which is called Sapakana. They are made of the heaviest and hardest wood which the native can find, and some of them are so large and heavy that they require a strong man to wield them. The blade is formed something like that of the New Zealand merai, being slightly convex in the middle, and coming to an edge on either side, so that it is as formidable a weapon as can well be imagined.

In order to give a firm grasp, the handle is covered with cotton string wound upon it very neatly, afterward being ornamented with feathers and similar decorations. As the heads of these clubs are very much alike, I have only given one entire, and the handles of two others. The central is the most highly ornamented, having tufts of brilliant green feathers just at the junction of the head and the handle, and below the feathers a series of white balls made of cotton-wool. The reader will doubtless admire the elaborate pattern in which the cotton string is wound upon the handle. One of these weapons in my own collection very much resembles that which has been already described, except that, instead of the feathers and cotton-wool balls, it is ornamented with a series of long trailing tufts made of cotton fibre.

At the present time the use of these beautiful clubs is practically abandoned, the musket having superseded the native weapons, so that the clubs, although they are still manufactured, are made for sale, and not for use.

Next comes a club which is used by the Caribs. It carries out fully the principle which has just been mentioned respecting the ratio between the ornament of the weapon and the warlike spirit of the user. This club is comparatively plain, being meant for use and not for show. The makers call it by the name of Potu, and it is evidently a modification of the "macana" club of the Gran Chaco Indians. To the eye it seems no very powerful weapon, but its weight, form, and balance render it capable of dashing out the brains of a man with a single blow. There is generally a wrapping of cotton string round the middle, so as to afford a firm grip, and a loop made of the same material, which passes over the wrist. A modification of the potu is shown in the left-hand specimen.

The very shape of the potus proves that they are meant to be used by a courageous and warlike people. As a rule the instinct of a really courageous people is to "get at" the adversary, while that of an unwarlike people is to keep the foe at a distance.

As to warfare and the mode of conducting it, there is considerable variation in the different tribes, some being peaceable and quiet, while others are just the reverse. The most warlike tribe among them is undoubtedly the Carib, of which Raleigh wrote that they were a naked people, but as valiant as any under the sky.

The Caribs were at that time the most important of the Guianan tribes, having earned their prominence by their weapons. If they quarrelled with another tribe, they were accustomed to make an expedition into the enemy's land by night, surround in succession their scattered villages, kill all the men, and take the women and children prisoners. Some of these captives were employed as slaves among themselves, and by degrees became incorporated with the tribe of their captors, while others were reserved for sale. They did not, however, restrict themselves to this kind of secret expedition, but openly made war with other tribes, and boasted that they would paddle their canoes against the stream, so that the enemy might hear them coming and not be taken by surprise.

There seems to be little doubt that the Caribs were at one time cannibals, though at the present day there is great difficulty in getting them to acknowledge the fact. The former cannibalism of these tribes was easily confirmed by some discoveries which were made in a large mound situated on a sand reef, some ten or twelve miles from the sea.

Thinking that this mound might be a kitchen midden similar to those which are found in many parts of the Old World, Mr. Brett instituted a search, and found that, like these mounds, the heap consisted chiefly of shells, mostly those of mussels and periwinkles, together with the claws and shells of crabs, and some bones of fishes and land vertebrates. At no very great depth from the surface, the excavators came upon a vast quantity of human bones, the skulls shattered to pieces, and the bones of the arms and legs split longitudinally.

To an experienced eye this state of the bones told its own story. The bones were not laid regularly, as they would have been if they had been the remains of bodies regularly interred, but were tossed about in confusion, the fragments of skulls, vertebræ, and limbs being scattered here and there without the least order. The story which these remains tell is simple enough. They are the bones of human beings who have been eaten by their fellow-men, which, after being cracked for the sake of the marrow, have been flung aside, together with the shells of molluscs and other refuse. That this horrid custom was common to all the tribes at one time seems very probable, but the Caribs are the last to whom cannibalism has been attributed.

Like the Mundurucús, the Caribs had an ordeal consisting in enduring the bites of ants. They had no hereditary chief, though the son of a chief would succeed his father if he were considered to possess sufficient ability and courage. Even in such a case, the candidate for chieftainship had to prove his superiority over his fellows by his capability of bearing privations as well as tor-

ture. He was required to show that he was acquainted with all the stratagems of war, that he could endure long fasting, that he was of unflinching courage, and that he could resist even the terrible ordeal of the ants, and not until he had satisfactorily passed through all those trials did the tribe lay their weapons at his feet in token of their submission to him.

We may naturally feel some surprise that a people who exhibit such an indomitable spirit, and such a love of freedom, who have overrun vast tracts of territory and successfully resisted even the well-armed and disciplined troops of Europe, should not have advanced in the scale of civilization, but have remained as savage at the present day as we know them to have been three hundred years ago. Mr. Brett, whose personal knowledge of them enables him to speak with authority, gives his solution of the question as follows:—

“There arose among them no master spirit, who, combining the wisdom of the legislator with the bravery of the warrior, might have established humane and civilizing institutions among his people, and permanently united their scattered hordes. In great emergencies the necessity for united action led them accordingly to follow, and implicitly obey, some one of their chiefs, invested by themselves with superior authority, like a dictator of ancient Rome. But at other times each petty head of a clan or family moved and acted in a great measure as he pleased, there being no actual power nor hereditary authority sufficiently respected to command the obedience of all.

“Having thus no permanent band of cohesion, their wild hordes could only fight, overrun, oppress, and destroy, and in their highest prosperity were incapable of accomplishing any great and useful work which might have remained as their memorial to future ages.”

In consequence of the want of leadership, the Carib tribe, once the greatest, and perhaps the origin of all the Guianan tribes, is steadily decreasing, and, valiant as they may be, they are no longer the terror of the other tribes, as they used to be. Indeed, during their feud with the Acawaios, in which they have been engaged for a long time, the Caribs have by no means been the winners. They have even been obliged to quit their own district, and settle themselves near the missionary stations for protection.

The same author who has just been quoted mentions several instances which show the failing power of the Caribs. On one occasion a Carib chief came to live at the mission station because he had found that a party of Acawaios, painted and equipped for war, were lurking near his home in the forest. Even in his place of refuge he was not safe from his enemies. One evening the village was disturbed by loud outcries,

and it was found that a son-in-law of the chief had been seriously hurt, and was lying in his hammock, writhing with the pain of a blow which he had received. He had wandered to some little distance from the house, when he caught sight of an Acawaios behind him. He turned round, sprang upon the enemy, and threw his arms round him; but the man was too strong, hurled him to the ground, and, as he fell, struck the blow which had caused him to take to his hammock.

The whole Carib party was in great confusion and terror for some time, but at last it turned out that the attack was in consequence of a personal feud with the wounded man. Two years before, his father had been assassinated by the Acawaios, and he very naturally used his bow and arrows in a vain attempt to save his father's life. This act drew upon him the vengeance of the Acawaios, who marked him for death whenever they could find an opportunity of killing him. He had fled from the Essequibo to Pomeroun, but uselessly, and was advised by the missionary to go to the coast and procure employment on one of the sugar estates, where his enemies would not be likely to follow.

Sometimes a blood feud is caused by a superstitious practice called Kanaima. A person dies, and the medicine man decides that the death has been caused by some one who has used sorcery for the purpose of taking away his life. The supposed wizard is then doomed to die, and a near relative of the deceased is set apart for the purpose of carrying out the sentence. He is supposed to be possessed by a wandering spirit called Kanaima, and is called by that name until the deed of vengeance is accomplished. During the time of possession, the Kanaima has to suffer many privations, so that the mere wish to be restored to his ordinary life acts as an incentive to the fulfilment of his office.

The mode of killing a victim according to the Kanaima superstition is a very cruel one. He is approached from behind (as was the case with the young Carib above-mentioned); and if the slayer can come within reach, the victim is struck down with a blow on the back of his neck. This blow is not meant to be fatal, and is only hard enough to cause insensibility for a time. The Kanaima then forces open his victim's mouth, and presses through his tongue the fangs of a venomous serpent. The tongue immediately swells to such an extent as to prevent the unfortunate wretch from speaking, and in the course of a day or two to end his life. Sometimes the Kanaima is said to substitute for the serpent's fangs a poisonous powder, made for the express purpose, and kept in a little tube made of the wing-bone of a bird. The preparation of this powder is a secret, handed down from father to son.

The task of the Kanaima is not yet ended. Three days after the burial of the victim, the murderer must visit the grave and go through some ceremony, before the Kanaima spirit departs and allows the man to return to his friends. The natives are very chary of their knowledge on this subject, but, as far as can be ascertained, the Kanaima presses a pointed stick through the body, tastes the blood, and by that act is relieved from the spirit of murder.

The friends of the victim, therefore, always endeavor to conceal the place of burial, and it is the duty of the murderer to hover about the place so that they shall not be able to inter the body without his knowledge. Should the friends be successful, the vengeance is reversed, for the unfortunate Kanaima is obliged to wander through the woods until he is afflicted with madness, or some other form of vengeance whereby the spirit of murder punishes those who have not carried out his wishes.

Mr. Brett witnessed several instances of this dreadful mode of punishment, and in one case had little doubt that he had come upon a Kanaima who had been unable to find the body of his victim. "An Indian, reduced almost to a skeleton, and in a dreadful state of exhaustion, was picked up in the forest by some Arawak, and brought to the Pomeroun mission. He had lost a portion of his scalp, and had his lower lip torn down at each corner. This he said had been done by a small 'tiger,' which had sprung on him while lying in the forest. . . .

"The Acawaios at the mission, whose language he spoke, took much care of him at first, but afterward judged, from his refusing certain kinds of food and other signs, that he was a devotee and victim of unappeased Kanaima, and the murderer of a man killed some time before. From this, and his savage, ungrateful demeanor (though Mr. M'Clintock aided by myself, cleansed and dressed his sores to encourage them), we had some difficulty in getting him nursed till his strength had returned, as they feared lest they should become his future victims."

If the friends of the murdered man fear that they will not be able to conceal the body effectually, they remove the liver, and put in its place a red-hot axe-head, under the belief that when the Kanaima tastes the blood of his victim, the heat which was in the axe-head will pass into his body and consume him.

Putting aside private feud, the Caribs have of late been beaten by the other tribes in open war. They had been partially successful against the Arawaks, who had been driven into the swampy district near the Waini. Here, however, the fugitives made a stand, and placed themselves under the supreme command of a well-known and tried warrior. Expecting that the Caribs would soon follow them into their place of refuge,

their leader placed his men in ambush among the islands, and awaited the coming of the enemy.

On came the Caribs in their great war canoes, following each other in single file through the narrow creeks which separate the "wet savannah" into islands. They were allowed to pass unhurt, until they rounded one of the islands, when a deadly shower of arrows from both banks disabled or killed every man on board. The second canoe pushed on, only to meet the same fate, while the others, not being able to see the carnage that was taking place, hurried onward toward the spot whence the cries proceeded, and were in their turn overwhelmed with the deadly shower. The victorious Arawáks then jumped into the water, seized the canoes, and killed every one of the warriors with the exception of two. These were sent home by the victors on the promise of a large ransom, to be paid in the cotton hammocks for the manufacture of which the Caribs are so famous; and an insulting message was also sent by them, requesting the Caribs to send another expedition.

On land the Caribs fared as badly against the same foes as they had done by sea. Being determined to resist the continual attacks of the Caribs, the Arawáks made up their minds to fly no more to the swamps for safety, but to boldly face their enemies. They therefore built a large house on the banks of a rivulet, surrounded it with trees laid with their branches outward—in fact, the *abattis* of modern engineering—and stored the house with as many arrows as they could make. Moreover, they made broad wooden shields, which were used on this occasion for the first and probably for the last time.

As had been anticipated, the Caribs were not very long in making their attack. Seeing a small party of men among the trees, they gave chase and pursued them as far as the house, which they immediately attacked. The defenders did not return the fire of the Caribs, but contented themselves with receiving on their shields the arrows of the enemy. When they judged that the arrows of the foe were nearly exhausted, they made use of their own stores, and poured volley after

volley on the invaders, being supplied by the women and boys with arrows as fast as they could shoot. The Caribs were unable to withstand such an attack, and were obliged to beat a retreat, during which they lost many more of their number by the pursuing Arawáks.

The two last decisive battles between these great tribes ended again in favor of the Arawáks. The latter established themselves on the banks of a branch of the river Moruca, a stream which is thickly wooded on both sides. The name of this branch is Haimara-Cabura. Across this stream the Arawáks sank a tree trunk at such a depth that it would allow small canoes to pass over it, while the large and heavily-laden war-canoes must inevitably strike upon it.

The invaders came, as had been expected, but found nothing except empty houses. They then descended the Moruca, looking about for their prey, and at last caught sight of several canoes and gave chase. The fugitive canoes, on reaching the mouth of the Haimara-Cabura, darted into it as if for shelter, and were followed by the invaders, yelling and shouting with excitement. Suddenly, their canoes struck violently against the sunken boom, jerked the paddles from their places, became entangled with each other, and caused inextricable confusion. In the midst of their perplexity, showers of arrows were hurled upon them, and very few of the invading force escaped.

Among them, however, was the Carib chief Manarrawa, who was incensed at the repulse with which he had met, returned to the Orinoco, organized another force, and again attacked the Arawáks. This time he was less fortunate, being wounded and taken prisoner. On being brought before the council of chiefs, Manarrawa promised that, if his life was spared, he would cause his people to cease from further attacks. The Arawáks, more lenient than the Caribs, granted his request, gave him a canoe, and sent him home. He, on his part, performed his promise, and from that time there has been no regular war between the Caribs and Arawáks, although there have been private blood feuds of the kind described.

CHAPTER CXXXII.

THE TRIBES OF GUIANA — *Continued.*

ARCHITECTURE AND SOCIAL CUSTOMS.

ARCHITECTURE — THE ORDINARY GUIANAN HOUSE — THE MACOUSHIE AND INLAND HUTS — CHOICE OF THE SITE — MATRIMONIAL ARRANGEMENTS — POLYGAMY AND ITS RESULTS — A BREACH OF PROMISE CASE — JEALOUSY AND ITS RESULTS — FORBIDDEN DEGREES AMONG THE ARAWÁKS — THE GUIANAN MOTHER AND CHILD — A SINGULAR CUSTOM — POLYANDRY — MAKING CASSAVA — THE MANIOC TREE AND ITS ALLIES — THE GRATER, THE BOWL, AND THE COLANDER — THE PRESS, OR TIPITI — USE MADE OF THE POISONOUS JUICE — MAKING SUGAR — PIWARRI DRINKING — THE MAQUARRI DANCE — CONSTRUCTION OF THE WHIPS — ENDURANCE OF PAIN.

WE will now examine the domestic life of the Guianan natives.

Their architecture differs considerably according to the district. As a rule, the climate is so warm that houses are but little needed, all that is required being a simple roof above the head. The ordinary kind of hut is nothing more than a mere shed, a sort of barn without the walls, supported on posts and thatched with leaves. From the posts and rafters are hung the personal goods of the natives, such as fans, paddles, clubs, blow guns, bows and arrows, and similar articles, while from one or two of the cross-beams is sure to be hanging the singular cassava press; which will be presently described. Such a house is represented on the preceding page.

Between the upright posts, and sometimes from the transverse beams, are suspended the hammocks, some of which are almost invariably occupied, as the master has a natural genius for lying in his hammock when he is not absolutely obliged to be on his feet. The number of hammocks under a single roof is almost incredible. They are hung in tiers, one above another, like the berths on board a passenger ship, and when thirty or forty of them are occupied at once, it seems rather wonderful that the building should be able to withstand such a strain.

As the inhabitants move about, or get into and out of their hammocks while replenishing the nightly fires, whose smoke is

the only defence against the mosquitoes and other winged pests, the whole building rocks, the joints creak, and the house seems on the point of coming down. But the junctions of the beams and posts are so firmly tied that they are far stronger than they look, and however fragile the shed may seem, it is quite equal to any strain they may have to endure.

In the interior, however, the huts are more of a complicated character, and have walls as well as a roof. Their form is invariably round, and their roofs pointed in the centre. Some are shaped almost exactly like single-poled tents, having a circular upright wall, some five or six feet in height, and from that wall a tolerably high conical roof ending in a sharp point. Their general shape much resembles that of the Makololo house, seen on page 329. The roof, however, is neater, and the central pole, by which it is supported, rises to some height above the top, looking like the ornamental spikes with which English builders are fond of decorating some of their villas.

Other houses, though built on the same principle, are not quite conical. They have no distinction between the wall and roof, and, instead of being circular, are octagonal. They may be very well imitated by cutting out eight isosceles triangles from cardboard, the larger sides being about four times the length of the shortest, and sewing them together. A knitting needle through the cen-

tre will act as a support, and look very much like the centre pole of the edifice.

These huts are used by the Macoushies, the makers of the very long blow guns which have already been described, and from projections in the upright poles the weapons are suspended when not in use. It need scarcely be said that the task of house building belongs to the women, inasmuch as it pertains to the category of heavy work, which is beneath the character of a man to undertake. Indeed, with these people, as with many other uncivilized nations, the rooted disinclination of the men to labor, and the consequent falling of all the work upon the women, is one of the most serious obstacles to their progress in civilization; and even polygamy is not so much a drawback as the inferior condition of the women.

Treating of the native houses, Mr. Brett remarks that the builders, simple as may be the house itself, carefully select a site which must combine several requirements. In the first place, it must be near a stream, so that the women may not have more trouble than needful in fetching water for the use of the household, and that the canoe may be within easy reach of the house when the owner wishes to set out upon one of the frequent migrations which take place among these tribes.

It must be a spot which is rather out of the way. The native Guianan likes peace and quietness, and has a strong objection to being disturbed, the apathy of his nature being supplemented by an inveterate shyness, which makes him keep aloof from strangers. It must also be a spot where the ground is light and sandy, and where the very slight cultivation needed in this land can be easily carried on.

The house being built, the next business is to prepare a field for the cultivation of yams and cassava, and this is the only hard work which the men will condescend to do. The ground is already occupied by trees, but this is of no consequence to the native agriculturist. Having selected a convenient spot, he cuts down the trees, ingeniously contriving that the fall of one shall bring down several others. This is done at the beginning of the hot season, *i. e.* somewhere in August. The tropical sun soon dries the fallen trees, and when they are sufficiently parched for the purpose, the Indian sets them on fire, a process which rapidly consumes all but the trunks and the largest branches. He has now done his share of the work, and leaves the rest to the women, who have to clear away the debris as far as they can, and to do all the digging, planting, and weeding that is needed.

Among these people polygamy, though not always the rule, is often the case, and a man's greatness is partly estimated by the number of his wives. It is not, however,

carried out to such an excess as is the case with many other peoples, inasmuch as one chief was looked upon with the greatest respect because he had the unusual number of nine wives. This chief, a Warau, was very jealous of his establishment, and was said to have shot one of his wives, and severely wounded another with his cutlass. As a rule, however, a man has one wife only, the exceptions being rarer in proportion to the number of wives.

The Caribs appear to carry out the principle of proprietorship in their women to the fullest degree, as is exemplified by an amusing anecdote related by Mr. Brett. It must be premised that, as is usual among nearly all uncivilized natives, the wife is purchased from her father or oldest male relative, who has absolute power over and can sell her as he would sell his bow, and with as much regard for the feelings of one article of property as the other.

"A high-spirited Caribi girl, indignant at being given in marriage to an elderly man, who had already other wives (one being her own sister), ran away from him, and bestowed her hand on one of the Essequibo Caribs, a younger man whom she liked better. After a while, the old man visited that quarter — not, however, to exercise his undoubted right to bring her back and beat her, but to claim compensation for her services. It was willingly allowed, and for a gun, a barrel of salt, or some article of like value, the woman was left with the man of her choice, who perhaps thought himself secure, and the business ended.

"But the next year the old man, who well knew what he was doing, paid them another visit, still, as he said, in quest of compensation. On being reminded by the husband that he had already been paid for the woman, he replied, 'Yes — for the woman; but she has since borne you a child — you must now pay me for that.' The unwritten law of Caribi usage was decidedly in the old man's favor, and he received compensation for that child. For each succeeding birth he could, if he chose, reappear, like an unquiet spirit, make a similar demand, and be supported therein by the custom of his nation."

Sometimes the second wife is purchased while still a child, and brought up together with the family of the first wife, and a prudent chief will thus provide himself with a succession of wives, each attaining marriageable years as her predecessors become too old to suit the taste of their proprietor. Now and then, the first wife successfully resists the introduction of a sharer of her household. In one such case, the first wife, after trying to commit suicide, and being prevented, took a more sensible course. She was an Arawak, one of three sisters, all living with their respective husbands at one settlement. One day, the husband of the

eldest sister, having been on a visit to some friends, brought home another wife, a full-grown young woman. The first wife, after her unavailing attempt at suicide, made an onslaught upon the intruder, aided by her two sisters, whose husbands stood quietly looking on. The end of the business was, that the woman was sent back to her friends, and the first wife was left in the undisturbed rule of her household.

The Arawáks have a curious and praiseworthy regulation concerning marriage. Their tribe is divided into a number of families, each descending in the female line, and being known by its own name. No one is allowed to marry into the family bearing the same name as himself or herself, and this principle is carried out in a rather curious manner.

As the succession falls in the woman's line, her sons and daughters, and the children of her daughters, bear the same name as herself, but not so the children of her sons, who will take the names of their respective mothers. The Arawáks are very tenacious of this rule, and think an infraction of it to be a great crime.

As is the case with most uncivilized nations, the Guianan mothers think but little of the event which lays a civilized European woman on the bed of sickness for weeks. Mr. Brett saw one Warau woman, only two hours after the birth of her child, tie up her hammock, and carry it, together with her newly born infant, from one house to another. When the child is very young, it is laid in a small hammock, but when it gains a little strength, a rather curious cradle is provided for it.

The body of the cradle is made of the ever-useful itirriti reed, which is split into slips about the tenth of an inch in width, and then woven so as to make a kind of basket, open at one end and down one side. The edges are strengthened by a rod of flexible wood lashed firmly to them, and the cradle is brought into shape by means of a framework consisting of tolerably strong sticks. The opening in front is much narrower than the body of the cradle, so that the child can be easily secured in it. The length of my specimen, drawn on page 1238, is exactly twenty inches, and width at the back thirteen inches, while that of the opening is only seven inches. This cradle is very strong, very elastic, and very light—three great requisites in such an article. When the mother wishes to carry her child, she only takes a broad plaited belt, the two ends of which are united, passes it over the crossbars at the top of the cradle, and then brings the belt across her forehead.

The parents are very kind to their children, and can seldom bring themselves to chastise them, except in a sudden fit of anger. The natural consequence of this

treatment is, that they have scarcely any control over the children, though, when they grow up, the respect shown by sons and daughters to their parents of either sex is worthy of all praise.

Connected with this subject, the Guianan natives have a very singular custom, which, according to our ideas at the present day, entirely reverses the order of things. With us, when a wife expects to be a mother, she often thinks it necessary to abstain from certain articles of food, and from too much exertion. With the Guianan Indians, the wife eats exactly what she chooses, and works as hard as ever, while the husband thinks himself bound to abstain and to rest. For example, the Acawaios and Caribs will not eat the flesh of the agouti, lest the future offspring should be thin and meagre; the haimara fish, lest it should be dim-sighted; or the maroudi, lest it should be still-born, the cry of this bird being held as an omen of death. The reader may remember that a Macoushie excused himself from making wourali by reference to this custom. This custom does not stop with the child's birth, but extends to several weeks afterward.

As soon as her child is born, the Indian wife washes the baby, rolls it in the cradle hammock, and goes about her business as usual. But the Indian husband is pleased to consider himself very ill, and straightway takes to his hammock, where he is waited upon by the women with the most solicitous attention. In some districts the sick husband has not a very pleasant part to play, being obliged to take nauseous drinks, and to go through a course of very unpleasant medicine. Generally, however, he does nothing but lie in his hammock for a week or two, during which time he is kept amply supplied with the daintiest food, and petted as if he were recovering from a dangerous sickness.

This custom has gradually expired in the vicinity of the mission stations, but it occasionally revives. Mr. Brett mentions an instance where a large influx of strangers reintroduced it into the station. It so happened that a young Christian Indian had become a father, and was violently importuned by his female relatives to take to his hammock according to ancient custom. He resisted for some time, but was so persecuted that he fairly ran away, and went to work at a distance for three weeks, at the expiration of which time he thought he might be considered as convalescent. Strange as this custom may seem to be, it is one which has prevailed through a very considerable portion of the globe, and even in Europe has not been extinct until comparatively late years.

Not only is polygamy practised among these tribes, but the strange custom of polyandry exists. On one occasion, when a missionary was arguing with a native against

the practice of polygamy, he used an *argumentum ad hominem*, and with the bad results that usually follow such an argument. Finding that he could not prove to his interlocutor that a man ought not to have two wives, the missionary asked how it would be liked by the men if one wife were to have two husbands. To his astonishment, the man replied that the plan answered very well, and that he knew a woman who at that time had three husbands.

It has been already mentioned that the natives of Guiana depend chiefly for their food upon the beasts, birds, and fishes which they capture. Vegetable food is not so important to them as it is generally to inhabitants of warmer climates, probably because the almost perpetual moisture of the country forces the inhabitants to partake of a comparatively generous diet.

The staple vegetable food is the cassava, which is prepared in rather a curious manner. Strange to say, it is obtained from a plant belonging to the natural order Euphorbiaceæ, plants which are celebrated for containing most poisonous juices.

Some of them are trees of the largest size, while others are little herbs that only exist for a few weeks. All of them, however, secrete an acrid juice, more or less poisonous. A familiar example of these plants may be found in the common spurge, or wart-wort of our gardens (*Euphorbia helioscopia*), the white, acrid, milky juice of which is employed in destroying warts. Several of these Euphorbiaceæ produce, beside the poisonous juice, a farinaceous substance, from which the poison can be separated, and which is then useful as human food.

The chief plant which produces the cassava is the *Jatropha manihot*, though there are others from which the farina can be obtained. The juice of this plant is so poisonous that a very small dose will produce death. Fortunately, the venomous principle is exceedingly volatile, and can be driven off by heat, so that the very substance which in its raw state is a deadly poison becomes, when cooked, a wholesome article of food.

The mode of preparing the cassava is as follows: Taking on her back the quake, which has already been described, the Guianan woman digs up a quantity of the cassava root, puts it into the quake, and brings it to her hut. She next peels it by tearing off the outer covering with her teeth, and then proceeds to scrape it into very fine shavings. This is done by means of the native grater, which, rude as it looks, is a very effective machine. It consists of a thick board about a yard in length and half as much in width. Into the upper surface of this board are driven in regular rows a number of fragments of sharp stones, which are further secured in their places by a sort

of vegetable glue obtained from the juice of a tree.

By being drawn over this surface, the cassava roots are soon reduced to thin shavings, much like those of the horse radish, which are collected into a basket. One of these baskets is shown in fig. 2, on page 1231. It is made much like the cradle already mentioned, but is of closer texture, and the strips of cane are wider. It is about two feet in diameter, and is capable of containing a considerable quantity of the grated root.

When the native cassava maker does not possess one of these graters, she uses as a substitute the acrid root of a species of *Ireartia* palm, which is covered with hard protuberances, and answers the purpose tolerably well, though it does not work so smoothly or neatly as the regular grater.

Sometimes a further process of grinding is employed, though not always. In such cases, the grated root is placed on a flat, sloping stone, and rubbed with another, just as is done by the Araucanians. See page 1203.

The next process is to rid it of its poisonous juices, and in this part of the operation there is also considerable variation. Among some tribes, the scraped cassava is taken out of the dish and pressed tightly into a sieve or colander. This instrument is very ingeniously made. It is of basket work, but instead of being made of flat strips of cane or reed, round twigs are used, about as thick as ordinary drawing pencils. The natives have an ingenious mode in which the shape of the vessel is preserved while the interstices are not allowed to diminish or increase in size. This is done by beginning with a comparatively few twigs at the apex of the colander, and inserting fresh twigs at regular intervals as the vessel increases in size.

Into this colander the cassava is pressed and kneaded with water, until a considerable amount of the juice is expressed. It is then left in the sieve to undergo a partial drying, and is soon ready for another process, that of the press; and it is remarkable that, though presses of various descriptions have been sent from Europe, none of them seem to answer so well as the native Guianan press called the "tipiti." This press is a long, cylindrical basket, from six to seven feet in length, and about four inches in diameter, made of the bark of the *Jacitara* palm, a species of *Desmoncus*. The lower part of the tipiti is closed, and brought nearly to a point, while the upper part is left open, each end terminating in a very strong loop. Owing to the mode in which the tipiti is made, the central portion is highly elastic, while the mouth and tip are comparatively stiff. One of these is represented on the following page.

Several of these tipities generally hang to the roof or the cross-beam of the hut, so as to be ready for use when wanted. One of them is then filled with grated cassava, which is thrust into the elastic tube as tightly as

BEAD APRON. (See page 1256.)

possible, so as to cause it to become very much shorter, and very much thicker in the middle. Underneath the tipiti is placed an earthenware bowl to receive the juice. Vessels such as these are made by the natives, and although they are very fragile, as the clay is never thoroughly kneaded, and the baking is insufficient, they can endure the fire well enough for cooking purposes. The vessel which is represented in the illustration is of a deep brown color, striped and spotted with black.

Besides these soft and fragile bowls, the natives make bottles for the purpose of carrying water. Some of these clay bottles are really elegant in form, and show evidences of artistic feeling on the part of the potter. A figure of a double water bottle, with its earthenware stoppers, is given on page 1249.

A heavy weight is then fastened to the bottom of the tipiti, which is consequently elongated and narrowed, so as to compress the contents forcibly, and squeeze out the juice that remains in the cassava. After a while a still stronger pressure is obtained by means of the lever. A pole is passed through the loop at the bottom of the tipiti, and the shorter end of it is lashed to one of the upright posts of the house. The heavy weight—usually a large stone—is then hung to the longer end of the pole, so as to produce a powerful leverage on the tipiti, and compress the cassava still further.

When the process has arrived at this state, the cassava maker often adds her own weight to that of the stone, by sitting on the end of the lever, and with her baby slung in its cradle on her back, occupies herself in some of the lighter feminine occupations.

The cassava is now fit for baking, for which purpose it is placed on circular iron plates, which are laid over the fire like the "girdles" on which oat cakes are baked. Although little known in this country under its proper name, cassava is largely used under the name of semolina, which is nothing more than the cassava roughly ground to a coarse sort of grain.

Nothing of this useful plant is thrown away. We have seen that the farinaceous matter can be rendered wholesome by being deprived of its poisonous juice, and we shall now see that even this juice itself can be rendered useful. If man or beast were to drink it as it pours from between the interstices of the tipiti, they would swell, and die in great agony. But by means of boiling the poisonous principle is driven off and the juice changes to a deep brown liquid, which is well known under the name of cassareep, and extensively used as a sauce. It is the foundation of the "pepper-pot" of the West Indies, and when used by natives is so highly impregnated with red pepper, that when they hospitably serve a white stranger with cassava bread and cas-

sareep sauce, the mouth of the stranger is excoriated by the quantity of capsicum.

If the reader will refer to the illustration representing a Warau house, on page 1244, he will see the various processes of cassava-making. On the right hand is seen a woman kneeling before the grater, and scraping the cassava into the dish or basket. Hanging to the cross-beams of the hut are two of the tipiti presses, one filled ready for the weight and the lever, and the other stretched nearly to its full extent. A woman is sitting on the lever, and so expressing the last drops from the cassava into the bowl. The baking of the cassava cake is shown in the background on the right hand.

A few little episodes of Guianan life are shown in the same illustration. On the left hand is seen a man armed with his bow and long arrows, and having slung on his shoulders the little bag which serves as a pocket. Another man is lying asleep in his hammock, and nearly in the middle is shown a mother with her two children, one of them dragging a huge spider tied to a string. The spiders of this country are sometimes as large as a man's outspread hand, and, unpleasant playfellows as they appear to us, they are used in this light by the children, as was seen by Mr. Bates.

The natives can also make sugar, though of a rather coarse character. Some of the tribes employ a machine with small wooden rollers, for the purpose of crushing the sugar-cane and expressing the juice, but the plan followed by the Caribs is the most simple, and at the same time the most remarkable. They carve the upper part of a stout post into the rude semblance of a human bust, the post being as nearly as possible as large as a man. The part that answers to the collar-bone projects considerably, and a hole is bored through the middle of the neck under the chin.

When the Caribs wish to make their sugar, they put one end of a long and stout lever, into the hole in the neck, and lay the cane horizontally upon the collar-bones. One man then takes the end of the lever, and by pressing it down crushes the cane so that the juice flows down the breast of the image into the vessel, while another man shifts the cane so as to bring every portion successively under the lever.

As for drink, the Guianan natives have from time immemorial made an intoxicating liquor called piwarri, which is almost exactly like the mudai of the Araucanians. A number of cakes of cassava bread are toasted brown, thrown into a large vessel, and boiling water poured over them. The remainder of the cakes are masticated and mixed with the others in the vessel. Fermentation then takes place very rapidly, and in a short time the liquor is fit to drink. The natives are immoderately fond of this disgusting preparation, and often brew and

and drink great quantities at a time. A canoe is no uncommon vessel to be filled with piwarri, and every one who joins in the revel is presumed to become intoxicated as soon as possible. Mr. Brett mentions an amusing instance of native feeling on this subject.

The Arawáks of the Mahaiconi district having begged that a missionary might be sent to them, the bishop determined on visiting them personally. In honor of his arrival, the Arawáks had got up a great festival, including a canoe full of piwarri, and the curious Maquarri dance, of which we shall presently learn. Most of them were intoxicated, but they apologized to the bishop for their shortcomings in politeness, and said that if they had known sooner of his visit, they would have had two canoes full of piwarri instead of one.

Piwarri feasts vary in detail according to the tribe which holds them. They are, however, always accompanied by a dance, and by some ceremonies practised by the piaman or conjurer. An interesting account of a piwarri feast is given by Messrs. Spix and Martius, in their "Travels in Brazil: "—

"By degrees, those residing at a greater distance arrived in single troops, each with his whole family, and with bag and baggage, as if they were going to migrate; the men who had not yet secreted their bows and arrows in the neighboring woods hid them here; the women put down their baskets, took the children on their shoulders, and looked for the drinking-cup (*cuja*). Without conversing with each other, each member of the family examined the surrounding company with an unsteady look; the men approached each other, and saluted their neighbors, at most, by putting out their lips, and a scarcely audible nasal tone.

"In the middle of the assembly, and nearest to the pot, stood the chief, who, by his strength, cunning, and courage, had obtained some command over them, and had received the title of captain. In his right hand he held the maracá, the above-mentioned castanet, which they call *gringrina*, and rattled with it, beating time with his right foot. We did not find any traces among the Indians of the oracles of the maracá, mentioned in the accounts of earlier travellers. Rather walking than dancing, he advanced slowly, with his body bent forward, round the pot, toward which his eyes were constantly turned. The dance, the measure of which was in triple time, was accompanied by him with a low monotonous singing, which was more strongly marked when he stamped with his foot. The oftener the song was repeated, the more solemn and animated was the expression of his voice and features. All the rest stood motionless round the pot, stared at him without speaking, and only now and then, when the words of the dancer, which seemed to be extempore,

moved them, they broke out into immoderate cries.

"After this measured circular dance, by which, probably, it was intended to conjure and keep off evil spirits, the leader approached the pot, took from the hand of his neighbor the drinking-vessel which he held ready, gravely dipped it into the pot, and took a sip. The rattling of the *gringrina* and the monotonous music became general, and more and more noisy the longer the cup went round. We, too, had a full *cuja* presented to us, and though filled with disgust, we were obliged to follow the advice of our guide to empty it, in order not to give the Indians any reasons for distrust.

"The beverage resembles in taste our malt liquor, and when taken in a large quantity is intoxicating, an effect which was but too manifest toward the end of the feast, by their leaping and noisy singing of, '*Hi! ha! ha!*' Hopes had been given us that we should see on this occasion the dances of the Coroados; but toward evening, after their stomachs and heads were full, one party slipped away after the other, as if by previous agreement."

The same authors give an account of a melancholy sort of dance performed by another tribe of natives, the Puris:—

"When they had been made familiar, and treated with plentiful draughts of brandy, of which, like all Indians, they are passionately fond, they began their dance by night, on an open spot not far from the fazenda of Guidowald. If the compact low stature, the brown-red color, the jet-black hair hanging down in disorder, the disagreeable form of their broad angular countenances, the small, oblique, unsteady, blinking eyes, and, lastly, the tripping, short, light step of these savages had excited in us the most sorrowful feelings at the debasement of humanity in them, these were further increased by the melancholy expression of their festivity in the darkness of the night. The men placed themselves close together in a line, and behind them the women, also in a line. The male children, sometimes two or three, took hold of each other and of the fathers round the waist, as the female children did their mothers. In this position they begin their melancholy '*Háu — jo — há — ha — há!*' It is remarkable that the melodies which Lery noted above two hundred years ago among the Indians in the neighborhood of Rio Janeiro very much resemble those observed by us.

"The song and the dance were repeated several times, and the two rows moved slowly forward in a measured triple time. In the first three steps they put the left foot forward, and bent the left side; at the first and third step they stamped with the left foot, and at the second with the right; in the following three steps they advanced the right foot at the first and last, bending on the right side.

In this manner they advanced a little alternately, in short steps. As soon as the song was concluded, they ran back in disorder, as if in flight—first the women with their daughters, and then the men with their sons. After this they placed themselves in the same order as before, and the scene was repeated. A negro, who had lived a long time among the Puris, explained to us the words sung to this dance as a lamentation, the subject of which was, that they had attempted to pluck a flower from a tree, but had fallen down. No interpretation of this melancholy scene could have appeared to us more appropriate than that of the loss of Paradise.”

The most curious of all the Guianan dances is that which is called the Maquarri dance, from the implement which forms its principal element. The Maquarri is a whip, and the object of the dance is giving and receiving blows from the maquarri. The form of this whip varies in different districts. The form usually employed, is made of silk grass fibre, bound together so as to form a stiff and elastic whip. The handle is strengthened by being bound strongly with a strip of dark cane wound spirally around it, and is ornamented by a tuft of fibres, which hang from the butt. Several tufts of white cotton wool adorn the transition between the handle and the lash, the latter of which tapers gradually to a point. The whole whip including the lash, is nearly five feet in length, and is a most formidable instrument of torture, capable of cutting into the bare skin like a knife, and causing the blood to spirt from the wound which it makes. The other form is scarcely so terrible a whip to the eye, though it may inflict quite as much pain when skillfully handled. It is entirely covered with cane, and, as it is swung about, it gives a crackling sound with every curve. The length of this whip is three feet four inches.

The maquarri dance is conducted in the following manner. The young men and boys, decorated with all the fantastic feather work which native art can supply, range themselves in two rows opposite each other, the dancers being all armed with their maquarri whips, which they wave in the air, uttering at the same time cries which are intended to imitate the notes of birds.

Presently two of the dancers from opposite sides challenge each other, leave the ranks, and dance opposite each other in the open space between the ranks. After dancing for a while, one of them stops, and stands firmly on one leg, thrusting the other forward, and remaining perfectly firm and steady. See illustration on page 1280.

His opponent, or partner, whichever he may be called, stoops down, takes deliberate aim at some part of the projecting leg, and then leaping into the air, in order to give force to his stroke, delivers a blow with all his strength. A practised maquarri dancer is

sure to cut deeply into the skin and to draw blood by the stroke; but the receiver does not shrink from the blow, gives no sign of pain, and only smiles contemptuously as he executes the dance. Presently his opponent holds out his leg in turn to be struck, and after a few lashes have been exchanged, they retire to the piwarri vessel, drink some of its contents, and return to their places in the ranks.

The greatest good humor prevails during this strange contest, though when a couple of powerful and experienced dancers have met, they have often scarcely been able to walk from the severity of the blows which they have received. Sometimes, after a hard day's dancing and drinking, when their legs are stiff and sore from the blows which they have received, and their heads are aching from the liquid they have drunk, they declare that they will abandon the dance for ever. But, as soon as their legs get well and their heads are clear again, they forget all their promises, and join in the next maquarri dance with unabated zest.

During one of these dances, which was performed in Mr. Brett's presence, a stout little Warau came to the encampment, when the dance was nearly over, evidently with the idea of getting some piwarri without undergoing the previous salutation of the maquarri whip. The young men at once divined his intention, and quietly passed the word among themselves to frustrate his design. Accordingly, he was challenged in rapid succession by the young men, and subjected to more than ordinary castigation before he obtained any piwarri. However, he bore his punishment manfully, and did his best to look pleasant, although he soon perceived the trap into which he had fallen.

On that occasion the dance was given in honor of a woman who had been buried in the house. A broad plank lay upon her grave, and on it, among other articles, was a bundle of silk grass being the remainder of the material from which the maquarri whips had been made, these articles having somewhat of the sacred character about them. After going through a few ceremonies, two or three men, armed with long knives, dashed in among the dancers, snatched the whips from them, cut off the lashes, and flung them into the grave. The owners of the whips pretended to be very savage at surrendering the whips, leaping, throwing somersaults, and going through all kinds of evolutions, so that it was great matter of surprise that any of them escaped injury.

On another occasion, when the maquarri dance had been got up in honor of the bishop, all the dancers, before they went into the large house, laid their whips on a board which had been placed there expressly for their reception.

With regard to this dance, Mr. Brett was

much struck with the apparent indifference to pain manifested by the natives, and asked them how they could endure such tortures without seeming to feel them. The Indians replied that their insensibility to pain was partly produced by the piwarri, and was partly owing to the presence of the women, who would scoff at any one who showed the least symptom of suffering.

Giving both these reasons their full value, there are two others of much greater importance. One is the natural apathy of the native, who requires a very strong stimulus for exertion. This apathy extends to the nerves of sensation as well as to those of volition, and the real fact is, that a blow which would cause the most horrible agony to a white man is scarcely felt by the native Guianan. The other is the effect of exposure and perfect health of body. All those who have gone into training for any athletic contest will remember how different is the pain-bearing capacity of the trained and untrained man, the former scarcely seeming to be aware of an injury which would have prostrated him for weeks had he been untrained. Now these natives are always in the state of body to which the civilized athlete occasionally brings himself, and the result is, that external injuries have but little effect on them.

Another and a rather picturesque dance is described by Mr. Brett. This is an Arawak dance, and is performed in the following manner:—Twelve young men step forward, and arrange themselves in parallel rows; but

instead of carrying maquarri whips, they bear slender rods, about twelve feet in length, decorated with strips of silk grass stained red, and having at the tips little gourds with stones in them. They dance backward and forward, striking the ends of their rods against the ground, and keeping time with the measure. From time to time the young women go up to the dancers, seize their arms, and dance with them, and then, as the men clash the rattling ornaments of beetles' wing cases with which their wrists and legs are decorated, the women loose their hold, and run back to their companions like frightened deer.

A Warau dance is described by the same missionary who witnessed the maquarri dance. "It was little more than a measured series of steps, accompanied with stamping, while the persons advanced or receded, sometimes in single rank, sometimes in two ranks facing each other, throwing their right arms over their right-hand neighbor's shoulders, and their left arms round their left-hand neighbor's waist, swaying their bodies to and fro. Occasionally the women would run, and, inserting themselves between the men, join in the dance.

"The effect was somewhat heightened by a monotonous chant sung in unison, and by the clatter of beads and anklets made of hard seeds and the wings of beetles. The dance was intended to represent the antics of a herd of kairounies, or bush hogs, and the chant was a succession of mocking or jeering expressions."

WATERTON'S ADVENTURE—THE INGENIOUS HOOK—GAMES AND SPORTS—SHIELD WRESTLING—CANOE MAKING—NAVIGATING THE FALLS.

DURING their dances the natives display all their best feather ornaments. Two of their headdresses are shown on page 1238. The foundation of these is a circlet made of thin dark cane, cut into strips. One of them (fig. 2) is made of parrots' feathers, beautifully shaded from dark blue to brilliant green, and being topped with three long straight scarlet feathers from the tail of the macaw. The general effect of this beautiful headdress is heightened by a row of white downy feathers by which it is surrounded. This specimen was made by the Macoushie tribe.

The other headdress (fig. 1) is called Arok, and, though very handsome in point of color, does not possess the beauty of form which characterizes the other. The greater part of the headdress is bright yellow, but just on either side of the top are two broad bands of scarlet. The feathers in this specimen are arranged four deep.

The reader may remember that, in many portions of the uncivilized world, aprons are made of thongs depending from the waist. This principle is carried out by many of the African tribes, who use thongs or strips of leather, as well as in several of the islands of Polynesia, where vegetable materials are used. We have at fig. 4, on page 1249, an example of the same principle carried out in Tropical America, feathers being employed instead of skin, grass, or bark. The length of this apron is one foot nine inches, and its depth one foot three inches. It is made of feathers, blue at the base and tip, and scarlet in the middle. As may be seen by the

smaller figure at the side, the feathers are fastened on the string that binds the apron on the waist by doubling over the quill, and tying the doubled end over the string.

It is on such occasions as the Arawák and Warau dances, of which a description was given in the last chapter, that the women produce their best apparel. Generally, as long as none but their own people are in sight, they are not particular about wearing clothes of any kind, but since they have mixed with the white people they have learned to be more fastidious. When a white stranger comes to a native settlement, the men and women are mostly independent of clothing, but the latter, as soon as they distinguish the color of their visitor, run off to their homes to put on their dresses.

Those settlements that are tolerably near civilization usually employ the "kimisa," *i.e.* a sort of petticoat passing round the waist, and suspended by a string over one shoulder. These dresses are considered merely a concession to the peculiar notions of the white man, and, though worn while he is present, are taken off as soon as he departs, and carefully put away until the next white visitor comes.

The native dress of ceremony is, however, the little apron called the queyu, or keu. At the present time it is made of beads, but before beads were procurable it was simply of cotton, decorated with shells, beetles' wings, and similar ornaments. Several of these odd little aprons are in my collection. The best and most elaborate of them is that which is represented at fig. 5, on

page 1249, and was presented to me by H. Bernau, Esq.

This beautiful specimen of native art is eight inches in length and four in depth, including the large beads that serve as a fringe. It is made entirely of "seed" beads, threaded on silk grass in such a manner that the thread is scarcely visible. The principle on which the maker has gone is, that she has woven a sort of framework of perpendicular threads or strings, set exactly wide enough apart to allow two beads to be placed between them. By this plan she has regulated the arrangement of the beads requisite to form the pattern, while the beads themselves are strung upon fine silk-grass threads that run at right angles to the others.

The colors are blue, yellow, green, and carmine, in transparent beads, and chalk-white and vermilion in opaque beads, not counting the larger beads used to form the fringe. The principle of the pattern is that of the square standing on an angle, or the "diamond," as it is more familiarly termed. First, three diamonds have been worked in yellow beads, a line of green beads running down the centre of the yellow, and a rather broad line of carmine beads passing along the inner and outer edge of each diamond.

The dark pattern in the centre of each diamond is made of blue beads, and the square patterns in each angle of the diamond are made of chalk-white beads with a centre of vermilion. The entire apron is edged with the chalk-white beads. The fringe at the bottom is made of a treble row of much larger beads, one of which is represented of the full size, and at either end of each bead is a small scarlet cylinder, like coral.

On looking at the form of the apron, the reader will notice that it is much wider at the bottom than at the top. This is intentional. The thick perpendicular strings only extend as far as the upper corners, the others being thin threads. The consequence of this structure is, that when the apron is held up by two loops, the middle of it is nearly flat, while the two ends fall into heavy folds.

There is a positively startling boldness about the coloring of this apron; such, for example, as the placing green beads next to the yellow. Still, the whole arrangement of the colors is so admirable, that in spite of the brilliant hues of the beads, which are of the brightest possible blue, yellow, carmine, and vermilion, they are so well harmonized, that in no case does one hue seem to predominate over another, or to interfere with another.

Some few years ago, I was discussing the coloring of this very apron with Mr. T. Baines, the celebrated traveller, and asking if he had any theory by which he could account for the artistic harmony of color which

is invariably displayed in the aprons. He said that he had long thought that the natives unconsciously imitated the coloring on the wings of the gorgeous butterflies which are so plentiful in that land, and, from specimens in his collection, showed that the very collocation of hues which produced harmony of coloring in the bead apron was also to be found in the wings of Guianan butterflies. Perhaps the splendid plumage of many Guianan birds may also afford hints for the native artist.

Another queyu in my collection is made of similar materials, and on the same principle, but is of a totally different pattern. In this case, the maker has evidently possessed a preponderance of the chalk-white beads, and comparatively few of the red, blue, and yellow beads. She has accordingly made the body of the apron of the white beads, and enlivened it by two patterns, of red, blue, and yellow, formed much like those which occupy the centre of the diamond in the apron which has been just described. In shape the two aprons are identical, but the latter is very much smaller in size, being only four inches in length and two in depth.

The third specimen of the queyu in my collection is much larger, being made of large beads, and really may take rank as an article of dress and not a mere ornament. It is thirteen inches in length by nine in depth, and, though not possessing the brilliant colors of the two queyus which have been described, is yet a handsome article of costume. The white beads of which the groundwork of this apron is made are as large as ordinary peas, so that the whole work is of a much coarser character than that which distinguishes the two other aprons. Those which form the pattern are deep garnet color, so dark that except in particular lights it looks black. The woman who made this apron has ingeniously selected the beads of such a size that two of the garnet beads occupy exactly the same space as one white bead, and exactly fill the interval between the perpendicular strings of the framework.

The most remarkable point in this apron is the pattern, which is exactly like that which is found on old patterns, and which has come into modern use under the name of the Greek fret. I have seen several queyus of different sizes and colors made with this pattern. The lower edge of the apron is made of six rows of topaz colored beads, as large as the white beads, and it is further decorated with a fringe made of tufts of cotton strings, one such tuft being fixed to every alternate bead.

As may be imagined from the description, the beads employed in making the apron are very heavy, the whole article weighing nearly a pound and a half, so that in this case the owner has good reason for not

wearing it except on occasions of ceremony. Owing to the material of which these aprons are made, none of them put forth their full beauties unless they are held between the spectator and the light.

One of these aprons was procured by a friend of mine in a manner which shows that they are considered rather as ornaments than dress. He happened to be in one of the civilized coast towns, and met a woman wearing a queyu of remarkable beauty. He stopped her and tried to induce her to sell the apron; but all his exertions were in vain, and for no amount of money could he purchase it. At last a brilliant thought struck him. He had in his pocket one of the common printed handkerchiefs containing the flags of all nations, and, as a last resource, he offered the kerchief in exchange for the queyu.

The woman could not withstand such a temptation. The gorgeous patterns on the handkerchief were far superior to the best examples of native art, and might afford new ideas for the future. Accordingly, she then and there took off the queyu, handed it to the purchaser, and received in exchange the kerchief, which she tied round her head, and then pursued her walk in all the dignity of the best-dressed woman in Guiana.

The strangest article of dress to be found in Guiana is undoubtedly the Carib sapuru, or garter, an ornament which can compete with the compressed foot of a Chinese beauty, or the wasp-like waist of an European belle, both for inconvenience and ugliness. While the Carib girl is young a band of rattan is bound tightly under the knee and another above the ankle. To give them an ornamental appearance they are stained with a red dye, but in fact they are instruments of torture, which entirely alter the form of the human limb and convert it into a mere spindle thicker in the middle than at each end.

There are now before me a number of photographic portraits of Carib women, and it is scarcely possible to imagine anything more hideously ludicrous than the effect of the sapuru. Deprived of its natural powers of extension, the limb has to expand itself as it can, and the consequence is, that it is obliged to develop itself in the comparatively narrow space between the two bandages.

If the reader should wish to obtain an accurate idea of a Carib belle's leg from the ankle to the knee, he can easily do so. Let him take an ordinary broomstick, eighteen inches in length, and push it through the middle of a rather small Stilton cheese; then let him wrap the stick above and below the cheese with a red bandage, adorn the cheese with a number of blue spots, and he will have a very good idea of the extraordinary shape which is assumed by the leg of a Carib female.

The women are inordinately fond of the sapuru, and are as scornful respecting those of their own sex who do not wear it as are the Chinese women respecting those who do not wear the "golden lilies."

These women have a variety of ornaments, but little clothes. Necklaces of various kinds are highly esteemed among them, especially when they are made of the teeth of the jaguar and alligator, inasmuch as such ornaments indicate the prowess of their admirers. The appearance of a Carib woman in full dress is not very attractive. These people are short, thick necked, and awkward looking, and in those respects the women are much worse than the men. Of the ten portraits there is not one that can bear comparison with the female inhabitants of Southern Africa, such as have been figured in the first part of this work. Their short necks are cumbered with row upon row of necklaces, their only dress is a narrow strip of blue cloth, and they have done their best to make themselves entirely hideous by the abominable sapuru.

Then, by way of adding to their attractions, they perforate the under lip, and wear in it one or several pins, the heads being within the mouth and the points projecting outward. Some of the women smear their whole bodies and limbs with the annatto dye, which gives them the appearance as if blood were exuding from every pore; and the reader may well imagine the appearance of such women, with pins sticking through their lips, their bosoms covered with row upon row of necklaces, their reddened limbs variegated with blue spots, and their legs swollen and distorted by the effects of the sapuru.

The Carib men wear an article of dress which is almost exactly like that which is worn by the inhabitants of the Nicobar Islands. It is a narrow but very long scarf, woven from cotton fibre. After passing round the waist and between the legs, it is tucked into the girdle, and then is so long that it can be hung over the shoulder like a Highlander's plaid. The men are very proud of a good girdle, and adorn it plentifully with cotton tassels, beetles' wings, and similar ornaments.

Of all the Guianan tribes, the Waraus are least careful respecting dress. Even the women wear nothing but a triangular piece of bark, or a similarly shaped article of apparel formed from the spathe of the young palm leaf. This spathe is also used for a head dress by several tribes. In order to understand the structure of this article the reader must remember that the palm tree is an endogenous plant, and that all the leaves spring from a central shoot. From this same spot there also starts a conical shoot, which contains the flowers. In its earlier stages of development this shoot is covered with a membranous envelope, called a

spathe, which bursts in order to allow the enclosed flower-stalk to develop itself. Before it has attained its full development, the spathe is drawn off the flower-stalk and soaked in water for a time, until all the green substance becomes decomposed, and can be washed away from the fibrous framework. The well-known skeleton leaves are prepared in exactly the same manner.

When decomposition is complete, the spathe is carefully washed in running water, so that the whole of the green matter is removed and nothing is left but the tougher fibres. These are tangled together in a very remarkable manner, so as to be very elastic, and to allow the fabric to be stretched in different directions without causing any interstices to appear between them.

In this state the spathe is conical, of a yellow-brown color, and extraordinarily light. A specimen in my possession, though measuring twenty-seven inches in length, weighs barely half an ounce.

When the native wishes to convert the spathe into a cap, he doubles the open end twice, and then makes a deep fold within eight or nine inches of the tip, thus causing it to assume the shape which is seen in the illustration on page 1249. Slight as is the texture of this odd cap, it forms an excellent defence against the rays of the sun, which is the only object of the headdress in such a climate.

The reader will see that the shape, as well as the lightness of the spathe, conduces to its usefulness as an apron as well as a headdress. Such at all events is the only dress for which the Waraus care; and whether on account of the perpetual exposure of their skins, or whether from other causes, the short, stout, sturdy Waraus are much darker than the other tribes — so dark, indeed, that they have been said to approach the blackness of the negro. Mr. Brett thinks their want of cleanliness is one cause of this deeper hue. They are the best native laborers that can be found, and, when they can be induced to shake off their national apathy and fairly begin work, they will do more than any other tribe. Neither do they want so much wages as are required by the other natives, preferring liberal rations of rum to actual wages.

Living as do the Guianan natives in the forests, amid all the wealth of animal life which is found in them, and depending chiefly for their subsistence on their success in hunting, they attain an intimate knowledge of the habits of the various animals, and display considerable skill in taking them. They capture birds, monkeys, and other creatures, not for the sake of killing them, but of domesticating them as pets, and almost every hut has a parrot or two, a monkey, or some such pet attached to it.

The women are especially fond of the little monkeys, and generally carry them on

their heads, so that at a little distance they look as if they were wearing a red or a black headdress, according to the species and color of the monkey. They carry their fondness for their animals to such an extent that they treat them in every respect as if they were their children, even allowing them to suck at their breasts in turn with their own offspring.

Dreading the venomous snakes most thoroughly, they have no fear of the non-poisonous kinds, and capture them without difficulty. Mr. Brett saw one of them catch a young coulacanara snake by dropping a noose over its head by means of a forked stick, and then hauling it out and allowing it to coil round his arm. Although a very young specimen, only five feet or so in length, the reptile was so strong that the man was soon obliged to ask some one to release his arm.

Sometimes this snake grows to a great length, and, as it is extremely thick-bodied, is a very dangerous reptile to deal with. Mr. Waterton succeeded in taking a coulacanara fourteen feet long, after a fierce struggle, which is amusingly told in his "Wanderings." I have seen the skin of this snake in the collection which then adorned Walton Hall.

The skill of these natives is well shown by their success in capturing a cayman with a hook. Mr. Waterton had tried to catch the reptile with a shark hook, but his efforts were unavailing, the reptile declining to swallow the bait, and at last contriving to get it off the hook, though it was tied on with string. After more than one failure, he showed the hook to a native, who shook his head at it, and said that it would not answer the purpose, but that he would make a hook that would hold the cayman.

Accordingly, on the following day he returned with a very remarkable hook. It consisted of four pieces of hard wood about a foot in length, curved, and sharpened at the ends, which were slightly barbed. These barbs, if we may so call them, were tied back to back round the lower end of a rope, a knot in the rope preventing it from dropping through the barbs, which were forced to diverge from each other by four pegs driven between them and the rope. The so-called hook, indeed, was very like a four-pronged Fijian spear, supposing the shaft to be cut off below the prongs, a hole bored through the centre of the cut shaft, and a rope passed through the hole and knotted below the prongs. It is evident that if such an instrument as this were taken into a cayman's throat, the diverging prongs would prevent it from coming out again, and as long as they remained unbroken, so long would the cayman be held.

This curious hook was then taken to the river side, and baited with an agouti. The

(2.) SHIELD WRESTLING OF THE WAR AUS. (See page 1261.)

end of the rope was made fast to a tree, and the barbed hook suspended about a foot from the water by means of a short stick driven into the bank. The native then took the empty shell of a tortoise, and struck it several blows with an axe, by way of telling the cayman that its meal was ready. The result of the operation justified the Indian's promise. The cayman could not get at the bait without lifting itself well out of the water, and securing it by a sudden snap; while the resistance offered by the stick caused the projecting barbs to be driven into the reptile's throat as it fell back into the water.

How the cayman was dragged out of the water, and how Mr. Waterton jumped upon its shoulders, and disabled it by seizing its fore-paws and twisting them on its back, is matter of history. The tale was generally disbelieved at the time, and gave rise to no small amount of banter; but it is a perfectly true one, and the objections to it have long died away. Indeed, one of Mr. Waterton's men, who was then little more than a mere lad, was, as an old man, in the service of one of my friends, and corroborated every word of the story.

As might be inferred from the natural apathy and indolence of the natives, they have but few games. They only work by fits and starts, and spend a very large proportion of their time in their hammocks, caring little for those contests of skill and strength which are so absorbingly interesting to the inhabitants of cooler and more bracing climates. There is, however, one such game which is played by the Waraus, who have already been mentioned as the stoutest and strongest of the tribes. This game is well described by Mr. Brett:—

“There is also a kind of wrestling, or trial of strength, practised by the Waraus at their drinking-bouts, in which each of the antagonists is furnished with a sort of shield, (see illustration on page 1260), made of the light branches of the itá, cut into equal lengths, and firmly lashed across a frame three or four feet in height, somewhat less in width, and slightly bending outward.

“The front of each shield is painted in various colors, and with some peculiar device, according to the fancy of the owner. From its upper edge arise elastic stems, generally three in number, adorned with colored tassels, and surmounted with streamers made of the same material as the maquarri whips, and not much unlike them. It has altogether a picturesque appearance.

“Each champion grasps the edges of his shield firmly with both hands, and, after various feints and grimaces to throw his opponent off his guard, a clash is heard, as one springs forward, and his shield strikes that

of his adversary. The contest is generally one of mere strength, the shield being pushed forward by the whole force of the body, and supported by one knee, while the other leg is extended behind. Sometimes one of the players is able to push the other off the ground, or, by a dexterous slip and thrust on the flank, to send him rolling on the ground. More frequently they remain pressing, panting, and struggling, till exhausted, when the contest ceases by mutual consent.

“It is then a point of Warau etiquette to shake the shields at each other in a jeering manner, with a tremulous motion of their elastic ornaments, and to utter a very peculiar and ridiculously defying sound, something like the whinnying of a young horse. This is generally followed by a hearty, good-humored laugh, in which the bystanders join. Another couple then step forward to engage.”

The itá palm, of which the Warau shields are made, will be briefly described when we come to that singular branch of the Warau tribe which lives in dwellings raised above the surface of the water. It has already been mentioned that the Waraus are celebrated for the excellence of their canoes. They are universally recognized as the chief canoe builders of the whole country, and to them the other tribes resort from considerable distances. Some of these canoes are large enough to hold fifty men, so that very considerable skill is needed in building them without the instruments and measures by which our own boat builders ensure the regularity of their craft.

There are several forms of these canoes. The most important is that which has just been mentioned. It is hollowed out of the trunk of a tree, and is forced into the proper shape partly by means of fire, and partly by wedges and cross planks. The largest of the canoes have the sides made higher by a narrow plank of soft wood, which is laced upon the gunwale, and the seam well caulked. The canoe is alike at both ends, the stem and stern being pointed, curved, and rising well out of the water. There is no keel, and it draws but a few inches of water. This formation would be very awkward in our own rivers; but in those of Guiana, such as the Essequibo, there are so many falls and rapids, that the canoe must be especially adapted for them. This kind of canoe is called a curial, or corial.

The perils of the rapids have been well told by Mr. Brett:—“Advantage is taken of the eddies which are found at the base of the huge rocks that interrupt the stream. The Indians pass from rock to rock by wading, leaping, or swimming, and by means of a hawser haul the boat through the rushing water from one resting point to another, the steersman meantime keeping his seat, and sometimes lashed to it, striving with his

large paddle to guide in some degree her course. The waters dashing and foaming amidst the surrounding rocks render this operation as exciting as it is difficult. Still more exciting and dangerous is the task of *descending* these rapids. The safety of all then depends on the perfect steadiness of those in the canoe, and on the bowman and steersman acting in concert and with instant decision.

“The canoe is kept in the very centre of the current, one of her best hands kneeling, with quick eye and ready paddle, in the bow, and the rest of the men exerting their strength to give her headway. Darting swiftly along, she arrives at the edge of the fall, and, pointing downward, shoots into the surf below it, dashing it up on either side, and leaving her crew alone visible. If all be well, rising above the fall, she obeys the guiding paddles in stem and stern, and dances over the tumbling waves, while her excited crew with a triumphant cry exult at their success.”

Sometimes even the skill of the natives fails to overcome all the difficulties, and the canoe is upset, the crew barely escaping with their lives. It was in descending one of these falls that Mr. Waterton's canoe was upset, and flung into the Essequibo the precious store of materials from which the wourali is made.

The simplest kind of boat, called by the colonists a “woodskin,” is nothing more than the flexible bark of the purple-heart trees stripped off in one piece, forced open in the middle, tied together at the ends, and so left until dry. In order to prevent these bark canoes from taking in water at the ends, a large lump of clay is pressed firmly into the end, so as to make a barrier against the water. This mode of caulking is necessarily but temporary, and the “back-dam,” as it is called by the colonists, is sure to be washed away sooner or later, according to the state of the river. The reader will remember that a similar appliance of clay is found among the Australian savages.

CHAPTER CXXXIV.

THE TRIBES OF GUIANA—*Concluded.*

RELIGION—BURIAL.

BELIEF IN ONE CHIEF DEITY AND MANY DEMI-GODS—THE SORCERER OR PIAI-MAN, AND HIS TRAINING—THE SACRED RATTLE—DUTIES AND PRIVILEGES OF THE PIAI-MAN—CURING DISEASE AND DRIVING OUT THE EVIL SPIRIT—MUSICAL INSTRUMENTS—THE WATER-MAMMA—THE ORIGIN OF THE CARIB RACE—A WILD LEGEND—DISPOSAL OF THE DEAD—THE LAKE-DWELLING WARAUS—THE ITÁ PALM AND ITS USES—AN AËRIAL HOUSE—THE LAKE-DWELLERS OF MARACAÏBO.

WE will conclude this history of the Guianan tribes with a few remarks on their religion.

As far as is known of their religious ideas as they were before they became intermixed with those taught to them by the white man, the Guianan natives believe in one supreme Deity, and a vast number of inferior divinities, mostly of the evil kind. All pain is said to be caused by an evil spirit called Yauhahu, and is said to be the Yauhahu's arrow.

As it is necessary that these evil beings should be propitiated when any calamity is feared, a body of sorcerers, called piai men, are set apart in order to communicate between their fellow men and the unseen world. In order to qualify themselves for the task, the piai men are obliged to go through sundry strange ceremonies, under the charge of some venerable professor of the art. The neophyte is taken to a solitary hut, and there compelled to fast for several days before his spirit is fit to leave his body and receive the commands of the Yauhahu.

For this purpose a quantity of tobacco is boiled, and the infusion drunk by the aspirant to priestly honors. The natural effect of this dose is to exhaust the already weakened body, and to throw the recipient into a state of fainting, during which his spirit is supposed to leave his body, and receive a commission from the Yauhahu. Indeed, he undergoes a civil death, he is proclaimed as dead, and his corpse is exposed to public view.

He recovers very slowly from the terrible state of prostration into which he has been thrown, and when at last he leaves his hut, he is worn almost to a skeleton. As a mark of office, he is solemnly presented with the marakka, or sacred rattle. This is nothing more than a hollow calabash, some eight inches in diameter, having a stick run through it, and a few white stones within it, so as to make a rattling sound when shaken. The calabash is painted red, and a few feathers are generally hung to the sticks. It is two feet in length, and adorned with scarlet and blue feathers. These rattles are held in the greatest veneration by the uninitiated, who will not venture to touch them, and are chary even of entering a house in which a marakka is hung. In consequence of the value set upon these instruments, the natives can scarcely be induced to part with them, and the few which have been sent to England have in nearly every case been procured from sorcerers who have been converted to Christianity, and, as a proof of their sincerity, have given up the emblems of their order.

The piai man is called in on almost every occasion of life, so that his magic rattle has but little rest. He is present at every piwarri feast, when he decorates himself with feather plumes, the skins of snakes, and similar ornaments, and shakes his rattle over the bowl before the contents are drunk.

Chiefly he is needed in times of sickness, when, by virtue of his rattle, he is supposed to be capable of driving away the evil spirit whose curse has caused the malady. When

a piai man is called to a case of sickness, he sends all the women away, and even keeps the men at a respectful distance. His exercises then begin, and are continued for hours, chants to the evil spirit being accompanied with sundry rattlings, until in the depth of night the Yauhahu manifests himself to the sorcerer, and tells him how to extract the "arrow" which he has aimed at the sick man. Of course it is incumbent on the sorcerer to produce the arrow in question, which is done by sucking the affected part, and producing from the mouth a little pebble, a bird's claw, a snake's fang, or something of the kind.

If the reader will refer to illustration No. 5, on page 1265, he will see a very complicated and rather elegantly formed rattle. The hollow gourd forms part of the rattle, but it is very small, and depends from a series of three hoops, which are strung with beetle wings. The noise which this simple instrument makes is really wonderful, and the slightest movement of the string by which it is held sets all the wings clattering against each other. This interesting object was brought from Guiana by H. Bernau, Esq.

Even accepting the maraka and the beetle wing rattle as musical instruments, we find that the Guiana natives have but little variety in music. The only instruments which are really worthy of the name are pipes or flutes made of different materials. One of these instruments is in my collection. It is made of the ever-useful bamboo, and includes one internode, *i. e.* the space between two knots.

The mouthpiece is narrow and oblong, and the maker has possessed sufficient knowledge of sound to cut out a large scooped piece from the middle of the instrument. The owner seems to have prized this flute exceedingly, as he has covered it with elaborate paterus. It is blown like our own flute, and the sound which it produces is loud, full, but, if musical, is melancholy also, and much resembles the wailing sound produced by blowing into the mouth of a soda-water bottle. The length of this flute is fourteen inches.

The natives also make a flute of the leg bone of the jaguar, which is very much prized, the spoils of the jaguar having a very high value among them. One of these is shown on the next page. The Caribs once used human bones for this purpose, but at the present time are content with jaguar bones, as equally indicative of courage and skill.

To return to the superstition of the Guianan natives. One of the beings which they most dread is the water mamma, or Orehu. This is an unfortunate being who inhabits the water, and occasionally shows herself, though in different forms, sometimes even assuming that of the horse, but often taking that of the manati. The Orehu is a female spirit, and is generally, though not

always, malicious, and, when she is in a bad temper, is apt to rise close to the canoes, and drag them and their crews under water.

The legends told by the various tribes respecting their origin are very curious, as showing a great similarity with those of other parts of the world with whom there could have been no geographical connexion. For example, the legend of the earth submerged under water, through the disobedience of some of its inhabitants, and re-peopled by a few who were placed in a safe spot until the waters subsided.

One of the strangest of their legends is told by Mr. Brett. It concerns the origin of the Warau and Carib tribes.

Originally the Waraus lived in a country above the sky, where they had all they could desire. One day a young hunter shot an arrow into the air, and when he came to search for it, found a deep hole through which it had fallen. Looking down through the aperture, he saw another world opened out beneath him, and was seized with curiosity to visit it. Accordingly, he made himself a sort of ladder of rattan, which grows abundantly in the upper world where he lived, and descended to the world below.

Here he remained for some time, reveling on the flesh of animals hitherto unknown to him. After a while, he climbed up the ladder with great trouble, and told his friends the wonders which he had seen. Struck with surprise at his narrative, and eager to partake of the luxuries which he described, the whole of his friends determined on paying a visit to these wondrous regions. Accordingly, they descended the ladder in safety, except the last of their number, a very fat man, who, in trying to squeeze himself through the aperture, became fixed in it, and could not escape, thus shutting off all communication between the two worlds.

Nothing was left for them but to make the best of a bad business, and first of all to beseech the Great Spirit to send them some water. He listened to their entreaties, created the Essequibo, the Demerara, and other rivers, and made for the special use of the Waraus a small lake of the purest water, of which they were to drink, but in which they were forbidden to bathe.

Now it happened that there was a Warau family of four brothers and two sisters, the latter beautiful, but wilful maidens. They rebelled against the prohibition, plunged into the lake, swam to a pole that was planted in its midst, and shook it. The presiding genius of the lake was a male spirit, who was kept prisoner as long as the pole was untouched, but as soon as it was shaken the spell was broken, and the spirit of the lake pounced on the offending maiden and carried her off. After a while he allowed her to rejoin her friends, but the indignation of her brothers was very great when they found that their sister was about to become

a mother, and they determined to kill the child when it was born. However, it was exactly like any other Warau child, and so they allowed it to live.

Though living among her own friends, the girl could not forget her strange lover, and went off again to him. A second child was born, but this time the upper parts of the body were those of a child, and the lower parts were developed into a water snake. The mother, though terrified at the appearance of her offspring, carried it off into the woods and cherished it, but it was discovered by her brothers, who pierced it with their arrows, and left it for dead. Her attention, however, restored it to life, and it grew to a formidable size. The brothers held a consultation, and at last surrounded it, transfixing it with showers of arrows, and, to make sure of its death cut it to pieces.

"The unhappy Korobona carefully collected the remains into a heap, which she kept continually covered with fresh leaves, and guarded with tender assiduity. After long watching, her patience was rewarded. The vegetable covering began to heave and show signs of life. From it there slowly arose an Indian warrior of majestic and terrible appearance. His color was of a brilliant red, he held bow and arrows in his hand, and was otherwise equipped for instant battle.

"That warrior was the first CARIB, the great father of a powerful race. He forthwith commenced the task of revenge for the wrongs suffered in his former existence. Neither his uncles, nor the whole Warau race whom they summoned, could stand before him. He drove them hither and thither like deer, took possession of such of their women as pleased him, and by them became the father of brave and terrible warriors like himself. From their presence the unhappy Waraus retired, till they reached the swampy shores of the Atlantic, forsaking those pleasant hunting grounds which they had occupied on their first descent from heaven."

The Waraus are wonderfully inventive with regard to legends; and have one which is worthy of notice, if only for the fact that it attributes all the learning of the white men to a Warau origin. This is the legend of Aboré. "Once upon a time," there was a very ill-conditioned female spirit, named Wowntá, who usually preferred the form of a frog, but who changed herself into a woman for the purpose of stealing a very beautiful little boy called Aboré. In the form of a woman she obtained access to the house of Aboré's mother, whom she induced to leave the child under her care. No sooner was she alone with Aboré than she pulled and stretched him to such a degree that in a few hours he grew as much as he would have done in several years, so that his mother repudiated him on her return.

As he grew to manhood, Aboré became the slave of his captor, whom he thought to be his mother, until he was undeceived by a friendly spirit who met him in the forest. After trying several plans for escape, and failing in them all, he hit upon the design of making a canoe of wax. He was aided in this task by the fondness of Wowntá for honey, in search of which the unfortunate Aboré passed nearly the whole of his time. Wowntá received the combs with croaks of delight, and as she threw them away after eating the honey, Aboré laid the wax aside, until he had enough for a canoe.

As soon as he had collected a sufficiency of wax, Aboré called his mistress to look at a hollow tree filled with bee-comb. She crept into the tree to regale herself on the honey, and was imprisoned by the crafty Aboré, who fastened up the aperture so that the sorceress could not escape, loaded his canoe with provisions, and set off for a land of refuge. He sailed far away until he came to a strange country where the people were white, naked, uneducated, and utterly barbarous. He taught them the elements of civilization, showed them how to forge iron, and initiated them into the arts and sciences, for which the white man was now so distinguished.

In that far land he still lives, and, remembering the wants of his fellow countrymen, he continually sends them shiploads of the things which they most need. But in consequence of the bad faith of those to whom they are delivered, the poor Waraus are obliged to pay for everything that he sends. The moral which is derived from this legend is, that all the white men who visit the Waraus ought to make up for the dishonesty of their countrymen, and give them as many beads, knives, and guns as they can procure.

When Mr. Brett first heard this tale, he thought that it was simply an ingenious invention framed for the purpose of unlimited begging, especially as the narrator asked for a shirt as soon as he had finished the story, and then proceeded to request a whole series of other articles. He found, however, by questioning different natives, that the legend was really a national one, and not a mere invention of an ingenious native.

There is evidently a distinction to be drawn between the two portions of the legend. The first part, containing the adventures of Aboré, is evidently ancient, while the second part is as evidently modern, and has been introduced since the coming of white men into Guiana.

In the disposal of the dead there is some little variation. The mode which was most prevalent before the missionaries introduced Christian burial among them was as follows: The body was placed in a net and sunk in the river, where the whole of the flesh was quickly eaten from the bones by the pirai and other voracious fish. If the dead man

were a person of distinction, the skeleton was then removed from the water, dried, painted red, and suspended under the roof of the house.

In the fifth book of Herodotus, chap. xv., occurs the following passage, which was long thought to be a mere invention on the part of the historian. After enumeration of the various nations that Megabazes subdued, he mentions that the Persian monarch also endeavored to conquer "those who live upon the Lake Prasias in dwellings contrived after this manner.

"Planks fitted on lofty piles are placed in the middle of the lake, with a narrow entrance from the mainland by a single bridge. These piles that support the planks all the citizens anciently placed there at the common charge; but afterward they established a law to the following effect: 'Whenever a man marries, for each wife he sinks three piles, bringing wood from a mountain called Orbelus,' but every man has several wives.

"They live in the following manner. Every man has a hut on the planks, in which he dwells, with a trap-door closely fitted in the planks, and leading down to the lake. They tie the young children with a cord round the feet, fearing lest they should fall into the lake beneath. To their horses and beasts of burden they give fish for fodder, of which there is such abundance, that when a man has opened his trap-door, he lets down an empty basket by a cord into the lake, and, after waiting a short time, draws it up full of fish."

In these words the old historian describes with curious exactitude the mode of life adopted by some branches of the Waraus and Caribs. These have been described at some length by Humboldt, in his "Personal Narrative." The large tract of land which forms the delta of the Orinoco possesses some very remarkable characteristics. It is always wet, but during several months in the year it is completely inundated, the river rising to an astonishing height, and covering with water a tract nearly half as large as England. This seems to be as unpropitious a spot as could be adopted for human habitations, and yet the Waraus (or Guarános, as Humboldt spells the word) have established themselves there, and prefer it to any other locality, probably because their strange mode of life enables them to pass an existence of freedom.

Varying much in the height to which it rises, in some places exceeding fifty feet, the Orinoco has the quality of rising year after year to the same height in the same place, so that when a mark is made to designate the height to which the water rose in one year, the same mark will answer year after year with scarcely the slightest deviation. It is evident that in such a spot, where the soil is in the dry season nothing but mud, and in

the wet season is forty or fifty feet under water, only a very peculiar vegetation can live. This is the Itá (pronounced Etáh) palm, belonging to the genus *Mauritia*, a plant which, like the mangrove of Africa, requires plenty of heat and moisture to enable it to develop itself fully. The native name for this tree is Murichi.

A brief description of the itá palm must be given before we proceed further, or the reader will not understand the peculiar conditions under which these water dwellers live. When full grown, it resembles a tall, cylindrical pillar, with a fan of ten or twelve vast leaves spreading from its extreme top. Each leaf is some ten feet in width, and is supported upon a huge stem about twelve feet in length, looking more like a branch than a leaf-stem. Indeed, a complete leaf is a heavy load for a man. At regular intervals the whole fan of leaves falls off, and is replaced by another, the tree adding to its height at every change of leaf, until the stem is nearly a hundred feet high, and fifteen in circumference.

Myriads upon myriads of these marvellous trees rise amid the waters of the Orinoco delta, sometimes clustered into solid masses of vegetation, sometimes scattered, and sometimes drawn up in devious avenues, according to the windings of the muddy channels that even in the dry seasons traverse the country. Whether grouped or scattered, the itá flourishes in this delta to such an extent that only the experienced canoe men of the place can navigate their barks among the tall stems, the narrow and winding channels which form the natural paths being completely obliterated by the waste of water. Any stranger who tried to thread this aquatic forest without the aid of a native guide would soon lose himself among the armies of itá palm, and perish miserably of hunger. Yet this very tree supplies to the Waraus of the Orinoco not only all the necessaries, but the luxuries of life, and were the whole tribe to be cut off from the mainland, they could support themselves without the least difficulty, the itá palm supplying house, food, drink, clothing, and furniture.

First, as to the house. The Warau requires for a house nothing but a floor and a roof. In the example seen on page 1244, the floor is supplied by the earth, but it is evident that in a house built in a locality where the ground is for many months together thirty or forty feet beneath the surface of the water, an artificial flooring is needed. The Warau architect, therefore, proceeds to construct his house in the following manner.

Selecting four itá trees that grow near each other in the form of a square, and, cutting away any of the intervening trees, he makes use of these four as the corner posts of his house. He knows by marks left on the trunks the precise height to which the

water will rise, and some three feet or so above this mark he builds his floor, cutting deep notches in the trunk. In these notches are laid beams made from the stems of the felled itá palms, and lashed tightly in their places by ropes made of itá fibre.

On these beams are laid a number of cross-pieces, sometimes made from the split trunks, but usually being nothing more than the gigantic leaf-stems which have been already mentioned, and which are when dry very light, very tough, and very elastic. These cross-pieces are tied firmly together, and constitute the essential part of the floor. On them is placed a layer of palm leaves, and upon the leaves is a thick coating of mud, which soon dries under the tropical sun, and forms a smooth, hard, and firm flooring, which will bear a fire without risk of damage to the wooden structure below. Ten or twelve feet above the floor the Warau constructs a roof of palm leaves, the corners of which are supported by the same trees which uphold the house, and then the chief labors of the native architect are over. An illustration on page 1244 shows the scenery of the Orinoco delta and the architecture of these lake dwellers. So much for the house furnished by the itá palm.

Food is supplied by it in various forms. First, there is the fruit, which, when ripe, is as large as an ordinary apple, many hundreds of which are developed on the single branch produced by this tree. Next, there is the trunk of the tree and its contents. If it be split longitudinally at the time when the flower branch is just about to burst from the enveloping spathe, a large quantity of soft, pith-like substance is found within it. This is treated like the cassava, and furnishes a sort of bread called yuruma.

Drink is also obtained from the itá palm. From the trunk is drawn a sap, which, like that of the maguey or great American aloe, can be fermented, and then it becomes intoxicating in quality. Another kind of drink is procured from the fruit of the itá, which is bruised, thrown into water, and allowed to ferment for a while. When fermentation has proceeded to a sufficient extent, the liquor is strained through a sieve made of itá fibre, and is thus ready for consumption.

The small amount of clothing required by the Warau is also obtained from the itá, the membrane of the young leaf being stripped off and woven into a simple fabric.

From the same tree the Warau obtains all his furniture. Bows, arrows, and spears are made from its leaf-stems, the canoe in which he goes fishing is made from a hollow itá trunk, and the lines and nets are both furnished from the same tree, as is also the string of which his hammock is made. That the one single tree should be able to supply all the wants of an entire population is the

more extraordinary, because in former days the Warau had no iron tools, and it is not easy to find a tree that will at the same time furnish all the necessaries of his life, and be of such a character that it can be worked by the rude stone implements which the Warau had to use before he obtained iron from the white men.

It may readily be imagined that the Warau who inhabit this strange region are lower in the scale of civilization than those who live on dry land, and, to use the words of Humboldt, "in the lowest grades of man's development we find the existence of an entire race dependent upon almost a single tree, like certain insects which are confined to particular portions of a flower."

THE Waraus are not the only lake dwellers of Southern America. At the extreme north of this half of the continent there is a province which derives its name from the mode of life adopted by the savage tribe which dwells upon the waters of a lake. On the north-western coast of Venezuela there is a large gulf, called the Gulf of Maracaibo, the name having been given to it by the Spanish discoverers in honor of a native chief whom they met on its shores. Close to the gulf, and only separated from it by a narrow, is a vast fresh-water lake, fed by the streams that pour from the mountains which surround it. The shape of this lake has been well compared to that of a jews-harp, with a rather elongated neck, and the depth of its water varies in a most remarkable manner.

From the sides the bottom of the lake shelves almost imperceptibly for a great distance, so that at a distance of two or three miles from the shore, a man would be able to walk with his head above the surface. Suddenly, and without the least warning, the bed of the lake dips into almost unfathomable depths, so that, though a man might be barely submerged above his waist, a single step will plunge him into water so deep that the tallest spire ever built would be plunged far below the surface.

Over the surface of this lake dwell numerous human beings, and, even at the present day, when the number of the inhabitants has been much decreased, upon its waters are no less than four large villages, beside numerous detached dwellings formed in the various bays which indent its shores.

The reason for thus abandoning the dry land and taking to the water is a very curious one, and may be summed up in a single word—mosquitoes. These tiny but most annoying insects are found in clouds around the edge of the lake, some species flying by night and others by day, so that at no hour is there the least respite from their attacks. Fortunately, they need the protection of the luxuriant vegetation that fringes the shore of the lake, and not being very enduring of

wing, are obliged to rest at intervals in their flight. They therefore keep to the shore, and do not venture to any great distance over the water. Knowing this characteristic of the insect, the natives manage to evade them by making their dwellings behind the range of the mosquito's flight.

In building these curious habitations, the lake dweller of Maracaibo is forced to employ a greater skill in architecture than is needed by the Waraus of the Orinoco delta. In that muddy delta, formed by the alluvium washed down by the river, the itá palm abounds, and forms natural pillars for the house; but the Lake Maracaibo furnishes no such assistance, and the native architect is therefore obliged to drive piles into the bed of the lake in order to raise his floor above the level of the water.

It is evidently needful that these piles should be made of wood which will not perish by the action of the water, and upon the shores of the lake grows a tree which supplies precisely the kind of timber that is required. It is one of the numerous iron-wood trees, and its scientific name is *Guaiacum arboreum*. It is a splendid tree, rising to the height of a hundred feet or so, and having wood so hard that it will turn the edge of an axe. The natives, however, manage to fell these trees, to cut them into proper lengths, and to drive them firmly into the bed of the lake, where they become even stronger by submersion, being covered in course of years with an incrustation of lime, which makes them look as if they had been actually converted into stone.

On these piles are laid cross-beams and planks of lighter wood, and when a strong roof and light walls have been added, the house is complete. All the parts of the

house are lashed together with green sipo, which contracts when dry, and binds the various portions as with bands of iron.

As has been already mentioned, numbers of these houses are gathered together into villages. When the Spaniards first entered the Gulf of Maracaibo, and came within view of the lake, they were struck with amazement, at these habitations, and called the place Venezuela — *i. e.* Little Venice — a name which has since been extended to the whole of the large province which is now known by that title.

It is on this lake that the gourd system of duck catching is carried to the greatest perfection. Great quantities of ducks frequent its waters, but they are shy of man, and will not allow him to come near them. The natives, however, manage to catch them by hand, without even employing a snare. They take a number of large gourds, scrape out the inside, and set them floating on the lake. At first the timid birds are afraid of the gourds and avoid them, but after a while they become accustomed to them, and allow them to float freely among their ranks.

The Indian then takes a similar gourd and puts it over his head, having previously cut a couple of holes through which he can see. He slips quietly into the water, and makes his way toward the duck, taking care to keep the whole of his body submerged. As soon as he gets among them, he grasps the nearest duck by the legs, jerks it under water, and ties it to his girdle, where it is soon drowned. He then makes his way to another duck, and, if an experienced hand, will capture as many as he can carry, and yet not alarm the survivors.

CHAPTER CXXXV.

MEXICO.

HISTORY — RELIGION — ART.

MEXICO AS IT IS, AND WAS BEFORE THE SPANISH CONQUEST — WHY THE EMPIRE FAILED — CONTRADICTORY ACCOUNTS OF THE ANCIENT MEXICANS — THE RUINS OF THEIR BUILDINGS — HUMAN SACRIFICES — THE SACRIFICIAL KNIFE — MEXICAN ART — MOSAIC WORK AND FEATHER PICTURES — CAPABILITIES OF THE COUNTRY.

BEFORE passing to the North American tribes, a brief notice must be taken of MEXICO.

At the present day this land is possessed of a sort of civilization which presents no features of interest. It is inhabited chiefly by a mixed people, the descendants of the Spanish conquerors having contracted alliances with the natives, and so produced a hybrid race, which is continually retrograding from the white parentage, and assuming more of the aboriginal type.

The failure in establishing a Mexican empire was entirely due to the question of race. Those inhabitants who were either pure whites, or in whom the white blood predominated, were naturally desirous to have a ruler of their own kind, thinking that an empire was the only mode of civilizing the land, and of putting an end to the constant civil wars and repeated changes of dynasty which kept back their most prolific and fertile land from developing its full capabilities. But in the great bulk of the people the Indian blood predominated, and in consequence an empire founded on the principles of European civilization was as irreconcilable to them as would be the rule of an Indian cacique in Europe. Such an empire could only be held by force of arms, and as soon as the bayonet was withdrawn the empire fell. We must, however, confine ourselves to Mexico as it was before the Spaniard crushed out her civilization and destroyed her history.

The accounts of ancient Mexico are most perplexing. If the narratives of the Spanish conquerors could be implicitly trusted,

nothing would be simpler than to condense them into a consecutive history. But it is quite certain that these accounts were very much exaggerated, and that the reality fell very far short of the romantic tales of the Spanish conquerors.

The following is an abstract of the narratives put forth by the Spaniards. The capital was situated on an island in the midst of a large lake. It contained twenty thousand houses, which were of great magnificence. In the midst was the emperor's palace, built of marble and jasper, and of prodigious extent. It was adorned with fountains, baths, and statues, and the walls were covered with pictures made of feathers. Not only the palace, but the houses of the caciques, possessed menageries filled with all the animals of the country, together with museums of various natural curiosities.

One of the greatest beauties of Mexico was a large square, daily filled with merchants, who came to buy and sell the various works of art in gold, silver, and feathers for which the Mexicans were famous. Between the city and the borders of the lake a hundred thousand canoes were continually passing; besides which mode of transit three vast causeways were built on the lake. The capital was not the only city of the waters, for more than fifty large cities and a multitude of villages were built on the same lake.

The dress of the nobles was most gorgeous, and their persons were adorned with gold and jewels in profusion. Their treasuries were filled with the precious metals, and gold was as plentiful in Mexico as copper in Europe.

That these statements were much exaggerated is not to be doubted, but they were not pure inventions, and had all some foundation in fact. For example, the architecture of the ancient Mexicans was of a Cyclopean vastness, as is proved by the ruins which are now almost the sole memorials of a vanished system of civilization. There is a strong resemblance between the architecture of Mexico and that of Egypt, not only in its massiveness, but in the frequent use of the pyramid.

One of these pyramids has the sides exactly twice as long as those of the large pyramid of Egypt. This is the great pyramid tower of Cholula, which had eight stories, each forming a platform on which rested the one above it, so that it closely resembled the Temple of Belus as described by Herodotus. The interior of these pyramidal structures was pierced with chambers, galleries, and flights of stairs, probably the habitations of the priests who served the temples and performed those terrible human sacrifices which formed an important part of their religious system. Viaducts which crossed deep valleys, bridges, and roads, remains of which are still in existence, testify to the vanished civilization of the Mexicaus, or, as some ethnologists think, of a race that preceded them.

Specimens of the artistic skill of the ancient Mexicans may be seen in the magnificent Christy Collection. There is, for example, one of the sacrificial knives with which the priests laid open the breast of the human victim in order to tear out the heart and offer it to the blood-loving deity of the temple. The blade of this instrument is obsidian, and its handle is a marvellous piece of mosaic work, made of lapis lazuli, ruby, and other precious stones. Then there are masks made of similar materials, one being a most ghastly imitation of a human skull.

The skill in feather working still survives, and even at the present day pictures are made so exquisitely from humming-birds' feathers that they seem, at a little distance, to be admirable specimens of enamel.

The courage of the ancient Mexicans was very great. They opposed their naked breasts to the mail-clad invaders, and their comparatively feeble weapons to the dreaded fire-arms. Even the horse, which at first struck terror into them as a supernatural being, soon ceased to be an object of dread, and there is a story that they captured a horse in battle, stabled it in a temple, and treated it as a god, feeding it with daintily dressed chickens and similar dishes, until the poor beast was starved in the midst of plenty.

The conduct of the Aztecs in destroying their once venerated Emperor Montezuma, because he yielded to the Spaniards, and the calm endurance of his warlike successor Guatemozin, when stretched on the fiery rack, are sufficient instances of the courage

possessed by the Mexicans when Cortez came into the country.

The real prosperity of Mexico is to come. There is every capability in the country, which is fertile in many valuable productions,—cattle and horses, for example, both of which, importations from Europe, have multiplied in an astonishing manner, and may at some time supply half Europe with cheap food, hides, and beasts of burden.

Insect life is almost as valuable as that of the higher and larger animals. The cochineal insect reproduces itself in vast numbers, and, large as is the trade in this valuable insect, it could be extended almost indefinitely. There is no trouble in breeding the insect, no risk, and scarcely any capital required. It feeds upon the prickly pear, a plant which springs up luxuriantly if but a leaf be stuck in the ground.

It is indeed so luxuriant, that riders are forced to employ a peculiar kind of stirrup, in order to prevent their feet from being riddled with the needle-like thorns with which the plant, the leaf, and fruit are covered. One of these curious stirrups is shown in illustration, No. 1, page 1265, drawn from my own specimens, which was brought from Mexico by Sir F. Wetherell.

It is cut from a solid block of wood, and is therefore exceedingly heavy. A hole is cut in the back of the stirrup, into which the foot can be thrust nearly half way. Owing to the size and weight of this curious implement, the prickly pears are pushed aside as the rider passes among them, and thus the foot and ankle are protected from the slender but formidable thorns with which they are armed. The stirrup is sometimes put to another use, and employed as a rough and ready drinking cup. The front of the implement is covered with bold and graceful patterns, the effect of which is often heightened by means of color. In my own specimen they are colored with blue, scarlet, and black.

As to the vegetable products of Mexico, they are too numerous to mention, but the principal are the indigo, the chocolate, and the vanilla.

Then it is as prolific in mineral as in animal wealth, and in the hands of an energetic and industrious people, the yield of copper, iron, gold, silver, and other metals might be almost indefinitely extended. In all these productions comparatively little labor is required. Nature gives almost gratuitously those privileges which in other lands cannot be obtained without the expenditure of time, labor, and money.

The past civilization of Mexico has vanished never to return. Its present is a comparative failure. The future is yet to be seen, but it may even eclipse the vanished glories of the past if guided by those who understand the epoch, the country, and the race.

CHAPTER CXXXVI.

THE NORTH AMERICAN INDIANS.

GOVERNMENT — CUSTOMS.

GENERAL NOTICE OF THE TRIBES — THEIR COLOR AND FEATURES — CATLIN'S DESCRIPTION OF A CROW CHIEF — LONG HAIR OF THE MEN — SILVER HAIR OF THE MANDAN TRIBE — GOVERNMENT OF THE TRIBES — THE HEREDITARY AND ELECTED CHIEFS — THEIR LIMITED POWERS — THEIR DISTINCTIVE DRESS — COSTUME — THE RECORD OF DEEDS — THE SCALP-LOCKS, PAINTED ROBES, AND CLAW COLLAR — PRESERVATION OF SKINS — THE FEATHER PLUMES — THE HORNS, AND THEIR SIGNIFICATION — INDIAN DANDIES — ESTIMATION IN WHICH THEY ARE HELD — THE PORTRAIT PAINTER BAFFLED — DRESS OF THE WOMEN — BISON SKIN ROBES — WAMPUM, AND ITS SIGNIFICATION.

It has already been mentioned that, with the exception of the shore districts, America is inhabited from the extreme south to extreme north by the same race.

The various tribes into which that race is divided are naturally varied according to the locality and climate of the spot which they inhabit. Those, for example, who live in the perpetual snow and ice of either the extreme north or south are naturally different in manners and customs from those who inhabit the tropical centre of America. Then, even in similar climate, there is very definite modification according to locality. The inhabitants of the mountains, for example, differ materially from the dwellers of the plain, while those tribes who live in the forests differ from both.

Yet they are all members of one and the same great race, and whether in the Esquimaux of the north, the Amazonian of the tropics, or the Patagonian of the extreme south, all display the same race characteristics.

The color of the skin is deep copper red, the cheek-bones are prominent, the nose mostly aquiline, the forehead rather receding, and the eyes apparently small, this latter characteristic being due to the continual exposure to the sun, and to the smoky atmosphere of the huts. The beard is very deficient, and even those few hairs that make their appearance are carefully eradicated with tweezers. Sometimes an old man

who is careless about his personal appearance allows his beard to grow, but in that case it is very scanty, thin, and never reaches any great length.

The hair of the head contrasts strongly with that of the face, being very long and fine, in some of the tribes attaining an almost incredible length. The Crow tribe are remarkable for the extraordinary development of their hair, which in some of the warriors actually trails on the ground as they walk. They pride themselves so much on this peculiarity, that in 1833 their chief received both his name of Longhair and his office from his wonderful tresses. The hair of this man was carefully measured by some white travellers, who had lived in his lodge for months together, and was found to be ten feet seven inches in length.

He did not allow it to hang at its full length except on occasions of ceremony, but kept it carefully wound with a broad leather strap, and made up into a bundle weighing several pounds. Usually this bundle was carried under his arm or in the bosom of his robe, but on great occasions the hair was let down to its full length, and carefully smoothed with bear's grease, and allowed to trail on the ground several feet behind the owner as he proudly stalked along.

Several other tribes, such as the Blackfeet (so called from the dark moccasins which they wear), have very long hair, of which

they are exceedingly proud, and those individuals whose locks do not reach the standard of beauty are in the habit of splicing false hair to their own tresses.

The Mandans, of whom we shall hear much in the course of this narrative, the Sioux, and the Minatarees, are all distinguished by this peculiarity, though none of them possess it so abundantly as the Crows. When Mr. Catlin was staying among the Minatarees, a party of Crows came to visit them, and excited the admiration of their hosts by their magnificent hair. One of them possessed so picturesque an appearance that the artist traveller transferred him at once to canvas, and the engraver has reproduced the sketch for the reader on the 1284th page. The following is Mr. Catlin's account of this splendid specimen of the North American Indian:—

"I think I have said that no part of the human race could present a more picturesque and thrilling appearance on horseback than a party of Crows rigged out in all their plumes and trappings—galloping about and yelling in what they call a war parade, *i. e.* in a sort of tournament or sham fight, passing rapidly through the evolutions of battle, and vaunting forth the wonderful character of their military exploits. This is an amusement of which they are excessively fond; and great preparations are invariably made for these occasional shows.

"No tribe of Indians on the continent are better able to produce a pleasing and thrilling effect in these scenes, not any more vain, and consequently better prepared to draw pleasure and satisfaction from them, than the Crows. They may be justly said to be the most beautifully clad of all the Indians in these regions, and, bringing from the base of the Rocky Mountains a fine and spirited breed of the wild horses, have been able to create a great sensation among the Minatarees, who have been paying them all attention and all honors for some days past.

"From amongst these showy fellows who have been entertaining us, and pleasing themselves with their extraordinary feats of horsemanship, I have selected one of the most conspicuous, and transferred him and his horse, with arms and trappings, as faithfully as I could to the canvas, for the information of the world, who will learn vastly more from lines and colors than they could from oral or written delineations.

"I have painted him as he sat for me, balanced on his leaping wild horse, with his shield and quiver slung on his back, and his long lance, decorated with the eagle's quills, trained in his right hand. His shirt and his leggings, and moccasins were of the mountain-goat skins, beautifully dressed; and their seams everywhere fringed with a profusion of scalp-locks taken from the heads of his enemies slain in battle. His long hair, which reached almost to the ground while

he was standing on his feet, was now lifted in the air, and floating in black waves over the hips of his leaping charger. On his head, and over his shining black locks, he wore a magnificent crest, or headdress, made of the quills of the war eagle and ermine skins, and on his horse's head was another of equal beauty, and precisely the same in pattern and material.

"Added to these ornaments there were yet many others which contributed to his picturesque appearance, and amongst them a beautiful netting of various colors, that completely covered and almost obscured the horse's head and neck, and extended over its back and its hips, terminating in a most extravagant and magnificent crupper, embossed and fringed with rows of beautiful shells and porcupine quills of various colors.

"With all these picturesque ornaments and trappings upon and about him, with a noble figure, and the bold stamp of a wild gentleman on his face, added to the rage and spirit of his wild horse, in time with whose leaps he issued his startling though smothered yelps, as he gracefully leaned to and fro, leaving his plume and his plumage, his long locks and his fringes, to float in the wind, he galloped about; and felt exceeding pleasure in displaying the extraordinary skill which a lifetime of practice and experiment had furnished him in the beautiful art of riding and managing his horse, as well as in displaying to advantage his weapons and ornaments of dress, by giving them the grace of motion, as they were brandished in the air and floating in the wind."

Although the hair is generally black, it sometimes takes various colors, the Mandan tribe being the most remarkable for this peculiarity. Some of them, even though quite young, have the hair of a bright silver gray, or even white. The men dislike this kind of hair in their own sex, and when it occurs try to disguise it by a plentiful use of red or black earth mixed with glue. The women, on the contrary, are very proud of such hair, and take every opportunity of displaying its beauties. Generally a woman wears the hair in two plaits, which are allowed to fall down the back over on each side of the head; but when they wish to appear to the best advantage, they rapidly unplait it, pass their fingers through it in the manner of a comb, and spread it as widely as possible over the shoulders. They always part it in the middle and fill the line of parting with red paint.

The silver gray hair is remarkable for its coarseness, in which respect it seems like a horse's mane, while the dark colored hair is quite soft. Among the Mandans almost every shade of hair is found between white, brown, and black, but there is never the least tinge of red in it.

The Mandan men have a curious habit of dividing their long hair into flat tresses, two

inches or so in width, and filling each tress at intervals of an inch with vermilion and glue, so as to keep them separate. These patches of glue and earth become very hard, and are never removed. The hair thus treated is drawn tightly over the top of the head, and allowed to fall down the back in parallel tresses, which mostly reach to the knee, and in some cases to the ground.

THE government of these tribes is of a similar character throughout. Each tribe has at its head a chief, whose office is usually, but not always, hereditary. Provided the eldest son of a chief be tolerably well qualified for the post, he is suffered to assume the leadership when his father dies, or becomes too old for work. Should the tribe be dissatisfied with him, they elect a leader from among the sub-chiefs. There is often a double system of government, two chiefs of equal power being appointed, one of whom manages all matters of war, and the other effects the administration of domestic policy.

It often happens that, although the head chief of the tribe is nominally the ruler, and holds the first place, the real power lies in the second or third chief, who pays to his superior every deference which is due to his position, but is practically the leader and commander of the tribe. This was the case among the Mandans when Mr. Catlin visited them. The head chief, though a man of abilities and courage, and therefore respected and feared by the people, was by no means loved by them, on account of his haughty and overbearing demeanor. The real leader of the tribe was the second chief, named Mah-to-toh-pa, *i. e.* the Four Bears, a name which he got from an exclamation of the enemy, who said that he came at them "like four bears." Some of the adventures of this extraordinary man will be mentioned in the course of the following pages.

Great as is the power of the chief, it is much more limited than that which is enjoyed by the chiefs of the African tribes. The American chief has no control over life, or limb, or liberty. He takes the lead in council, and if an offender be cited before the councillors, his voice carries great weight with it, but nothing more. Should he be the war chief, he cannot compel a single man to follow him to battle, nor can he punish one of his followers for deserting him. Any of the warriors, even the very youngest, may follow or desert his chief as he pleases, the principal check against desertion being the contempt with which a warrior is sure to be regarded if he leaves a chief who is worthy of his office.

The chiefs have, as a rule, no advantage over the other members of the tribe in point of wealth. A chief would soon lose the popularity on which his influence depends if he were to amass wealth for himself. By

virtue of his office, he has a larger house or tent than the rest of the tribe, and he generally possesses a few more wives. But he is often actually poorer than most of the warriors, thinking himself bound in honor to distribute among the tribe the spoils that he takes in war. Many chiefs even dress worse than the warriors under their command, so as not to excite envy, and only assume their splendid dress of office on great occasions.

The question of dress is really an important one. Varying as it does among the different tribes, there is a general character which runs through the whole.

Every man without distinction wears a scanty dress much like the "cheripa" which has already been described, but is very much smaller. In battle or hunting, and in all cases in which exertion is required, he contents himself with this single garment; but when he is enjoying himself at home, he assumes his full costume. He wears a pair of leggings reaching to the hips, and falling as low as the ankles, sometimes spreading well over them. These leggings are mostly adorned with little bells, bits of fur, or similar decorations; and if the wearer be a successful warrior, he fringes them along the sides with tufts of hair taken from the head of a slain enemy.

He has also a loose coat descending to the knees, and ornamented in a similar manner with feathers or scalp-locks, and, when the owner has performed any conspicuous feat of valor, he makes a rude painting of the event. This answers the same purpose as the Victoria Cross among ourselves. Although it is conferred by the man himself, it is equally valuable. No man would dare to depict on his robe any deed of valor which he had not performed, as he would be challenged by the other warriors to prove his right to the decoration, and, if he failed to do so, would be utterly scorned by them. The chief Mah-to-toh-pa represented on his robe a series of events in which he had killed no less than fourteen of the enemy with his own hand. Sometimes, when the tribe uses skin huts or wigwams, the warriors also paint their adventures upon the walls of their dwellings.

From a similar spirit the scars and wounds received in war are kept covered with scarlet paint, and when a man has succeeded in killing a grizzly bear he is entitled to wear its skin, claws, and teeth. The usual mode of so doing is to string the claws into necklaces and bracelets, and to make the skin into robes. Sometimes they dress the skin without removing the claws, and wear it in such a fashion that the claws are conspicuously seen. Owing to the extreme ferocity, strength, and cunning of the bear, to kill one of these animals is considered equivalent to killing a warrior, and the claw necklace is as honorable an ornament as the much prized

scalp. Some of the most valiant hunters have killed several of these animals, and it is a point of honor with them to appear on great occasions with all their spoils, so that they have to exercise considerable ingenuity, and display some forty huge claws about their persons in a sufficiently conspicuous manner.

All the dress of a North American Indian is made of skin, mostly that of the deer, and in dressing it the natives are unrivalled, contriving to make a leather which is as soft as silk, is nearly white, and which may be wetted and dried any number of times without becoming harsh.

The skin is first washed in strong lye, made of wood-ashes and water, so as to loosen the hair, which is then scraped off. The hide is next stretched tightly upon the ground upon a frame, or by means of a number of wooden pegs driven firmly into the ground. In this position it remains for several days, the brains of the animal being spread thickly upon it, and rubbed into it. The next process is to scrape it carefully with a blunt knife made of the shoulder-blade of the bison, the native tanner pressing heavily upon it, and scraping every portion of the hide.

The process by which it is made capable of resisting the effects of water has yet to be undergone. A hole is made in the ground, and a quantity of rotten wood is piled in it, so that when lighted it will continue to smoulder for a long time, and produce smoke, but no flame. Around the hole are stuck a number of sticks, which are then tied together at the top, so as to make the framework of a sort of tent. The wood is then set on fire, the hides are placed within the tent, and over the sticks are wrapped other hides carefully fastened together, so as to prevent the smoke from escaping. For several days the hides are left in the smoke, and at the expiration of that time they have assumed the peculiar quality which has been described. The whole of the processes are conducted by women, manual labor being beneath the dignity of a man and a warrior.

The headdress of a North American Indian deserves some attention. Variable as are the modes of dressing the hair, no warrior ever wears his hair short. By so doing he would be taking an unfair advantage of an adversary. When a warrior is killed, or even totally disabled, the successful adversary has a right to take his scalp, in which he would be much impeded if the hair was short. Moreover, he would lose the honorable trophy with which he is entitled to fringe his garments. So for a warrior to wear his hair short would be a tacit acknowledgment that he was afraid of losing his scalp, and all the men therefore always leave at least one lock of hair attached to the crown of the head.

The process of scalping will be presently described, when we treat of war.

A great chief always wears, in addition to the ordinary headdress of the warrior, a plume of eagle feathers, by which he is made as conspicuous as possible, so that the enemy shall have no difficulty in recognising him. The form of plume varies according to the different tribes. That of the Crows may be seen in an illustration on page 1284. That of the Mandans is represented on the following page. It is made of a long strip of ermine, to which are fastened the quill feathers of the war eagle, so as to form a crest beginning at the back of the head and descending to the feet. These quills are so valuable that a perfect tail of the war eagle is considered to be worth a first-rate horse.

In the present instance two horns may be seen projecting from the headdress. This is a decoration very rarely seen, and only conferred by the chief and council upon the most distinguished warriors. Even the head chief will not be able to assume them unless by the general vote of the council, and in the case of the Mandans the second chief wore them, while the head chief was not privileged to do so.

Even a brave may wear them, though he be below the rank of chief.

They are made from the horns of the bison bull, divided longitudinally, scraped nearly as thin as paper, and highly polished. They are loosely attached at the base, so that they can be flung backward or forward by the movement of the head, and give a wonderful animation to the action of the wearer when he is speaking.

This elaborate headdress is very seldom worn, and is only assumed on occasions of special state, such as public festivals, war parades, or the visits of other chiefs. In battle the wearer always assumes the headdress by way of challenge to the enemy. There is good reason for not always wearing this dress. I have worn the dress formerly used by Mah-to-toh-pa, and found it to be hot, heavy, and inconvenient.

As a contrast to the dress of a noted warrior, we may take that of a mere dandy, a few of whom are sure to be found in every tribe. They are always remarkable for elegance of person and effeminacy of nature, having the greatest horror of exposing themselves to danger, and avoiding equally the bear, the bison, and the armed enemy. Consequently they may not deck themselves with the plume of the war eagle, every feather of which signifies a warrior slain by the warrior's own hand. Neither may they adorn their necks with the claws of the grizzly bear, their robes with scalp-locks and paintings, nor their bodies with the scarlet streaks that tell of honorable wounds received in battle.

Such ornaments would at once be torn from them by the indignant warriors of the

THE MANDAN CHIEF MAH-TO-TOH-PA AND WIFE.

(See pages 1276, 1286, 1287.)

tribe, and they are forced to content themselves with mountain goat, doe, and ermine skins, swans' down, porcupine quills, and similar articles—all more beautiful than the sombre eagle quills, bears' claws, and scalp-locks that mark the brave.

They spend their whole lives in idleness, and do not even join the athletic games of which the Americans are exceedingly fond, but devote their whole energies to the adornment of their persons. They will occupy four of five hours in making their toilets, being fastidious as to the arrangement of every hair of their eyebrows, and trying by the mirror the effect of various expressions of countenance.

Having spent the whole morning in this occupation, they sally out on their horses, seated on white and soft saddles, beautifully ornamented with porcupine quills and ermine, and lounge about the village for an hour or two, displaying their handsome persons to the best advantage. They then saunter, still on horseback, to the place where the young warriors are practising athletic exercises, and watch them for an hour or two, plying all the while their turkey-tail fans. Fatigued with the effort, they lounge home again, turn their horses loose, take some refreshment, smoke a pipe, and fan themselves to sleep.

These men are utterly despised by the warriors, as Mr. Catlin found. He was anxious to procure a portrait of one of these men:—

“Whilst I have been painting, day by day, there have been two or three of these fops continually strutting and taking their attitudes in front of my door, decked out in all their finery, without receiving other information than such as they could discover through the seams and cracks of my cabin. The chiefs, I observed, passed them without notice, and, of course, without inviting them in; and they seemed to figure about my door from day to day in their best dresses and best attitudes, as if in hopes that I would select them as models for my canvas. It was natural that I should do so, for their costume and personal appearance were entirely more beautiful than anything else to be seen in the village.

“My plans were laid, and one day, when I had got through with all of the head men who were willing to sit to be painted, and there were two or three of the chiefs lounging in my room, I stepped to the door, and tapped one of these fellows on the shoulder, who took the hint, evidently well pleased and delighted with the signal and honorable notice I had at length taken of him and his beautiful dress. Readers, you cannot imagine what was the expression of gratitude which beamed forth in this poor fellow's face, and how high his heart beat with joy and pride at the idea of my selecting him to be immortal alongside of the chiefs and

worthies whose portraits he saw ranged around the room; and by which honor he undoubtedly considered himself well paid for two or three weeks of regular painting, and greasing, and dressing, and standing alternately on one leg and the other at the door of my premises.

“Well, I placed him before me, and a canvas on my easel, and chalked him out at full length. He was truly a beautiful subject for the brush, and I was filled with enthusiasm.

“His dress from head to foot was made of the skins of the mountain goat, dressed so neatly that they were almost as soft and white as Canton crape. Around the bottom and the sides it was trimmed with ermine, and porcupine quills of beautiful dyes garnished it in a hundred parts. His hair, which was long and spread over his back and shoulders, extending nearly to the ground, was all combed back, and parted on his forehead like that of a woman. He was a tall and fine figure, with ease and grace in his movements that were worthy of better caste. In his left hand he held a beautiful pipe, in his right hand he plied his fan, and on his wrist was attached his whip of elk-horn and his fly-brush, made of the buffalo's tail. There was nought about him of the terrible, and nought to shock the finest and chastest intellect.”

Unfortunately, the portrait was never taken, for the chiefs were so exceedingly offended that so contemptible a being should be put on the same level as themselves by being painted, that they left the hut in angry silence, and sent a message to the effect that, if Mr. Catlin painted the portrait of so worthless a man, he must destroy all the portraits of the chiefs and warriors. The message was also given to the obnoxious individual, who at once yielded the point, walked consequentially out of the hut, and took up his old station at the door as if nothing had happened to disturb his equanimity.

On their feet the American Indians wear moccasins, *i. e.* shoes made of soft leather, the sole of which is no thicker than the upper part. To an European walking in moccasins is at first very fatiguing, on account of the habit of turning out the toes. When, however, the white man learns to walk as the natives do, with his toes rather turned in, he soon finds that the moccasin is a better preservative of the feet than the European shoe, with its thick and almost inflexible sole.

The dress of the women is made of the same materials as that of the men, and differs chiefly in its greater length, reaching nearly to the ankle. It is generally embroidered in various patterns with colored porcupine quills, as are the leggings and moccasins. The women are fond of tattooing themselves, and produce blue and red patterns by the use of charcoal and vermilion.

ion rubbed into the punctures. Both sexes are furnished with large robes made of bison skins, and the inner side of these robes is often painted in curious patterns. One of these robes in Mr. Catlin's collection, had a most elaborate figure of the sun in the centre, around which were figures of men and animals, showing the prowess of the owner both in war and hunting.

Beads and such like ornaments, obtained from the white men, are much in fashion; but, long before a glass or porcelain bead was introduced into America, the natives had an ornament of their own manufacture. This is the celebrated wampum, an article which is now almost extinct. It is made of fresh water shells, which are found on the borders of the lakes and streams. The thick part of the shell is cut into cylinders an inch or so in length, and then bored longitudinally, like the "bugles" that are worn by European ladies. Indeed, when the shell is, as is mostly the case, a white one, the piece of wampum looks almost exactly like a fragment of clay tobacco-pipe stem.

The wampum is either strung like beads

and worn round the neck, or is formed into war belts for the waist. It answers several purposes. In the first place, it acts, like the cowries of Africa, as a substitute for money, a certain number of hand breadths being the fixed value of a horse, a gun, or a robe. It is also the emblem of peace when presented by one chief to another, and, when war has ceased between two hostile tribes, a wampum belt is presented as a token that the two tribes are at peace.

There is no particular beauty about the wampum. If the reader will break a tobacco-pipe stem into pieces an inch in length and string them on a thread, he will produce a very good imitation of a wampum necklace. Its only value lies in the labor represented by it; and, as the white men have introduced tons of imitation wampum made of porcelain, which looks rather better than the real article, and is scarcely one-hundredth part of the value, the veritable wampum is so completely extinct among many of the tribes that, if one of the natives should wish to see a string of wampum, he must go to a museum for that purpose.

CHAPTER CXXXVII.

THE NORTH AMERICAN INDIANS — *Continued.*

WAR — WEAPONS.

MARTIAL CHARACTER OF THE TRIBES — THEIR MODE OF FIGHTING — DECLARATION OF WAR, AND APPLICATION FOR VOLUNTEERS — WEAPONS — THE PLAIN AND THE SPIKED CLUB — THE SHIELD, AND THE INGENIOUS MODE OF MAKING IT — THE LONG SPEAR — THE BOW AND ITS CONSTRUCTION — MODE OF SHOOTING — THE STONE AND IRON TOMAHAWKS — THE SCALPING-KNIFE — MODE OF SCALPING — USE MADE OF THE LOCKS — THE SCALP DANCE — THE EXPLOITS OF MAH-TO-TOH-PA — SHAM BATTLES OF THE BOYS — THE TORTURE OF PRISONERS — TWO WONDERFUL ESCAPES — HOW THE CAMANCHEES FIGHT — SMOKING HORSES.

THE North American Indians are essentially a warlike people, measuring their respect for a man almost entirely by his conduct in battle and the number of enemies which he has slain.

The very constitution of the tribes, which prevents any leader from enforcing obedience upon his followers, as is done with civilized armies, entirely precludes the possibility of such military manoeuvres as those which are employed in civilized countries, where bodies of men are wielded by the order of one individual. The leader can only give general orders, and leave his followers to carry them out in the way that best suits each individual. Consequently, war among these tribes is much of the guerilla kind, where each combatant fights almost independently of the other, and the moral effect of mutual defence and support is therefore wanting.

A few very simple manoeuvres are known to them, and practised by them from infancy, but they lead to nothing more than skirmishing, the chief being merely the leader of his men, and expected to be in the post of danger. The idea of a general directing the battle from a place of comparative safety is unknown to them.

Declaration of war is made in the full council of chiefs and doctors, the majority deciding the question. The chief who is to lead the expedition then asks for volunteers by sending his reddened war pipe through the tribe by means of his messengers, and

each warrior who draws a puff of smoke through its stem by that act enlists himself.

After the pipe has gone its round and a sufficient number of men have volunteered, a grand war dance is got up in front of the chief's house, where has been set up a post covered with red paint, the sign of war. The newly enlisted warriors make their appearance with all their weapons, and execute a solemn dance, each man in succession dancing up to the reddened post and striking his axe into it as a public ratification of his promise. As has been mentioned, the leader always wears every decoration to which he is entitled, so as to make himself as conspicuous a mark as possible, while the braves and warriors wear scarcely any clothing, and have their faces so disguised with black and red paint that even their most intimate friends can scarcely recognize them.

As among us, white and red are the signs of peace and war, and each leader carries with him two small flags, one of white bison's hide, and the other of reddened leather. These are kept rolled round the staff like a railway flag-signal, and only produced when required.

At the present day fire-arms have superseded the original weapons of the American Indians, and much changed the mode of warfare. We will, however, contemplate the warfare of these tribes as it was conducted before the introduction of these weapons, when the bow, the club, the axe,

the spear, and in some districts the lasso, were the only weapons employed.

In illustration No. 4, on page 1265, are seen examples of the clubs and shield, drawn from specimens in the Christy Collection. The clubs are short, seldom exceeding a yard in length, and mostly eight or nine inches shorter. They are almost invariably made upon one or other of two models, examples of which are seen in the illustration. The primitive idea of a club is evidently derived from a stick with a knob at the end, and that is the form which is most in vogue. In the common kind of club the whole of the weapon is quite plain, but in many specimens the native has imbedded a piece of bone or spike of iron in the ball or bulb at the end of the club, and has decorated the handle with feathers, bits of cloth, scalps, and similar ornaments.

The second kind of club is shaped something like the stock of a gun, and has always a spike projecting from the angle. In most cases this spike is nothing more than a pointed piece of iron or the head of a spear, but in some highly valued weapons a very broad steel blade is employed, its edges lying parallel with the length of the weapon. Such a club as this is often decorated with some hundreds of brass headed nails driven into it so as to form patterns, and is besides ornamented so profusely with strings and feathers, and long trailing scalp-locks five or six feet in length, that the efficacy of the weapon must be seriously impeded by them.

I have handled both kinds of clubs, and found this latter weapon to be most awkward and unwieldy, its thick, squared, sloping handle giving scarcely any power to the grasp, while the abundant ornaments are liable to entanglement in the other weapons that are carried about the person.

The shield is made by a very ingenious process from the thick hide which covers the shoulders of the bull bison. Making a shield is a very serious, not to say solemn, business, and is conducted after the following manner.

The warrior selects a piece of hide at least twice as large as the intended shield, and from the hoof and joints of the bison prepares a strong glue. He then digs in the ground a hole the exact size of the shield, and almost two feet in diameter, and makes in it a smouldering fire of decayed wood. These arrangements being completed, his particular friends assemble for the purpose of dancing, singing, and smoking round the shield maker, and invoking the Great Spirit to render the weapon proof against spears and arrows.

The fire being lighted and the glue heated, the skin is stretched above the hole by means of numerous pegs round the edge, which keep it a few inches above the ground. As soon as the skin is thoroughly heated, the

glue is spread over it and rubbed carefully into the fibres. This operation causes the skin to contract forcibly, and at the same time to become thicker. As it contracts, the family of the shield maker busy themselves in loosening the pegs, and shifting them inward, so as to yield with the contraction of the skin, and at the same time to keep it on the full stretch. This goes on until the skin has absorbed all the glue which it is capable of receiving, and has contracted to the very utmost. By this time it is only half as wide, though twice as thick, as it was when first placed on the fire, and is allowed to cool slowly, after which it is carefully trimmed into shape, furnished with a strap, painted with the "totem" or symbol of the owner, and decorated with the usual ornaments.

The completed shield is rather flexible, but is so strong that it will resist the direct blow of a spear or arrow, and if turned a little obliquely will throw off even a pistol bullet. The specimen shown in the illustration is painted light green with a white pattern. Above it is a cover made of very thin and soft leather, which is thrown over it in case of rain. The long strap is for the purpose of throwing the shield when not in use over the shoulders, where it hangs, together with the bow and quiver.

The spear presents nothing especially worthy of remark, except that the blade is leaf-shaped, long, and narrow, and the shaft is often so covered with feathers and scalp-locks that there is barely enough space for the hand of the wielder. It sometimes measures fourteen or fifteen feet in length.

Next come the bows and arrows. The bow is always a very short and apparently insignificant weapon, being mostly used on horseback. It scarcely ever exceeds three feet in length, and is mostly six inches shorter, so that it looks more like a child's toy than a weapon fit for a warrior's hand. Yet, with this apparently feeble bow, the American Indian can drive an arrow completely through a man, and some of their best hunters are known to have sent their arrows fairly through the body of a bison, so that the missile fell on the ground after passing through the huge animal.

These bows are made of wood, horn, or bone. Ash is considered the best wood for bows, and it is strengthened enormously by having the wet sinews of the bison or deer fastened along the back, and so worked and kneaded into it that they appear to be of one substance with the wood. Several layers of sinews are often used, so that, in spite of its small size, the bow is a very powerful one. Some of them are made of the horn of the mountain or big horn sheep, and a few which are the most valuable are made of bone, probably obtained on the Pacific coast from the spermaceti whale, and sent inland by the traders. The owners of these bows do

(1.) CROW CHIEF. (See page 1274.)

(2.) AMERICAN INDIANS SCALPING. (See page 1285.)
(1284)

not like to have the material questioned, and check the interrogation with a remark of "Hush! that is medicine." One of these bows is in the Christy Collection. I have tried several of the bows in Mr. Catlin's collection, and found them to be very elastic, and, in spite of their small size, very stiff.

The arrow is headed with flint or bone, and when used against the enemy is usually poisoned. The feathers are taken from the wing of the wild turkey. (See page 1290.) When a warrior is fully armed, he has a hundred or so of these arrows in a neat quiver made of deer or cougar skin, and tastefully decorated with patterns woven in stained porcupine quills.

In an illustration on page 1318, the reader may see the usual costume of the Indian when equipped for battle. The portrait is that of Ee-a-chin-che-a (the red thunder) son of Black Moccasin of the Minatarees. He was at this time one of the bravest and most desperate warriors of this tribe. He has on his war-dress, with quiver slung, and shield upon his arm. "In this plight," says Mr. Catlin, "*sans* headdress, *sans* robe, and *sans* everything that might be a useless encumbrance, — with the body chiefly naked, and profusely bedaubed with red and black paint, so as to form an almost perfect disguise, the Indian warriors sally forth to war." The chief only plumes himself, and loaded with his ornaments and trophies renders himself a conspicuous target for the enemy.

The Indians are not celebrated for their skill in marksmanship, which indeed is scarcely required, as they never shoot at long ranges, like the old English bowmen. But they are wonderfully skilled in discharging a number of arrows in rapid succession, a practised archer being able to throw twenty or more in a minute while galloping at full speed.

There is a game much practised by the various tribes, by means of which this peculiar modification of skill in archery is kept at the highest pitch. The young men assemble with their bows and arrows, and each brings several articles of property which he is willing to stake on his skill, and throws one of them on the ground. When every one has thrown down his stake, the first archer advances with his bow and ten arrows clenched in his left hand. He then draws the arrows and shoots them upward as rapidly as he can, the object being to throw as many arrows as possible into the air before the first arrow has reached the ground. He who gets the greatest number simultaneously in the air wins the stakes. Some archers are so skilful that they will discharge the eighth arrow before the first has touched the ground.

We now come to the axe or tomahawk. The two figures in illustration No. 2, page 1265, afford excellent examples of the prin-

cipal forms of this weapon; namely, that which is made entirely by themselves, and that which is partly made in Europe and finished by themselves. The most primitive tomahawk is that which is made of a stone fixed to a wooden handle. Fig. 2, on the above mentioned page, shows how the head is fixed to the handle, exactly as a blacksmith fixes his punches. The stone *axc*-heads which are found so abundantly as relics of a bygone age, were fastened on their handles in precisely the same manner. This kind of weapon is now so rare that it is scarcely possible to procure a specimen.

The steel-headed tomahawk has in most tribes superseded that which is made of stone. Vast numbers of these steel *axe*-heads are made in Birmingham, and sold at a very high price to the Indians.

The form which is most valued is that which is shown in fig. 1, page 1265. It is a "pipe-tomahawk," the upper part of the head being formed into a pipe-bowl, and the smoke drawn through the handle, which is plentifully decorated with porcupine quills and feathers. This is specially valued by the American Indians, because it saves them the trouble of carrying a separate pipe, and is most formidable as a weapon, and in time of peace is an efficient axe for chopping fire-wood and similar purposes. The tomahawk is used both in close combat and as a missile, in which latter capacity it is hurled with wonderful force and accuracy of aim.

Beside these weapons, every warrior carries the scalping knife, which, with the poniard of early English times, is equally useful for war and domestic purposes. Almost without an exception every scalping knife used in North America is nothing more than a common butcher's knife, made in Sheffield for sixpence, and sold to the Indians at the price of a horse. After all, it is perhaps the very best instrument that they could use. One of my friends, an experienced hunter, said that he discarded all his elaborate and costly hunting knives, and preferred the Sheffield butcher's knife, which combines the advantages of strength, lightness, and the capability of taking an edge like a razor.

Every one has heard of the custom of scalping as practised by these tribes, a custom which takes the place of the preserved heads of the Dyak and Mundurucú. When an American Indian slays an enemy, he removes the scalp as a proof of his victory. The scalp is a piece of skin, with the hair attached to it, taken from the very crown of the head, so as to exhibit that portion of the skin where the hair radiates from a centre. The size of the scalp is of no importance, provided that it only contain this indispensable mark.

Generally, the piece of skin secured is almost as large as the palm of the hand, and it is taken in the following manner. The

enemy being fallen, the victor sits behind him on the ground, seizes the scalp-lock with his left hand, and with the knife makes two semicircular incisions in the skin, cutting it completely down to the bone. He then twists the scalp-lock round both his hands, puts his feet on the victim's shoulders, and with a violent pull drags off the circular piece of skin with the hair adhering to it.

This whole scene (illustrated on page 1284) is enacted in much less time than it has taken to write, the Indians being well practised in their sham fights before they come to taking scalps in actual battle. Brandishing the scalp in one hand and the knife in the other, the exultant conqueror utters the terrible "scalping yell," which even when given in a mock battle seems as if it were uttered by a demon rather than a man.

The scalped man is always supposed to be dead or dying, and, as the scalp is always accepted as a proof of death, the native warrior would never scalp a man whom he thought likely to recover. There have, however, been many instances, where in the heat of battle a man has been scalped while stunned, though without a mortal wound, and has afterward recovered and lived for many years.

When the battle is over and the warrior returns to his home, he dresses the scalp for preservation. This is usually done by stretching it in a sort of battledore, made by bending a flexible stick and lashing the ends together, and it is then solemnly "danced" before it takes its place with the other valuables of the owner. Some of the scalps are quite small, not larger than a penny, and are hung on the bridles of the horses, or the handles of clubs.

Generally, however, they are, when quite dry, painted on the inside so as to resemble a human face, and hung to the end of a long, slight pole. On a fine day, the head chief of an encampment mostly orders that the scalps should be hung out, and sets the example, by protruding from the top of his own hut the pole on which are hung the scalps which he has taken. All the warriors at once follow his example, so that by walking round the village and counting the scalps, a stranger can learn the standing of every warrior.

It has been mentioned that many of the scalps are very small. Their limited size is thus accounted for. If a warrior be hurried, as is mostly the case when scalping a fallen man in the heat of battle, he contents himself with the scalp alone. But, if he should have leisure, he removes the whole of the hair-bearing portion of the skin, and treats it as follows. He first cuts out a small circular piece containing the crown of the head, this being the actual scalp. The remainder of the hair he divides into little locks, and with them he fringes the seams

of his leggings, the arms and edges of his coat, the shaft of his spear, the handle of his club, etc., etc. The whole of Mah-to-toh-pa's dress was covered with fringes made from the hair of those whom he slew in battle.

A dress thus ornamented is valued beyond all price, and there is scarcely any price sufficiently high to tempt a warrior to part with these trophies of his valor.

The "scalp dance" is a ceremony quite in keeping with the custom of securing the trophy. A scalp dance of the Sioux is thus described by Mr. Catlin:—"Among this tribe, as I learned whilst residing with them, it is danced in the night by the light of their torches, just before going to bed. When a war party returns from a war excursion, bringing home with them the scalps of their enemies, they generally dance them for fifteen nights in succession, vaunting forth the most extravagant boasts of their wonderful prowess in war, whilst they brandish their war weapons in their hands.

"A number of young women are selected to aid (though they do not actually join in) the dance, by stepping into the centre of the ring and holding up the scalps that have been recently taken, while the warriors dance, or rather jump, around in a circle, brandishing their weapons, and barking and yelping in the most frightful manner, all jumping on both feet at a time, with a simultaneous stamp, and blow, and thrust of their weapons, with which it would seem as if they were actually cutting and carving each other to pieces. During these frantic leaps and yells, every man distorts his face to the utmost power of his muscles, darting about his glaring eyeballs, and snapping his teeth as if he were in the heat—and actually breathing through his nostrils the very hissing death—of battle.

"No description that can be written could ever convey more than a feeble outline of the frightful effects of these scenes enacted in the dead and darkness of night, under the glaring light of their blazing flambeaux; nor could all the years allotted to mortal man in the least obliterate or deface the vivid impression that one scene of this kind would leave upon his memory."

Mr. Catlin suggests, with much reason, that these dances are propitiatory of the spirits of the slain men, showing how highly their valor was prized by the conquerors, and the great respect and estimation in which they were held, though the fortune of war had gone against them.

A good example of the war career of an American Indian chief may be gained by the exploits of Mah-to-toh-pa, as displayed on his robe, and explained by him to Mr. Catlin. It was covered with twelve groups of figures, which will be briefly described.

His first exploit was killing a Sioux chief, who had already killed three Riccarees.

This feat entitled him to wear eagles' quills on his lance, and in the second group he is shown as killing with this lance a Shienne chief, who challenged him to single combat. The third scene represents a combat in which Mah-to-toh-pa was forsaken by his party, and yet, though badly wounded, killed a Shienne warrior in the presence of some thirty of his fellows.

The fourth scene shows a great chief of the Shiennes killed by this warrior, whose splendid headdress was assumed by his slayer. The fifth picture represents a strange episode in a battle. Mah-to-toh-pa was travelling with a party of Riccarees, when they were fired upon by a war party of Sioux. The Riccarees fled, leaving Mah-to-toh-pa, who sprang from his horse, faced the Sioux on foot, killed one of them, and secured his scalp.

The sixth drawing illustrates a most remarkable piece of personal history. A Riccaree brave, named Won-ga-tap, shot the brother of Mah-to-toh-pa with an arrow, drove his well-known spear into the body of the fallen man, and left it there, as a challenge to the surviving brother. The challenge was accepted. Mah-to-toh-pa found the body, recognized the spear, and vowed that he would slay the murderer of his brother with the same weapon. Four years passed without an opportunity to fulfil the vow, when he could no longer brook delay, but dashed out of his house with the fatal spear in his hand, and a small wallet of parched corn at his belt. He told the Mandans to mention his name no more unless he returned victorious with the scalp of Won-ga-tap.

Amid the awe-struck silence of his people he left the village, and disappeared over the grassy bluffs. For two hundred miles he travelled alone and by night, always concealing himself by day, until he reached the Riccaree village, which he boldly entered, mixing with the inhabitants as if he were a friendly stranger. He knew the position of Won-ga-tap's hut, and after having seen that the intended victim and his wife had smoked the evening pipe and were in bed, he walked gently into the hut, sat down by the fire, took some meat out of the cooking-pot, and began to eat in order to strengthen himself for the fulfilment of his task. This was according to the hospitable custom of the American Indians. If a man be hungry, he need not ask for food, but has only to go to the nearest hut and help himself.

The repast being ended, Mah-to-toh-pa took the still warm pipe, filled it with tobacco, and began to smoke it, breathing, with every curl of smoke, a prayer for success in his undertaking. Once or twice the wife of Won-ga-tap asked her husband who was eating in their hut, but he replied that some one must be hungry, and was helping himself.

When the last smoke-wreath had as-

cended, Mah-to-toh-pa turned toward the bed, and with his foot pushed an ember on the fire, so as to make a blaze by which he might see the exact position of his victim. In an instant he leaped toward the bed, drove the spear through the heart of Won-ga-tap, tore off his scalp, snatched the spear from his heart, and darted out of the hut with the scalp of his victim in one hand, and in the other the fatal spear, with the blood of Won-ga-tap already drying over that of the man he had killed four years before. The whole village was in an uproar, but Mah-to-toh-pa succeeded in making his escape, and on the sixth day after leaving the Mandan village, he re-entered it with the scalp of his enemy. A portrait of this celebrated chief is given on the 1277th page.

Another of these pictures records a single combat fought with a Shienne chief in presence of both war parties. They fought on horseback, until Mah-to-toh-pa's powder-horn was shattered by a bullet. The Shienne chief flung away his gun, horn, and bullet pouch, and challenged the foe with bow and arrow. Both parties were wounded in the limbs, but kept their bodies covered with their shields.

Presently Mah-to-toh-pa's horse fell with an arrow in its heart. The Shienne chief immediately dismounted, and proceeded with the fight until he had exhausted his arrows, when he flung the empty quiver on the ground, challenging with his knife, the only weapon which he had left. The challenge was accepted, and they rushed on each other, but Mah-to-toh-pa had left his knife at home, and was unarmed. He closed with his antagonist, and a struggle ensued for the knife. Mah-to-toh-pa was dreadfully wounded in the hands, but at last wrested the knife from his adversary, drove it into his heart, and in silence claimed the scalp of his fallen foe.

On another occasion he alone faced sixty Assineboins, drove them back, and killed one of them. It was in this battle that he earned the name of "Four Bears," by which must be understood the grizzly bear, the most terrible quadruped of North America. This is a sample of the mode in which warfare is conducted by the North American Indians — a strange mixture of lofty and chivalrous nobility with cunning and deceit. In fact, in contemplating these interesting tribes, we are thrown back to the time of Ulysses, whose great fame was equally derived from his prowess in battle and his skill in deceiving his foes, or, in other words, of being a most accomplished liar.

The men are taught the operations of war from a very early age. Every morning, all the lads who are above seven years old and upward, and have not been admitted among the men, are taken to some distance from the village, where they are divided into two opposing bodies, each under the command

of an experienced warrior. They are armed with little bows, arrows made of grass stems, and wooden knives stuck in their belts. In their heads they slightly weave a plaited tuft of grass to represent the scalp-lock.

The two parties then join in sham combat, which is made to resemble a real fight as much as possible. When any of the combatants is struck in a vital part, he is obliged to fall as if dead, when his antagonist goes through the operation of scalping with his wooden knife, places the scalp in his belt, utters the wild yell, and again joins in the battle. As no one may fight without a scalp-lock, the fallen adversary is obliged to withdraw from the fight. This goes on for an hour or so, when the mock fight is stopped, and the lads are praised or rebuked according to the skill and courage which they have shown, the number of scalps at the belt being the surest criterion of merit.

It is well known that after a battle the American Indians torture their prisoners, and that they display the most diabolical ingenuity in devising the most excruciating torments. Still, there has been much exaggeration in the accounts of this custom. They do not torture all their prisoners, selecting only a few for this purpose, the others being absorbed into the tribe by marriage with the widows whose husbands have been killed in battle, and enjoying equal rights with the original members of the tribe.

Neither is the torture practised with the idea of revenge, though it is likely that vengeful feelings will arise when the victim is bound to the stake. Superstition seems to be at the root of the torture, which is intended to propitiate the spirit of those members of their own tribe who have suffered the like treatment at the hands of their adversaries. The doomed warrior accepts his fate with the imperturbable demeanor which is an essential part of a North American Indian's character, and, for the honor of his tribe, matches his endurance against the pain which his enemies can inflict.

Tortures too terrible even to be mentioned are tried in succession; for when the victim is once bound to the stake, the Indian never has been known to relent in his purpose, which is to extort acknowledgments of suffering from the captured warrior, and thereby to disgrace not only himself but the tribe to which he belongs. He, in the meanwhile, prides himself on showing his enemies how a warrior can die. He chants the praises of his tribe and their deeds, boasts of all the harm that he has done to the tribe into whose power he has fallen, ridicules their best warriors, and endeavors to anger them to such an extent that they may dash out his brains, and so spare him further torture. He will even laugh at their attempts to extort cries of pain from a warrior, and tell them that they do not know how to torture.

One remarkable instance of endurance in a captured Creek warrior is told by Mr. Adair. The man had been captured by the Shawnees, and forced to run the gauntlet naked through all the tribe; he had been tied to the stake, and was horribly tortured with gun-barrels heated redhot. All the efforts of his enemies only drew from him taunts and jeers, to the effect that the Shawnees were so ignorant that they did not even know how to torture a bound prisoner. Great warrior though he was, he had fallen into their hands through some fault in addressing the Great Spirit, but that he had enough virtue left to show them the difference between a Creek and a Shawnee. Let them only unbind him, and allow him to take a redhot gun-barrel out of the fire, and he would show them a much better way of torturing than any which they knew.

His demeanor had excited the respect of the Shawnees, and they unbound him and took him to the fire, in which were lying the redhot tubes. Unhesitatingly, he picked up one of them with his bare hands, sprang at the surrounding crowd, striking right and left with this fearful weapon, cleared a passage through the astonished warriors, and leaped down a precipice into the river. He swam the river amid a shower of bullets, gained a little island in its midst, and, though instantly followed by numbers of his disconcerted enemies, actually succeeded in getting away. In spite of the injuries which he had suffered, and which would have killed an ordinary European, he recovered, and lived for many years, the implacable foe of the Shawnees.

A somewhat similar adventure occurred to a Katahba warrior, who was pursued by a band of Senecas, and at last captured, though not until he had contrived to kill seven of them. A warrior of such prowess was guarded with double vigilance, and he was brought to the Seneca village for the torture, after having been beaten at every encampment through which the party had passed.

As the torturers were taking him to the stake, he, like the Creek warrior, burst from his captors, and flung himself into the river, swimming across in safety. He paused for a moment on the opposite bank to express emphatically his contempt for the pursuers who were crowding down the bank and into the river, and then dashed forward so fast that he gained nearly a day's journey upon the foremost of the pursuers.

Five of the enemy pressed upon him, and, though naked and unarmed, he deliberately waited for them. At night, when they were all asleep, not having thought a sentry needful, he crept up to the party, snatched one of their tomahawks, and killed them all before they could wake. He scalped them, clothed and armed himself, invigorated his wasted frame with food, and set off to the

spot where he had slain the seven foes as he was first pursued. They had been buried for the sake of preserving their scalps, but he found the place of burial, scalped them all, and not until then did he make for his home, which he reached in safety.

When the rest of the pursuers came to the place where the five had been killed, they held a council, and determined that a man who could do such deeds unarmed must be a wizard whom they could not hope to resist, and that the best course that they could pursue was to go home again.

The reader will not fail to notice the great stress that is here laid on the possession of the scalp. A war party of Indians care comparatively little for the loss of one of their number, provided that they conceal his body so that the enemy shall not take his scalp. Here we have an instance of a man pursued by numbers of infuriated and relentless foes deliberately going back to the spot where he thought his slain enemies might be buried, and a second time risking his life in order to secure the trophies of victory. He knew that his intention would be foreseen, and yet the value set upon the scalp was so incalculable that even the risk of undergoing the torture was as nothing in comparison.

On more than one occasion, a warrior who has been struck down, and felt himself unable to rise, has saved his life by feigning death, and permitting his victorious foe to tear off his scalp without giving the least sign of suffering. He must lose his scalp at any rate, and he might possibly contrive to save his life.

Several of the tribes are remarkable for the use which they make of the horse in war, and their marvellous skill in riding. The most celebrated tribe in this respect are the Camanches, the greater part of whose life is spent on horseback. As is often the case with those who spend much of their time on horseback, the Camanches are but poor walkers, and have a slouching and awkward gait. No sooner, however, is a Camanchee on the back of a horse, than his whole demeanor alters, and he and the animal which he bestrides seem one and the same being, actuated with the same spirit. "A Camanchee on his feet," writes Mr. Catlin, "is out of his element, and comparatively almost as awkward as a monkey on the ground without a limb or branch to cling to. But the moment he lays his hand upon his horse, his face becomes handsome, and he gracefully flies away like a different being."

There is one feat in which all the Camanchee warriors are trained from their infancy. As the man is dashing along at full gallop, he will suddenly drop over the side of his horse, leaving no part of him visible except the sole of one foot, which is hitched over the horse's back as a purchase by which he can pull himself to an upright

position. In this attitude he can ride for any distance, and moreover can use with deadly effect either his bow or his fourteen-foot lance.

One of their favorite modes of attack is to gallop toward the enemy at full speed, and then, just before they come within range, they drop upon the opposite side of their horses, dash past the foe, and pour upon him a shower of arrows directed under their horses' necks, and sometimes even thrown under their bellies. All the time it is nearly useless for the enemy to return the shots, as the whole body of the Camanchee is hidden behind the horse, and there is nothing to aim at save the foot just projecting over the animal's back.

To enable them to perform this curious manœuvre, (illustrated on the 1291st page) the Camanches plait a short and strong halter of horse hair. This halter is passed under the horse's neck, and the ends are firmly plaited into the mane, just above the withers, so as to leave a loop hanging under the animal's neck. Into this loop the warrior drops with accurate precision, sustaining the weight of his body on the upper part of the bent arm, and allowing the spear to fall into the bend of the elbow. Thus both his arms are at liberty to draw the bow or wield the spear; and as in such cases he always grasps a dozen arrows in his left hand, together with the bow, he can discharge them without having recourse to his quiver.

Sometimes the Camanches try to steal upon their enemies by leaving their lances behind them, slinging themselves along the sides of their steeds, and approaching carelessly, as though they were nothing but a troop of wild horses without riders. A very quick eye is needed to detect this guise, which is generally betrayed by the fact that the horses always keep the same side toward the spectator, which would very seldom be the case were they wild and unrestrained in their movements.

Every Camanchee has one favorite horse, which he never mounts except for war or the chase, using an inferior animal on ordinary occasions. Swiftmess is the chief quality for which the charger is selected, and for no price would the owner part with his steed. Like all uncivilized people, he treats his horse with a strange mixture of cruelty and kindness. While engaged in the chase, for example, he spurs and whips the animal most ruthlessly; but as soon as he returns, he carefully hands over his valued animal to his women, who are waiting to receive it, and who treat it as if it were a cherished member of the family.

It need scarcely be added that the Camanches are most accomplished horse stealers, and that they seize every opportunity of robbing other tribes of their animals. When a band of Camanches sets

out on a horse stealing expedition, the warriors who compose it are bound in honor not to return until they have achieved their object. Sometimes they are absent for more than two years before they can succeed in surprising the settlement which contains the horses on which they have set their hearts, and they will lie in ambush for months, awaiting a favorable opportunity.

The value set upon horses by the equestrian tribes cannot be better illustrated than by the singular custom of "smoking horses," which prevails in some parts of the country. The reader will find this illustrated on the following page.

When one of these tribes determine on making war, and find on mustering their forces that they have not sufficient horses, they send a messenger to a friendly tribe to say that on a certain day they will come to "smoke" a certain number of horses, and expect the animals to be ready for them. This is a challenge which is never refused, involving as it does the honor of the tribe.

On the appointed day, the young warriors who have no horses go to the friendly village, stripped and painted as if for war, and seat themselves in a circle, all facing inward. They light their pipes and smoke in silence, the people of the village forming a large circle around them, leaving a wide space between themselves and their visitors.

Presently in the distance there appears an equal number of young warriors on horseback, dashing along at full gallop, and in "Indian file," according to their custom. They gallop round the ring, and the foremost rider, selecting one of the seated young men, stoops from his saddle as he passes, and delivers a terrible blow at his naked shoulders with his cruel whip. Each of his followers does the same, and they gallop round and round the smokers, at each circuit repeating the blow until the shoulders of the men are covered with blood. It is incumbent upon the sufferers to smoke on in perfect calmness, and not to give the slightest intimation that they are aware of the blows which are inflicted on them. When the requisite number of circuits have been made, the leader springs off his horse, and places the bridle and whip in the hands of the young man whom he has selected, saying at the same time, "You are a beggar; I present you with a horse: but you will always carry my mark on your back." The rest follow his example.

Every one is pleased with this remarkable custom. The young men are pleased because they get a horse apiece; and as to the flogging, in the first place they really care very little for pain, and in the next place they have enjoyed an opportunity of showing publicly their capability of endurance.

Those who give the horses are pleased because they have been able to show their liberality, a trait which is held in great esti-

mation by these people, and they have also the peculiar satisfaction of flogging a warrior with impunity. Both tribes are also pleased, the one because they have gained the horses without which they could not have made up their forces, and the other because they have shown themselves possessed of superior wealth.

FLINT-HEADED ARROW.

CHAPTER CXXXVII.

THE NORTH AMERICAN INDIANS — *Continued.*

HUNTING — AMUSEMENTS.

NORTH AMERICAN HUNTERS — BISON OR BUFFALO HUNTING — THE CHASE ON HORSEBACK — USE OF THE GUN — BISON DRIVING — THE SNOW SHOE, AND ITS USE IN BISON HUNTING — THE DISGUISE IN WOLF SKINS — HORSE CATCHING — MODES OF USING THE LASSO — HOW HORSES ARE TAMED — "CREASING" HORSES — THE BUFFALO DANCE — CREDIT OF THE BUFFALO DANCE RESTORED — A SINGULAR MASK — INVARIABLE SUCCESS OF THE DANCE — HOW THE DANCERS ARE RELIEVED — AN INGENIOUS DECEPTION.

As might be expected from a migratory people like the North American Indians, all the tribes excel in hunting, though some are notable above the others. Next to Africa, this country presents the finest hunting grounds in the world, the game varying according to the locality, and giving the hunter an almost unrivalled scope of action.

First and most important of the North American game is the bison, popularly but erroneously called the buffalo. This animal exists in countless myriads, and in spite of the continual persecutions to which it has been subjected, and the utterly reckless manner in which it has been destroyed, it still blackens the plains with its multitudes.

Before the horse came into use, the North American Indians were obliged to chase the bison on foot, and even at the present day there are many celebrated hunters who are able to run down a bison on foot and kill it with the lance. The mode, however, which is generally adopted is the chase by mounted hunters, a chase which offers the greatest results, and exhibits the wildest enthusiasm and excitement. Armed merely with his tiny bow and flint-headed arrows, the native hunter mounts his horse, and goes off in chase of the bison.

When he comes up with the animals, he selects one, usually a fat and well-conditioned cow, presses his horse to her and prepares his bow and arrow. The well-trained

horse needs no guiding, but keeps close to the right shoulder of the bison, and a little behind it, so that it may not run upon the horns of the animal if it should happen to stop suddenly and turn its head. This plan, moreover, just brings the rider into the proper position to deliver his arrow in the most deadly manner, *i. e.* directing it just behind the shoulder. When an arrow is discharged by a practised hand, the bison falls mortally wounded, and, tenacious of life as the animal is, soon breathes its last. Leaving the arrow in the wound in order to mark the owner of the dead animal, the successful archer dashes on in pursuit of another animal, and does not cease until he has expended all his store of arrows. An illustration on page 1299 shows a herd of bisons, and the Indians on horseback engaged in the exciting sport.

It is the pride of the native hunter to kill a bison with every arrow, and not to shoot twice at the same animal. The younger hunters are fierce and anxious rivals in this sport, knowing that the result of the day's hunt will be the talk of the whole village, and that on their success or failure will much depend the estimation in which they are held. So each successive hunt produces its eager competitors for honor, some being desirous of wiping off past disgrace by present success, and others equally anxious to maintain the reputation which they have gained on former occasions.

Even in those parts of the country where the bow has been almost entirely superseded by fire-arms, it is equally a point of honor to kill the bison with a single shot, and to claim a slain bison for every bullet. In such cases, the hunter takes little pains in loading his gun. He carries the powder loose in his pocket or bag, scoops hastily a random quantity into the gun, drops upon it, without any wadding, a bullet wetted in the mouth, and the loading is complete. The muzzle of the gun is kept uppermost until the moment for firing, when the gun is dropped, aimed, and fired simultaneously, without being brought to the shoulder.

The skill displayed in managing the horse is the more remarkable, as these Indians use no bit by which the animal can be guided. They have nothing but a slight hide halter tied round the lower jaw of the horse, the only use of which is to cause it to halt when required. This is popularly called the "lariat," a corruption from the French word, *l'arêt*.

The excitement caused by this chase is indescribable, though Mr. Catlin gives a very graphic idea in a few words:—"I have always counted myself a prudent man, yet I have often waked, as it were, out of the delirium of the chase, into which I had fallen as into an agitated sleep, and through which I had passed as through a delightful dream—where to have died would have been to have remained, riding on, without a struggle or a pang."

Sometimes the bison is destroyed in a much less sporting manner, the precipice and the pound being the two modes which are usually followed. The reader may probably be aware that, in those parts of North America inhabited by the bison, the surface of the plain is frequently interrupted by ravines with precipitous sides and of tremendous depth. When a hunting party see a herd of bisons within several miles of one of these ravines, they quietly separate, and steal round the herd, so as to place the bisons between themselves and the ravine.

They then gently move forward, and the bisons, retreating from them, draw nearer and nearer to the ravine, at the same time becoming packed closer and closer together. Suddenly the hunters raise a shout, and dash forward at the bisons. The affrighted animals take to flight at their best speed, and run on until they reach the edge of the ravine. Here the foremost bisons try to check themselves, but to no avail, as they are pressed forward by their companions behind, and thus almost the whole of the herd are forced over the precipice, and killed by the fall. Even those in the rear, which at last see their danger, and try to escape, have to run the gauntlet of their enemies, who allow but very few of them to escape.

A somewhat similar plan is adopted with

the pound, into which the bisons are driven by the hunters. The pound is an enclosure made of felled trees and branches, with an opening which gradually widens. The bisons are driven toward the enclosure, a task which often occupies several weeks, and, when they arrive within the fatal arms of the entrance, are urged forward by means of little fires, which are lighted on either side. Instinct urges the animals to escape from an element which sweeps over vast districts of country, and kills every living thing in it, and in their haste they run toward the pound, in which they are at once shut up. It is fortunate for the hunters that the bisons do not know their own strength. They could easily break through the walls of the pound, but they mostly content themselves with turning round and round, and passively await the arrival of the destroyer. So foolish are they in this respect, and in such numbers are they killed, that pounds have been built of the bones of slaughtered bisons.

In the winter another plan of hunting the bison is followed. At this time of the year the fur or "pelt" of the bison is the thickest and warmest, and the skin is of the most value. It is from these skins that the "buffalo" rugs and robes are made, without which out-of-door life would be scarcely endurable in the more northern parts of this vast continent.

During the winter months the prairies assume a new aspect. They are not only covered with snow, so that the ordinary landmarks are obliterated, but the snow is blown by the wind into the most fantastic shapes, raised in some places into long and sharply scarped hills where no hills were, forming level plains where the ground is really cut up by hollows, and leaving only the tops of eminences bare, whence the snow is blown away by the tempestuous winds that sweep across the vast expanse. On these hills the bison congregate for the purpose of grazing, shovelling away with their broad noses the snow which still clings to the herbage.

The animals instinctively keep clear of the small but treacherous plains and valleys, knowing that the hidden crevices may at any time swallow them up. Into these valleys the hunters try to drive them, so that they may be helplessly entangled in the snow, and fall easy victims to the spear. Were it not for some invention whereby the hunters are enabled to skim over the surface of the snow, the bisons would be in perfect safety, but the snow shoe lays the poor animals at the mercy of their pursuers. It is necessary first to describe this ingenious implement.

The best form of snow shoe is seen on the next page. The shape is that of a fish, and its framework is made of ash-wood, kept in form by two cross-bars, one in front and one

behind. It is slightly turned up in front. The whole of the space within the framework is filled in with a close and strongly made netting of hide thongs, much like those of a racquet—indeed, the French Canadians use the word “*raquet*” to represent the snow shoe. As the snow shoe is about five feet in length and eighteen inches or more in breadth, it is evident that the weight of the wearer is distributed over a large surface, and that a heavy man wearing these shoes can pass with impunity over snow in which a child would sink if only supported on its feet.

The most ingenious part of the snow shoe is the mode by which it is fitted to the foot. It is evident that if it were fastened firmly to the foot, like the sole of a shoe, the wearer would be unable to stir a step. The movement of a snow-shoe wearer is somewhat analogous to that of a skater, the shoe being slid over the snow, and not raised and depressed like shoes in ordinary walking. If the reader will refer to the illustration, he will see that in the middle and toward the forepart of the shoe there is a square opening, edged by thongs, very much stronger than the others.

SNOW SHOE.

(From my collection.)

Just behind the opening is a triangular space crossed by parallel thongs. When the shoe is to be worn, the foot is placed on it so that the heel rests on the parallel thongs, and the centre of the foot is supported by the thick cross-thong, call the “*bimikibison*,” the toes passing into the square opening, which is called the eye of the shoe. In order to keep the foot in its place, two leathern loops (not shown in the figure) are attached to the *bimikibison*, one of which passes over the instep and the other comes round the heel.

As, therefore, the wearer moves along, the feet play freely on the *bimikibison*, the heels coming down at each step on the parallel thongs, while the toes move up and down through the “eye” of the shoe, which is dragged over the snow by the instep thong, the heel strap being only useful in keeping the foot from slipping out backward.

After some practice, the wearer is able to skim over the snow with astonishing speed, but to a novice the first attempt is not only awkward, but causes excruciating pain. The unaccustomed movement of the foot, together with the pressure of the instep strap, produces a pain peculiar to the snow shoe, called by the Canadians “*mal du raquet*.” Not only does blood stain the snow as the excoriated foot drags the heavy shoe over the surface, but a pain pervades the whole foot, as if all the little bones were dislocated, and rubbing against each other. Perseverance is the only cure for the “*mal du raquet*,” and after a few days the wearer is able to proceed with perfect comfort.

It often happens that heavy snow storms fall before the people are able to replace the shoes, which are generally damaged in the course of the summer months, and in this case they are obliged to extemporize snow shoes out of flat boards. These are shorter and wider than the regular snow shoes, but are used in much the same manner, the “eye” being cut out of the board, and the necessary thongs being fixed across the opening. These simple instruments are called by a name which signifies “bear’s-paw” shoes. Some of the prairie tribes use very long and comparatively narrow skates, turned up in front, and precisely resembling the “*skidor*” of Northern Europe.

Upborne on the snow shoe, the American Indian has the bison at his mercy. He drives the herd from the eminences into the valleys, and while the poor animals are floundering about in the deep snow, he deliberately selects those which have the largest and softest “robes,” and kills them with his spears. Thousands are annually slain in this manner, their skin removed, and with the exception of the tongue and the hump, which are the best parts of the bison, the whole of the carcass is left to the prairie wolves and birds of prey.

On these shoes the native hunters capture the huge moose. They select a time when there has been a partial thaw followed by a frost, so as to leave a thin crust of ice upon a substratum of soft snow. As the moose plunges through the snow, it breaks through this icy crust at every step, cutting its legs frightfully with the broken edges, and so falls an easy victim.

Another mode of bison hunting presents a curious analogy with the ingenious method of ostrich hunting which is practised by the Bosjesmans of Southern Africa.

Upon the vast plains of North America the so-called wolves prowl in numbers. They will follow the hunter for weeks together for the sake of the offal of the beasts which he kills. They will not venture to harm him, but follow him by day at a distance of half a mile or so, and at night, when he lies down to sleep, they will couch also at a respectful distance.

Should he wound a bison and not be able to secure it, the wolves are sure to have that animal sooner or later, and if they manage to detach a single bison from the herd, they will fairly persecute the wretched animal to death. But they will never venture to attack a herd of bisons, and, being instinctively aware of the protection afforded by mutual support, the bisons allow the wolves to approach quite close to them, and, indeed, to wander freely among the herd. Of this fact the hunters take advantage in the following manner. They remove the skin of a large wolf, and put it upon themselves, so that when they go on all fours the head of the wolf projects just above their own head, and their arms and legs are partly covered by the skin belonging to the corresponding members of the wolf.

Thus disguised, they creep slowly and cautiously toward the herd, bearing their bow and arrows in their left hands. The bisons, whose eyes are none of the best, being overshadowed by the masses of black hair that overlap them, think nothing of the supposed wolves, and allow them to come quite close. Even if an animal more wary than his comrades does suspect the ruse, the disguised hunter has merely to turn in another direction, as if the creature he represents has no business with the herd. By degrees, he contrives to creep close to the bison which he prefers, and drives the flint-headed arrow to its heart. No report attending the discharge of the arrow, the wounded bison runs for a few paces, and sinks on the ground, mostly without alarming any of its companions. The hunter leaves his dying prey, goes off after another victim, and slays it in a similar fashion. Thus a skilful hunter will manage to exhaust the whole of his stock of arrows, killing a bison with each arrow, and yet not alarm the rest of the herd.

Both in hunting and in warfare the equestrian warriors always carry the lasso attached to the saddles of their horses. It is not, however, kept coiled, as is the case in Mexico, but is allowed to trail on the ground behind their horse. The object of this custom is easily understood. It often happens that, whether in the hunt or warfare, the rider is thrown from his horse. In such a case, as soon as he touches the ground, he seizes the

lasso, stops his well-trained horse with a jerk, leaps on its back, and is at once ready to renew the combat or the chase.

The mode in which the natives supply themselves with horses is worth a brief description. In various parts of the country the horses have completely acclimatized themselves, and have run free for many years, so that they have lost all traces of domestication, and have become as truly wild as the bison and the antelope, assembling in large herds, headed by the strongest and swiftest animals. It is from these herds that the natives supply themselves with the horses which of late years have become absolutely necessary to them; and in most cases the animals are captured in fair chase after the following manner:—

When an American Indian—say a Camanchee—wishes to catch a fresh horse, he mounts his best steed, and goes in search of the nearest herd. When he has come as near as he can without being discovered, he dashes at the herd at full speed, and, singling out one of the horses, as it gallops along, hampered by the multitude of its companions, flings his lasso over its neck.

As soon as the noose has firmly settled, the hunter leaps off his own steed (which is trained to remain standing on the same spot until it is wanted), and allows himself to be dragged along by the affrighted animal, which soon falls, in consequence of being choked by the leathern cord.

When the horse has fallen, the hunter comes cautiously up, keeping the lasso tight enough to prevent the animal from fairly recovering its breath, and loose enough to guard against its entire strangulation, and at last is able to place one hand over its eyes and the other on its nostrils.

The animal is now at his mercy. He breathes strongly into its nostrils, and from that moment the hitherto wild horse is his slave. In order to impress upon the animal the fact of his servitude, he hobbles together its fore-feet for a time, and casts a noose over its lower jaw; but within a wonderfully short period he is able to remove the hobbles, and to ride the conquered animal into camp. During the time occupied in taming the horse, it plunges and struggles in the wildest manner; but after this one struggle it yields the point, and becomes the willing slave of its conqueror. Those who have seen the late Mr. Rarey operate on a savage horse can easily imagine the scene that takes place on the prairie.

The rapidity with which this operation is completed is really wonderful. An experienced hunter is able to chase, capture, and break a wild horse within an hour, and to do his work so effectually that almost before its companions are out of sight the hitherto wild animal is being ridden as if it had been born in servitude.

The native hunter, cruel master though

he generally is, takes special care not to damp the spirit of his horse, and prides himself on the bounds and curvets which the creature makes when it receives its master upon its back.

There is only one drawback to this mode of hunting. It is impossible to capture with the lasso the best and swiftest specimens. These animals always take command of the herd, and place themselves at its head. They seem to assume the responsibility as well as the position of leaders, and, as soon as they fear danger, dart off at full speed, knowing that the herd will follow them. Consequently, they are often half a mile or more in advance of their followers, so that the hunter has no chance of overtaking them on a horse impeded by the weight of a rider.

A rather strange method of horse taking has been invented since the introduction of fire-arms. This is technically named "creasing," and is done in the following manner. Taking his rifle with him, the hunter creeps as near the herd as he can, and watches until he fixes on a horse that he thinks will suit him. Waiting till the animal is standing with its side toward him, he aims carefully at the top of the neck, and fires. If the aim be correct, the bullet just grazes the neck, and the horse falls as if dead, stunned for the moment by the shock. It recovers within a very short time; but before it has regained its feet the hunter is able to come up to the prostrate animal, place his hands over its eyes, breathe into its nostrils, and thus to subdue it.

This is a very effectual mode of horse catching; but it is not in favor with those who want horses for their own riding, because it always breaks the spirit of the animal, and deprives it of that fire and animation which the native warrior prizes so highly. Indeed, so careful is the Camanchee of his steed, that he will not mount his favorite war horse except in actual warfare, or in the hunt. When he is summoned by his chief, he attends muster, mounted on a second horse, or hack, and leading his war horse by the bridle.

The wild horses of North America are a small and neat-limbed, though powerful, breed of animal. Mr. Catlin says that their value has been much overrated, as even those which belong to the Camanchees, and are thought to be equal to the best Arab horses, are on the average worth some twenty pounds each. The chiefs have generally one or two horses of very superior quality; but as far as the average goes, the Camanchee horse is not worth more than the above mentioned sum.

The horses that are generally brought into the market are those that are obtained by "creasing." Experienced purchasers, however, do not care much about such animals. Creasing is, moreover, liable to two disadvantages. The hunter is equally in danger of missing his mark altogether, in

which case the whole herd dashes off, and gives no more chances to the hunter; or of striking too low, in which case the horse is killed on the spot.

In accordance with their usual custom, some of the tribes perform a sacred dance as a means of bringing the bison within their reach. The most characteristic of these performances is the Buffalo Dance as practised by the Mandans.

Sometimes it happens that the supplies of fresh meat fail. During the greater part of the year the bisons are scattered with tolerable evenness throughout the land, so that the hunters are able to find a sufficiency of game within a few miles of their village, to supply them with food. Indeed, large herds of bisons can often be seen from the village itself, their black masses being conspicuous against the verdure of the ground over which they range.

At certain seasons of the year, however, the animals are sure to withdraw themselves further and further from the villages, so that the hunters, in order to procure meat, are obliged to venture so far from their own ground that they are in danger of meeting with war parties of an inimical tribe. At last the hunters report to the council of chiefs and medicine men that they can no longer find game. A solemn conclave is at once held, and if, after a few days of patient waiting, during which every adult throughout the community is reduced to a state of semi-starvation, no bisons are found, the buffalo dance is ordered. This remarkable dance is a sort of homage to the Great Spirit, acknowledging that He can send the animals to them, and praying that He will do so; and, as we shall presently see, it is a remedy that never fails.

Among the Mandans every man is obliged by law to have a buffalo mask, *i. e.* the skin of the head, with the horns added to it. Usually to the head is added a strip of skin some four or five inches wide, extending along the whole length of the animal, and including the tail. When the wearer puts on his mask, the strip of skin extends down his back, and the tufted tail drags on the ground behind him.

I have worn one of these strange masks, and found it much less inconvenient than might have been supposed. It is not nearly so cumbrous as the chief's dress of state, described on page 1276. The buffalo mask is kept by each man at the head of his bed, a circumstance which gives a strange wildness to the interior of the hut, or lodge, as it is called, especially if several young warriors sleep in the same lodge.

As soon as the mandate for the buffalo dance is given, the men repair to their lodges and bring out their masks, together with the weapons which they are accustomed to use in the hunt. Ten or fifteen of them arrange themselves in a circle, while the

medicine men seat themselves on the ground, beating their sacred drums and shaking their rattles to a rhythmical sort of movement which guides the steps of the dancers.

These move continually in a circle, stamping, yelping, grunting, bellowing, and imitating in various ways the movements of the bison. The dance goes on day and night without cessation, and as it never ceases until bisons are seen, the reader will understand that it is absolutely effective in bringing them. A spirited sketch of such a dance is given on the following page.

The mode in which it is kept up is rather amusing. The medicine men who beat the drums and encourage the dancers are relieved from time to time by their companions. But for the dancers there is supposed to be no relief but death. This difficulty, however, is surmounted by a sort of legal fiction. When one of the performers has yelped, stamped, bellowed, and leaped until he can dance no longer, he stoops down and places his hands on the ground. Another dancer, who is armed with a very weak bow and arrows with large blunt heads, fits an arrow to his bow, and shoots him. The wounded dancer falls to the ground, and is seized by the bystanders, who drag him out of the ring, go through the movements of skinning him and cutting him up, when he is allowed to retire and rest from his labors. As soon as he is dragged out of the ring, another dancer leaps into his place, and in this way the dance may go on for weeks without cessation.

Meanwhile scouts are posted on all the hills within range, and as soon as one of them sees the bisons, he gives the signal by tossing his rope in the air in the direction of the game. Mr. Catlin relates a remarkable instance of the buffalo dance and its sequel.

Game had been scarce, the dance had been going on for days, and the village was in a state of increasing distress, when the welcome signal was seen from the hills. The dance ceased, the young men flew to their arms, sprang on their horses, and dashed off into the prairie toward the signal.

"In the village, where hunger reigned and starvation was almost ready to look them in the face, all was instantly turned to joy and gladness. The chief and doctors, who had been for seven days dealing out minimum rations to the community from the public crib, now spread before their subjects the contents of their own private *caches* (i. e.

hidden stores), and the last of everything that could be mustered, that they might eat a thanksgiving to the Great Spirit for His goodness in sending them a supply of buffalo meat.

"A general carouse of banqueting ensued, which occupied the greater part of the day, and their hidden stores, which might have fed them on an emergency for several weeks, were pretty nearly used up on the occasion. Bones were half picked, dishes half emptied, and then handed to the dogs. I was not forgotten in the general surfeit. Several large and generous wooden bowls of pemmican and other palatable food were sent to my painting room, and I received them in this time of scarcity with great pleasure."

When the feast was over, songs and dances set in, and the whole village was filled with sounds of revelry. Suddenly, in the midst of their mirth, two or three of the hunters dashed in among the feasters, one having in his hands a still bleeding scalp, another sitting wounded on his horse, whose white coat was crimsoned with the fast-flowing blood of the rider, while another was, though unwounded, totally unarmed, having flung away his weapons in the hurry of flight.

Their fatal story was soon told. The bisons, after whom the hunters had gone were nothing more than empty skins, within which a party of Sioux warriors had hidden themselves, and were imitating the action of the animals which they personated. Inveterate enemies of the Mandans, they had reconnoitred their village by night, and ascertained that they were executing the buffalo dance. Several of them procured bison skins, and enacted the part of the animals, while their comrades were concealed behind the bluffs.

Fortunately for the Mandans, their leader became suspicious of the supposed bisons, and halted his troop before they had quite fallen into the trap, and, when some eighty or ninety mounted Sioux dashed at them from behind the bluff, they were just starting homeward. As it was, however, eight of them fell, a loss which was but ill compensated by one or two Sioux scalps secured by the Mandans in the hurry of flight. Even under such untoward circumstances, the buffalo dance did not lose its reputation, for within two days a large herd of bisons passed near the village, and afforded an abundant supply of meat.

CHAPTER CXXXVIII.

THE NORTH AMERICAN INDIANS — *Continued.*

RELIGION — SUPERSTITION.

THE TERRIBLE ORDEAL OF THE MANDANS — LEGEND OF THE FLOOD — APPROACH OF THE FIRST MAN — THE GREAT MEDICINE LODGE, AND ITS CONTENTS — APPROACH OF THE CANDIDATES, AND DEPARTURE OF THE FIRST MAN — BUFFALO DANCE, AND THE BIG CANOE — APPROACH OF THE EVIL SPIRIT — POWER OF THE MEDICINE PIPE — COMMENCEMENT OF INITIATION — TRIAL BY SUSPENSION — SWOON AND RECOVERY — THE LAST RACE — TWO COURAGEOUS INITIATES — LOOKING AT THE SUN — RAIN MAKING — THE WHITE BUFFALO HAIR, AND HIS PROWESS — THE MEDICINE BAGS AND THE TOTEMS — THE MEDICINE MAN AT WORK — THE WOUNDED MAN AND SICK GIRL — INITIATION OF THE MIDÉ ORDER — THE PIPES OF PEACE AND WAR — SACRIFICES.

WE now come to the religious ceremonies of these remarkable tribes, and will begin with the terrible ordeal through which the youths have to pass before they can be acknowledged as men. Among the Mandans, this ordeal, for length and for severity, throws into the shade all the various ordeals of which we have read. Even the terrible gloves of the Mundurucú are mild when compared with the horrors of the Mandan initiation.

Until late years this ceremony was quite unknown. Every one who knew the people was aware that the Mandan youths had to pass through some terrible scenes of torture before they could take their place, among the warriors, but the details of the whole ceremony were kept a profound secret, and were never betrayed until Mr. Catlin, in his character of medicine man (which he had gained by his skill in painting), was permitted to be present. It is most fortunate that he did so, for the Mandan tribe has utterly perished, and thus the records of a most extraordinary superstition would have vanished. The ceremony is a very long and complicated one, and the following is a condensed account of it.

The ceremony has a religious aspect, and is, in fact, performed for the sake of propitiating the Great Spirit in favor of the young men who undergo it, so that he may make them valiant warriors and successful hunters. It has also another important object. Be-

ing conducted in the presence of the great chief and medicine man, it enables the leader of the tribe to watch the behavior of the young men who pass through the ordeal, and to decide upon their ability to sustain the various privations of Indian warfare.

The reader must first be told that among the Mandans there survived the legend of a flood which covered the earth, and from which only one man escaped in a large canoe. In the centre of the village there is a large open space, in which is a conventional representation of the "big canoe," in which the First or Only Man escaped. It is not the least like a canoe, and in fact is nothing more than a sort of tub standing on one end. It is bound with wooden hoops, and is religiously preserved from injury, not the least scratch being allowed to defile its smooth surface.

The ceremony only takes place once in the year, the time being designated by the full expansion of the willow leaves under the banks of the river. The Mandans possess the legend of the bird flying to the big canoe with a leaf in its mouth, only with them the leaf is that of the willow, and not of the olive. The bird itself is held sacred, and, as it may not be injured, it may often be seen feeding on the tops of the Mandan huts.

Early on the morning of the appointed day, a figure is seen on a distant bluff, approaching with slow and stately steps. As

soon as he is seen, the whole village becomes a scene of confusion, as if the enemy were attacking it. The dogs are caught and muzzled, the horses that are feeding on the surrounding pastures are driven into the village, the warriors paint their faces for battle, seize their spears, string their bows, and prepare their arrows.

In the midst of the confusion the First Man, or Nu-mohk-muck-a-nah, as he is called in the Mandan tongue, stalks into the central space, where the chief and principal warriors receive him and shake hands. He is a strange object to the eye. His nearly naked body is painted white, a white wolf-skin mantle is thrown over his shoulders, his head is decorated with plumes of ravens' feathers, and in his left hand he bears his mystery pipe, which he treats with the greatest veneration.

After greeting the chief, he proceeds to the great medicine lodge, which is kept closed during the year, and has it swept and the floor strewn with fresh green boughs and aromatic herbs. Several skulls of men and bisons are laid on the floor, a number of new ropes are thrown over the beams, a quantity of strong wooden skewers are placed under them, and in the centre is built a slight platform, on the top of which is laid the chief medicine or mystery of the tribe. This is so sacred that no one is allowed to approach it except the conductor of the ceremony, and none but he ever knows what it is.

He next goes to every hut in succession, stands before the gate, and weeps loudly. When the owner comes out, the First Man narrates the circumstances of the flood and of his own escape, and demands an axe or a knife as a sacrifice to the Great Spirit. Every hut furnishes an edged tool of some kind; and when the tale is completed, they are carried into the medicine lodge. There they rest until the last day of the ceremonies when they are thrown into a deep pool in the river. No one is allowed to touch them, and there they lie until at some future day they will be discovered, to the great bewilderment of antiquarians.

From the moment that the First Man enters the village a dead silence reigns, a circumstance quite in opposition to the usual noisy habits of a native village. Where he sleeps no one knows, but at dawn of the following morning he again enters the village, as he had done before, and walks to the medicine lodge, whither he is followed by the candidates for initiation walking in Indian file, and each painted fantastically, and carrying his bow and arrows, his shield, and "medicine bag." Of this article we shall learn more in a future page. In silence they seat themselves round the lodge, each having his weapons hung over his head.

Here they have to sit for four days, during which time they may not communicate

with those on the outside of the hut, and are not allowed to eat, drink, or sleep. When they have taken their places, the First Man lights his pipe from the fire that is kept burning in the centre of the lodge, and makes an oration to the candidates, exhorting them to be courageous and enduring, and praying that the Great Spirit may give them strength to pass satisfactorily through the ordeal.

He then calls to him an old medicine man, and appoints him to be master of the ceremonies, handing him the mystery pipe as a symbol of office. Addressing the assembled company, he takes leave of the chiefs, saying that he will return in another year to re-open the lodge, and stalks slowly out of the village, disappearing over the bluffs whence he came. The master of the ceremonies then takes his place in the centre of the lodge, and relights the pipe, uttering with every whiff of smoke a petition to the Great Spirit in behalf of the candidates. For three full days they sit silently round the lodge, but outside it a strange series of ceremonies takes place.

Chief among them is the buffalo dance, in which the eight actors wear the entire skins of bisons, and carry on their backs a large bundle of slight twigs. They also carry a mystery rattle in one hand, and a slender staff in the other. They arrange themselves in four pairs round the Big Canoe, each pair corresponding with one of the cardinal points of the compass. Between each group dances a young man, two of them painted black and covered with white stars, so as to represent the night, and the other two painted red, to represent the day.

Beside the Big Canoe sit two medicine men, wearing the skins of grizzly bears, and threatening to devour the whole village. In order to appease their hunger, the women bring continual relays of meat in dishes, which are at once carried off to the prairie by men painted entirely black, except their heads, which are white. They are thus colored in imitation of the bald-headed eagle. As they run to the prairie they are pursued by a host of little boys painted yellow, with white heads, and called antelopes. After a severe chase they catch the eagle-men, seize the food, and devour it.

These dances occur several times daily, the performers being summoned by the master of the ceremonies, who comes out of the medicine lodge, followed by his immediate assistants, and proceeds to the Big Canoe, against which he leans, and weeps aloud as if in dire distress. The dance takes place four times on the first day, eight times on the second, twelve times on the third, and sixteen times on the fourth; the sound of the old man's wailing cry being the signal for the dancers to issue from the hut in which they dress.

During each performance, the old medi-

ciné men who are beating their drums address the bystanders, telling them that the Great Spirit is pleased with their invocations, and that he has given them peace; that even their women and children can hold the mouths of grizzly bears; and that the evil spirit who is challenged by these rites has not dared to make his appearance. Thirty-two times during the four days this vaunt is made, and no evil spirit appears; but after the last day he comes, and a horrible-looking object he is.

On a distant bluff the evil spirit makes his appearance, rushing toward the village in a wild and devious course. Presently he enters the circle, perfectly naked, with his body painted black and covered with white rings, his mouth decorated with white indentations like great teeth, and holding in his hand a long magic staff tipped with a red ball. As he runs along, he slides this ball before him on the ground, and suddenly makes a rush at the groups of women who are witnessing the ceremony.

They fall back on each other in terror, and shriek for aid, which is given by the master of the ceremonies. As soon as he hears their cries, he runs from the Big Canoe, where he has been weeping, and holds his magic pipe in front of the intruder. The demon is instantly checked by its wondrous influence, and he stands as if petrified, each limb remaining in the attitude which it had taken when the pipe was held before him.

"This check gave the females an opportunity to get out of reach, and when they were free from their danger, though all hearts beat yet with the intensest excitement, their alarm was cooled down into the most exorbitant laughter and shouts of applause at his sudden defeat, and the awkward and ridiculous posture in which he was stopped and held. The old man was braced stiff by his side, with his eyeballs glaring him in the face, whilst the medicine pipe held in its mystic chain his satanic majesty, annulling all the powers of his magical wand, and also depriving him of the power of locomotion.

"Surely, no two human beings ever presented a more striking group than these two individuals did for a few moments, with their eyeballs set in direct mutual hatred upon each other; both struggling for the supremacy, relying on the potency of their medicine or mystery; the one held in check, with his body painted black, representing, or rather assuming to be, O-kee-hee-de (the Evil Spirit), frowning everlasting vengeance on the other, who sternly gazed him back with a look of exultation and contempt, as he held him in check and disarmed under the charm of his sacred mystery-pipe."

This scene is repeatedly enacted, until the powers of the magic pipe are proved against the assaults of the evil one, and the people have gained confidence in its protection.

The women then begin in their turn to assail their persecutor with jeers and laughter, until at last one of them snatches up a handful of mud and dashes it in his face. He is at once vanquished by this attack, and begins to weep piteously. Emboldened by this confession of weakness, another woman snatches away his magic staff, and breaks it across her knee. The fragments are seized by the surrounding women, who break them to pieces and fling them at the head of the demon. Being now deprived of all his power, he runs off across the prairie, followed for half a mile or so by the women, who pelt him with sticks, stones, and mud, until at last he effects his escape, and the village is rid of the evil spirit for another year.

Now the remainder of the initiation may proceed.

The little scaffold with its mystic burden is removed from the centre of the great medicine lodge, the hide ropes are passed through apertures in the roof to men who stand outside, and the master of the ceremonies, and his assistants, together with the chiefs and braves of the tribe, re-enter the lodge, and take up their positions.

The first candidate is now called, and, wasted by four days of abstinence from food, drink, or sleep, places himself in front of two of the operators. One of these, who is armed with a double edged knife, purposely blunted and notched, pinches up an inch or so of flesh of the shoulder or breast, and pushes the knife through it, between his finger and thumb and the body of the candidate. The knife is then withdrawn, and one of the wooden skewers forced through the aperture. This operation is repeated on the other shoulder or breast, on each arm just below the shoulder and below the elbow, upon each thigh, and upon each leg just below the knee.

While this operation is being performed, the candidates do not allow the slightest symptom of pain to escape them, and they even invite the spectators to watch their countenances, so as to ascertain that they betray no signs of suffering. They may well do so, for upon the verdict of these chiefs depends the consideration in which they will be held in after life, and no man has a chance of being appointed the leader of a war party if he has been seen to flinch during the ordeal.

As soon as these preparations are completed, two of the hide ropes are lowered from the roof, and hitched round the skewers on the breast or shoulders. To the others are hung the weapons of the candidate, while to those of the lower arm and leg are suspended the skulls of bisons. A signal is then given, and the poor wretch is hauled up into the air, when he swings suspended only by the two skewers, and sustaining not only his own weight but that of the heavy skulls, his feet being some six or eight feet

from the ground. In this terrible position he has to remain until nature finally gives way, and he faints. The artist has represented this stage of the fearful ordeal on the following page.

"Surrounded," writes Mr. Catlin, "by imps and demons, as they appear, a dozen or more, who seem to be concocting and devising means for his exquisite agony, gather around him, when one of the number advances toward him in a sneering manner, and commences turning him round with a pole which he brings in his hand for that purpose. This is done in a gentle manner at first, but gradually increased, until the poor fellow, whose proud spirit can control its agony no longer, bursts out in the most lamentable and heart-rending cries that the human voice is capable of producing, crying forth a prayer to the Great Spirit to support and protect him in this dreadful trial, and continually repeating his confidence in his protection.

"In this condition he is continued to be turned faster and faster, and there is no hope of escape for him, nor the chance for the slightest relief, until, by fainting, his voice falters, and his strugglings cease, and he hangs a still and apparently lifeless corpse. When he is by turning gradually brought to this condition, which is generally done within ten or fifteen minutes, there is a close scrutiny passed upon him among his tormentors, who are checking and holding each other back as long as the least struggling or tremor can be discovered; lest he should be removed before he is, as they term it, entirely dead."

When they are satisfied, a signal is given to the rope-holders, and the senseless man is lowered to the ground, the skewers which passed through his breast are removed, and the ropes attached to another candidate. Just as he falls, he is allowed to lie, no one daring to touch him, for he has put himself under the protection of the Great Spirit, and to help him would be a sacrilege.

When he recovers a little strength, he crawls to another part of the lodge, where sits a medicine man with a bison skull before him, and an axe in his hand. Holding up the little finger of his left hand as a sacrifice to the Great Spirit, the initiate lays it upon the skull, when it is severed by a blow from the axe. Sometimes the fore-finger of the same hand is also offered, so that there are only left the thumb and the two middle fingers, which are all that are needed to hold the bow.

It is a point of honor with the initiates to recover as quickly as possible from their swoon, and the chief warriors all watch them narrowly on this point, inasmuch as rapidity of recovery is a proof that the individual is strong, and capable of enduring the hardships which every war party is nearly certain to undergo before their return.

The final scene of the initiation is called the Last Race, and is, if possible, even a more dreadful trial than any which the candidates have yet undergone. An illustration of it is also given the reader on the next page.

The reader will remember that, although the skewers by which the young men were suspended are removed as soon as they are lowered to the ground, there yet remain eight more, two in each arm, and two in each leg. To each of these is attached a heavy weight, such as the bison skull, and none of them may be drawn out. They must absolutely be torn out through the flesh by main force, and that this object may be accomplished the Last Race is run. Hitherto the ordeal has been confined to the interior of the medicine lodge, but the Last Race is run in the open air, and the whole of the inhabitants are spectators.

The master of the ceremonies leaves the medicine lodge, goes to the Big Canoe, leans his head against it, and sets up his wailing cry. At the sound of his voice twenty young men issue from the dressing hut, all of the same height, and all wearing beautiful war dresses of eagle quills. Each carries in one hand a wreath of willow boughs, and on reaching the Big Canoe they arrange themselves round it in a circle, holding the wreaths as connecting links. They then run round the canoe, from left to right, screaming and yelping at the top of their voices, and going as fast as their legs can carry them.

The candidates are now brought out of the medicine lodge, each trailing the heavy weights attached to his limbs, and are placed at equal intervals outside the ring of runners. As each takes his place, he is given into the charge of two powerful young men, who pass round each of his wrists a broad leathern strap, which they grasp firmly without tying.

As soon as all are ready, a signal is given, and the candidates are set running round the Big Canoe, outside the inner circle, each man being dragged along by his supporters, until the skulls and other weights tear out the skewers to which they are fastened. The bystanders yell and applaud at the tops of their voices, so as to drown the groans of the sufferers, should the force of nature extract a sound from them, and to encourage them to endure this last trial. It often happens that the flesh is so tough that the skewers cannot be dragged out, and in such cases the friends of the sufferers jump on the skulls as they trail along the ground so as to add their weight to them.

The candidates mostly faint before they have run very far, but they are still dragged round the circle, and not released until the last weight has been torn away. As soon as this occurs, the two men who have dragged their senseless charge loosen their

(1.) MANDAN ORDEAL OF SUSPENSION. (See page 1304.)

(2.) THE LAST RACE. (See page 1304.)

holds, and run away as fast as they can, leaving the body lying on the ground. No one may touch the poor wretch; and there he lies, a second time in the keeping of the Great Spirit. After a few minutes he recovers his senses, rises, and staggers through the crowd to his own hut, where his friends meet him, and do their best to succor him.

The rule is absolute that the man may not be released until the skewers have been fairly torn through the flesh. Mr. Catlin relates two remarkable anecdotes illustrative of this fact. In the one case the skewer had been unfortunately passed under a sinew. The poor lad was in vain dragged round the ring, and in vain did his friends throw themselves on the elk skull that was hung to him. At last the spectators set up a cry of distress, and the master of the ceremonies stopped the runners, leaving the senseless body lying on the ground. Presently the lad recovered himself, looked at the cause of his torment, and with a pleasant smile crawled on his hands and knees to the prairie, where he remained for three days longer without food or drink, until suppuration took place, and enabled him to release himself from his encumbrance. He crawled on his hands and knees to his home, and, in spite of his sufferings, recovered in a few days.

In the other case, two of the weights attached to the arms could not be removed. The unfortunate wretch crawled to the precipitous bank of the river, and drove a stake into the ground. To this stake he fastened the weights by two ropes, and let himself down half-way to the water. In this terrible position he hung for more than two days, until the too stubborn flesh at last gave way, and let him fall into the water. He swam to the side, made his way up the steep bank, and recovered.

Such instances as these, terrible as they are at the time, are never regretted by those to whom they occur, as they offer means of proving their valor and endurance, and any one who has overcome them is held in much consideration by the rest of the tribe.

Dreadful as is the whole scene of suffering, and sufficient to kill an ordinary white man, several of the warriors have undergone it more than once, and Mr. Catlin saw by the scars left on the body and limbs that some of the chief Mandan braves had submitted to the torture no less than five times. Some part of the estimation in which such men are held is owing to the belief of the Mandans that the annual supply of bisons depends on the proper fulfilling of these ceremonies, and that the Great Spirit is gratified in proportion to the number of times that the rites are performed. Thus those who have undergone them repeatedly are benefactors to the tribe in general, and as such receive their gratitude.

A somewhat similar system prevails among the Dacotah or Sioux Indians, as they are generally called. This, however, is a voluntary proceeding very rarely seen, and one which is intended simply to raise the candidate to the rank of medicine man. A tall and slender pole is set firmly in the ground, and to the top of it is fastened one end of a rope, the other being made into a loop. The candidate for mystic honors takes his place at the pole before dawn, painted gaily, and holding his medicine bag in his hand. Just before the sun rises, two skewers are passed through his breast, as is done by the Mandans, and the loop of the rope is passed over them.

The man now stands opposite the spot where the sun will rise, fixes his eyes upon it, and leans backward so as to throw the whole weight of his body on the rope, his feet serving more to balance than sustain him. As the sun passes over the heavens, he moves gradually round, never speaking nor taking his eyes from it; and if he can endure this torture from sunrise to sunset without fainting, he earns the rank to which he aspires, together with all the valuable presents which are laid at the foot of the pole by his admirers.

There is great risk attending this practice. Should the man faint in spite of the shouts and cheering cries of his friends, and the prayers and songs of the medicine men who sit around the pole, chanting and beating their magic drums, his reputation is lost, and he will ever afterward be held up to ridicule as one who had the presumption to set up for a medicine man, and had no power to sustain the character.

The Mandans have a curious mode of obtaining the rank of medicine man, resembling in many points the rain making ceremonies of Africa. As they depend much for their subsistence on the maize which they grow, a drought is always a great calamity, and must be averted if possible. When such an event occurs, the women, whose business it is to till the ground, come to the chiefs and doctors, and beg them to make rain, lest the corn should die. A council is then held, and the medicine men assemble in the council-house, and go through their preliminary ceremonies. No one is allowed to enter the house except the medicine men and those candidates who aspire to that rank.

There are generally ten or fifteen young men who prize that rank so highly that they are willing to run the risk of failure, and to lose all reputation in their tribe if they fail in drawing down the rain from the sky. They are called one by one out of the lodge, and take their position on the roof, when they go through the ceremonies which they think will produce the desired rain. They stand there from sunrise to sunset, and if no rain falls, they go to their houses dis-

graced, and debarred from all hope of being admitted into the Council of the tribe. Should, however, the rain descend, the reputation of the rain maker is assured, and he is at once admitted into the council among the chiefs and greatest braves.

Mr. Catlin relates a curious account of rain making of which he was a witness. There had been a drought for some time in the land, and the rain makers had been at work for three days. On the first day a man named Wah-kee, or the Shield, essayed his fortune, and failed. The same fate befell Om-pah, or the Elk, in spite of his head-dress made of the skin of the raven, the bird that soars amid the storm. Wa-rah-pa, or the Beaver, also tried and failed; and on the fourth day Wak-a-dah-ha-hee, the White Buffalo Hair, took his stand on the lodge. He placed his chief reliance on the red lightnings with which he had painted his shield, and the single arrow which he carried in his hand.

He made an oration to the people, saying that he was willing to sacrifice himself for the good of the tribe, and either to bring rain or live with the dogs and old women all his life. He explained that one candidate had failed because the shield warded off the rain clouds; that the second failed because the raven was a bird that soared above the storm, and so did not care whether it rained or not; and the third failed because the beaver was always wet, and did not require rain. But as for himself, the red lightnings on his shield should bring the black thunder-cloud, and his arrow should pierce the cloud and pour the water on the fields.

Now it happened that just at that time a steamboat the first that had ever been up the Missouri fired a salute from a twelve-pounder gun, as she came in sight of the Mandan village. The sound of the gun was naturally taken for thunder, and the village was filled with joy. Valuable gifts were presented on all sides to the successful candidate, mothers were bringing their daughters to offer them as his wives, and the medicine men were issuing from their lodge in order to admit him formally among themselves.

Suddenly, from his elevated post, Wak-a-dah-ha-hee saw the steamboat ploughing her way up the river, and emitting the thunder from her sides. He turned to the chiefs and the assembled multitude, and told them that, though the sounds were not those of thunder, his medicine was strong, and had brought a thunder-boat to the village. The whole population thronged to the bank in silent wonder, and in the excitement of the time even the rain maker was forgotten. The passengers landed among the Mandans, and for the rest of the day all was turmoil and confusion. Just before sunset the White Buffalo Hair spied a black cloud creeping up from the horizon,

unnoticed by the excited crowd. In a moment he was on the roof of the council-house again, his bow strung and the arrow brandished in his hand. He renewed his boastings and adjurations, and as the cloud came over the village, he bent his bow and shot his arrow into the sky. Down came the rain in torrents, drenching the fortunate rain maker as he stood on the roof, still brandishing his thunder shield and vaunting its power.

The storm continued during the night, but unfortunately a flash of lightning entered a lodge, and killed a young girl. Consternation reigned throughout the village, and no one was more frightened than the newly-made medicine man, who feared that the Council would hold him responsible for the girl's fate, and condemn him to a cruel death. Moreover, he really considered that he was in some way responsible, as he had left the top of the council-house before he had brought rain.

So, early in the morning, he sent his friends to bring him his three horses, and, as the sun rose, he again mounted the lodge and addressed the people. His medicine was too strong, he said. "I am young, and I was too fast. I knew not where to stop. The wigwam of Mah-sish is laid low, and many are the eyes that weep for Ko-ka (the Antelope). Wak-a-dah-ha-hee gives three horses to gladden the hearts of those that weep for Ko-ka. His medicine is great. His arrow pierced the black cloud, and the lightning came, and the thunder boat also. Who says that the medicine of Wak-a-dah-ha-hee is not strong?" This ingenious address was received with shouts of applause, and from that time to his death Wak-a-dah-ha-hee was known by the honorable title of the "Big Double Medicine."

We will now glance at the medicine bag, which plays so important a part among all the tribes of North America.

When a boy is fourteen or fifteen years old, he is sent into the woods to find his medicine. He makes a couch of boughs, and then lies without food or drink for several days, the power of his medicine being in proportion to the length of his fast. So severe is this discipline that instances have been known when the lad has died from the long abstinence to which he subjected himself. When he has endured to the utmost, he yields himself to sleep, and the first beast, bird, or reptile of which he dreams becomes his "medicine."

He then returns home, and as soon as he has recovered a little strength, he goes out in search of his medicine, and, having killed it, preserves the skin in any shape which his fancy may dictate. It is mostly sewed up in the form of a bag, and contains one or two other charms. The reader will see that the size of the medicine bag is exceedingly variable, according to the size of the creature

from whose skin it is formed. Sometimes it is three feet or more in length, and often it is so small that it can be concealed under the garments of the owner.

From the medicine bag the Indian never parts. He considers its presence absolutely indispensable to ensure success in any undertaking, and even carries it into battle, where he trusts to it for protection. Should he lose it in battle, he is utterly disgraced, and there is only one way of restoring himself to reputation. An Indian can only "make his medicine" once, so that he may not restore it by another probation of fasting and dreaming. But if he can slay an enemy in open battle, and take his medicine bag, his status in the tribe is restored, and he thenceforth assumes the medicine of the slain man in exchange for his own. If a man who has not lost his own medicine succeeds in capturing one from an enemy in fair battle, he is entitled to assume a "double-medicine," and never loses an opportunity of displaying both the medicine bags as trophies of his prowess. Taking a medicine bag is as honorable as taking a scalp, and the successful warrior has the further advantage of being doubly protected by the two charms.

Very few instances have been known where an Indian has voluntarily parted with his medicine bag, and in such cases scarcely any display of valor will reinstate him in the opinion of his tribe. Sometimes he can be induced by the solicitation of white men to bury it, but he treats the grave as if it were that of a revered relation, hovering about it as much as possible, lying over the sacred spot, and talking to the bag as if it were alive. Sometimes he offers sacrifices to it; and, if he be a wealthy man, he will offer a horse.

Such a sacrifice as this takes rank as a public ceremony. A long procession goes to the prairie, the lead being taken by the owner of the medicine bag, driving before him the horse, which must always be the best he possesses. The animal is curiously painted and branded, and is held by a long lasso. When the procession arrives at the appointed spot, the sacrificer makes a long prayer to the Great Spirit, and then slips the lasso from the animal, which from that time takes its place among the wild horses of the prairie, and if at any time caught by the lasso, is at once recognized by the brand, and set free again. Such a sacrifice as this is appreciated very highly by the tribe, and gives the man the privilege of recording the circumstance on his mantle and tent. One Mandan chief sacrificed in this way no less than seventeen horses.

In connection with the medicine bag may be mentioned the "totem," or mark by which each family is known. This is mostly an animal, such as a wolf, a bear, a dog, a tortoise, &c. If a chief wishes to show that he

and his party have passed a given spot, he strikes with his axe a chip off a tree and draws on the white surface his totem. Or, if he sends an order to a distance, he draws his totem on a piece of bark, and gives it to his messenger as a token.

To return to the medicine man. He is best seen to advantage when exercising his art upon a sick person. He wears for this purpose one of the most extraordinary dresses which the mind of man ever conceived. No two medicine men wear a similar costume, but in all it is absolutely essential that every article shall be abnormal. Mr. Catlin saw one of these men called in to practise on a Blackfoot Indian, who had been shot through the body with two bullets. There was not the least chance of his recovery, but still the medicine man must be summoned. His strange, grotesque appearance, and the wild ceremony over the sick man are vividly represented on page 1311.

A ring was formed round the dying man, and a lane was preserved through them, by which the mystery man would make his appearance. In a few minutes a general hush-h-h ran through the assembly as the tinkling and rattling of his ornaments heralded the approach of the wise man. As he entered the ring, nothing could surpass the wild grotesqueness of his costume. By way of a coat, he wore the skin of a yellow bear—an article exceedingly rare in North America, and therefore in itself a powerful medicine. The skin of the head was formed into a mask, which entirely hid the features of the enchanter. The skins of various animals dangled from his dress, and in one hand he held his magic wand, and in the other the mystery drum, which contained the arcana of his order.

His actions were worthy of his appearance. He came in with a series of wild jumps and yells, accompanied with the rattling and beating of his magic drum as he approached the dying man. Having reached his patient, he began to dance round him to the accompaniment of his drum; to leap over him, to roll him from side to side, and in every imaginable way to render his last hours unendurable. In fact, the man might well die, if only to be rid of his physician. In a short time he did die; but the man, not in the least disconcerted at the failure of his efforts, danced out of the circle as he had entered it, and went off to his lodge to take off and pack up his official dress.

A somewhat similar scene was witnessed by Mr. P. Kane, in which the mode of manipulation was almost identical, though the medicine man, instead of disguising himself in a strange dress, went just to the opposite extreme. The story is narrated in Mr. Kane's "Wanderings of an Artist," being as follows:—

"About ten o'clock at night I strolled into

the village, and on hearing a great noise in one of the lodges, I entered it, and found an old woman supporting one of the handsomest Indian girls I had ever seen. She was in a state of nudity. Cross-legged and naked, in the middle of the room, sat the medicine man, with a wooden dish of water before him; twelve or fifteen other men were sitting round the lodge. The object in view was to cure the girl of a disease affecting her side. As soon as my presence was noticed, a space was cleared for me to sit down.

"The officiating medicine man appeared in a state of profuse perspiration, from the exertions he had used, and soon took his seat among the rest, as if quite exhausted; a younger medicine man then took his place in front of the bowl, and close beside the patient. Throwing off his blanket, he commenced singing and gesticulating in the most violent manner, whilst the others kept time by beating with little sticks on hollow wooden bowls and drums, singing continually. After exercising himself in this manner for about half an hour, until the perspiration ran down his body, he darted suddenly upon the young woman, catching hold of her side with his teeth, and shaking her for a few minutes, while the patient seemed to suffer great agony. He then relinquished his hold, and cried out he had got it, at the same time holding his hands to his mouth; after which he plunged them in the water, and pretended to hold down with great difficulty the disease which he had extracted, lest it might spring out and return to its victim.

"At length, having obtained the mastery over it, he turned round to me in an exulting manner, and held something up between the finger and thumb of each hand, which had the appearance of a piece of cartilage; whereupon one of the Indians sharpened his knife, and divided it in two, leaving one in each hand. One of the pieces he threw into the water and the other into the fire, accompanying the action with a diabolical noise, which none but a medicine man can make. After which he got up perfectly satisfied with himself, although the poor patient seemed to me anything but relieved by the violent treatment she had undergone."

Mr. Mulhausen relates an amusing anecdote of a native doctor's practice upon himself. He had suffered so much in a long march that he was at last compelled to ask for a day's rest. One of his companions, a medicine man, immediately tried the effect of his art. First he kneaded the body, and especially the stomach, of the prostrated traveller with all his force. This was to drive out the evil spirit; and, in order to effectually exorcise him, he procured his drum, and seated himself on the ground.

Placing the drum close to the ear of his patient, he kept up a continual rub-a-dub for

two whole hours, singing the magic chant the while, until, in spite of his wounded feet, Mr. Mulhausen crawled out of the tent in sheer despair. The triumphant doctor wiped his streaming brows, and, declaring that no evil spirit could withstand such a medicine as that, gave the signal for resuming the march.

Among the Ojibbeways there is a remarkable ceremony by which an infant is received into the order of the Midés, a society in some degree resembling the Freemasons, the members of which consider themselves as related to each other, and addressing each other by the names of uncle, aunt, brother, sister, cousin, &c.

A temple, forty feet in length, was constructed for the express purpose, and built of boughs, like the bowers of the Feast of Tabernacles. It was built east and west, and had the entrance door at the eastern end, and the exit door at the western. In the middle sit the great Midés, each with his mystery bag, and opposite them sits the father of the child, dressed in his full paraphernalia of feathers, furs, and scalp-locks, and holding in his arms the child, lying tied on its board after the manner of Indian babies. On either side of him are the witnesses of the reception, and eastward of the chief Midés lies a large rough stone, which prevents the evil spirit.

The ceremony begins with an address of the principal Midé, and then the chiefs rise, and after walking in procession, each of them runs at one of the guests, presenting his medicine bag at him, and yelling in quickening accents, "Ho! ho! hohohoho! O! O! O! O!" As he presents the bag, the breath proceeding from it is supposed to overcome the person to whom it is presented, who falls down and lies there motionless. Having struck one person down, the Midé runs round the temple, to allow the medicine bag to recover its strength, and then presents it to another victim. This process is repeated until all the inmates of the hut, with the exception of the officiating Midés, are lying prostrate on the ground, where they lie until a touch from the same bag restores them to life and activity. This ceremony is repeated several times during the day, and is intended to show the virtue of the medicine bag.

The father then presents his child to the Midés, after which there is another speech from the chief Midé, and then follows a curious dance, consisting of two leaps to the right and two to the left alternately. After this, every one produces his medicine bag, and tries to blow down everybody else. And, as the bags are covered with tinkling bells, bits of metal, and shells, and the principal Midés are beating their drums and shaking their rattles with all their might, it may be imagined that the noise is deafening.

(1.) THE INDIAN BALL PLAY. (See page 1324.)

(2.) THE MEDICINE MAN AT WORK. (See page 1309.)

This completed the first part of the ceremony. In the next act, a pile of boughs covered with a cloth lay in front of the evil stone, and the chief Midé summoned all the initiated. They formed a procession of men, women, and children, and walked round the lodge, each stooping over the cloth as he passed, and looking at it. The second time they stooped closer, and the third time they were seized with convulsive movements as they approached the cloth, and each ejected from the mouth a little yellow shell upon the cloth. By the ejection of the shell (which typifies the sinful nature of man) the convulsions are healed, and, after going once more round the lodge, each performer takes one of the shells and places it in the medicine bag.

The last scene was a general feast, and gifts of amulets and charms presented by the chief Midés to the child.

One of the most pleasing traits in the character of these tribes is the strong religious feeling which pervades the general tenor of their lives, and which has raised them above the rank of mere savages. However imperfect may be their ideas on this subject, they are not idolaters, and give all their worship, either directly or indirectly, to one Great Spirit, whose aid and protection they continually invoke.

They believe in future existence and a future recompense according to their character in this life. Whatever their superstitions and ignorance, the mysteries enveloping their belief, there is running clearly through them all, these great doctrines accepted by the civilized Christian races.

To the Great Spirit they ascribe the possession of all the necessities and pleasures of life, and to him they offer their prayers and return their thanks on almost every occasion. For example, the bison, on which many of the tribes depend for food, clothing, and lodging, are held to be direct gifts of the Great Spirit to the red men, and asked for accordingly. The same is the case with the maize, or Indian corn, and religious ceremonies are held both at the planting and at the harvest time.

Tobacco is placed in the same category, and the smoke of the plant is considered to be a sort of incense, which is offered to the Great Spirit whenever a pipe is lighted, one wreath of smoke being blown silently to each quarter of the heavens, and to the sun, as an acknowledgment that the tobacco is a gift of the Great Spirit. Indeed, to the Indian mind there is something peculiarly sacred about tobacco smoke, probably on account of the soothing, and at the same time exhilarating, properties which have caused its use to extend to every portion of the globe.

Every religious ceremony is begun and ended with the pipe; war is declared, volunteers enlisted, negotiations conducted, and peace concluded, by its means. The char-

acter of the pipe varies with the occasion, the most valued being the sacred calumet, or medicine pipe, by which are settled the great questions of war and peace.

Among the Cree Indians the calumet is borne by a man who is solemnly elected to the office, and who has to pay rather dearly for the honor, from fifteen to twenty horses being the usual fee which each pipe bearer presents to his predecessor on receiving the insignia of office. These, however, are of considerable intrinsic value. They include a bear skin, on which he lays the pipe-stem when uncovered, a beautifully painted skin tent, in which he is expected to reside, a medicine rattle of singular virtue, a food bowl, and other articles so numerous that two horses are needed to carry them.

During his term of office, the pipe bearer is as sacred as the calumet itself. He always sits on the right side of the lodge, and no one may pass between him and the fire. He is not even allowed to cut his own food, but this is done by his wives, and the food placed in the official bowl which has just been mentioned. The pipe, with its innumerable wrappers, hangs outside the lodge, and is finally enclosed in a large bag, embroidered with the most brilliant colors which native art can furnish.

When it is uncovered, great ceremony is shown. No matter how severe may be the weather,—sometimes far below zero,—the bearer begins his operations by removing all his garments with the exception of his cloth, and then pours upon a burning coal some fragrant gum, which fills the place with smoke. He then carefully removes the different wrappers, fills the bowl with tobacco, and blows the smoke to the four points of the compass, to the sky, and to the earth, at each puff uttering a prayer to the Great Spirit for assistance in war against all enemies, and for bison and corn from all quarters. The pipe is replaced with similar ceremonies. No woman is allowed to see it, and if during the beginning of the ceremony a single word is spoken, it is looked upon as a very bad omen, and all the ceremony has to be begun again.

The bowl of the calumet is made of a peculiar stone, found, I believe, only in one place in the world, namely, in the Great Pipe-stone Quarry. This is situated in the Côteau des Prairies, about three hundred miles west of the Falls of St. Anthony, on the southern summit of the dividing ridge between the Minnesota and Missouri rivers, in the very middle of the Sioux territory. On this sacred spot the Great Spirit is said to have stood in the ancient times, and to have called together all the Indian nations. He broke from the rock a piece of stone, moulded it in his hands into a huge pipe bowl, and smoked it toward the four quarters of the compass. Then he told them that the ground was sacred, and that

no weapon of war should be raised in it, for the red stone was their flesh, and belonged equally to them all. At the last whiff of the pipe the Great Spirit disappeared in the cloud, and the whole ground was melted, and became polished as at the present time.

In consequence of this legend, the Indians have the greatest reverence for this place. They will not allow any white man to touch the stone, or even to approach the place, if they can keep him away, saying that the stone is their flesh, and that if a white man takes the red men's flesh, "a hole will be made in their flesh, and the blood will never stop running."

Even the natives themselves never take a pipe without asking permission of the Great Spirit, depositing tobacco in the hole whence they dug it, and promising that it shall be made into a pipe. When Mr. Catlin succeeded in reaching this sacred spot, one of the chief obstacles lay in the fact that a native had once given a piece of the red stone to a white man in order to be made into a pipe, and he had made it into a dish, thereby offending the Great Spirit, and "making the heart of the Indians sick."

Mr. Catlin's opinion is, that the red pipes, found among almost every tribe of Indians on the continent, were obtained at this place. His reasons are that every tribe he visited alleged this as their source; and furthermore, the stone from which they are made is different from any mineral yet discovered in America or Europe. He expresses the conviction substantiated by striking proof that the various tribes had for centuries visited this quarry, laying aside the war club and scalping knife, and smoking together in amity upon this neutral ground by command, as they thought, of the Great Spirit.

This stone is of a soft, creamy red color, rather variable in point of tint, and taking a peculiar polish. It has been analyzed, and is said to be a kind of steatite. It is cut into various fanciful shapes, those shown in the illustration on the next page being ordinary examples, though in some cases the bowls are adorned with figures of men and various animals. Some of these pipe heads have two bowls, one in front of the other.

These bowls are fitted with stems worthy of their sacred character. They are generally made of the stalk of the young ash, and are often adorned in the most elaborate manner. They are mostly flat, and sometimes are twisted spirally and perforated with open patterns in such a way that the observer cannot but marvel how the aperture for the smoke is made. After all, the mode of boring is simple enough. As every one knows who has cut a young ash sapling, the centre is occupied with pith. This is easily burned out with a hot wire, or bored out with a piece of hard wood, and the aperture is completed.

Afterward the wood is cut away on two sides, so as to leave only a flat stem, with the bore occupying the centre. The perforated patterns are next cut at either side of the bore, being carefully kept clear of it; and if the stem be then softened in boiling water, it can be made to assume almost any shape. One valued but rather rare form is a screw, or spiral, and several of the pipes in Mr. Catlin's collection have this form.

The stems are very seldom left bare, but are almost invariably decorated with colored porcupine quills, woven into various patterns, sometimes representing the forms of men and animals. The calumet is always decorated with a row of eagle feathers, sometimes stained scarlet, and being tufted at their ends with slight plumes of hair. Indeed, this portion of the calumet is formed on exactly the same principle as the headdress of the chief, of which a drawing is given on page 1277. An example of this kind of pipe is shown in the upper figure, on page 1315. Many pipes, instead of feathers, have long tufts of hair dyed scarlet. This hair is taken either from the tail of a white horse or that of a white bison, as in the lower figure of the same illustration. The woodpecker furnishes many ornaments for these pipes, and sometimes the stem passes through the preserved skin of a bird, or through that of a particularly beautiful cruminate. But whatever may be the ornament of a medicine pipe, it is always the very best and most valuable that can be procured. The stem of the pipe varies from two to four feet.

The natives do not restrict themselves to tobacco, but smoke many narcotic vegetables, whether leaves, roots, or bark. These are generally mixed with tobacco, and go by the general name of *k'neck-k'neck*.

The custom of sacrifice obtains among all Indian tribes and is performed in various ways and upon many occasions. Cruel as the Indian is reputed to be, none of the tribes, except the Pawnees, have ever made human sacrifices; and these many years since abandoned the inhuman custom.

Their offerings to the Great Spirit must consist of the best of their possessions: the choicest piece of buffalo meat, the finest arrow, the most costly piece of cloth, the favorite horse or dog, and sometimes their own fingers. Such offerings are erected over the great medicine lodge in the centre of the village. When Mr. Catlin was among the Mandans there was placed there beside other gifts a beautiful skin of a buffalo, the history of which he gives as follows:—
"A few weeks since a party of Mandans returned from the mouth of the Yellow Stone with information that a party of Blackfeet were there on business with the American Fur Company, and that they had with them a white buffalo robe. Such a robe is a great curiosity, even in the coun-

try of buffaloes, and will always command an incredible price. Being the most costly article in the region it is usually converted into a sacrifice, being offered to the Great Spirit as the rarest and most acceptable gift that can be procured. Among the vast herds of buffaloes there is not one in a hundred thousand, perhaps, that is white; and when such is obtained it is considered a great medicine or mystery.

“Receiving the intelligence above mentioned the chiefs convened in council and deliberated on the propriety of procuring this valuable robe. At the close of their deliberation eight men were fitted out on eight of their best horses, who took from the Fur Company’s store, on the credit of

the chief, goods exceeding the value of the horses. They arrived in due time, made the purchase, and leaving their horses and all the goods carried, returned on foot, bringing the coveted robe, which was regarded as vastly curious and containing (as they express it) something of the Great Spirit. This wonderful anomaly lay several days in the chief’s lodge, till public curiosity was gratified; then it was taken by the high priests, and with a great deal of ceremony consecrated and raised on the top of a long pole over the medicine lodge, where it stands and will stand as an offering to the Great Spirit, until it decays and falls to the ground.”

INDIAN PIPES. (From my collection.)

CHAPTER CXXXIX.

THE NORTH AMERICAN INDIANS—*Continued.*

SOCIAL LIFE.

MARRIAGE—AN ENTERPRISING BRIDEGROOM, AND HIS SUDDEN ELEVATION TO RANK—TREATMENT OF WOMEN—TREATMENT OF CHILDREN—PORTRAIT OF PSHAN-SHAW—OF INDIAN BOY—THE CRADLE—THE FLAT-HEADED TRIBES—AFFECTION OF THE MOTHERS—THE COUGH OF MOURNING—ABANDONING THE SICK AND OLD—DANCES OF THE TRIBES—GAMES—THE SPEAR AND RING GAME—PAGESSAN, OR THE BOWL GAME—THE BALL PLAY—THE BALL DANCE—STARTING THE GAME, AND EXCITING SCENES—THE WOMEN'S BALL PLAY—HORSE-RACING—CANOE-MAKING—THE CANOE RACE—PRIMITIVE SAILS—SWIMMING—THE LEAPING ROCK—QUILL ORNAMENTS—BARK-BITING—WIGWAMS—MUSIC—PLEDGE OF FIDELITY—DISPOSAL OF THE DEAD—BURIAL OF BLACKBIRD—REFLECTIONS UPON CHARACTER AND DESTINY OF THE INDIANS.

THE ordinary social life of these interesting tribes now comes before us. As to marriage, there is little to distinguish it from the same ceremony among other uncivilized tribes, the girl being in fact purchased from her father, and her affections not necessarily, though generally, considered. A man may have as many wives as he can afford to keep, and when he can purchase four or five, their labor in the field is worth even more to the household than his exertions in the hunting field.

Mr. Catlin relates one rather amusing wedding.

There was a young lad, the son of a chief, whom his father started in life with a handsome wigwam, or tent, nine horses, and many other valuable presents. On receiving these presents, the young man immediately conceived a plan by which he could perform an act which would be unique. He went to one of the chiefs, and asked for the hand of his daughter, promising in return two horses, a gun, and several pounds of tobacco. The marriage was fixed for a certain day, but the transaction was to be kept a profound secret until the proper time. Having settled the business, he went to three other chiefs, and made exactly the same bargain with each of them, and imposed silence equally upon all.

On the appointed day, he announced to the tribe that he was to be married at a certain hour. The people assembled, but no

one knew who was to be the bride, while each of the four fathers stood proudly by his daughter, inwardly exulting that he alone was in the secret. Presently the young bridegroom advanced to the chief to whom he had made the first offer, and gave him, according to his promise, the two horses, the gun, and the tobacco. The other three fathers immediately sprang forward, each denouncing the whole affair, and saying that the offer was made to his daughter, and to his alone. In the midst of great confusion, which was partially quelled by the chiefs and doctors, the young bridegroom addressed the assembly, saying that he had promised each of the claimants two horses, a gun, and a certain amount of tobacco in exchange for his daughter, and that he expected them to fulfil their part of the contract. There was no gainsaying the argument, and in the sight of the admiring spectators, he delivered the stipulated price into the hands of the parents, and led off his four brides, two in each hand, to his wigwam.

The action was so bold, and so perfectly unique, that the doctors immediately determined that a lad of nineteen who could act in this manner must have a very strong medicine, and was worthy to be ranked among themselves. So they at once installed him a member of their mystery, thereby placing him on a level with the greatest of the tribe, and by that bold *coup* he had raised himself from a mere untried

(2.) FSHAN-SHAW. (See page 1319.)

warrior to the height of native ambition, namely, a seat in the Council, and a voice in the policy of the tribe.

The Indian women are the slaves of their husbands. They have to perform all the domestic duties and drudgeries of the tribe, and are never allowed to unite in their religious ceremonies or amusements.

That the reader may form a better idea of the appearance and dress of the women, I have given on the preceding page the portrait of a beautiful girl of the Riccarees (a part of the Pawnee tribe), whose name is Pshan-shaw (the Sweet-scented Grass). "The inner garment, which is like a frock, is entire in one piece, and tastefully ornamented with embroidery and beads. A row of elk's teeth passes across the breast, and a robe of young buffalo's skin, elaborately embroidered, is gracefully thrown over her shoulders, and hangs down to the ground behind her."

On the same page the reader may find, as illustrative of Indian childhood, a portrait of the grandson of a chief of the Blackfeet, a boy of six years of age. He is represented at full length, with bow and quiver slung, and his robe of raccoon skin thrown over his shoulder. This young chief, his father dying, was twice stolen by the Crows, and twice recaptured by the Blackfeet, and then placed in the care of a Mr. M'Kenzie until he should be old enough to assume the chieftainship of his tribe, or be able to defend himself against his foes.

The Indian mothers do not have many children, possibly owing to the early age at which they marry. For example, the ages of the four brides just mentioned ranged from twelve to fifteen. Two or three is the average, and a family of five is considered quite a large one.

The children are carried about much in the same way as those of the Araucanians. A sort of cradle is made by bandaging the infant to a flat board, the feet resting on a broad hoop that passes over the end of the cradle. Another hoop passes over the face of the child, and to it are hung sundry little toys and charms; the one for the amusement of the infant, and the other for its preservation through the many perils of infantile life. When the mother carries the child, she hangs the cradle on her back by means of a broad strap that passes over her forehead. Both the cradle and band are ornamented with the most brilliant colors which native art can furnish, and are embroidered in various patterns with dyed porcupine quills.

Among the tribes which inhabit the banks of the Columbia River, and a considerable tract that lies contiguous to it, the cradle is put to a singular use, which has earned for the tribes the general title of Flat-heads. To the upper part of the cradle is fastened a piece of board, which lies on the child's

forehead. To the other end of the board are fastened two strings, which pass round the foot or sides of the cradle. As soon as the infant is laid on its back, the upper board is brought over its forehead, and fastened down by the strings. Every day the pressure is increased, until at last the head is so flattened that a straight line can be drawn from the crown of the head to the nose. One of these cradles with a child undergoing this process of head flattening, is illustrated below. The mother's head is a type of its permanent effect.

THE FLAT-HEADED WOMAN.

This is perhaps the most extraordinary of all the fashionable distortions of the human body, and the wasp waist of an European belle, the distorted leg of the female Carib, and even the cramped foot of the Chinese beauty, appear insignificant when compared with the flattened head of a Chinook or Klick-a-tack Indian. Mr. Catlin states that this custom was one far more extended than is the case at present, and that even the Choctaw and Chickasaw tribes of Mississippi and Alabama were accustomed to flatten their heads, their burial-places affording incontrovertible evidence that such must have been the case, and at no very distant date.

The reader, especially if he dabble in phrenology, might well imagine that such a practice must act injuriously upon the mental capacities of those who are subjected to it. Let us, for example, fancy a skull which has been so ruthlessly compressed that it only measures an inch and a half, or at the most two inches, in depth, at the back; that it is in consequence much elongated, and forced outward at the sides, so that it is

nearly half as wide again as it would have been if it had been permitted to assume its normal form. The hair, combed down in one place, and expanding in others, would seem to have its natural capabilities much altered, even if not in many cases destroyed. Yet those who have mixed with the Flat-headed tribes say that the intellect is in no way disturbed, much less injured, and that those members of the tribe who have escaped the flattening process are in no way intellectually superior to those who have undergone it. Indeed, as Mr. P. Kane observes, in his "Wanderings of an Artist," the Chinooks despise those who retain the original shape of their heads. They always select their slaves from the round-headed tribes, the flattened head being the sign of freedom.

There is another point about the head flattening which deserves attention. Seeing that it is begun almost in the same hour that the infant is born, and is continued for eight months to a year or more, it might naturally be imagined that it would cause considerable pain to the child, and in many cases be dangerous to life. This, however, is not the case; and that it should not be so is one of the many proofs of the extent to which the human frame may be distorted without permanent injury. Mr. Kane's remarks are as follows:—

"It might be supposed, from the extent to which this is carried, that the operation would be attended with great suffering to the infant, but I have never heard the infants crying or moaning, although I have seen the eyes seemingly starting out of the sockets from the great pressure. But on the contrary, when the lashings were removed, I have noticed them cry until they were replaced. From the apparent dulness of the children while under pressure, I should imagine that a state of torpor or insensibility is induced, and that the return to consciousness occasioned by its removal must be naturally followed by the sense of pain."

Should a child die before it is old enough to be released from the cradle, the mother is not released from her maternal duties, but, on the contrary, continues to perform them as assiduously as if the little creature were living.

After the child is buried, she makes a "mourning-cradle," *i. e.* in the place which the child had formerly occupied she places a large bundle of black feathers, by way of representative of the deceased infant, and treats it in all respects as if the little one still occupied the cradle. She carries it on her back wherever she goes, and when she rests, stands it upright against a tree or the side of the hut, and talks to it as if to a living child. This custom is continued for at least a year, and in many cases is extended even beyond that period. And, though a bereaved mother may be so poor as scarcely

to have sufficient clothing for herself, she will contrive to decorate the cradle of her lost child with the appropriate ornaments.

As a rule, the North American Indians are affectionate parents. Mr. Catlin mentions an instance where he had painted a portrait of a married woman, the daughter of a chief. Some time afterward she died, and the father, happening to see and recognize the portrait of his lost daughter, offered ten horses—an enormous price for an American Indian to pay. Of course the portrait was presented to him at once.

Parental affection is fully reciprocated by the children, and the greatest respect paid by the younger to the elder men. Yet we find even among them, as among so many tribes which lead a semi-nomad existence, the custom of abandoning the sick and aged when they are obliged to make a forced march of any distance.

This is generally done at the instance of the victims themselves, who say that they are old and useless, and can be only an encumbrance to the rest of the tribe. Accordingly, a rude shelter is formed of a bison hide stretched over four upright rods, under which the sick man is laid; a basin of water and some food are placed by his side; and he is left to perish, if not by privation or disease, by the ranging flocks of wolves that roam the prairies.

WE will now pass to a more agreeable phase in the life of these tribes, and take a glance at their dances and games.

It has been the prevalent impression that the Indian is taciturn, unsocial, and morose. Mr. Catlin, whose testimony cannot be impeached, takes considerable pains to correct this opinion; and states as the result of his travels among the Indian tribes, that "they are a far more talkative and conversational race than can easily be seen in the civilized world. No one can look into the wigwams of these people, or into any little momentary group of them, without being at once struck with the conviction that small talk, garrulity, story-telling and amusements, are leading passions with them." To watch their games, and hear their shouts of exultation, in any of their villages, to sit down in their lodges and listen to their jokes, repartee, anecdote and laughter, would effectually banish this erroneous opinion so generally held in regard to the Red Men. With no anxieties for the future—no necessities goading them, it is natural that they should be a merry people, and most of their life be spent in sports and games.

The Indian fondness for amusement is shown in the great variety of their dances, most of which are very fanciful and picturesque, though some of them have a religious significance. There are the ball-play dance, pipe dance, buffalo and scalp dances (already described), beggar's, bear, and dog

(1.) BIRCH BARK CANOE. (See page 1326.)

(2.) DANCE TO THE MEDICINE OF THE BRAVE. (See page 1323.)

(3.) THE SNOW SHOE DANCE. (See page 1323.)

dances. But the most pleasing of all are the eagle dance, dance of the braves which is peculiarly attractive, and the green corn and snow-shoe dances. The latter is exceedingly picturesque, and the artist has represented it on the preceding page.

Before the first snow shoe hunt, the Indians always perform a dance by way of thanksgiving to the Great Spirit for sending the snow which will enable them to live in plenty so long as it lasts. Several spears are stuck upright in the snow covered ground, on one of which are tied a pair of snow shoes, and on the others sundry sacred feathers and similar objects. The dancers, clad in hunting dress, and wearing snow shoes, go round and round the spears, imitating the while all the movements of the chase, and singing a song of thanksgiving.

Nearly all the tribes, however remote from each other, have a season of festivity annually, when the ears of corn are large enough for eating. Green corn is regarded a great luxury, and is dealt out with most improvident profusion — the festivities lasting eight or ten days. The whole tribe feast and surfeit upon it so long as it lasts, making sacrifices, singing songs of thanksgiving to the Great Spirit, and celebrating the green corn dance. Every occupation is suspended during these festivities, and all unite in the carnival of gluttony and merriment. Mr. Catlin thus describes this dance: — “At the time when the corn is thought to be nearly ready for use, several of the old women, who have fields or patches of corn (the men disdain such degrading occupations as cultivating the field or garden), are appointed by the medicine men to examine the cornfields at sunrise every day, and bring to the council house several ears of corn, which they must on no account break open or look into. When the doctors, from their examination, decide that the corn is suitable, they send criers to proclaim to every part of the village or tribe that the Great Spirit has been kind, and they must meet next day to return thanks to Him. In the midst of the assembled tribe, a kettle filled with corn is hung over a fire. While this corn is being boiled, four medicine men, each with a stalk of corn in one hand and a rattle in the other, their bodies painted with white clay, dance around it chanting a thanksgiving to the Great Spirit, to whom the corn is to be offered. In a more extended circle around them, a number of warriors dance, joining in the same song. During this scene, wooden bowls are laid upon the ground, in which the feast is to be dealt out.”

When the doctors decide that the corn is sufficiently boiled, the dance assumes a different form, and a new song is sung, the doctors in the meantime placing the corn on a scaffold of sticks built over the fire, where it is consumed. This fire is then removed, the ashes are all buried, and a new

fire is originated on the same spot, and in the same way as by the Hottentots, described on page 100. Then corn is boiled for the feast, at which the doctors and warriors are seated. An unlimited license is given to the whole tribe, who mingle excess and amusement until the fields of corn are stripped, or it has become too hard for eating.

The dance of the braves is beautiful and exciting in the highest degree: — “At intervals the dancers stop, and one of them steps into the ring and vociferates as loudly as possible the feats of bravery which he has performed during his life. . . . He boasts of the scalps he has taken, and reproduces the motions and actions of the scenes in which his exploits were performed. When his boasting is concluded, all assent to the truth of his story, and express their approval by the guttural ‘*waugh!*’ Then the dance commences again. At the next interval another makes his boast, and so another and another, till all have given a narrative of their heroic deeds, and proved their right to be associated with the braves of the nation.”

The dog dance, though a favorite with the Sioux, is not an attractive one.

The hearts and livers of two or more slain dogs are placed entire and uncooked upon two crotches, about as high as a man's head, and are cut into strips so as to hang down. The dance then commences, which consists in each one proclaiming his exploits in loud, almost deafening gutturals and yells. At the same time the dancers, two at a time, move up to the stake, and bite off a piece of the heart and swallow it. All this is done without losing step or interrupting the harmony of their voices. The significance of the dance is that none can share in it but the braves who can boast that they have killed their foe in battle and swallowed a piece of his heart.

Among the Sacs and Foxes there are several singular dances, besides some already mentioned, viz: the slave dance (a very curious one), dance to the Berdashe, which is an amusing scene, and dance to the medicine of the brave. There is a tender and beautiful lesson conveyed in this latter dance. In the illustration of it on page 1322, a party of Sac warriors are represented as returned victorious from battle, with the scalps they have taken as trophies. Having lost one of their party, they appear and dance in front of his wigwam fifteen days in succession, about an hour each day, the widow having hung his medicine bag on a green bush, which she erects before her door, and under which she sits and cries whilst the warriors dance and brandish the scalps they have taken. At the same time they recount the heroic exploits of their fallen comrade, to solace the grief of his widow, and they throw her presents as they dance before her, that she may be kept from poverty and suffering.

There is little in these dances that resembles the "light fantastic toe" and giddy maze of the dance among the civilized. The former consist very much of jumps and starts—oftentimes the most grotesque, and even violent exertions—united with songs and yells, sometimes deafening by their sound or fearful by the wildness and intense excitement that are manifested.

To a looker on not familiar with the peculiar significance of these displays, they seem only a series of uncouth and meaningless motions and distortions, accompanied with harsh sounds, all forming a strange, almost frightful medley. Yet Mr. Catlin says "every dance has its peculiar-step and every step has its meaning. Every dance has also its peculiar song, which is so intricate and mysterious oftentimes, that not one in ten of the young men who are singing know the meaning of the songs. None but medicine men are allowed to understand them." There are dances and songs, however, not so intricate, which are understood and participated in by all the tribe.

The beating of drums, the yells, stamping, and bellowing, the noisy demonstrations forming so great a part of Indian amusements, will remind the reader of similar manifestations among some of the African tribes, recorded in the first part of this work.

The game which is perhaps the most popular and widely spread is almost unintelligible to an un instructed bystander. Its title is *Tchung-chee*, that being the name of the spear which will be presently described. It is played with a ring about three inches in diameter, made of bone or wood wrapped with cord, and a slight spear, on which are several little projections of leather. The players roll the ring along the ground, and as it is about to fall, project the spear so that, as the ring falls, it may receive within it one of the pieces of leather. If it does so, the player scores one or more points, according to the particular projection which is caught in the ring, and the mode in which it flies.

Another variation of this game, called *Al-kol-lock*, has the spear without the leathern projections, but in their stead six colored beads are fixed inside the ring. At each end of the smooth clay course, which is about fifty feet in length, a slight barrier is erected. The players bowl the ring from one end of the course, run after it, and as it falls after striking the barrier, throw their spears as described above, the points being reckoned according to the color of the bead which lies on them.

The absorption of the players in this game is beyond description. They will play at it all day, gamble away their horses, their tents, their clothes, and, when they have lost all their property, will stake themselves, the loser becoming the slave of the winner.

Another game, called *Pagessan*, or the bowl game, is very popular, though it is a sedentary one, and lacks the graceful action that gives so great a charm to the preceding game. It is played with a wooden bowl, containing a number of pieces of wood carved into various forms; some, which we may call the pieces, having round pedestals on which to stand, and others, which we will term the pawns, being round, and painted on one side and plain on the other. The players take the bowl alternately, give it a shake, and set it in a hole in the ground. The contents are then examined, and the points are scored according to the number of pieces which stand on their pedestals. If the pawn has its colored side upward, the player scores one point; if it has the plain side uppermost, he deducts a point from his score. The position of the pawns is entirely a question of chance, but considerable skill is exerted in getting the pieces to stand on their pedestals.

The game which is most characteristic of the American Indians is the celebrated ball game, a modification of which has been introduced into England under the name of *La Crosse*. The principle on which it is played is exactly that of foot-ball and hockey, namely, the driving of a ball through a goal defended by the opposite party. We will first take the game as it is played by the Choctaws. The reader will find it illustrated on page 1311.

A ball is carefully made of white willow wood, and ornamented with curious designs drawn upon it with a hot iron. The ball-sticks, or racquets, are much like our own racquets, but with larger and more slender handles, and with a very much smaller hoop. Each player carries two of these sticks, one in each hand. The dress of the players is very simple, being reduced to the waist-cloth, a tail made of white horsehair or quills, and a mane of dyed horsehair round the neck. The belt by which the tail is sustained may be as highly ornamented as possible, and the player may paint himself as brilliantly as he likes, but no other article of clothing is allowed, not even moccasins on the feet.

On the evening of the appointed day, the two parties repair to the ground where the goals have been already set up, some two hundred yards apart, and there perform the ball-play dance by torchlight. Exactly in the middle between the goals, where the ball is to be started, sit four old medicine men, singing and beating their drums, while the players are clustered round their respective goals, singing at the top of their voices, and rattling their ball-sticks together. This dance goes on during the whole of the night, so that the players are totally deprived of rest—a very bad preparation, as one would think, for the severe exertion of the ensuing day. All the bets

are made on this night, the article staked, such as knives, blankets, guns, cooking utensils, tobacco, and even horses and dogs, being placed in the custody of the stakeholders, who sit by them and watch them all night.

About nine o'clock on the next morning the play begins. The four medicine men, with the ball in their custody, seat themselves as before, midway between the goals, while the players arrange themselves for the attack and defence. At a given signal, the ball is flung high in the air, and as it falls, the two opposing sets of players converge upon it. As there are often several hundred players on each side, it may be imagined that the scene is a most animated one.

"In these desperate struggles for the ball," writes Mr. Catlin "where hundreds are running together, and leaping actually over each other's heads, and darting between their adversaries' legs, tripping, and throwing, and foiling each other in every possible manner, and every voice raised to its highest key, in shrill yelps and barks, there are rapid successions of feats and incidents that astonish and amuse far beyond the conception of any one who has not had the singular good luck to witness them.

"In these struggles, every mode is used that can be devised to oppose the progress of the foremost, who is likely to get the ball; and these obstructions often meet desperate individual resistance, which terminates in a violent scuffle, and sometimes in fisticuffs. Then their sticks are dropped, and the parties are unmolested, whilst they are settling it between themselves, except by a general *stampede*, to which those are subject who are down, if the ball happen to pass in their direction. Every weapon, by a rule of all ball players, is laid by in the respective encampments, and no man is allowed to go for one; so that the sudden broils that take place on the ground are presumed to be as suddenly settled without any probability of much personal injury, and no one is allowed to interfere in any way with the contentious individuals.

"There are times when the ball gets to the ground, and such a confused mass is rushing together around it, and knocking their sticks together, without a possibility of any one getting or seeing it for the dust that they raise, that the spectator loses his strength, and everything but his senses; when the condensed mass of ball sticks and shins and bloody noses is carried around the different parts of the ground, for a quarter of an hour at a time, without any one of the masses being able to see the ball, which they are often scuffling for several minutes after it has been thrown off and played over another part of the ground.

"For each time that the ball was passed between the goals of either party, one was counted for their game, and they halted for

about one minute; when the ball was again started by the judges of the play, and a similar struggle ensued; and so on until the successful party arrived at 100, which was the limit of the play, and accomplished at an hour's sun, when they took the stakes."

In this game the players are not allowed to strike the ball with their sticks, or catch it in their hands; though to do so between the netted ends of the sticks, and then to run away with it, is a feat which each player tries his best to accomplish. Ball-play among the Sioux is exactly the same in principle as that of the Choctaws, but the players only carry one stick, which is wielded with both hands.

Sometimes the men are kind enough to indulge the women with a ball-play, and to present a quantity of goods as prizes, hanging them across a horizontal pole, in order to stimulate the players by the sight. Such inferior beings as women are not, however, allowed to use the ball and racquet of their superiors, the men, but play with a couple of small bags filled with sand, and attached to each other by means of a string about eighteen inches in length. Each of the players is furnished with two slight sticks, about two feet in length, and with these sticks they dexterously catch the sand bags, and fling them toward the goals. The women play with quite as much enthusiasm as the men, and the game often assumes the appearance of a general battle rather than of a pastime.

Since the introduction of horses, the American Indians have become very fond of horse racing, and bet so recklessly on the speed of their animals that they often lose everything which they possess. In these races neither the horse nor the rider are allowed to be costumed in any way, not even a saddle or a girth being allowed. They also have boat races, in which the spectators take as much interest as those who witness the Oxford and Cambridge races. The canoes are mostly propelled by one man only.

The canoes are of various forms and materials, according to the tribe to which they belong. For example, the Mandans have an odd, circular vessel, made from a bison hide, stretched over a wooden framework. This is called a "bull boat," and is propelled in a very singular manner. A woman is the usual paddler, and she stands or kneels with her face toward the direction in which she intends to proceed, and, thrusting the paddle into the water as far forward as she can reach, draws it smartly toward her, and thus propels the boat with considerable speed.

On one occasion, Mr. Catlin and two companions were desirous of crossing the river, and were packed into one of these bull boats by the wife of a chief. She then went into

the water, and swam across the river, towing the boat after her. As, however, she neared the opposite bank, a number of young girls surrounded the canoe, took it into their own management, and kept it in mid-stream, until the passengers, utterly powerless in such a craft, ransomed themselves with bead necklaces and other decorations. Then there is another kind of canoe, which is simply a hollowed tree-trunk, and which is graphically called a "dug-out." No very particular care is taken about the shaping of this simple boat, which is more like a punt than a canoe.

The best and most characteristic form of native canoe is that which is made of the bark of the birch tree. The mode of making these canoes is briefly as follows. Canoe building is a work in which both sexes take a part. The men first select the largest and finest birch trees, with the smoothest skins, and strip off large pieces of the bark. The women then take charge of the bark, and, while it is still fresh and moist, clean and scrape it as if it were leather, and then sew the pieces together, so as to make the "cloak" of the future canoe.

While the women are at this work, the men are busily preparing the skeleton of the canoe. This is made of the white cedar, the ribs being cut and scraped until they are quite thin and light, and held in their places by smaller cross-pieces, and a long thin piece of wood, which runs round the entire edge of the boat, and is, in fact, the chief support of the canoe. This is technically called the "maitre." No nails are used, the whole of the junctions being effected by means of thongs of bass, obtained from the inner bark of the white cedar.

The skeleton being completed, it is laid upon the cloak, which is brought over the ribs, firmly lashed to the "maitre," and then by degrees brought into its proper shape. A strengthening piece, called the "faux maitre," is next tied along the whole of the gunwale in order to protect it from injury, and the interior is lined with cedar boards, scarcely thicker than pasteboard. When the canoe is finished and dry, the holes through which the lashings have passed, as well as all the junctions of the bark, are carefully stopped with pitch obtained from the pine or fir-tree, and the weaker parts of the bark are also strengthened with a coat of pitch.

The bark canoe of the Chippeways is, unquestionably, the most beautiful model of all the water crafts ever invented. It is usually made complete, from the rind of one birch tree, and so ingeniously formed and put together, that it is water-tight, and will ride upon the water with singular grace and swiftness.

These canoes are wonderfully light, as indeed is necessary for the navigation of the rivers. The many rapids would effectually

prevent a boat from passing up the river, were it not for the plan called "portage." When the canoe arrives at the foot of a rapid, it is taken ashore, the crew land, take all the goods out of the canoe, and carry them to the opposite side of the rapid. They then go back for the canoe itself, launch it in the smooth water above the rapid, and load it, and proceed on their journey. The figure at the head of page 1322 will give the reader a good idea of the form of the birch bark canoe.

These vessels can be propelled with wonderful speed, as they sit on the surface like ducks, and, when empty, scarcely draw two inches of water. The number of paddlers varies according to the size of the boat, but the course is regulated by the two who sit respectively in the bow and stern, whom we may for convenience call the "bow" and "stroke." It is the duty of the "bow" to look carefully ahead for any rocks or any other obstacles, and, by movements well understood, to indicate their presence to the "stroke," who, with a sweep of the paddle, brings the canoe round in the direction indicated by the "bow."

The canoes which are used in races are made of birch bark, and are almost always of small size — so small, indeed, that a man can easily carry his canoe on his head from his house to the water's edge, and then launch it without assistance. Mr. Catlin gives a very animated description of a canoe race, the competitors being accompanied by large canoes, full of their respective friends, who yell encouragements to the antagonists, fire guns in the air, and render the scene a singularly exciting one, even to a stranger.

Toward the right hand of the illustration which depicts the canoe race, on the following page, the reader may see a curious mode of propelling canoes, which is often adopted when there is no necessity for speed and the wind is favorable. The man who acts as "bow" stands up in the front of the canoe, extends a robe or a blanket in his two hands, and then he presses the two other corners at the bottom of the boat with his feet. The robe thus becomes an extemporized sail, of which the man is the mast. In this manner a canoe is often carried for a considerable distance, to the great relief of the paddlers.

An European would instantly upset the fragile canoe if he tried to stand erect in it; but the natives are absolutely perfect masters of their little vessels, and seem to move about in them as easily and firmly as if on dry land. They will load a canoe within an inch and a half of the water's edge, and paddle it for a whole day, without dreaming of danger. And an accomplished canoe man will take a fish spear in his hand, place a foot on each gunwale of the boat, and, propelled by a friend in the stern of the boat, dart down rapids, spearing fish as he shoots

(1.) CANOE RACE. (See page 1326.)

(2.) ESQUIMAUX DWELLINGS. (See page 1335.)

along, hauling the struggling fish out of the water, and shaking them into the boat behind him.

Among most Indian tribes, when mourning for the death of relatives, the women are required to cut their hair entirely off, and the period of mourning is until it has grown to its former length. As long tresses are so highly valued by most of the tribes this is no small sacrifice. But long hair being of much more importance to the men they cut off only a lock or two, to indicate grief or affliction for their departed kindred.

There is a game which has in it somewhat of a religious aspect. On the border of the Great Pipe-stone Quarry a solitary rock rises from the plain. It resembles a large pillar, being only a few feet in diameter, though more than thirty feet in height. It is situated within a short distance from the edge of the precipice, and the Indians who come to procure red stone for their pipes often try to leap upon it and back again. The mere leap to the rock is comparatively easy, but there are two terrible dangers which threaten the leaper. In the first place, the small, flat surface of the rock is so polished and smooth, that if the leaper should exert too much power, he must slip off, and be killed on the sharp rocks below. Should he retain his foot-hold he has still a difficult task in regaining the spot whence he sprang, as he can take no run, and the slippery surface of the rock affords but a slight fulcrum from which he can take his spring.

Before an Indian essays this terrible leap, he offers up many prayers to the Great Spirit for help and protection, and he has at all events the satisfaction of knowing that, if he should fail, his body will be buried in the sacred ground of the nation. Those who succeed leave an arrow sticking in the rock, and have a right to boast of it at every public meeting when they are called upon to speak. No man would dare to boast of this feat without having performed it, as he would at once be challenged to visit the Leaping Rock and to point out his arrow.

If the reader will refer to the figure of the canoe on page 1322, he will see that its sides are decorated with a pattern. This is made by fastening dyed porcupine quills to the sides of the little vessel. Porcupine quills are used very largely for ornaments, and, even though they have been partly superseded by beads, are still in use for decorating the dresses and utensils of the natives.

These quills are never so long or thick as those of the porcupine of the Old World, and are naturally white or gray, so that they can easily take any desired dye. They are first sorted very carefully into their different sizes, the largest rarely exceeding three inches in length, while the smaller are quite thread-like, and can be passed through the eye of an

ordinary needle. Both ends are sharp. When the native artist desires to produce a pattern, the design is first drawn on the right side of the bark or leather; the two ends of the quill are then pushed through the fabric, and fastened on the wrong side, the quill acting both as needle and thread.

Perhaps the most ingenious mode of making ornaments is that which is practised by the Ojibbeway women, and called Bark-biting. The following description of this curious art is given by Mr. Kohl in his "Kitchi-Gami:"—

"This is an art which the squaws chiefly practise in spring, in their sugar plantations. Still, they do not all understand it, and only a few are really talented. I heard that a very celebrated bark-biter resided at the other side of St. Mary's River, in Canada, and that another, of the name of Angélique Marte, lived in our cataract village. Naturally, I set out at once to visit the latter.

"Extraordinary geniuses must usually be sought here, as in Paris, on the fifth floor, or in some remote faubourg. Our road to Angélique Marte led us past the little cluster of houses representing our village far into the desert. We came to morasses, and had to leap from stone to stone. Between large masses of scattered granite block, the remains of the missiles which the Indians say Menaboju and his father hurled at each other in the battle they fought here, we at length found the half-decayed birch-hut of our pagan artiste, who herself was living in it like a hermit.

"The surrounding landscape seemed better adapted for a *renversi* than for an *atelier*. When we preferred our request for some specimen of her tooth carving, she told us that all her hopes as regarded her art were concentrated in one tooth. At least she had only one in her upper jaw properly useful for this operation. She began, however, immediately selecting proper pieces of bark, peeling off the thin skin, and doubling up the pieces, which she thrust between her teeth.

"As she took up one piece after the other, and went through the operation very rapidly, one artistic production after the other fell from her lips. We unfolded the bark, and found on one the figure of a young girl, on another a bouquet of flowers, on a third a tomahawk, with all its accessories, very correctly designed, as well as several other objects. The bark is not bitten into holes, but only pressed with the teeth, so that, when the designs are held up, they resemble, to some extent, those pretty porcelain transparencies made as light-screens."

The mode of constructing the wigwam is very much the same among the various tribes. Generally it is made of dressed buffalo skins sewed together and arranged in the form of a tent, with a score or more of poles about twenty-five feet in height, as a

support, and with an opening at the apex for the escape of smoke or the admission of light. The Crows, however, excel all others in the style of their lodge. They dress the skins almost as white as linen, embellish them with porcupine quills, and paint them in various ways so as to make their tents exceedingly beautiful and picturesque.

The Indian lodges may be removed in a few minutes. The taking down and the transportation is the work of the squaws. A tribe will generally remove six or eight times in a summer in order to find good hunting grounds among the herds of buffaloes.

The Indian tribes judging from their musical instruments, have little taste or skill in music. These are very rude, and consist of rattles, drums, the mystery whistle, war whistle and deer skin flute. The war whistle is from six to nine inches in length, made of the bone of the deer's or turkey's leg, with porcupine quills wound around it. The chief wears this to battle under his dress. It has only two notes — one, produced by blowing into one end of it, is shrill, and is the summons to battle; and the other sounds a retreat. Even in the noise of battle and amid the cries and yells of their fierce conflicts, this little instrument can be distinctly heard.

The chief pledge of friendship among these tribes, is a dog feast. If we consider that the dog is an object of special affection with the Indians; that he is more valued by them than anywhere else on the globe; — we can understand the significance of this feast. This sacrifice of what is dearest to them is therefore the very strongest evidence of friendship. On their coats of arms, on the rocks, they carve the image of the dog, and everywhere and always, he is the emblem of fidelity. Accordingly, to ratify friendship, to give the most unquestionable proof of honor and devotion, the Indian will take his beloved companion of the chase and wigwam, and offer it as the sacrifice to hospitality and affection.

These feasts are conducted in the most solemn and impressive manner, as if with the conviction that the pledge of friendship is a sacred thing. Those were tender words which Catlin gives at the conclusion of an Indian chief's address to him and other white guests, to whom such a feast had been given: "we offer you to-day not the best we have got, for we have plenty of good buffalo hump and marrow — but we give you our hearts in this feast — we have killed our faithful dogs to feed you, and the Great Spirit will seal our friendship. I have no more to say."

We come now to consider the customs of the Indians in regard to death and the disposal of the dead.

The Mandans take the body of the deceased,

clothe it in his best robes and ornaments, furnish it with food, pipes, tobacco, and arrows, and wrap it up in skins previously soaked in water, so as to render them pliant, and cause them to exclude the air as much as possible. The body is then placed upon a slight scaffold, some seven feet in height, and left to decay. In process of time, the scaffold gives way and falls, when the relations of the deceased bury the whole of the remains, with the exception of the skull, which they place on the ground, forming circles of a hundred or more, all with the faces looking inward, and all resting on fresh bunches of herbs. In the centre of each circle is a little mound, on which are placed the skulls of a male and female bison, and on the mound is planted a long pole, on which hang sundry "medicine" articles, which are supposed to aid in guarding the remains of the dead.

No people are more fond of swimming than the Indians, the youth of both sexes learning the art at a very early age. Such knowledge is indispensable to them, especially liable as they are to accidents with their light canoes, and in their marches compelled to cross the widest rivers. The squaws will fasten their children to their backs, and easily cross any river that lies in their way.

The Indian mode of swimming, however, is quite different from ours. They do not make a horizontal stroke outward from the chin, but throw the body alternately from one side to the other, and raising one arm out of the water, reach as far forward as possible, while the other arm having made the same motion, goes down and becomes a propelling power. And this, though an apparently awkward, is yet a most effective mode of swimming, and less likely to be attended with injury to the chest, or with fatigue.

The relatives constantly visit the skull circles, and the women may often be seen sitting by the skulls of their dead children for hours together, going on with their work, and talking to the dead skull as if it were a living child. And, when tired, they will lie down with their arms encircling the skull, and sleep there as if in company with the child itself. The Sioux and many other tribes lodge their dead in the branches or crotches of trees, enveloped in skins, and always with a wooden dish hanging near the head of the corpse, for the purpose, doubtless, to enable it to quench its thirst on the long journey they suppose awaits it after death. The Chinooks place them in canoes, which, together with the warrior's utensils accompanying the dead, are so shattered as to be useless.

The most singular funeral of which a record has been preserved was that of Blackbird, an Omaha chief. The artist has reproduced the strange scene on page 1341.

Upon the bank of the Missouri, and in the

district over which he ruled, there is a lofty bluff, the top of which can be seen for a vast distance on every side. When the chief found that he was dying, he ordered that he should be placed on the back of his favorite war horse, and buried on the top of the bluff.

The request was carried out to the letter. On the appointed day, the whole tribe, together with a vast concourse of spectators, repaired to the bluff, leaving an open space in the middle, where the chief was to be buried.

Presently, the body of the dead chief was borne up the sides of the bluff, and after him was led his war horse, a noble milk-white steed which he had valued exceedingly. When the funeral procession reached the top of the bluff, the dead chief was clothed in full panoply of war, the feather plumes on his head, the strung bow, quiver, arrows, shield, and medicine bag slung on his back, his scalps, which no other man might take, hung to his horse's bridle and to his weapons, and his favorite spear in his hand. He was also furnished with food and drink, to sustain him in his passage to the spirit land, and with his pipe and filled tobacco pouch, flint, and steel, so that he might solace himself with the luxury of smoking.

This done, he was mounted on the back of his horse, and all the chiefs advanced in their turn to make their farewell speeches to their dead leader. Each, after delivering his address, rubbed his right hand with vermilion, pressed it against the white coat of the horse, and left there the scarlet imprint of his hand. Then began the burial. The warriors brought in their hands pieces of turf, and with them began to raise a huge mound, in the middle of which the chief and his horse were to be enclosed. One by one they placed their turves around the feet of the devoted horse, and so, by degrees, they built the mound over the animal while yet alive.

The mound, when completed, rose high above the head of the chief thus strangely buried in its centre, and there he and his horse were left to decay together. On the top of the mound a cedar post was erected; and this mound has been, ever since it was built, a familiar landmark to all the surrounding country. This green, flower spotted mound is visited by great numbers of travellers, both white and red. The former ascend the bluff partly out of curiosity to see so strange a tomb, and partly for the sake of the magnificent view from its summit, while the latter visit it for the sake of paying their respects at the burial-place of one of their most renowned chiefs and greatest medicine men.

The custom of burying wives and other victims with the deceased husband seems now to be extinct among the North American tribes, but such an event has happened within comparatively late years. There was

a Nachez chief, called the Stung Serpent, who died; and as he was the head chief of the tribe, a considerable number of victims were devoted for sacrifice. The French, however, remonstrated, and induced the friends of the dead chief to limit the number to eight or ten. Among them was a beautiful girl, who, though not his wife, had loved him greatly, and desired to share his grave.

On the day appointed a procession was formed, in which the victims were led in great state, accompanied by eight relatives of the deceased, who were to act as executioners, and who bore the fatal cord, the deer-skin which was thrown over the head of the victim, the tobacco pills which were to be taken before the ceremony, and the other implements required. When they were all placed at the grave, the chief wife made a speech, in which she took leave of her children; and the victims, after being strangled, were deposited in the grave.

As the object of this work is to present the manners and customs of tribes and races in their primitive state, and not those semi-civilized; it will be enough to merely introduce the names of the Cherokees, Choctaws, Creeks, Chickasaws, Senecas, Delawares, etc. Nor is it necessary to consider those, now extinct, that occupied the country when first settled by white men. For the same general characteristics, now presented, pertain to all the North American races. The Indian tribes are rapidly retreating or vanishing before the steady, irresistible march of civilization, and the growing grandeur of the great Republic in North America. The line, where the echoes of the Indian's yell blends with the shout of advancing pioneers and the sound of the wood-chopper's axe, is continually moving westward. In a few years we have seen it pass from the Mississippi River, to the base of the Rocky Mountains. The settler's cabin is unceasingly encroaching upon the wigwams of the Red Men. With sadness, having smoothed the graves of their fathers, and taken a last look of their hunting grounds, they retreat before a power which they vainly strive to resist. Pressed backward in two centuries and a half, across three-quarters of the continent, from Massachusetts Bay almost to the Pacific, except a few decaying remnants of tribes, their history and doom cannot but awaken sympathy for an unfortunate and overpowered race.

Even though we do not form our estimate of the Indian from the romantic creations of Cooper, every right-thinking person will accord them the tribute of many qualities that constitute a real grandeur of character. Their marvellous bravery, their ardent rage, their steadfast, fiery enthusiasm in the fight or in the chase, their manly sports, their grave, philosophic demeanor in the council, their stern, stoical endurance in misfortune, their disdain of death, are traits that have

given to the Indian a character unique and noble, a character and history that the annalist, poet, and novelist, have transferred to their immortal pages, and over which multitudes of old and young alike have bent with eager, breathless interest. As Mr. Mangin in his "Desert World" says:—"There was poetry in their faith, in their customs, in their language, at once laconic and picturesque—and even in the names they bestowed on each tribe, each chief and warrior, on mountain and river. One can hardly suppress a feeling of regret that so much of wild romance and valor should have been swept from the face of the earth, unless we call to mind the shadow of the picture—the Indian's cruelty, perfidiousness and savage lust. Even then, our humanity revolts from the treatment to which he has been subjected by the white man." Tracked and hunted like wild beasts, driven from their hunting grounds and the territory of their ancestors, imbruted by drink, decimated and dying by epidemics and vices contracted from white men, the poor Indians vainly struggling to avert their doom of extermination have elicited the sympathy and commiseration of the civilized world. The theory advocated in the preceding part of this work, (see page 790), in regard to the decay and extinction of savage races, does not forbid regrets that such a people should have suffered so grievously at the hands of the United States Government, by the greed of its agents, the frauds of traders and the fatal contagion of the vices of a civilized people. What with American rifles and American whiskey, their extinction has been rapid, and their doom certain.

These tribes, contending in a most unequal strife with the forces of modern civilization, more readily falling victims to the vices of white men than accepting their virtues, are entitled to the just consideration and protection of the government, as its wards, from whom, or their ancestors, have been taken their soil and their homes.

It is gratifying to know that a more humane policy is about being inaugurated, and though the wrongs of the past may not be redressed, that their rights in future may be

recognized and maintained. Major-General Thomas, of the U. S. army, whose name and history are the guarantee of candid and wise judgment, says, in respect to an instance of cold-blooded, unprovoked, unpunished outrage upon an Indian boy (it is given only as a representative fact of many more and bitter wrongs):—"I see no better way than to extend civil authority over the Indians and enable them to appear as witnesses in all cases affecting their own status and that of the whites toward them. This is a fair instance of the cause of the Indian troubles; and until white murderers and robbers of the Indians are punished, a large force of troops will be necessary to protect peaceful white settlers from Indian avengers." And Gen. Sherman, in whose opinion the utmost confidence can be reposed, makes the following indorsement to General Thomas' view:—"This case illustrates the origin of most of the Indian wars on the frontier. A citizen may murder an Indian with impunity; but if the Indian retaliate, war results, and the United States must bear the expense."

Here we have the secret of many of the barbarities of the Indian tribes. Inflamed and imbruted by the whiskey sold them, their ignorance imposed upon by the greed of traders and even government agents, having little or no chance for securing justice in their real or imagined injuries, there is certainly some extenuation if this wild son of the forest go forth with tomahawk and scalping knife, as the self-appointed avenger of his own and his people's wrongs. This is not the place, if there were room, for a thorough discussion of the wrongs of the Red Men, but I cannot forego the duty, in treating of the manners, customs and character of tribes so interesting, so noble and superior, by many traits, to most savage races, of recording at the same time, this tribute and testimony. It will unquestionably be the verdict of the future, as coming generations shall study the memorials and character of the North American Indians.*

* These reflections, with much relating to the customs of the Indians, have been introduced into the work by the American editor.

CHAPTER CXL.

THE ESQUIMAUX.

APPEARANCE — DRESS — DWELLINGS.

APPEARANCE OF THE PEOPLE — THEIR COMPLEXION, AND DIFFICULTY OF SEEING IT — AN ESQUIMAUX CHILD WASHED AND COMBED — BODILY STRENGTH — DRESS OF THE MEN — THE TAILED COAT — “MILLING” BOOTS — DRESS OF THE WOMEN — THE LARGE HOOD AND BOOTS — THE TATTOO, AND MODE OF PERFORMING IT — HAIR-DRESSING — PREPARING SKINS — THE SNOW HOUSES, AND MODE OF BUILDING THEM — CAPTAIN LYON’S DESCRIPTION — INTERNAL ARRANGEMENTS OF THE HUT — ICE AND BONE HOUSES — THE TUPIC, OR SUMMER DWELLING — FOOD OF THE ESQUIMAUX — A WISE TRAVELLER.

WE now come to those extraordinary people, called by Europeans the ESQUIMAUX (their own name being Innuít), who, placed amid perpetual ice and snow, have bent those elements to their own purposes, and pass as happy lives in their inclement country as do the apparently more favored inhabitants of the tropics amid their perpetual verdure. Indeed, the Esquimaux has a perfect yearning for his beloved country, should he be away from it. Captain Hall relates the circumstances attendant upon the “death of Kndlago, a singularly intelligent man, who had visited the United States, and fully learned to appreciate the advantages of the high civilization which he saw there. But all his wishes were for home, and he was taken back. As the ship neared his native land, he fell ill and died, his last words being the eager inquiry, ‘Do you see ice? Do you see ice?’”

IN appearance, the Esquimaux are a peculiar people. Their stature is short, when compared to that of an ordinary European, the average being about five feet three inches for the men, and two or three inches less for the women.

The complexion is in some cases rather dark, but, as a rule, is not much darker than that of the inhabitants of Southern Europe. It looks, however, many shades darker, in consequence of the habits of the Esquimaux, who never wash from their birth to their death. It is not that they neglect their ablutions, but the very idea of washing never

enters the mind of an Esquimaux, who, unless he has met with white men, has not even heard of such an operation. When, however, an Esquimaux has been induced to allow his skin to be cleansed, he is found to lose many shades of his original darkness. There is an amusing passage in the journal of Captain Hall, given in his “Life with the Esquimaux,” a work to which frequent reference will be made in the next few pages.

“Kinnaloo” has just been Americanized. Captain B——’s good wife had made and sent to her a pretty red dress, a necktie, mittens, belt, &c.

“Mr. Rogers and I, at a suggestion from me, thought it best to commence the change of nationality with soap and water. The process was slow, that of arriving at the beautiful little girl, whom we at length found, though deeply imbedded layer after layer in dirt. Then came the task of making her toilet. With a very coarse comb I commenced to disentangle her hair. She had but little, the back part from behind her ears having been cut short off on account of severe pains in her head. How patiently she submitted to the worse than curry-comb process I had to use! This was the first time in her life that a comb had been put to her head. Her hair was filled with moss, seal and reindeer hairs, and many other things, too numerous to call them all by name. Poor little thing! Yet she was fat and beautiful, the very picture of health. Her cheeks were as red as the blown rose; Nature’s vermilion was upon them.”

The skin is smooth, soft, and yet wonderfully tough, with a sort of unctuous surface, probably occasioned by the enormous amount of oil and fat which forms the principal part of their diet. The features are not very pleasing, the face being broad, and the cheek-bones so high that in many cases, if a flat ruler were laid from cheek to cheek, it would not touch the nose. As is the case with the Chinese section of this vast race, the eyes slope rather downward, and the face is often covered with wrinkles to a wonderful extent, extending from the eyes down each cheek.

In bodily strength, the Esquimaux present a great contrast to the Andamaners, who, though short, are possessed of gigantic muscular powers. Captain Lyon found that the natives could not raise burdens that were easily lifted by his sailors, whereas an ordinary Andamaner is often a match for two powerful sailors. The neck is strangely thin and feeble, however well-proportioned the chest may be, and it is a curious fact that the Esquimaux are almost wholly ignorant of running and jumping. There is but little beard; and the hair is black, coarse, straight, and lank.

The general character of the dress is alike in both sexes, so that at a little distance it is not easy to tell whether the spectator be looking at a man or a woman, both sexes wearing trousers, and jackets with a large hood, which can either be drawn over the head or allowed to fall on the shoulders. The jacket of the man is made something like a broad-tailed dress-coat, hanging behind as far as the middle of the calf, and cut away in front just below the waist. It is mostly made of deer-hide, and the hood is lined and turned up with white fur, which forms a curious contrast to the dark, broad face within it. The edge of the coat is generally bordered with a lighter-colored fur, and is often decorated with little strips of fur hanging like tassels.

Under this coat is another of similar shape, but of lighter material, and having the furry side turned inward. The legs are clothed in two pairs of trousers, the outer pair being often made of strips of differently colored deer-skins arranged in parallel stripes, and having the fur outward, while the other has the fur inward, as is the case with the coats. They only come as low as the knee, so that the joint is often frost-bitten; but nothing can induce the Esquimaux to outrage fashion by adding a couple of inches to the garment.

The boots are made of the same materials as the other parts of the dress. In winter time the Esquimaux wear first a pair of boots with the fur inward, then slippers of soft seal-skin so prepared as to be waterproof, then another pair of boots, and, lastly, strong seal-skin shoes. In the summer time one pair of boots is sufficient protection.

The soles are made of thicker material than the rest of the garment, and it is the duty of the women to keep the soles flexible by chewing or "milling" them, an operation which consumes a considerable part of their time.

Mittens are made of various skins, the hairy side being inward; and if the wearer be engaged in fishing, he uses mittens made of watertight seal-skin. During the summer, light dresses are worn, made of the skins of ducks, with the feathers inward. Over all there is sometimes a very thin and light waterproof garment made of the intestines of the walrus.

The jackets worn by the women have a much longer and narrower tail than those of the men, and a tolerably deep flap in front. The hood is of enormous size, being used as a cradle as well as a hood, in which a child of nearly three years old is carried. The trousers, or rather leggings, are tied to a girdle that passes round the waist, and are so cut away at the top, that they allow a portion of the skin to be visible between them and the sides of the jacket, an exposure from which the wearers do not seem to suffer. The oddest article of the female apparel is, however, the boots, which more resemble sacks or buckets than boots, and are simply tied to the girdle by a broad strap that passes up the front of the leg. The boots are used as receptacles for all kinds of portable property, food included, and in consequence impart a most singular walk, or rather waddle, to the wearers, who are obliged to keep their feet widely apart, and, as they walk, to swing one foot round the other, rather than to use the ordinary mode of walking.

The Esquimaux women use the tattoo, called by them the kakeen, and in some places cover their limbs and a considerable portion of their persons with various patterns. There are some who mark the forehead, cheeks, and chin, these being mostly proof that the woman is married, though they are sometimes worn by unmarried females. The mode in which the kakeen is performed is amusingly told by Captain Lyon, who courageously submitted to the operation.

"My curiosity determined me on seeing how the kakeen was performed, and I accordingly put myself into the hands of Mrs. Kettle, whom I had adopted as my amama, or mother.

"Having furnished her with a fine needle, she tore with her teeth a thread off a deer's sinew, and thus prepared the sewing apparatus. She then, without a possibility of darkening her hands beyond their standard color, passed her fingers under the bottom of the stove pot, from whence she collected a quantity of soot. With this, together with a little oil and much saliva, she soon made a good mixture, and taking a small piece of

whalebone well blackened, she then drew a variety of figures about my arm, differing, as I easily saw, from those with which she herself was marked; and, calling her house-mates, they all enjoyed a good laugh at the figures, which perhaps conveyed some meaning that I could not fathom.

"I had, however, only determined on a few strokes, so that her trouble was in some measure thrown away. She commenced her work by blackening the thread with soot, and taking a pretty deep but short stitch in my skin, carefully pressing her thumb on the wound as the thread passed through it, and beginning each stitch at the place where the last had ceased. My flesh being tough, she got on but slowly, and, having broken one needle in trying to force it through, I thought fit, when she had completed forty stitches, or about two inches, to allow her to desist; then, rubbing the part with oil in order to stanch the little blood which appeared, she finished the operation. I could now form an idea of the price paid by the Esquimaux females for their embellishments, which for a time occasion a slight inflammation and some degree of pain. The color which the kakeen assumes when the skin heals is of the same light blue as we see on the marked arms of seamen."

The dress of the children is alike in both sexes. None at all is worn until the infant is nearly three years old, up to which age it is kept naked in its mother's hood. A dress is then made of fawn skin, having the jacket, trousers, boots, and hood in one piece, the only opening being at the back. Into this odd dress the child is put, and the opening being tied up with a string, the operation of dressing is completed. The hood or cap is generally made in the shape of the fawn's head, so that the little Esquimaux has the strangest appearance imaginable, and scarcely looks like a human being.

As to the hair, the men cut it short over the forehead, and allow the side locks to grow to their full length, tying them, when very long, over the top of the head in a large knot projecting over the forehead. The women part the hair in the middle, and make it into two large tails. A piece of bone or wood is introduced into each of the tails by way of a stiffener, and they are then bound spirally with a narrow strip of deer-hide, with the fur outward. Those women who can afford such a luxury pass the hair through two brass rings, which are then pressed as closely as possible to the head.

The whole of the operations of preparing the skin and making the clothes are done by the women, the men having completed their task when they have killed the animals. The fat, blood, and oil are first sucked from the skins, and the women then scrape the inner surface with an ingenious instrument, sometimes furnished with teeth, and at

other times plain, like blunt knives. The skins are then rubbed and kneaded, and are dried by being stretched by pegs to the ground in summer, and laced over a hoop in winter and exposed to the heat of the lamp, which constitutes the only fire of the Esquimaux.

Bird skins are prepared in a somewhat similar fashion, and are stripped from the bodies of the birds in a marvellously expeditious manner. With their knife, which exactly resembles a cheese cutter, they make an incision round the head and round the outer joint of each wing. The cut part is then seized between the teeth, and with a pull and a jerk the skin comes off in one piece, and turned inside out. These skins are considered a great luxury by the Esquimaux, who bite and suck off the fat which adheres liberally to them.

IN a country where the thermometer remains many degrees below zero for many months together, and in which ice and snow are the prevailing features, it is evident that houses cannot be built after the fashion of those in most countries. No trees can grow there, so that wooden houses are out of the question, and in a land where ice has been known to choke up the iron flue of a stove always kept burning neither clay could be made into bricks, nor stones cemented with mortar. There is only one substance of which houses can be made, and this is frozen water, either in the form of snow or ice, the former being the usual material. These snow houses, called igloos, are made in a dome-like shape, and are built with a rapidity that is perfectly astonishing. The reader will find the form and mode of building these houses illustrated on page 1327.

The general appearance of these strange houses is thus described by Captain Lyon, in his "Private Journal." "Our astonishment was unbounded, when, after creeping through some long passages of snow, to enter the different dwellings, we found ourselves in a cluster of dome shaped edifices, entirely constructed of snow, which, from their recent erection, had not been sullied by the smoke of the numerous lamps that were burning, but admitted the light in most delicate hues of verdigris green and blue, according to the thickness of the slab through which it passed. . . . There were five clusters of huts, some having one, some two, and others three domes, in which thirteen families lived, each occupying a dome or one side of it, according to their strength. The whole number of people were twenty-one men, twenty-five women, and eighteen children, making a total of sixty-four.

"The entrance to the building was by a hole about a yard in diameter, which led through a low arched passage of sufficient breadth for two to pass in a stooping pos-

ture, and about sixteen feet in length; another hole then presented itself, and led through a similarly shaped but shorter passage, having at its termination a round opening about two feet across. Up this hole we crept one step, and found ourselves in a dome about seven feet in height, and as many in diameter, from whence the three dwelling-places with arched roofs were entered. It must be observed that this is the description of a large hut; the smaller ones, containing one or two families, have the domes somewhat differently arranged.

"Each dwelling might be averaged at fourteen or sixteen feet in diameter, by six or seven in height; but as snow alone was used in their construction, and was always at hand, it might be supposed that there was no particular size, that being of course at the option of the builder. The laying of the arch was performed in such a manner as would have satisfied the most regular artist, the key piece on the top being a large square slab. The blocks of snow used in the buildings were from four to six inches in thickness, and about a couple of feet in length, carefully pared with a large knife. Where two families occupied a dome, a seat was raised on either side two feet in height. These raised places were used as beds, and covered, in the first place, with whalebone, sprigs of Andromeda, or pieces of seal-skin; over these were spread deer-pelts and deer-skin clothes, which had a very warm appearance. The pelts were used as blankets, and many of them had ornamental fringes of leather sewed round their edges.

"Each dwelling-place was illuminated by a broad piece of transparent fresh-water ice, of about two feet in diameter, which formed part of the roof, and was placed over the door. These windows gave a most pleasing light, free from glare, and something like that which is thrown through ground glass. We soon learned that the building of a house was but the work of an hour or two, and that a couple of men — one to cut the slabs and another to lay them — were sufficient laborers.

"For the support of the lamps and cooking apparatus a mound of snow is erected for each family; and when the master has two wives or a mother, both have an independent place, one at each end of the bench."

In the middle of the hut is erected a slight scaffold, which supports a rudely made net, and under the net is placed the one essential piece of furniture of the house, namely, the lamp. This is a very simple contrivance. It is merely an oval shaped dish of stone, round the edge of which is arranged a long wick made of moss. Oil is poured into it, and a quantity of blubber is heaped in the centre of the lamp, so as to keep up the supply. Over the lamp is hung the cooking pot, the size of each being pro-

portioned to the rank of the possessor. It sometimes happens that two wives occupy the same hut. In this case, the chief or "igloo-wife" has the large lamp and the supporting scaffold, while the other has to content herself with a little lamp and a small pot, which she must support as she can.

The value of the lamp is simply incalculable, not so much for its use in cooking, as the Esquimaux like meat raw quite as well as cooked, but for its supply of warmth, for the water which is obtained by melting snow over it, and for its use in drying clothes. All garments, the snow being first beaten off them, are placed on the "dry-net" over the lamp, where they are gradually dried, and, after being chewed by the women, are fit for wear again: otherwise they become frozen quite hard, and are of no more use than if they were made of ice. Oil is supplied by chewing blubber, and the women, who always perform the task, have the curious knack of expressing the oil without allowing a drop of moisture to mix with it. In one minute a woman can obtain enough oil to fill a lamp two feet in length.

Sometimes, when snow is scarce, the igloo is made of ice. The walls are formed of this material, and are generally of an octagonal form, the ice slabs being cemented together with snow. The domed roof is usually made of snow, but the tunnel, or passage to the interior, is of ice. Such a house is, when first made, so transparent that, even at the distance of some paces, those who are within it can be recognized through its walls.

It may seem strange that such materials as snow and ice should be employed in the construction of man's dwelling-place, as nothing seems more opposed to comfort; yet these houses, instead of being cold, are so warm that the inhabitants throw off the greater part, and sometimes the whole, of their clothes when within them; and the bed of snow on which they recline is, when covered with the proper amount of skins, even warmer than an European feather bed. In the summer time the Esquimaux prefer the skin hut, or "tupic." This is a mere tent made of deer-skins thrown over a few sticks, though the supports are sometimes formed from the bones of whales.

THE food of the Esquimaux is almost wholly of an animal character. In the first place, the country supplies scarcely any vegetation; and, in the next place, an abundant supply of animal food is required in order to enable the inhabitants to withstand the intense cold. The seal and the reindeer form their favorite food, and in both cases the fat is the part that is most highly valued.

In the reindeer, the fat of the hinder quarters, called by the Esquimaux "toodnoo," is

the portion that is most valued. Captain Hall, who very wisely lived as the Esquimaux while staying with them, says that it is as much superior to butter as is the best butter to lard; and when the deer is in good condition, the meat is so tender that a steak almost falls to pieces if lifted by its edge. Another part of the reindeer is almost as valuable as the fat. This is the contents of the deer's paunch, eaten raw with slices of raw venison. It has a slightly acid flavor, like that of sorrel, and if the consumer were not to know what he was eating, he would be delighted with it.

This was the case with Captain Hall, while partaking of a deer feast in an igloo. He tried the deer flesh, and found it excellent; he then took a morsel of the unknown substance, and describes it as ambrosial. After eating the greater part of it, he took it to the light, and was horrified to find the nature of the feast. However, he soon came to the wise conclusion that epicurism of any kind was nothing but the effect of education, and that, in consequence, he would ignore his previous prejudices on the subject, and eat whatever the Esquimaux ate, and as they ate it. As to the quantity consumed, neither he nor any other white man would be a match for an Esquimaux, who will consume nine or ten pounds of meat at a sitting, and lie leisurely on his back, being fed by his wife with pieces of blubber when he is utterly unable to help himself. An Esquimaux finds a sort of intoxicating effect in utter repletion, which stands him in the stead of fermented liquors.

Putting aside the gourmandizing propensity of the Esquimaux, Captain Hall found that if he were to live with them, as he intended to do, he must sooner or later come to the same diet. He determined in making a bold plunge, and eating whatever he saw them eat. At first it was rather repugnant to his feelings to eat a piece of raw meat that had been carefully licked by a woman, in order to free it from hairs and other extraneous matters. But he reflected that, if he had not known of the licking, he would not have discovered it from the flavor of the meat, and he very wisely ignored the mode in which it had been cleaned. Similarly, fresh seal's blood just drawn from the animal seemed rather a strange kind of soup, and the still warm entrails a remarkable

sort of after-dinner delicacy. But finding that the Esquimaux considered them both as very great dainties, he tried them, and pronounced that the Esquimaux were perfectly right, and that his preconceived ideas were entirely wrong.

HARPOON HEAD. (From my collection.)

(See page 1340.)

CHAPTER CXLI.

THE ESQUIMAUX—*Continued.*

HUNTING—RELIGION—BURIAL.

MODES OF HUNTING—SEAL HUNTING IN THE SNOW—THE INFANT DECOY—THE SEAL'S IGLOO—AN IVORY FLOAT—SEAL "TALK"—THE HARPOONS AND SPEARS—SPEARING THE WALRUS—THE ICE RAFT—THE BOW AND ARROWS AND WRIST GUARD—DEER HUNTING—GROUSE SHOOTING—THE WOLF AND FOX TRAPS—THE BIRD SLING—BEAR HUNTING—THE MEN'S AND WOMEN'S BOATS—CONSTRUCTION OF THE KIA, AND MODE OF USING IT—AQUATIC FEATS—THE WOMEN'S BOAT AND ITS USES—THE SLEDGE—THE VARIOUS RUNNERS—SLEDGE DOGS AND THEIR TRAINING—EXAMPLES OF THEIR CLEVERNESS—BARBEKARK AND THE CAPELINS—MARRIAGE AND EDUCATION OF CHILDREN—GAMES AND DANCING—RELIGION—THE ANGEKO AND HIS MYSTERIES—“IN VINO VERITAS”—HONESTY—HOSPITALITY—DISPOSAL OF THE DEAD.

DEPENDING wholly upon the products of the chase for their food, the Esquimaux are most accomplished hunters, and in their peculiar way are simply unequalled by any other people on earth. Take, for example, their mode of seal catching. The reader is doubtless aware that the seal, being a mammal, breathes atmospheric air, and that in consequence it cannot remain very long under water, but is obliged to come up at certain intervals for the purpose of breathing. When it dives under the ice, it would therefore be drowned did it not form for itself certain breathing holes in the ice. These are very small, not more than an inch and a half, or at the most two inches, in diameter, and do not penetrate through the coating of snow that lies on the ice.

The hunter's dog, which is specially trained for this purpose, detects the breathing hole, and the master then reverses his harpoon, which has a long, spindle shaped butt, and thrusts it through the snow in search of the concealed hole, which often lies under some two feet of snow. When he has found it, he seats himself by the hole, with his harpoon ready; and there he will sit until he hears the blowing sound of the seal, when he drives the harpoon into the hole, and invariably secures his prey. This is the more difficult, as, if the stroke be wrong by even a quarter of an inch, the

seal will not be struck, and the man is often wearied with waiting and need of sleep.

The patience with which the Esquimaux hunter will watch a seal hole far surpasses that of a cat at a mouse hole. Captain Hall mentions one case, where an Esquimaux, a notable seal hunter, actually sat watching a seal hole for two and a half days and two nights without either sleep or food. Considering the nature of the climate, such a feat as this is almost incredible. The poor man, after all his trouble, failed to secure the seal, but was not disheartened, and, after taking some food, went off again to the seal hole to renew his watch.

Some of the Esquimaux seal hunters use a singularly ingenious instrument for enabling them to detect the approach of the animal. It consists of a very slender ivory rod, about twelve inches in length, pointed at one end, and having a round knob at the other. It is about as thick as a crow quill. When the hunter has found a seal hole, he ties to the upper end a very fine thread made of sinew, and lowers it into the seal hole, where it is allowed to dangle by the thread. When the seal comes to breathe, it takes no notice of so small an object, but rises as usual for air, pushing the little rod before it. As soon as the hunter sees the rod rise, he knows that the seal is there, and drives his spear down the hole. Even a

larger float—if we may so call it—might be unseen by the seal, but it would interfere with the passage of the spear.

There is another mode of catching seals, in which the young acts as a decoy for its mother. The seal, when she is about to produce her young, scratches away the ice until she comes to the snow, which lies deep upon it. She then scratches away a quantity of the snow until she has made a dome-like chamber, in form exactly like the snow hut of the Esquimaux. The tunnel through the ice is just large enough to allow the passage of the seal, while the chamber is about five feet in diameter, so that a tolerably large platform of ice is left, on which the creature can rest. Here its young is produced, and here it remains until the sun melts away the snow covering of the chamber, or igloo, as it is called, by which time the young animal is able to take care of itself.

At the proper season, the Esquimaux set off in search of these seal igloos, and when they are detected by the dogs, the hunter flings himself on the snow, thus beating down the roof of the igloo. He then thrusts his sealing hook into the igloo, and drags out the young seal. It is remarkable, by the way, that the polar bear acts in precisely the same manner, crushing down the walls of the igloo, and dragging out the young one with its paws.

When the Esquimaux has secured the young seal, he ties a long line to one of the hind flippers, and allows it to slip into the sea through the tunnel, while he creeps into the igloo with his hook, in hopes of catching the mother as she comes to help her young one. The Esquimaux always kill young seals by putting the foot on their shoulders, and pressing firmly down, so as to suffocate it. This is done for the purpose of preserving the blood.

Sometimes the seal hunter actually stalks the wary animal on the ice. The seal has a strange way of sleeping when lying on the ice. It takes short naps of only a few seconds' duration, and between them raises its head and looks round to see if any enemy be approaching. The Esquimaux takes advantage of this habit, and, lying down on the ice, he waits for these short naps, and hitches himself along the ice toward the animal, looking himself very much like a seal as he lies on the ice, covered with seal skin garments. Whenever the seal raises its head, the hunter stops, begins to paw with his hands, and utters a curious droning monologue, which is called "seal talk," and is supposed to act as a charm. Certain it is, that the seal appears to be quite gratified by the talk, is put off its guard, and allows the hunter to approach near enough to make the fatal stroke.

The same kind of "talk" is used when the sealer goes out in his boat, and some of the hunters are celebrated for the magical

power of their song. In seal hunting from a boat, a different kind of harpoon is employed. It is longer and slighter than that which is used for ice hunting, and is furnished with a float made of a leathern bag inflated with air. This is fastened to the shaft, and just below it one end of the harpoon line is secured, the other end being made fast to the head of the weapon.

When the seal is struck, the shaft is shaken from the head, so that there is no danger of its working the weapon out of the seal by its leverage, and it acts as a drag, impeding the movements of the animal, so that the hunter is able to overtake it in his boat, and to pierce it with another harpoon. When the seal is dead, the float serves another purpose. Seals, when killed in the water, almost invariably sink so rapidly that they cannot be secured. The float, however, remains at the surface, so that the successful hunter has only to paddle to it, take it into the canoe, and haul the seal on board. Perhaps the most curious part of the business lies in the skill with which the hunter carries the seal home. The boat in which he sits is entirely covered with skin, except a small aperture which admits his body, and yet he lays the body of the seal upon this slight platform, and manages to balance it as he paddles homeward, regardless of the waves upon which his light little canoe trembles like a cork.

Of these boats we shall presently see something, and will now merely look at the weapons which are employed by the Esquimaux in hunting.

It is worthy of remark that war is totally unknown among the Esquimaux, who are perhaps the only people in the world who possess no war weapons, and have no desire to do so. Generally, when a savage obtains for the first time possession of fire-arms, he uses them in warfare, and by the superiority of his weapons raises himself to eminence. The Esquimaux cares for none of these things. He is essentially a family man, and when he is fortunate enough to procure a musket, he simply uses it for hunting purposes, never wasting the precious powder and lead upon the bodies of his fellow-men. Of fame he is totally ignorant, except that sort of local fame which is earned by skill in hunting. He finds that all his energies are required to procure food and clothing for his household, and therefore he does not expend them upon any other object.

The weapon which is to the Esquimaux what the rifle is to the backwoodsman, the boomerang to the Australian, the sword to the Agageer, the lasso to the South American, and the sumpitan to the Dyak, is the harpoon, a weapon which undergoes various modifications, according to the use to which it is put, but is essentially the same in principle throughout.

The first example is the typical harpoon.

It consists of a long wooden shaft, with a float attached to it, as has already been described on page 1339. Owing to the great scarcity of wood in Esquimaux land, the greater part being obtained from the casual drift-wood that floats ashore from wrecks, such a weapon is exceedingly valuable. The shaft is generally made of a number of pieces of wood lashed together in a most ingenious fashion.

The barbed head is but loosely fitted to the shaft, a hole in the base of the head receiving a point at the end of the shaft. It is held in its place by leathern thongs, so arranged that, as soon as the wounded animal darts away, the shaft is shaken from the head. The arrangement of the leathern thongs varies according to the kind of weapon. The illustration on page 1337, shows the head of the harpoon which is used for spearing the walrus.

It is about nine inches in length, and is made of ivory, either that of the walrus or the narwhal, probably the former, as it partakes of the curve of the walrus tooth. It consists of two pieces, which we call, for convenience' sake the body and the head. The upper part of the body is slightly pointed and rounded, and is meant to be fixed to the shaft of the harpoon. About an inch and a half from the end two holes are bored, through which is passed a double thong of leather about as thick as a goose quill. Next comes the head, which is a triangular and deeply barbed piece of ivory, armed with a thin, flat plate of iron, almost exactly like the armature of the Bosjesman's war arrow. Through this head is bored a hole, and through the hole passes the loop of the double thong already mentioned. At the butt of the head there is a hole, into which is fitted the conical termination of the body.

By reference to the illustration, the reader will easily comprehend the arrangement. Fig. 1 shows the entire instrument, the head fitted on the body, and held in its place by the double thong. Fig. 2 shows the head disjointed from the body. The reader will now see what a perfect barb this instrument forms. When the harpoon is hurled at the walrus, the head penetrates through the tough skin, and, becoming disjointed from the body, sets at right angles across the little wound which it made on entering, and effectually prevents the weapon from being withdrawn. Fig. 3 shows the upper view of the head, and fig. 4 shows the hole at its base, into which the conical end of the body is loosely fitted.

The line attached to the shaft of this harpoon is very long and of great strength, and, when the hunter goes out to catch walrus, is coiled round and round his neck in many folds, very slightly tied together so as to prevent the successive coils from being entangled with one another. When the hunter launches his harpoon with the right hand,

he with the left hand simultaneously jerks the coils of rope off his neck, and throws them after the harpoon. The jerk snaps the slight ligatures, and the animal is "played" like a salmon by an angler, until it is utterly wearied with pain, loss of blood, and its struggles to escape, and can be brought near enough to receive the fatal wound from a spear.

Casting off the rope in exact time is a most important business, as several hunters who have failed to do so have been caught in the coils of the rope, dragged under the ice, and there drowned. On the end of the harpoon line is worked a loop, and, as soon as the weapon is hurled, the hunter drives a spear deeply into the ice, slips the loop over it, and allows the walrus to struggle against the elastic rope until it is quite tired. He then hauls up the line until he has brought the animal to the ice, snatches up his spear, and with it inflicts a mortal wound. On the next page the reader may find an illustration showing the Esquimaux in his usual dress, and engaged in walrus hunting.

One mode of employing this harpoon against the walrus is singularly ingenious. When the Esquimaux hunters see a number of the animals sleeping on a sheet of ice, they look out for an ice fragment small enough to be moved, and yet large enough to support several men. Paddling to the ice, they lift their canoes upon it, bore holes in it, and make their harpoon lines fast to the holes. They then gently paddle the whole piece of ice, men, canoes, and all, to the spot where are lying the drowsy animals, who do not suspect any danger from a piece of ice floating by.

Having made their selection, the hunters tell off two men to each walrus, and, at a given signal, all the harpoons are hurled. The whole herd instantly roll themselves into the sea, the wounded animals being attached to the piece of ice by the harpoon lines. The hunters allow them to tow their ice craft about until they are exhausted, when they launch their canoes, and kill the animals with their spears. As soon as the walrus is dead, the hunters plug up the holes with little pegs of ivory, for the purpose of preserving the blood, which is so highly valued by the Esquimaux.

The Esquimaux have another kind of spear. The shaft is made of wood, but the point and the barbed projections are of ivory. This spear is chiefly used for catching fish, and is flung by means of a throwing stick, almost in the same manner as the spears of the Australians. The throwing stick is made of wood, flattish, and near one end has a hole, into which the butt of the spear is passed. This is altogether a much slighter and lighter weapon than that which has been described.

Bows and arrows are also employed by the Esquimaux. The former are made of horn, bone, or wood, and are almost always

(1.) BURIAL OF BLACKBIRD. (See page 1330.)

(2.) SPEARING THE WALRUS. (See page 1340.)

composed of several pieces lashed firmly together. As is the case with the bows of the North American tribes, the chief strength is obtained, not so much from the material of the bow, as from a vast number of sinew strings which run down its back. There are often a hundred or more of these sinews, which are put on sufficiently tight to give the bow a slight curvature against the string. The shape of the bow is rather peculiar. And though the weapon is so powerful, it is seldom used at a greater distance than twelve, or at most twenty yards. The length of the bow is on an average three feet six inches.

The arrows are extremely variable. Some have wooden shafts tipped with bone, but the shafts of the best specimens are half bone and half wood, and the points are armed with a little piece of iron. The arrows are contained in a quiver, and the bow is kept in a case. This quiver and bow-case are generally made of seal skin, as being impervious to wet, though they are frequently made of other materials. My own specimen is formed from the hide of the reindeer. When the Esquimaux shoots, he always holds his bow horizontally. The bow-string is made of some fifteen or twenty sinew strings, which are loosely twisted, but not made into a cord.

The bow and arrows are chiefly used in the capture of the reindeer and in shooting rabbits, birds, and other small game. The mode of deer hunting is very ingenious. When the hunter sees some deer feeding on the level plain, he takes his bow and arrows, draws his hood well over his head, and creeps as close as he can to the spot where the deer are reposing. Here he begins to bellow in imitation of the cry with which the deer call each other, and thus attracts the animals within the short distance at which an Esquimaux archer shoots.

Even if he should not use the bellowing call, he has only to lie patiently on the ground to be sure that, sooner or later, some of the deer will come and look at him. They are most inquisitive animals, and when they see any strange object, they cannot resist satisfying their curiosity by inspecting it. Providing the object of their curiosity does not move after them, they approach in a series of circles which they gradually narrow, capering and tossing their heads capriciously, and at last will come within a yard or two of the motionless hunter, and so fall a victim to the arrow which he has already fitted to his bow.

Sometimes the deer hunters adopt an ingenious ruse. Two of them walk near the deer, and purposely show themselves. When the animals' attention is fixed upon them, they walk slowly away, knowing that the innate curiosity of the deer will induce them to follow. They direct their course past some stone or similar object, when one

of them quickly steps behind it, while the other walks onward as before. The deer do not notice that one of the men has disappeared, and so follow the other, thus coming within a yard or two of the deadly arrow.

The arrow is also used for shooting birds, which are always killed when sitting. The arctic grouse are killed in great numbers by the arrow. They pack closely together, so that an arrow shot at random among them can scarcely avoid hitting one of them; and the birds are so apathetic that, when the missile falls among them, they only fly a few yards further and then settle, so that the hunter can pick up his arrow and shoot it at them again, until he has shot the greater number of the covey.

In order to save the wrist from the recoil of the bow-string, the Esquimaux wears a very ingenious guard, composed of several pieces of bone tied together and fastened on the wrist by a bone button and loop. The pieces of bone are about four inches in length. Below the wrist-guard, which is shown on the 1353d page, some curiously formed hooks are represented. No bait is required with them. They are simply moved up and down in the water so as to attract the attention of the fish, and then are jerked sharply upward, so as to catch the fish on one of the projecting points. There are many varieties of this curious hook, but those which are illustrated are the most characteristic.

There is also an instrument called the *akeeway*, or little nippers, which is used in a similar manner by the Esquimaux boys. They take a model of a fish made of ivory, tie a string to it, and troll it about in the water in order to attract the fish, when they are struck with the *akeeway*, and hauled out of the water. The artificial fish are about three inches long, and are very neatly made, with eyes of iron pyrites. This is a very slow process of fish catching, but the boys, to whom time is of no object, are very fond of it, and will sit on their heels all day for the chance of catching two or three little fish.

The foxes and wolves are generally taken in traps. There are several kinds of traps, but they are mostly made on one or the other of two principles. The usual trap is very like a common mouse trap, except that it is made of ice instead of wood. It is so long and narrow that a wolf cannot turn himself in it, but, if he wishes to retreat, must do so backward. The door is a heavy slab of ice, which moves up and down in two grooves. The door being raised, it is held in position by a line which passes over the top of the trap, through a hole at the end, and is then slightly hitched over a peg. A bait is then attached to the end of the line, and when the wolf pulls it, the door is released, and effectually secures the animal in the icy prison. A hole is then

made in the side of the trap, and the wolf is speared where he lies.

Foxes are also taken in these traps, but the usual kind of fox trap is made on a different plan. It is built in a form somewhat resembling a lime-kiln, and the aperture is covered with a piece of whalebone, along which the animal must walk to get at the bait. As it steps on the whalebone, the elastic material gives way, lets the fox into the trap, and then resumes its former position, ready for another victim.

It has already been mentioned that birds are often shot with arrows as they are sitting. The Esquimaux have a singular instrument by which they can capture birds on the wing, provided that they do not fly at any great height from the ground. It consists of seven or eight pieces of bone or ivory, or stone, the latter being preferred on account of its weight. To each of the weights is attached a sinew cord about two feet six inches in length, and all the ends of the cords are tied together, their junction being usually ornamented by a tuft of feathers. When the Esquimaux sees a bird flying so that it will pass tolerably near him, he whirls the sling round his head and flings it at the bird. As it leaves his hand, all the weights fly apart, on account of the rotatory motion which has been communicated to them, so that the weapon covers a space of five feet. Should one of the weights or strings strike the bird, the whole of the sling becomes wrapped round it, and the bird falls helpless to the ground. The reader will doubtless see that this sling is in fact a modification of the Patagonian bolas.

In bear hunting the Esquimaux use either the walrus harpoon or the spear, and often both. They set their dogs at the bear, and while he is engaged in repelling their attacks, which are always made at his back and hind-quarters, the hunter drives the harpoon at him, and fastens the end of the line to the ice, so as to prevent the bear from escaping. He then attacks the animal with another harpoon and with his lance, and, avoiding skilfully the repeated attacks which the bear makes upon him, drives the sharp weapon into the animal's heart.

The Esquimaux are always very careful not to kill a young bear without previously killing its mother. Should one of them, pressed by hunger, commit so rash an act, the whole party to which he belongs are obliged to take the strictest precautions lest they should be assailed by the mother, who will assuredly follow on their track. They therefore proceed for some five or six miles in a straight line, and then suddenly turn off at right angles, so that the bear may overrun their track as she presses eagerly forward. This manœuvre is several times repeated. When the houses are reached, the weapons are laid ready for use by the bedside, and the sledges are stuck upright

outside the house. This is intended by way of a warning to the sleepers. The bear is suspicious about the erect sledge, and always knocks it down before attacking the house, so that the noise of the falling sledge awakens the sleepers, and puts them on their guard.

THE two means of transport used by the Esquimaux are the boat and the sledge, both of which deserve description.

There are two kinds of boats, those of the men and those used by women. The man's boat is called *kajak* or *kia*, according to the dialect of the people, and is a very remarkable piece of workmanship. It is shuttle shaped, both ends being sharply pointed. It is made of a very slight framework of wood and whalebone, over which is stretched a covering of skin. In the middle there is a hole just large enough to admit the body of the rower, and when he takes his seat, he gathers his skin together and ties it round his waist, so that the boat is absolutely impervious to water. The average length is twenty-five feet, and so light are the materials of which it is made, that a man can carry his *kia* on his head from the house to the water.

These slight canoes have no keel, and sit so lightly on the water that they can be propelled over, rather than through, it with wonderful speed. The paddle is a double one, held in the middle, and used in a manner which is now rendered familiar to us by the canoes which have so largely taken the place of skiffs. It is between nine and ten feet in length, small in the middle, which serves as a handle, and gradually widening to the blades, which are about four inches in width, and edged with ivory, not only for ornament but for strength.

The paddle acts much the same part as the balance pole to the rope-dancer, and by its aid the Esquimaux canoe man can perform really astonishing feats. For example, if two *kias* are out together, one of them will remain still, the canoe man keeping his boat exactly in the same place, by delicate management of his paddle. The other goes to a distance at right angles to him, and then, urging his *kia* to the utmost speed, drives it fairly over that of his friend. In performing this remarkable feat, the skill of both is equally tried, for it is quite as difficult to preserve the balance of the stationary *kia* as to drive the other over it.

There is one feat which is sometimes performed in order to show the wonderful command which an Esquimaux has over his little vessel. He does not, however, attempt it unless another *kia* is close at hand. After seeing that the skin cover is firmly tied round his waist, and that his neck and wrists are well secured, the man suddenly flings himself violently to one side, thus capsizing the *kia*, and burying himself under

water. With a powerful stroke of his paddle he turns himself and canoe completely over, and brings himself upright again. A skilful canoe man will thus turn over and over some twenty times or so, almost as fast as the eye can follow him, and yet only his face will be in the least wet.

In the illustration on page 1347 both these feats are shown.

The paddler is so tightly tied to the kia, that he is unable to change his position without assistance, or even to lift a heavy weight, such as a seal. In such a case, he asks assistance from a companion. The two kias are placed near each other, and paddles are laid from one to the other, so that for the time they are formed into a double canoe, which cannot be upset. Small lines of whalebone are stretched across the end of the kia, and under them are thrust the points of the spears and harpoons, so that they cannot roll off the boat, and yet are always ready to hand. An inflated seal's bladder is always attached to the canoe. When the kia is not in use, it is taken out of the water, and rested in a reversed position upon the snow houses, as is seen on page 1327.

The second kind of boat is that which is called the oomiak, and is used by the women. It is evident that the slight and fragile kia, useful as it is for hunting purposes, cannot be employed for the conveyance of baggage, or for the transport of more persons than one, and that therefore some other kind of boat must be made. This is a large, clumsy, straight sided, square ended, flat bottomed vessel, more like a skin trough than a canoe, to which it bears about the same analogy as a punt does to a racing skiff. The framework of the oomiak is made of wood and whalebone, and the covering is of seal skin, from which the hair has been removed. When wet, these skins are nearly transparent, so that the forms of the persons sitting in the boat can be indistinctly seen.

The sides of the boat are about three feet in height, and the weight which a well-made oomiak will carry is really wonderful. Captain Lyon mentions that in one of these boats, measuring twenty-five feet in length by eight in width and three in depth, more than twenty human beings were conveyed. There are two very clumsy paddles by which the boat is slowly propelled, and it is steered by another paddle in the stern. The post of steerer is usually occupied by an old man, who is unable any more to manage the kia, but is still capable of guiding the oomiak, and of flinging a knife, a harpoon, a seal hook, or anything that may come to hand, at the women, if they neglect their paddling.

To each oomiak there can be attached a very primitive mast, with its sail. The mast is but a short one, and is stepped in the fore-

part of the boat. Toward the top it is pierced, and in the hollow is placed a sheave, or deeply grooved wheel of ivory, on which the halyards run. The sail is that simplest of all sails, the lug, and is made of the intestines of the walrus, split open so as to form strips of some four inches in width. These strips are sewed together, and produce a sail which is remarkable both for its strength and its extreme lightness. The reader will doubtless have noticed the singular contrast between the canoes of the hot and cold parts of the world. In the former, the canoe and sails are entirely of vegetable materials, without a particle of hide, sinew, or any animal product; while, in the latter, the animal world furnishes almost the whole of the materials.

We now come to the sledge, which is quite as important to the Esquimaux as the canoe. The materials and form of the sledge differ exceedingly, so that in these respects no two sledges are alike, while the principle is identical in all. A sledge is nothing more than two runners, connected with each other by a number of cross-pieces, on which the driver can sit and the goods be packed.

The best sledges are those in which the runners are made from the jaw-bone of a whale, sawn into narrow planks and cut into the proper shape. They are always shod with a strip of the same material. Others are made of wood, shod with bone, and in these cases the wooden part is usually in several pieces, which are lashed together with hide thongs. In the winter, the hide of the walrus is often used for runners. It is fully an inch in thickness, and, when frozen, is very much stronger than a board of the same thickness.

When neither wood, bone, nor walrus skin can be procured, the Esquimaux is still at no loss for runners. He cuts long strips of seal skin, and sews the edges of each strip together, so as to make two long tubes. The tubes are next filled with moss and earth, and water is then poured into them. In a minute or two they are frozen as hard as stone, and are then ready to form the runners of a sledge. The lower edge of the runner, whether it be of bone, wood, or skin, is always shod with a coating of ice, which is renewed as soon as it is worn off by friction, which not only causes the sledge to glide faster over the frozen surface, but preserves the valuable material of the runners from being rubbed to pieces.

The cross-bars of the sledge are generally of bone. They project a little beyond the runners on either side, and are so arranged that the sledge is narrower in front than behind. They are not lashed too tightly, as they are required to yield to the jerks and continual strain which the sledge undergoes in its travels.

The sledge is drawn by a team of dogs, varying from seven to ten, or even more, ac-

ording to the weight to be carried. They are very simply harnessed to it by a strong cord, or trace, made of seal hide, the trace of the leading dog being considerably longer than that of any of the others. Being accustomed to the work of the sledge, as soon as they can walk, their training is very complete, and a good team will do almost anything but speak.

A team of seven dogs drew a heavy sledge, full of men, a mile in four minutes and a half; and Captain Lyon mentions that three dogs drew him the same distance in six minutes, the weight of the sledge being one hundred pounds. Several times, when returning to the ships, the sagacious animals brought him and his companions safely to the vessels, though the night was pitchy dark and the snow-drift blowing about in clouds. They kept their noses to the ground, and galloped on at full speed, in absolute certainty of their proper line.

The dogs are guided, not by reins, but by a whip, the lash of which is from eighteen to thirty feet in length, and the handle only one foot in length, much like the stock-whip of Australia. A skilful driver makes but little use of the whip when he has a good team of dogs, but guides the animals partly by his voice, and partly by flinging the lash of the whip on one side or other of the leader, who perfectly understands the signal. When they are required to stop, the driver gives a cry almost exactly like the "Woa!" of our own country. He then throws the lash gently over their backs, when they all lie down, and will remain couched in the snow for hours even, during their master's absence.

The worst of these dogs is that they are very quarrelsome, and are apt to snap and snarl at each other as they gallop along. Sometimes a dog will be exasperated with a bite, and turn furiously on his assailant, when a general fight takes place, the whole of the dogs tumbling over each other, and entangling the traces in a manner that none but an Esquimaux could hope to disentangle. A plentiful application of whip is then made, which is always resented by the dog that receives the stroke. He chooses to think that his next neighbor has hurt him, and so bites his ear. Sometimes a dog is so unruly that the driver is obliged to use his last argument. Making a little hole in the snow with the toe of his boot, he presses the dog's snout into it, and pounds away at it with the ivory handle of his whip. The dog never howls, nor tries to release himself, but only utters a low whine. Such a punishment never has to be repeated, and the dog always goes quietly for the rest of the day.

The endurance of these animals is wonderful. They are kept in the open air when the temperature is from thirty to forty degrees below zero. They are very ill fed, being forced to content themselves with

the bones of fish and seals, scraps of hide, and such very few fragments as their masters cannot devour. Consequently they are always hungry, and can eat almost anything. Captain Hall mentions that in one night they ate a whiplash thirty feet long, and that on one occasion a single dog ate in seven seconds a piece of walrus hide and blubber six feet long and an inch and a half square.

Yet, in spite of all the hardships which they undergo, they can endure almost any amount of fatigue without appearing to be the worse for it, and a team has been known to eat nothing for at least forty-eight hours, to traverse some seventy miles of ground, and yet to return to their homes apparently as fresh as when they set out.

Many of them are possessed of singular intelligence, especially those which are trained to chase the seal, the bear, or the deer. One of these dogs, named Barbekark, belonging to Captain Hall, actually killed a deer himself, took one morsel from the neck, and then went home and fetched his master to the spot where he had left the dead deer. He had a brother that equally distinguished himself in seal catching. He was the leading dog in the team, and once, while drawing a sledge, he caught sight of a seal on the ice. He immediately dashed forward at full speed, and just as the seal was plunging into the water, caught it by the hind flippers. The seal struggled frantically to escape, but the dog retained his hold, and, aided by his fellows, dragged the seal firmly on the ice, when it was secured by his master.

A very amusing example of the intelligence of these dogs is related by Captain Hall. He fed the dogs on "capelins," a small dried fish, and used to make them stand in a circle round him, so that each received a capelin in turn. "Now Barbekark, a young and shrewd dog, took it into his head that he would play a white man's trick. So every time he received his fish he would back square out, move a distance of three or four dogs, and force himself in line again, thus receiving double the share of any other dog. But this joke of Barbekark's bespoke too much of the game many men play upon their fellow-beings, and, as I noticed it, I determined to check his doggish propensities. Still, the amusing and the singular way in which he evidently watched me induced a moment's pause in my intention.

"Each dog thankfully took his capelin as his turn came round, but Barbekark, finding his share came twice as often as his companions, appeared to shake his tail twice as thankfully as the others. A twinkle in his eyes as they caught mine seemed to say, 'Keep dark; these ignorant fellows don't know the game I'm playing. I am confoundedly hungry.' Seeing my face smiling at his trick, he now commenced making another change, thus getting three portions to each of the others'

(1.) THE KAJAK AND ITS MANAGEMENT. (See page 1344.)

(2.) ESQUIMAUX SLEDGE DRIVING. (See pages 1345, 1346.)

one. This was enough, and it was now time for me to reverse the order of Barbekark's game by playing a trick upon him.

"Accordingly, every time I came to him he got no fish, and though he changed his position three times, yet he got nothing. Now, if ever there was a picture of disappointed plans — of envy at others' fortunes, and sorrow at a sad misfortune — it was to be found in that dog's countenance as he watched his companions receiving their allowance. Finding that he could not succeed by any change of his position, he withdrew from the circle to where I was, and came to me, crowding his way between my legs, and looked up in my face as if to say, 'I have been a very bad dog. Forgive me, and Barbekark will cheat his brother dogs no more. Please, sir, give me my share of capelins.' I went the rounds three times more, and let him have the fish, as he had shown himself so sagacious, and so much like a repentant prodigal dog."

MARRIAGE among the Esquimaux is of the very simplest description, and is generally arranged by the parents of the bride and bridegroom, the latter having nothing to do with the affair. There is no marriage ceremony, the parties merely going to live in the same igloo. A man may, and often does, have several wives, and in this case one of them takes the position of the chief, or igloo wife, and is supreme under her husband. She has the largest lamp, the best bed, and the best provision. But she also has the entire management of the household, such as cooking the food, and drying the clothes on the "dry-net." This is by no means a sinecure, as it forces her to rise many times in the night for the purpose of turning the clothes and drying them equally. She also has to see that the boots are properly "milled."

After a child is born, the mother is obliged to confine herself to her own igloo for some months, and when the allotted time has expired, she throws off all the clothing which she has worn, and never wears it again. She then dresses herself in a totally new suit of clothes, and visits in succession the inhabitants of every igloo. If a second or third child be born, a separate igloo is always built for the mother, to which she repairs before the birth of the child, and in which she remains until the customary time has elapsed and she is able to call upon her neighbors.

The children begin their education at a very early age; the boys being taught to paddle the *kia*, to hunt and to fish, and to build igloos; while the girls learn to row the women's boat, to dress skins, to manage the lamp, to cook, and perform the multitudinous tasks that fall to their lot. The carving of the Esquimaux women is wonderfully good. They make spirited, though conventional, imitations of fish, ducks, dogs, and various animals, from ivory, using in the manufac-

ture nothing but a knife. In the earlier days, before white men visited them, the Esquimaux were obliged to rely entirely upon flint as a material for their knives, which were exactly like those of the ancient and perished races. In chopping the flakes off the flint, the Esquimaux employed a very simple instrument, the use of which showed an exact knowledge of the fracture-line of flint. It is made of bone and ivory, and is about six inches in length. Iron, indeed, is of so late introduction, that when Captain Lyon visited the natives, in 1821, he could purchase a complete harpoon, with its ivory head, float, and line, for a nail; while a knife would purchase a *kia*, or indeed anything that was asked in exchange for it.

As may be inferred from the climate, the games of the Esquimaux are but few. They are wonderful experts at a sort of "cat's-cradle," producing with a piece of string imitations of seals, reindeer, ducks, canoes, and other objects. The little ivory models of ducks and other animals, which have already been mentioned, are used in several of the native games.

Their dances are remarkable for their simplicity, the dancer inventing the steps according to his own taste. There is a dance in which a number of women stand in a ring, with their hands under the front flaps of their jackets, and sing, with half-closed eyes, the inevitable *Amna-aya* song: these are the band. The dancers are represented by one man, who takes his place in the middle of the ring, swings his head and arms from side to side, his long, lank hair flapping in the wind, while he utters sharp yells at intervals, and occasionally flings one leg as high as his thick garments permit.

The women have a special dance of their own, which consists in kneeling on the ground, leaping to their feet as fast as they can. This is really a difficult task when the heavy and clumsy boots are taken into consideration. Sometimes the men challenge each other to dance, and in that case the challenge is accepted by employing the "*koonik*," or national salutation, which is given by rubbing the noses together, and inhaling strongly through the nostrils.

With regard to religion, the Esquimaux seem to have no very definite idea of the subject, except that they believe in a future existence, in a heaven and a hell — the latter being, according to their ideas, dark, full of ice, with snow-storms always blowing, and no seals. They have also a hazy description of a Supreme Being, and a secondary female divinity, the special protector of the Esquimaux.

By way of worship, they have sundry medicine men, or "*angekos*," as they are called, who go through a series of strange ceremonies on various occasions, such as illness, or when a party is setting out on a hunting expedition. They make the people

pay heavily for their services, and rule with a rod of iron, so that no Esquimaux is likely to retain possession of any valuable piece of property if an angeko should happen to be in the neighborhood. They act upon a very simple and intelligent principle, namely, that the amount of success in "ankooting," or divining, is in exact ratio with the amount of pay.

Sometimes, in order to impress awe upon their victims, the angekos go through a series of imposing ceremonies, the performance of which infers a vast amount of practice. By the present of a knife and some beads, Captain Lyon induced a celebrated angeko, named Toolemak, to have an interview with a Tornga, or familiar spirit, in the cabin of the ship.

"All light excluded, our sorcerer began by chanting to his wife with great vehemence, and she, in return, answered by singing the Amna-aya (the favorite song of the Esquimaux), which was not discontinued during the whole ceremony. As far as I could learn, he afterward began turning himself rapidly round, and, in a loud, powerful voice, vociferated for Tornga with great impatience, at the same time blowing and snorting like a walrus. His noise, impatience, and agitation increased every moment, and he at length seated himself on the deck, varying his tones, and making a rustling with his clothes.

"Suddenly the voice seemed smothered, and was so managed as to sound as if retreating beneath the deck, each moment becoming more distant, and ultimately giving the idea of being many feet below the cabin, where it ceased entirely. His wife, now, in answer to my queries, informed me very seriously that he had dived, and that he would send up Tornga:

"Accordingly, in about half a minute, a distant blowing was heard very slowly approaching, and a voice which differed from that which we at first had heard was at times mixed with blowing, until at length both sounds became distinct, and the old woman informed me that Tornga was come to answer my questions. I accordingly asked several questions of the sagacious spirit, to each of which inquiries I received an answer by two loud slaps on the deck, which I was given to understand was favorable.

"A very hollow yet powerful voice, certainly much different from the tones of Toolemak, now chanted for some time, and a strange jumble of hisses, groans, shouts, and gabblings like a turkey succeeded in rapid succession. The old woman sang with increased energy, and, as I took it for granted that this was all intended to astonish the Kabloona, I cried repeatedly that I was very much afraid. This, as I expected, added fuel to the fire, until the form immortal, exhausted by its own might, asked leave to

retire. The voice gradually sank from our hearing, as at first, and a very indistinct hissing succeeded. In its advance, it sounded like the tone produced by the wind upon the bass-cord of an Æolian harp; this was soon changed to a rapid hiss, like that of a rocket, and Toolemak, with a yell, announced his return. I held my breath at the first distant hissing, and twice exhausted myself; yet our conjuror did not once respire, and even his returning and powerful yell was uttered without a previous stop or inspiration of air.

"Light being admitted, our wizard, as might be expected, was in a profuse perspiration, and certainly much exhausted by his exertions, which had continued for at least half an hour. We now observed a couple of bunches, each consisting of two strips of white deer-skin and a long piece of sinew, attached to the back of his coat. These we had not seen before, and were informed that they had been sewed on by Tornga while he was below." A similar exhibition has been seen by several travellers, and they have expressed their astonishment at the length of time during which an angeko can howl, hiss, and gabble without taking breath.

While he is below the earth, the angeko is supposed to visit the habitation of the particular spirit whom he is addressing, and sometimes gives a detailed account of the places in which he has been, and of their inhabitants. One female spirit, for example, is called Aywilliyoo. She commands all the bears, whales, seals, and walruses by means of her right hand. So, when there is a scarcity of provisions, the angeko makes a visit to Aywilliyoo and attacks her hand. If he can cut off her nails, the bears immediately are set free, the loss of one finger joint liberates the small seals, the second joint sends the large seals, the knuckles free the whole herds of walrus, while the entire hand liberates the whale.

In figure this spirit is very tall, and has only one eye and one pigtail, but this is as large as a man's leg, and descends to her knee. Her house is a very fine one, but Toolemak did not venture to enter it, because it was guarded by a huge dog with black hind-quarters and no tail. Her father is no larger than a boy of ten years old, and he has but one arm, which is always covered with a large bear's-skin mitten. His house is also handsome, but its entrance is guarded by troops of bears and walruses, who keep up a continual growling.

Unfortunately for his own credit, Toolemak got drunk one evening, as he might well be, having consumed in succession nearly ten glasses of rum, or "hot water," as he was pleased to call it. During his intoxication he became very good-natured, and betrayed the secrets of his magic art, showing how he altered his voice by covering his face with his hands and then with

his jacket, so as to make the voice appear as if it came from a continually increasing depth. He finished this singular exhibition by drinking in succession eleven pints and one gill of water, and within a few minutes became sober enough to leave the ship and walk to his sledge.

Sometimes the Esquimaux say that they are annoyed by spirits. On one occasion when a man nicknamed Kettle was eating in Captain Lyon's cabin, he became uneasy, and frequently ceased eating, a very remarkable circumstance in a hungry Esquimaux. Presently he said that there was a spirit sitting on the opposite side of the cabin, making grimaces at him, and preventing him from eating. He asked leave to drive his tormenter away, which he did by raising a long, bellowing sound, and then blowing sharply on the ends of his fingers. He resumed his meal quietly, and nothing would induce him to blow on his fingers or raise the exorcising yell again, on the ground that the spirit was no longer to be seen.

THE Esquimaux possess wonderful powers of drawing. They know scarcely anything of perspective, but they can make their sketches tell their own tale; while in drawing from memory a chart of a coast, their skill is really admirable. In Captain Hall's book there are fac-similes of several native charts and sketches, the most curious of which is one which was not only drawn but engraved on wood by the native draughtsman. It represents a woman with a child nestling in the hood behind her back, and is quite equal in execution to wood-cutting in the earlier stages of the art. The point about it which most strikes a practised eye is the force and fidelity with which the artist has marked the texture of the different parts of the dress; the fur coat and trowsers edged with leather, and the white-edged, fur-lined hood, are most admirably managed.

Of music and musical instruments the Esquimaux know little. They have the Amnaya song, which has already been mentioned, and they possess one national musical instrument, called the "keeloun." This is something like a tambourine, being formed of a very thin deer skin, or the envelope of the whale's liver, stretched over one side of a wooden hoop. A handle is attached to the hoop, and the instrument is struck, not upon the membrane, but upon the hoop.

As a nation they are remarkable for two good qualities, honesty and hospitality. There are, of course, exceptions to every rule, and such is the case with the Esquimaux. But the early voyagers found that they might leave their knives and axes on shore, and that not one of them would be touched. Now, to an Esquimaux a steel knife or axe is more valuable than a box full of sovereigns would be to us, and the honesty of the Esquimaux was as much tried by the sight of these articles as would be that of our London

poor if a heap of sovereigns were left lying on the pavement.

As to hospitality, their food is considered to be merely common property, so that if one of the Esquimaux should kill a seal, all his friends and neighbors assemble as a matter of course to assist in eating it; and even though the family of the successful hunter should be starving, he will nevertheless invite all his friends to partake of the food. In this way, it often happens that an entire seal barely affords a single meal to all who come to share it.

FUNERALS among the Esquimaux are rather variable in their forms. Generally, when a sick person is on the point of death, a new igloo is built, and carefully fitted with lamp, provisions, and other furniture. The dying person is carried in — not through the regular doorway, but through a breach in the wall — placed on the couch, the lamp lighted, and the provisions laid ready to hand. The attendants then leave the igloo, build up the openings, and never trouble themselves again about the sick person. The principal reason why the dying are left alone is, that if the relatives are in the igloo at the moment of death, they are obliged to throw away the dresses which they were wearing, and never to wear them again. None of them can tell the reason for this strange belief, but it is so strongly ingrained that no argument can induce them to abandon it.

Sometimes the body of a dead person is simply buried in a hole scooped in the snow, and sometimes it is laid upon a ledge of rock, accompanied by the lamp, kettle, knives, spears, and dresses which the deceased used while in life. When a child dies, all its toys are placed with it in the grave, that it may be supplied with them in the next world.

The demeanor of the Esquimaux with regard to their dead is a most extraordinary mixture of affection and unconcern. After having buried the body, whether alive or dead does not matter, they care nothing about it, and this strange insensibility is even displayed before the burial. For example, a man's wife had died, leaving a child of a few weeks old, which in a short time followed its mother. The father was very sorrowful for his dying child, and was seen in the night lifting the curtains of its bed as it lay ill on board ship, and sighing deeply. But, on the next day, when he came to the ship, he made no scruple of laying his meat on the body of the child, and using it as a table at breakfast.

Once, when Captain Lyon visited the grave where an Esquimaux named Pekooya had been laid, he found that the wolves and dogs had uncovered the body, and had eaten a considerable portion of it. He was naturally shocked at the scene, but the natives treated it with absolute indifference, and though the father and a brother of Pekooya were witnesses of the desecration, they would not cover up the mangled body, and only laughed

when Captain Lyon remonstrated with them. Moreover, when the body was buried, it was covered so slightly with snow that the first day's thaw would melt off all the snow, and leave it to the mercy of the dogs.

Judging from such a fact as this, it might be thought that the Esquimaux have but little natural affection, and that they are indifferent to the loss of their nearest relatives. Such, however, is not the case. An Esquimaux never passes the grave of an acquaintance without depositing a piece of meat as an offering, and the surviving relatives often visit the burying-place of their dead, and sit there for hours, talking to them as if they were still alive. On comparing all the conflicting accounts respecting the Esquimaux and their dead, it seems likely that they consider the dead body as something that the deceased once possessed, but cast away at death, and that, as their departed friend abandoned the body, they need take no trouble about so worthless an article.

If the reader will refer to the illustration on page 1347, he will see that the horizon is illuminated by strange and wild-looking flashes of light. These represent the Aurora Borealis, as it often appears in those parts, — not pale and flickering as we see it in these comparatively southern regions, but blazing with all imaginable hues, and giving out a light that stands the natives in stead of the sun, which in those latitudes is absent for months at a time. The glory and magnificence of these displays can only be described by those who have seen them, and very inadequately even by such.

There is an account given by Captain Hall of one of these marvellous exhibitions:—"I had gone on deck several times to look at the beautiful scene, and at nine o'clock was below in my cabin, when the captain hailed me with these words, '*Come above, Hall, come at once! THE WORLD IS ON FIRE.*'"

"I knew his meaning, and quick as thought I re-dressed myself, scrambled over several sleeping Innuits close to my berth, and rushed to the companion stairs. In another moment I reached the deck, and as the cabin door swung open, a dazzling and overpowering light, as if the world were really ablaze under the agency of some gorgeously colored fires, burst upon my startled senses. How can I describe it? Again I say, *No mortal hand can truthfully do so.* Let me however, in feeble, broken words, put down my thoughts at the time, and try to give some faint idea of what I saw.

"My first thought was, 'Among the gods there is none like unto Thee, O Lord; neither are any works like unto Thy works!' Then I tried to picture the scene before me. Piles of golden light and rainbow light, scattered along the azure vault, extended from behind the western horizon to the zenith; thence down to the eastern, within a belt of space, 20° in width, were the fountains of beams,

like fire-threads, that shot with the rapidity of lightning hither and thither, upward and athwart the great pathway indicated. No sun, no moon, yet the heavens were a glorious sight, flooded with light. Even ordinary print could easily have been read on deck.

"*Flooded with rivers of light!* Yes, flooded with light; and such light! Light all but inconceivable. The golden hues predominated, but in rapid succession *prismatic colors leaped forth.* We looked, we saw, and trembled; for as we gazed, the whole belt of aurora began to be alive with flashes. Then each pile or bank of light became myriads; some were dropping down the great pathway or belt; others springing up, others leaping with lightning flash from one side, while more as quickly passed into the vacated space; some twisting themselves into folds, entwining with others like enormous serpents, and all these movements as quick as the eye could follow.

"It seemed as if there were a struggle with these blazing lights to reach and occupy the dome above our heads. Then the whole arch above became crowded. Down, down it came; nearer and nearer it approached us. Sheets of golden flame, coruscating while leaping from the auroral belt, seemed as if met in their course by some mighty agency that turned them into the colors of the rainbow, each of the seven primary colors 3° in width, sheeted out to 21°.

"While the auroral fires seemed to be descending upon us, one of our number could not help exclaiming, —

"'Hark! hark! such a display! almost as if a warfare were going on among the beautiful lights above — so palpable — so near — it seems impossible without noise.'

"But no noise accompanied this wondrous display. All was silence.

"I would here make the remark that the finest displays of the aurora only last a few moments. Though it may be playing all night, yet it is only now and then that its grandest displays are made. As if marshalling forces, gaining strength, compounding material, it continues on its silent workings. At length it begins its trembling throes; beauty anon shoots out here and there, when all at once the aurora flashes into living hosts of powdered coruscating rainbows, belting to the heavenly dome with such gorgeous grandeur that mortals sometimes tremble to behold."

These wonderful aerial phenomena are characteristic of the Arctic regions. One of the most extraordinary appearances in the sky is called the Parheliion, or Mock Sun. It assumes various and most astounding forms, the sun appearing in the middle, and being surrounded with dimmer imitations of itself, round which run circular bands of light. There seems, indeed, to be no end to the extraordinary modifications of aerial effects which take place in these regions.

Captain Hall described many of them, among which may be mentioned a moon distorted beyond all recognition, its lower limb all crushed and shapeless, and the whole appearance of the planet like that of a man under the influence of liquor.

Then the refractive powers of the atmosphere produce most wonderful effects, destroying all perspective, and bringing into sight all kinds of objects which, by the ordinary laws of optics, are far out of sight. All sailors are familiar with the appearance of a vessel high in the air, sailing, as it were, through the sky with her keel in the clouds, and the tops of her masts pointing downward. In these regions the refractive powers are even terrible to accustomed eyes, so wonderful are the sights presented to them.

In one of these strange exhibitions, witnessed by Captain Hall, a vast white inverted pyramid seemed to form in the sky, and at every roll of the vessel to dip into the sea. Presently "some land that was seventy-five miles distant, and the top of it only barely seen in an ordinary way, had its rocky base brought full in view. The whole length of this land in sight was the very symbol of distortion.

"Pendant from an even line that stretched across the heavens was a *ridge of mountains*. Life hangs upon a little thread, but what think you of mountains hanging upon a thread? In my fancy I said, 'If Fate had decreed one of the Sisters to cut that thread while I witnessed the singular spectacle, what convulsions upon the land and sea about us might not have followed!' But Nature had an admirable way of taking down these rock-giants, hanging between the heavens and the earth. Arch after arch was at length made in wondrous grandeur from the rugged and distorted atmospheric land; and, if ever man's eye rested upon the sublime, in an act of God's creative power, it was when He arcuated the heavens with such a line of stupendous mountains.

"Between those several mountain arches in the sky were hung icebergs, also inverted, moving

silently and majestically about as the sea-currents shifted those along of which they were the images. In addition to all this there was a *wall of water*, so it appeared, far beyond the apparent horizon. This wall seemed alive with merry dancers of the most fantastic figures that the imagination could conceive, and its perpendicular columns were ever playfully changing. Oh, how exquisitely beautiful was this God-made, living wall! A thousand youthful forms of the fairest outline seemed to be dancing to and fro, their white arms intertwined, bodies incessantly varying, intermixing, falling, rising, jumping, skipping, hopping, whirling, waltzing, resting, and again rushing to the mazy dance—never tired—ever playful—ever light and airy, graceful, and soft to the eye."

Such, then, is a brief account of the remarkable and interesting Innuít people—a people which, according to the observation of Captain Hall, are gradually dying out, and in a few more years will cease to exist.

WRIST-GUARD AND HOOKS. (See page 1343.)

CHAPTER CXLII.

VANCOUVER'S ISLAND.

THE AHTS AND NEIGHBORING TRIBES.

DEFINITION OF THE AHT TRIBES—APPEARANCE OF THE NATIVES—STRENGTH OF GRASP—PECULIARITY OF THE LEGS—GAIT OF THE WOMEN—SPEED OF THE MEN—DANCE—THE LIP ORNAMENT OF THE WOMEN—CLOTHING—THE BOAT CLOAK AND HAT—WEAPONS—THE BOW AND ARROW—INGENIOUS CONSTRUCTION OF THE BOW—ITS BACKING OF ELASTIC STRINGS—THE ARROWS AND THEIR SPIRAL FEATHERING—THE FISH SPEAR AND HARPOON ARROWS—THE HALIBUT HOOK—VARIOUS MODES OF HUNTING—SALMON SPEARING BY TORCHLIGHT—THE HERRING RAKE—HOW TO KEEP THE BOAT FROM SINKING—THE WHALE FISHERY.

BEFORE leaving this part of the world, we will cast a brief glance at the tribes which inhabit Vancouver's Island. They are singularly interesting, inasmuch as they combine some of the habits which distinguish the Esquimaux with others of the North American tribes, and add to them several of the customs which have been already noticed among the Polynesians, their insular position and peculiar climate no doubt affording the cause for this curious mixture.

As a type of these tribes, we will take the AHTS, though other tribes will be casually mentioned. The Ahts may rather be called a nation than a tribe, being divided into some twenty tribes, the names of which all end in "aht," as, for example, Ohyah, Muchlah, Ayhuttisah, Toquaht, etc. Altogether they number about seventeen hundred. They do not, however, act together as a nation, and each tribe is perfectly distinct, and often at war with another.

They are not a tall people, the men averaging a little less than five feet six inches, and the women being just above five feet. Possibly, from the continual paddling which they practise almost from childhood, the upper limbs of an Aht are exceedingly strong, so strong, indeed, that a slight-looking native can carry with ease on his extended fingers a weight which a white man can scarcely lift. Their power of grasp, probably from the same cause, is more like the grip of a machine than the grasp of a man; and those who have had to fight with them

have found that if once an Aht be allowed to seize either the clothing or the hair, the only way to loosen his grasp is to knock him down with a blow in the throat or in the ribs—he cares nothing for a blow on the head.

When he comes to such close quarters in a quarrel, he has an awkward habit of grasping the enemy with one hand, and using with the other a knife which he has kept concealed in his long hair. Fortunately for his white opponent, so extraordinary a proceeding as a blow from the fist, which deprives him for a time of breath, bewilders and alarms him to such an extent that he seldom risks its repetition.

The legs of the Aht tribes are, as a rule, short, ill-made, bowed, and apparently deficient in power. This peculiarity is especially noticeable in the women, whose legs are so bowed, and whose toes are so turned inward, that they waddle rather than walk, and at every step they are obliged to cross their feet as a parrot does. The legs of the inland tribes are, as a rule, better developed than those of the inhabitants of the coast. Yet these unsightly limbs are by no means deficient in power. An Aht, powerfully built above, will step out of his canoe, and exhibit a pair of legs scarcely as thick as his arms, and yet he will walk in the woods for a whole day without showing any signs of fatigue.

Owing to this form of limb, the natives, though enduring enough, are not swift of foot, and can be easily overtaken by a white

man on the open ground, notwithstanding the impediments of clothing, and especially of shoes, which hinder the progress of the pursuer, the pursued usually throwing off the only garment that he wears. Should he once reach the woods, pursuit is useless, as no white man can follow a naked native in them.

The color of the Ahts is a dull, but not dark, brown. Their face is broad and flat, the nose tolerably well formed when it is not dragged out of shape by rings and other ornaments, and the cheek-bones are strongly marked and broad, but not high. There is very little hair on the faces of the men, but that of the head is long, straight, and is generally allowed to hang loosely over the shoulders, though it is sometimes gathered into a knot at the back of the head, merely covered by a cap or a wreath of grass. They are very proud of their hair, so that when an Aht has been guilty of some offence which is not very serious, the best punishment is to cut off his hair, inasmuch as he will be an object of constant ridicule until it has grown again. The women divide their hair in the middle, and tie it in two plaits, one of which hangs at each side of the face, and often has a piece of lead suspended to the end to keep it straight. Mr. Sproat thinks that the physical characteristics of the Ahts have been modified by means of a large importation of Chinese, which took place about the end of the last century, and remarks that the peculiar Chinese eye is sometimes seen among these natives. Still, even if this be the fact, the modification can be but slight, as both people are undoubtedly members of the same great race, though altered by the conditions in which they have respectively been placed.

Some of the women have a hideously ugly ornament which they wear in their under lip, just as do the Botocudos of Tropical America. This practice exists only among the northern tribes, where it is carried out to an enormous extent. As the size of the ornament is gradually increased from childhood, the lip of an old woman will contain an oval ornament three inches long by two wide. There is a shallow groove round the edge so as to keep it in its place, and both sides are slightly concave. Sometimes it is used as a spoon, the woman putting on it a piece of meat that is too hot, and, when it is cool, turning it into her mouth by a contraction of the lip.

The value that is set upon this horrible disfigurement is almost ludicrous, a woman's rank being due to the size of her lip ornament. Possibly, on account of the long time which must be occupied in stretching the orifice in the lip to the required size, the opinion of a woman with a large lip is always held in respect; and, if she should be opposed by a younger person of her own sex, she will contemptuously decline to enter

into argument with a woman who has so small a lip. Some of them wear a shell ornament, like the stem of a clay tobacco-pipe, one or two inches long, stuck through the lip and projecting forward at a considerable angle with the chin. This ornament is called the hai-qua.

As for clothing, the men wear a sort of robe made by themselves, for which they have in later days substituted an European blanket. They are not at all particular as to the disposal of this robe, and even if it should fall off do not trouble themselves. The women also wear the blanket, but always have a small apron in addition to it. In their canoes they wear a cape. It is made of cedar-bark string, and is woven in nearly the same manner as the mat of the New Zealander, which has already been described; namely, by stretching the warp threads parallel to each other on a frame, and tying them together at intervals with a cross-thread which represents the woof. A specimen in my collection has the cross-threads at intervals of half an inch.

It is shaped exactly like the cross section of a boat, straight above, and rounded below. It measures five feet three inches in width, and three feet six inches in depth in the centre. As is usual with such robes, the upper edge is adorned with a strip of marten fur a quarter of an inch wide, wound spirally round the selvage so as to form quite a thick rope of fur. These capes are the work of the women, who have the manufacture of all the clothing. Fur bags are made by the simple process of skinning the marten, the body being then extricated through a cut made across the abdomen just below the tail. As the skin comes off it is reversed, and when dry and properly dressed it is turned with the fur outward, and the bag is complete, the tail serving as a handle. One of these bags in my collection was presented to me by Lieut. Pusey.

The woof thread is also made of the white pine bark, and the needle is nothing more than a sharpened twig. The same useful materials are also employed for the curious hats which the natives wear in their canoes. These hats are made on the principle of the sailors' "sou'-westers," and are fashioned so as to shoot rain off the shoulders. The outside of the hat is made of cedar bark, and the inside of white pine bark.

DEPENDING largely upon animal food for their nourishment, the Aht tribes are expert hunters, and make very ingenious weapons, some of which are shown in the illustrations on page 1357, drawn from my own specimens.

The bow and arrows used by these people are worthy of a brief description. The bow is an admirable specimen of savage art, and must be the result of long experience. It is four feet three inches in length, and made of one piece of wood. In general shape it re-

sembles the bow of the Andamans, though it is not of such gigantic dimensions. In the middle the wood is rounded, so as to form a handle which is nearly four inches in circumference. From the handle to the tips, the wood is gradually flattened and widened for about fourteen inches, where it is just two inches wide. From this point it gradually lessens again to the tip, which is rounded and thickened, so as to receive the notch for the string.

Were no addition made to the bow it would still be a very powerful weapon, but the maker has not been satisfied with the simple wood, and has strengthened it with a wonderfully complex arrangement of strings made of twisted sinews. In my specimen there are rather more than fifty of these strings, which are laid on the bow and interwoven with each other in a manner so strong and neat, that the most skilful sailor might be envious of such a piece of handiwork. Each of these strings is double, the two strands being about as large as thin whipcord, and when seen against the light they are quite translucent.

They are put on in the following manner. Two deep notches, parallel to the line of the bow, are made at each tip, these notches serving two purposes: first, the reception of the bow-strings, and next the support of the strengthening strings. Eight of the strings, measuring about eleven feet in length, have been doubled, the loop passed over the tip of the bow, and the strings led along the back over the corresponding notch at the other tip, and brought back to the middle. These strings lie parallel to each other, and form a flat belt from one end of the bow to the other. About an inch below the tip, three other sets of strings are fastened in a somewhat similar manner, so that four distinct layers of strings run throughout the length of the weapon.

Even these have not sufficed the maker, who has added six more layers starting from the widest and flattest part of the bow, so that nearly three feet of the centre of the weapon are strengthened by no less than twelve layers of sinew strings. By referring to the illustration, the reader will perceive the extreme ingenuity with which the strings are laid on the bow, so that whether the weapon be bent or unstrung, they all keep their places. So firmly are they lashed to the bow, that even when it is unstrung they are all as tight as harp strings.

The string of the bow is made of the same material as those which strengthen the back, and in consequence of the very great strength of the material, it is much thinner than the string of an ordinary archer's bow. It is made of two strands, each strand being about as large as the back strings.

By referring to illustration No. 3, on the next page, a good idea can be gained of this singularly ingenious weapon. At first the bow is seen as it appears when strung, fig. 3 giving a section of the wood. At fig. 2 is an enlarged representation of one end of the bow, so as to show the manner in which the various sets of strings are fastened. At the upper part are seen the strings which form the first layer, passing over the end of the bow, and filling up the notch in which they lie. Just below the tip come the second and third sets, which pass down the bow, where they are met by, and interwoven with, the remainder of the strings, the whole of them being gathered in the rope with its spiral building. This beautiful weapon was added to my collection by Lieut. Pusey, R. N.

The arrows are of various kinds, according to the object for which they are intended. That which is used for ordinary occasions is shown in the uppermost figure of the illustration. It is two feet three inches in length, and is headed with bone.

ARROWS.

There is a peculiarity about these arrows which is worthy of notice. Some time ago an arrow was patented in England, which had the feathers placed spirally upon the end of the shaft, so as to give it a rapidly revolving movement when discharged from the bow. The principle was exactly that of the screw which is applied to steam vessels; and those who used the arrow acknowledged that the spiral setting of the feathers not only increased the power of flight, but enabled the archer to drive his arrow through the

wind with greater ease and certainty than could be obtained with the ordinarily feathered arrow. There is a very old saying that there is nothing new under the sun, and this is the case with the arrow in question, the savages of Northern America having adopted the same principle long ago. In their arrows the feathers are set spirally, with a bold curve, and there is really no difference between the weapon of the savage and the toy of civilization, than the greater neatness and higher finish of the latter.

(1.) AHT FISH-HOOK. (See page 1359.)

(2.) PIPES. (See page 1370.)

(3.) BOW OF THE AHTS. (See page 1356.)

(4.) BEAVER MASK OF AHT TRIBE. (See page 1365.)

(5.) HEADRESS. (See page 1365.)

(6.) PADDLES. (See page 1363.)

The lower figure represents the arrow which is used for killing fish. In this weapon the point is also of bone, but is very much longer, and is double, the two halves diverging considerably from each other, and being barbed on the inner surface. It is firmly lashed to the shaft, and their divergence is given by means of two pegs, which are driven between the shaft and the two portions of the point. If a fish be struck by this ingenious weapon, it cannot possibly escape, the elastic points contracting violently and holding the fish between them.

It is worthy of notice that a police spear made exactly on the same principle is used by the Malays. It consists of a handle some seven feet long, from the end of which project two diverging points. The inner side of each point is armed with a row of very sharp barbs, all directed backward. Thorns are often used for this purpose. Should a criminal try to escape, the police officer has only to thrust his spear against the back of the man's neck, when he is at once a prisoner, the barbed points effectually preventing him from escaping, even should the officer drop his weapon. The zoological reader will remember that the teeth of the snake and of many fish—the pike, for example—are set on exactly the same principle.

In some specimens the head is fitted loosely on the shaft, and connected with it by means of a string, which is wound spirally round it, and when the fish is struck the head is shaken off the shaft, which serves both as a drag to aid in tiring the fish, and as a float by which its presence may be indicated.

The most ingenious of these arrows is used for shooting seals and the larger fish, and is very elaborately constructed. It measures about four feet in length, and is almost deserving of the name of harpoon rather than arrow.

The shaft is made of very light wood, and is about as thick as a man's finger. At the butt-end it is feathered in the usual manner, and at the other it is terminated by a pear-shaped piece of bone an inch in diameter at the thickest part. Into the end of this bone is bored a small conical hole, which receives the head. This is also made of bone, and is very small in comparison with the arrow, and is furnished with two deeply cut barbs. As is the case with all harpoon weapons, the head is connected with the shaft by a line, but in this case there is a peculiarity about the line and its mode of attachment.

Instead of being a mere double-strand string, it is made of a number of fibres arranged in three strands, and plaited, not twisted together, so as to form a flat line, which possesses enormous strength combined with great elasticity and small size. The mode of attachment is as ingenious as the method of manufacture. The line is a double one, measuring twelve feet in length.

The line is first doubled, the loop is put through a hole in the point and over the head, so as to secure it, and the two halves of the line are then lashed together about eighteen inches from the point. One end is then fastened to the arrow just below the feathers, and the other to the shaft just above the bone tip. The object of this arrangement is evident. As soon as a seal is struck, it dashes off, shaking the shaft from the barbed head, which remains in its body. Were the line simply tied to the end of the shaft, the wounded creature would easily drag it through the water. But, as the line is fastened to each end of the shaft and to the head besides, when the latter transfixes a seal it is separated from the shaft, and the shaft is drawn crosswise through the water, presenting so great a resistance that the seal becomes exhausted with its unavailing struggles, and comes to the surface, where it is despatched with a second or third weapon.

Besides the harpoon and fish arrow, these people also use the hook (see page 1357), which is quite as ingenious in its way as the implements which have been described. The body of the hook is of wood, and is exactly in the shape of the capital letter U. The point bends slightly outward, and is charred at the tip to render it harder. It is also defended and strengthened by a band of very tough vegetable fibre, which covers it for about three inches. The barb is a piece of bone, about five inches in length, sharpened like a needle at the point. This barb is not attached to the point, as is the case with the generality of hooks, but is fastened to the shank, and is so long that its tip reaches to the middle of the hook.

At first sight this seems a very inadequate arrangement for securing fish, and looks as if the creature could easily slip off the unguarded point. If, however, the hook, which is a very large one, be tested, it will be found astonishingly efficacious. If the point be inserted between the fingers, as it would be inserted into the jaws of a fish, and then brought upward, it will be found that the sharp barb effectually prevents the hook from being withdrawn.

There is one effect of this mode of fixing the barb which may or may not have been intended. Should, by any accident, the line become entangled with the hook, and reverse it, the fish is quite as secure, the long, straight barb forming a second hook, to which it is transferred. The body of this hook is made of the Douglas pine, and it is brought into shape by steaming. The hook is chiefly used for catching the halibut, as, for some reason, the Ahts will not use a steel hook in the capture of this fish.

There is plenty of game, both large and small, in these regions, though the chase is in all cases a severe one, and tests not only the skill but the endurance of the hunter.

There is, for example, the black bear, which is a most valuable animal, its fur being used for clothing, and its flesh for food. Bear hunting is not carried on at all times of the year, but is generally followed toward the end of autumn, when the bears are fat, and about to enter their winter quarters. Sometimes the Ahts wait until the bear has gone into retirement, and then spear it in its winter home. Traps are in great favor, because they do not spoil the skin. They are very simple; the trap consisting of a tree trunk heavily loaded with stones, and suspended at one end over the animal's track. It is kept in position by a trigger, to which is attached a slight rope crossing the track. It is always placed in some spot where a large stump or the root of a fallen tree allows the trap to be set without disturbing the appearance of the track.

Then there are one or two deer, the largest of which is the wapiti, commonly but erroneously called the elk. The hunter generally takes it by following its track, and stalking it as it feeds, when the powerful bow drives an arrow to its heart. The skill of the hunter is shown as much after the deer is dead as during the actual chase. Captain Mayne mentions that he has seen a wapiti killed, and in a quarter of an hour it has been skinned, the whole of the flesh removed from the bones, and the skin converted into moccasins. The natives have rather a strange way of carrying the meat. At their first halt after killing a deer, they cut the meat into pieces two or three inches square, transfix them with a long stick, and carry the stick upon their shoulder, every now and then pulling off a piece and eating it as they go along. In this manner the flesh of a deer vanishes in a wonderfully short time. Very little meat is preserved, the Ahts generally eating it as soon as the animal is killed.

As to the fish, there are so many that only one or two can be mentioned. The salmon is the fish that seems to be the most valued by these fish-eating tribes, and it is caught, as with us, in a variety of ways. Sometimes the natives use a rather curious fish spear, about fifteen feet long in the shaft, and with a double head, made of wapiti bone. The head is only slightly fixed in the shaft, to which it is attached by a line, as in the harpoon arrow already described. Should the fish be a very heavy one, the hunter merely ties to the line a number of inflated bladders, and causes it to tire itself by useless struggles before he risks the fracture of the line or loss of the barbed head, one or both of which events would probably happen if he were to try to secure a fresh and powerful fish.

Sometimes, when the fish are plentiful, they are caught by dropping among them a stick armed with barbed points, and jerking it upward sharply, until it impales a fish on one or other of these points.

"Burning the water" is employed in catching salmon, and is carried on by two natives, one of whom paddles the canoe, while the other stands in the bow, where a torch is kept burning, and strikes the fish as they glide through the water. Mr. Sproat mentions that a single canoe has been known to bring back forty fine salmon as the result of a day's fishing. Salmon traps are also employed. These are made after a fashion closely resembling that of the eel-traps used in this country. They are double baskets, externally cylindrical, and are set with their mouths directed down the stream. When the fish try to pass up the stream they enter the basket, and, as the inner basket is very much shorter than the other, shaped like a sugar-loaf, the salmon finds itself imprisoned between them. Some of these baskets measure as much as twenty feet in length, and five feet in diameter, so that they will contain a considerable number of fish.

One of the oddest fishing instruments is that by which the herring is caught. This is a pole about ten feet in length, flattened at one end like the blade of an oar, and armed along the edge with projecting spikes. When the fisherman gets among a shoal of herrings, he plunges his pole into the mass of fish, draws it through them with a peculiar movement of the arms, so as to transfix the herrings on the spikes, and then shakes them into his boat. By this mode of fishing, which is called "herring-raking," great numbers of fish are taken, as well as by the net, which is ingeniously made from fibre obtained from a native nettle, which reaches eight or ten feet in height.

The Ahts are such keen fishermen that they will often endanger the safety of their canoes by the quantity of fish with which they will heap them, so that the gunwales are sunk within an inch or so of the water's edge. In calm weather they can manage well enough, even with such a burden as this; but if the wind should get up before they can reach the shore, the danger is very great. Should such an event happen, these enterprising fishermen will not throw their cargo overboard to save the boat, but will fasten all the spare floats round the canoe, so as to keep it from sinking even if it be filled with water.

There is scarcely any end to the use which is made by the Ahts of these floats, and with their aid they will attack and conquer even the gigantic whale. The following account of their mode of whale fishing is written by Mr. G. M. Sproat:—"A whale-chase is an affair of some moment. The kind of whale commonly seen on the coast was described by an old whaling skipper as 'finner,' in which there is not much oil. The season for fishing whales commences about the end of May or in June. Many whales are killed every season by the Nitinahts, who live principally on the seaboard near

Barclay or Nitinaht's Sound. This tribe has a custom, which I have not observed elsewhere, of separating during spring and summer into small parties, each under a separate head, but all still continuing under the chieftaincy of the principal chief of the tribe.

"Months beforehand preparations are made for the whale fishing, which is considered almost a sacred season. I particularly noticed this circumstance from having, in my boyhood, heard of the Manx custom, in which all the crews of the herring fleet invoke a blessing before 'shooting' their herring-nets. The honor of using the harpoon in an Aht tribe is enjoyed but by few,—about a dozen in the tribe,—who inherit the privilege. Instances, however, are known of the privilege having been acquired by merit.

"Eight or nine men, selected by the harpooner, form the crew of his canoe. For several moons before the fishing begins, these men are compelled to abstain from their usual food; they live away from their wives, wash their bodies morning, noon, and night, and rub their skins with twigs or a rough stone. If a canoe is damaged or capsized by a whale, or any accident happens during the fishing season, it is assumed that some of the crew have failed in their preparatory offices, and a very strict inquiry is instituted by the chief men of the tribe. Witnesses are examined, and an investigation made into the domestic affairs of the accused persons. Should any inculpatory circumstance appear, the delinquent is severely dealt with, and is often deprived of his rank and placed under a ban for months.

"When the whales approach the coast, the fishermen are out all day, let the wind blow high or not. The canoes have different cruising grounds, some little distance apart. The Indian whaling gear consists of harpoons, lines, inflated seal-skins, and wooden or bone spears. The harpoon is often made of a piece of the iron hoop of an ale cask, cut with a chisel into the shape of a harpoon blade, two bars fashioned from the tips of deer-horns being affixed to this blade with gum. Close to the harpoon the line is of deer sinews. To this the main line is attached, which is generally made of cedar twigs laid together as thick as a three-inch rope. Large inflated skins are fastened to this line about twelve feet from the

harpoon. The weapon itself is then tied slightly to a yew handle ten feet long.

"On getting close, the harpooner, from the bow of his canoe, throws his harpoon at the whale with full force. As soon as the barb enters, the fastening of the wooden handle, being but slight, breaks, and becomes detached from the line. The natives raise a yell, and the whale dives quickly, but the seal-skins impede his movements. Very long lengths of line are kept in the canoes, and sometimes the lines from several canoes are joined. On the re-appearance of the whale on the surface, he is attacked from the nearest canoe; and thus, finally, forty or fifty large buoys are attached to his body. He struggles violently for a time, and beats and lashes the water in all directions, until, weakened by loss of blood, and fatigued by his exertions, he ceases to struggle, and the natives despatch him with their short spears. The whale is then taken in tow by the whole fleet of canoes, the crews yelling and singing, and keeping time with their paddles.

"Sometimes, after being harpooned, the whale escapes, and takes ropes, harpoons, seal-skins, and everything with him. Should he die from his wounds, and be found by another tribe at sea, or on shore within the territorial limits of the finders, the instruments are returned to the losers, with a large piece of the fish as a present. Many disputes arise between tribes on the finding of dead whales near the undefined boundaries of the tribal territories. If the quarrel is serious, all intercourse ceases, trade is forbidden, and war is threatened. By and by, when the loss of trade is felt, negotiation is tried. An envoy is selected who is of high rank in his own tribe, and, if possible, connected with the other tribe by marriage. He is usually a quiet man of fluent speech. Wearing white eagle feathers in his head-dress as a mark of peace, he departs in a small canoe. Only one female attendant, generally an old slave, accompanies him, to assist in paddling, as the natives never risk two men on such occasions. The envoy's return is anxiously awaited. As a general rule, the first proposition is rejected. Objections, references, counter proposals, frequently make three or four embassies necessary before the question can be settled. By that time the blubber must be very rancid."

CANOE OF THE AHTS. (See page 1362.)

CHAPTER CXLIII.

VANCOUVER'S ISLAND—*Continued.*

THE AHTS AND NEIGHBORING TRIBES—*Continued.*

MANUFACTURE OF CANOES—CORRECT EYE OF THE NATIVE BUILDERS—MATERIAL AND SHAPE OF THE PADDLE—MODE OF USING IT—PATTERN WITH WHICH IT IS DECORATED—"CUTTING" THE WAVES—SKILL AND ENDURANCE OF THE PADDLERS—ESCAPE OF A NATIVE—FEASTS AMONG THE AHT TRIBES—METHOD OF COOKING—THE WOODEN POTS AND HEATED STONES—HOW "THE INDIANS DIED"—DISTRIBUTION OF PROPERTY, AND ITS CONSEQUENT DESTRUCTION—SACRED CHARACTER OF A FEAST—THE SACRED MARKS—THE ARTIFICIAL SNOW-STORM—THE DOCTOR'S DANCE—ADMIRABLE ACTING—SIMULATED MURDER AND RECOVERY OF THE CORPSE—THE ROOF DANCE.

THE canoes in which the Aht tribes make their expeditions are carved out of solid wood. The tree which is employed for this purpose is a kind of cedar (*Thuja gigantea*), which flourishes by the sea. When a native wishes to make a canoe, he looks out for a good tree as near as possible to the water, and, with the assistance of a comrade, cuts it down. Now that he has European tools, he can fell a tree with some rapidity, but in the olden times, when his sole tool was a sort of chisel made of wapiti horn, it was a very slow process indeed. The only way of using this primitive instrument was by placing the edge of the chisel against the tree, and striking the butt with a heavy stone, shaped something like a dumb-bell.

The tree being felled, the bark is stripped off, and the trunk split lengthwise by wedges. The next process is to hollow out the inside, which is done entirely by hand, fire not being employed, as is the case with many savage tribes. The outside is then dubbed down to the proper thickness by means of an adze formed of a large mussel-shell fixed in a handle. In this work the natives use no measuring tools, but trust entirely to the eye; yet their work is so true that, when the boat is completed, it sits lightly on the water, and is well balanced. Any of my readers who have made even a toy boat will appreciate the difficulty of this task.

In about three weeks or so the canoe is roughly hewn and hollowed, and then comes

a more difficult business, namely, the bringing it into the peculiar shape which the Ahts think to be the best. This is done by filling the canoe with water, and throwing red-hot stones into it till the water boils. This part of the process is continued for a considerable time, until the wood is quite soft, and then a number of crosspieces are driven into the interior, so as to force the canoe into its proper shape, which it retains ever afterward.

While the canoe is still soft and comparatively pliant, several slight crosspieces are inserted, so as to counteract any tendency toward warping. The outside of the vessel is next hardened by fire, so as to enable it to resist the attacks of insects, and also to prevent it from cracking when exposed to the sun. Lastly, the bow and stem pieces are fixed to the canoe, and the interior is painted of some brilliant color, usually red. The outside is generally quite black and highly polished, this effect being produced by rubbing it plentifully with oil after the fire has done its work. Lastly, a pattern of some kind is generally painted on the bow and stern.

The figure on page 1361 will give the reader a good idea of the form of this canoe. It is drawn from a large model brought from Vancouver's Island by Lieut. Pusey, and added by him to my collection. In this specimen the patterns at the bow and stem are red and blue. As is mostly the case with

canoes made by savages, there is no keel to the boat.

The paddle by which the canoe is propelled is a singularly ingenious one, combining the three qualities of lightness, elasticity, and strength to a really remarkable extent. The paddle represented in fig. 1 of illustration No. 6, on page 1357, is one of the specimens in my collection. It is four feet six inches in length, and the blade is about six inches wide at the broadest part. It is shaped with the greatest accuracy, the part where it is grasped by the left hand being nearly cylindrical, and then widening gradually until it forms the blade. At this part it is very thin—so thin, in fact, that it seems scarcely able to bear the strain that is put upon it when the paddler urges his canoe swiftly over the water.

The lightness of such a paddle is wonderful. The specimen which is figured in the illustration only weighs eighteen ounces, being hardly half the weight of a similarly sized New Zealand paddle. The reader will notice the peculiar handle. This is made in order to suit the mode of paddling. When the Aht gets into his canoe, he grasps the paddle with his left hand about eighteen inches from the end, and places his right hand upon the crosspiece that serves as a handle. The left hand thus acts as a fulcrum; upon the right hand works the leverage of the paddle. Beside this paddle is figured another from the Solomon Islands, in order to show how two totally distinct races of mankind have hit upon the same invention. There is even a similarity in the form of their canoes, as well as in the shape of their paddles.

The reader will observe that the blade of the paddle is covered with a pattern which extends some way up the handle. This is the work of the women, who take upon themselves the decoration of the paddles after their husbands have shaped them. The colors employed are generally black and red, the latter hue being obtained by a preparation of annatto. In this particular specimen, red is the chief color, the large oval marks on the side of the blade and on the handle being red, while the more intricate pattern on the blade is drawn in black.

No matter what may be the color of the paddle, the pattern is always of the same character. I have no doubt in my mind that it is really a conventional mode of depicting the human face, such as is seen upon the work of many extinct races of mankind; and although at a first glance the semblance may not be seen, it is evident to a practised observer, and is, moreover, quite in character with other works of art found of these people.

The broad, flat, sharp-edged blade of the paddle is often used for other purposes besides propelling the canoe. It has already been mentioned that the Ahts will not throw

overboard their cargo of fish, no matter how high the waves may roll, or how deeply the canoe may be loaded. They watch carefully for the waves, and if one of them comes in such a manner that it would dash inboard, they have the art of cutting it in two with a blow from the edge of the paddle, and causing it to fly harmlessly over the little vessel.

Both in making canoes and in other work where holes have to be bored, the Ahts make use of a simple drill, formed from the bone of a bird, fixed in a wooden handle. When it is used, the shaft is taken between the two hands, the point placed on the object to be bored, and the hands moved swiftly backward and forward until the hole is made. In the same manner, by using a stick instead of a drill, fire is produced, precisely as is done by the Kaffirs.

The skill of the paddlers is wonderful. Mr. Sproat mentions the escape of an Aht Indian who had committed several murders, and had contrived to escape from custody. Finding the place where he had concealed himself, a party set out to recapture him, and discovered him running across the snow to gain the shelter of a wood. Had he reached it he would have been safe, so one of the pursuers chased him, and, notwithstanding the disadvantage of wearing shoes, which soon became clogged by the snow, succeeded in gaining on him, the Ahts being, as has already been remarked, very poor runners.

The man soon perceived that he was no match for his pursuer in running, and so, abandoning his intention of reaching the wood, he turned sharply off toward the river, flung off his blanket, and leaped into the stream. Presently he was seen making his way toward a canoe which was made fast to a drift tree in the river, and in a short time he reached it, looked eagerly into it to see if there were a paddle, scrambled into the boat, cast it off, and paddled away. Meanwhile two of his pursuers had got into a canoe, and were paddling after him, so that when he cast the boat loose they were not more than twenty yards from him. It was, however, quite enough for the fugitive, who forced his canoe up the stream with a power and rapidity which soon increased the distance between the two boats, and, in spite of all the efforts of his pursuers, he made his way to the bank nearly fifty yards ahead of them. As soon as he reached the shore, he jumped out of the canoe, and dashed into the wood, where it was useless to follow him.

Several times during the struggle Mr. Sproat had the man covered with his revolver, but the skill, grace, and strength of the fugitive were so admirable, that, much to the discontent of his companions, he would not fire. He remarks that in such a chase as this a white man has no chance with an Aht, but that in a long race on the sea the white

man will win, his powers of endurance exceeding those of the savage.

The possession of a canoe is an object of much ambition among the Ahts, as it confers upon them a sort of distinction, and is looked upon much as is the possession of a carriage among ourselves. Each canoe is furnished with a baling instrument, which is always made of wood. It is, in fact, a large spoon, the bowl being angular, and shaped something like the gable of a house.

The domestic manners of the Ahts are, from Mr. Sproat's account, very interesting, and, as he remarks, if any one only knew their strange language well, and had the stomach and the nose to live among them during the winter months, he would obtain copious information respecting them.

Winter is the time mentioned, because during the summer the men are generally dispersed in their pursuit of game, especially of salmon, which they dry and preserve for winter use. But about November they return to their homes, and a time of general feasting and enjoyment sets in. Cooking goes on all day, and the revellers are perpetually feasting, while during times of work they only eat twice in the day, namely, in the morning and evening, and even then do not eat much at each meal. Fish is the principal article of their diet, and dried salmon is the food which is most plentiful, though they also eat the flesh of the seal and the whale when they can get it. Of late years the Ahts have obtained rice and molasses, and apparently with a bad effect upon their health.

The pots in which the food is cooked are made of wood, the water being boiled, not by placing the pots on the fire, but by heating stones red hot and throwing them into it. Rude as this mode of boiling water may seem, it is much more rapid and effectual than might be imagined, which will account for the wide spreading of the custom. In more than one place, when the white man visited the natives for the first time, nothing impressed them so strongly as the fact that, when he boiled water, he put the vessel on the fire. The capability of making a vessel that would endure such treatment had, in their eyes, something of the supernatural.

An old native illustrated well the astonishment which they themselves felt when they saw a kettle placed on the fire for the first time. He narrated the story to Mr. Duncan in the following quaint but forcible language:—"The strangers landed, and beckoned the Indians to come to them and bring them some fish. One of them had over his shoulder what was supposed to be only a stick. Presently he pointed it at a bird that was flying past—a violent 'poo' went forth—down came the bird to the ground. The Indians died! As they revived, they ques-

tioned each other as to their state, whether any were dead, and what each had felt.

"The whites then made signs for a fire to be lighted. The Indians proceeded at once according to their tedious practice of rubbing two sticks together. The strangers laughed, and one of them, snatching up a handful of dry grass, struck a spark into a little powder placed under it. Instantly, another 'poo' and a blaze! The Indians died! After this, the new-comers wanted some fish boiled. The Indians therefore put the fish and some water into one of their square wooden buckets, and set some stones in the fire, intending, when they were hot, to cast them into the vessel, and thus boil the food. The whites were not satisfied with this way. One of them fetched a tin kettle out of the boat, put the fish and some water into it, and then, strange to say, set it on the fire. The Indians looked on with astonishment. However, the kettle did not consume, the water did not run into the fire. Then again the Indians died!"

Sometimes a man of consequence issues invitations for a solemn feast, and on such an occasion he seizes the opportunity of showing his wealth by the liberal distribution of presents, every individual present receiving a share of the property. Consequently, a feast always affords a scene of destruction. For example, Captain Mayne mentions that at one feast which he witnessed, he recognized three sea-otter skins, for one of which thirty blankets had been offered and refused. Yet, valuable as they were, they were cut up into little pieces about three inches by one, so that every guest might have a piece. As each blanket is to the Aht the equivalent of a sovereign among ourselves, the amount of waste may be imagined. Mr. Duncan, the successful missionary among these people, relates several instances of the waste of property which takes place both on these and other occasions. For example, a chief had just built a house, and issued invitations for a great feast. "After feasting, I heard he was to give away property to the amount of four hundred and eighty blankets, of which one hundred and eighty were his own property, and the three hundred were to be subscribed by his people.

"On the first day of the feast, as much as possible of the property to be given to him was exhibited in the camp. Hundreds of yards of cotton were flapping in the breeze, hung from house to house, or on lines put up for the occasion. Furs, too, were nailed up on the fronts of houses. Those who were going to give away blankets or elk-skins managed to get a bearer for every one, and exhibited them by making the persons walk in single file to the house of the chief. On the next day, the cotton which had been hung out was now brought on the beach, at a good distance from the chief's house, and there run out at full length, and a number

of bearers, about three yards apart, bore it triumphantly away from the giver to the receivers. I suppose that about six to eight hundred yards were thus disposed of.

"After all the property the chief is to receive has been thus openly handed to him, a day or two is taken up in apportioning it for fresh owners. When this is done, all the chiefs and their families are called together, and each receives according to his or her position. If, however, a chief's wife is not descended from a chief, she has no share in this distribution, nor is she ever invited to the same feasts as her husband. Thus do the chiefs and their people go on reducing themselves to poverty. In the case of the chiefs, however, this poverty lasts but a short time; they are soon replenished from the next giving away, but the people only grow rich again according to their industry. One cannot but pity them, while one laments their folly.

"All the pleasure these poor Indians seem to have in their property is in hoarding it up for such an occasion as I have described. They never think of appropriating what they can gather to enhance their comforts, but are satisfied if they can make a display like this now and then; so that the man possessing but one blanket seems to be as well off as the one who possesses twenty; and thus it is that there is a vast amount of dead stock accumulated in the camp, doomed never to be used, but only now and then to be transferred from hand to hand for the mere vanity of the thing.

"There is another way, however, in which property is disposed of, even more foolishly. If a person be insulted, or meet with an accident, or in any way suffers an injury, real or supposed, either of mind or body, property must at once be sacrificed to avoid disgrace. A number of blankets, shirts, or cotton, according to the rank of the person, is torn into small pieces, and carried off."

Sometimes a feast assumes a sacred character, and such festivals are held during the latter half of the last month in the year, their object being to induce the demons who have charge of the weather to give them rain instead of snow. In one of these feasts, witnessed by Mr. Garrett, the principal part was performed by a female chief, who lay on her back in the middle of the house as if dead, while all the people assembled were making a hideous noise, howling, wailing, and beating with sticks the bench on which they sat, while a young man added to the hubbub by drumming upon a wooden box. After a while the prostrate woman began to show signs of life, and gradually assumed a sitting posture. In this attitude she contrived to jump round the room, and exhibited some extraordinary vagaries, the other occupants of the room alternating dead silence with deafening uproar at signals from her hand.

The costumes that are worn at such feasts are very remarkable articles, especially the head-dresses that are worn by the chiefs. They take the form of masks, and are cut out of solid wood, generally imitating the heads of various birds and beasts, though they sometimes are carved in the semblance of a grotesque human face. The specimens which are shown in the illustrations on page 1357 will give a good idea of these strange head-dresses. One of them, which was presented to me by Lieut. Pusey, is carved in imitation of a beaver's head, and is tied on the wearer's head with strings. There are holes bored through the eyes, by means of which the wearer is enabled to see, and these holes are cleverly bored in a slanting direction, so as to coincide with the pupil of the eye. Some of these masks are made with great goggle eyes and large jaws. Both the eyes and the jaws are movable, and are worked by strings that pass down the back, so that the wearer can make the eyes roll and the jaws open and close without any apparent cause.

Sometimes the masks are made in the form of birds, and by a similar arrangement of cords, the birds can be made to turn their heads from side to side, and to flap their wings while the wearer speaks. There is a very remarkable specimen of these masks in the museum at Maidstone. It is double, one mask within another. The outer mask is divided by lines drawn from forehead to chin, down the centre of the nose, and across the face, so that it is in four distinct pieces. The pieces all work on hinges, and are so well fitted to each other that a spectator could not suspect that they were not one solid piece. Suddenly, while the wearer is dancing, he will fling all the pieces open, and discover a second and more hideous mask beneath.

When the chief wishes to pay an extraordinary compliment to a visitor, he puts on a mask that is fitted with a number of porcupine quills. Upon this head-dress he heaps a vast quantity of swan's down, which is retained in its position by the quills. He then dances up to the visitor, and, as he retreats backward in the dance, gives a jerk with his head, and sends the down flying over him. It is a point of honor that the visitor should be kept enveloped in a shower of down, as if he were in a snow-storm, and this can only be done by perpetually dancing and nodding the head, which is kept well supplied with down by attendants.

White feathers and down always signify peace, and hence, when a man sets off on a mission of peace to a neighboring tribe with whom there has been a quarrel, he puts white down on his head, and knows that his person will be as sacred as that of the bearer of a flag of truce in civilized warfare.

One of the dances practised by the Ahts

displays a really wonderful amount of ingenuity, and must take no little time to practise. It was witnessed by Mr. Sproat, who describes it in the following terms. The different dances are called Nooks in Aht language. This might be called the "Doctor's (Ooshtukyu) Nook." A fine representation of it by the artist is given on the following page.

"During the song and dance, which at first seemed to present nothing peculiar, a well-known slave (one, however, who was in a comparatively independent position, being employed as a sailor on board the steamer *Thames*), suddenly ceased dancing, and fell down on the ground apparently in a dying state, and having his face covered with blood. He did not move or speak, his head fell on one side, his limbs were drawn up, and he certainly presented a ghastly spectacle. While the dance raged furiously around the fallen man, the doctor, with some others, seized and dragged him to the other side of the fire round which they were dancing, placing his naked feet very near the flames.

"After this a pail of water was brought in, and the doctor, who supported the dying man on his arm, washed the blood from his face; the people beat drums, danced, and sang, and suddenly the patient sprang to his feet and joined in the dance, none the worse for the apparently hopeless condition of the moment before. While all this was going on, I asked the giver of the feast whether it was real blood upon the man's face, and if he were really wounded. He told me so seriously that it was, that I was at first inclined to believe him, until he began to explain that the blood which came from the nose and mouth was owing to the incantations of the medicine man, and that all the people would be very angry if he did not afterward restore him.

"I then recalled to mind that in the early part of the day, before the feast, I had seen the doctor and the slave holding very friendly conferences; and the former had used his influence to get a pass for the latter to be present at the entertainment, to which, probably, he had no right to come. I feel sure that many of the Indians really believed in this exhibition of the doctor's power. When the affair was over, many of the natives asked me what I thought of it, and referred to it as if it must set at rest for ever any possible doubts with regard to the abilities of their native doctors. The Indian, who explained this and other performances to me, said that the cure was not entirely owing to the doctor, but to the large body of dancers and singers, who all 'exerted their hearts' to desire the recovery of the sick man, and so procured the desired effect."

This simulated production of blood forms an element in several of the Aht dances. In one of them a man, stripped even of his blanket, is bound with his hands behind him, and driven about at the end of long cords, while the spectators yell, shout, and hammer with sticks upon wooden dishes and drums made of bear-skin.

Suddenly the chief dashes among the people, brandishing a knife, and, on seeing the bound man, gives chase to him, and to all appearance drives the knife deeply into his back. Blood pours abundantly from the wound, and the man rushes wildly about in search of shelter, followed by the chief, who plunges his bloody weapon repeatedly into the man's back. Exhausted by his wounds and loss of blood, the victim staggers, falls, and dies. His friends gather round the dead body, and carry it outside the house, when it washes itself, and puts on its blanket.

Mr. Sproat remarks of this dance that the illusion is absolutely perfect, and the acting so lifelike, that the performers would make the fortune of a minor theatre in London. The red liquid which simulates blood is a mixture of red gum, resin, oil, and water; and is, indeed, the material which is used for painting the inside of the canoes.

Another of these "nooks" is called the seal dance. The performers take off their blankets, and, though in the depth of winter, go into the sea, and crawl upon the shore, imitating the movements of the seals as they flounder along the ground. They proceed in the same manner until they reach the houses, which they enter, and crawl about the fires, which are purposely kept brightly blazing by being fed with oil. The dance is finished by jumping up and dancing round the house until the performers are tired.

There is one dance which belongs specially to the Sesaht tribe, and, absurd as it may seem, appears to have in it something of a religious nature. It is peculiar to that tribe, and may not be omitted. While the people are singing and dancing within the house, a number of the performers clamber up the posts, push some of the roof-boards aside, get on the roof, and dance there, making a noise like thunder. As the dancers become fatigued, they descend from the roof and others take their places, so that there is a constant stream of men ascending and descending the roof.

After the dance is over, an old man makes a speech to the owner of the house, saying that he is aware that the roof-boards are damaged by the dance, but at the same time the ceremony may not be omitted. A number of men then come forward, and each presents the owner of the house with a small stick, which is a token that the owner will redeem it with a new roof-board as soon as possible.

CHAPTER CXLIV.

VANCOUVER'S ISLAND—*Concluded.*

THE AHTS AND NEIGHBORING TRIBES—*Concluded.*

ARCHITECTURE OF THE AHTS—SEMI-NOMADIC CHARACTER OF THE PEOPLE—THE PERMANENT FRAMEWORK, AND MOVABLE WALLS AND ROOF—DIVISION OF THE HOUSE—RANK OF THE OCCUPANTS—OBJECT AND MODE OF MIGRATION—PIPES OF THE AHT TRIBES—LABOR EXPENDED IN THEIR MANUFACTURE—RELIGIOUS SYSTEM OF THE TRIBES—AN AHT PROMETHEUS—SOCIETY OF THE "ALLIED"—THE MEDICINE MEN AND THEIR EDUCATION—THE CANNIBALS AND DOG-EATERS—REVOLTING SCENES—THE TWO CANNIBALS—SACRED RATTLES—TERROR INSPIRED BY THE MEDICINE MEN—DISPOSAL OF THE DEAD—RESPECT FOR THE CEMETERY.

FROM the account of the Roof-dance in the preceding chapter, it is evident that the houses are built very strongly, or they would not be able to endure the violent stamping and jumping which constitute the principal charms of the dance. The houses of the Ahts are constructed after a very peculiar manner, the posts and framework being stationary, and the roof and sides movable. The effect of this arrangement is to enable the people to shift from one place to another. At each of the spots to which they migrate they find the framework of their houses ready for them, and all that they have to do is to carry with them the roofs and walls. The mode of migrating will be presently described.

The framework of the houses consists of stout posts about twelve feet in diameter, and twelve feet or so in height, placed at distances of twenty feet from each other. The top of the post is hollowed so as to receive the cross pieces which connect them. A house is some eighty feet in length, and the ridgepole which supports the roof is made of a single tree trunk. The roof, which is gabled-shaped, but slopes gently from the back to the front of the house, so as to throw off the rain, is made of cedar boards, about five feet long and nearly two inches thick. The walls are made of similar boards lashed to small upright posts driven into the ground.

Just below the roof a rude framework is extended, on which the inhabitants keep their stores of food, their weapons, and sim-

ilar articles. About six feet from the walls, a strong stockade is erected, so that each house becomes a sort of fortress. There are no windows, and the only chimney is formed by removing one of the roof-boards above the fireplace. In many of these houses, the large inside posts are ornamented by having great faces carved upon them, face-carving being an art in which these tribes excel, just as is the case with the New Zealanders. Mr. Sproat mentions, that he has seen a row of such houses extending for the third of a mile along a river's bank, and that the depth of the houses varied from twenty-five to forty feet.

Inside the house, the earth is dug away for a foot or so in depth, in order to give additional height to the interior. Every house is partitioned off into several divisions, each of which is occupied by a family, which is thus separated from the other inhabitants by a sort of bulkhead about four feet high. These partitions are movable, so that on occasion of a great festival they can be taken away, and the whole of the space kept clear. There is a fire in the middle of each division, and around it are placed wooden couches, about nine inches from the floor, and covered with a whole series of mats by way of bedding.

There is to each building one main entrance, and other small doors, which are always in a corner of one of the divisions. The rank of the different occupants is marked by the position which they occupy in the house.

For example, the chief of the house occupies the extreme end on the left of the building, the next in rank lives in the corresponding place at the other end, while the common people occupy the space between the two great men.

These houses are much more agreeable to the eye than to the nostrils. Having no windows, and all the stores of salt fish and other provisions being kept in them, the interior atmosphere is close, fishy, rank, and pungent, the last quality being due to the wood smoke of the several fires. Neither is the exterior air better than that of the interior, for the ground is covered with heaps of putrefying heads, tails, and bones of fish, decaying mollusks, and refuse of all kinds, which is simply flung into heaps and never removed, the nostrils of the natives being incapable of feeling any annoyance from the horrible odor that arises from the decomposing heaps.

The ownership of these houses is rather a complicated question. The framework of the house is generally considered as being in several divisions, each division being called after the name of the owner, while the planks are the common property of the inhabitants.

When the Ahts wish to move to another spot, which is done for the purpose of changing to better fishing, hunting, and fruit grounds, according to the time of year, they always migrate by water. They place two large canoes about five or six feet apart, and connect them together with the planks of the roof and walls, which thus form a platform on which can be placed the stores and household goods. Mr. Sproat remarks that he has seen this platform heaped to a height of fourteen feet, only just enough space being left for the passengers. As soon as they arrive at their destination, the travellers unpack the boats, and, assisted by the slaves who have been sent forward in readiness, fix the boards on the already existing framework, so that in a very short time the house is ready for the occupants.

These migrations have one beneficial effect. While the people have deserted their villages, the birds, aided by the elements, the only scavengers of Vancouver's Island, clear away a considerable portion of the heaps of putrefying rubbish, which would otherwise become too much even for native endurance.

In the meetings which are held within these houses the pipe naturally plays an important part; and, as the pipes made by these tribes differ from those of any other part of the world, a short description is here given of them. Both in shape and material these pipes are most remarkable. They seem to have been made for the express object of expending the greatest possible amount of labor upon the clumsiest possible pipe. I have seen and tried many of these

pipes, and, except that they draw the smoke very well, there is not a redeeming point about them.

In the first place, they are carved — stem and bowl — out of solid stone, a sort of very dark slate. The upper figure in illustration No 2, on page 1357, which represents one of these pipes in my collection, shows the lightest and least cumbersome form of pipe. Although only eight inches in length, it weighs six ounces, no trifle for a pipe of that description. As is usually the case with these pipes, it is adorned with a human figure and a human head. The figure evidently represents a man seated in a canoe. On account of the details of dress, it seems likely that it is intended to represent a native — possibly the carver himself — in European costume, the features being of a strongly-marked Indian type, while the dress is European. This pipe was presented to me by Lieut. Pusey.

Sometimes the natives absolutely run riot in pipe making, and expend infinite labor in making pipes which look utterly unlike pipes, and which cannot be smoked without the very greatest inconvenience. The lower specimens represent two views of a pipe of this kind, belonging to T. W. Wood, Esq., which has apparently been made for the purpose of trying how many heads of men and birds could be compressed into a certain space. As the reader may observe, the whole character of this carving bears a very strong resemblance to the art of the ancient Mexicans, so strong, indeed, that it might almost be passed off as a specimen of that art.

In total length it is a very little more than eight inches, but from bowl to the mouth-piece it only measures five inches, the remaining three inches being simply superabundant material. The number of heads that the carver has contrived to introduce into this pipe is really wonderful, the ingenuity of combination, together with force of effect, being worthy of all praise, especially when the rudeness of the workmanship is considered. Taken as a work of art, it is admirable; taken as a pipe, it is detestable. It is so heavy that the mere exertion of holding it is fatiguing, and it is so thick and clumsy that it does not at all adapt itself to the lips. And, in so cold a climate, to grasp or to put to the lips such a piece of hard, cold stone, must involve very great inconvenience.

The religious ideas of the Aht tribes are, as may be expected, exceedingly vague, and are rendered still more so by the reticence which a savage always exhibits on such subjects. Mr. Sproat remarks that he lived for two years among the Ahts, with his mind constantly directed toward this subject, before he could discover whether the people believed in any overruling power, or had any

idea of a future existence. He then proceeds to say that "a traveller must have lived for many years among savages, really as one of themselves, before his opinion as to their mental and spiritual condition is of any value at all." How true this statement is, none know better than the missionaries, who find that even their most promising converts are almost as unwilling to give information on such subjects as they were during their state of heathenism.

It is, however, ascertained that the Ahts really have a belief in a deity and in a future state, and that they possess several legends on these subjects. Some of these legends treat of a certain Quawteah, who made the earth and the animals, but would not give them fire, this being concealed in the body of the cuttle-fish. In those days they needed fire, because the Indians, who were afterward to people the earth, were hidden in their bodies. At last the deer succeeded in discovering the fire, and carried away some of it in the joint of his hind leg. The reader will doubtless perceive the similarity of this legend to the old myth of Prometheus.

As far as can be understood, this Quawteah is the chief of their deities, but they have a whole host of minor divinities, who preside over the sea, the woods, and their inmates, as well as rule the elements. So, if a native sees a sudden breeze curl the surface of the sea, he thinks it signifies the approval of some spirit; and if he should hear a rustling in the woods for which he cannot account, or a sound which he does not recognize, he immediately puts it down to the presence of some demon or other.

As might be expected, there are plenty of medicine men, who have great power over the people, and are implicitly trusted by them. They have to go through a long and unpleasant ordeal before they can be admitted into the order of the "Allied," as the medicine men call themselves. When their education is nearly finished, they go into the bush alone, and remain there for several days, fasting until they have received the spiritual gifts. The society of the Allied is encouraged by the chiefs, not from religious motives, but because they become enriched by it. No one can become an Allied unless he possesses considerable wealth, the whole of which he must give away before he can be admitted into the society. The act of giving away his property is done as ostentatiously as possible, the candidate being escorted by a large body of men, who shout and make as great a noise as they can. In front of them goes the candidate, with one end of a large rope round his waist, the other end being held by fifteen or twenty men, who pretend that all their strength is required in order to hold him back.

Captain Mayne relates a curious anecdote respecting the doings of these medicine men. He was called one evening to see a

moon on the beach. On arriving at the spot he found that the men had made a flat disk of wax to represent the moon, and had painted a man upon it,—they having the belief, which is still prevalent among the illiterate of our own country, respecting a man who lives in the moon. They had lighted a torch and placed it behind the artificial moon, so as to illuminate it, and were supposed to be holding converse with its inhabitant, much to the awe of the surrounding crowd.

These medicine men seem to be divided into three parties, or sects. One of them does not appear to be particularly distinguished, but the other two gradually rise in circumstances of horror. The former sect is called the Dog-eaters, a portion of whose initiation is described by Mr. Duncan, and is illustrated on page 1367.

"Early in the morning the pupils would be out on the beach or on the rocks, in a state of nudity. Each had a place in front of his own tribe, nor did intense cold interfere in the slightest degree. After the poor creature had crept about, jerking his head and screaming for some time, a party of men would rush out, and, after surrounding him, would commence singing. The dog-eating party occasionally carried a dead dog to their pupil, who forthwith commenced to tear it in the most dog-like manner. The party of attendants kept up a low, growling noise, or a whoop, which was seconded by a screeching noise made from an instrument which they believe to be the abode of a spirit.

"In a little time the naked youth would start up again, and proceed a few more yards in a crouching posture, with his arms pushed out behind him, and tossing his flowing black hair. All the while he is earnestly watched by the group about him, and when he pleases to sit down, they again surround him and commence singing. This kind of thing goes on, with several little additions, for a time.

"Before the prodigy finally retires, he takes a run into every house belonging to his tribe, and is followed by his train. When this is done, in some cases he has a ramble on the tops of the same houses, during which he is anxiously watched by his attendants, as if they expected his flight. By and by he condescends to come down, and they then follow him to his den, which is signified by a rope made of red bark being hung over the doorway, so as to prevent any person from ignorantly violating its precincts. None are allowed to enter that house but those connected with the art: all I know, therefore, of their further proceedings is, that they keep up a furious hammering, singing, and screeching, for hours during the day.

Even this mode of initiation cannot be very pleasant, involving, as it does, the

devouring of raw dog-flesh; but it is nothing in comparison to that of the most powerful and dreaded of the three sects, namely, the cannibals. Mr. Duncan was also a witness to part of the initiation of a cannibal Allied.

In order to give his assistance to the ceremony, a chief ordered one of his slaves, an old woman, to be killed, and her body flung into the sea. As soon as this was done, the whole of the uninitiated population left their houses and formed themselves into groups at a distance from the fatal spot, lest they should also become victims, a fear for which there was very good reason. Presently two bands of Allied men came rushing along, producing the most hideous sounds, each being headed by a candidate for membership.

The two candidates advanced with a long creeping step, waving their arms, and jerking their heads backward and forward, so as to make their long hair wave in the breeze. They pretended for some time to be seeking for the body, and at last they discovered it, and made a simultaneous rush at it. In a moment they were closely surrounded by their respective bands, but in a few minutes the crowd opened, and out passed the two men, each bearing half the body of the murdered woman, which they had actually torn in two with their hands and teeth alone. They then began devouring the body, when the spectator was unable to endure the sight any longer, and left the spot.

These cannibal medicine men are the dread of their country. At the cost of such revolting practices, as have been but very lightly touched, they gain such a complete influence over the people, that they can do exactly as they choose, no man daring to contradict them. Sometimes at a feast one of them will be taken with a fit of inspiration, and dash among the people, biting like a mad dog at every one whom he meets. On such occasions it is thought very manly and praiseworthy of the guests to welcome instead of repelling his attacks, and to offer their arms or shoulders for him to bite. The Allied cannibal responds to the invitation by biting at and swallowing a piece of the flesh, and the man who offers it thinks himself honored in proportion to the size of the piece that is removed. The wound thus made is not only productive of excruciating pain, but is also dangerous, many men having died from the effects of it. Yet they are willing to have both the pain and the danger for the sake of the honor which is conferred upon them.

The general public have very good reason for getting out of the way when one of these cannibals chooses to make an excursion in search of a human body. Should not one be found, the cannibal Allied who escort their companions would think themselves bound to provide a corpse for his eating, and would

seize and kill the first person whom they might meet. Therefore, when the sound of the horrid cannibal songs is heard in the distance, the whole population of a village will desert their houses, take to their canoes, and remain at a distance from the shore until the danger is over for the time.

These medicine men are considered all-powerful in the cure of the sick, and are always called in when any one is ill. They almost invariably say that the malady is local, and that it is due to some object or other, which they can extract by their incantations. In the ceremonies which they employ, they make much use of a rattle, the material of which does not seem to be of much consequence, provided that it can only make a noise. For example, a favorite form is a hollow wooden case, carved like a bird or a frog, and containing a few stones. Some rattles, however, are made on totally different principles, and resemble the beetle-shell rattle of Guiana that is figured on page 1265. Captain Mayne saw one which was made of three or four dozen puffin-beaks strung loosely together.

Incisions are often made over the part affected, or the doctor uses the actual cautery by means of a moxa, made of a pledget of dried flax. These remedies often do have the effect of relieving pain, and when that is the case, the patient and his friends present the doctor with liberal gifts, all which, however, he is bound to return should a relapse come on and the patient die. They even say that, when they are violently excited by their incantations, they can see the soul of the patient, which they say is in the shape of a fly, with a long curved proboscis. One man, who had recovered from a dangerous illness, said that he had seen his own soul, which the medicine man had caught as it was escaping from the body, and had put back again.

The noise which these medicine men make at their incantations is almost indescribable. Mr. Sproat describes their howling as being perfectly demoniacal, and says that no wild beast could utter sounds so calculated to strike sudden horror into the heart. Even himself, though a white man, and in perfect security, has often shuddered at the savage yells of the mystery men. Indeed, their object is to keep up the dread in which they are held, and, in order to do this, they must ever be doing something to keep themselves before the eyes of the people.

Sometimes they will assemble together on the outskirts of the village, set up a furious howling, and then rush like a pack of wolves through the village, the cannibals and dog-eaters tearing to pieces with their teeth any corpses or dogs that they may find. Sometimes a single man will leave the place and bury himself in the woods, whence he will suddenly rush, quite naked, reduced to a

skeleton through his long fast, with his body and limbs covered with wounds inflicted by himself in his mad violence, and with foam flying from his lips, while he utters wild yells and beats furiously his drum or shakes his magic rattle. As is the case in Africa, women as well as men can enter this sacred order, and exercise quite as powerful an influence over the people as do their male colleagues.

Sometimes a man will leap up in the night terrified, and crying that he sees a spirit. All within the house are at once in motion. The women begin to sing, while the visionary tears his blanket to pieces, snatches feathers from his pillow, eating some of them, and scattering the others over his head. His nearest relation then makes incisions in his legs and arms, receives the blood in a dish, and scatters it over the place where the spirit is supposed to be standing. Should the spirit withstand this exorcism, it is evident that he wants property. Accordingly the friends of the visionary throw his property on the fire; his clothes, his mats, and even the very boxes in which they were kept, go to make up the demands of the spirit, which will not take its leave until all the property has been destroyed.

THE mode of disposal of the dead varies extremely among the different tribes, and even in the same tribe is not always uniform. The bodies of slaves and people of no consequence are simply taken to the burial-ground — which is usually a small island — wrapped in mats, and merely laid on the ground, covered with sticks and stones. The bodies of chiefs and young girls of rank are placed in boxes, and hoisted into the branches of trees, where they are allowed to remain. The rank of the person is indicated by the height to which the body is raised, that of a great chief or of his daughter being nearly at the top of the tree, while that of an inferior chief will be on one of the lowest branches.

Over the coffin are thrown blankets and mats, and similar articles are hung on the boughs of neighboring trees. They are

always torn into strips, partly perhaps as a sign of mourning, and partly to guard them from being stolen. With the dead man is deposited all the property which he has not given away before his death, except his best canoe, his share of the roof and wall boards, his weapons, and his slaves, all of which belong by right to his eldest son. In some cases even his house is burned, and in others the posts are dug up, and the whole house transported to another position.

Near the bodies of chiefs are placed large wooden images intended to represent the dead man. One of them, seen by Mr. Sproat, held a skull in its hand, which it was grimly contemplating; another, which represented a deceased orator, had its hand outstretched as in the act of speaking; and a third was shown as if grasping a wolf. The relatives often visit their burial-places. They come about dark, light a great fire, and feed it with oil and other inflammable materials, while they wail loudly at intervals.

To the honor of these tribes, it may be said that they never disturb the relics of the departed, even if they occupy the burial-ground of a hostile tribe. In consequence of the mode of burial, nothing can have a more dreary or forlorn look than an island which has been selected as a burial-ground. On the branches of the trees are the mouldering bodies of the dead, and on their boughs flutter the tattered remains of their clothing. And on the ground the scene is no better, for it is occupied with decaying boards, broken boxes, shattered canoes, rotten paddles, and other emblems of decay.

When the dead chief has been a man of very great importance, his emblem or crest is either painted or carved. In the former case it is painted on the coffin, but in the latter it is generally placed on a post or a tree near the body. According to Mr. Duncan, if the crest should happen to be an eagle or a raven, it is carved as if in the act of flying, and fixed to the edge of the coffin with its wings spread, as if it were typical of the escaping and aspiring spirit of the dead chief.

CHAPTER CXLV.

ALASKA.

MALEMUTES — INGELETES — CO-YUKONS.

LARGE STATURE — THE TO-TOOK — ORNAMENTS — BAI DARRES — UNDERGROUND HOUSES — MALEMUTE DANCE — CHIEF ALEUYANUK — INGELETES — HOUSES — HONESTY — CO-YUKONS — DRESS — MOURNING FOR THE DEAD — WAKE — DISPOSAL OF THE DEAD — APPEARANCE OF THE WOMEN — AFFECTION FOR CHILDREN — COMMUNITY OF GOODS — CHARACTER.

THE United States Government having recently purchased the territory of Alaska, this work will be increased in value to the American public, by including some account of the uncivilized tribes which are its most numerous inhabitants.

At the mouth of the Unalachleet River is the most northern settlement on the coast, a Russian trading post. To the northwest of this post Mr. Whympfer found a large village of Malemute and Kaveak Indians. They resemble the Esquimaux, except that they are a tall and stout race. It is not unusual to find men among them six feet in height, and some even taller than this. The men shave the crown of the head, and are fond of an ornament called the To-took. It is made by pieces of bone run through holes on either side of the face just below the mouth. The ornaments of the women, who are stout and good-humored, are a tattoo on the chin, beads hanging from their hair, and also leaden or iron bracelets. Both sexes wear skin clothing. The coat has a hood almost always, which is generally of wolf skin. Men and women alike wear pantaloons of seal or reindeer skin, the women having the socks attached and in one piece. The "baidarres" of these natives, similar to the Esquimaux kajak, are admirably made. The frames are light and strong, the skin covering being sewed with sinew, and the seams made watertight by fat rubbed into them.

Their houses are usually underground, and have a tunnel, through which one must crawl to enter them. A hole in the roof — which is just above the surface of the ground — lets out the smoke. When there is no fire, this aperture is closely covered with a skin.

Mr. Whympfer gives the following account of a dance to which he and his party were invited:—

"On arriving at the doorway, we found a subterranean passage, two and a half feet high, crawling through which we at last reached the room, — dimly lighted by blubber lamps. The Indians who were to take part in the dance, chiefly young men, were nude to the waist, and wore seal, deerskin or cotton pantaloons, with tails of wolves or dogs hanging behind, and feathers round their heads. The elders sat on a bench or shelf, running round the entire building, and looked on approvingly, while they consumed their own smoke, like the Tchuktchis, by swallowing it, and getting partially intoxicated thereby. The women brought in berries and fish in large 'contogs,' or wooden bowls.

"The performance commenced by the actors ranging themselves in a square, and raising these dishes of provisions to the four cardinal points successively, and once to the skies, with a sudden noise like 'swish!' or the flight of a rocket.

"Then came the feast; and that over, a monotonous chorus, with an accompaniment of gongs, was started. The words of the song commenced, 'Yung i ya, i ya, i ya!' and continued throughout, 'Yung i ya!' Then a boy sprang out on the floor; he was joined by a second, then a third, till a circle of twenty was formed. Now they appeared violently attracted together, and now as much repelled; now they were horrified at one another's conduct, and held up their arms in warning gestures, and again all were friends and made pantomime of their happiness. In this performance there was nearly as much done by arms and bodies, as with feet. When

there was a lull in the entertainment, small presents were given to all the strangers invited."

The Malemutes and Kaveaks, though intermingling, and having similar habits, manners, and customs, yet speak different dialects and inhabit different parts of the

territory. They are considered as superior to the other Indian tribes of that region. The Malemute chief "Aleuyanuk," whom Mr. Whymper saw, "was a fine-looking old man, erect and soldierly, and, wearing a mustache and imperial, his manuers would not have disgraced a civilized assembly."

INGELETES.

THE Ingeletes speak a dialect entirely different from that of the Malemutes, — one nearly allied to the Co-yukon. They are a stout, noble-looking race, good-natured, and having considerable intelligence.

Polygamy, though allowed, is not very common, and marriage is a permanent relation, except occasionally, when the wife is barren or has too many daughters. Female children not being prized so highly as sons, in such instances the wife is sometimes dismissed. They live in underground houses, such as have been described, and in mild,

wet weather, the passage-way is nothing but a sewer. The entrance being covered with a skin, the mixture of foul smells inside, arising from stale fish and meat, old skins, dogs, dirt and smoke, is sickening and unendurable by any but an Indian. Mr. Whymper testifies to the good temper of the children and the honesty of the people. "At their villages our goods lay unguarded in our absence, and I cannot recall a single case of proved dishonesty among them, although we found them becoming more greedy in their demands for payment."

THE CO-YUKONS.

THE Co-yukons are an interior tribe, and the largest on the Yukon, which is the great river of the north, being 2,000 miles long, and navigable 1,000 miles. They may be found on the banks of the Co-yukuk, and other interior rivers. These Indians resemble the Ingeletes, already mentioned, but have a more ferocious countenance. Their dress is a double-tailed coat, one tail before, the other behind, and this style, with some modifications, prevails for a thousand miles on the Yukon.

The dress of the women is cut more squarely, and they wear an ornament of Hy-a-quaa shells on the nose, which runs through a hole made in the cartilage between the nostrils. It is a singular fact that higher up the river it is the men only who wear this ornament.

Among these tribes the period of mourning for the dead is one year, the women during this time often gathering to talk and cry over the deceased. At the end of the year, they have a feast or "wake," which is generally a queer compound of jollity and grief. One such scene, to commemorate the death of a child, was witnessed by Mr. Whymper at Nulato. "The poor old mother and some of her friends wept bitterly, while the guests were gayly dancing round a painted pole, on which strings of beads and some magnificent wolf skins were hung. They kept up singing and dancing to a fashionable hour of the morning, and one little savage, who had been shouting at the top of his lungs for hours, got up the next day without any voice at all, a case of righteous retribu-

tion. The decorations of the pole were divided among those who took part in the 'wake.'"

Their method of disposing of the dead is not interment, but enclosure in oblong boxes, raised on posts. These are sometimes ornamented with strips of skin, and the possessions of the deceased, as the canoe, paddles, &c., are placed on the top of the box. Smaller articles are placed within the box. This four-post coffin is a custom also among the coast tribes already described. The women are quite prepossessing in appearance, are affectionate toward their children, and especially fond of their first-born. They are good-natured and playful, snowballing and rolling each other in the snow, sliding down hill on sledges or snow-shoes, with the enthusiasm of children.

There are other tribes, the names of which need only be mentioned, viz: the Kotch-a-Kutchins (or lowland people), the Au Kutchins, the Tatauchok Kutchins, Birch River and Rat River Indians. The Zanana Indians (or knoll people), Mr. Whymper thinks are the most unsophisticated of all the Indian tribes of the present day. Those he saw "were gay with painted faces, feathers in their long hair, patches of red clay at the back of their heads, covered with small fluffy feathers, double-tailed coats and pantaloons of buckskin, much adorned with fringes and beads, and elaborately worked fire-bags and belts." Many of them, as in other Indian tribes, wore through the nose the Hy-a-quaa shell as an ornament. The women of the upper tribes wear less ornament than the

men, and are compelled to do more drudgery than those of the lower Yukon and coast of Alaska.

Among the coast tribes, and especially on the Yukon, there is, to some extent, a community of goods, the industrious hunter supplying the village crowd. This is a custom so much practised that the hunter gets no praise for his service. Some of the chiefs maintain their position by frequent distributions of their effects, and the game which they, being good hunters, have been able to take. "These chiefs are often the worst clothed and worst fed of all the tribe. Such generosity is expected as a matter of course. No man, woman, or child among them goes unfed, unhoused, or unwarmed, if there be food, dwelling, or fire in the settlement."

Among the tribes of Alaska, a system of slavery exists that can hardly be surpassed for barbarism. They all buy and sell slaves. "Parents will sell their children for three or four blankets or a few dollars, and have no compunction of conscience for the use they may be put to in the future. When one tribe goes to war with another, all the prisoners taken by either tribe are called and used as slaves. When a chief or any of his family dies, it is the custom to kill one or more of these slaves, so that the chief or his deceased relative may have a servant in the other world to wait on him. In 1868 an old chief of the Sitka tribe died, and a few days before his death, when his relatives were satisfied that he could live but a short time, they selected as a victim for sacrifice a young, healthy, good-looking warrior, whom the Sitka tribe had taken prisoner while at war with one of the tribes down near Queen Charlotte's Sound. The slave had been tied up two days about the time the old chief died, and by some means some of his friends were apprised of his condition, and immediately notified Gen. Davis that the Indian slave was liable to be killed at any moment. Gen. Davis had one of the chiefs brought before him, and after a long conversation about the foolishness of such sacrifices, he agreed to let the slave go free; and lest they might attempt to put into execution their original idea of killing him, the General permitted the Indian to remain in the city, where he would be protected.

"Recently one of the chiefs tried hard to

get hold of a half-breed, named Eyanoff, to sacrifice him. For the two preceding weeks this chief would go up every day to Gen. Davis, stating that he had a slave in the city, and wanting to know if he could not get him into Indian town. The General, supposing the chief wanted one of his Indians, told him to go and get him, but it was not until the day in question that the effort was made to get this man. It seems that Eyanoff's mother was an Indian woman, but his father was a Russian, and when he was but three years of age a lady named Bengeman adopted and brought him up. The chief who claimed him had a child that was expected to die, and afterward did die. Having no slave but his claim on Eyanoff, he made this effort to sacrifice him that he might be a servant for his child in the spirit world. When the general saw whom the chief claimed, in a very few well-timed words he taught him and several of his warriors more about civilization than ever they knew before. He asked the chief what he wanted with this man. Pointing to Eyanoff, the Indian told him his child was sick, and he only wanted him for three hours, and then he would let him go free. The General told him that the best thing he could do was to look on Eyanoff as a free man already, and warned the Indian if in the future he should ever attempt to trouble Eyanoff again, he would put him in the guard-house and keep him there. The Indian went off well pleased, and stated that he would be a good Indian thereafter.

"The slaves are put to death as follows: As soon as a chief dies, the slave is compelled to wash the body of the corpse; and is then taken out and thrown flat on his back and held there, when a stick of wood is placed across his throat, and two Indians sit down on each end of it, and in this way strangle him to death. His body is then placed inside a large pile of wood and burned to ashes. It is customary when a big chief dies to put to death two or more slaves. All slaves taken in war have to act as servants for the chiefs who own them." — (*Sitka Times of Nov. 27, 1869.*)

The Indian population of the whole territory of Alaska is estimated at about 30,000. They are peaceful and quite capable, learning quickly, and exhibiting considerable skill in their utensils and weapons.

CHAPTER CXLVI.

SIBERIA.

THE TCHUKTCHI — JAKUTS — TUNGUSI.

HOMES OF THE TCHUKTCHI — INDEPENDENCE — DISTRICT OF THE RUSSIANS — CARAVANS — INTOXICATION BY TOBACCO — FAIR OF OSTROWNOJE — GRAVITY OF THE TCHUKTCHI — THEIR TENT — MADAME LEÜTT — HOSPITALITY — SHAMANISM — HUMAN SACRIFICE — POLYGAMY — MURDER OF THE AGED — JAKUTS — THEIR ENDURANCE — RESERVE — SUPERSTITION — THE TUNGUSI — DIFFERENT TRIBES — CANNIBALISM — ORNAMENTS — BRAVERY — DIET — SHAMANISM — DISPOSAL OF THE DEAD — A NIGHT'S HALT WITH THE TUNGUSI IN THE FOREST — SPORTS — FAIRS.

CROSSING Behring's Straits into Asia, we find in Northern Siberia several peoples whose condition and character bring them within the scope of this work.

The home of the TCHUKTCHI is at the extreme north-eastern point of Asia; bounded by the Polar Ocean on one side, and by Behring Sea on the other. It is, as the few travellers who have visited it say, one of the dreariest regions of the earth. There is no indication of summer before July 20th, and winter begins about the 20th of August. The sea coasts abound with seals, sea-lions, and walruses; while the wolf, reindeer, and Arctic fox abound in the interior. In this cold, desolate region dwell the only aboriginal race of Northern Asia that has resisted all attempts of the Russian government to take away its independence. Dr. Hartwig, in his sketch of this tribe, says: "The rulers of Siberia have confined them within narrower limits, but they obey no foreign leader, and wander unmolested, with their numerous reindeer herds, over the naked tundras.

A natural distrust of their powerful neighbors has rendered them long unwilling to enter into any commercial intercourse with the Russians, and to meet them at the fair of Ostrownoje, a small town, situated not far from their frontiers, on a small island of the Aninj, in 68° N. lat.

From the East Cape of Asia, where, crossing Behring's Strait in boats covered with

skins, they barter furs and walrus teeth with the natives of America, the Tchuktchi come with their goods and tents drawn on sledges to the fair of Ostrownoje. One of these caravans generally consists of fifty or sixty families, and one fair is scarcely at an end when they set off to make their arrangements for the next.

Tobacco is the *primum mobile* of the trade which centres in Ostrownoje. Their pipes are of a peculiar character, larger at the stem than the bowl, which holds a very small quantity of tobacco. In smoking, they swallow the fumes of the tobacco, and often, after six or eight whiffs, fall back, completely intoxicated for the time.

But Ostrownoje attracts not only Tchuktchi and Russians; a great number of the Siberian tribes, from a vast circuit of 1,000 or 1,500 versts, — Jukahiri, Lamutes, Tungusi, Tschuwanzi, Koriacks, — also come flocking in their sledges, drawn partly by dogs, partly by horses, for the purpose of bartering their commodities against the goods of the Tchuktchi. Fancy this barbarous assembly meeting every year during the intense cold and short days of the beginning of March. Picture to yourself the fantastic illumination of their red watch-fires blazing under the starry firmament, or mingling their ruddy glare with the aurora flickering through the skies, and add to the strange sight the hollow sound of the Shaman's drum, and the howling of several

hundreds of hungry dogs, and you will surely confess that no fair has a more original character than that of Ostrownoje.

The imperturbable gravity of the Tchuktch forms a remarkable contrast with the greedy eagerness of the Russian trader. Although the Tchuktchi have no scales with them, it is not easy to deceive them in the weight, for they know exactly by the feeling of the hand whether a quarter of a pound is wanting to the pound. The whole fair seldom lasts longer than three days, and Ostrownoje, which must have but very few stationary inhabitants indeed (as it is not even mentioned in statistical accounts, which cite towns of seventeen souls), is soon after abandoned for many months to its ultra-Siberian solitude.

But before we allow the Tchuktchi to retire to their deserts, we may learn something more of their habits by accompanying Mr. Matiuschkin Wrangell's companion on a visit to the ladies of one of their first chiefs. "We enter the outer tent, or 'wamet,' consisting of tanned reindeer skins supported on a slender framework. An opening at the top to let out the smoke, and a kettle in the centre, announce that antechamber and kitchen are here harmoniously blended into one. But where are the inmates? Most probably in that large sack made of the finest skins of reindeer calves, which occupies, near the kettle, the centre of the 'wamet.' To penetrate into this *sanctum sanctorum* of the Tchuktch household, we raise the loose flap which serves as a door, creep on all-fours through the opening, cautiously re-fasten the flap by tucking it under the floor-skin, and find ourselves in the reception or withdrawing-room,—the 'polog.' A snug box, no doubt, for a cold climate, but rather low, as we cannot stand upright in it, and not quite so well ventilated as a sanitary commissioner would approve of, as it has positively no opening for light or air. A suffocating smoke meets us on entering. We rub our eyes, and when they have at length got accustomed to the biting atmosphere, we perceive, by the gloomy light of a train-oil lamp, the worthy family squatting on the floor in a state of almost complete nudity. Without being in the least embarrassed, Madame Leüti and her daughter receive us in their primitive costume. But, to show us that the Tchuktchi know how to receive company, and to do honor to their guests, they immediately insert strings of glass beads in their greasy hair. Their hospitality equals their politeness; for, instead of a

cold reception, a hot dish of boiled reindeer flesh, copiously irrigated with rancid train-oil by the experienced hand of the mistress of the household, is soon after smoking before us. Unfortunately, our effeminate taste is not up to the *haut goût* of her culinary art, and while Mr. Leüti does ample justice to the artistic talent of his spouse, by rapidly bolting down pieces as large as a fist, we are hardly able to swallow a morsel."

Though most of the Reindeer or nomadic Tchuktchi have been baptized, yet Wrangell supposes the ceremony to have been a mere financial speculation on their part, and is convinced that the power of the Shamans is still as great as ever. An epidemic had carried off a great number of persons, and also whole herds of reindeer. In vain the Shamans had recourse to their usual conjurations. The plague continued. They consulted together, and directed that one of their most respected chiefs, named Kotschen, must be sacrificed, to appease the irritated spirits. Kotschen was willing to submit to the sentence, but none could be found to execute it, until his own son, prevailed on by his father's exhortations, and terrified by his threatened curse, plunged a knife into his heart, and gave his body to the Shamans.

Polygamy is general among the Tchuktchi, and they change their wives as often as they please. Still, though the women are certainly slaves, they are allowed more influence, and are subjected to less labor, than among many savages. Among other heathenish and detestable customs, is that of killing all deformed children, and all old people as soon as they become unfit for the hardships and fatigues of a nomad life. They do not indulge in any needless cruelty, but stupefy the aged victim, by putting some substance up the nostrils before opening a vein. Two years before Wrangell's arrival at Kolyma there was an instance of this in the case of one of their richest chiefs. Waletka's father became infirm and tired of life, and was put to death at his own express desire, by some of his nearest relations.

The number of the Tchuktchi is greater than one might expect to find in so sterile a country. According to the Russian missionaries, there were, some years back, 52 ulusses or villages of the Onkilon (or stationary Tchuktchi), with 1,568 tents, and 10,000 inhabitants, and Wrangell tells us that the Tennygk (or Reindeer Tchuktchi), are at least twice as numerous, so that the entire population of the land of the Tchuktchi may possibly amount to 30,000.

JAKUTS.

THE JAKUTS are the most energetic of these races, having reached a higher civilization than the others in the same latitude, with the exception of Iceland, Finland, and Norway. They are a pastoral people, hospitable, possess considerable mechanical skill, and are so shrewd and cunning that no Russian can compete with them.

"Even in Siberia," Wrangell says, "they are called 'men of iron.' Often have I seen them sleeping at a temperature of 4° in the open air, and with a thick ice rind covering their almost unprotected bodies."

Though reserved and unsocial, they are kind to strangers that need assistance. They are the universal carriers to the east of the Lena. Bidding defiance to the cold and the storm, fearing neither the gloom of the forest nor the dangers of the icy stream, yet they are not emancipated from the old belief in Schamanism—the dread of evil spirits. They number about 200,000, and form the principal part of the population of the vast and dreary province of Jakutsk.

THE TUNGUSI.

THIS race having spread over East Siberia, driving before them the Jakuts, Jukahiri, Tchuktchi, and other aboriginal tribes, were conquered by the Russians, and are now as ignorant and uncivilized as they were two hundred and fifty years ago. Dr. Hartwig, deriving his information from Wrangell, the Arctic explorer, thus sketches the traits of this people:—

"According to their occupations, and the various domestic animals employed by them, they are distinguished by the names of Reindeer, Horse, Dog, Forest, and River Tungusi; but, although they are found from the basins of the Upper, Middle, and Lower Tunguska, to the western shore of the sea of Ochotsk, and from the Chinese frontiers and the Baikal to the Polar Ocean, their whole number does not amount to more than 30,000, and diminishes from year to year, in consequence of the ravages of the small-pox and other epidemic disorders transmitted to them by the Russians. Only a few rear horses and cattle, the reindeer being generally their domestic animal; and the impoverished Tunguse, who has been deprived of his herd by some contagious disorder, or the ravages of the wolves, lives as a fisherman on the borders of a river, assisted by his dog, or retires into the forests as a promyschlenik, or hunter."

Of the miseries which here await him, Wrangell relates a melancholy instance. In a solitary hut, in one of the dreariest wildernesses imaginable, he found a Tunguse and his daughter. While the father, with his long snow-shoes, was pursuing a reindeer for several days together, this unfortunate girl remained alone and helpless in the hut,—which even in summer afforded but an imperfect shelter against the rain and wind,—exposed to the cold, and frequently to hunger, and without the least occupation. No wonder that the impoverished Tungusi not seldom sink into cannibalism. Neither the reindeer nor the dogs, nor the wives and children of their more fortunate coun-

trymen, are secure from the attacks and voracity of these outcasts, who, in their turn, are treated like wild beasts, and destroyed without mercy. A bartering trade is, however, carried on with them, but only at a distance, and by signs; each party depositing its goods, and following every motion of the other with a suspicious eye.

The Russian government, anxious to relieve the misery of the impoverished nomads, has given orders to settle them along the river banks, and to provide them with the necessary fishing implements; but only extreme wretchedness can induce the Tunguse to relinquish his free life of the forest. His careless temper, his ready wit, and sprightly manner, distinguish him from the other Siberian tribes,—the gloomy Samoiede, the uncouth Ostiak, the reserved Jakut,—but he is said to be full of deceit and malice. His vanity shows itself in the quantity of glass beads with which he decorates his dress of reindeer leather, from his small Tartar cap to the tips of his shoes. When chasing or travelling on his reindeer through the woods, he of course lays aside most of his finery, and puts on large water-tight boots, or sari, well greased with fat, to keep off the wet of the morass. His hunting apparatus is extremely simple. A small axe, a kettle, a leathern bag containing some dried fish, a dog, a short gun, or merely a bow and a sling, is all he requires for his expeditions into the forest. With the assistance of his long and narrow snow-shoes, he flies over the dazzling plains, and protects his eyes, like the Jakut, with a net made of black horse-hair. He never hesitates to attack the bear single-handed, and generally masters him. The nomad Tunguse naturally requires a movable dwelling. His tent is covered with leather, or large pieces of pliable bark, which are easily rolled up and transported from place to place. The yurt of the sedentary Tunguse resembles that of the Jakut, and is so small that it can

be very quickly and thoroughly warmed by a fire kindled on the stone hearth in the centre. In his food the Tunguse is by no means dainty. One of his favorite dishes consists of the contents of a reindeer's stomach mixed with wild berries, and spread out in thin cakes on the rind of trees, to be dried in the air or in the sun. Those who have settled on the Wiluj and in the neighborhood of Nertschinsk likewise consume large quantities of brick tea, which they boil with fat and berries into a thick porridge, and this unwholesome food adds, no doubt, to the yellowness of their complexion.

But few of the Tungusi have been converted to Christianity, the majority being still addicted to Shamanism. They do not like to bury their dead, but place them, in their holiday dresses, in large chests, which they hang up between two trees. The hunting apparatus of the deceased is buried beneath the chest. No ceremonies are used on the occasion, except when a Shaman happens to be in the neighborhood, when a reindeer is sacrificed, on whose flesh the sorcerer and the relatives regale themselves, while the spirits to whom the animal is supposed to be offered are obliged to content themselves with the smell of the burnt fat. As among the Samoiedes or the Ostiaks, woman is a marketable ware among the Tungusi. The father gives his daughter in marriage for twenty or a hundred reindeer, or the bridegroom is obliged to earn her hand by a long period of service.

In East Siberia the Tungusi divide with

the Jakuts the task of conveying goods or travellers through the forests, and afford the stranger frequent opportunities for admiring their agility and good humor. On halting after a day's journey, the reindeer are unpacked in an instant, the saddles and the goods ranged orderly on the ground, and the bridles collected are hung on branches of trees.

Comfortably seated on his reindeer saddle, the traveller may now amuse himself with the dances, which the Tungusi accompany with an agreeable song; or, if he choose to witness their agility in athletic exercises, it only costs him a word of encouragement and a small donation of brandy. Two of the Tungusi hold a rope, and swing it with all their might, so that it does not touch the ground. Meanwhile a third Tunguse skips over the rope, picks up a bow and arrow, spans the bow and shoots the arrow, without once touching the rope. Some particularly bold and expert Tungusi will dance over a sword which a person lying on his back on the ground is swinging about with the greatest rapidity. Should our traveller be a friend of chess, the Tungusi are equally at his service, as they are passionately fond of this noblest of games, especially in the Kolymsk district.

Like all other Siberian nomads, they visit, at least once a year, the various fairs which are held in the small towns scattered here and there over their immense territory, such as Kirensk, Olekminsk, Bargusin and Ochotsk, which, before the opening of Amoor to trade, was the chief port of East Siberia.

CHAPTER CXLVII.

SIBERIA — *Concluded.*

THE SAMOÏEDES AND OSTIAKS.

THEIR BARBARISM — NUM, OR JILIBEAMBAERTJE — SHAMANISM — SAMOÏEDE IDOLS — SJADÆI — HAHE — THE TADEBTSIOS, OR SPIRITS — THE TADIBES, OR SORCERERS — THEIR DRESS — THEIR INVOCATIONS — THEIR CONJURING TRICKS — REVERENCE PAID TO THE DEAD — A SAMOÏEDE OATH — APPEARANCE OF THE SAMOÏEDES — THEIR DRESS — A SAMOÏEDE BELLE — CHARACTER OF THE SAMOÏEDES — THEIR DECREASING NUMBERS — TRADITIONS OF ANCIENT HEROES — OSTIAKS — WHAT IS THE OBI? — A SUMMER YOURT — POVERTY OF OSTIAK FISHERMEN — A WINTER YOURT — ATTACHMENT OF OSTIAKS TO THEIR ANCIENT CUSTOMS — ARCHERY — APPEARANCE AND CHARACTER OF THE OSTIAKS.

THE Samoïedes, the neighbors of the Laplanders, are still farther removed from civilized society, and plunged in even deeper barbarism. The wildest tundras and woods of Northern Russia and Western Siberia are the home of the Samoïede. With his reindeer herds he wanders over the naked wastes, from the eastern coasts of the White Sea to the banks of the Chatanga, or hunts in the boundless forests between the Obi and the Jenissei. His intercourse with the Russians is confined to his annual visit at the fairs of such miserable settlements as Obdorsk and Pustosersk, where, far from improving by their company, he but too often becomes the prey of their avarice, and learns to know them merely as cheats and oppressors. Protestant missionaries have long since brought instruction to the Laplander's hut, but the majority of the less fortunate Samoïedes still adhere to the gross superstitions of their fathers. They believe in a Supreme Being, — Num, or Jilibembaertje, — who resides in the air, and, like the Jupiter of old, sends down thunder and lightning, rain and snow; and as a proof that something of a poetic fancy is to be found even among the most savage nations, they call the rainbow "the hem of his garment." As this deity, however, is too far removed from them to leave them any hope of gaining his favor, they never think of offering him either prayer or sacrifice. But, besides Num, there are a great many inferior spirits, or idols, who directly interfere in

human concerns, — capricious beings, who allow themselves to be influenced by offerings, or yield to magical incantations; and to these, therefore, the Samoïede has recourse when he feels the necessity of invoking the aid or averting the wrath of a higher power.

The chief of all Samoïede idols is in the island of Waygatz, — a cold and melancholy Delos, — where it was already found by old Barentz. This idol is a mere block of stone, with its head tapering to a point. It has thus been fashioned, not by a mortal artist, but by a play of nature. After this original the Samoïedes have formed many idols of stone or wood of various sizes, which they call "Sjadæi," from their possessing a human physiognomy (sja). These idols they dress in reindeer skins, and ornament them with all sorts of colored rags. But a resemblance to the human form is not the necessary attribute of a Samoïede idol; any irregularly shaped stone or tree may be thus distinguished.

If the object is small, the savage carries it everywhere about with him, carefully wrapped up; if too cumbersome to be transported, it is reserved as a kind of national deity. As with the Ostiaks, each Samoïede tribe has in its train a peculiar sledge, — the Hahengan, — in which the household idols (or Hahe) are placed. One of these Penates protects the reindeer, another watches over the health of his worshippers, a third is the guardian of their connubial happiness, a fourth takes care to fill their nets with fish.

Whenever his services are required, the Hahe is taken from his repository, and erected in the tent or on the pasture ground, in the wood or on the river's bank.

His mouth is then smeared with oil or blood, and a dish with fish or flesh is set before him, in the full expectation that his good offices will amply repay the savory repast. When his aid is no longer necessary, he is put aside without any further ceremony, and as little noticed as the Madonna of the Neapolitan fisherman after the storm has ceased.

The Hahe, or idols, are very convenient objects of reverence to the Samoïede, as he can consult them, or ask their assistance, without being initiated in the secrets of magic; while the Tadebsios, or invisible spirits, which everywhere hover about in the air, and are more inclined to injure than to benefit man, can only be invoked by a Tadibe, or sorcerer, who, like the Cumæan sibyl, works himself into a state of ecstatic frenzy. When his services are required, the first care of the Tadibe is to invest himself with his magical mantle,—a kind of shirt made of reindeer leather, and hemmed with red cloth. The seams are covered in a similar manner, and the shoulders are decorated with epaulettes of the same gaudy material. A piece of red cloth veils the eyes and face,—for the Tadibe requires no external organs of sight to penetrate into the world of spirits,—and a plate of polished metal shines upon his breast.

Thus accoutred, the Tadibe seizes his magical drum, whose sounds summon the spirits to his will. Its form is round, it has but one bottom, made of reindeer skin, and is more or less decorated with brass rings, and other ornaments, according to the wealth or poverty of its possessor. During the ceremony of invocation, the Tadibe is generally assisted by a disciple, more or less initiated in the magic art. They either sit down, or walk about in a circle. The chief sorcerer beats the drum, at first slowly, then with increasing violence, singing at the same time a few words to a mystic melody. The disciple immediately falls in, and both repeat the same monotonous chant.

At length the spirits appear, and the consultation is supposed to begin; the Tadibe from time to time remaining silent, as if listening to their answers, and but gently beating his drum, while the assistant continues to sing. Finally, this mute conversation ceases, the song changes into a wild howling, the drum is violently struck, the eye of the Tadibe glows with a strange fire, foam issues from his lips, when suddenly the uproar ceases, and the oracular sentence is pronounced. The Tadibes are consulted, not only for the purpose of recovering a strange reindeer, or to preserve the herd from a contagious disorder, or to obtain success in fishing. The Samoïede, when a prey to illness,

seeks no other medical advice; and the sorcerer's drum either scares away the malevolent spirits that cause the malady, or summons other to the assistance of his patient.

Besides dealing with the invisible world, the Tadibe does not neglect the usual arts of an expert conjurer, and knows by this means how to increase his influence over his simple-minded countrymen. One of his commonest tricks is similar to that which has been practised with so much success by the brothers Davenport. He sits down, with his hands and feet bound, on a reindeer skin stretched out upon the floor, and, the light being removed, begins to summon the ministering spirits to his aid. Strange, unearthly noises now begin to be heard; bears growl, snakes hiss, squirrels rustle about the hut. At length the tumult ceases, the audience anxiously awaits the end of the spectacle, when suddenly the Tadibe, freed from his bonds, steps into the hut, no one doubting that the spirits have set him free.

As barbarous as the poor wretches who submit to his guidance, the Tadibe is incapable of improving their moral condition, and has no wish to do so. Under various names,—Schamans among the Tungusi, Angekoks among the Esquimaux, medicine-men among the North American Indians,—we find similar magicians or impostors assuming a spiritual dictatorship over all the Arctic nations of the Old and the New World, wherever their authority has not been broken by Christianity or Buddhism. This dreary faith still extends its influence over at least half a million of souls, from the White Sea to the extremity of Asia, and from the Pacific to Hudson's Bay.

Like the Ostiaks and other Siberian tribes, the Samoïedes honor the memory of the dead by sacrifices and other ceremonies. They believe that their deceased friends have still the same wants and pursue the same occupations as when in the land of the living; and thus they place in or about their graves a sledge, a spear, a cooking-pot, a knife, an axe, etc., to assist them in procuring and preparing their food. At the funeral, and for several years afterward, the relations sacrifice reindeer over the grave. When a person of note, a prince, a Starschina, the proprietor of numerous herds of reindeer, dies (for even among the miserable Samoïedes we find the social distinctions of rich and poor), the nearest relations make an image, which is placed in the tent of the deceased, and enjoys the respect paid to him during his lifetime. At every meal the image is placed in his former seat, and every evening it is undressed and laid down in his bed. During three years the image is thus honored, and then buried; for by this time the body is supposed to be decayed, and to have lost all sensation of the past. The souls of the Tadibes, and of those who have died a violent death, alone

enjoy the privilege of immortality, and after their terrestrial life hover about in the air as unsubstantial spirits.

Like the Ostiaks, the Samoïedes consider the taking of an oath as an action of the highest religious importance. When a crime has been secretly committed against a Samoïede, he has the right to demand an oath from the suspected person.

If no wooden or stone Hahe is at hand, he manufactures one of earth or snow, leads his opponent to the image, sacrifices a dog, breaks the image, and then addresses him with the following words: "If thou hast committed this crime, then must thou perish like this dog." The ill consequences of perjury are so much dreaded by the Samoïedes, — who, though they have but very faint ideas of a future state, firmly believe that crime will be punished in this life: murder with violent death, or robbery by losses of reindeer, — that the true criminal, when called upon to swear, hardly ever submits to the ceremony, but rather at once confesses his guilt, and pays the penalty.

The most effectual security for an oath is that it should be solemnized over the snout of a bear, — an animal which is highly revered by all the Siberian tribes, from the Kamschatkans to the Samoïedes, as well as by the Laplanders. Like the Laplanders, they believe that the bear conceals under his shaggy coat a human shape with more than human wisdom, and speak of him in terms of the highest reverence. Like the Lapps, also, they will drive an arrow or a bullet through his skin; but they preface the attack with so many compliments that they feel sure of disarming his anger.

The appearance of the Samoïedes is as wild as the country which they inhabit. The dwarfish stature of the Ostiak or the Lapp, thick lips, small eyes, a low forehead, a broad nose, so much flattened that the end is nearly upon a level with the bone of the upper jaw (which is strong and greatly elevated), raven-black, shaggy hair, a thin beard, and a yellow-brown complexion, are their characteristic features, and in general they do nothing to improve a form which has but little natural beauty to boast of. The Samoïede is satisfied if his heavy reindeer dress affords him protection against the cold and rain, and cares little if it be dirty or ill-cut; some dandies, however, wear furs trimmed with cloth of a gaudy color. The women, as long as they are unmarried, take some pains with their persons; and when a Samoïede girl, with her small and lively black eyes, appears in her reindeer jacket tightly fitting round the waist, and trimmed with dog-skin, in her scarlet moccasins, and her long, black tresses, ornamented with pieces of brass or tin, she may well tempt some rich admirer to offer a whole herd of reindeer for her hand. For among the Samoïedes no father ever thinks of bestowing a portion on his

daughter; on the contrary, he expects from the bridegroom an equivalent for the services which he is about to lose by her marriage. The consequence of this degrading custom is that the husband treats his consort like a slave, or as an inferior being. A Samoïede, who had murdered his wife, was quite surprised at being summoned before a court of justice, for what he considered a trifling offence; "he had honestly paid for her," he said, "and could surely do what he liked with his own."

The senses and faculties of the Samoïedes correspond to their mode of life as nomads and hunters. They have a piercing eye, delicate hearing, and a steady hand; they shoot an arrow with great accuracy, and are swift runners.

The Samoïede is good-natured, melancholy, and phlegmatic. He has, indeed, but indistinct notions of right and wrong, of good and evil; but he possesses a grateful heart, and is ready to divide his last morsel with his friend. Cruelty, revenge, the darker crimes that pollute so many of the savage tribes of the tropical zone, are foreign to his character. Constantly at war with a dreadful climate, a prey to ignorance and poverty, he regards most of the things of this life with supreme indifference.

A common trait in the character of all Samoïedes is the gloomy view which they take of life and its concerns; their internal world is as cheerless as that which surrounds them. True men of ice and snow, they relinquish, without a murmur, a life which they can hardly love, as it imposes upon them many privations, and affords them but few pleasures in return.

The entire number of the European and Asiatic Samoïedes is estimated at no more than about 10,000, and this number, small as it is when compared to the vast territory over which they roam, is still decreasing from year to year. Before their subjugation by the Russians, the Samoïedes were frequently at war with their neighbors, the Ostiaks, the Woguls, and the Tartars, and the rude poems which celebrate the deeds of the heroes of old are still sung in the tents of their peaceful descendants. The *minstrel*, or *troubadour*, — if I may be allowed to use these names while speaking of the rudest of mankind, — is seated in the centre of the hut, while the audience squat around. His gesticulations endeavor to express his sympathy with his hero. His body trembles, his voice quivers, and during the more pathetic parts of his story, tears start to his eyes, and he covers his face with his left hand, while the right, holding an arrow, directs its point to the ground. The audience generally keep silence, but their groans accompany the hero's death; or when he soars upon an eagle to the clouds, and thus escapes the malice of his enemies, they express their delight by a triumphant shout.

THE OSTIAKS.

WHAT is the Obi? "One of the most melancholy rivers on earth," say the few European travellers who have ever seen it roll its turbid waters through the wilderness; "its monotonous banks a dreary succession of swamps and dismal pine forests, and hardly a living creature to be seen, but cranes, wild ducks, and geese." If you address the same question to one of the few Russians who have settled on its banks, he answers, with a devout mien, "Obi is our mother"; but if you ask the Ostiak, he bursts forth in a laconic but energetic phrase, "Obi is the god whom we honor above all other gods."

To him the Obi is a source of life. With its salmon and sturgeon he pays his taxes and debts, and buys his few luxuries; while the fishes of inferior quality which get entangled in his net he keeps for his own consumption and that of his faithful dog, eating them mostly raw, so that the perch not seldom feels his teeth as soon as it is pulled out of the water. In spring, when the Obi and its tributaries burst their bonds of ice, and the floods sweep over the plains, the Ostiak is frequently driven into the woods, where he finds but little to appease his hunger. At length, however, the waters subside, the flat banks of the river appear above their surface, and the savage erects his summer hut close to its stream. This hovel has generally a quadrangular form, low walls, and a high-pointed roof, made of willow branches covered with large pieces of bark. These, having first been softened by boiling, are sewed together, so as to form large mats or carpets, easily rolled up and transported. The hearth, a mere hole inclosed by a few stones, is in the centre, and the smoke escapes through an aperture at the top. Close to the hut there is also, generally, a small store-house erected on high poles, as in Lapland; for the provisions must be secured against the attacks of the glutton, the wolf, or the owner's dogs.

At the beginning of winter the Ostiaks retire into the woods, where they find, at least, some protection against the Arctic blasts, and are busy hunting the sable or squirrel; but as fishing affords them at all times their chief food, they take care to establish their winter huts on some eminence above the reach of the spring inundations, near some small river, which, through holes made in the ice, affords their nets and anglers a precarious supply. Their winter yurt is somewhat more solidly constructed than their summer residence, as it is not removed every year. It is low and small, and its walls are plastered with clay. Light is admitted through a piece of ice inserted in the wall or on the roof.

Besides those who live solely upon fishes

and birds of passage, there are other Ostiaks who possess reindeer herds, and wander in summer to the border of the Polar Sea, where they also catch seals and fish. When winter approaches, they slowly return to the woods. Finally, in the more southerly districts, there are some Ostiaks who, having entirely adopted the Russian mode of life, cultivate the soil, keep cattle, or earn their livelihood as carriers.

In general, however, the Ostiak, like the Samoïedes, obstinately withstands all innovations, and remains true to the customs of his forefathers. He has been so often deceived by the Russians that he is loth to receive the gifts of civilization from their hands. He fears that if his children learn to read and write, they will no longer be satisfied to live like their parents, and that the school will deprive him of the support of his age. He is no less obstinately attached to the religion of his fathers, which in all essential points is identical with that of the Samoïedes. In some of the southern districts, along the Irtysch, at Surgut, he has indeed been baptized, and hangs up the image of a saint in his hut, as his Russian pope or priest has instructed him to do; but his Christianity extends no further. Along the tributaries of the Obi, and below Obdorsk, he is still plunged in Schamanism.

Like the Samoïedes, the Ostiaks, whose entire number amounts to about 25,000, are subdivided into tribes, reminding one of the Highland clans. Each tribe consists of a number of families, of a common descent, and sometimes comprising many hundred individuals, who, however distantly related, consider it a duty to assist each other in distress.

The Ostiaks are excellent archers, and, like all the other hunting tribes of Siberia, use variously constructed arrows for the different objects of their chase.

They are generally of a small stature, and most of them are dark-complexioned, with raven-black hair like the Samoïedes; some of them, however, have a fairer skin and light-colored hair. They are a good-natured, indolent, honest race; and though they are extremely dirty, yet their smoky huts are not more filthy than those of the Norwegian or Icelandic fishermen.

As among the Samoïedes, the women are in a very degraded condition, the father always giving his daughter in marriage to the highest bidder. The price is very different, and rises or falls according to the circumstances of the parent; for while the rich man asks fifty reindeer for his child, the poor fisherman is glad to part with his daughter for a few squirrel-skins and dried sturgeon.

CHAPTER CXLVIII.

INDIA.

THE SOWRAHS AND KHONDS.

LOCALITY OF THE SOWRAH TRIBE—GENERAL APPEARANCE—THE TARTAR CHARACTER OF THE FEATURES—DRESS OF THE MEN, THEIR SCANTY COSTUME AND PLENTIFUL ORNAMENTS—CURIOUS EAR-RINGS—DRESS OF THE WOMEN—MODE OF OBTAINING CLOTHES FOR WINTER USE—WEAPONS OF THE SOWRAHS—THEIR COURAGE, AND THE APPREHENSION WHICH THEY EXCITE—A SOWRAH WEDDING—RELIGIOUS SYSTEM OF THE SOWRAHS—THEIR TRUTHFULNESS—THE KHONDS—DRESS AND APPEARANCE—THE KHOND POCKET—FEATURES OF THE WOMEN—THE MERIAH SACRIFICE AND ITS OBJECT—PROCURING OF THE VICTIM—VARIOUS MODES OF PERFORMING THE SACRIFICE—SUBSTITUTE FOR THE MERIAH—STRANGE USE OF BRACELETS—THE MERIAH'S INDIFFERENCE TO THEIR FATE—INFANTICIDE—WEAPONS OF THE KHONDS—DEATH OF A BEAR—PRIDE OF THE KHONDS—SUPERSTITION—RELIEF IN THE POWER OF TRANSFORMATION—A KHOND MARRIAGE.

THE reader may remember that the Andaman Islands trench closely upon the shores of India, thus bringing closely together the two phases of utter savagery that never has advanced in the scale of humanity, and of a civilization which has advanced to the utmost limits of which it is capable. In the following pages I propose to give a brief account of various phases of Indian life, throwing most emphasis upon those which trench least upon civilization, as being most akin to the objects of this work.

From the figures which illustrate this country, and which are all taken from photographs, the reader will notice the very distinct type of man which is exhibited throughout India; and though in some of the tribes there is a facial resemblance to the Australian type, and in others to the Mongolian, it is impossible to mistake an entire figure in either instance. We will begin with those parts of India which are the least civilized, and in which the inhabitants retain most of their aboriginal manners and customs.

THERE is a remarkable hill tribe of India which deserves a short description, as the people seem to have preserved the original characteristics of their race better than any other inhabitants of the country. They are called Sowrahs, and live in a tract of

country about lat. 18° 30' N., and long. 72° 30' E.

The Sowrahs are a tolerably good-looking tribe, some of the girls being even handsome, were not their faces disfigured by the nose rings, of which one woman will often wear three. The men, as is the case with all the Indian tribes, are slenderly built, and appear to be devoid of muscles, especially in the legs. This apparent slightness, however, conceals great muscular power, as has often been shown in the skirmishes which their predatory habits constantly entail upon them. In one of these skirmishes, a Sowrah who had been taken prisoner suddenly snatched a bayonet out of the hands of his captor, and bent the blade double.

There is about the features of the Sowrahs a decidedly Tartar look, which increases with age, and is marked most strongly in the men. Some photographs of them now before me exhibit this characteristic very distinctly marked, and in one case so strongly that, but for color and the mode of dressing the hair, the face might easily be mistaken for those of a genuine Tartar. Indeed, Mr. Hooper, from whose paper this account is condensed, thinks that they may have a Tartar origin.

One remarkable point about the Sowrahs is, that they have no distinction of caste, though they are divided into two distinct

classes, the Hill Sowrahs and the Sowrahs of the Plain. The latter are comparatively civilized, and live in villages, and it is only of the former that this work will treat.

The dress of the Sowrahs is primitive enough. The men wear nothing but the "languti," *i. e.* a narrow strip of cloth passing round the waist, through the legs, and tucked into the waistband. They are, however, very fond of ornaments, though they care so little about dress, and have their necks loaded with beads, and their ears and nostrils filled with rings. A photograph of one of these men shows that he is wearing no less than twenty-seven bead necklaces, as well as a broad brass collar. Besides the ordinary ear-rings, he wears an ornament which seems rather popular among the Sowrahs. A hole is bored in the upper part of the ear, and through it is passed one end of a string almost four inches in length, to the other end of which is attached a glittering bead about as large as a walnut. Some of the Sowrahs also thread small beads upon the string.

The hair of the men is allowed to grow to a considerable length, and on festival days it is gathered into a knot at the back of the head, and adorned with feathers, mostly those of the peacock. This mode of dressing the hair gives a very effeminate look to the countenance, and on seeing a photograph of the face alone, especially if it be that of a young man, it is not very easy at a hasty glance to discover whether it is the portrait of a man or woman.

The dress of the women consists of a cloth wrapped round the waist. Those women who have been photographed wear long calico cloths wrapped round them from shoulder to knee after the ordinary Indian fashion; but it is evident that they have borrowed these cloths for the occasion, and so, after the custom of all uncivilized people, have contrived, through anxiety to look their best, to baffle the real object of the photographer, *i. e.* to represent them as they really appear. Like the men, they wear an abundance of necklaces, and also are fond of simple bracelets, consisting of broad metal bands wound spirally round the wrists. The hair is parted down the middle, but no particular care is expended upon it.

When the colder weather comes on, and the Sowrahs want more clothing, they do not make it, but have recourse to the simple plan of waylaying travellers, killing them, and taking their garments. In these robberies, as well as in the skirmishes to which they often tend, the Sowrahs chiefly use the bow and arrow. The bow is a comparatively weak one, only being a yard or so in length, and having a string made of the outer coating of the bamboo. The arrows are of reed, armed with a flat, many-barbed iron head. The Sowrahs always lie in wait for their victims, and direct their aim at the

stomach and legs, so that the wounds are always dangerous, and generally mortal.

They also carry a kind of battle-axe. They are a brave as well as a warlike people, and are the terror of the inhabitants of the plains. Even the Khonds, who will be presently described, ready as they are to fight among each other, and skilled as they are in the use of the bow and the battle-axe, stand in awe of the Sowrahs, and do not like to be drawn into a quarrel with them. They are especially afraid of these enemies, because the favorite mode of attack with the Sowrahs is to make a raid under cover of night, and, after securing all the plunder they can seize, and doing all the harm in their power, to return to their hill fastnesses as rapidly as they issued from them.

General Campbell thinks that their mode of life may have something to do with this superiority, and that their more abstemious and less dissipated life renders them stronger and more enduring than their self-indulgent neighbors. In some places, Sowrahs and Khonds dwell together in tolerable amity, but both of the tribes, although they may derive their origin from the same source, and both assert themselves to be the aboriginal inhabitants of the land, and to have a right to its possession, preserve their own characteristic differences so rigidly that there is no difficulty in distinguishing a Sowrah from a Khond.

THE ceremony of marriage among the Sowrahs, illustrated on the following page, is thus described by Mr. Hooper: "A young man, or his friends for him, having selected a bride, messengers are sent to her parents, and finally the young man goes, bearing a pot of toddy, or other present. If the consent of the parents is obtained, the ceremony is commenced by fixing three posts in the ground, between which the bride and bridegroom, with their respective friends, assemble, and a feast is commenced at which nearly every person gets drunk upon toddy.

"The bride and bridegroom sit together, while turmeric water is poured on their heads. Presents of cloth, beads, rings, etc., are exchanged, fowls, and if possible sheep, are sacrificed to propitiate the demons, and the flesh is then cooked, made up into balls with some sort of grain, and distributed among the party. On these occasions they all join in a dance, which seems to consist principally in hopping from one leg to the other, at each movement snapping their fingers and uttering an ejaculation, while at intervals the whole of the dancers come bumping together, and then separate.

"If the parents of the bride refuse to consent to the marriage, it frequently happens that the friends of the bridegroom watch their opportunity, and if the girl is found alone, they seize and carry her off. The relatives of the girl then pursue and attack

(1.) A SOWRAH MARRIAGE. (See page 1386.)

(2.) MERIAH SACRIFICE. (See page 1391.)

the opposite party, but, even though successful in retaking her, they are prohibited by their customs from giving her in marriage to any one else. Should such a thing be attempted, the parties would have to fight it out in a more serious manner with bows and arrows."

The reader will doubtless recognize the similarity of these marriage rites to those which are practised by savage tribes in many parts of the world.

In the account of the wedding, the propitiation of the demons is mentioned. This is the key to their religious system, such as it is, and explains the reason for the absence of caste. The Sowrahs of the Plains seem to have a rather better religious system, but that of the Hill Sowrahs is simply demonolatry. They seem to have but little notion of worship, the only ceremonies which have been observed taking place at harvest time. When the crops reach maturity, the owners set small stones upright in the earth as emblems of the presiding demons, and lay before them little heaps of each crop. After the offerings have remained there for some little time, they are consumed at a feast to which the proprietor of the crops invites his relatives and friends.

When a Sowrah dies, his body is burned, the ashes buried, and a small building erected over the spot. Five days after the burial a pot of toddy is laid on the grave, round which are placed a number of leaves representing the ancestors of the deceased. A little toddy is poured upon each leaf, and the remainder is drunk by the people who have assisted at the ceremony. A somewhat similar rite, but accompanied with feasting, is celebrated at the end of the first and fourth years after burial.

According to General Campbell, they do not destroy their female infants, as is done by too many of the Indian tribes, neither do they practise human sacrifice. Yet they will sometimes participate in the remarkable Meriah sacrifice, which will presently be described, and will travel some distance to do so. They do not, however, seem to attach very great importance to the rite, and when General Campbell remonstrated with them on the subject, they at once promised to abandon it, and not even to be present as spectators.

Perhaps the most characteristic trait of the Sowrahs is their absolute truthfulness, which, according to Mr. Hooper, is the result from their want of capacity to invent a lie.

THE KHONDS.

IN the now renowned district of Orissa live the remarkable tribes called Khonds, who, like the Sowrahs, appear to be immediately descended from the aboriginal inhabitants, and to have retained, though in a somewhat modified form, several of the customs of their savage forefathers, the chief of which will be briefly described.

The Khonds are active, wiry, and of much darker complexion than the inhabitants of the plains, and neither sex trouble themselves much about clothing. The men wear a few yards of coarse cotton round their waists, a separate piece dyed red hanging down behind like a tail. Their hair is allowed to grow to its full length, and is twisted round and round the head, and fastened in a knot in front, in which the Khond always keeps a few cigars made of tobacco rolled in a green leaf. He generally decorates this top-knot with a piece of red cloth and feathers.

The women wear a rather large cloth round their loins, and decorate themselves with vast quantities of beads and other ornaments, among which the most conspicuous are some heavy bracelets, which are little more than thick brass bands twined round their wrists. Among some of the tribes, these ornaments are put to a very tragical use, as we shall presently see. Slips of red cloth are considered very fashionable ornaments by the Khond women, and in some cases strings of copper coins are worn by way of necklaces.

These, however, are mostly reserved for the children. There is some excuse for the anxiety of the Khond women to make the best of themselves, as they are very inferior to the men in appearance, being short, stumpy, and so plain in features, that they are pronounced by General Campbell to be absolutely repulsive. Some photographs, however, which are now before me, do not give this impression. Perhaps these women were selected for their good looks.

They are divided into many tribes, and as a rule live in villages varying in population from forty to ten times the number. We will now proceed to the manners and customs of the Khond tribes.

THROUGHOUT the whole of Khondistan there is a system of human sacrifice, varying exceedingly in detail according to the locality, but agreeing in all principal points. There is one point especially which seems to be the very essence of the sacrifice, and which is common to all the tribes. The victim, or Meriah, must be bought with a price. Should a captive be taken in war, he may not be offered as a Meriah by his captor, but he may be sold for that purpose, and will then be accepted by the priests.

There is no restriction of age, sex, or caste, but adults are thought more acceptable because they are more costly, and the healthy more likely to propitiate the gods than the

sick or feeble. That the Meriah should be sacrificed is thought an absolutely necessary condition for the prosperity of every undertaking, but especially for the growth of the crops, and the Khonds therefore use every endeavor to secure a succession of victims. Sometimes they purchase children from their parents or relations when they have fallen into poverty, but, as a rule, they are stolen by a set of robber tribes called Pannoos, who decoy them into the hills, seize them, and sell them to the Khonds. It is rather remarkable that although the Khonds avail themselves of the services of the Pannoos, and are very glad to purchase victims, they bear an intense hatred and contempt toward them, and, except in the way of business, will have no dealings with them.

The Meriah victims have no reason to complain of their lot, with the one exception that it must soon come to an end. They are well fed and kindly treated, and, with the ruling fatalism of the Oriental character, generally resign themselves to their fate, and make no efforts to escape. Often a Meriah girl is married to a Khond man, and allowed to live until she has borne children. These, as well as herself, are liable to be sacrificed, but must never be offered in the village wherein they were born. In order to avoid this difficulty, the various towns agree to exchange their Meriah children.

The mode of sacrificing the Meriah is so exceedingly variable that it will be necessary to give a short abstract of the various modes.

In the first place, the Meriah must always be sacrificed openly in the sight of the people, and this rule is absolute throughout all the land.

In Goomsur, the sacrifice is offered to the Earth-god, Tado Pennor, who is represented by the emblem of a peacock. When the time is fixed, the victim is selected, and for a month there is much rejoicing, feasting, and dancing round the Meriah, who is abundantly supplied with food and drink, and is in all appearance as merry and unconcerned as any of the people. On the day previous to the sacrifice a stout pole is set up, having on its top the peacock emblem of Tado Pennor, and to it is bound the Meriah. The people then dance round him, saying, in their chants, that they do not murder the victim, but sacrifice one who was bought with a price, and that therefore no sin rests with them. As the Meriah is previously intoxicated with toddy, he can give no answer, and his silence is taken as consent to his sacrifice.

Next day he is anointed with oil, and carried round the village, after which he is brought to the peacock post, at the foot of which is a small pit. A hog is then killed, and the blood poured into the pit and mixed with the soil, so as to form a thick mud. The Meriah, who has been previously made senseless from intoxication, is thrown into the pit, with his face pressed into the mire until

he is dead. The officiating priest or zani then cuts off a small piece of the flesh of the victim and buries it near the pit, as an offering to the earth, and, as soon as he has done so, all the spectators rush upon the body, hack it to pieces, and carry off the fragments to bury them in their fields as a propitiation to the earth deities who produce the crops. Revolting as this custom is, it is much more merciful than most modes of Meriah sacrifice, inasmuch as suffocation is not a death involving much physical pain, and the victim has been previously deprived of his senses.

In Boad, the Meriah is taken round the village, when every one tries to procure one of his hairs, or to touch his lips with their fingers so that they may anoint their heads with the sacred moisture. After being drugged into insensibility, he is taken to the fatal spot, where he is strangled by placing his neck between the two halves of a split bamboo, the ends of which are then brought together by the priests. The head priest next breaks the bones of the arms and legs with his axe, and when he has done so, the body is cut to pieces as in Goomsur.

In Chinna Kimeday a grotesquely cruel mode of sacrifice is employed. In lieu of the peacock which is used at Goomsur, a large wooden figure of an elephant is placed on the post, and revolves on a pivot. The Meriah is tied to the extended proboscis of the elephant, and, amid the yells of the spectators, is whirled round as fast as the figure can be turned. In this case the Meriah is not drugged. At a signal from the officiating zani, the crowd rush on the Meriah with their knives, and in a few moments hack him to pieces as he is tied, still living, on the elephant.

General Campbell, while executing his mission of mercy in Khondistau, saw as many as fourteen of their elephant images, all of which he caused to be pulled down and destroyed by the baggage elephants attached to his force, so that the Khonds might see that those venerated emblems of a cruel worship were powerless even against the animals which they simulated. His task was naturally a difficult one, as it involved the abolition of a rite which had existed from time immemorial, and which no amount of reasoning could persuade them to be wrong, much less criminal. So deeply was it ingrained in their nature, that their only idea of his object in setting free so many hundred Meriahs was, that he might sacrifice them on his own account, in order to bring back water into a large tank which he was thought to have constructed for the use of his elephants.

In this very place, a most singular circumstance occurred. The English officer was told that a sacrifice was being actually performed, the victim being a young and handsome girl, only fifteen or sixteen years old. He instantly started off with an armed party,

and found the offering of the Meriah already complete, and nothing wanting but the actual sacrifice. The aged priest was ready to give the signal, and the surrounding people were mad with excitement, when the armed party came to the rescue, and demanded the girl. The Khonds, furious as they were, found that they dared not risk a collision, and so the party retired with the rescued victim.

The remainder of the story has yet to be told. Scarcely were the English soldiers out of sight than the assembled Khonds broke out into loud murmurings at their disappointment. At last one of them hit upon a happy thought. "Why," said he, "should we be debarred from our sacrifice? See our aged priest. Seventy summers have passed over his head—what further use is he? Let us sacrifice *him*." And forthwith the old man was tied on the elephant, spun round, and cut to pieces.

In Maji Desc another mode of sacrifice is employed. They do not keep a large supply of Meriahs, as do most of the tribes, but buy them immediately before the sacrifice. The consequence is, that it is very difficult to detect them, except in the very act of offering the victim. Their mode of killing the Meriah is as follows. The Khonds surround the victim, and beat him on the head with the heavy metal bracelets, which they are in the habit of wearing. Mostly they kill him in this way, but if they fail in doing so, they strangle him with a split bamboo, as has already been described. The flesh of the back is then cut into long and narrow strips, and each person carries off a strip and suspends it on a pole, which he thrusts into the bed of the stream which waters his fields.

In Patna, the mode of sacrifice varies exceedingly. In some cases the victim is stoned, in others beaten to death with bamboos, together with other barbarous modes of putting to death. General Campbell remarks, that in this district there are places where sacrificing and non-sacrificing tribes inhabit the same village. They live harmoniously together until the time of sacrifice, when the non-sacrificing tribes retire to their houses, and never pass through the front door of their dwellings until seven days are over, and the remains of the Meriah buried. After that time, all goes on as usual, until the next sacrifice takes place.

Bundari appears to be the place where the people adhere most firmly to the Meriah system. When General Campbell visited this district, they refused to give up the Meriah, and on the near approach of his force, fled to their hiding-places in the mountains. As he approached Bundari, he found that the people had been actually offering a sacrifice, and that they had gone off in such haste that they had left behind them the sacrificial post with the head of a victim hanging to it by the hair, and the fatal knife

suspended beside it. The mode of sacrifice employed in this district is thus described:—

"The sacrifice which had taken place, and which is called Junnah, is performed as follows, and is always succeeded by the sacrifice of three other human victims, two to the sun to the east and west, and one in the centre, with the usual barbarities. A stout wooden post is firmly fixed in the ground. At the foot of it a narrow grave is dug, and to the top of the post the victim is firmly fastened by the long hair of his head. Four assistants hold his outstretched arms and legs, the body being suspended horizontally over the grave, with the face toward the earth. The officiating zani, or priest, standing on the right side, repeats the following invocation, at intervals hacking with his sacrificing knife the back part of the shrieking victim's neck:—

"O mighty Manicksoro, this is your festival day (to the Khonds the sacrifice is Meriah, to the Rajahs, Junnah). On account of this sacrifice you have given to Rajahs countries, guns, and swords. The sacrifice we now offer, you must eat; and we pray that our battle-axes may be turned into swords, and our bows and arrows into gunpowder and balls, and if we have any quarrels with other tribes, give us the victory, and preserve us from the tyranny of Rajahs, and other officers."

"Then, addressing the victim, he added, 'that we may enjoy prosperity, we offer you a sacrifice to our god Manicksoro, who will immediately eat you, so be not grieved at our slaying you. Your parents were aware when we purchased you from them for sixty gunties (artieles) that we did it with intent to sacrifice you; there is, therefore, no sin on our heads, but on those of your parents. After you are dead, we shall perform your obsequies.'

This speech being concluded, the head of the victim is severed from the body, and allowed to hang from the post until it is eaten by wild beasts. The knife is also suspended from the post, and allowed to remain there until the three additional sacrifices have been offered, when it is removed with many ceremonies. Eight of these posts were found in the village, and were all destroyed.

It is this mode of sacrifice which is shown in the illustration on page 1387. In the centre is seen the aged priest in the act of sacrificing the Meriah, which in this case is a young girl. Her head is supported by her long hair, which is tied to the top of the post, and her body is held horizontally by the four assistants, who each grasp a hand or a foot. On the right hand is shown a post, to which hangs the head of the first sacrificed Meriah, and on the other side is another victim bound by the hair to the post, waiting until the priest had completed the sacrifice in which he is engaged.

One circumstance connected with the Meriah sacrifice is rather remarkable, namely, the indifference to their fate that seems to possess the victims. One young man, a Meriah, said that it was better to be sacrificed among his own people, and to give them pleasure, than to live upon the plains. The natives believe that this indifference is caused by the Meriah food, a mixture of rice, turmeric, and other ingredients, prepared with certain magical ceremonies. Even the Meriahs themselves have this belief. For example, three young women were hired by a seller of salt fish to carry his goods among the Khonds, and when he got them there, the treacherous dealer sold not only the fish but the women. Twice the victims attempted to escape, but were recaptured, and after the second attempt, the Khonds fed them on Meriah food, when they became reconciled to their fate, and made no further efforts to escape.

Other ties seem to have their effect on the Meriahs. Sometimes a man wishes to buy a Meriah, that being a very meritorious act; but the cost is so great, amounting on an average to sixty-five rupees, that the Khond is almost reduced to poverty. Under such circumstances, he is unable to marry, inasmuch as he cannot pay the heavy price which is demanded of a bridegroom. Accordingly, he buys a Meriah girl, and takes her as his wife until the time when she may be required for sacrifice.

It has already been mentioned that children are sold by their parents as Meriahs. This seems so cruel and heartless a system, that some explanation ought to be offered. It is very seldom that such a purchase is made, unless the parents be very poor, and fear that they shall not be able to provide their children with food. In such cases they argue that it is better for the child to be nourished and kindly treated, and then to die as a sacrifice to the deities, than to perish by degrees of starvation. Moreover, it is considered rather a meritorious action for a parent to devote a child to the gods, and, when it is done, the parents are very proud of such children, and regard them with respect and admiration as belonging to the deities.

Another reason for the continuance of the Meriah sacrifice is the slight regard in which the Khonds hold human life, sacrificing that which we consider as priceless because they are indifferent to it, not only with regard to others, but with regard to themselves.

That the custom of propitiating the deities of agriculture with living sacrifices should be entirely abolished could not be expected, and General Campbell found that the best mode of extinguishing human sacrifice was to induce the Khonds to substitute that of a beast. This was done in many cases, the sacrificers apologizing to the god for the substitution, and begging him, if he should be

angry, to vent his wrath, not upon them, but upon the foreigner who had suggested the alteration. He had no objection to this arrangement, and as the crops turned out well afterward, it was to be supposed that all parties, the gods included, were satisfied.

A very similar custom was once prevalent among certain tribes of the Lower Amazon. The name of these tribes was Tapuyos, but this title has now been given to all the inhabitants of the Lower Amazon district. Prisoners taken in war by them were reserved for sacrifice. They were treated with extreme kindness, fed in the most liberal manner, so that they might be plump and fat, and were provided with wives. They were generally allowed to live for several years, until their wives had borne children. They were then taken to the place of sacrifice, and killed with a single blow of a club; their children being carefully reared, for the purpose of undergoing a similar fate after they had grown up.

Even without reference to the Meriah system, the Khonds are in the habit of killing their female children. This custom has arisen partly from the fear of poverty, and partly from the system on which marriages are conducted. The Khonds dislike marrying among themselves, and seek their wives among distant tribes, alleging as a reason that they can purchase them at a cheaper rate. But General Campbell tried to show them that if they were to rear their own female children, they would find them much cheaper as wives, and recommended them, as a beginning, to marry their Meriah women, for whom a high price had already been paid.

In some of the hills of Chinna Kimedya, children of both sexes are put to death. As soon as a child is born, a priest is called to ascertain whether it is to live or die. To effect this purpose, he employs a plan very like the "Sortes Virgilianæ." He produces a book, and, after some prayers, thrusts an iron style at random among the leaves. He then reads the passage to which the style points, and if it be unfavorable, the child must die, or the fields would bear no more crops.

The fatal edict having been pronounced, the child is placed in a new earthen vessel (which has been painted in red and black stripes), the cover is fastened down, and the jar is buried. Some flowers and rice are laid on the cover, and, after the earth is filled in, a fowl is sacrificed upon the poor little victim's grave.

BEFORE leaving these remarkable tribes, we will glance slightly at one or two of their most characteristic customs.

Their weapons are very simple, consisting of a curious sword fixed to a gauntlet, the bow and arrow, and the axe. The last is the national weapon of the Khonds, and in its

use they are wonderfully adroit. General Campbell mentions that a British officer was out in the evening for the purpose of shooting a bear, but only wounded the animal slightly, instead of killing it outright. The bear started for the hills, but was pursued by several Khonds, who overtook it, got between the hill and the bear, and then, armed only with their axes, attacked and hacked the animal to pieces. These axes are about four feet long in the handle, and have but small heads. These, however, are made of good steel, and in the practised hand of a Khond the axe is a weapon much more formidable than it looks. This exhibition of courage is the more remarkable, because the actors in it were Meriah men who had been rescued from sacrifice. The sword that has been mentioned is a comparatively rare weapon, and belongs rather to the Ooryahs than to the Khonds proper.

The Khond tribes seem to be rather fond of quarrelling among each other, and carry on a kind of desultory or guerilla warfare. Pitched battles they dislike, preferring to steal cattle from their opponents, and to kill them by stealth, to meeting them in open fight. Indeed, they pride themselves on doing as much injury as possible to their antagonists, while receiving the least possible harm themselves. Accordingly, when the delegates of two inimical tribes meet for the purpose of restoring peace, some very absurd scenes take place. The umpires call upon the representatives of the tribes to declare the number of cattle stolen and men killed; and it is generally found that the latter item is equally balanced, neither party caring to acknowledge that a man of their own tribe has been killed, unless the adversaries can prove it. They cannot but admit that the man was killed, but attribute his death to accident, such as being carried off by a tiger, or bitten by a snake.

Pride forms a great element in the Khond character. The people are fond of their land, and nothing can induce a Khond to sell one yard of ground to a foreigner, nor even to part with a single tree that grows on that soil. Generally, they are too proud to barter, but leave that business to the Pannoo tribes, by whom, as may be remembered, the Meriah victims are generally furnished. Among the Khonds there are but two employments worthy of their dignity, *i. e.* warfare and agriculture, and all persons are despised who carry on any other profession or business, even though they may profit by it themselves. Yet there is no system of caste among them, such as we find among the Hindoos, neither have they any prejudice in regard of diet, except perhaps a dislike to milk.

As to the religion of the Khonds, it is of the simplest description, and their worship is practically comprised in the Meriah sacrifice. There are certain very barbarous sa-

cred images to be found in the hill districts, but no one seems to care or even to know much about them, and the priests, or medicine men, are as ignorant or careless on the subject as the people in general. It ought to be mentioned that very elaborate accounts have been published respecting the religion of the Khonds, their vast army of deities, and their quadruple souls. But there is now no doubt that the information upon which these accounts were based was simply invented by the narrators in order to suit their own purposes.

Putting aside the Meriah system, the Khonds have several superstitions in which they firmly believe, and the strangest of them is their idea that certain human beings can transform themselves into tigers. These persons are called "Pulta Bags," and are very much dreaded by the people, upon whose fears they intentionally play for the purpose of extortion. Knowing that the ignorant people believe them to be possessed of such a power, they extort food, clothing, and other property from them at intervals, saying that they are poor, and unless supplied with the necessaries of life, they will be forced to transform themselves into tigers, and to carry off the cattle.

General Campbell mentions an instance where he was brought in contact with, or rather in opposition to, this superstition. An excited crowd came to him, accompanied by several armed men, who guarded two women. One of the men then said that he and his son were in the jungle cutting firewood, when a tiger sprang upon the lad and carried him off. The father pursued the animal, shouting after it until it turned the corner of the rock, when it disappeared, and on the top of the rock were then seen the two women. The case was clear. These two women were Pulta Bags. While in the tiger form they had carried off his son, but, alarmed by his shouts, had hidden the body of the lad and resumed their human shapes.

On being questioned, the women acknowledged that the story was true, and that they did possess the power attributed to them. General Campbell then offered to release them, provided that they would transform themselves into tigers in his presence. This, to his astonishment, they agreed to do, provided that he accompanied them to a neighboring jungle. Finding, however, that the English general was not so easily frightened as a Khond warrior, and that they would be taken at their word, they threw themselves at his feet, and acknowledged their imposture.

A remarkable instance of this belief is narrated by the same writer. A brave little Khond, belonging to the irregular force, was engaged in a conflict when several of the enemy were killed, among whom was one who was shot by his own hand. Instead of being proud of his exploit, he was seized

with terror, declaring that the man whom he had killed was a Pulta Bag, and that he would assume the shape of a tiger and avenge himself. After the campaign was over, he obtained leave to visit his family, and, previous to his departure, he brought his uniform, asking that care might be taken of it, as he felt sure that he should never wear it again. He joined his family, and lived with them for some weeks, when, as he was watching his cattle, a tiger sprang on him, and wounded him so cruelly that he shortly died. Nothing could persuade him that the tiger was not the man whom he had shot, and the event only strengthened the hold which the superstition has on the native mind.

Marriage is generally celebrated at the

hunting season, probably because the stores of food and drink are secured for that time, and there is always plenty of food for the marriage feast. Among them prevails the custom of carrying off the bride. The bridegroom snatches up the girl and runs off with her, pursued by a number of young women who try to snatch her from him, or at least pretend to do so. He, however, is protected by twenty or thirty young men, who keep him and his burden in their midst, and do their best to shield him from the bamboos, stones, and other missiles which are hurled at him by the women. When he reaches the boundaries of his own village, he is supposed to have won his bride, while the assailing party scamper at full speed to their own dwellings.

BOWS AND QUIVER. (From my Collection.)

(See page 1401.)

CHAPTER CXLIX.

INDIA — *Continued.*

WEAPONS.

THE GHOORKA TRIBE AND THEIR FAVORITE WEAPON — BLADE AND CURVED HANDLE OF THE "KOOKERY" — MODE OF STRIKING WITH IT — THE ADDITIONAL KNIVES — MAKING "WOOTZ" STEEL — FIGHTING A TIGER — THE HUNTER'S NECKLACE — ROBBERS OF INDIA — THE BURGLAR, THE BURROWER — THE PURSE CUTTER — AN INGENIOUS THEFT — STRANGE MODE OF ESCAPING OBSERVATION — VARIOUS BOWS — THE PELLET BOW AND ITS DOUBLE STRING — THE REVERSED BOW AND MODE OF USING IT — STRINGING THE BOW — THE VARIOUS ARROWS — ARMOR AND CHAIN MAIL — SIR HOPE GRANT'S SPECIMEN — INDIAN SWORDS AND MODE OF USING THEM — VARIOUS DAGGERS — THE "CHAKRA" OR QUOTT WEAPON.

ONE of the hill tribes, called the Ghoorka tribe, is worthy of notice, if only for the remarkable weapon which they use in preference to any other. It is called the "kookery," and is of a very peculiar shape. One of the knives, drawn from a specimen in my collection, is given in illustration No. 2, on page 1403. As may be seen by reference to the drawing, both the blade and hilt are curved. The blade is very thick at the back, my own specimen, which is rather a small one, measuring a little more than a quarter of an inch in thickness. From the back it is thinned off gradually to the edge, which has a curve of its own, quite different to that of the back, so that the blade is widest as well as thickest in the middle, and tapers at one end toward the hilt, and at the other toward the point. The steel of which the blade is formed is of admirable temper, as is shown by the fact that my specimen, which, to my knowledge, has not been cleaned for thirty years, but has been hung upon the wall among other weapons, is scarcely touched with rust, and for the greater part of its surface is burnished like a mirror. Indeed, on turning it about, I can see reflected upon its polished surface the various objects of the room. The handle is made after a very remarkable fashion, and the portion which forms the hilt is so small that it shows the size of the hand for which it was intended. This smallness of hilt is common to all Indian swords, which cannot be grasped by an

ordinary English soldier. My own hand is a small one, but it is too large even for the heavy sabre or "tulwar," while the handle of the kookery looks as if the weapon were intended for a boy of six or seven years old. Indeed, the Ghoorkas are so small, that their hands, like those of all Indian races, are very delicate, about the same size as those of an English boy of seven. The point of the kookery is as sharp as a needle, so that the weapon answers equally well for cutting or stabbing. In consequence of the great thickness of the metal, the blade is exceedingly heavy, and it is a matter of much wonder how such tiny hands as those of the Ghoorkas can manage so weighty a weapon, which seems almost as much beyond their strength as does the Andamaner's gigantic bow to the dwarfish man who wields it. It may be imagined that a blow from such a weapon as this must be a very terrible one. The very weight of the blade would drive it half through a man's arm, if it were only allowed to fall from a little height. But the Ghoorkas have a mode of striking which resembles the "drawing" cut of the broadsword, and which urges the sharp edge through flesh and bone alike.

Before passing to the mode in which the kookery is used, I may mention that it is not employed for domestic purposes, being too highly valued by the owner. For such purposes two smaller knives are used, of very similar form, but apparently of inferior metal.

These are kept in little cases attached to the side of the kookery-sheath, just as is the case with the knives attached to a Highlander's dirk, or the arrangement of the Dyak sword, which has already been described in the article upon Borneo. There is also a little flat leathern purse, with a double flap. This is pointed like a knife-sheath, and is kept in a pocket of its own fastened upon the larger sheath.

In the illustration the kookery is shown with all its parts. Fig. 1 shows the kookery in its scabbard, the top of the purse and the handles of the supplementary knives being just visible as they project from the sheaths. At Fig. 2 the kookery itself is drawn, so as to show the peculiar curve of the blade and the very small handle. Fig. 3 represents the purse as it appears when closed, and Figs. 4 and 5 are the supplementary knives. My own specimen, which, as I have already mentioned, is a small one, measures fifteen inches from hilt to point in a straight line, and twenty-one inches if measured along the curve of the back. Its weight is exactly twelve ounces. The knife is a very plain one, no ornament of any kind being used, and the maker has evidently contented himself with expending all his care upon the blade, which is forged from the celebrated "wootz" steel.

This steel is made by the natives in a very simple but effectual manner. After smelting the iron out of magnetic ore, the Indian smith puts small pieces of it in a crucible, and mixes little bits of wood with them. He then covers the crucible with green leaves and plenty of clay, and puts it in his simple furnace. The furnace being lighted, a constant blast of air is driven through it for about three hours, at the expiration of which time the iron, now converted into cast-steel, is found in the form of a small cake at the bottom of the crucible. Wootz steel was at one time much used in England, and great numbers of these cakes were imported.

In the hands of an experienced wielder this knife is about as formidable a weapon as can be conceived. Like all really good weapons, its efficiency depends much more upon the skill than the strength of the wielder, and thus it happens that the little Ghoorka, a mere boy in point of stature, will cut to pieces a gigantic adversary who does not understand his mode of onset. The Ghoorka generally strikes upward with the kookery, possibly in order to avoid wounding himself should his blow fail, and possibly because an upward cut is just the one that can be least guarded against.

Years ago, when we were engaged in the many Indian wars which led at last to our Oriental empire, the Ghoorkas proved themselves most formidable enemies, as since they have proved themselves most invaluable allies. Brave as lions, active as mon-

keys, and fierce as tigers, the lithe, wiry little men came leaping over the ground to the attack, moving so quickly, and keeping so far apart from each other, that musketry was no use against them. When they came near the soldiers, they suddenly crouched to the ground, dived under the bayonets, struck upward at the men with their kookeries, ripping them open with a single blow, and then, after having done all the mischief in their power, darting off as rapidly as they had come. Until our men learned this mode of attack, they were greatly discomfited by their little opponents, who got under their weapons, cutting or slashing with knives as sharp as razors, and often escaping unhurt from the midst of bayonets. They would also dash under the bellies of the officers' horses, rip them open with one blow of the kookery, and aim another at the leg of the officer as he and his horse fell together.

Perhaps no better proof can be given of the power of the weapon, and the dexterity of the user, than the fact that a Ghoorka will not hesitate to meet a tiger, himself being armed with nothing but his kookery. He stands in front of the animal (see the next page), and as it springs he leaps to the left, delivering as he does so a blow toward the tiger. As the reader is aware, all animals of the cat tribe attack by means of the paw; and so the tiger, in passing the Ghoorka, mechanically strikes at him.

The man is well out of reach of the tiger's paw, but it just comes within the sweep of the kookery, and, what with the force of the tiger's stroke, what with the blow delivered by the man, the paw is always disabled, and often fairly severed from the limb. Furious with pain and rage, the tiger leaps round, and makes another spring at his little enemy. But the Ghoorka is as active as the tiger, and has sprung round as soon as he delivered his blow, so as to be on the side of the disabled paw. Again the tiger attacks, but this time his blow is useless, and the Ghoorka steps in and delivers at the neck or throat of the tiger a stroke which generally proves fatal.

The favorite blow is one upon the back of the neck, because it severs the spine, and the tiger rolls on the ground a lifeless mass. For so fierce is the tiger's fury, that, unless the animal is rendered absolutely powerless, rage supplies for a few moments the place of the ebbing life, and enables it to make a last expiring effort. All experienced hunters know and dread the expiring charge of a wounded lion or tiger, and, if possible, hide themselves as soon as they inflict the death wound. If they can do so, the animal looks round for its adversary, cannot see him, and at once succumbs; whereas, if it can espy its enemy, it flings all its strength into one effort, the result of which is frequently that the man and the tiger are found lying dead together.

(1.) INGENIOUS RUSE OF BHEEL ROBBERS.

(See page 1400.)

(2.) A GHOORKA ATTACKED BY A TIGER.

(See page 1396.)

Many of these little hunters are decorated with necklaces made from the teeth and claws of the animals which they kill. One of these necklaces is in my collection, and is figured in illustration No. 1, on page 1403. It is made of the spoils of various animals, arranged in the following way. The central and most prominent object is one of the upper canine teeth of a tiger. The man may well be proud of this, for it is a very fine specimen, measuring five inches and a half in length, and more than three inches in circumference. This tooth is shown at Fig. 5. At Fig. 1 is a claw from a fore-foot of a tiger, evidently the same animal; and at Fig. 9 is a claw of the hind-foot. Figs. 2, 3, 7, 8 are differently sized teeth of the crocodile; and Figs. 4 and 6 represent claws from the foot of the sloth-bear. The reader may remember that in all uncivilized countries such spoils are of the highest value, and play the same part with regard to them, that titles and decorations do among more civilized nations. Consequently, it is almost impossible to procure such ornaments, the natives having as strong objection to part with them as a holder of the Victoria Cross would have to resign at the same time his badge and a right to wear it.

AMONG men of such a stamp, leading a half-savage existence, with ideas necessarily limited to their own range of thought, it is likely that a strange sort of morality should prevail. We have already seen that there is one existing system in which treacherous murder, instead of being regarded as a capital offence, is exalted into a religion, and we may therefore expect that robbery may in some cases be considered as a virtue. Certain it is that there are no more accomplished thieves in the world than those of India.

The natives are justly celebrated for their wonderful powers of posture making and conjuring, and it is to be expected that, when they turn those powers to an evil use, they must be most dangerous opponents. Lately a most valuable report has been issued by the Inspector-General of Prisons, relating to the thieves of Lower Bombay, in the perusal of which it is impossible to restrain a smile, so wonderfully ingenious are the devices of the thieves, and so astonishing is the skill with which they are employed.

For example, there are the regular burglars, who completely carry out the description of the Scriptures, "breaking through the wall and stealing." Two of these burglars work together. One acts as sentinel, while the other gently bores a hole through the wall, large enough to admit the passage of his person. When he has completed the breach, he pushes through it a stick, with a piece of grass wrapped round it, so as to look like a human head. This is done to ascertain whether the inmates are alarmed, for it sometimes happens that the owner of

the house hears the miner at work, and quietly stands by the side of the hole, armed with a sword or cudgel, with which he strikes at the head of the robber, as soon as it appears through the wall. Should the sham head be smashed by a blow from the inside, the thieves escape as fast as they can. If not, one of them crawls through the breach, steals all the property on which he can lay his hands, and returns to his comrade, who has been keeping careful watch, and will alarm him, should danger appear.

Other thieves appear to be more harmless, though they probably steal as much money as the burglars. They carry in their mouths a tiny knife, with a blade as sharp as that of a razor. They frequent the bazaars, mix with the crowd, and contrive to feel for the money which is wrapped up in the girdle. With their little knives, they gently cut the cloth, noiselessly extract the money, and slink off into the midst of the crowd, where they can scarcely be detected. In short, they act precisely after the manner of our European cut-purses.

The most ingenious of all the thieves are those who get into the zenanas, or women's apartments, and steal their jewelry. As the reader is probably aware, the women's apartments are in the most central portion of the house, and are so carefully guarded that little precaution is taken with respect to the costly jewels with which the women deck themselves so abundantly. The Indian burglar knows of this wealth, and sometimes manages to steal it. He digs a hole in the ground outside the walls of the house, and burrows under the foundation until he comes beneath the floor of the zenana. He then cautiously works his way upward, and so obtains admission into the apartment. But even when there his task is not completed, as a large portion of the jewelry consists of nose rings and bangles, or bracelets. The skill of these thieves is now shown, for they will contrive to cut the rings and bangles, remove them from the wearers, and make good their escape without disturbing the sleeping women.

These adroit burglars often commit the most daring robberies in the very midst of an army. Knowing the position of the tents, they mark out that which is the residence of a great man, and creep silently toward it. Arrived at the tent, their sharp knife cuts a hole and they glide into the interior without making the slightest noise. Indeed, so wonderfully adroit are they, that even the very watch-dogs do not discover them, and a thief has been known actually to step over the body of a dog without disturbing the animal. They take an extraordinary pride in their skill, and have not the least objection to boasting of it. Once, an English officer, who had been robbed of all his valuables, his clothing included, in the course of a night, was talking to a robber,

who made very light of the exploit, and boasted that if he chose he could steal the blanket from under him as he slept. Such a challenge as this could not but be accepted, and the officer laid a wager with the man that his blanket could not be stolen without arousing him.

Accordingly, one morning, when the officer awoke, he found his blanket missing. The thief came openly with the blanket, restored it, and told him how he had achieved the theft. It was done by gently tickling the face and hands of the sleeping man, so that he involuntarily turned on his bed. As he moved, the thief gave the blanket a slight pull, and so by degrees "coaxed" it away without fairly awaking the sleeper.

When these thieves set about their task of robbery, they remove all their clothes, and rub themselves with oil. Round their neck is a slight string, which holds their razor-bladed knife, so that, if they should be detected, the pursuer has no hold of them; and even should he succeed in grasping them, the ready knife is used to sever his wrist and to deal a fatal stab.

Then there are other thieves of altogether a sneaking and despicable character. The burglars have, at all events, the redeeming points of audacity and ingenuity. The Mooches exhibit neither of these qualities, but act in a way that exactly resembles the proceedings of the gipsy thieves as described by Mr. Borrow. They lay poison on plantain leaves, and drop them about at night among the cattle. The bait is sure to be taken, and the dead cattle are thrown away next morning. This is exactly what the Mooches have expected, and they flay the dead cattle and sell their skins.

Sometimes a band of these thieves is pursued, and then the robbers are often driven to use all their ingenuity in evading their pursuers. One stratagem is marvellously clever. Should a company of these men succeed in reaching the jungle, there is no hope of capturing them; but when they find that they must be overtaken on a level plain, they are not without a mode of avoiding detection. As is the case in many hot countries, the ground is often cleared by fire, which destroys all the coarse, dry, rank herbage, and leaves it free for the fresh green blades that at the first rains shoot through the surface. In those spots where the grass is short, the fire does but little damage; but where it is long, the flames are powerful enough to destroy the small trees which grow upon them, and to leave nothing but a lumber of blackened stumps.

If the thieves think that they cannot pass the plain without being observed, they put in practice a *ruse* which they may have borrowed from the habits of many insects. They strip off all their clothes, place them and their weapons under their little round shields, which they disperse so as to look

like stones, and then dispose themselves in such strange attitudes that their slender and nearly fleshless limbs bear the most exact resemblance to the blackened branches or which their bodies represent the trunks. In these attitudes they will remain fixed until the enemy has passed them, when they slip off as fast as they can to the nearest jungle. An illustration on page 1397 shows with what rare ingenuity, even artistic verisimilitude these rascals simulate the charred trunks and branches of the trees.

Before the English had become used to these manœuvres, a very ludicrous incident occurred. An officer, with a party of horse, was chasing a small body of Bheel robbers, and was fast overtaking them. Suddenly the robbers ran behind a rock or some such obstacle, which hid them for a moment, and, when the soldiers came up, the men had mysteriously disappeared. After an un-availing search, the officer ordered his men to dismount beside a clump of scorched and withered trees, and, the day being very hot, he took off his helmet and hung it on a branch by which he was standing. The branch in question turned out to be the leg of a Bheel, who burst into a scream of laughter, and flung the astonished officer to the ground. The clump of scorched trees suddenly became metamorphosed into men, and the whole party dispersed in different directions before the soldiers could recover from their surprise, carrying with them the officer's helmet by way of a trophy.

This stratagem is not confined to one tribe, or even one race, but is practised in many parts of the world where the country is cleared by means of fire.

WE will now examine some of the weapons used by the Indians. I intentionally omit any description of their fire-arms, as such weapons are of a modern date, and the use of gunpowder has been imported from other countries. In the following pages will be described some of the most characteristic weapons of India.

The reader will probably notice that whatever may be their form, there is a nameless something which designates the country in which they were produced. No matter whether the weapon has belonged to a rich or a poor man, whether it be plain wood and iron, or studded with jewels and inlaid with gold, the form remains the same, and there is about that form a graceful elegance which is peculiar to India. Take, for example, that simplest of weapons, the kookery, and see how beautiful are the curves of the blade and handle, and how completely they satisfy the eye. In the same manner we shall find that, with all the weapons that will be figured, there is always a graceful curve or a well-balanced arrangement of lines.

We will begin with the bow and arrows.

Many kinds of bows are used by the Hindoos, the most simple of which is made from a piece of male bamboo. Even this simple weapon is not complete in the eyes of an Indian without some ornament, and accordingly it is bound at intervals by belts of split reed drawn tightly round it, and tied up at the back of the bow in a sort of rosette form. This kind of bow is often used for shooting bullets or stones. For this purpose two strings are placed side by side, and kept apart by a little piece of wood near one end, so that in the middle there is an interval of a couple of inches between the strings. A strip of leather rather more than an inch in width is then sewed to the strings, so that when the bow is bent the leather is stretched tightly between them.

The bow is used in the following manner. A bullet or stone is placed on the leather, and the two strings are grasped by the forefinger and thumb of the right hand, so as to enclose the bullet in the leather. The bow is then drawn and aimed, and when the strings are released from the pressure of the fingers, they fly asunder and permit the bullet to escape. The precision that may be obtained by this weapon is really wonderful, and even Europeans soon learn to pride themselves on their skill with the "pellet-bow." Squirrel shooting with this bow is a favorite amusement with many persons, and some of the natives of rank occasionally amuse themselves with shooting at the earthenware jars carried on the heads of the women, a successful shot smashing the jar to pieces, and deluging the women with the water which had been contained in it.

There is another kind of bow which is much used in different parts of Asia, varying somewhat in form and material, but smaller in principle. The bow is so formed that when it is unstrung it curves in exactly the opposite direction to the string. The amount of curvature varies considerably in different bows, the most perfect being that in which the two ends almost touch each other. The specimen which is shown in Fig. 1 of the illustration on page 1394, and which is drawn from a bow in my collection, is a singularly perfect example of this kind of weapon. It is made in the following manner:—

A horn of the buffalo is sawn longitudinally, so as to produce two tapering pieces of exactly the same size. These are then flattened by heat and pressure, and are trimmed until when bent they give exactly the same amount of curvature. The handle and the tips are made of very hard wood, and are fitted to the horn with the greatest care, the wood which forms the tips running for some distance along the under side of the horn. After the handle and tips are fitted in their places, a great number of sinews are laid wet over the back of the bow, and kneaded so carefully that the wood, the

sinews, and the horn seem to be altogether one substance. After this part of the work is finished, the whole of the bow is covered with repeated layers of a kind of glue, which is very carefully smoothed and polished. The bow is practically complete, but the maker is not satisfied unless he adds plenty of ornament. This is always a sort of conventional flower pattern, gilt on a brilliantly colored background. I possess several such bows, in each of which there is a dissimilarity of color and pattern. In the bow now before us, the groundwork is vivid green and scarlet, on which are drawn the most elaborate patterns of flowers, leaves, and arabesques in gold. It is impossible, on looking at the surface, not to admire both the beauty of the patterns and the excellence of the paint and varnish, which can be subjected to such violent treatment as is caused by the bending of the bow and shooting the arrow, and yet not be cracked to pieces.

The elasticity of this bow is wonderful. I have often tried to string it, but without effect, and indeed I never saw but one man, the late Colonel Hutchinson, of the Indian Army, who could do so. It is strung by passing it under one leg, bending it back sharply over the other leg, at the same time slipping the loop of the string into its notch. A groove passes along the back of the bow, so as to guide the string. When strung it assumes quite a different shape, and looks something like the bow which the ancient sculptors placed in the hands of Cupid. I regret that the bow could not be strung, so as to give two illustrations of the same bow in its different aspects.

The classical reader may perhaps remember that this weapon is exactly similar to the ancient Scythian bow. Reference is made to this shape by Athenæus (book x.) when an unlearned shepherd, trying to describe the letters which formed a name, said that "the third (*i. e. c*) was like a Scythian bow." This kind of bow was of horn, as indeed were most of the ancient bows.

The length of the bow above mentioned, measured along the back, is a little more than four feet, whereas the measurement across it as it appears when unbent is only nineteen inches. The reader will see how useful a bow of this description would be to a horseman, its peculiar curvature rendering it easy of carriage. It could even be carried along on the bridle arm, if required, so as to leave the sword hand at liberty, and in a moment could be strung when needed, by passing it under the leg as the rider sits on horseback. Small as this bow seems, almost indeed insignificant in appearance as a weapon, its performances in skilful hands are something marvellous. With one of these bows an arrow has been shot to a distance which was said to be six hundred yards, and was actually not much short of that meas-

urement. And, although so powerful, it is wonderfully manageable. Colonel Hutchinson told me that he once saw an archer shoot an arrow along a corridor, and send the missile through a hole which a bullet had made in a pane of glass at the end of the corridor.

Next comes a form of bow which is much more common than the preceding. In this bow the reflex curvature is strongly marked, though not so strongly as in the case of the weapon just described.

Several of these bows are in my collection, the handsomest of which was presented to me by J. Allen, Esq. This bow, with its case, its quiver, and score of arrows, is shown in Fig. 2 of illustration 0, on page 000. Measuring along the back, the bow is four feet five inches in length, whereas the space between the two tips is only twenty-eight inches. The color with which the bow is painted is bright scarlet, profusely covered with gilt flowers and arabesques, so that it is a more showy weapon at a distance than the previous specimen, though it is not nearly so handsome when closely examined, the patterns being larger and more roughly executed. The bow-string is made of some vegetable fibre,—I think that of some species of aloe,—and is very thick, being composed of nine strands twisted very closely together.

The case, quiver, and straps by which they are held have been once very splendid, being crimson velvet, so covered with gold embroidery that scarcely any part of the velvet is visible. The arrows are two feet three inches in length, and are very carefully made. The shaft is of reed, and to either end is fixed a piece of hard wood four inches in length. On one end of the shaft is fixed the point, which is a heavy and solid quadrangular piece of steel brought to a sharp point. The hard wood at the end receives the feathers, and is enlarged at the extreme end, so as to allow space for the nock or notch in which the thick bow-string is received. Both the pieces of hard wood are colored, that in which the point is fixed being simply green, but that at the other end being gilt, and covered with patterns in blue and scarlet.

This is the most common kind of arrow, but there are many varieties, of which I possess specimens. Several varieties are in many collections, the chief distinction being in the shape of the point. In most of them it is more or less quadrangular; though in some it is leaf-shaped, like a spear head, in others it is conical, and in others round and blunt. In one of the arrows the place of the lower piece of hard wood is taken by a solid piece of steel nearly four inches in length, and weighing about three ounces, looking something like a rather elongated Whitworth bullet.

The most primitive form of Indian arrow is that which is made by the hill tribes.

The shaft is of wood, not of reed, and the head is deeply barbed, and tied to the shaft with fibre, exactly as is done with the flint-headed arrows, which this weapon almost precisely resembles in form, though not in material. Instead of feathers, dry leaves are substituted, cut into the required shape, and passed through slits in the shaft of the arrow, these slits being afterward bound up. In one arrow the nock has been formed in a very strange manner, a piece of wood being lashed to each side of the shaft, and projecting a little beyond it.

Some very beautiful examples of the best kinds of weapons are shown in the illustration on page 1406. They belong to General Sir Hope Grant, G.C.B. etc., who kindly allowed them to be drawn for the use of this work. They are splendid instances of Indian art, one or two of them displaying a most elaborate ornamentation.

The first of the illustrations shows a suit of armor and weapons, which is made of steel most elaborately engraved and inlaid with gold, the patterns resembling those on the bow, and looking much as if they had been taken from the bow and sunk into the steel, the freedom and grace of the lines being quite as remarkable as the elaborate minuteness of the pattern.

In the centre (Fig. 1) is seen the martial looking helmet, with its slight feather plume. There are often several of these plumes in a helmet, their shafts being adorned with gold and jewels, and placed in sockets projecting from the helmet. In front is seen the flat bar which protects the nose and upper part of the face from a sword cut. This bar slides up and down through a groove for the convenience of the wearer. From the helmet depends a piece of very slight but very strong chain-mail, which falls behind and on either side of the face, and hangs as low as the shoulders, so that, however abruptly the wearer may move his head, the folds of the chain-mail protect his neck. In several of these helmets the links of the mail are gilt, and arranged so as to form patterns, mostly of a diamond shape.

By the side of the helmet (Fig. 3) is the curious gauntlet, which extends far up the arm, and has no joint at the wrist. The absence of the joint, unpleasant as it would be to an European swordsman, is no obstacle to the proper use of the sword by the Oriental warrior. If the reader will refer to the figure of the sword (Fig. 6), he will see that the hilt is terminated by a large circular plate of steel. In a specimen in my own collection, this plate is three inches in diameter, so that when the sword is grasped after the European fashion, the plate comes against the wrist, and acts as a fulcrum by which, when a blow is struck, the leverage of the blade forces the sword out of the grasp.

But the whole system of swordsmanship in India differs essentially from that which

(1) NECKLACE. (See page 1399.)

(2) KOOKERY. (See page 1395.)

(3.) THE CHAKRA, OR QUOIT WEAPON.
(See page 1406.)

(4.) INDIAN ARMS AND ARMOR. (See page 1405.)

is employed in England, or indeed in Europe generally, strength not being used so much as dexterity. For the object of this weapon its curved form is essential. The stroke of the sword is done by a turn of the wrist more than by a direct blow, so that the curved edge of the weapon is drawn rapidly over the object of attack.

The mode of employing the Indian sword was illustrated to me by the same Colonel Hutchinson whose name has already been mentioned.

He took a large mangold-wurzel, and laid it on a table. He then placed the flat side of the sword upon the root, so that no blow could be dealt, and then, with a slight turn of the wrist, he drew the blade toward him, and the root fell apart, severed in two pieces. In the same manner he cut the whole of the root into slices. The feat looked so easy that I tried it on another root, but, instead of cutting it in two, the edge of the sword glided off it as if it had been a solid piece of glass, and jarred my arm to the shoulder. However, after a few lessons, the feat became tolerably easy.

The same effect can also be produced by pushing the blade from the swordsman instead of drawing it toward him. It is to this delicate, drawing cut that the Indian sword owes its efficiency, the steel of the blade not being nearly of so good a quality as that of our common dragoon swords, and not being capable of taking so fine an edge. But if in battle an Indian warrior meets or overtakes an enemy, he does not strike at him with the whole power of the arm, as is done by our swordsmen, but places the edge of his weapon against the neck of the enemy, and with a turn of his wrist nearly severs the head from the body.

In the same illustration is seen the circular shield or target. This is of no great size, measuring about eighteen inches in diameter, and sometimes even less. It is made of the hide of the rhinoceros, which, when properly dressed and dried, is of considerable thickness, as hard as horn, though not so brittle, and almost equally translucent. The shield is generally adorned with four circular plates of metal, which in an ordinary specimen are merely of iron, but in a peculiarly handsome one are covered with lacquered gilding. The reader will doubtless see the almost exact resemblance between the Indian shield and the target of the Scotch Highlander. The other portions of the armor are adorned with gold inlaying, like those parts which have been described.

Illustration No. 4, on page 1403, contains several articles used in warfare, all of which are drawn from specimens in Sir Hope Grant's collection. In the centre is seen a coat of mail. This is one of the most beautiful pieces of armor I have ever seen, each of the links bearing upon it a sentence from

the Koran. Three of the links are shown underneath the coat of mail, drawn of the size of the originals. If the reader will reflect upon the vast number of such links which are required to form a coat of mail, he will appreciate the amount of labor that must have been expended on it, the letters having to be formed after the links are put together, so that they may not be obliterated in the forging. The helmet belonging to this suit is seen by its side at Fig. 2.

Between the helmet and the coat of mail is a Coorg knife or dagger, and its sheath. This weapon is sometimes very plain, and sometimes blazes with gold and jewels on the hilt and sheath. A specimen in my collection is of the former kind, and, though the blade is of good quality, the handle is of wood, and is secured to the blade by a stout brass rivet which passes through the tang. A bold ridge runs along either side of the blade.

Two more characteristic forms of the Indian dagger are shown at Figs. 7 and 9 in the illustration. One, Fig. 7, with its sheath at Fig. 8, is in great favor, especially with the rich. It is made entirely of steel, the two cross-bars constituting the handle. The form of the blade varies somewhat in different specimens, but the general form is the same in all. A good specimen in my collection is altogether twenty inches in length, and weighs exactly a pound, so that it must be rather an awkward weapon for the girdle. The blade, if it can be so called, is nearly a foot in length, flat toward the handle, and within five inches of the tips welling suddenly into a sort of quadrangular bayonet, rather more than half an inch in thickness.

The reader will see that when this dagger is grasped, the steel continuations of the handle project on either side of the wrist, and effectually guard it and the lower part of the arm from a sword-blade. The weight of this instrument, as well as the force with which a thrust can be delivered by a straight blow as in boxing, render the weapon well calculated to drive its way through the folds of dress, or even between the joints of armor.

Next comes a weapon (Fig. 9) which would scarcely be recognized as a dagger. It is, however a dagger, made from the two horns of the Indian antelope. In the simplest form of this curious weapon, the horns are arranged with their bases crossing each other for about six inches. The curvature of the bases thus furnishes a sort of handle, which can be grasped in such a way that the holder of the weapon can strike right and left with it, and, among a number of people, could do a vast amount of damage in a very short time.

A dagger such as has been described could be made in half an hour, and, indeed, a temporary weapon might be made in a few minutes by lashing the horns together.

But the Indians prefer to add ornament to the weapon, and so they often make a hollow steel hilt in the form of a cup, with the curved side outward. The hand passes into this cup as into the basket-hilt of a singlestick, and is effectually guarded from injury. The dagger shown in the illustration has one of these steel hilts. In some places this weapon is in such favor that, instead of making it of antelope horns, with a steel hilt, the entire dagger is of steel, the points made in imitation of the horns.

The last weapon (Fig. 10) is one which is used by the Afghans, and is a sort of compromise between a sword and a dagger. A weapon of a similar form and character is carried by the Moors.

There is one kind of sword which ought not to be passed without some notice. It is a most murderous looking weapon, and is made on precisely the opposite principle to that of the sword which has already been described. In that form of sword, the edge is on the outer curve of the blade, which narrows toward the point. In the other sword, the edge is on the inside curve, and the blade widens greatly at the tip, which is curved like a bill-hook. Indeed, the weapon bears some resemblance to a bill-hook with a greatly elongated blade. In a specimen in my collection the blade is very little more than an inch wide by the hilt, but at the point (or rather the tip, for this part of the blade is squared) it is just four inches in width. The weight of this sword is rather more than two pounds.

There is also the quoit, or chakra, a missile

weapon, that bears some resemblance to the boomerang of Australia or the casting-knife of the Fan tribe, it being intended to cut and not to pierce, as is generally the case with missiles. It is made of thin steel, and is sharpened to a razor-like edge on the outside. The mode of casting it is to spin it on the forefinger and then to hurl it. The reader may imagine that such a missile, which not only strikes an object, but revolves rapidly at the time, must be a very formidable one. It is generally aimed at the face of the adversary, and a skilful warrior will hurl four or five in such rapid succession that it is scarcely possible to avoid being struck by one of them, and having the face laid open, or the nose or lip absolutely cut off. These quoit-like articles are carried upon a tall, conical head-dress worn by the natives, into the folds of which they also put several small knives, as Irish laborers stick their pipes in their hats. See illustration No. 3, on page 1403.

A similar weapon, made of brass instead of steel, is used by the cattle-poisoning Mooches, who have already been described. They call it by the name of "thäl."

The chakra is the special weapon of Vishnu, and may be seen in the various representations of that deity, hanging in one of the hands. Reference is made to this by Southey in the "Curse of Kehama." Other deities also hold the chakra in the many-armed images by which the Indian artists clumsily attempt to depict omnipotence. This takes us to another branch of the subject.

SUIT OF ARMOR INLAID WITH GOLD.

(See page 1402.)

CHAPTER CL.

INDIA — *Continued.*

SACRIFICIAL RELIGION.

PRINCIPLE OF HUMAN SACRIFICE — THE SUTTEE, OR WIDOW BURNING — HER FATE DESIRED BY HERSELF AND HER NEAREST RELATIVES — REASONS FOR THE SACRIFICE — CONTRAST BETWEEN THE LIFE OF A WIFE AND A WIDOW OF HIGH CASTE — SOCIAL STATUS OF THE BRAHMINS — HONOR IN WHICH THE SUTTEE IS HELD — MODE OF CONDUCTING THE SACRIFICE — STRUCTURE OF THE PILE — COURAGEOUS CONDUCT OF THE VICTIM — ATTEMPTED ESCAPE OF A SUTTEE — BERNIER'S DESCRIPTION — GRADUAL ABOLITION OF THE SUTTEE — THE GODDESS KALI AND HER WORSHIPPERS — THE THUGS AND THEIR CONSTITUTION — THE SACRED "ROOMAL" OR NOOSE — MODE OF OFFERING A VICTIM — THE FESTIVAL OF JUGGERNAUT — HARDSHIPS OF THE PILGRIMS — FORM OF THE IDOL — SELF-SACRIFICE IN THE GANGES — SACRIFICE OF BEASTS — THE GODDESS DOORGA OR KALI — FAKIRS OR JOGIS — THEIR VARIOUS MODES OF SELF-TORTURE — THE SWINGING FESTIVAL — THE MOTIONLESS FAKIR.

THERE is no part of the world, not even Africa itself, where the principle of human sacrifice is so widely spread, and is developed so variously, as in India. Several forms of human sacrifice, such as the Meriah, which has already been described, belong to definite districts, and even in them are carried out with certain limitations. Some forms of the same principle, such as the murders by Thugs or Phânsigars in their worship of the dread goddess Kali, are restricted to certain societies of men. Again, the victims annually crushed under the wheels of Juggernaut's car are comparatively few, and can only be sacrificed in a certain locality, and at certain times.

There is, however, one mode of human sacrifice which at no distant period prevailed over the whole of India, and has only been checked by the influence of England in those parts of the country which has been subject to British dominion. Even in those districts the task has been a very difficult one, and there is no doubt that if the strong hand of England were ever lifted, the practice would again prevail as it did before.

This form of human sacrifice is the dreadful Sutte, or the death of the widow on the funeral pyre of her dead husband. Both in Africa and Polynesia we have seen several instances where the widow is sacrificed on the grave of her husband, so that

he may not find himself wifeless when he reaches the spirit land. But it is remarkable that even among the lowest of the savages, whose indifference to inflicting pain is well known, there are none who exercise such horrible cruelty toward the widow as do the highly civilized Hindoos. On referring to the former portions of this work, the reader will see that in some places the widows are strangled and laid in the grave, in others they are buried alive, and in others they are killed by a blow of a club (perhaps the most merciful death that can be inflicted), but that in no instance is the surviving wife burned alive, as is the case with the Hindoo.

At the first glance, it seems strange that not only should the relatives of the miserable wife desire her to be burned, but that she herself should wish it, and should adhere to her determination in spite of every opportunity of escaping so dreadful a death. Yet the calm, dispassionate cruelty of the Hindoo nature is shown by the fact that, painful as is a death by burning, the life of a widow who survives her husband is made so miserable that the short though sharp agony of the funeral pyre is infinitely preferable to life. She loses all caste, and a Brahmin widow who refuses to be burned is loathed and despised even by the very Pariahs, whose shadow would have been a contami-

nation to her during the lifetime of her husband. The horror of such a life can scarcely be conceived by an European, even supposing a delicate girl, bred in the midst of all luxury and refinement, to be suddenly cast among the most debased of savages without possibility of rescue, and to be made an object of scorn and contempt even to them.

To realize the depths of utter degradation which a high-caste widow incurs, we must first see what is her opinion of her own status. The reader is doubtless aware that the Hindoos are divided into a number of distinct castes, the peculiarity of which is, that no one can ascend to a superior caste, though he may fall into a lower. Now, of all the castes, the Brahmins are immeasurably the highest, and the reverence which is paid to them by their countrymen is almost incredible. Wealth or secular rank have nothing to do with this reverential feeling. A Hindoo of inferior caste may be, and often is, a man of almost unbounded wealth, may possess almost unbounded power, and, in his own way, unbounded pride. But the very poorest of Brahmins is infinitely his superior, and should he meet one of these exalted beings, he bows before him, and pays divine honors to him. And, according to his belief, he is right in so doing, the Brahmin being an incarnation of Deity, sprung from the mouth of Vishnu, the Saviour God himself. He may be mounted on a magnificent elephant, covered with glittering trappings, he may be clothed in gorgeous robes and sparkle with costly gems, but before a Brahmin, with a single cloth round his waist, and bearing the solitary sign of his caste,—the slight cord hung over one shoulder and under the other,—he is an abject slave. Even if, as sometimes happens, he should employ a Brahmin as his cook, that Brahmin retains his rank, and receives the worship of the man by whom he is paid.

According to their sacred books, "when a Brahmin springs to light, he is born above the world; the chief of all creatures; assigned to guard the treasury of duties, religious and civil." According to the same books, the very existence of mankind, and even of the world itself, depends upon the forbearance of the Brahmins, whose power even exceeds that of the gods themselves. Should there be one who cannot be slain by the great god Indra, by Kali, the goddess of destruction, or even by Vishnu himself, he would be destroyed if a Brahmin were to curse him, as if he were consumed by fire. In the same spirit, princes were warned not to take the property of the Brahmins, however much in want of money, for that if these holy men were once enraged, they could by a word destroy them, their armies, elephants, and horses.

By them, under Brahma, were originally made the earth, the sun, the moon, and the fire, and by them they could be destroyed.

"What prince could gain wealth by oppressing those who, if angry, could frame other worlds, and legions of worlds, *could give being to new gods and mortals?*" Just as these tremendous privileges are independent of the external circumstances of wealth and rank, so are they independent of individual character. The pure soul of a Brahmin is beyond all moral elevation, and above all moral pollution. He may be a man of the purest life and loftiest morality, but he is none the better Brahmin for that; he may be one of the vilest of debauchees, and be none the worse Brahmin for that, provided he does not commit any act which would forfeit his caste,—such, for example, as killing a cow, or eating food that had been cooked by an inferior.

To fall from such an estate as this, above humanity and equal to divinity, must be something almost too terrible to conceive, and we can easily imagine that any death would be preferable to such a life. But not even the horror of a life like this would be equivalent to the sufferings of the Indian widow, who believes that her very soul is contaminated beyond hope by the loss of her caste, and who feels herself degraded below the level of those on whom she had looked with an utter loathing that is almost incomprehensible to the Western mind. She has to cut off her hair; she has to live on the coarsest of food, she has to clothe herself in the coarsest of raiment, and altogether to lead a life utterly and hopelessly miserable in every hardship that can afflict the body, and every reproach that can torture the mind.

On the other side comes the belief, that if she follows the dictates of her religion, and suffers herself to be burned on the funeral pile of her husband, she qualifies herself for everlasting happiness. From the moment that the ceremonies of the sacrifice are begun, she becomes an absolutely sacred being, whose very touch sanctifies the objects on which she lays her hands; she renders herself a model to be imitated by all her sex, and her memory is forever venerated by her family. It is therefore no wonder that, swayed by such considerations, the Indian widow prefers death to life, and that the sacrifice of the Sutte has taken such hold upon the people.

Varying slightly in details according to the rank of the individual and the particular district in which the sacrifice takes place, the ceremony is conducted after the following manner.

A hole is dug in the ground, over which the funeral pile is raised. The object of the hole is to supply a current of air by which the fire may be fed. Sticks are then driven round the edge of the hole to support the materials of the pile, which are dry wood, rushes, and hemp. These are heaped carefully to a height of four feet or so, and resin and ghee (*i. e.* liquid butter) are thrown

on the pile, so as to increase the vehemence of the flames. The body is then taken to the river, on whose bank the pyre is always erected, and is there washed by the relatives, and afterward wrapped in a new cloth and laid on the pile.

During this time the widow stands on the bank, uttering prayers, and waving in her hand a branch of mango. After the corpse is removed from the water, she descends into it herself, and, having washed, distributes to her friends all her ornaments, which are eagerly sought, as being sanctified by having been touched by the sacred hand of a suttee. She is then dressed in a new robe, and places herself by the side of the body, to which she is usually, though not always, lashed. Dry rushes and wood are next heaped over her, only her head being suffered to be uncovered, so that she may breathe for the short time she has to live. Two long bamboos are then laid across the pile, the ends being held by the relations, so as to press her down should she struggle to escape when the flames reach her. The fire is lighted by her nearest relation, and, if the pile has been properly constructed, the suttee is soon dead, being killed rather by suffocation from the smoke than by the flames.

Sometimes, however, when the building of the pile has been entrusted to inexperienced hands, a terrible scene takes place, the wretched victim trying to escape from the flames that torture her, and being ruthlessly held down by the bamboo poles across her body. Dr. Massie relates several instances of attempted escape. In one case, the mode of preparing the pile was evidently the cause of the poor victim's sufferings. At each corner a stout pole was erected, and from this pole was suspended a second pile, like a canopy, elevated three or four feet above the surface of the principal pile. This canopy was chiefly made of logs of wood, and was exceedingly heavy.

After the suttee had been laid upon the pile, and covered with straw saturated with ghee, the fire was kindled, and the smoke rolled in thick volumes over the head of the victim. The flames began to blaze fiercely, and if they had been allowed to burn in their own way, the death of the poor woman would have been almost immediate. But just at this time four assistants severed with their swords the ropes which upheld the canopy, so that it fell with its whole weight upon her.

Possibly it was intended as an act of mercy, but its effect was anything but merciful. For the moment she was stunned by the blow, but the mass of billets checked the action of the fire, and caused it to burn slowly instead of rapidly. The creeping flames soon restored her to consciousness through the agony which they inflicted upon her, and she shrieked pitifully for the help

that none would give her, until death at last put an end to her sufferings.

The same author quotes an account of a suttee who actually did succeed in escaping from the flames, in spite of the resistance offered by the officiating Brahmins and her relatives:—

“Another well-authenticated and brutal instance of this sacrifice occurred about the same time in a more northern province of India: ‘The unfortunate Brahminee, of her own accord, had ascended the funeral pile of her husband’s bones, but finding the torture of the fire more than she could bear, by a violent struggle she threw herself from the flames, and, tottering to a short distance, fell down. Some gentlemen, who were spectators, immediately plunged her into the river, which was close by, and thereby saved her from being much burnt. She retained her senses completely, and complained of the badness of the pile, which, she said, consumed her so slowly that she could not bear it; but expressed her willingness again to try it if they would improve it. They would not do so, and the poor creature shrunk with dread from the flames, which were now burning intensely, and refused to go on.

“When the inhuman relations saw this, they took her by the head and heels, and threw her into the fire, and held her there till they were driven away by the heat; they also took up large blocks of wood, with which they struck her, in order to deprive her of her senses; but she again made her escape, and, without any help, ran directly into the river. The people of her house followed her here, and tried to drown her by pressing her under the water, but an European gentleman rescued her from them, and she immediately ran into his arms and cried to him to save her.

“I arrived at the ground as they were bringing her the second time from the river, and I cannot describe to you the horror I felt on seeing the mangled condition she was in: almost every inch of skin on her body had been burnt off; her legs and thighs, her arms and back, were completely raw, her breasts were dreadfully torn, and the skin hanging from them in threads; the skin and nails of her fingers had peeled wholly off, and were hanging to the back of her hands. In fact, I never saw and never read of so entire a picture of misery as this poor woman displayed. She seemed to dread being again taken to the fire, and called out to ‘the Ocha Sahib’ to save her. Her friends seemed no longer inclined to force, and one of her relations, at our instigation, sat down beside her, and gave her some clothes, and told her they would not. We had her sent to the hospital, where every medical assistance was immediately given her, but without hope of recovery. She lingered in the most excruciating pain for about twenty hours, and then died.”

It is often said that the woman is stupefied with opium or Indian hemp before she is brought to the pile, and that the bystanders beat drums and shout in order to drown her shrieks. This, however, is not the case, the woman requiring the use of all her senses to enable her to go through the various ceremonies which precede the actual burning, and the pile being generally made so carefully that death is so rapid that the victim scarcely utters a cry or makes a single struggle to escape.

Additions to the mere burning of the widow have been mentioned by various travellers. Bernier, for example, says that, while travelling near Agra, he heard that a Suttee was about to take place. He went to the spot, and there saw a great pit, in the midst of which was a large pile of wood. On the pile lay the body of a man, and beside it sat a young and handsome woman, whose dress was almost saturated with oil, as was the wood of the pile. The fire being lighted, she sat on the pile, and as the flames wrapped her body, she exclaimed with a loud voice that, according to the Indian belief in the transmigration of souls, this was the fifth time that she had become a suttee, and that she would have to do so twice more in order to attain perfection.

Round the edge of the pit danced five women, holding each other by the hand, and appearing regardless of the fire. Presently the flames seized upon the dress of one of them; whereupon she detached herself from her companions, and flung herself headlong into the burning pit. The remaining four continued their dance, and, as the fire caught their garments, they one by one leaped into the flaming pit. These women, it appeared, had been slaves of the suttee. They were greatly attached to their mistress, and when they heard her offer the vow to die on the funeral pile, they determined to die with her.

The same traveller relates a very curious anecdote of a suttee who employed the dreadful ceremony for a strange purpose.

She was a widow by her own act, having poisoned her husband in order to carry on an intrigue with a young tailor, a Mohammedan, who was celebrated for his skill in playing the drum. He, however, was alarmed at her crime, and declined her society. On account of the caste to which she belonged, the death by burning was not a necessity, but on her lover's refusal she went to her relations, reported the sudden death of her husband, and declared that she would be burned with him.

"Her kindred, well satisfied with so generous a resolution, and the great honor that she did to the whole family, presently had a pit made and filled with wood, exposing the corpse upon it, and kindling the fire. All being prepared, the woman goes to embrace and bid farewell to all her kindred that were there about the pit, among whom was also

the tailor, who had been invited to play upon the tabor that day, with many others of that sort of men, according to the custom of the country. This fury of a woman, being also come to this young man, made sign as if she would bid him farewell with the rest, but, instead of gently embracing him, she taketh him with all her force about his collar, pull him to the pit, and tumbles him, together with herself, into the ditch, where they both were soon despatched."

The date at which the Suttee was instituted is not known, but it was in operation at the time of Alexander the Great, and must have been established long before. Under the British rule the Suttee system has gradually been abolished, and we may hope that never again will the dread scene be repeated.

REFERENCE has already been made to several other modifications of human sacrifice, and we will give a few pages to a description of them.

There is in the Indian mythology a certain dreadful goddess of destruction, named Kali. Her statues show her attributes, her many hands being filled with all kinds of weapons, and her person decorated with a huge necklace of human skulls. In order to propitiate this terrible divinity, a system has been developed which is perhaps the most remarkable, illogical, and best regulated system that is to be found upon the face of the earth. It is simply murder raised to the rank of a religious rite, and differs from all other human sacrifices in that blood is not shed, that the victim is always killed by stratagem, and that the worshippers need neither temple nor altar.

The members of the society call themselves THUGS, from a Hindoo word which signifies "deception," and which is given to them in consequence of the mode in which the victims are entrapped. In some parts of India they are called PHANSIGARS, from a Sanscrit word which signifies "a noose." Perhaps the strangest point, in this country of strict and separate caste, is that the Thugs do not belong to one caste, nor even to one religion. They all agree in worshipping Kali, but in other respects they admit among their numbers men and women of all castes, and a large number of them are Mahommedans, who have no caste at all. Indeed, the Mahommedan Thugs claim for themselves the origin of the system, though the Hindoos say that it was in existence long before the time of Mahommed.

They always go in companies, a complete band often consisting of several hundred persons of all ages and both sexes. As the very essence of the sacrifice is secrecy, they assume all kinds of disguises, the usual being that of travelling merchants. In this capacity they act their part to perfection, and endeavor to entice travellers into their clutches.

For this purpose they have a regular organization. At their head they have a chief, or Sirdar, who directs the operations of the band. Then an old experienced Thug acts as instructor, and teaches the younger men how to use the sacred noose by which the victims are strangled. This is not a cord with a running knot, but a sort of handkerchief, which is flung round the neck of the unsuspecting man, and suddenly drawn tight. This noose, or handkerchief, is called the "roomal." Then come the men who are entrusted with the noose. These are called Bhuttotes, or stranglers, and are generally men possessing both strength and activity. Next are the entrappers, or Sothas, namely, those whose business it is to entrap the victim into a convenient spot for his assassination, and to engage his attention while preparations are being made for his death. Lastly come the Lughaees, or grave-diggers, who prepare the grave for the reception of the body.

The method in which the Thugs perform their sacrifices is almost exactly like that which is employed by the modern garroters, except that a noose is used instead of the arm, and that the victim is always killed, instead of being only made insensible for a time.

Having pitched upon a person whom they think will be a fit offering for Kāli, the Sothas manage to induce him to come to the fatal spot. Several days are often spent in this endeavor; for, unless there is every probability that the murder will not be executed before any except members of their own society, the Thugs will not attempt the traveller's life. The women and children attached to the band are usually employed as Sothas, inasmuch as they would excite less suspicion than if they were men. If the women be young and handsome, they are the more valuable as decoys; and, horrible to say, even young girls take the greatest interest in decoying travellers within the fatal noose.

When the party have arrived at the appointed spot, the attention of the traveller is adroitly directed to some object in front of him, while the Bhuttote who acts the part of executioner steals quietly behind him. Suddenly the noose is flung round the victim's neck, the knee of the murderer is pressed into his back, and in a short time he ceases to live. Generally the executioner is so adroit at his dread office that the murdered man makes no resistance, but dies almost without a struggle, the first pressure of the noose causing insensibility.

The body of the murdered man is then stripped, and his property falls to the band. Sometimes a whole party of travellers is entrapped by a band of Thugs, and all are simultaneously murdered. This is generally the case when several wealthy men travel together, in which case they and their servants are all murdered in honor of Kali;

who, on her part, yields to her servants the goods of the murdered men, by way of recompense for their piety.

The sacrifice over, the body is pierced in several places to prevent it from swelling, and is then laid in the grave. The soil is carefully filled in, and levelled with such ingenious care that scarcely any except those who dug the grave can discover it after the burial. In one case, when an English force was in chase after a band of Thugs, they passed over ground which was full of bodies, and never suspected it until one of the Thug prisoners exultingly pointed out grave after grave as proofs of their success.

After the body is buried, and all signs of the murder removed, the Thugs go through a sort of religious ceremony, sitting round a white cloth, on which are laid the sacred pickaxes with which the graves are dug, a piece of silver, and some sugar. The Sirdar then sits on the sheet, facing westward, with the most accomplished stranglers on either side of him, and distributes the sugar to all present, who eat it in solemn silence. The sheet is then put away, and to all appearance the Thugs are nothing more than a party of harmless travellers.

So secretly is the whole business conducted, that the system has only been discovered within late years. Numbers of persons had mysteriously disappeared; but in India the natives are singularly apathetic, and it is always easy to account for the disappearance of a traveller by saying that he has been carried off by a tiger. The Thugs take the greatest pride in their profession, and, when captured, do not attempt to disguise it, but openly boast of the number of victims whom they have slain, and describe with glee the method in which they destroyed them; and, when themselves led to the gallows, they treat the whole business with calm contempt, having no more care for their own lives than for those of their victims.

WE now come to another ceremony, in which human life is sacrificed, though as an adjunct, and not as its essential feature. This is the celebrated procession of Jugernaut, or Jaganatha. The ceremonies connected with this idol, and indeed the invention of the idol itself, seem to be of comparatively modern date, and, except for the great annual procession of the car, are of little interest.

The great temple of the idol is situated in Orissa, rather more than three hundred miles southwest from Calcutta. It is a tall, pyramidal tower, some two hundred feet in height, built of a warm red sandstone, covered with the lime-cement called "chunam." Being on the sea-coast, this tower is a most useful landmark to navigators in the Bay of Bengal.

Once in every year the great festival of Juggernaut takes place, and the huge idol-car is brought out for the procession. The car is an enormous edifice of wood, more than forty feet high, and thirty-five feet square. This mass of timber is supported on sixteen wheels, each more than six feet in diameter, some of the wheels being under the body of the car. The car itself is plentifully adorned with sculptures of the usual character, and it is conventionally supposed to be drawn by two great wooden horses, which are attached to it in readiness for the procession, and kept inside it during the rest of the year.

On the appointed day three idols are placed in the car. The central figure represents Krishna, and the others are his brother Bala Rama and his sister Sûhadra. They are nothing but three enormous and hideous busts, not nearly so well carved as the tikis of New Zealand, and, in fact, much resemble the human figures scribbled on walls by little boys. Stout and long cables are attached to the car, by means of which the worshippers of the idol drag it along. The scene that takes place at the procession is most vividly described by Bruton:—

“In this chariot, on their great festal days, at night they place their wicked god, *Jaggarnat*; and all the *Bramins*, being in number nine thousand, attend this great idol, besides of *ashmen* and *fackeeres* (fakirs) some thousands, or more than a good many.

“The chariot is most richly adorned with most rich and costly ornaments; and the aforesaid wheels are placed very complete in a round circle, so artificially that every wheel doth its proper office without any impediment; for the chariot is aloft, and in the centre betwixt the wheels; they have also more than two thousand lights with them. And this chariot, with the idol, is also drawn with the greatest and best men of the town; and they are so greedy and eager to draw it, that whosoever, by shouldering, crowding, shoving, heaving, thrusting, or in any insolent way, can but lay a hand upon the rope, they think themselves blessed and happy; and when it is going along the city, there are many that will offer themselves as a sacrifice to this idol, and desperately lie down on the ground, that the chariot-wheels may run over them, whereby they are killed outright; some get broken arms, some broken legs, as that many of them are so destroyed; and by this means they think to merit heaven.”

Another of the earlier writers on this subject states that many persons lie down in the track of the car a few hours before it starts, and, taking a powerful dose of opium, or “*bhang*,” i. e. Indian hemp, meet death while still unconscious.

In former days the annual assemblage at the temple of Juggernaut, which is to the Hindoos what Mecca is to the Mahomme-

dans, was astonishing, a million and a half of pilgrims having been considered as the average number. Putting aside the comparative few who perished under the wheels of the great car (for, indeed, had the whole road been paved with human bodies, they would have been but a few), the number that died from privation and suffering was dreadful.

We know by many a sad experience how difficult it is to feed a large army, even with the great advantage of discipline on the part of the commissariat and the recipients. It is therefore easy to see how terrible must be the privation when a vast multitude, quadruple the number of any army that ever took the field, arrives simultaneously from all directions at a place where no arrangements have been made to supply them with provisions, and where, even if the locality could furnish the requisite food, the greater number of the pilgrims are totally without money, and therefore unable to pay for food. In those days the pilgrims perished by thousands, as much victims to Juggernaut as those who were crushed under his chariot wheels, and, indeed, suffering a far more lingering and painful death. Still, according to their belief, they died in the performance of their duty, and by that death had earned a high place in the paradise of the Hindoos.

Such was the case before the English raj was established in India. Since that time a gradual but steady diminution has taken place in the number of the pilgrims to Juggernaut's temple; and we have lately seen a most astonishing and portentous event. Formerly, the vast crowd of worshippers pressed and crowded round the cables by which the car was drawn, trying to lay but a hand upon the sacred rope. Of late years the Brahmins have found fewer and fewer devotees for this purpose, and on one occasion, in spite of all their efforts, the ropes were deserted, and the car left stationary, to get along as it could.

As to the idol Juggernaut itself, Bruton gives a curious description of it, saying that it is in shape like a serpent with seven heads, and that on the cheeks of each head there are wings which open and shut and flap about as the car moves along.

An idol in the form of a five-headed cobra is mentioned by Messrs. Tyerman and Bennett in their “*Missionary Voyages*”: “We happened to be visiting a very handsomely built stone temple (at Allahabad), covered with well executed sculptures of their idols, holy persons, etc., in stone of the highest relief. In the temple were several stone idols representing the serpent—the *cobra capella*, or hooded snake. The largest, which represents a serpent twelve feet long, with five heads, and the heads all expanded, coiled into a sort of Gordian knot, is the principal object of worship in this temple.

"While we were looking at this stone snake, a horrid-looking man, unclothed, rushed in (he was about twenty-five years old), being covered with ashes, and his huge quantity of hair matted with mud dust. His eyes appeared inflamed; he bowed before the serpent, then prostrated himself, afterward respectfully touched his head, looked fixedly upon the serpent, prostrated himself again, then touched it and rushed out, as if in a paroxysm of delight at the thought of having worshipped this thing. When he got out of the temple, he walked all round within the verandah, and, having once more bowed at the door of the temple, he departed with a hurried step. We cannot conceive of any human being having more the appearance of a demoniac than this miserable creature, who, nevertheless, is regarded by the poor Hindoos as one of the holiest of men."

ANOTHER form of human sacrifice was intended, like the prostration under Juggernaut's car, to take the devotee to Paradise, though by a less painful and less revolting process.

The Ganges has always been reckoned as a most sacred stream, whose waters wash from the soul all taint of sin. There is, however, one spot, namely, the confluence of the Jumna with the Ganges, which is so very sacred, that any one who dies there must of necessity go straight to Paradise. It is evident, therefore, that the simplest plan of entering Paradise is to ensure death at the junction of the rivers. For this purpose the devotee entered a boat, and tied to each of his feet a chatty or earthenware jar filled with sand. The boat was rowed into mid-stream, and the devotee dropped overboard into the river. The boats used for this purpose were kept by Brahmins, who charged a fee for officiating at the sacrifice.

Sometimes the devotees managed to sacrifice themselves without the assistance of the Brahmins and their boat. They tied an empty chatty to their waists in front and behind, and, buoyed up by the empty vessels, paddled themselves with their hands until they reached the desired spot. They then scooped water into the chatties, until they were filled, and so sank, the weight of the vessels being sufficient to take them to the bottom. In like manner are corpses entrusted to the keeping of the holy river, when the relatives of the deceased are not able to afford the great expense of a funeral pile. The body is surrounded by lighted straw, so that it is scorched, and therefore considered to be purified by fire. Two chatties are then fastened to it, the relatives tow the body into mid-stream, fill the chatties with water, and allow the body to sink. What becomes of it afterward they care nothing, and though it be devoured by the many creatures of prey which haunt the rivers in search of their loathsome food, they

are perfectly satisfied with their share in its disposal.

In many cases beasts are substituted for human sacrifices. A short, stout post is fixed in the ground, and on its top is cut a deep notch, in which is received the neck of the animal, the size of the notch and height of the post being suited to the size of the victim. Sacrifices are thus offered to Doorga, the goddess of nature, and it is of the utmost importance that the head of the victim should be severed at a single blow. This is easy enough with a lamb, or even a goat, but when a buffalo is to be sacrificed, the success of the blow is so doubtful that many ceremonies are employed to ensure its right performance. The sacrificial knife is a tremendous weapon, shaped something like a bill-hook, very broad, very heavy, and kept as sharp as a razor. When the sacrifice is to take place, the buffalo is brought to the post, which stands before the ten-armed image of Doorga, its horns are painted red, turmeric is poured over its head, water from the Ganges is sprinkled over it, and garlands of flowers are hung about its neck.

The animal is then placed so that its neck rests in the fork of the post, to which it is firmly secured by an iron bar which passes through holes in the fork, and presses its head downward. The body is supported on a mound of earth in front of the post, and the legs are drawn apart and held by ropes, so that a movement is impossible. The sacrificer, always a man of great muscular power, then comes forward and takes the sacrificial knife from the altar before Doorga's statue, and, together with the assembled multitude, prays that strength may be given to enable him to fulfil his office.

Amid the breathless silence of the assembled worshippers, he raises the heavy blade, and with one blow drives it through the neck of the helpless victim. As the head falls to the ground, it is snatched up by the officiating Brahmins, who offer it to the goddess, while the people, in a frenzy of delight, dance round the sacrificer, embrace him, chant songs in his honor, and crown him with garlands of flowers. The body of the buffalo becomes the property of the spectators, who struggle for it until one party gains the superiority over the other, and carries off the prize. Around the blood, that lies in pools on the ground, the multitude crowd, dip their fingers in it, and daub it on their bodies and on the walls of the temple.

The goddess Doorga, to whom these sacrifices are made, is in fact Kali under another title; the former name meaning the Inaccessible, and the latter the Black One. She is represented as the wife of the Destroying God, Shiva, and as the mother of the God of War, Kartikeya. As Doorga, her many-armed figure is carved of wood,

or modelled in pasteboard, and painted rose color. She is seated cross-legged on a peacock, and surrounded by many other deities of the multitudinous Hindoo mythology. Before her is represented a man being devoured by a nondescript beast, something like the heraldic griffin. As soon as the sacrifice is over, the goddess is supposed to depart from her image, which is then taken in procession to the Ganges, and amid the deafening shouts of the people, the blast of trumpets, and the beating of kettle-drums, is cast into the stream.

THE reader may remember that on page 1413 was given a short description of a holy man who came to worship the many-headed snake-god. He was one of the Fakirs, or Jogis, *i. e.* ascetics, who in India are wonderfully numerous, and submit themselves to the most dreadful tortures in honor of their deities. By rights the Fakirs are Mohammedans, though the English have been accustomed to call both the Mohammedan and Hindoo ascetics by the common title of Fakir. "Jogi" is the usual title for the Hindoo devotees, though they are divided into a number of sects, such as Bairágés, Sangasés, Gosarés, &c.

In all ages and in almost all countries, there have been religious enthusiasts, who have sought to gain the favor or propitiate the anger of the deity by voluntary suffering, but there is perhaps no country where we find so great a variety of this principle as we do in India. There are Mohammedan as well as Hindoo ascetics, and the latter have this advantage, that they need not belong to any particular caste. To describe fully the extraordinary proceedings of these men would occupy much more space than can be afforded, and we will therefore only take a few of the most characteristic examples.

One of the commonest, as well as one of the lightest, of these tortures is, to have the tongue bored with a red-hot iron. This practice used to prevail largely at Chinsurah, at the temple of the Bull-god. Under a clump of banyan trees the devotees assembled in order to inflict various tortures upon themselves, and by far the most common was that of tongue boring. The operation was performed by a native smith, who was reckoned very skilful at it, and at certain seasons he was completely beset by applicants, doubly clamorous in the first place to have their tongues bored, and in the next to have it done as cheaply as possible. At these seasons he used to range the applicants in regular lines, and take them in their turn, varying his fee according to their number, rank, and impatience.

A strange instance of self-torture is described by Colonel Campbell. At Colar, the birthplace of Tippoo Sultan, a man was seen marching up and down before a mosque,

chanting a hymn. He was shod with a pair of wooden sandals, not tied but nailed to his feet by long iron spikes that had been driven through the sole and projected above the instep. Yet he walked with a firm, unconcerned step, and chanted his measured tune as if utterly unconscious of the horrible torture which each step must have cost him.

Sometimes these devotees show their piety by long pilgrimages to certain sacred spots, making the journey as difficult and fanciful as possible. Some will lie on the ground and roll the whole distance, while others measure the track by prostrating themselves on their faces, marking the spot where their heads lay, getting up, placing their feet on the marked spot, and then prostrating themselves again. Sometimes they will lie on their backs and push themselves along the road by their heels, thus cutting and bruising their backs terribly against the rough ground. Some of these men practise a most extraordinary penance in honor of the goddess Doorga, a penance which in some respects resembles the initiation of the Mandans. A stout pole, some twenty feet high, is fixed in the ground, and a long bamboo is placed horizontally over the top, on which it revolves by means of a pivot. Sometimes two or even three poles cross each other on the top of the post. Ropes hang from each end of the bamboos, and to half of them are fastened large unbarbed hooks of polished iron. The devotees having placed themselves under the bamboo, the hooks are run into their backs, and by persons hauling on the rope at the other end of the bamboo they are raised into the air. The men who hold the ropes then run in a circle, so as to swing the devotees round at a great pace, the whole weight of their bodies being borne by the hooks. While swinging they scatter flowers and other gifts among the spectators, who eagerly scramble for them, thinking they possess very great virtues.

Both men and women submit to this terrible torture, and do so for a variety of reasons. Some permit themselves to be swung in pure honor of the goddess, some do it in fulfilment of a vow, while many submit to the operation for pay, acting as substitutes of persons who have made the vow and are afraid to fulfil it personally, or who prefer honoring the goddess by deputy rather than in their own person. From one to two rupees, *i. e.* from two to four shillings, is considered a fair price to the substitute.

Sometimes the upright post is fastened upon an ordinary bullock wagon, and is shorter than when it is fixed in the ground. After the hooks have been inserted, the opposite end of the bamboo is drawn down, so as to elevate the devotee some thirty feet in the air, and made fast to the wagon. The cart is then drawn as fast as possible

round the enclosure by six or eight bullocks, which are harnessed to it for the occasion, and selected for their speed.

In many instances, the Jogis (pronounced Yogeas) perform their penance by keeping one or more of their limbs in one attitude, until after a time it becomes incapable of motion, and the muscles almost entirely waste away. Some of these men will hold one arm stretched upward to its fullest extent. This is done by supporting the arm by a cord when the wearied muscles refuse to uphold the limb any longer. In some instances, where the Jogi has clenched his hand, the nails have grown fairly through the hand, forced their way through the back, and hung nearly to the wrist.

A very common practice is to sit completely motionless; in which case the legs become in time totally incapable of moving, so that the man could not change his position even if he desired to do so. In some instances they even go beyond this, and manage to stand instead of sit, with scarcely any support for their bodies during sleep. One of these men is described by Mr. Williamson: "Within a few yards of the river on our left stood one of those horrid figures called a *yogee*, or Indian saint,—a gentleman beggar, who had placed himself in a certain attitude, from which he had vowed never to swerve during the remainder of his life, but to spend his life in mental abstraction.

"He appeared on a platform of earth raised about eighteen inches from the ground. At one end of this mound (which might be seven feet long by five broad) were erected two bamboos, seven or eight feet high, and sufficiently apart for him to stand between them. At elbow height a broad board was placed from one bamboo to the other, and upon the middle of this another piece of plank, two feet long by five inches wide, was fixed, sloping upward from him. He therefore, standing on the platform, and resting his arms upon the cross-bar, held with his hands on each side of the upright sloping board. He seemed to press equally on either foot, leaning a little forward, with his face turned rather aside, and raised toward the sun.

"His personal appearance was squalid and miserable. His body was daubed all over with blue mud; his hair—long, matted, discolored to a yellowish brown with exposure—dangled in all directions. His beard was bushy and black, and the rest of his face so disfigured with hair, that it might be said to be all beard.

"Not the slightest motion in one of his limbs, nor in a muscle of his countenance, was perceptible. He was altogether without clothing, except a slip of brown stuff about the loins. He wore the 'poita,' or sacred thread, indicating that he was a Brahmin.

Night and day, it is understood, the wretched sufferer (if indeed his state can be called one of suffering) maintains without any variation this paralyzing position."

Mr. Bennett then expresses some disbelief in the constant immobility of the devotee, and evidently suspects him to be an impostor, who, under cover of night, leaves his post, and refreshes himself with sleep in a recumbent position. This, however, was certainly not the case, and indeed the very language of the account shows that it could not be so. A very long period must have elapsed before the devotee in question could have trained his body to remain, as Mr. Bennett admits was the case, without the movement of a muscle during the whole time that his proceedings were watched. And, before such a consummation could have been attained, the limbs of the man must have been so entirely stiffened by non-usage, that they would be as inflexible as if they had been cut out of wood or stone, and whether he stood or lay would have been a matter of perfect indifference. As to sitting, or assuming any attitude that involved the flexion of a limb, it would have been utterly impossible.

We may see a similar phenomenon, if it may be so called, among ourselves. There is not one man in a thousand who preserves the normal flexibility of his limbs, unless he be a professional athlete. Naturally, the limbs of every man and woman are as flexible as those of the posture-masters, who can cross their feet over the back of their necks, pick up a coin with their mouths from the ground between their heels, or sit on the ground with their legs stretched straight at either side of their bodies. But, unless men preserve this flexibility by constant use, the limbs become stiff, and it is quite as difficult, not to say impossible, for an ordinary Englishman to perform the feats of the professional acrobat, as it is for the Jogi to bend the knees or ankles that have been unbent for a series of years.

Moreover, the spectators who assemble round such devotees, and who never leave him unwatched by day or night, would be very ready to detect any attempt at imposture, and would be excited by it to such a pitch of religious fury, that the man would be torn to pieces by the excited crowd. And the very fact that the man was a Brahmin was proof enough that he was no impostor. By virtue of his Brahminical rank, he was at the summit of humanity. Had he been a low-caste man, he might with reason have been suspected of imposture, in order to obtain respect from his countrymen. But, as the man was already a Brahmin, such imposture was totally needless, and his devotion, superstitious and fanatical as it might be, was undoubtedly sincere.

CHAPTER CLI.

INDIA — *Concluded.*

THE INDIANS WITH RELATION TO ANIMALS.

FALCONRY — THE MINA BIRD AND ITS FEATS — SNAKE CHARMERS — SUSPICION OF IMPOSTURE — GENERAL CAMPBELL'S ACCOUNT OF THE COBRA AND THE CHARMER — DEATH OF THE MAN — DIFFICULTY OF THE TASK — THE POISON FANOS NOT REMOVED — INITIATION OF A NOVICE — ELEPHANT HUNTING — CATCHING ELEPHANTS WITH KOOMKIES — TAMING THE CAPTURED ANIMAL — AN ENTHUSIASTIC KOOMKIE — HUNTING IN NEPÁI, — JUNG BAHADŪR AND THE ELEPHANTS — HUNTING WITH TRAINED STAGS AND ANTELOPES — THE CHEETAHS OR HUNTING LEOPARDS.

WE will end this description of India with a few remarks on one of the chief peculiarities of native character, namely, the wonderful capacity of the Indians in taming and training animals. This capacity develops itself in various ways, some partaking of a religious character, and being considered as in some sense miraculous, and some only illustrative of the natural ascendancy which these men exert over beasts, birds, and reptiles.

The Indians are, for example, unsurpassed in their powers of training falcons, which they teach to attack, not only birds, but antelopes and other game. These falcons are of course unable of themselves to kill an antelope, but they will mark out any one that has been designated by their master, and will swoop down upon its head, clinging firmly with their talons, and buffeting the poor beast about the eyes with their wings, so that it runs wildly hither and thither, and thus allows itself to be captured by the dogs, from which it could have escaped had it been able to proceed in a straight line. A thoroughly trained falcon is held in very great esteem, and many a petty war, in which many lives were lost, has been occasioned by the desire of one rajah to possess a falcon owned by another.

Then there is a little bird called the Mina, belonging to the Grakles. It is a pretty bird, about as large as a starling, with plumage of velvety black, except a white patch on the wing. From either side of the head pro-

ceeds a bright yellow wattle. This bird can be taught to talk as well as any parrot, and it is said that, as a rule, the mina's tones more closely resemble those of the human voice than do those of any parrot. It is very intelligent besides, and can be taught to perform many pretty tricks.

One trick, which is very commonly taught to the bird, is to dart down upon the women, snatch away the ornaments which they wear on their heads, and carry them to its master. This is a little trick that is sometimes played by a young man upon the object of his affections, and is intended to make her grant an interview in order to have her property restored.

As to reptiles, the cobra seems to be as unlikely a creature to be tamed as any on the face of the earth. Yet even this terrible serpent, whose bite is nearly certain death, is tamed by the Indians, and taught to go through certain performances. For example, a couple of serpent charmers will come, with their flat baskets and their musical instruments, and begin to give a performance. One of them plays on a rude native pipe, while the other removes the cover of one of the baskets. Out comes the hooded head of the cobra, which seems as if it were about to glide among the spectators, when a gesture and a few notes from the piper check its progress, and it begins to rise and fall, and sway its head from side to side, as if in time to the music. The men will then take up the venomous reptile, allow it to crawl over

their bodies, tie it round their necks, and take all kinds of liberties with it, the serpent appearing to labor under some strange fascination, and to be unable or unwilling to use its fangs.

Some persons think that the serpents are innocuous, their poison fangs having been extracted. This may be the case in some instances, but in them the performers are not the genuine snake charmers. Moreover, there are several sets of fangs, one behind the other, so that when one pair is broken or extracted, another pair speedily comes forward.

That the genuine charmers do not depend upon such imposture for their success is evident from many cases in which the serpents have been carefully examined before and after the performance, and their fangs found to be perfect in every respect. One such instance is narrated by General Campbell in his "Indian Journal." He had previously been under the impression that the fangs were always removed from the serpents, but the following circumstance convinced him that the charmers could perform their tricks with snakes whose fangs were perfect:—

"When I was on General Dalrymple's staff at Trichinopoly, there was a dry well in the garden which was the favorite haunt of snakes, and in which I shot several. One morning I discovered a large cobra-capella at the bottom of this well, basking in the sun; but while I ran to fetch my gun some of the native servants began to pelt him with stones, and drove him into his hole among the brickwork. I therefore sent for the snake charmers to get him out. Two of these worthies having arrived, we lowered them into the well by means of a rope. One of them, after performing sundry incantations, and sprinkling himself and his companion with ashes prepared from the dung of a sacred cow, began to play a shrill, monotonous ditty upon a pipe ornamented with shells, brass rings, and beads, while the other stood on one side of the snake's hole, holding a rod furnished at one end with a slip-noose.

"At first the snake, who had been considerably bullied before he took refuge in his hole, was deaf to the notes of the charmer, but after half an hour's constant playing the spell began to operate, and the snake was heard to move. In a few minutes more he thrust out his head, the horse-hair noose was dexterously slipped over it and drawn tight, and we hoisted up the men dangling their snake in triumph.

"Having carried him to an open space of ground, they released him from the noose. The enraged snake immediately made a rush at the by-standers, putting to flight a crowd of native servants who had assembled to witness the sport. The snake charmer, tapping him on the tail with a switch, induced him to turn upon himself, and at the same

moment sounding his pipe. The snake coiled himself up, raised his head, expanded his hood, and appeared about to strike, but, instead of doing so, he remained in the same position as if fascinated by the music, darting out his slender forked tongue, and following with his head the motion of the man's knee, which he kept moving from side to side within a few inches of him, as if tempting him to bite.

"No sooner did the music cease, than the snake darted forward with such fury that it required great agility on the part of the man to avoid him, and immediately made off as fast as he could go. The sound of the pipe, however, invariably made him stop, and obliged him to remain in an upright position as long as the man continued to play.

"After repeating this experiment several times, he placed a fowl within his reach, which he instantly darted at and bit. The fowl screamed out the moment he was struck, but ran off, and began picking among his companions as if nothing had happened. I pulled out my watch to see how long the venom took to operate.

"In about half a minute the comb and wattles of the fowl began to change from a red to a livid hue, and were soon nearly black, but no other symptom was apparent. In two minutes it began to stagger, was seized with strong convulsions, fell to the ground, and continued to struggle violently till it expired, exactly three minutes and a half after it had been bitten. On plucking the fowl, we found that he had merely been touched on the extreme point of the pinion. The wound, not larger than the puncture of a needle, was surrounded by a livid spot, but the remainder of the body, with the exception of the comb and wattles (which were of a dark livid hue), was of the natural color, and I afterward learned that the coachman, a half-caste, had eaten it.

"The charmer now offered to show us his method of catching snakes, and seizing the reptile (about five feet long) by the point of the tail with his left hand, he slipped the right hand along the body with the swiftness of lightning, and grasping him by the throat with his finger and thumb, held him fast, and forced him to open his jaws and display his poisonous fangs.

"Having now gratified my curiosity, I proposed that the snake should be destroyed, or at least that his fangs might be extracted, an operation easily performed with a pair of forceps. But, the snake being a remarkably fine one, the charmer was unwilling to extract his teeth, as he said the operation sometimes proved fatal, and begged so hard to be allowed to keep him as he was, that I at last suffered him to put him in a basket and carry him off. After this he frequently brought the snake to the house to exhibit him, and still with his fangs entire, as I ascertained by personal inspection, but so

tame that he handled him freely, and apparently without fear or danger."

The best proof that the snake's fangs were not extracted is, that some weeks afterwards the reptile bit the charmer, and killed him.

It seems strange that serpents should be thus subject to man. It is comparatively easy to tame a bird or a beast, as hunger can be employed in the process, and really is the chief power, the creature learning to be fond of the person who furnishes it with food. Or, in extreme cases, the power of inflicting pain is employed, so that the animal is ruled by fear, if not by love.

But, in the case of a snake, the tamer is deprived of both of these adjuncts. As a serpent only feeds at very long intervals, and possesses an almost inexhaustible power of fasting, hunger cannot be employed; and its peculiar constitution would render the infliction of pain useless. The charmer has, therefore, to fall back upon some other mode of working upon his pupil, and finds it in music, to which the cobra seems peculiarly accessible. That it is powerfully influenced by music was known many centuries ago, as we may see by the references to serpent charming in the Scriptures. Any music seems to affect the creature, and, if it can be rendered docile by the harsh sounds that proceed from the charmer's flute, we may conjecture that more melodious sounds would have a like effect. Mr. Williams, who was very much inclined to be sceptical on the subject of serpent charming, and thought that the poison fangs were always removed, mentions that a gentleman at Chinsurah, who was a very excellent violinist, was forced to lay aside his instrument because the sounds of the violin attracted so many serpents to his house.

Serpent charming is thought to be a semi-sacred calling, and is one of those cases where the process of taming partakes of the religious character. The charmers are regularly initiated into their duties, and undergo certain ceremonies before they are thought to be impervious to the serpent's teeth. Sometimes an European has been initiated into these mysteries, as happened to Lady Duff Gordon, to whom a snake charmer took a fancy, and offered to initiate her. He and his pupil sat opposite each other, and joined their hands. The charmer then twisted a cobra round their joined hands, and repeated some invocation. Both of them afterward spat on the snake, and the novice was pronounced to be safe, and enveloped in snakes as a proof of the success of the incantation.

THERE is perhaps no better instance of the mastery of the Indians over animals than the manner in which they catch and instruct elephants.

The reader will doubtless remember that, though the elephant is abundant both in

Africa and India, the inhabitants of the former country never attempt to domesticate it. It has been thought that the African elephant is not trained, because it is fiercer than the Asiatic species or variety, and lacks the intelligence which distinguishes that animal. This, however, is not the case. The African elephant is as docile and intelligent as that of Asia, and quite as capable of being trained. The elephants which were used in the time of the ancient Romans were brought from Africa, and yet we read of the most wonderful feats which they could perform. Moreover, the African elephants which have been in the Zoological Gardens for some years are quite as tractable as the Asiatic animals. The real cause for the non-use of the African elephant is, not its incapacity for domestication, but the lack of capacity in the Africans to domesticate it.

In almost all cases of domesticated animals, the creatures are born in captivity, so that they have never been accustomed to a wild life. The Indian, however, does not trouble himself by breeding elephants, but prefers to capture them when sufficiently grown to suit his purposes. There are two modes of catching the elephant, one of which is so ingenious that it deserves some description, however brief. A common way is by making a large enclosure, called a "keddah," and driving the elephants into it. The keddah is so made, that when the elephants have fairly entered it they cannot get out again, and are kept there until subdued by hunger and thirst.

By this mode of elephant catching, the animals are taken in considerable numbers, and of all sizes. The genuine elephant hunter, however, cares little for this method, and prefers to pick out for himself the best animals, the Indians being exceedingly particular about their elephants, and an elephant having as many "points" as a prize pigeon or rabbit.

In every herd of elephants the males are given to fighting with each other for the possession of the females, and it often happens that a male, who for some time has reigned supreme in the herd, is beaten at last. Furious with rage and disappointment, he leaves the herd, and ranges about by himself, destroying in his rage everything which opposes him. In this state he is called a "rogue" elephant by the English, and *saun* by the natives. Now, furious and dangerous as is the saun, he is always a splendid animal, scarcely inferior indeed to the master elephant of the herd. The elephant hunters, therefore, are always glad to hear of a saun, and take measures to capture so valuable a prize.

They possess several female elephants, called "koomkies," which are used as decoys, and, strangely enough, take the greatest interest in capturing the saun. When

the hunter goes out on his expedition, he takes with him at least two koomkies, and sometimes three, if the saun should happen to be a very large one; and in all cases he takes care that the koomkies shall not be much smaller than the saun.

The hunters, furnished with ropes and the other apparatus for securing the saun, lie flat on the koomkies' backs, cover themselves with a large dark cloth, and proceed toward the place where the saun was seen. Often the koomkies carry in their trunks branches of trees, which they hold in such a manner as to prevent their intended captive from seeing that they carry anything on their backs. The saun, seeing them approach, loses some of his fury, and thinks that he is in great good-fortune to meet with females over whom he can rule as he had done before. He is so delighted with this idea that he fails to perceive the hunters, who usually slip off behind a tree as they near him, but sometimes boldly retain their post.

The koomkies then go up to the saun and begin to caress him, one on each side, and sometimes another in front of him, when three decoys are employed. They caress him, make much of him, and gradually bring him near a stout tree, where they detain him. The hunters then creep under the huge animal, and pass stout ropes round his forelegs, binding them tightly together, being aided in this by the decoys, who place their trunks so that their masters cannot be seen, and sometimes even assist him by passing the rope when he cannot conveniently reach it. The forelegs being secured, the hunter places round the elephant's hindlegs a pair of strong fetters. These are made of wood, and open with a hinge of rope. They are studded inside with sharp iron spikes, and, when clasped round the feet of the elephant, are fastened to the trunk of the tree with strong ropes.

The elephant being now made fast, the hunters creep away, and are followed by the koomkies, who receive their masters on their necks, and go off, leaving the unfortunate saun to his fate. If he was furious before, he is tenfold more so when he has to add to disappointment the sense of confinement, and the knowledge that he has been tricked. He screams with rage, tears branches off the tree, pulls up the grass by the roots and flings it about, and even tries to break the rope which holds him to the tree, or to pull up the tree itself by the roots. The spikes with which the wooden fetters are lined give him such pain, that he is soon forced to desist, and wearied out with pain and exertion, he becomes more quiet. On the following day the same men and elephants come to him, and bring him a little food; and so they go on until he has learned first to endure, and afterward to desire their presence. When they judge him to be sufficiently tamed, strong ropes are fastened to his legs,

and attached to the koomkies, and, the ligatures round his feet being removed, he is marched off to his new quarters.

Sometimes he resists, on finding his limbs at liberty. In such a case the koomkies drag him along by the ropes, while a large male pushes him on from behind, sometimes using his tusks by way of spurs. When he has been taken to his abode, he is treated with firm but kind discipline, and is so effectually tamed, that in a few months after he was ranging wild about the forest he may be seen assisting to convey a refractory brother to his new home.

The intelligence of the koomkies is really wonderful, and they take quite as much interest in the pursuit as their masters. Captain Williams mentions an instance where a gentleman had purchased a koomkie, not knowing her to be such. The mahout or driver would not mention her capacity, because he very much preferred the ease and comfort of a gentleman's establishment to the dangers and hardships of a hunter's life. The wealthy natives of the neighborhood would not mention it, because each of them hoped to buy the animal for himself at a less price than would be asked for a koomkie.

One day the animal was missing, and did not return for several days. However, she came back, and was harnessed as usual for a walk. When she came to a certain spot, she became restive, and at last dashed into the jungle, where she brought her master to a fine saun, whom she had crippled by fastening a chain round his forelegs.

In Nepal the natives adopt a very dangerous mode of elephant hunting. They go to the hunt on elephants, and furnish themselves with very strong ropes, one end of which is made fast to the body of the riding elephant, and the other furnished with a slip-knot, to which is attached a line, by which the noose can be relaxed. They give chase to the herd, and, selecting a suitable animal, the hunter dexterously flings the noose upon the head of the animal just behind its ears and on its brows. The elephant instinctively curls up its trunk, whereupon the noose slips fairly over its head.

The hunter then checks the pace of his animal, so that the noose is drawn tightly round the neck of the captured elephant, and causes a partial choking. His speed being checked, another hunter comes up and flings a second noose, so that by their united force the captive can be strangled if necessary. Sometimes, when he is very furious, the hunters are obliged to render him insensible over and over again, before he can be induced to obey his new masters. The well-known Nepalese ambassador, Jung Bahadur, was celebrated for his skill and daring in this dangerous sport.

As an example of the perfect command which the Indian mahouts have over their animals, Captain Williams mentions an

adventure which took place at Chittagong. During a stormy night, an elephant got loose, and escaped into the forest. Four years afterward, when a herd of elephants was driven into a keddah, the mahout, who had climbed the palisades to view the enclosed animals, thought that he recognized among them his missing elephant. His comrades ridiculed him, but he persisted in his idea, and called the animal by name. The elephant recognized the voice of its driver, and came toward him. The man was so overjoyed at this, that, regardless of the danger which he ran, he climbed over the palisades, and called to the elephant to kneel down. The animal obeyed him, he mounted on its neck, and triumphantly rode it out of the keddah.

Elephants are sometimes taken in pits, at the bottom of which are laid bundles of grass in order to break the fall of the heavy animal. The elephants are generally decoyed into these pits by a tame animal which is guided close to the pit by the mahout, who has placed certain marks by which he knows its exact locality. Sometimes they are merely dug in the paths of the elephants, which fall into them in their nightly rambles, and by their moanings inform the hunters of their proceedings.

In these pits they are forced to remain until they have been tamed by hunger, just as is the case with those animals that are tied to the trees. When they are sufficiently tame, the hunter throws into the pit successive bundles of jungle grass. These the sagacious animal arranges under his feet in such a way that he soon raises himself sufficiently high to step upon the level earth, where he is received by the hunters and his tame elephants. These "pitted" elephants, as they are called, are not held in high estimation, as there is always danger that they may have suffered some injury by the fall.

Just as tame elephants are brought to capture the wild animals, so are tame stags taught to capture those of their own species. An account of the sport is given in the "Private Life of an Eastern King":—

"I have never heard of trained stags being employed elsewhere as I saw them employed in Oude. . . . In our rides in the neighborhood of the lake, near which we encamped, we lighted upon a fine open country adjoining a forest, which would answer admirably for the purpose. The adjoining wood was full of the smaller game of Oude, or, if not smaller, at all events the more harmless, among which the wild deer must be classed as one. Skilful beaters were sent off into the forest to drive the deer, as if unintentionally,—that is, without violence, or making much noise,—toward the point of the forest adjoining the open space which I have just mentioned. Here, protected by its watching guardians,

the most warlike and powerful of its males, the herd was congregated in apparent safety.

"We had about a dozen trained stags, all males, with us. These, well acquainted with the object for which they were sent forward, advanced at a gentle trot over the open ground toward the skirt of the wood. They were observed at once by the watchers of the herd, and the boldest of the wild animals advanced to meet them. Whether the intention was to welcome them peaceably, or to do battle for their pasturage, I cannot tell, but in a few minutes the parties were engaged in a furious contest. Head to head, antlers to antlers, the tame deer and the wild fought with great fury. Each of the tame animals, every one of them large and formidable, was closely contested with a wild adversary, standing chiefly on the defensive, not in any feigned battle or mimicry of war, but in a hard-fought combat. We now made our appearance in the open ground on horseback, advancing toward the scene of conflict. The deer on the skirts of the wood, seeing us, took to flight, but those actually engaged maintained their ground, and continued the contest.

"In the meantime a party of native hunters, sent for the purpose, gradually drew near to the wild stags, getting in between them and the forest. What their object was we were not at the time aware; indeed, it was not one that we could have approved or encouraged. They made their way to the rear of the wild stags, which were still combating too fiercely to mind them; they approached the animals, and, with a skilful cut of their long knives, the poor warriors fell hamstrung. We felt pity for the noble animals as we saw them fall helplessly on the ground, unable longer to continue the contest, and pushed down by the tame stags. Once down, they were unable to rise again.

"The tame ones were called off in a moment; not one of them pursued his victory. Their work was done; they obeyed the call of their keepers almost at once, and were led off like hounds, some of them bearing evidence in their gored chests that the contest in which they had been engaged was no sham, but a reality. As we rode up we saw them led off, triumphantly capering over the ground as if proud of their exploits, tossing their fine spreading antlers about joyously, and sometimes looking as if they would enjoy a little more fighting,—this time with each other."

The antelope is sometimes used in a similar manner. The largest and most powerful male antelopes are trained for the purpose, and are sent toward the herd with nooses fastened on their horns. The wild antelopes soon come out to fight the intruders, and are caught by the nooses.

THERE is another sport of which the

Indians are very fond, namely, the chase of the deer by means of the chetah, or hunting leopard. This animal is by no means the same species as the common leopard, from which it is easily distinguished by its much larger legs, its comparatively bushy tail, and a crest or ridge of hair along the neck. It is not so much of a tree-climber as the common leopard, and though it can ascend a tree, very seldom does so. Whether the common leopard could be trained to catch deer is rather doubtful. The experiment has not been tried, probably owing to the fact that the chetah performs its part so well that there is no object in trying another animal.

Chetahs are very docile creatures, and, when tame, seem to be as fond of notice as cats. This I can personally testify, having been in the same cage with the animals at the Zoological Gardens, and found them very companionable, even allowing me, though after some protest in the way of growling and spitting, to take their paws in my hand, and push out the talons.

Those which are used for the sport are led about by their attendants, merely having a cord round their necks, and are so gentle that no one is afraid to be near them. Lest, however, they might be irritated, and in a moment of passion do mischief, they wear on their heads a sort of hood, shaped something like the beaver of an ancient helmet. This hood is generally worn on the back of the head, but if the keeper should think that his charge is likely to be mischievous, he has only to slip the hood over the eyes, and the animal is at once rendered harmless.

When the hunters go out in search of deer, the chetahs are taken on little flat-topped carts, not unlike the costermongers' barrows of our streets. Each chetah is accompanied by its keeper, and is kept hooded during the journey. When they have arrived within sight of deer, the keeper unhoods the animal and points out the prey. The chetah instantly slips off the cart, and makes its way toward the deer, gliding along on its belly like a serpent, and availing itself of every bush and stone by which it can hide its

advance. When it can crawl no closer, it marks out one deer, and springs toward it in a series of mighty bounds. The horsemen then put their steeds to the gallop, and a most exciting scene ensues.

The chase is never a very long one, for the chetah, though of wonderful swiftness for a short distance, does not possess the conformation needful for a long chase. Sometimes a chetah of peculiar excellence will continue the chase for some little time, but, as a rule, a dozen mighty bounds bring the animal to its prey. We all know the nature of the cat tribe, and their great dislike to be interrupted while their prey is in their grasp. Even a common cat has a strong objection to be touched while she has a mouse in her mouth, and we may therefore wonder how the keepers contrive to make the chetah relinquish its prey. This is done either by cutting off part of the leg and giving it to the chetah, or filling a ladle with its blood and allowing the leopard to lap it. The hood is then slipped over the eyes, and the chetah allows itself to be replaced in its cart.

Sometimes it is necessary to leave the cart, and lead the animal by its chain toward the place where the animals are known to be. This is always a difficult business, because the animal becomes so excited that the least noise, or the scent left by a passing deer, will cause it to raise its head aloft, and stare round for the deer. In a few moments it would become unmanageable, and dash away from its keeper, were not he prepared for such an event. He carries with him a kind of ladle, made of a hollowed cocoa-nut shell at the end of a handle. This is sprinkled on the inside with salt, and as soon as the man perceives a change of demeanor on the part of his charge, he puts the ladle over the muzzle of the chetah. The animal licks the salt, forgets the cause of excitement, and walks on quietly as before.

Some of the great men in India take considerable pride in their chetahs, and have them paraded daily, covered with mantles of silk heavily embroidered with gold, and wearing hoods of similarly rich materials.

CHAPTER CLII.

TARTARY.

THE MANTCHU TARTARS.

MUTUAL INFLUENCE OF THE TARTARS AND CHINESE UPON EACH OTHER—A CHINESE BATTLE—DASH AND COURAGE OF TARTAR HORSEMEN—TARTAR GUNNERS—"CATCHING A TARTAR"—THE BOW, AND MODE OF STRINGING IT—SYSTEMATIC TRAINING OF THE ARCHER—THE TARTAR ARROW—ATHLETIC EXERCISES—BLOODLESS CONQUEST OF THE TARTARS BY THE CHINESE. •

WE now proceed to the more civilized portions of the vast Mongolian race, namely the Tartars, the Chinese, and the Japanese. It will of course be impossible to give even the briefest account of the numerous nations which have been called Tartars, and we will therefore confine ourselves to the Mantchu Tartars, who have exercised so remarkable an influence on the empire of China.

It has been well said, that when a strong people invade and conquer the territory of a weaker, their conquest has a double effect. The victors impose certain habits and modes of life upon the vanquished, and, in so doing, generally strengthen them in those points where they are weak. But, in return, the vanquished exert an influence upon their conquerors which has precisely the opposite effect, and tends to diminish rather than to increase their strength. So it has been with the Tartars and the Chinese, whose history during the last few centuries has been most instructive to the ethnologist,—I should rather say, to the anthropologist.

Just as in one family we invariably find that there are members of very different powers, and that the possessor of the stronger intellect invariably obtains dominion over the others, so it has been with the two great divisions of the Asiatic Mongols. The Tartar is in many points superior to the Chinese, and, as a rule, is easily distinguished even by his appearance. He possesses more decided features, is more alert in his movements, and certainly possesses more courage. The Chinese will fight wonderfully well behind walls, or on board ship, and even in the field display great courage of a quiet nature if they

are led by European officers. But, when left to themselves, they are not good soldiers in the field, unless opposed to enemies much inferior. Mr. Scarth, who had the opportunity of witnessing a battle, describes it as an absolute farce.

"One day, when a great many soldiers were out, I saw more of the contest than was pleasant. Having got into the line of fire, I was forced to take shelter behind a grave, the bullets striking the grave from each side every second. Why they came my way it was difficult to discover, for they ought to have passed on the other side of a creek, about twenty yards distant, to the people they were intended for; but to see the dodging of the soldiers, then of the rebels, each trying to evade the other, was almost amusing.

"One fellow, ready primed and loaded, would rush up the side of a grave-hillock, drop his matchlock over the top, and, without taking aim, blaze away. There is no ramrod required for the shot they use; the bullet, or bar of iron, is merely dropped in loose upon the powder.

"There was a fine scene on an occasion when the Shanghai rebels made a sortie. One of the men was cut off by an imperial skirmisher, who had his piece loaded. The rebel had no time to charge his; so he ran round and round a grave, which was high enough to keep his enemy from shooting him when on the opposite side. Hare hunting was nothing to it. Red-cap described hosts of circles, and the royalist was fast getting blown, when the gods took pity on his wind, for, by some unlucky chance, the

rebel tripped and fell. The soldier was at him in a moment, and, to make sure of his prize, put the muzzle of his matchlock close to Red-cap's head, fired, and took to his heels as fast as he could go. It is difficult to say who was most astonished, when Mr. Red-cap did exactly the same! The bullet that dropped down readily on the powder fell out as easily when the barrel was depressed. The rebel got off with a good singeing of his long hair."

The Tartars, however, are very different men in battle, as was frequently proved during our wars in China; and though they were comparatively ignorant of the art of war, and were furnished with weapons that were mere toys in comparison with the arms to which they were opposed, they showed themselves to be really formidable antagonists. As irregular cavalry, they displayed an amount of dash and courage which would make them most valuable allies, could they be trained by European officers. They boldly charged in the face of field-batteries of Armstrong guns, and, though the shells burst among them with murderous precision, they came on in the most gallant manner.

Indeed, a British officer, who was opposed to them, said that scarcely any regular cavalry would have advanced in the face of such a fire, delivered from fifteen breech-loading guns. Of course, when they did close, the superior discipline of their opponents prevailed against them, and the Sikh cavalry of Probyn and Fane at once routed their undisciplined ranks. But, had they been drilled and commanded by such men as those who led the Sikh cavalry against them, the issue of the fight might have been very different.

They served their guns with dauntless courage, and allowed themselves to be cut to pieces by the Armstrong shell rather than leave them. A single man would sometimes be seen working a gun by himself after his comrades had been killed, and he expected the same fate every moment; and it therefore happened, that of the slain in that war by far the greatest number were Tartars. They are better horsemen than the Chinese, and both themselves and their steeds are hardy, active, and capable of existing on very little food. One of their peculiarities is the method in which they carry the sword. Instead of hanging it to the waist, and letting it bang against the horse's side, they pass it under the saddle-flap, where it is held tight by the pressure of the leg. They thus avoid the jingle and swing of the European sabre, and moreover are free from the drag of a heavy weapon upon the waist of the rider.

Of the courage displayed by the Tartars under adverse circumstances, a curious instance is given by Mr. M'Ghee. After one of the charges of Probyn's horse, the Tartar cavalry, in spite of their skill in evading

the thrust of a lance or the stroke of a sword, had suffered severe loss, and many were stretched on the ground. Among them was the body of a very powerful man, who had carried a handsome lance. As Mr. M'Ghee found himself without arms, in a rather dangerous position, he thought he would arm himself with the lance, and began to dismount.

As he took his foot from the stirrup, the supposed dead man sprang to his feet, lance in hand, and showed fight. An officer just then rode to the rescue with his revolver, and shot the Tartar in the back. The man fell, but rose again, charged the officer with his lance, unhorsed him, and made off, but was killed by a lance thrust from a Sikh horseman. The fact was, his horse had been killed in battle, and he meant to feign death until he could find an opportunity of slipping away. Even the wounded men, knowing nothing of the amenities of civilized war, and expecting no quarter, used to fire at the enemy when they lay writhing with pain on the ground.

These Tartar soldiers are commanded by a general belonging to their own people, and his immediate subordinate is almost invariably a Tartar also. The office of Tartar general is one of great importance, because, as the Emperor is always of a Tartar family, it is thought that the safety of his person and dynasty ought to be confided not to a Chinese, but to a Tartar. The lieutenant-general, who serves under him, though his post is perhaps the least lucrative in the Imperial household, is glad to hold the appointment, because he is usually selected to succeed to the generalship.

The chief weapons of these soldiers are the bow and the spear, the sword and fire-arms playing a comparatively subordinate part. Being good riders, they naturally take to the spear, the true weapon of a horseman, and are drilled in the various modes of delivering a thrust, and of avoiding one, the latter feat being performed with a dexterity almost equalling that of a Camanchee Indian. Although they carry fire-arms with them, they really place little dependence on the heavy, clumsy weapons which they use, that require two men to fire them, and generally knock down the firer by the recoil. Nor do they care very much for the improved fire-arms of Europeans, for, as one warrior said, guns get out of order, spears and swords do not.

The bow of the Tartar (which has spread throughout all China) is much on the principle of the reversed bows which have already been described, though the curve is not so continuous. The bow is nearly straight for the greater part of its length, and then takes an abrupt curve within a foot or so of each end. One of these bows, in my collection, is nearly six feet in length, and measures two inches in width. About

seven inches from each end, a broad piece of bone nearly an inch in length is fixed to the bow, so that the string passes over it, and does not strike against the wood.

The strength of these bows is enormous, varying, according to our mode of reckoning, from sixty to ninety pounds. The weapon is strung in manner somewhat resembling that which has already been described in connection with Indian bows. It must be done in a moment, or not at all, and the only method of doing so is, by placing it behind the right thigh and in front of the left, and then bending it with a sudden stoop of the body, at the same time slipping the loop of the string into its notch. My own weapon is so powerful that I can scarcely make any impression upon it, though I have used my best efforts.

The soldiers undergo a vast amount of practice in the use of this weapon, of which they are as proud as were the English archers of their long-bow and cloth-yard arrow. They have a saying, that the first and most important duty of a soldier is to be a good archer, and that a man ought even to sleep with a bow in his hands. In order to instruct them in the proper attitude of an archer, they have invented a simple piece of machinery, by means of which the soldier undergoes a vast amount of "position drill," so that he may learn to keep his body straight and firm, his shoulders immovable, and his hands in the right position.

From a beam or branch are suspended two rings, which can be moved up and down, to suit the height of the learner. The young archer places his hands in the rings as far as the wrists, and then goes through the various movements of the weapon. When he can satisfy his instructor, a bow is placed in his hands, and he then practises the art of drawing the string to its proper tension. Lastly, he has an arrow besides, and shoots it repeatedly. The head of the arrow is blunted, and the target is a piece of stout leather, hung loosely at a little distance, so that it partially yields to the arrow, and allows the missile to fall to the ground.

The arrow corresponds to the bow. One of these missiles in my collection is three feet three inches in length. It is made of some light wood, and is terminated by a flat, spear-shaped head, two inches long and one inch wide. The other end of the arrow is expanded, so as to allow a large "nock" for the reception of the thick string, and is bound with fish-skin as far as the feathers, which are exactly a foot in length. The shaft is extremely slight in comparison with the length of the arrow.

These men train their muscular powers to a great extent, and have several exercises for this purpose. One of them is called Suay-tau, or throwing the weight. They have a nearly square stone, weighing rather

more than fifty pounds, and having a handle in a hollow cut in its upper surface.

The men mark out a square on the ground, and the players stand at some distance apart. One of them takes the stone, swings it once or twice, and hurls it in the air toward the next player. It is thrown with such skill that the hollow always comes uppermost, and the stone descends into the hand with a shock that makes the man spin round on his heels. The same movement, however, is utilized to give force to the stone; and so the players pass this heavy weight from one to the other with apparent ease, and with the regularity of a machine. A similar exercise is conducted with a heavy sand-bag.

It may easily be imagined how such men would vanquish in battle the comparatively sluggish Chinese, and how they would impose upon them many of their manners and customs. But, though they succeeded in their conquest, though they changed the dress of the Chinese, though they placed a Tartar monarch on the throne, and though they have been the chief military power in China, they have themselves suffered a far severer, though slower, conquest at the hands of the vanquished.

The Chinese, being essentially a contemplative and intellectual nation, care very little for military ability, so that the lowest civil mandarin feels a thorough contempt for the highest military mandarin, because the active life of the latter precludes him from following up those peculiar studies which can raise a Chinese from the state of a peasant to that of the highest in the land. Especially do the Chinese despise their intellectual capacities, though they may appreciate and utilize their bodily strength and military prowess. "The Tartars," said a Chinese shopkeeper, "are cows."

The extraordinary reaction of the vanquished upon their conquerors is admirably put by Mr. Fleming, in his "Travels on Horseback in Mantchu Tartary."

"By dint of their extraordinary industry, thrifty habits, an unceasing desire to accumulate wealth by any amount of plodding, cunning, or hardship, the Chinaman has wormed himself beyond the Great Wall, built towns and villages, cultivated every rood of land, and is at once the farmer and the trader everywhere. He claims the best part of Mantchuria as his own, and dares even to scandalize the Tartar race in their own capital, though it is barely two centuries since that race filed in long cavalry troops through those gates at Shan-kis-Kwan, and were introduced by an indiscreet Chinese general to the vast empire which they soon conquered and sternly governed.

"Now the Chinese seem the conquerors, for they have not only obtained possession of the land, and converted it into a region thoroughly Chinese, but they have imposed

their language, their habits and customs, and every trait belonging to them, on those of the original occupants who choose to mix with them, and ousted out every grim old banner-man who would not condescend to shopkeeping, or handling the spade or plough.

“There is not the most trifling Mantchu word to designate town, hamlet, mountain, or river, in use among the people nowadays, and anything that might at all tell of the character and power of the original proprietors is entirely effaced. If the Mantchus obtained possession of the Dragon Throne at Peking, partly by force of arms in military prowess, and partly by perfidy, aided by rebellions among the Chinese themselves; if they compelled the hundreds of millions over whom they found cause to rule to alter their dress, wear tails, and perhaps smoke

tobacco, — the people thus subjugated have made ample retaliation by wiping out every trace of their invaders in their own country, and leaving the existence of the usurpers all but traditionary in the metropolis where, two hundred years ago, they held their court, and where one of their kings boldly vowed vengeance for seven great grievances that he imagined had been brought on him by the Chinese Emperor.

“Nothing prevents the invasion of the Corea by these wonderful Chinese but the high palisade that keeps them within the limits of Mantchuria. For, if once they got a footing in that country, the Coreans would suffer the same fate as the Mantchus, and there is no telling when these sons of Ham would stop in their bloodless aggrandizement and territorial acquisitiveness.”

REPEATING CROSSBOW. (From my Collection.)
(See page 1434.)

CHAPTER CLIII.

CHINA.

APPEARANCE — DRESS — FOOD.

APPEARANCE OF THE CHINESE — MODE OF PLAINTING THE "TAIL" — THE CHINESE BARBER — THE REFUSE HAIR AND ITS USES — CEREMONIOUS EMPLOYMENT OF THE TAIL — DRESSING THE HAIR OF THE WOMEN — MUTUAL ASSISTANCE — POWDER FOR THE SKIN, AND MODE OF APPLYING IT — SMALL FEET OF THE CHINESE WOMEN — ORIGIN AND DATE OF THE CUSTOM OF COMPRESSING THE FEET — DRESS OF THE WOMEN — DRESS OF THE MEN — THE "BUTTON" OF RANK — SYSTEM OF EXAMINATION — INGENUOUS MODES OF EVASION — EXCEPTION IN FAVOR OF OLD AGE — THE FAN AND ITS VARIOUS USES — CHINESE LANTERNS — THE "STALKING-HORSE LANTERN" — FEAST OF LANTERNS — THE GREAT DRAGON — CHOPSTICKS, AND THE MODE OF USING THEM — THE CASE OF CHOPSTICKS — FOOD OF THE CHINESE — LIVING CRABS — BIRDS' NEST SOUP — TEA, AND MODE OF PREPARATION.

WE now come to China, a country of such extent, so thickly populated, and containing so many matters of interest, that justice could not be fully done if an entire volume were devoted to it. We will therefore restrict ourselves to a selection of those particulars in which the Chinese appear to offer the greatest contrast to Europeans.

The appearance of the Chinese possess many of the characteristics of the Tartar, both nations being different branches of the same great family. The Chinese, however, are, as a rule, of a less determined and manly cast than the Tartars, and have about them a sort of effeminacy which accounts for the conquest suffered at their hands.

One of the chief peculiarities in a Chinaman's appearance is his "tail." This mode of dressing the hair was imposed upon the Chinese by the Tartars, and has remained in full force ever since. The Tae-ping rebels, however, viewing the "tail" as an ignominious sign of conquest, refuse to wear it, and allow the whole of their hair to grow.

With the loyal Chinese, however, the tail has become quite an institution, and they regard it with the same sort of reverence which is felt by an Arab, a Turk, or a Persian for his beard. It is scarcely possible to punish a Chinaman more severely than by cutting off his tail, and, though he may

supply its place with an artificial tail curiously woven into the hair, he feels the indignity very keenly. Sometimes, when two men are to be punished severely, they are tied together by their tails, and exposed to the derision of the public:

The tail bears some resemblance to the scalp-lock of the American Indian, but it includes very much more hair than is comprehended in the scalp-lock. The Chinaman shaves the hair from his forehead and round the temples, but leaves a circular patch of tolerable size, the hair of which is allowed to grow to its full length. Sometimes, if the patch be not large enough to nourish a sufficient quantity of hair to produce a good tail, it is enlarged by allowing more and more hair to grow at each successive shaving. On an average, the head is shaved once in ten days, and no one would venture to go into good society unless the hair of his head were clean shaven. As for his face, he has so few hairs upon it, that he does not trouble the barber very much with his countenance.

Owing to the position of the tail, a man cannot dress it properly without aid, and, chiefly for this purpose, the peripatetic barber has become quite an institution in China. All the materials of his trade are carried at the ends of a bamboo pole, which the barber carries in yoke fashion

across his shoulders. When his services are required, he puts down his load, arranges his simple apparatus in a few moments, and sets to work upon the cherished tail of his customer.

Very little capital is required to set up a barber in trade. There is the razor, a most primitive-triangle of steel, two inches long by one inch wide, which cost, perhaps, three half-pence, or twopence if it be of the best kind. There is the linen strop, which costs a penny, and a bamboo seat and table, which cost, perhaps, twopence each. There is one expensive article, namely, the brass basin, but, as a rule, a Chinese barber can be well set up in trade at the expenditure of about six or seven shillings, and can make a good living by his business. This sum includes a supply of black silk, wherewith to supplement the tails of his customers, and a few locks of real hair, with which he can supply artificial tails in cases where they are denied by nature.

The customer always holds a sort of basin in which to catch the clippings of hair. These are preserved, not from any superstitious ideas, as is the case in many parts of the world, but are put aside for the hair collector, who makes his daily rounds with his basket on his back. The contents of the basket are carefully utilized. The long hair combed from women's heads is separated and made into false tails for the men, while the short pieces shaven from men's heads are used as manure, a tiny pinch of hair being inserted into the ground with each seed or plantlet. In consequence of the universal practice of shaving the head and wearing a tail, the number of barbers is very great, and in 1858 they were said to exceed seven thousand in Canton alone.

The right management of the tail is, among the Chinese, what the management of the hat is among ourselves. For example, it is a mark of respect to allow the tail to hang at full length, and any one who ventured to address an equal without having his tail hanging down his back would be thought as boorish as would an Englishman who went into a lady's drawing-room without removing his hat. When the people are at work, they always coil the cherished tail round their heads, so as to get it out of the way; but if a man of superior rank should happen to pass, down go all the tails at once.

During the late war in China, the common people soon found that the English, in their ignorance of Chinese customs, did not trouble themselves whether the tails hung down their backs or were twisted round their heads. Accordingly, Oriental-like, they

took advantage of this ignorance, and, though they would lower their tails for the meanest official who happened to pass near them, they made no sign even when an English general came by. However, one of the English officers discovered this *ruse*, and every now and then one of them used to go through the streets and compel every Chinaman to let down his tail.

The tail is never entirely composed of the hair of the wearer. Sometimes it is almost wholly artificial, a completely new tail being fixed to a worn-out stump, and, as a general rule, the last eighteen inches are almost entirely made of black silk. Besides being a mark of fashion, the tail is often utilized. A sailor, for example, will tie his hat to his head with his tail when the wind rises, and a schoolmaster sometimes uses his tail in lieu of a cane.

Absurd as the tail looks when worn by any except a Chinese or Tartar, it certainly does seem appropriate to their cast of countenance, and it is to be doubted whether the Tartar conquerors did not confer a benefit instead of inflicting an injury on the Chinese by the enforcement of the tail.

The hair of the women is not shaven, but on the contrary, additions are made to it. While they are unmarried, it hangs down the back in a long queue, like that of the men; but when they marry, it is dressed in various fantastic forms. There is a very fashionable ornament in China, called the "butterfly's wings." This is a quantity of false hair made in fanciful imitation of a huge butterfly, and fastened to the back of a woman's head. Fashions, however, vary in different parts of China, and even in the same locality the women are not tied to the absolute uniformity which distinguishes the hair of the men. One mode of hair-dressing which is very prevalent makes the hair look very much like a teapot, the long tress

MUTUAL ASSISTANCE.

being held in their place by a strong cement made from wood shavings. Another mode of hair-dressing which prevails in Northern China is thus described by Mr. Fleming: "Here it is dressed and gummed in the form of an ingot of sycee silver, which is something in shape like a cream-jug, or an oval cup, wide at the top and narrow at the bottom, with a piece scooped out of the edge at each side, and with bright-colored flowers fastened by, or stuck about with skewers and pins, that stand out like porcupine quills. Though their necks be ever so dirty, and their faces not much better, yet the hair must be as exquisitely trimmed and plastered, according to the local rage, as that in a wax model seen in a London barber's shop-window."

In the accompanying illustration two women are shown, who render aid to each other in arranging their hair after the "tea-pot" fashion. In the households of Chinese women, dressing-cases are considered almost the chief requisites of life. In the drawers are the combs, pins, and paint for the cheeks and lips, and the white powder which is rubbed into the skin. This powder is made from white marble, which is broken small with a hammer, and then thrown into a tub in which revolve two stones turned by a buffalo, just like the wheels which are used in making gunpowder. The coarsely ground mass is then transferred, together with water, to a second mill, in which it is reduced to a mixture like cream. This creamy substance is then levigated in a succession of tubs, the sediment of which is taken out and returned to the mill, and the remainder is allowed to settle, the superfluous water drawn off, and the sediment pressed, while still moist, into cakes.

When used it is not only rubbed on the skin, but actually worked into it with string, which is placed on the hands in a sort of cat's-cradle, and worked backward and forward until the required effect is produced. This powder is also used to give rice a factitious whiteness. The coarser portions are employed for making whitewash and whitening mortar.

Many of the Chinese of both sexes are remarkable for the great length to which they allow their nails to grow. This is supposed to be a sign of rank or literary occupation, inasmuch as the nails would be broken by any laborious work. For this purpose, they are kept carefully oiled to prevent them from being brittle, and are further preserved by being enclosed in tubes which slip over the end of the finger. These tubes are sometimes of bamboo, sometimes of silver, and a few of the most precious minerals.

The feet of the Chinese women are often more strangely decorated than their heads. A vast number of the women have their feet cramped by bandages into a state which renders them little better than mere pegs on

which to walk, or rather totter. It is not only the rich who are thus deformed, but the poorest often have their feet cramped. The operation is begun at a very early age, so that the feet of the full-grown woman may not exceed in size that of a child of five or six. Bandages are bound firmly round the foot in such a way as to force it into an arched shape, the heel being pressed forward and the ball of the foot backward, while the four middle toes are bent under the foot, and so completely squeezed into its substance that they almost lose their identity. In fact, the member is made artificially into a club-foot, which, repugnant as it may be to European eyes, is the delight of the Chinese, who call it metaphorically by the name of "golden lily."

CHINESE WOMAN'S FOOT AND MODEL OF A SHOE.

(From my collection.)

Clay models of these "golden lilies" are sold at many of the shops; and as they are very accurate imitations of the foot, and it is almost impossible to induce a Chinese woman to remove the bandages and exhibit the member, a representation of one of these models is here given. The gait of the woman is necessarily reduced to an awkward waddle. There is no play of the beautiful machinery of the human foot, and the wearer of the "golden lily" walks exactly as she would do if she had no feet at all. Indeed, her gait is even more awkward, inasmuch as the weight of the body is thrown forward upon the great toe, than which nothing can be imagined more opposed to the real intention of the foot.

Fast walking is impossible with these feet, and running is out of the question, the women being obliged to support themselves by holding to walls or other objects, or to balance themselves by holding out their arms at

right angles to their bodies. Indeed, even when walking quietly in the house, the woman generally leans on the various articles of furniture as she passes them, the act appearing to be instinctive, and one of which she is not conscious. Stairs are of course a difficulty in the way of "golden lilies." Fortunately, there are not many stairs in a Chinese dwelling-house, the living rooms of which are mostly on the ground floor. I have noticed that a small-footed Chinawoman can ascend stairs easily enough, but that she always holds by the banisters or wall as she descends.

The deformity in question does not end with the foot. As the toes and ankles are deprived of motion, the muscles which work them, and which form the calf of the leg, gradually dwindle away for want of use, so that from the ankle to the knee the leg is scarcely thicker than a broomstick.

Utterly hideous as is this deformity, it is coveted by all, and those who do not possess it try to look as if they did. This they achieve by making an artificial "golden lily" of wood, putting it into a fashionable shoe, and fastening the contrivance on the sole of the real and serviceable foot. Mr. Milne remarks that a nurse, if called up suddenly in the night, will make her appearance walking firmly on her full-sized bare feet, instead of hobbling along with the fashionable waddle which she has been exhibiting by day. By a similar *ruse*, the boys who enact female parts on the stage imitate not only the feet but the peculiar walk of the women, and do it with such perfection that no one who was not in the secret would have the least idea that they are not what they pretend to be.

Of the origin or date of the custom nothing is known, though there are various legends which attempt to account for both. One legend, for example, attributes it to an empress of China named Tan-key, who lived some three thousand years ago, and who, having club feet by nature, induced her husband to impose the same deformity on all his female subjects. Another legend states that a certain empress was discovered in the chamber of a courtier, and laid the fault on her feet, which carried her against her will. The emperor accepted the excuse, but cut off the fore-part of her feet in order to render them more subordinate for the future. Another legend, which is a very popular one, attributes the custom to a certain prince named Le-yuh, who in consequence was condemned to seven hundred years' torture in the infernal regions, and to make with his own hands one million shoes for the women.

The dress of the Chinese varies greatly according to the rank of the individual and the season of the year. Without going into detail, which would occupy too much time, it is sufficient to say that the principle of the dress is similar, not only among different

classes, but with the two sexes, the coat and trousers being the principal articles, modified in material and form according to circumstances. The dress of a mandarin or noble, and of his wife, may be seen in the illustration on the 1437th page. The richness of material and beauty of work displayed in some of these dresses are really marvellous. They are generally of the most delicate silks, and are covered with embroidery of such harmonious coloring and exquisite workmanship as no country can equal.

It is not, however, the richness of dress which denotes rank among the Chinese. The symbol of social status is simply a spherical "button," about as large as a boy's playing marble, placed on the apex of the cap. The different colors and materials of the buttons designate the rank, the "blue ribbon" being a plain red coral button. The possession of these buttons is an object of high ambition for the Chinese, and its value is increased by the fact that there is no hereditary rank in China, and that the coveted button must be earned, and can neither be purchased nor given by favor.

It can only be gained by passing through a series of examinations, each increasing in severity, and no candidate for high rank being permitted to compete unless he can show the certificate that he has gained the rank immediately below it. The examinations are conducted in a building expressly made for the purpose. It has double walls, between which sentinels are continually pacing. The gates are watched in the strictest manner, and each candidate is locked into a tiny cell, after having undergone the strictest search in order to ascertain that he has not carried in any scrap of writing that may help him in the examination.

The examiners themselves are conveyed from a distance, and surrounded by troops, so that no one can approach them; and so careful are the officers who conduct the examination that the examiners are not allowed to see the original passages written by the candidates, but only copies made by official scribes. When they have passed a paper as satisfactory, the original is produced, the two are compared, and not until then does any one know the name of the writer, which has been pasted between two leaves.

The precautions are most stringent, but the ingenuity exercised in evasion sometimes conquers all the barriers set up between a candidate and external assistance. Sometimes a man, already a graduate, will manage to substitute himself for the candidate, write all the essays, and contrive a second change on leaving the place, so that the real candidate takes up the substituted essays. Sometimes a friend within the building will learn the subject of the essays, write them in tiny characters on very thin paper, enclose the paper in wax, and drop it

into the water which is supplied to the candidates. One man of peculiar daring hit on the plan of getting a friend to tunnel under the walls of the college, and push the required documents through the floor of the cell. Should any such attempt be discovered, the candidate is at once ejected, and disqualified from a second attempt.

The Chinese have good reason to be ambitious of the honors of a button, as even the very lowest button exempts the wearer from military service and from arrest by the police. The bearer of this coveted symbol becomes at once one of the privileged classes; he wears an official costume when he likes, and is qualified to enter as candidate for still higher honors. Such privileges are worth much trouble to obtain, and accordingly the rejected candidates will enter the examination year after year, even until they are gray-headed. With the respect for old age which is one of the most pleasing characteristics of the Chinese, there is a law that if a man should attend the examinations annually until he is eighty years of age, and still be unable to pass, he is invested with an honorary degree, and may wear the button and official dress *honoris causâ*. The same rule holds good with the higher degrees.

The very highest posts in the kingdom are denoted by a peacock's feather, which falls down the side of the cap. The gradations in rank of the feather wearers are marked by the number of "eyes" in the ornament, the summit of a Chinaman's ambition being to wear a feather with three eyes, denoting a rank only inferior to that of the Emperor.

There is one article common to all ranks and both sexes, and equally indispensable to all. This is the fan, an article without which a Chinaman is never seen. The richer people carry the fan in a beautifully embroidered case hung to their girdles; but the poorer class content themselves with sticking it between the collar of the jacket and the back of the neck. Whenever the hand is not actually at work on some task, the fan is in it, and in motion, not violently agitated, as is mostly the case in Europe, but kept playing with a gentle, constant, and almost imperceptible movement of the wrist, so as to maintain a continuous though slight current of air.

Sometimes, in very hot weather, a stout mandarin will quietly lift up the skirts of his jacket, place his fan under the garment, and send a current of cool air round his body; and this done, he drops the skirts afresh into their place, and directs the refreshing breeze over his countenance. Sometimes it is used by way of a parasol, the man holding it over his head as he walks along. Sometimes the schoolmaster uses it by way of a ferule, and raps his pupils unmercifully on the knuckles; and so inveterate is the use of the fan, that soldiers, while

servicing their guns, have been observed quietly fanning themselves in the midst of a brisk fire of shot, shell, and bullets.

The materials and patterns of Chinese fans are innumerable. They are made of paper, silk, satin, palm-leaf, wood, feathers, horn, or ivory. Some of them are made so that when they are opened from left to right they form very good fans, but when spread from right to left all the sticks fall apart, and look as if they never could be united again. Those which are made of paper have various patterns painted or printed on them, and thousands are annually sold on which are complete maps of the larger Chinese cities, having every street and lane marked. Those which are made of silk or satin are covered with the most exquisite embroidery; while the horn and ivory fans are cut into patterns so slight and so delicate that they look more like lace than the material of which they really are composed. The wooden fans are made in much the same way, though the workmanship is necessarily coarser: the material of these fans is sandalwood, the aromatic odor of which is much prized by the Chinese.

Choice sentences and aphorisms from celebrated authors are often written on the fan; and it is the custom for Chinese gentlemen to exchange autographs written on each other's fans. The price of these fans varies according to the material and workmanship, common ones being worth about four or five for a penny, while a first-class fan will cost several pounds.

The lantern is almost as characteristic of the Chinese as the fan, inasmuch as every one who goes abroad after dark is obliged by law to carry a lantern, whereas he need not carry a fan unless he chooses. These lanterns have of late years become very common in England, the subdued light which they give through their colored envelopes having a very pretty effect at night, especially in conservatories. There is a wonderful variety of these lanterns, some of them being most complicated in structure, enormous in size, and hung round with an intricate arrangement of scarlet tassels. Others are made of a balloon-like shape, the framework being a delicate net of bamboo, over which is spread a sheet of very thin paper saturated with varnish, so that it is nearly as transparent as glass. Figures of various kinds are painted upon the lantern, and so great is the sale of these articles, that many artists make a good living by painting them. Generally, when a man buys a lantern, he purchases a plain one, and then takes it to the painter to be decorated. The name of the owner is often placed upon his lantern, together with his address, and sometimes the lantern is used as a representative of himself.

Many of the lanterns shut up flat, on the principle of the fan; some of them open out

into cylinders, and some into spherical and oval shapes.

One of the most ingenious of these articles is the "stalking-horse lantern," which is only used for festivals. It is of large size, and contains several tapers. Above the tapers is a horizontal paddle-wheel, which is set revolving by the current of air caused by the flame, and from the wheel silk threads are led to a series of little automaton figures of men, women, birds, beasts, etc., all of which move their arms, legs, and wings as the wheel runs round. A good specimen of this lantern is really a wonderful piece of work, the threads crossing each other in the most complicated style, but never getting out of order.

So completely is the Chinaman a lantern-carrying being, that, during our war in China, when a battery had been silenced by our fire in a night attack, and the garrison driven out, the men were seen running away in all directions, each with a lighted lantern in his hand, as if to direct the aim of the enemy's musketry.

In connection with this subject, the celebrated Feast of Lanterns must not be omitted. In this remarkable ceremony, every lantern that can be lighted seems to be used, and the Chinese on this occasion bring out the complicated "stalking-horse lantern" which has just been described. The chief object, however, is the Great Dragon. The body of the Dragon is made of a number of lanterns, each as large as a beer barrel, and having large candles fastened within it. Nearly a hundred of these joints are sometimes used in the construction of a single Dragon, each joint being tied to its neighbor, so as to keep them at the same distance from each other. At one end is an enormous head with gaping jaws, and at the other is a tail of proportionate dimensions.

This Dragon is carried through the streets and villages, and has a most picturesque effect as it goes winding along its course, the bearers contriving to give it an undulating movement by means of the sticks to which the different joints are attached. A similar festival is held in the autumn. Accompanying the Dragon are a number of men dressed in various fantastic ways, as representations of the attendants of the gods. Some of them have heads like oxen, others like horses, and they are all armed with curious pronged weapons. Then there are simulated giants and dwarfs, the former being carried on the shoulders of men whose legs are concealed by the robes of the image, and the latter by boys whose heads are received into the hats which the images wear. In neither instance do the bearers trouble themselves to conceal their faces.

Various ceremonies of a like nature are enacted, of which no description can be given for want of space.

Of the Chinaman's social habits none has been more widely known than the use of the "chopsticks," or the two little rods by means of which the solid food is eaten. This is not the Chinese name, but is one invented by foreigners, who have employed the term as a sort of equivalent for the "kwai-tsze," or nimble-lads, as they are very appropriately termed by the Chinese. Originally they were simply two slips of bamboo, but now they are of wood, bone, ivory, or sometimes silver. Two pairs of chopsticks in my collection are nearly ten inches in length, and about as thick at the base as a small goose-quill, tapering gradually to half the thickness at the tip.

Much misunderstanding prevails as to the use of the chopsticks, many persons supposing that they are held one in each hand, after the manner of knives and forks in Europe. These curious implements are both held in the right hand after the following manner: One of them is taken much as a pen is held, except that, instead of being held by the thumb and forefinger, it passes between the tips of the second and third fingers. This chopstick is always kept stationary. The second chopstick is held lightly between the thumb and forefinger, and can be worked so as to press with its tip against the point of the other, and act after the manner of pincers.

The adroitness displayed by the Chinese in the use of these implements is worthy of all admiration. I have seen them pick up single grains of rice with the chopsticks, dip them in soy, and carry them to the mouth with perfect precision; and, indeed, after some few lessons, I could do it tolerably well myself. In eating rice after the usual manner, the tips of the chopsticks are crossed, and the rice lifted with them as if on a spoon. If, however, the man be very hungry, he does not trouble himself about such refinement, but holds the bowl to his lips, and scoops the rice into his mouth with a celerity that must be seen to be believed. In point of speed a spoon would be nothing compared with the chopstick.

The reader must understand that the Chinese never carve at table, thinking that to do so is an utterly barbarous and disgusting custom. The meat is brought to table ready cut up into small morsels, which can be taken up with the chopsticks. The only use made of a knife at table is to separate any small pieces of meat that may adhere together; and for this purpose, a narrow, long-bladed knife is generally kept in the same sheath with the chopstick.

As a rule, every Chinaman who can afford so cheap a luxury has his chopstick-case hanging from his girdle. The case is made of different materials, such as shagreen, tortoise shell, and ivory. Specimens of the two latter kinds of case are in my collection. The ordinary case contains the two chop-

sticks, the knife, and a flat ivory toothpick. Sometimes, however, a wealthy man will carry a much more complicated set of table apparatus. Besides the usual chopsticks, the knife, and the toothpick, there is a spoon for eating soup, a neat little quatrefoil saucer for soy, and a peculiar two-pronged fork, with its prongs united in the middle by a floriated ornament.

As to the food of the Chinese, it varies according to the wealth of the individual, so that a man of property would not think of eating the food which the poor man thinks luxurious. In fact, it is much the same as with ourselves, so that it is impossible to make the dietary of one station the sample for that of the nation in general. There are, perhaps, one or two articles of food which ought to be casually mentioned. One, which is not generally known, is rather graphically described by Mr. Milne: "Like other Chinese, he" (*i. e.* a Chinese officer named Le) "invited me to dine with him on an early day after our acquaintance was formed. On this occasion I met at his table with a peculiar dish, which I had never seen under the roof of any other host, though I was informed that it was not a monopoly of Mr. Le's taste.

"When our party of six had seated themselves at the centre table, my attention was attracted by a covered dish, something unusual at a Chinese meal. On a certain signal, the cover was removed, and presently the face of the table was covered with juvenile crabs, which made their exodus from the dish with all possible rapidity. The crablets had been thrown into a plate of vinegar just as the company sat down, such an immersion making them more brisk and lively than usual. But the sprightly sport of the infant crabs was soon checked by each guest seizing which he could, dashing it into his mouth, and swallowing the whole morsel without ceremony.

"Determined to do as the Chinese did, I tried this novelty also with one. With two I succeeded, finding the shell soft and gelatinous, for they were tiny creatures, not more than a day or two old. But I was compelled to give in to the third, who had resolved to take vengeance, and gave my lower lip a nip so sharp and severe as to make me relinquish my hold, and likewise desist from any further experiment of this nature."

The celebrated birds'-nests, which the

Chinese convert into soup, are not, as some persons seem to think, made of sticks, and straws, and wool, but are formed from the gelatinous substance obtained by masticating a sort of seaweed. The nests are transparent, as if made of gelatine, and when placed in hot water they dissolve as readily. The nest, when dissolved, is very much like the well-known "Irish moss," or carrageen; and I fully believe that, if the Chinese were to obtain the seaweed itself, and prepare it like the nests, it would answer every purpose. I possess specimens both of the seaweed and the nest, and, after tasting both, have found them to be identical in flavor and consistence. And, as the seaweed might be obtained for about ten shillings per hundred-weight, and the finest kind of nest costs eight hundred pounds for the same amount, the importation of the seaweed instead of the nests from Java might be a good speculation.

With regard to the great staple of the country, namely tea, very little can be said here. In the first place, the public is very well informed on the subject, and, in the next, the tea question is so large that it would occupy far too great space. The mode of preparing tea differs much from that practised by ourselves. Instead of allowing the tea to be made and then to stand for a considerable time, the Chinaman puts a little tea into a cup, pours boiling rain-water on it, inverts the saucer over it, so as to prevent the aroma from escaping, and drinks it immediately, using the saucer as a strainer whereby to keep the tea-leaves out of his mouth. As to adulterating the tea with such abominations as cream and sugar, he would be horrified at the idea. The Chinese never use milk for themselves, though of late years they have learned to milk their buffaloes for the service of the foreigner, and they consume sugar in almost every shape except in tea.

We who use either of these accessories cannot understand the true flavor of tea, the aroma of which is as much destroyed by such admixture as would be that of the choicest wine. Even those who do not spoil their tea in the usual manner can seldom know what the best tea is, because it is never sent to this country. Not in China can a foreigner purchase it, as it is not made for general sale, but is reserved for "cumshaws," or presents.

CHAPTER CLIV.

CHINA — *Continued.*

WARFARE.

WEAPONS OF THE CHINESE — BREECH-LOADING CANNON — VARIOUS FORMS OF THE JINGALL — CHINESE ARTILLERYMEN AND THEIR MAGAZINE — BOWS AND ARROWS — THE REPEATING CROSS-BOW AND ITS MECHANISM — CONSTRUCTION OF THE ARROWS — CHINESE SWORDS — THE DOUBLE SWORD, AND MODE OF USING IT — TWO-HANDED SWORDS — CRUELTY OF THE VICTOES — VARIOUS MODES OF TORTURE — KNEELING ON THE CHAIN — THE CANGUE — FINGER AND ANKLE SQUEEZING — USE OF TORTURE IN MONEY-GETTING — THE LARGE AND SMALL BAMBOO — MODE OF EVADING IT — EXPOSURE IN A CAGE — THE HOT-WATER SNAKE — CAPITAL PUNISHMENTS — SUICIDE BY ORDER — STRANGLING — CRUCIFIXION PREFERRED TO BEHEADING — EXECUTION OF A THIEF — SAWING ASUNDER — CONDUCT OF THE MANDARINS — THE “UMBRELLA OF A THOUSAND PEOPLE” — THE ROBE OF HONOR — TRANSFER OF RANK.

WITHOUT going into the question of warfare in China, we will mention one or two of the characteristic weapons.

Fire-arms have apparently been known to them for ages, but in all the years that we have been acquainted with China, no improvement has been made in these weapons, the cannon, the jingall, and the hand-gun being as rude and ineffective as they were two centuries ago. The cannon are little more than thick tubes of iron, mostly hooped to strengthen them, and of various lengths and bores. As to preserving any exactness of size in the bores, the Chinese care little for it, and if the ball is too small to fit the cannon, they wrap it up in cotton and then push it upon the powder. Wadding is thought to be needless in fire-arms. It is rather remarkable, however, that the Chinese have used breech-loading cannon from time immemorial. Each of these guns is supplied with several separate chambers, which can be kept loaded, and dropped one by one into the aperture of the gun as fast as they can be fired.

Clumsy as may be the jingall, it appears to be the most efficient of the Chinese fire-arms. It looks something like a duck-gun, and is supposed to carry an ounce ball, though the missiles sent from it are generally of a very miscellaneous character. Some of these guns are pivoted and fixed on tripod stands, while others are either sup-

ported on the shoulder of an assistant gunner while the firer takes aim, or rest upon two supports which are pivoted to the stock not very far from the muzzle of the gun. Of the manner in which the jingall is fired, Captain Blakiston gives a very amusing account, the whole proceeding having a very ludicrous aspect to an English artillery officer.

“We explained to them that we should like to see some practice with their artillery, on which the bombardier, as he seemed to be, went to the powder magazine, which was an old sack carefully tied up and lying under a bed in the hut, and brought forth the charge in a tea-cup. Then he mounted on a stool, and poured the powder in at the muzzle; the jingall was thumped on the ground, and with a long bamboo, which served as a ramrod, they rammed the powder home. A little of the already soft powder was then mealed, and the touch-hole filled with it.

“One man then held on tight to the butt, while another, coming out with a hot poker, discharged the weapon, the effect of which in noise and smoke was marvellous; but the poor fellow who was doing the marksman was knocked heels over head backward. He seemed, however, quite accustomed to that sort of thing, for, picking himself up in a minute, he performed what I certainly took for the *coup d'état* of the whole pro-

ceeding. Suddenly swinging round the jingall on its pivot, he applied his mouth to the muzzle, and blew violently down it, which sent the remaining sparks flying out of the vent, and then swung it back into its former position, by which manœuvre he nearly knocked my companion off his legs.

"The piece was then left with its muzzle inclined well upward, so that any rain which might fall would trickle nicely down the barrel and accumulate at the breech. The picket seemed to be without any shot for their jingall, for we tried to get them to put one in, so that we might fire across the bows of our junks, in order to test the courage of the boat coolies. Probably shot are not used in the warfare of the interior: our after experience was favorable to this supposition."

Captain Blakiston rather maliciously adds, that the picket was placed there for the purpose of giving an alarm by running away as soon as any body of rebels might come in sight.

I possess a specimen of the jingall. It is exactly seven feet in length, and is, in fact, nothing more than a heavy iron tube mounted on a stock, and supplied with the rudest imaginable arrangement for the match. Altogether, I think that the risk of firing it would be rather greater than that of being fired at with it.

As for the bow and arrow, they are substantially the same as that which has been described when treating of the Tartars, the weapon having been taken up by the Chinese, and its use carefully learned after the same fashion as has been mentioned.

The most characteristic Chinese weapon with which I am acquainted is the repeating crossbow (shown on page 1425), which, by simply working a lever backward and forward, drops the arrows in succession in front of the string, draws the bow, shoots the missile, and supplies its place with another. The particular weapon from which the drawings are taken was said to have been one of the many arms which were captured in the Peiho fort.

It is not at all easy to describe the working of this curious bow, but, with the aid of the illustration, I will try to make it intelligible.

The bow itself is made of three strong, separate pieces of bamboo, overlapping each other like the plates of a carriage-spring, which indeed it exactly resembles. This is mounted on a stock, and, as the bow is intended for wall defence, it is supported in the middle by a pivot. So far, we have a simple crossbow; we have now to see how the repeating machinery is constructed. Upon the upper surface of the stock lies an oblong box, which we will call the "slide." It is just wide and long enough to contain the arrows, and is open above, so as to allow them to be dropped into it. When in the

slide, the arrows necessarily lie one above the other, and, in order to prevent them from being jerked out of the slide by the shock of the bowstring, the opening can be closed by a little wooden shutter which slides over it.

Through the lower part of the slide a transverse slit is cut, and the bowstring is led through this cut, so that the string presses the slide upon the stock. Now we come to the lever. It is shaped like the Greek letter π the cross-piece forming the handle. The lever is jointed to the stock by an iron pin or bolt, and to the slide by another bolt. Now, if the lever be worked to and fro, the slide is pushed backward and forward along the stock, but without any other result.

Supposing that we wish to make the lever draw the bow, we have only to cut a notch in the under part of the slit through which the string is led. As the slide passes along the stock, the string by its own pressure falls into the notch, and is drawn back, together with the slide, thus bending the bow. Still, however much we may work the lever, the string will remain in the notch, and must therefore be thrown out by a kind of trigger. This is self-acting, and is equally simple and ingenious. Immediately under the notch which holds the string, a wooden peg plays loosely through a hole. When the slide is thrust forward and the string falls into the notch, it pushes the peg out of the hole. But when the lever and slide are drawn backward to their full extent, the lower end of the peg strikes against the stock, so that it is forced violently through the hole, and pushes the string out of the notch.

We will now refer to the illustration. Fig. 1 represents the bow as it appears after the lever and slide have been thrust forward, and the string has fallen into the notch. Fig. 2 represents it as it appears when the lever has been brought back, and the string released.

A is the bow, made of three layers of male bamboo, the two outer being the longest. B is the string. This is made of very thick catgut, as is needed to withstand the amount of friction which it has to undergo, and the violent shock of the bow. It is fastened in a wonderfully ingenious manner, by a "hitch" rather than a knot, so that it is drawn tighter in proportion to the tension. It passes round the end of the bow, through a hole, and then presses upon itself.

C C show the stock, and D is the slide. E is the opening of the slide, through which the arrows are introduced into it, and it is shown as partially closed by the little shutter F. The lever is seen at G, together with the two pins which connect it with the stock and the slide. H shows the notch in the slide which receives the string. I is the pivot on which the weapon rests, K is the handle, and L the place whence the arrows issue.

If the reader should have followed this description carefully, he will see that the only limit to the rapidity of fire is the quickness with which the lever can be worked to and fro. As it is thrust forward, the string drops into its notch, the trigger-peg is set, and an arrow falls with its butt just in front of the string. When it is drawn sharply back, the string is released by the trigger-peg, the arrow is propelled, and another falls into its place. If, therefore, a boy be kept at work supplying the slide with arrows, a constant stream of missiles can be poured from this weapon.

The arrows are very much like the "bolts" of the old English cross-bow. They are armed with heavy and solid steel heads, and are feathered in a very ingenious manner. The feathers are so slight, that at first sight they appear as if they were mere black scratches on the shaft. They are, however, feathers, projecting barely the fiftieth of an inch from the shaft, but being arranged in a slightly spiral form so as to catch the air, and impart a rotatory motion to the arrow. By the side of the cross-bow on Fig. 2 is seen a bundle of the arrows.

The strength of this bow is very great, though not so great as I have been told. It possesses but little powers of aim, and against a single and moving adversary would be useless. But for the purpose for which it is designed, namely, a wall-piece which will pour a series of missiles upon a body of men, it is a very efficient weapon, and can make itself felt even against the modern rifle. The range of this bow is said to be four hundred yards, but I should think that its extreme effective range is at the most from sixty to eighty yards, and that even in that case it would be almost useless, except against large bodies of soldiers.

Of swords the Chinese have an abundant variety. Some are single-handed swords, and there is one device by which two swords are carried in the same sheath, and are used one in each hand. I have seen the two-sword exercise performed, and can understand that, when opposed to any person not acquainted with the weapon, the Chinese swordsman would be irresistible. But in spite of the two swords, which fly about the wielder's head like the sails of a mill, and the agility with which the Chinese fencer leaps about and presents first one side and then the other to his antagonist, I cannot but think that any ordinary fencer would be able to keep himself out of reach, and also to get in his point, in spite of the whirling blades of his adversary.

Two-handed swords are much used. One of these weapons in my collection is five feet six inches in length, and weighs rather more than four pounds and a quarter. The blade is three feet in length and two inches in width. The thickness of metal at the back is a quarter of an inch near the hilt,

diminishing slightly toward the point. The whole of the blade has a very slight curve. The handle is beautifully wrapped with narrow braid, so as to form an intricate pattern.

There is another weapon, the blade of which exactly resembles that of the two-handed sword, but it is set at the end of a long handle some six or seven feet in length, so that, although it will inflict a fatal wound when it does strike an enemy, it is a most unmanageable implement, and must take so long for the bearer to recover himself, in case he misses his blow, that he would be quite at the mercy of an active antagonist.

Should they be victorious in battle, the Chinese are cruel conquerors, and are apt to inflict horrible tortures, not only upon their prisoners of war, but even upon the unoffending inhabitants of the vanquished land. They carry this love for torture even into civil life, and display a horrible ingenuity in producing the greatest possible suffering with the least apparent means of inflicting it. For example, one of the ordinary punishments in China is the compulsory kneeling bare-legged on a coiled chain. This does not sound particularly dreadful, but the agony that is caused is indescribable, especially as two officers stand by the sufferer and prevent him from seeking even a transient relief by shifting his posture. Broken crockery is sometimes substituted for the chain.

The most common punishment in China is that of the cangue, a sort of moveable pillory. A piece of wood, some four feet square and nearly four inches in thickness, has a hole in the middle, through which the culprit's head is passed. The machine opens with a hinge, and when closed is locked, and a placard designating the offence is pasted on it. As long as the cangue is worn, the unhappy delinquent cannot feed himself, so that he would be starved to death were he not fed by casual contributions. Fortunately, it is considered a meritorious action to feed a prisoner in the cangue, so that little risk of actual starvation is run, and the principal terror of the cangue lies in the pain caused by carrying such a weight upon the neck and shoulders. This instrument is often worn for weeks and sometimes for three months, which is the extent of its legal use.

Finger squeezing is another torture which is frequently used. Four pieces of bamboo are tied loosely together at one end, and a string passes through the other ends, so arranged that by drawing it they can be pulled closely together. The fingers are introduced between the bamboos, and by pulling at the string they can be crushed almost to pieces. This torture is often employed by the mandarins, when endeavoring to extort money from persons whom they suspect of concealing their wealth. The ankles are squeezed

after a similar fashion, only in this case the bamboos are much larger. Both these modes of torture are shown in the illustration on the next page.

Most of the so-called minor tortures, *i. e.* those which are not directly aimed at life, are employed for the purpose of extorting money. The fact is, the mandarins who are set over districts only have a limited term of office, and may, indeed, be transferred at any time. As during their term of office they have to make up a certain sum demanded by their superiors, and have also to keep up considerable state on a nominal salary, it follows that they oppress the people to the utmost of their power, looking upon them merely in the light of tax-producing animals. It is, therefore, no wonder that a Chinaman of any ability strives for literary rank, and the privilege of wearing the button, which exempts him from arrest except by imperial order.

Beating with the bamboo is another common punishment. There are two kinds of bamboo for this purpose, the small and the large; the latter being capable of producing death if used with severity. Indeed, even the lesser bamboo, if the blows be struck with the edge, instead of the flat, bruises the flesh so completely as to bring on mortification, of which the sufferer is sure to die in a few days. This punishment is chiefly used by the speculative mandarins, in order to extort money, and is employed for men and women alike; the only difference being that the man is thrown prostrate on the ground, while the woman suffers in a kneeling posture.

A man of forethought, however, never suffers much from the bamboo, and, if possible, nothing at all. In the former case, he bribes the executioner, who strikes so as to produce a very effective sounding blow, but in reality inflicts very little injury. In the latter case, he bribes a man to act as a substitute, and, just as the first blow is about to be struck, some of the officers, who are also bribed, get between the judge and the culprit, while the latter rolls out of the way, and the substitute takes his place. A similar ruse is enacted at the completion of the punishment. It may seem strange that any one should act as a substitute in such a business; but in China men care little for their skins, or even for their lives, and it is possible to purchase a substitute even for capital punishment, the chief difficulty being not to bribe the substitute, but to find enough money to bribe all the officials, who must act in concert.

Powerful as they may be, the mandarins have not all the power of life and death, though they can inflict punishments which practically lead to the same result. Mr. Milne mentions a case of this kind. Two men had been arrested in the act of robbing a house during a fire. This is rightly held to be the most heinous kind of theft, and is generally punished with decapitation. The

mandarin of the district had not the power to inflict death, but contrived to manage that the men should die. Accordingly, he had two tall bamboo cages made, placed a man inside each, and tied him by his tail to the top bars of the cage. The cages were placed in the open air, in charge of officers, who would not allow any communication with the offenders. The natural consequence was, that privation of food, drink, sleep, and rest of any kind, together with exposure to the elements, killed the men as effectually as the sword of the executioner.

A modification of this mode of punishment is by covering the top of the cage with a board through a hole in which the head of the sufferer passes. It is, in fact, a fixed cangue. The top of the cage is adjusted so that the man is forced to stand on tiptoe as he is suspended by the neck. His hands being bound behind him, relief is impossible. This mode of punishment is shown in the last figure but one, on the right-hand side.

The other figures speak for themselves, except that of the kneeling figure with snakes coiled round his body. These snakes are tubes of soft metal, fashioned in the shape of snakes with open mouths. They are coiled round the naked limbs and body of the sufferer, and boiling water is then poured into them, producing the most horrible torture.

As to capital punishments, they are inflicted in various ways. The mode that is thought to be the least terrible is the command to commit suicide, because in that case they can avoid the mangling of the body, and so make their appearance in the spirit world whole and entire. This is a privilege only accorded to officers of very high rank, and is conferred upon them by sending the "silken cord." No cord is really sent, but the mandate implies the instrument of death. When it is received, the doomed man takes some of his nearest relatives and most valued friends to his house, fastens the silken cord to a beam, places himself on a stool, passes the noose round his neck, and then leaps off the stool, and so dies. Officers of lower rank, when they see that they will probably be condemned to death, generally anticipate their sentence by hanging themselves on their own responsibility.

For criminals of no status, strangulation is the mode of death most preferred. It is accomplished in a manner exactly resembling the Spanish garrote. The criminal stands with his back to a post, through which a hole is bored at the level of his neck. The two ends of a cord are passed through the hole, the loop embracing the man's neck. The ends are then twisted round a stick, and, by a few rapid turns of the stick, the man is killed. The rapidity of the process is such that Mr. Lockhart mentions an instance where he and a friend saw a file of soldiers coming along, carrying a pole and a pinioned man in a basket. They stopped, lashed the

(1.) MANDARIN AND WIFE. (See page 1429.)

(2.) MODES OF TORTURE. (See page 1436.)

pole to an upright post, took the man out of the basket, tied him to the pole, and strangled him before the foreigners could find out what they were doing. The strange part of the business was that the officials had bribed the apparent culprit and his friends, as they wanted to make the foreigners believe that he was an opium smuggler, and that they were doing their best to stop the trade. Truly it is a strange country.

To beheading the Chinese have the strongest aversion, because they shrink from the idea of appearing headless in the next world, and they will therefore do all in their power to avoid it. A most remarkable instance of the extent to which a Chinaman will go to avoid decapitation is given in the following extract from a letter to an Indian newspaper. The man was a well-known and most abandoned criminal, who with his wife had been arrested.

"On his trial before his judge he refused to criminate himself, although repeatedly scourged until his back was raw. If a female witness fails in giving satisfactory evidence in a court of justice, she is beaten with a leather strap across the mouth. His wife, desirous of sparing her husband, refused to give evidence, but after two or three applications of strap her courage gave way. She confessed his guilt. The prisoner was then sentenced to decapitation,—deemed by the Chinese to be the most severe of punishments, because they imagine that if a man leaves this world *minus* any of his members, he appears in the same condition in the next. The culprit, therefore, prayed to be crucified instead of being beheaded.

"The cross was of the Latin form, the foot being inserted in a stout plank, and the criminal, standing on a board, had nails driven through his feet, and his hands stretched and nailed to the cross-beam. His legs were fastened to the cross with an iron chain, and his arms bound with cords, and on the cord round his waist was inserted a piece of wood on which was written his name and offence; a similar piece on his right arm contained his sentence, namely, to remain on the cross night and day until he died; another on his left arm had the name of the judge, with his titles and offices.

"The criminal was nailed to the cross inside the Yamun in the presence of the magistrate, and then carried by four coolies to one of the principal thoroughfares leading from the city, where he was left during the day, but removed at night inside the prison for fear of his friends attempting to rescue him, and again carried forth at daylight in charge of two soldiers. He was crucified at noon on the Wednesday, and Mr. Jones conversed with him at five in the evening. He complained of a pain in the chest, and thirst. On Thursday he slept for some hours, when the cross was laid down within

the jail compound. No one was allowed to supply him with food or drink, and during the day there was quite a fair in front of the cross, people being attracted from a distance, and the sweetmeat venders driving a large trade.

"On Saturday he was still alive, when the Taotai was appealed to by a foreigner to put an end to the wretch's sufferings, and he immediately gave orders that the vinegar should be administered, which he expected would produce immediate death; but the result was otherwise, and at sunset, when the cross was taken within the jail, two soldiers with stout bamboos broke both his legs, and then strangled him."

It is no matter of wonder that the woman confessed her husband's guilt, for the face is sometimes beaten with a hard leather strap until the jaws are broken, and the whole of the lips fall from them. In all probability she was quite as guilty as her husband, so that she was not altogether deserving of pity.

Decapitation is always conducted with much judicial solemnity, and, as a rule, is restricted to certain seasons of the year, when large batches of criminals are executed. There are, however, occasional exceptions to the rule. The instrument employed is a sword made expressly for the purpose. It is a two-handed weapon, very heavy, and with a very broad blade. The executioners pride themselves on their skill in its management, and, in order to show their powers, will draw a black-ink line round a turnip, and sever it at a blow, the cut never passing on either side of the line. Before a man is admitted to be an executioner, he is obliged to prove his ability by this test.

The criminal is carried to the place of execution in a bamboo cage, and by his side is the basket in which his head will be removed. He is pinioned in a very effective manner. The middle of a long and thin rope is passed across the back of his neck, and the ends are crossed on the chest, and brought under the arms. They are then twisted round the arms, the wrists tied together behind the back, and the ends fastened to the portion of rope upon the neck. A slip of paper, containing his name, crime, and sentence is fixed to a reed, and stuck at the back of his head. See illustration No. I, on page 1451.

On arriving at the place of execution, the officials remove the paper, and take it to the presiding mandarin, who writes on it in red ink the warrant for execution. The paper is then replaced, a rope loop is passed over the head of the culprit, and the end given to an assistant, who draws the head forward so as to stretch the neck, while a second assistant holds the body from behind; and in a moment the head is severed from the body. The head is taken away, and generally hung

up in a bamboo cage near the scene of the crime, with a label announcing the name and offence of the criminal, and the name of the presiding mandarin by whose order he was executed. In some places these heads are unpleasantly numerous. In many cases the rope and assistants are not employed.

There is even a lower depth of degradation than mere beheading. This is called "cutting into small pieces." Before striking the fatal blow, the executioner makes long but not deep cuts on the face and in all the fleshy parts of the body, taking care to avoid the chief blood-vessels, so that when the culprit is released by the loss of his head, he may enter the next world not only without a head, but with scarcely any flesh on his bones.

The last of the punishments which will be mentioned in this work is that of sawing asunder, a punishment which of late years has been but rarely inflicted, and we may hope is dying out, though in reality it does not cause nearly as much pain to the sufferer as many of the minor punishments. The mode in which it is performed may be seen from an anecdote related by Mr. Fleming, in the work which has been already quoted. There was a distinguished Imperial officer named Sun-kwei who was taken prisoner by the rebel leader Kih-yung. Knowing the ability of his prisoner, the rebel leader offered to spare his life on the condition that he would accept a command in his army. Sun-kwei flatly refused to do so, saying that as he was defeated he must die, for that to take service against his emperor was impossible. Bribes, threats, and promises were of no avail, and at last Kih-yung ordered his prisoner to be sawn asunder.

The executioners began to exercise their dreadful office, but with all their endeavors could not make the saw enter the body of their victim, who only jeered at them for their ignorance in not knowing how to saw a man asunder. At last Sun-kwei was good enough to instruct them in their business. "You dead dogs and slaves," said he, "if you would saw a man asunder, you should compress his body between two planks; but how could you know it?" The men followed his advice, and sawed him and the planks asunder at the same time, he never relenting, but scoffing at them to the last moment.

It is with some reluctance that I describe, however briefly, these horrible scenes, but to pass over them would be to omit some of the most characteristic traits of this strange people. Those who know the Chinese nation will be aware that I have touched the subject very lightly, and that the most revolting modes of punishment have not been

and for obvious reasons cannot be mentioned at all.

Although the mandarins are generally hated by those over whom they are placed, there are exceptions to the usual rule, and men are found who resist the temptation of extorting money from the people,—a temptation which is rendered the stronger because a mandarin who can report that his district has paid a very large sum into the Imperial treasury is sure of promotion, and if he has "squeezed" a large tribute out of a district that previously had paid but a small sum, he may almost reckon on obtaining the coveted peacock's feather, with all its privileges.

When an honest and kind-hearted mandarin vacates his post at the expiration of his term of office, the people subscribe to present him with an umbrella of state, called "The Umbrella of Ten Thousand of the People." It is made of red silk and satin, with three rows of flounces, and bears upon it the names of the chief donors written in golden characters. When he takes his formal leave of office, the umbrella is carried in procession by his attendants, and he is followed for a certain distance by those who presented it.

The highest honorary reward of this kind that can be given is an outer garment made of the same material as the umbrella, and also decorated with the names of the principal donors. This robe of honor is carried in procession, hung within a kind of pavilion that all may see it, and accompanied by a band of music. Such a robe is very seldom presented, and the recipient naturally values it very highly.

While treating of honorary rewards, one particular kind must be mentioned. If a man distinguishes himself greatly, and feels that he is under great obligation to some person who has no real claim on him, he will solicit some high title from the emperor, and then ask permission to transfer it to his benefactor. Thus it has frequently happened that a man, without any rank of his own, has taken upon himself the education of a young lad of promising abilities, and has been afterward rewarded by finding himself raised even to a higher rank than that of his *protégé*. Sometimes, when a man who has been thus educated is presented to a higher title, the emperor bestows on his benefactor the lower rank from which he has been raised. Thus it will be seen that in this country every incentive is employed to promote education among the people, and that not only the educated man obtains the reward which his powers have earned, but that those by whom he was educated have their share in his honors.

CHAPTER CLV.

CHINA — *Continued.*

SOCIAL CHARACTERISTICS.

OPIMUM SMOKING—SINGULAR RESULT OF THE HABIT—MODE OF USING THE OPIUM PIPE—TOBACCO SMOKING—THE WATER PIPE—WEIGHTS AND MEASURES—THE STEELYARD AND ITS USES—BOAT-LIFE IN CHINA—CORMORANT FISHING—FISH SPEARING—CATCHING FISH WITH THE FEET—THE DUCK BOATS—AGRICULTURE—MODE OF IRRIGATION—CHINESE MUSIC AND INSTRUMENTS—A SKILFUL VIOLINIST—CHINESE SINGING—ART IN CHINA—PORCELAIN—CARVING IN IVORY AND JADE—MAGIC MIRRORS—RESPECT TO AGE.

WE will conclude this subject with a short account of the miscellaneous manners and customs of the Chinese.

Among the chief of their characteristic customs is opium smoking, a vice which is terribly prevalent, but which is not so universally injurious as is often stated. Of course, those who have allowed themselves to be enslaved by it become gradually debased, but the proportion of those who do so is very small, though, by the terrible sight which they present, they are brought prominently into notice. It seems, moreover, that the quantity consumed at a time is not of so much importance as the regularity of the habit.

Let a man once fall into the way of smoking opium, though it be but one pipe, at a certain hour of the day, that pipe will be an absolute necessity, and he takes it, not so much to procure pleasure, as to allay the horribly painful craving from which he suffers. In fact, a man destroys his health by opium smoking in China, much as a drunkard does in England, not so much by taking immoderate doses occasionally, but by making a habit of taking small doses repeatedly. From such a habit as this very few have the courage to break themselves, the powers of their mind being shattered as well as those of the body.

A confirmed opium smoker really cannot exist beyond a certain time without the deadly drug, and those who are forced to exert themselves are generally provided with some opium pills, which they take in order to give them strength until they can

obtain the desired pipe. An anecdote illustrative of this practice is narrated by Mr. Cobbold in his "Pictures of the Chinese":—

"A small salesman, or pedler, was seen toiling along with great difficulty through the gates of Njingpo, as if straining every nerve to reach some desired point. He was seen to stagger and fall, and his bundle flew from him out of his reach. While many pass by, some good Samaritan comes to him, lifts up his head, and asks what is the matter, and what he can do for him. He has just strength to whisper, 'My good friend, please to untie that bundle; you will find a small box in the centre; give me two or three of the pills which are in it, and I shall be all right.' It was soon done; the opium pills had their desired effect, and he was soon able to rise and pursue his journey to his inn."

This most graphically describes the extreme state of exhaustion which comes on if the usual period of taking the pipe has passed by. The pedler thought, no doubt, he had strength just to reach his inn, where he would have thrown himself upon a bed and called for the opium pipe; but he miscalculated by a few minutes his power of endurance, and the pills (often resorted to in like cases of extremity), when supplied him by his friend, perhaps saved him from an untimely end. Very similar scenes have happened to foreigners travelling in sedan chairs through the country, the bearers having been obliged to stop and take a little of the opium, in order to prevent complete exhaustion. A long hour or more, in the

middle of the day, has frequently to be allowed, nominally for the sake of dinner and rest, but really, in some instances, for the opium pipe.

The pipe which is used for smoking opium is not in the least like that which is employed for tobacco. The stem is about as large as an ordinary office-ruler, and it has a hole near one end, into which the shank of the bowl is fixed. The bowl itself is about as large as a Ribstone pippin, and nearly of the same shape, the bud representing the tiny aperture in which the opium is placed, and the stalk representing the shank which fits into the stem. These pipes are made of various materials, some being mere bamboo and wood, while others have bowls of the finest porcelain, and the stem richly enamelled. My own specimen has the stem twenty inches in length, and an inch and a half in diameter, the bore not being large enough to admit an ordinary crowquill. The bowl is of some light-colored wood, well varnished, and covered with landscape scenes in black lines. Although it has not been in use for many years, it still smells strongly of opium, showing that it had been saturated with the fumes of the drug before it came into my possession.

The mode of using it is as follows: The smoker has a couch prepared, together with a little lamp, and his usual supply of the prepared opium. He lays his head on the pillow, with a long, needle-like implement places over the aperture of the bowl a little piece of the opium, about as large as a mustard seed, holds it to the flame of the lamp, and, with a long and steady inspiration, the whole of the opium is drawn into the lungs in the state of vapor. The smoke is retained for a few seconds, and then expelled. The generality of opium smokers are content with one pipe, but the votary of the drug will sometimes take as many as twelve in succession before he is completely under the influence of the opium. As he finishes the last morsel of opium, the pipe falls from his hand, and he passes into that dreamland for which he has bartered everything that makes life precious.

The terrible scenes which have so often been related take place for the most part at the opium shops, places which are nominally illegal, but which carry on their trade by payment of periodical bribes to the ruling official of the place. In Tien-tsin alone there were upwards of three hundred of these shops, in which opium could be purchased or sold wholesale, or could be refined for smoking, and consumed on the premises.

There is only one redeeming point in opium smoking, namely, that it does not produce the brutal scenes which too often take place in the gin palaces of this country. Mr. Fleming remarks of this vice: "If opium smoking is a great evil among the Chinese people, as it is no doubt, yet they

endeavor to hide it, they are ashamed of it, and it offends neither the eyes nor the hearing by offensive publicity. It is not made a parade of by night and by day, neither does it give rise to mad revels and murderous riots. Its effects on the health may be more prejudicial than our habits of alcohol drinking, but yet it is hard to see any of those broken-down creatures that one reads about."

Indeed, the Chinese themselves, who are apt to drink more than they ought of a fiery liquid called samshu, say that the spirit is far more injurious than the drug.

We will now see how the Chinese smoke tobacco. The pipe which is ordinarily used has a very little bowl of brass, at the end of a slight stem about as large as a drawing pencil. The bowl is scarcely large enough to hold the half of a boy's playing marble, and is almost exactly like the Japanese pipe, which will be presently described.

A pipe that is very much in fashion, especially with the women, is a kind of water-pipe made of brass, and enlarged at the bottom so as to stand upright. The enlarged portion is filled with water, through which the smoke passes, as in a hookah. The little brass tube which serves the purpose of a bowl can be drawn out of the body of the pipe, so as to be charged afresh; and in most cases each pipe is supplied with several bowls, so that they can be used successively as wanted. Only three whiffs are taken at a time; and indeed the quantity of tobacco used is so small, that more would be almost out of the question. For this pipe, tobacco is prepared in a peculiar manner, a minute quantity of arsenic being mixed with it.

One peculiarity about the Chinese is their almost universal employment of weight as a measure. With the exception of objects of art, nearly everything is bought by weight, and the consequence is, that the most absurd modes of increasing the weight are often employed. Fowls and ducks, for example, are sold alive by weight, so that the dishonest vendor has a habit of cramming with stones before he brings them to market. Fish are also taken to market while still living, and are improved in appearance by being blown up with bellows, and in weight by being crammed with stones. Through the lips of each fish a ring is passed, so that it may be at once taken from the water and hung upon the hook of the balance. Nor is the fish dealer particular as to the sufferings of the creatures which he sells, and he has not the least hesitation in cutting off a pound or two in case his customer does not wish to purchase an entire fish.

In these transactions the Chinese do not use scales, but employ a "steelyard" balance, made of various materials and various sizes, according to the object for which it was intended. That which is

meant for ordinary market use is made of wood, and is marked at regular distances by small brass studs, so as to designate the exact places on which the weight should be hung. Those which are intended for finer work are of ivory.

It is kept in a case, which looks something like two wooden spoons laid upon each other, so that their bowls enclose any object placed between them. They are united by a rivet or pivot, which passes through the ends of the handles, enabling them to be separated at will by drawing them sideways. In order to prevent them from coming apart needlessly, a ring of bamboo is plaited loosely round the stem; so that when it is slipped toward the bowl, the two halves of the case are kept together, and when it is slid to the end of the stem, they can be separated. In one of the halves of the bowl a large hole is scooped, in which the pan of the balance lies, and a smaller hole is cut for the reception of the weight. The steelyard itself lies in a groove cut along the inside of the stem. The reader will see that when the apparatus is closed, it lies very compactly, and can be stuck into the girdle ready for use at any moment.

The "yard" of this balance is of ivory, and is longer and more slender than the chopsticks which have already been described. In my specimen it is eleven inches in length, and the sixth of an inch in diameter in the thickest part. Three distinct sets of marks are made upon it, and there are three separate fulcra, so that when the weight exceeds the amount which can be measured with one fulcrum, the second or third fulcrum can be used with its own set of marks.

The arrangement of these marks is a fertile source of dispute among the Chinese. There is no standard by which all the balances can be regulated, but each dealer has his own balance, and his own arrangement of the gradations upon it. The natural consequence is, that quarrels take place with every purchase. A vast amount of time is wasted upon disputes which might easily be avoided, were the government to establish a standard balance, by which all others might be graduated. Time, however, is not of the least importance to a Chinese, and as a prolonged bargain has a positive fascination for him, it is probable that such a regulation would not be popular, and would indeed be evaded in every mode which Chinese ingenuity could invent. The larger steelyards have a hook whereon to hang the article to be weighed, but those which are intended for weighing small and valuable objects are furnished with a shallow brass pan, attached to the end of the balance by four silken threads.

The extraordinary economy which distinguishes the Chinese is characteristically shown in the population which crowds the rivers near the principal towns. A vivid

picture of Chinese boat-life is given by Mr. Tiffany, in his "American's Sojourn in the Celestial Empire." After describing the various kinds of boats that he has seen, he proceeds as follows:—

"We have passed through several miles of boats, and have not seen the quarter of them. It is, indeed, impossible to give an idea of their number. Some say that there are as many as seventy thousand of them at the city of Canton alone. But let us be content with forty thousand. Then fancy forty thousand wild swans, closely packed together, floating on some wide pond, and mostly restless, and you would say that they would cover many acres of their element. Now, by the enchantment of imagination, convert the pond into the roaring Pekiang River, the swans into boats of every shape and size, the notes of the birds into the yells, the shrieks, the piercing voices of the river people, and you may have the actual scene before you.

"And all these boats, miles upon miles, from border to border, are densely packed with human beings in every stage of life, in almost every occupation that exists upon the shore that they seldom trespass upon; and there they are born and earn their scanty bread, and there they die. The boats are moored side by side, in long-reaching thousands, so that the canal which they form stretches to a point in the distance. In the Shaneem quarter, above the foreign factories, they form large squares and avenues. Forty thousand floating tenements would, under any circumstances, be considered a singular sight, but here the swarming occupants give them the appearance of a mighty metropolis."

It seems strange that so vast a population should live on the river, within pistol shot of the land, and yet that the greater number of them, from their birth to their death, have never known what it is to put a foot on the shore. When one of the older boatmen does so for the first time, he can hardly walk, the firm land being as difficult for him to tread as the deck of a tossing vessel is to a landsman.

Though the smallest of all the vessels that traverse a Chinese river, the sampans are perhaps the most conspicuous. They are rather small boats, drawing but little water, and for the most part propelled by two women, one sitting in the bow with her oar, and the other stationed in the stern, working the huge implement, half oar, half rudder, by which the boat is at once propelled and guided. Many of the boat-steerers are quite young girls, but they manage their craft with wonderful skill and power, hardly ever touching another boat, no matter how many may be darting about the river, and, with one mighty sweep of the huge scull, sending the boat clear of the obstacle from which escape seemed impossible but a second

before. To the eye of a foreigner, the boat-women are more pleasing in appearance than their sisters of the land, inasmuch as their feet are allowed to assume their proper shape, and exposure to the air and exercise take away the sickly, pasty complexion which often distinguishes the better-class women on shore, and is heightened by the white powder with which they persist in disfiguring themselves.

Some of the mandarin boats present the greatest possible contrast to the little sampans. They are, in fact, floating palaces, decorated in the most picturesque and sumptuous manner, and furnished with every luxury that a wealthy Chinaman can command. They often have thirty or forty oars of a side, are gaily bedecked with flags and brilliant lanterns, and mostly carry several cannon, together with abundance of fire-arms, in order to deter the pirates, who would be likely to swoop down upon an unarmed vessel, kill the passengers, and seize the boat for their own purposes.

In connection with the river life of the Chinese may be mentioned the various modes of fishing. The most celebrated method is that in which the fish are caught by cormorants. The fisherman has several of these birds, which are trained to the sport, and indeed are bred from the egg for the purpose, and sold at high prices when fully trained. The man goes out in a boat or on a raft, accompanied by his birds, and when he comes to a favorable spot, sends them into the water. They immediately dive, and dart upon the fish, which they are taught to bring to the boat.

Should the fish be too large, the man generally takes both fish and bird into his boat by means of a net at the end of a handle; and often when a bird has captured a very large fish, and is likely to lose it, one or two of its companions will come to its assistance, and by their united efforts hold the fish until their master can come up. A ring is put loosely round the throats of the birds, so that they cannot swallow the fish even if they desire to do so; but a well-trained cormorant will no more eat a fish than a well-trained pointer will eat a partridge. Each time that the cormorant brings a fish to the boat, it is rewarded with a mouthful of food, generally a mouthful of eel, its master raising the ring to allow it to swallow.

Fishing with cormorants is almost invariably carried on at high tide, and near bridges, as fish always love to congregate under shelter. At such times the bridges are always crowded with spectators watching the feats of the cormorants.

The raft on which the fisherman stands is made of five or six bamboos, about twenty feet in length. Now and then a cormorant which has not completed its course of training is so delighted when it catches a fish, that it swims away from its master as fast as

it can. The fisherman, however, can propel his light raft faster than the cormorant can swim, and soon brings the truant to reason. This sport has recently been introduced into England, and bids fair to be successful.

Though caring little for sport, and pursuing game merely for the "pot," the Chinese employ one or two methods of fishing which have the sporting element in them,—*i. e.* which give the quarry a fair chance of escape. Such, for example, is fish spearing, which is practised after rather a curious manner. The fisherman generally takes his stand upon a low bridge, and is furnished with a trident spear and a decoy fish. The decoy fish is prepared by lacing a strip of wood to either side of its dorsal fin, and to these sticks a slight line is fastened.

All being prepared, the fisherman takes his place on the bridge, drops the decoy into the water, and ties the end of the line to a stick like a fishing-rod, while he holds the three-pronged spear in his right hand. As large a fish as the sportsman can procure is used for the decoy; and as it swims about, its fellows come up to it, apparently attracted by its peculiar movements. As they come within reach, they are struck with the trident, and deposited in the fisherman's basket.

A very inferior kind of fishing is carried on in places where the bed of the river is muddy. The fisherman wades into the river up to his knees or deeper, and every now and then strikes the surface of the water violently. As he does so, the fish which love such localities dive under the mud, where they are felt and held down by the bare feet of the man. As soon as he feels the wriggling of a fish under his foot, he stoops down, often having to plunge entirely under water, draws the fish from under his foot, and drops it into his basket. It is evident that only small fish can be caught by this method. I have tried it myself, and found that after a little trouble it was easy to catch any quantity of small flounders and similar fish,—too small, indeed, to be of any use, except to the thrifty Chinese, two of whom will buy a duck's head and divide it for their dinner.

Among other river industries may be mentioned the system of duck feeding that is there carried on. Vast quantities of ducks' eggs are hatched by artificial heat, and are purchased, when only a day or two old, by the persons who make their living by feeding and selling the birds. One favorite mode of duck feeding is to keep the birds in a boat fitted up for the purpose, and to take the boat along the banks of the river. At low water the keeper lets out the ducks, which find abundance of food in the multitudinous creatures that swarm in the mud, and when he thinks fit, he recalls them by a signal. As soon as they hear the signal,

they hurry to the boat with an alacrity that seems rather ludicrous, unless the spectator knows that the last duck always gets a sharp blow from a switch.

The characteristic thrift of the Chinese is well shown in their various agricultural operations, which are marvellously successful, not only on account of the real skill and knowledge possessed by the Chinese, but by reason of the systematic and ceaseless labor bestowed upon the various crops. Not a weed is allowed to absorb the nutriment which ought to go to the rice, and between the rows of plants the laborer creeps on his hands and knees, searching for every weed, and working with his fingers the earth round every root. Taken alone, this is hard and disagreeable work, but, as the rice is planted in mud, as sharp stones are often hidden under the mud, and as leeches abound in it, the hardships of a rice-weeder's life may be conceived.

The water which is so necessary for the crop is mostly supplied by mechanical means. If the agriculturist is fortunate enough to have land near the river or canal, his task is comparatively easy. He has only to erect a certain number of water-engines. These are almost all on the same principle, — *i. e.* an endless chain passing over two wheels, and drawing the water through an inclined trough. The wheels are generally worked by men, who turn them with their feet, supporting themselves on a horizontal bamboo. A larger and more complicated apparatus is worked by a buffalo.

At the smaller wheels all labor, as Mr. Milne observes: "In working them the energies of every household appeared taxed to the utmost vigor, as if each individual felt convinced of the necessity of his personal aid in securing a good and plentiful crop. I saw both young and old leaning on the same frame, treading the same wheel, and humming together their rustic song as they trod. Boys six years of age kept the step very well with men of fifty, and if too small to mount the wheel, they were placed on the ground to work the paddles with their little hands; and women, too, whose tiny and compressed feet disable them from treading the mill, stood at the feet of the men, keeping time with their hands. . . . None were indolent. There was no cessation, nor was there exemption from labor; and, while they fought among the thorns and thistles with which the ground had been cursed, and with the sweat of the brow under a blazing sun sowed, weeded, and watered the earth, no murmurs were heard, save the undulating sound of the husbandman's song as it waved over the field." Those women who are fortunate enough to possess feet of the natural size work as hard in the field as the men do, and are then almost as scantily attired, a wide and short pair of trousers, and a wide hat to shelter them

from the sun, being all the clothing they care for.

Though the earth be poor, the Chinese agriculturist forces it to bear, for every substance which can serve as manure is carefully saved for that purpose. Not only do the Chinese dispose of all the refuse of their houses and streets in the fields, but, as we have seen, even the little scraps of hair that are shaved from the head are saved and used as manure. Indeed, it is only by means of this exceeding economy that the inhabitants of so densely populated a country can sustain life.

Our concluding notes on Chinese life must be few and short.

According to their own ideas, they are as much adepts in music as in the other arts and sciences, which, as they believe, have placed them at the very summit of humanity. They have a tolerable variety of musical instruments, the most common of which is the San-hien, a sort of three-stringed guitar, with a very long neck and a very little cylindrical body. The strings are of silk, and are struck with a thin slip of bamboo at the end of the finger. Then, as a type of stringed instruments played with a bow, may be mentioned the Urh-heen, or two-stringed fiddles, the sounds of which are generally very disagreeable, — that is, when produced for Chinese ears; but when the player desires to imitate the characteristics of European music, he can do so very perfectly, as is shown by Mr. Fleming: —

"In one of the most thronged streets I was, on one afternoon, elbowing my way along, exploring the 'Heavenly Ford,' when

the sound of a violin playing a well-known waltz fixed my attention in a by-lane; and there, instead of a hairy Briton flourishing a bow over a Cremona, was a blind beggar eliciting those pleasant notes with as great precision and tone from the rude and weighty mallet-shaped urh-heen, as if he had been all his public life first violin at the opera."

The same traveller remarks of the vocal music of the Chinese, that "a Chinaman rehearsing a song looks and gives utterance to such goat-like bleats, that it is impossible to avoid the conclusion that he is laboring under a violent attack of chronic whooping-cough, combined with intermittent seizures of hiccough, — the 'dying falls' of the inhuman falsetto at the end of each

MOUTH ORGAN.

verse finishing in the most confounding hysterical perturbations of the vocal chords."

There are several Chinese wind instruments. For instance, there is a clarinet, called Shu-teh, an instrument with a very loud and piercing note, and a peculiar "mouth-organ," in which are a number of pipes. One of these instruments, drawn from a specimen in my collection, is shown on page 1445. It contains sixteen pipes, of different lengths, arranged in pairs. Some of the pipes, however, are "dummies," and are only inserted to give the instrument an appearance of regularity. The length of the pipes has nothing to do with the pitch of the note, as they speak by means of brass vibrators inserted into the lower end, exactly like those of harmoniums. The pipes are bound together by means of a horn band that passes around them. When it is used, the player blows into the projecting mouth-piece, and with his fingers stops or opens the apertures in the pipes. The tone of this instrument is not pleasing to European ears.

Strange as Chinese music seems to us, and unpleasant as are the odd and unexpected intervals of their melodies, the art is evidently cultivated among the people, and there is scarcely a house without its musical instrument of some kind. In the evening, according to Mr. Fleming, "in passing through the narrow streets, one is sure to hear from the dimly lighted houses the squealing, incoherent, and distorted vibrations tumbling out on the night air with a spasmodic reality and a foreignness of style that at once remind the listener of the outlandish country he is in." The preference of the Chinese for the strange, wild, abrupt intervals of their own music is not, as the reader may see, merely occasioned by ignorance of a more perfect scale, but is the result of deliberate choice on their part. They have no objection to European music. On the contrary, they are pleased to express their approbation of it, but with the proviso that it is decidedly inferior to their own.

From Music we turn to Art. In their own line of art the Chinese are unsurpassed, not to say inimitable. Ignorant of perspective as they may be, there is a quaint force and vigor about their lines that is worthy of all praise, while their rich softness of color can scarcely be equalled. From time immemorial they have been acquainted with the art of color printing from wooden blocks, and some of their oldest examples of color printing are so full of life and spirit,

despite their exaggeration of gesture, and their almost ludicrous perspective, that the best English artists have admired them sincerely.

Of their porcelain, in which they simply stand alone, it is impossible to treat fully in such a work as this, as the subject would demand a volume to itself. Their carved work in ivory is familiarly known throughout the greater part of the civilized world. In many of these carvings the object of the artist seems to have been, not to develop any beauties of form, but to show his power of achieving seeming impossibilities. Among the best-known forms of Chinese carving may be reckoned the sets of concentric balls, which are cut out of solid ivory, or at least are said to be so made.

There is quite a controversy about the mode of cutting these balls, and even those who have spent much time in China, and are thoroughly acquainted with the arts and manufactures of the country, disagree on this subject, some saying that the balls are really cut from solid ivory, and others that each ball is made of two separate portions, which are joined very artificially by cement, and can be separated by steeping in boiling water. Of the two explanations I am rather inclined to believe the former, as none of those who say that the balls can be separated seem to have tried the experiment for themselves. The mode of cutting these curious

SPECIMENS OF CHINESE ART. (From Sir Hope Grant's Collection.)

specimens of art is said to be by boring conical holes from the circumference of the ball to its centre with a spherical piece of ivory, and the detaching each ball in succession with curved tools.

The jade carving of China is also celebrated. This material is remarkable for the beautifully soft polish which can be given to it, and, as it is a rare mineral and exceedingly hard, coming next in that respect to the ruby, articles made of jade are valued very highly by the Chinese. In the accompanying illustration are shown a number of jade carvings belonging to Sir Hope Grant, who kindly allowed me to have them engraved for this work. The bowl in the front is carved in imitation of a water-lily, the handle being formed from the flower-stem. The ring which hangs from the handle is cut from the same piece of jade. Just behind it is a jar of the same material, which is a wonderful specimen of carving, and admirably shows the patient industry of the Chinese worker. The second small bowl in the front, and the jar behind it, are also of jade.

The elegant jar which occupies the centre of the group is a splendid specimen of enamel, and beside it is a large piece of *lapis lazuli*, on which is engraved a poem written by the emperor himself.

The celebrated Summer Palace or Yuen-ming-yuen, which was sacked and burned by the English and French forces, was filled with splendid specimens of jade carving, some of which are shown in the preceding illustration. There are three kinds of jade, the cream-colored, the clear white, and the bright green. This last is the most esteemed, and is so valuable that a single bead, not so large as a boy's playing marble, is worth a pound, or even more. Some necklaces made of these beads were sold after the destruction of the Summer Palace, and though they only contained about a hundred and fifty beads, a hundred and twenty pounds were given for them, the Chinese commissioners thinking that they were sold at a very cheap rate. The Chinese name for this jade is "feh-tsui."

One of the most remarkable instances of Chinese art is the magic mirror. This article is a circular plate of metal rather more than a quarter of an inch thick, having its face smooth and highly polished, and its back dark and ornamented with various patterns, among which four Chinese characters are conspicuous. These characters are in honor of literature, and seem to be generally employed for the decoration of these mirrors.

When used simply for the purpose of reflecting the face, the mirrors present nothing worthy of notice, but when they are held to the sun, and the beams thrown upon a white surface, the whole of the characters on the back are shown in the reflection. The mirror will even show its powers when used with a lamp, but the sun is required to bring out the characters clearly. A small but excellent specimen of this mirror was presented to me by Dr. Flaxman Spurrell, and always excites great admiration wherever it is shown. Not

the least trace of any figure is to be found in the face of the mirror, and the higher the polish given to the face, the clearer is the representation of the figures on the back.

Several theories have been promulgated respecting the mode of making these extraordinary mirrors, the most probable one being that the characters and patterns on the back are made of a harder and more condensed metal than that of the rest of the mirror, and that, when a high polish is given to the face, the difference of the metal is not perceptible, except by the mode in which it reflects light.

There is much to say respecting the customs of the Chinese. The small space, however, which remains will not permit us to treat fully of such wide subjects as religion, marriage, and disposal of the dead, and that they should be cursorily treated is impossible. We will therefore conclude with one of the most pleasing traits in the Chinese character, namely, the respect paid to old age.

According to Mr. Milne, "The sacred regard which Chinese pay to the claims of kindred secures to the patriarchs of respectable families ample support in the advanced and helpless stage of their pilgrimage; and charity often relieves poor septuagenarians whose relations may be unable to supply them with comforts or necessities at their mature age. In China one's feelings are not harrowed with the sad spectacle of an aged parent discarded by his children, and left to perish, unattended and un nursed, under a scorching sun, or on the banks of a rolling river. But you will see the tottering senior, man or woman, who has not the means to hire a sedan, led through the alleys and streets by a son or a grandchild, commanding the spontaneous respect of each passer-by, the homage of every junior.

"The deference of the *polloi* to the extreme sections of old age is manifest likewise from the tablets and monuments you may any day stumble upon, that have been erected by public subscription to the memory of octogenarians, nonagenarians, and centenarians. Nor is the government backward in encouraging this, but the reverse. Hence I have often seen very aged men and women in the streets, arrayed in yellow, *i. e.* imperial robes, the gift of the emperor, in mark of honor, and out of respect to their gray hairs." The reader will remember that an honorary degree is given to competitors who have reached an advanced age.

On one occasion, the emperor called together about four thousand old men at his palace, entertained them with a banquet, at which they were served by his own children and grandchildren, presented each of them with money and a yellow robe, and conferred upon the oldest of the assembly, a man aged one hundred and eleven years; the rank and dress of a mandarin.

Family festivals are held, something like the silver and golden wedding of the Germans, to celebrate each decade of life; and so important do the Chinese consider these festivals that they are often held by children even after the death of their parents, the only difference being that they have somewhat of a funeral cast, white, the color of mourning, being substituted for red, the color of joy. On those occasions the children offer gifts, and no present is thought to be more grateful to the recipient than a very handsome coffin. All Chinese, who can afford it purchase during their lifetime a coffin as handsome as their means will permit, and so, should they not have been able to purchase this their last resting-place, their children think themselves honored by taking the purchase into their own hands. These coffins are nearly square, are made of immense thickness, and are so carefully cemented that the body may be kept in them without needing burial.

Filial respect is inculcated into the Chinese with their earliest breath, and their youthful minds are filled with legends of pious children. For example: Wu Mang was the son of parents who were too poor to possess mosquito curtains. So at night Wu Mang used to allow the mosquitoes to feed upon

him, hoping that they would prefer a young boy to aged people. Wang Liang lost his mother, and had a step-mother who disliked him. Still he behaved to her as though she had been his own mother, and once, when she wished for some fresh fish and the river was frozen, Wang Liang went to the river, took off his clothes, and lay on the ice, hoping to melt it. Suddenly, in reward for his filial conduct, the ice opened, and out leaped two fine carp, which he took to his step-mother. Again, Lae, when he was seventy years of age, dressed and behaved like a child, in order that his parents should not be troubled, when looking at him, with the idea of their own age.

In every town or village, the oldest persons are treated with the greatest consideration, not on account of their rank or wealth, but of their age. Every one gives way to them, they have the best places in the theatres, are brought forward at every public spectacle, and are indulged in every possible way. Such has been the custom from time immemorial in this great nation, which was civilized when the inhabitants of England were naked savages. The oldest civilized nation in the world, they have honored their fathers and their mothers, and their days have been long in the land.

CHAPTER CLVI.

JAPAN.

DRESS — ART — AMUSEMENTS.

POSITION AND NAME OF JAPAN — APPEARANCE OF THE JAPANESE — DRESS OF THE MEN — USE OF SLEEVES — HAIR-DRESSING — COURT DRESS — THE TATTOO AND ITS USES — A STREET SCENE IN JAPAN — DRESS OF THE WOMEN — ARRANGEMENT OF THE HAIR — THE ANCIENT HAIR-PINS — USE OF PAINT — BLACKENING TEETH AND PULLING OUT EYEBROWS — MR. THE Empire of JAPAN extends over a vast cluster of Islands, of different sizes, situated on the north eastern coast of Asia. There are nearly four thousand of these islands, but the kingdom practically consists of three chief Islands, Nippon, Kiou-siou; or Kew-sew, and Sikok, or Sitkokf. The first of these islands gives its name to the entire empire, our word Japan not having even a Japanese origin, but being a corruption of the Chinese rendering of the word Nippon, *i. e.* Land of the Sunrise. As might be inferred, it is within the island of Nippon that the capital, Jeddo or Yedo, is placed.

The complexion of the Japanese is yellowish, with a little brown, and in many cases is no darker than that of a Portuguese or southern Italian. The eyes are small, and not so much sunk in the head as those of the Chinese; the hair is black, straight, and coarse, and the nose, though thick, is well formed. Their stature is about equal to that of ordinary Europeans, and their limbs, though not large, are often very powerful, a slightly-made Japanese being able to lift easily a weight which a stalwart Englishman would find a heavy burden.

The dress of the Japanese is very peculiar, and well suited to their features and complexion. Although it has about it something of a Chinese aspect, it is as distinct from the Chinese as is the character of the two people. As in China, the dress consists of much the same articles with both sexes, that of the

women differing from male apparel chiefly in the comparative length of the robes and the mode of dressing the hair. A male Japanese may or may not wear trousers, his liberty in this point being absolute, sometimes amounting to a practical dispensation with all dress whatever.

The chief articles of male dress are robes of differing lengths, one being worn upon the other, until a man will sometimes carry four or five robes at once. They are girt round the waist with a broad sash, so that if the wearer wishes to remove his dress, he has only to loosen the sash, and draw his arms out of the sleeves, when all the garments fall to the ground together. The sleeves are very large, and, being partly closed at the ends, are used as pockets, in which are carried various little articles of portable property. In the sleeves, for example, are carried the squares of white paper which serve as pocket handkerchiefs, and which are always thrown away when used; and in the same convenient receptacle the Japanese guest will carry off the remains of the feast to which he has been invited, such being the custom of this strange country.

The material of these robes differs according to the wealth and quality of the wearer, some being of simple cotton, while those of the higher classes are made of the finest silks, and ornamented with the device or arms of the family, embroidered on the breast and back of the outer robe.

The hair of the men is dressed in a very singular manner. The front and temples of the head are shaved, as in China, and the remaining hair is made into a tail, as is the case with the Chinese. The hair, however, is not allowed to grow to its utmost length, and to hang down the back, but is made into a short queue, about three inches in length, and as thick as the finger, and is turned up over the top of the head. Generally the head is bare, but it is sometimes covered with a hat. The hats differ much in shape. That which is in general use is nearly flat, and is fastened to the head by six strings, two of which pass under the chin, two are crossed at the back of the head, and two more are passed under the nose. A hat thus fastened gives to the head a very singular aspect, making the face look as if it had suffered from a severe accident, and was covered with bandages. Some hats look like beehives, and entirely conceal the features, and are worn by outlaws, or "lonins," and disgraced nobles. Sometimes the men pass a piece of stuff over their heads in such a way as to hide the forehead and chin, and only to leave the eyes, nose, and mouth exposed; and in winter they throw over the hat a piece of cloth, which is tied over the nose so as to shield that member from the cold blasts.

Men of consideration also wear a scarf over the shoulders, its length being regulated by the rank of the wearer, and thus serving to indicate the amount of courtesy which is due from one man to another. When two Japanese gentlemen meet, they bow until the ends of the scarf touch the ground. It is evident, therefore, that the man who, in virtue of his rank, wears the longest scarf, has the less distance to bow.

In addition to the ordinary costume, the dress of ceremony has two extraordinary additions. The first is the "kami-samo," respecting which the Japanese are exceedingly punctilious. It consists of a piece of stuff which is folded back over the shoulders in a fan-like form, and gives a most extraordinary and awkward look to the wearer. Courtiers wear another article of dress which is exactly opposed to our customs.

In European courts the nether garments are abbreviated, and only come to the knee; in Japan the custom is reversed. When the nobles appear before the emperor, they wear a pair of trousers with legs fully twice as long as those of the wearer, so that in walking they trail a yard or so on the ground. Walking in such garments is an art which can only be attained by long practice, and which, even when learned, is nothing more than an ungainly shuffle, threatening every moment to throw the courtier on his face. The attitudes which are assumed by fashionable courtiers are so absurd that the Japanese picture books abound in caricatures of noble-men at court. The object of this curious

custom is probably to give the wearer of the court dress an aspect as if he were kneeling instead of standing.

Men of the better classes always appear in public carefully dressed, but those of the lower orders consider themselves sufficiently clothed if they have a mere strip of cloth like the "languti" of India. Coolies, for example, laborers of various kinds, post-runners, etc., wear nothing but the cloth strip while at work.

Mr. Oliphant, in his "Narrative," mentions this fact in connection with the custom of tattooing, which is carried out in Japan to as much perfection as in Polynesia. "Some, however, denied themselves the benefit of dress, apparently for the purpose of exhibiting the brilliant patterns in which their skins were tattooed. One man had a monster crab on the small of his back, and a pretty cottage on his chest. It is rather fashionable to have scarlet fish playing sportively between your shoulders. The scarlet tattooing presents a very disgusting appearance. The skin looks as if it had been carefully peeled off into the required pattern.

"On a really well-tattooed man there is not an inch of the body which does not form part of a pictorial representation. If the general effect is not agreeable, it is perfectly decent, for the skin ceases to look bare, or like skin at all; it rather resembles a harlequin's costume. It must be dreadful to feel that one can never undress again. Yet what anguish does not the victim undergo, in order to put himself into a permanent suit of red dye and gunpowder!" The Japanese are very fond of their children, and in summer time a man may often be seen in the streets, wearing nothing but the cloth strip, and carrying in his arms his infant child, who has no clothing whatever.

Sometimes a man will appear in a costume which even seems more absurd than the almost entire nudity which has just been mentioned, and will walk about in a hat, a short jacket, and nothing else but the cloth.

In an illustration on the next page, the artist has shown a number of the ordinary costumes as they appear when the wearers are gathered round a ballad-singer. The most conspicuous figure is that of a Samourai or Yaconin, an armed retainer of a nobleman, swaggering along with the two swords emblematic of his office, and his features nearly hidden under his hat. The men wearing the extraordinary piebald dresses are a sort of street constable, who accompany a man of rank on his journey, and who jingle an iron rod laden with rings, in order to warn people to get out of the way of the great man. The other figures of men are arranged so as to show the mode of dressing the hair, and one or two varieties of costume.

The general appearance of the women's

(1.) DECAPITATION OF CHINESE CRIMINAL. (See page 1440.)

(2.) THE STREET BALLAD-SINGER. (See page 1450.)

dress is well shown by a figure opposite to that of the Samourai. The dress is almost exactly like that of the men, except that the materials are generally finer, and the sash which confines the garments to the waist is very broad, and gathered up into a large and peculiar knot, almost exactly like the "panier" of European fashion. Both sexes wear stockings made like mittens, and having a separate place for the reception of the great toe. Without this provision they would not be able to wear the peculiar sandals and clogs of the country, which are held on the foot by a Y-shaped strap, the fork of which passes between the great and the second toe. The clogs that are worn by the women very much resemble those of the Malays in general shape, and, awkward as they look, are easily manageable after a little practice. Some clogs in my collection elevate the foot of the wearer six inches above the ground, but I have found that walking, or rather shuffling, in them is not at all difficult.

The chief distinction between masculine and feminine attire lies in the hair. Whereas the men shave nearly the whole of the head, the women allow their hair to grow, and even add to it when they do not possess a sufficient amount to produce the extraordinary forms into which they twist their locks. Various fashions of hair-dressing prevail in different parts of the country, but in all cases the women take extraordinary pains with their heads, and twist their hair into elaborate and fantastic patterns, which scarcely any European hairdresser could equal.

Hair-pins are very fashionable, not so much for the purpose of confining the locks in their places, as of mere adornment. The pins are of enormous size, seven or eight inches in length, and half an inch wide, and are made of various substances, such as tortoise shell, carved wood, and ivory. Some of the most characteristic hair-pins are made of glass. They are hollow, and nearly filled with some colored liquid, so that at every movement of the wearer an air bubble runs from one end of the pin to the other. Sometimes a woman will wear a dozen or more of these pins in her hair, so that at a little distance her head looks as if a bundle of firewood had been stuck loosely into it.

Having pleasing features by nature, it may be expected that the women do their best to disfigure them by art. The soft pale brown of their complexions is made ghastly and hideous by white paint, with which the face, neck, and bust are thickly covered. The natural pink of the lips is rendered disgusting by a layer of red paint, the white teeth are blackened, and the eyebrows are pulled out. This style of adornment belongs only to the married women, so that a really pretty girl will in a few hours transform herself into a repulsive hag.

Mr. Oliphant, in the work which has already been mentioned, gives rather a humorous reason for this strange custom. "The first impression of the fair sex which the traveller receives in a Japanese crowd is in the highest degree unfavorable; the ghastly appearance of the faces and bosoms, thickly coated with powder, the absence of eyebrows, and the blackened teeth, produce a most painful and disagreeable effect. Were it not for this abominable custom, Japanese women would probably rank high among Eastern beauties, certainly far before Chinese.

"All Japanese writers whom I have read upon the subject affirm that to have no eyebrows and black teeth is considered a beauty in Japan, and that the object of the process is to add to the charms of the fair one. The result of my inquiry and observation, however, rather led me to form an opposite conclusion.

"In the first place, young ladies do not, as a rule, neglect any opportunity of improving their looks; but no Japanese young ladies, even after they are 'out,' think of taking this method of increasing their powers of fascination; they color their lips and cheeks, and deck their hair, but it is not until they have made a conquest of some lucky swain, that, to prove their devotion to him, they begin to blacken their teeth and pull out their eyebrows.

"He, privileged being, is called upon to exhibit no such test of his affection: on the contrary, his lawful wife having so far disfigured herself as to render it impossible that she should be attractive to any one else, seems to lose her charms for her husband as well. So he places her at the head of his establishment; and adds to it an indefinite number of handmaidens, who neither pull out their eyebrows nor blacken their teeth. Hence it seems not difficult to account for the phenomenon which is universally admitted, that while Japanese wives are celebrated for their virtue, their husbands are no less notorious for their licentiousness."

While upon the subject of dress, we must not pass unnoticed the extraordinary ideas which the Japanese have on the subject. Possessed as they are of much taste in dress, and having certain complete costumes for various ranks, it seems very remarkable that they are utterly indifferent to clothing considered in the light of covering. They attach no sense of indelicacy to exposure of the person, and men, women, and children may be seen bathing exposed to the sight of every passer-by.

Even their public baths, though some of them have two doors, one for men and one for women, are common to both sexes, and in those baths which are specially set apart for women the attendant is often a man. Sometimes there is a partition, about breast

high, to separate the sexes, but the usual baths have no such refinement. The baths are merely shallow pans or depressions in the floor, in which the bathers sit while they pour over themselves abundant supplies of hot and cold water. Baths of this nature are attached to all the "tea-houses," so that travellers can refresh themselves with a bath, in true Homeric style, before they take their meals. And, in Homeric style also, the attendants are women. The baths are known by a dark blue strip of cloth which hangs like a banner over the doorway. Europeans, when they first visit the country, are rather surprised when they pass along the streets to see a whole family "tubbing" in front of their houses, or, when they pass a public bath, to see the inmates run out to look at the strangers; but they very soon become used to such spectacles, and think no more of them than do the Japanese themselves.

Sir Rutherford Alcock, in dealing with this subject, and illustrating it by a Japanese drawing representing a bath tenanted by a man, a boy, and five women, makes the following remarks: "Men and women steaming in the bathing-houses raise themselves to the open bars of the lattice fronts to look out, the interior behind them presenting a view very faithfully represented in the following sketch by a native artist.

"In reference to which, I cannot help feeling there is some danger of doing injustice to the womanhood of Japan if we judge them by *our* rules of decency and modesty. Where there is no *sense* of immodesty, no consciousness of wrong-doing, there is, or may be, a like absence of any sinful or depraving feeling. It is a custom of the country. Fathers, brothers, and husbands all sanction it; and from childhood the feeling must grow up as effectually shielding them from self-reproach or shame, as their sisters in Europe in adopting low dresses in the ball-room, or any other generally adopted fashion of garments or amusements. There is much in the usual appearance and expression of Japanese women to lead to this conclusion. Any one of the real performers in the above scene, — a bathing saturnalia as it may appear to us, — when all is over, and the toilet completed, will leave the bath-door a very picture of womanly reserve and modesty."

Certainly, no women can be more decently clad than those of Japan, as we may see by any of the multitudinous native drawings; and that they should attach no sense of decency to the dress, or indecency to its absence, is one of the many strange characteristics of this remarkable and enigmatic country.

The travelling dress of the women is little more than their ordinary costume, *plus* a large flat hat, which serves as a parasol. Japanese picture books abound with illustra-

tions of women travelling, and, multitudinous as they are, each has always some characteristic point, and no two are exactly alike. Sometimes we see the women sauntering quietly along the river bank, sometimes they are being carried across the river on the shoulders of men, or, if they be of importance, in "norimons" or chairs borne by six or eight coolies. Some of the drawings depict women as sitting in boats, as being caught in a heavy snow or rain storm (see illustration), as walking by moonlight, and as they appear when riding.

The attitude and general appearance of a female equestrian in Japan differ considerably from those of an European. Side-saddles are unknown, the fair rider perching herself upon a saddle which lifts her high above the back of the animal, concealing her body downward, holding on tightly by the front part of the saddle, and, in fact, giving herself a look very much resembling that of a gayly attired monkey on horseback, as shown on the next page. This mode of riding is even followed by the opposite sex, the retainers of the high nobles sitting in their lofty saddles in very much the same attitude as that employed by the women, and being in consequence absolutely useless, except in looks, as cavalry.

Yet, when they choose, the Japanese can ride tolerably, as is shown by the fact of a game which is played among them, in which the competitors are all mounted. In this game the players have to contend against very great disadvantages. In the first place, the horses which they bestride are wretched animals, mere rough ponies, and the accoutrements are so clumsy, that it is a wonder

how the horse can be guided at all. According to our ideas, a horse is guided by the pressure of the leg and the touch of the rein, but the Japanese saddles render such guidance impossible.

The former mode is prevented by the shape of the saddle, which has large flaps of stiff leather hanging so low that the heel or knee of the rider has no effect upon the animal; and the latter mode is nearly as impossible as the former, by reason of the bit and the fashion of riding. The bit is a mere light snaffle placed loosely in the mouth, and the reins are used, not so much for the purpose of guiding the horse, as of keeping the rider in his seat. The horsemen grasp a rein tightly in each hand, and so hang to the bit. The natural consequence is, that the mouths of the horses are nearly as tough as the leather saddle-flaps, and the animals always go with their noses in the air, so as to counteract the perpetual haul on the bridle.

The game which is played under these untoward conditions is a sort of mall. A large space is marked out, and at each end is a curtain. At some few feet from the ground a circular hole is cut in the curtain. Each player is furnished with a long-handled, small-headed racket, almost exactly resembling that which is employed by the North American Indians in their ball play, described on page 1324. The object of the game is to pick up the ball from the ground with the racket, and to throw it through the hole. In order that there may be no doubt whether the ball has really passed through the hole, a net is hung loosely on the opposite side of the hole, and receives the ball. The players arrange themselves in two parties, distinguished by colors, and the chief point of the game is to pursue the opponent as he is galloping triumphantly toward the goal, and knock the ball out of the racket just as he is going to throw it through the hole.

The stirrups used by the Japanese are very curious in shape, and not at all like the ordinary models. Their general outline resembles that of the letter S, the foot being thrust into the opening as far as it will go. The comparatively small stirrups used by Europeans are as troublesome to the Japanese as would be the tiny triangular stirrups of Patagonia to an English rider.

The strangest part of horse equipment in Japan is, however, the shoe. Our idea of a horseshoe is a metallic plate to protect the horse against hard ground. The Japanese shoe is made of plaited straw, and is, in fact, nothing more than a straw sandal tied to the foot, giving it a very clumsy appearance. As may be imagined, their shoes never last very long, and on a stony road are soon cut to pieces. The rider, therefore, takes a supply of shoes with him, and renews them as fast as they are worn out. Indeed, a journey is often roughly calculated as a distance of so many shoes.

Under such circumstances, it is not surprising that the horse is seldom used in travelling. None but a poor noble will condescend to ride from one place to another, as it might be supposed that he could not afford the retinue which is required to carry him. Sometimes a nobleman will condescend to ride in public, but then his horse must be held by two grooms, who tug continually at the poor animal's mouth, and shout continually, "Chai! chai!" *i. e.* gently, for haste is always thought undignified by the Japanese, and a person of consideration would suffer a great infraction of dignity if he allowed himself to hurry over the road.

For those who can afford so expensive a luxury, the usual mode of conveyance is a sort of palanquin called a Norimon. It is a square cage, hung from a pole, and carried by four men, two in front and two behind. For Japanese travellers this is a very comfortable conveyance, but for Europeans,

who are not accustomed to the crouching attitude so characteristic of the Japanese, even a short journey in a norimon is a source of torture, the unfortunate passenger finding great difficulty in getting into the machine, and, when the journey is over, almost as much difficulty in getting out again, his limbs being stiff and cramped by the position into which they have been forced.

The pole of the norimon is stout, and very long; and it is a matter of rivalry between young and fashionable men to have their norimon poles as long and as profusely decorated as possible. When the coolies carry the norimon, they hoist it on their shoulders at a signal from their master, and step along at some three miles an hour.

In many parts the coolies much resemble the palanquin bearers of India, but are in this respect superior, that they travel in silence, and do not weary the soul of their master by the perpetual grunts and moans with which the Indian bearers are accustomed to lighten their journey.

Uncomfortable as is the norimon, there is a popular conveyance which is even more painful to European limbs. This is called the cango, and it bears about the same relationship to the norimon as a wheelbarrow does to a carriage. Indeed, if the reader can imagine the wheel, the legs, and handle of a wheelbarrow to be removed, and the body of the machine to be hung from a pole, he can form some idea of a cango. In the norimon the inmate has to crouch, in the cango he has almost to tie himself in a knot. Yet the Japanese limbs are so supple, that cango employers travel for many successive hours without being in the least oppressed by the attitude which they are compelled to assume. Cangos are largely used in Japan, and are indeed what cabs are to Londoners, the norimons supplying the place of carriages.

When a great noble or Daimio travels, he always uses the norimon, partly because it is the most luxurious conveyance which he knows, and partly because it gives him an excuse for displaying the strength of his retinue, which is about the only mode of ostentation known to the Japanese. The norimon is preceded by some of the men called Samourais, or Yaconins, *i. e.* men who are permitted to attach themselves to his service, and thereby to gain the privilege of wearing two swords. As their master passes along, they continually utter the word "Shitanirio!" *i. e.* kneel down, whereupon every one that hears it must at once prostrate himself on the ground, or remain erect at his peril. The most serious quarrels that have arisen between strangers and the natives in Japan have originated in this custom, the strangers either not knowing the custom, or refusing to comply with it lest they should compromise the dignity of their nation. Refusing to obey such an order is sure to cause a quarrel, and is likely to end in loss of life, as the Yaconins who give the order to kneel are always ready to enforce obedience with their swords.

Around the norimon is a crowd of servants, each wearing his master's badge on his back, and each armed according to his rank. Some led horses generally accompany the procession, so that the great man may ride when he is tired of the norimon, and a number of coolies bear umbrellas covered with waterproof cases, and large boxes on poles. These boxes are almost invariably empty, but are conventionally supposed to contain the stores of baggage without which so great a man could not be expected to stir. Superior officers in norimons, and inferior officers on horseback, accompany the

procession, for which a passage is kept by a number of men fantastically dressed in harlequin-like suits of various colors. Each of them carries a long iron rod, to which are attached a number of rings made of the same metal. As they walk they strike the end of the rod against the ground at each step, so that a clashing sort of jingle is produced, and strikes awe into the people.

That the Japanese should be such poor horsemen is very singular, considering the marvellous perfection to which they have brought other athletic exercises. As "acrobats" the performers are far superior to those of any other nation, performing the most audacious and apparently impossible feats with an absolute precision which quite removes any idea of danger.

Until the Japanese gymnasts came to this country, we were inclined to treat the accounts of travellers as exaggerated, but they proved to be capable of performing any feats which our professional athletes could achieve, and many others which they never even dreamt of attempting. For example, nothing seems much more difficult than for a man to lie on his back and balance on the soles of his feet a ladder thirty feet high. But when we add that to the top of the ladder a second ladder was attached at right angles, like the top of the letter F, and that a boy went up and down the ladder, and even crawled to the end of the cross piece and there hung by his instep, while the ladder was balanced on the soles of the reclining man's feet, we appear to be romancing rather than relating a fact. Yet this astonishing performance was repeated day after day, and nothing was more wonderful than the elaborate perfection and finish of the performance. The heavy ladder was placed on the upturned feet, and in a moment it was as steady as if it had been planted in the ground. Though, owing to the cross-piece, it was considerably inclined, its steadiness was not impaired, and even when the boy ascended and descended it, causing the centre of gravity to be continually altered, there was not the slightest wavering perceptible.

So with the other feats achieved by these remarkable performers. Everything was done with the deliberation which forms an essential part of the Japanese nature, but there were no needless delays, and whether the man was balancing the ladder on his feet, or whether he was spinning tops and making them act as if they were rational beings, or whether he was making two paper butterflies flutter about as if they were real insects, the same quiet perfection characterized the whole of the performance, and every feat was done with such consummate ease that it looked as if it really required no skill at all. The extraordinary life which the Japanese performers contrive to infuse into inanimate objects is almost incredible.

Had not the feat been actually seen, it would be scarcely possible to believe that a top could be spun, and then launched off to perform the following feats without being even touched:—

It ascended an inclined plane to a temple, the doors of which were closed. It knocked open one of the doors, entered the temple, waited inside some time, and then knocked open another door at right angles to the former, and emerged. It then went over an inclined bridge, entered another temple, and went up stairs, emerging at an upper story. It then proceeded along an inclined plane standing at right angles to the temple, and passed over a drawbridge, which was immediately lifted, leaving a gap over which the top had to pass in order to get back again. However, by the loosing of a catch, the top was flung over the gap, and went on as gayly as ever, finishing with entering a third temple, ringing a bell inside, coming out again, and running over two more bridges into the hands of the spinner, having traversed some forty feet, besides the work in the temples.

The same man spun a top upon the edge of a sword, making it pass from one end of the blade to the other. He flung the top in the air and threw the string at it: the top caught the middle of the string by the peg, wound itself up, and was again flung into the air, spinning faster than before. It was then caught on the slender stem of a pipe,

along which it ran as if alive, was passed behind the back, and caught again in front, and lastly, was received upon the hem of the sleeve, made to spin up the garment, over the neck and shoulders, and down the sleeve of the opposite side. It was also made to spin upon a slight string stretched from the wall, and to pass backward and forward as long as the spinner chose.

Some of these tops required no string, but were merely spun with the hand; they could be taken up and put down again, still spinning, or they could be stood on their heads and still spin, or they could be built into a perfect edifice of tops, three or four spinning upon each other, sometimes each leaning in a different direction, and then being brought upright by a touch of the ever-ready fan. The concluding feat was a very curious one. Some thirty feet above the heads of the spectators was hung a model of a temple, from which depended a string. The chief top-spinner then took a small but very heavy top, wound up its string, and flung the top in the air, drawing back the arm so that the top came flying into his hand. He went under the temple, gave the pendent string a half turn round the peg, and away went the top into the temple, bursting open its doors, and flinging out a quantity of rose leaves, which came fluttering down round the top as it descended the string, and fell into the hands of the performer.

CHAPTER CLVII.

JAPAN — *Concluded.*

MISCELLANEOUS CUSTOMS.

SUMPTUARY LAWS — SYSTEM OF ESPIONAGE — THE DUPLICATE EMPIRE — POWERS OF THE TYCOON AND MIKADO — THE DAIMIOS AND THEIR RETAINERS — THE TWO SWORDS — LONINS, OR OUTLAWS — JAPANESE FENCERS — DEFENSIVE ARMOR — ARCHERY — THE HAPPY DESPATCH — PUBLIC EXECUTIONS — ARCHITECTURE — REASONS FOR ITS FRAGILITY — PRECAUTIONS AGAINST FIRE — SIMPLE HABITS OF THE JAPANESE — AMUSEMENTS AND GAMES — WRESTLERS — THEATRES IN JAPAN — CURIOUS ARRANGEMENT OF PLAYS — THE TEA-HOUSES AND THEIR ATTENDANTS — JAPANESE ART — THE PORTABLE INKSTAND — THE CRANE, HERON, AND STORK — THE SNOW-CLOAK — SILK MADE BY NOBLES.

In Japan there is a tolerably strict code of sumptuary laws, certain modes of dress and the power of carrying certain weapons being denied to all except the privileged classes. We will, therefore, take a hasty glance at the different ranks in Japan.

With regard to all official ranks a duplicate system exists throughout the kingdom. At the head of the government there are two emperors, — the civil emperor, or Tycoon, and the spiritual emperor, or Mikado. The former of these potentates (whose title is sometimes spelled as Siogocn) is the real administrator of the empire, although he is nominally inferior to the Mikado, an inferiority which is carefully marked by certain visits of ceremony paid to the Mikado, but is not allowed to proceed beyond mere etiquette.

Indeed, the powers of the Tycoon himself are practically limited, though theoretically unbounded, and the government is in fact exercised by the nobles, through a double council, one of which is chosen by the emperor, and the other selected by the nobles from themselves. Every man who is employed in the duties of government has his duplicate, or "shadow," as he is called; he is subject to espionage on every side, and is himself a spy on others.

This system, uncomfortable as it may appear, has its advantages. According to Mr. Oliphant: "One most beneficial result arising from this universal system of espionage — for it extends through all classes of society

— is the entire probity of every government employé. So far as we could learn or see, they were incorruptible. When men can neither offer nor receive bribes; when it is almost impossible, even indirectly, to exercise corrupt influences, there is little fear of the demoralization of public departments of the state. In this respect Japan affords a brilliant contrast to China, and even to some European countries. So long as this purity exists, even though purchased at the cost of secret espial, there can be little cause to fear the decadence of Japan."

It is as well to mention in this place that the word Tycoon, or Tai-kû, is not of Japanese but of Chinese origin, and that it came into use through its insertion in an official document, the unlucky minister who employed it having in consequence fallen into disgrace and poverty. The name of Tycoon is never applied to him by the Japanese, who use instead the title which has been conferred upon him by his nominal superior, the Mikado.

The Mikado, or spiritual emperor, is held in the greatest veneration, and many of the honors paid to him are almost identical with those which are rendered to the Grand Lama of Thibet. He is too sacred to touch the earth with his feet, and is carried on men's shoulders on the rare occasions when he moves from one part of the palace to another. Outside it he never goes. He is too holy to wear any garment twice, or to use any article a second time, and, should

any one venture to wear or use a garment or utensil sanctified by his touch, he would bring down on himself the vengeance of heaven. Consequently, every garment that he has worn or every wooden utensil which he has employed is burned, and those which are made of earthenware are broken.

A similar rule extends to his wives, of whom he has twelve, one of them being the head wife or queen. A curious piece of etiquette is practised by the wives of the Mikado. All other women dress their hair into fantastic shapes, but the Mikado's wives are obliged to allow their hair to flow at length down their backs. In consequence of the innumerable restrictions to which he is subjected, the Mikado generally becomes tired of his comfortless rank, and resigns in favor of his heir.

Next come the Daimios or nobles, who, as among ourselves, are of different ranks, and who are the real rulers of the country. The difficulties which foreigners have experienced in Japan have almost invariably been caused by the Daimios, who fear that their position as feudal nobles may be endangered by the introduction of foreigners into the country. The greater Daimios are as formidable as were the great barons of early English history, and in like manner keep vast numbers of armed retainers. There is a general idea that in Japan every man wears a pair of swords. This is far from being the case, as none are permitted to wear even one sword unless he be in the service of the State. Even the wealthiest merchant may not wear a sword unless he is enrolled among the retainers of a Daimio, and, as the privilege is a great one, it is purchased for a certain annual sum. This indirect tribute is a lucrative source of income to the Daimios, and enables them to maintain the enormous retinue with which they are surrounded.

The higher classes in Japan are privileged to wear a garment called the "hakkama." This is much like the huge petticoat trousers of the French Zouave, and is indeed a very full and abundantly plaited petticoat, sewed together in the middle, and gathered in at the knees. The wearers are inordinately proud of this garment, and, though one of the unprivileged classes may purchase the right to carry a sword, no expenditure of money will enable a man to wear the hakkama.

The most troublesome of the retainers are the Yaconins or Samourais, men who have been admirably described by Sir Rutherford Alcock in his "Capital of the Tycoon":—

"All of a certain rank are armed with this formidable weapon projecting from their belt; swords, like everything else in Japan, to our worse confusion, being double, without much or any obvious distinction between military and civil, or between Tycoon's officers and Daimios' retainers. These

are the classes which furnish suitable specimens of that extinct species of the race in Europe still remembered as *Swashbucklers*,—swaggering, blustering bullies; many cowardly enough to strike an enemy in the back, or cut down an unarmed and inoffensive man; but also supplying numbers ever ready to fling their own lives away in accomplishing a revenge, or carrying out the orders of their chief.

"They are all entitled to the privilege of two swords, rank and file, and are saluted by the unprivileged (professional, mercantile, and agricultural classes) as *Sama*, or Lord. With a rolling straddle in his gait, reminding one of Mr. Kinglake's graphic description of the Janissary, and due to the same cause,—the heavy, projecting blades at his waist, and the swaddling clothes round his body,—the Japanese Samourai or Yaconin moves on in a very ungainly fashion, the hilts of his two swords at least a foot in advance of his person, very handy, to all appearance, for an enemy's grasp. One is a heavy, two-handled weapon, pointed and sharp as a razor; the other short, like a Roman sword, and religiously kept in the same serviceable state.

"In the use of these he is no mean adept. He seldom requires a second thrust with the shorter weapon, but strikes home at a single thrust, as was fatally proved at a later period; while with the longer weapon he severs a limb at a blow. Such a fellow is a man to whom all peace-loving subjects and prudent people habitually give as wide a berth as they can. Often drunk, and always insolent, he is to be met with in the quarters of the town where the tea-houses most abound; or returning about dusk from his day's debauch, with a red and bloated face, and not oversteady on his legs, the terror of all the unarmed population and street dogs. Happy for the former, when he is content with trying the edge of a new sword on the quadrupeds; and many a poor crippled animal is to be seen limping about, slashed over the back, or with more hideous evidences of brutality. But, at other times, it is some coolie or inoffensive shopkeeper, who, coming unadvisedly between 'the wind and his nobility,' is just as mercilessly cut down at a blow."

In some sort of a way, each noble is responsible for the acts of his retainers. Therefore, if any of these men determine upon some act which they know will compromise their master,—say the assassination of some one whom he dislikes,—they formally divest themselves of his protection, and become "lonins," or outlaws, or almost exactly the same as the "masterless-men" of the feudal English days. Each of them carries with him a paper on which his renunciation is written, and to perform such an act is thought extremely honorable. Nearly all the men who murdered Europeans were lonins.

The swords which these men wear in virtue of their rank are most formidable weapons, the temper of the steel, the balance of the weapon, and the slight curve of the edge, being all that can be desired. They are finished with the utmost care, and every part receives the minutest attention. A very beautiful specimen of the shorter sword was presented to me by C. Allen, Esq., of Blackheath. It measures two feet four inches in total length, of which the handle occupies nearly nine inches. This roomy handle of the Japanese sword presents a remarkable contrast with the small and cramped hilts of the Indian weapons. It affords an admirable grasp for the hand, being covered with diamond-shaped patterns of silken cord twisted over a basis of rough skate-skin. The blade is a little more than an inch in width, and even after a stay of many years in this country, is as bright as a mirror and sharp as a razor.

Indeed, for a hand-to-hand encounter, it would be difficult to find a more formidable weapon, even the kookery of India being inferior to it, as being heavier and less manageable. It is equally adapted for thrusting or cutting, and is so effective for the former purpose that one of these swords has been driven completely through a man's body by a single thrust. The balance of the weapon is admirable, and, though it is somewhat unsightly, it can be managed with perfect ease.

The amount of labor that has been bestowed on this particular weapon is really astonishing. The effect is not in the least obtrusive, and it is only by close examination that its beauties can be seen. The blade is left entirely without ornament, its excellence being shown by its high polish and sharp edge. But, with the exception of the blade, every portion of the weapon has its ornament. On the guard is represented a buffalo grazing under a tree, the groundwork being of bronze, and the leaves of the tree and the herbage being gold. Between the silken cords of the hilt and the skate-skin are inserted two beautifully executed models, in bronze, of a bow and arrows, the feathers of the arrows and wrappings of the head being gilt. One of these models is inserted on either side of the hilt, which is terminated by a richly engraved bronze ornament.

In the upper part of the sheath is kept a small knife, somewhat similar in shape to that which is kept in the chopstick-case of the Chinese. The handle of the knife is bronze, and is adorned with the figure of a crayfish, beautifully wrought in gold, together with a banner and one or two other devices. The sheath itself is a wonderful piece of workmanship. At a little distance it looks as if it were covered with dark-brown leather; but a closer inspection shows that it is entirely covered with a minute and

delicate pattern that looks as if it had been traced with a needle's point, and must have cost the artist a very considerable expenditure of labor.

The larger sword is made after precisely the same pattern, except that it is four feet in length, and must be used with both hands. With one of these swords a Japanese will strike off a limb at a single blow; and so sharp are they, that an executioner, in beheading a criminal, scarcely raises the sword a foot for his stroke. The Japanese swordsmen practise the use of their weapon by means of sham swords, with which they fence, the combatants padding their limbs and sides, and covering their faces with wire masks. They have a very dangerous cut, which is made by the mere motion of unsheathing the sword, and takes effect at a distance where an inexperienced person would think himself safe.

So good is the temper of these weapons, that a Japanese has been known to sever a thick iron bolt with a single blow, the edge of the sword not showing the slightest indication of the severe test to which it had been put. The Japanese name for the large sword is "ken"; that of the shorter, "katan."

Defensive armor was at one time much worn by the Japanese, though at the present day the introduction of improved fire-arms has caused them to abandon armor, except for purposes of show. A complete suit of Japanese armor is shown on page 1469. It is made of multitudinous plates hung upon cloth, and profusely ornamented by gilding. Though very light, it is strong enough to resist the blow of the long sword, though it is worse than useless against rifled fire-arms. Indeed, had it not been for the recent disuse of protective armor, we should scarcely have been able to procure a suit; but, finding their suits of mail to be practically useless, the Japanese nobles very generously presented many of them to their foreign guests, and allowed others to be sold.

The oddest part of the suit is the helmet, with its appendages. The fantastic crest is very light, being made of exceedingly thin material, covered with gilding; and is so slight that a blow with a stick would crush it. Perhaps the reader may wonder at the beards which apparently depend from the chins of the soldiers. The fact is, the helmet is furnished with a very complete visor, shaped like a mask, which covers the whole of the face, and is decorated with a large gray beard and mustache, in order to strike terror into the beholders.

The bow is a favorite weapon with the Japanese, who expend nearly as much labor upon it as they do upon the sword. It is mostly japanned in black, and adorned with various decorations. Some of these bows are very powerful, and are strung in

rather a peculiar manner, the archer placing the lower end of the bow on the ground, and grasping the upper end with his right hand. He plants his right foot on the middle of the bow, bends it with the united powers of his foot and right hand, and with his left slips the string into its place. The arrows are made like those of China, but, in accordance with the national character of the people, are more highly finished.

One of the strangest weapons used by the Japanese is the war fan. Like the Chinese, the Japanese are never without the fan, and are obliged, by force of long habit, to take it into battle. The fan which is kept for this purpose has its sheath made of iron, and is of very large size, so that if the warrior be surprised without his sword, he is sure to have his fan ready by way of a club. These fans are decorated with the national emblem, a red sun on a black ground.

In connection with the Japanese weapons must be mentioned some of their modes of punishment. The first is the celebrated Hara-kiri, or Happy Despatch, and consists of suicide by ripping open the abdomen with two cuts in the form of a cross. Only the upper classes are privileged to perform the Happy Despatch, and to them it is in reality a privilege. If a Japanese official has failed in some duty, or committed some act which is likely to call upon him the anger of his superiors, he applies for permission to perform the Hara-kiri. At the appointed time, he assembles his friends, dresses himself in white, as a token of innocence, gives an entertainment, and makes a speech upon the position in which he is placed. He then takes the fatal knife, and as he raises his clothing for the purpose of inflicting the wounds, a good swordsman comes behind him, bearing a two-handed sword or "ken." The victim begins the Hara-kiri, but, as soon as he has made a slight incision, his head is swept off, so that death is not the result of the horrid wounds in the abdomen.

Sometimes, however, when time presses, the victim is obliged to perform the Hara-kiri as he can, and in that case dies from the self-inflicted wounds. For example, in several cases where assassination has been attempted, and notably in the celebrated attack on the British Legation, when the would-be assassins were chased on the succeeding day, it was found that three of them had committed the Hara-kiri, two of whom were already dead, but one was still living and was captured. In these cases the weapon used for the purpose is the shorter sword, or "kattan."

When a man has committed the Hara-kiri, he is supposed to have died an honorable death, and so to have earned for himself a reputation as a brave man. His family are proud of him, and his memory is revered. But should he lose his life by the

hand of the executioner, his whole property is confiscated, his family falls under ban, and his name is held as infamous. It will be seen, therefore, that the Hara-kiri is really a very great privilege, especially among a people so entirely indifferent to life as the Japanese.

Public executions are very simply carried out. The criminal is taken to the spot on a horse, and when he arrives, is bound, and made to kneel on the ground over a hole which is to receive his head. The executioner, who uses the "ken" above named, arranges the culprit's head in the proper position, and, apparently without any effort, decapitates the man with a blow. The old traveller Purchas very neatly expresses the mode of execution by a single word. After narrating the preliminaries, he states that the criminal "holds out his head, presently wiped off."

Crucifixion is employed by the Japanese as well as by the Chinese, and is mostly reserved for high treason. Minor punishments are not much in vogue, inasmuch as a theft above a certain sum entails the penalty of death, and so does a theft of a smaller sum if repeated. Flogging and banishment are sometimes employed as punishments. The dreadful tortures to which the earlier Christian missionaries and their converts were subjected appear to be reserved for political and religious offenders.

The architecture of the Japanese is rather peculiar. Owing to the physical condition of the country, and its liability to earthquakes, the houses are not remarkable for size or beauty. Private houses are never of any great height, a little exceeding forty feet being the utmost limit. They are built of wood, and, wherever possible, are only one story in height. They have a very ingenious mode of dividing their houses into rooms. Instead of using permanent walls for that purpose, they prefer folding screens made of wood and paper, so that they can alter at will the size and shape of the rooms.

The floors are covered with mats, which serve also as measurements. They are beautifully made of straw and rushes, are several inches in thickness, and by law obliged to be exactly of the same dimensions, *i. e.* one "kin," or seven feet four and a half inches in length, and half as much in breadth. The window frames are movable, and, instead of glass, are filled with oiled paper, mica, and the translucent shell of the great pearl oyster. The partitions of the houses and all the posts are curiously varnished and painted, and the Japanese, essentially a cleanly people, are very careful in keeping the interior of their houses in the best possible order. Like many Orientals, they always remove their sandals before entering a house, and no one even enters a shop without slipping off his shoes.

The roof is also of wood, and is generally composed of thick boards, which are kept in their places by wooden pegs, or by heavy stones laid upon them. The ends of the roof project considerably beyond the walls, so that they protect the doorways from the sun. On the roof of each house is kept a tub full of water, and near at hand is a broom, so that, in case of a fire, all the wooden roofs are at once drenched with water. The extremely inflammable nature of the materials renders this precaution needful; and, in addition, there are cisterns and tubs kept in the streets, together with tolerably effective fire-engines.

The furniture of the houses is on the same simple plan as the edifices themselves. A Japanese, no matter what his rank or wealth, has but little furniture. From the highest Daimio to the ordinary workman, the furniture of the houses is much the same. The room is bare, and floored by mats; a few shelves hold some cups and saucers, and there are generally several small trays on stands. This, with a few coverlids and a small pillow, made of wood and having a padding on the top, constitutes the furniture of the living-room. As to the kitchen, one or two small movable stoves, a few pans of metal, and some brooms, are all that are needed.

The Japanese cannot in the least understand why their Western visitors should encumber themselves with such quantities of furniture, which, to them, are not only useless, but absolutely in their way. They need neither tables, chairs, sideboards, nor bedsteads, and care nothing for large and handsome rooms.

Some years ago, when preparations were made for the reception of a British Consul in Hakodadi, it was almost impossible to find any place that could accommodate him. However, after much trouble, a locality was found. After the arrangements had been made, the Japanese Governor rose, took Sir R. Alcock by the hand, and led him through a corridor to a little room, or rather closet, nine feet by six, and quietly remarked that in that room his successor would be installed.

Sir R. Alcock has some very pertinent remarks on this subject: "As we slowly wended our way through the streets, I had full opportunity of observing the absence of all the things we deem so essential to comfort, and which crowd our rooms almost to the exclusion, and certainly to the great inconvenience, of the people who are intended to occupy them, as well as to the detriment of the proprietor's purse.

"If European joints could only be made supple enough to enable their owners to dispense with sofas and chairs, and, *par consequent*, with tables; and we were hardy enough to lie on straw mats, six feet by three, stuffed with fine straw, and beautifully made with a silk border, so as to form a sort of

reticulated carpet for rooms of any size; the solution of that much-debated question, the possibility of marrying on 400*l.* a year, might certainly be predicted with something like unanimity in favor of matrimony. The upholsterer's bill can never offer any impediment to a young couple in Japan.

"Their future house is taken, containing generally three or four little rooms, in which clean mats are put. Each then brings to the housekeeping a cotton stuffed quilt, and a box of wearing apparel for their own personal use; a pan to cook the rice, half-a-dozen larger cups and trays to eat off, a large tub to bathe and wash in are added, on the general account: and these complete the establishment."

Such being the simplicity of the house and furniture, it is evident that loss by fire — an event by no means uncommon — is not nearly so severe as is the case with us. The Japanese have, however, a very sincere dread of fire, and at the end of every principal street there is an elevated station, furnished with a bell, by means of which information can be given as to the part of the city in which the fire rages, so that all can go to assist in extinguishing it. Fires are of almost daily occurrence, and whole streets are levelled at a time. The Japanese take these fires as a matter of course, and look on the destruction of an entire quarter with characteristic equanimity. Indeed, they calculate that, taking one part with another, Yeddo is burned down once in every seven years; and so they build their houses with the least possible expense, considering them to be sooner or later food for fire.

Of the amusements of the Japanese only a very short account can be given. First among them must be placed the calm and contemplative amusement of the pipe, in which the Japanese indulge largely. The pipe which they use is very small, the bowl being scarcely large enough to contain a moderately sized pea. The tobacco is very mild, something like Turkish tobacco, and it is smoked by drawing the vapor into the lungs, so that the whole of the tobacco is consumed at one inhalation. The ashes are then turned out of the pipe, which is replaced in its case, and the smoke is leisurely exhaled. A Japanese will smoke thirty or forty such pipes in a morning.

Games for children are almost identical with those used in England; the ball, the shuttlecock, the still, the kite, and the hoop, being all common toys. As for adults, they have dice, the theatre, the wrestling matches. The dice are prohibited by law, and therefore they are made so minute as to be easily concealed. A pair of dice and their box are so small that they can be concealed between the tips of two fingers, the dice being barely the tenth of an inch in diameter, and the box just large enough to hold them.

The wrestling matches are very singular

performances. The wrestlers are the strangest imaginable beings, being fattened to the last possible degree, so that they seem incapable of any feats of activity. Yet one of these elephantine men took in his arms a sack of rice weighing a hundred and twenty-five pounds, and turned repeated somersaults with as much ease as any light and unencumbered gymnast could do. The wrestlers are kept by the Daimios, who are very proud of them, and fond of exhibiting their powers. Each wrestler is supplied with several attendants, and clad in magnificent garments, the privilege of wearing two swords being also accorded to them. When they perform, all their robes are removed, leaving them in the wrestler's garb, a fringed apron, embroidered with the cognizance of their patron.

In wrestling, they try, not only to throw their antagonist, but to push him out of the arena, a man who is forced beyond the boundary being held as vanquished. One of these encounters is vividly described by an American traveller.

"They were, in fact, like a pair of fierce bulls, whose nature they had not only acquired, but even their look and movements. As they continued to eye each other, they stamped the ground heavily, pawing as it were with impatience, and then, stooping their huge bodies, they grasped handfuls of the earth, and flung it with an angry toss over their backs, or rubbed it impatiently between their massive palms, or under their stalwart shoulders. They now crouched down low, still keeping their eyes fixed upon one another, and watching each movement, when, in a moment, they had both simultaneously heaved their massive frames in opposing force, body to body, with a shock that might have stunned an ox.

"The equilibrium of their monstrous persons was hardly disturbed by the encounter, the effect of which was barely visible in the quiver of the hanging flesh of their bodies. As they came together, they had flung their brawny arms about each other, and were now entwined in a desperate struggle, with all their strength, to throw their antagonist. Their great muscles rose with the distinct outline of the sculptured form of a colossal Hercules, their bloated faces swelled up with gushes of red blood, which seemed almost to burst through the skin, and their bodies palpitated with savage emotion as the struggle continued. At last one of the antagonists fell with his immense weight upon the ground, and, being declared vanquished, he was assisted to his feet and conducted out of the ring."

The theatres much resemble those of the Chinese, the building being a mere temporary shed, and the parts of the women taken by young lads. The plays last for some two hours, and the Japanese have a very odd plan of arranging them. Suppose that five plays

are to be acted in a day: the performers go through the first act of the first play, then the first act of the second play, and so on, until they have taken in succession the first act of every play. They then take the second act of each play, and so on until the whole are concluded. The object of this custom is, to enable spectators to see one act, go away, and come again in time for the next act. Often, however, the spectators remain throughout the entire day, and in that case refreshments are openly consumed. It is also thought correct for ladies to change their dress as often as possible during the day, so that there is as much change of costume in front of the stage as upon it. In these plays there is generally a considerable amount of love-making, and a still greater amount of fighting, the "terrific combat" being an acknowledged essential of the Japanese stage.

Perhaps the most characteristic and most perplexing institution of Japan is that of the Tea-house. In many points the whole tone of thought differs so much in Japan from anything that we Westerns have learned, that it is scarcely possible for two so diverse people to judge each other fairly. We have already seen that nudity conveys no ideas of indecency to a Japanese, the people having been accustomed to it from infancy, and thinking no more of it than do infants. In the tea-houses we find a state of things which in Europe would be, and rightly, stigmatized as national immorality: in Japan it is taken as a matter of course. These tea-houses are situated in the most picturesque spots, and are furnished with every luxury. The extraordinary part of them is, that the attendants are young women, who are sold for a term of years to a life of vice. They are purchased by the proprietors of the tea-houses, and instructed in various accomplishments, so as to make them agreeable companions. No sort of infamy attaches to them, men of high rank taking their wives and families to the tea-houses, so that they may benefit by the many accomplishments of the attendants.

When the term of servitude is over, the girls retire from their business, and may re-enter their families without losing the regard of their relatives. Many enter a Buddhist order of mendicant nuns, but the greater number find husbands. It is one of the most startling characteristics of this strange people that institutions such as this should exist, and yet that female virtue should be so highly valued. No sooner does one of these girls marry, than she is supposed to begin her life afresh, and, no matter what may have been their previous lives, no wives are more faithful than those of the Japanese: The only resting-point in this mass of contradiction is, that, though the girls incur no shame for the course of life into which they have been sold, the keepers of the tea-houses

are looked upon as utterly infamous, and no one of respectability will associate with them.

That the men should resort to such places is no matter of surprise, but that they should be accompanied by their wives is rather remarkable.

Sometimes the husbands prefer to go without their wives, and in that case the ladies are apt to resent the neglect. The accompanying illustration is copied from a Japanese book in my collection, and is a good example of the humorous power which a Japanese artist can put into his work. The engraving tells its own story. Two husbands are going off together, and are caught by their wives. The different expressions thrown into the faces and action of the truants are admirably given,—the surprise and horror of the one, who has evidently allowed his wife to be ruler in the house, and the dogged determination of the other to get away, are rendered with such force that no European artist could surpass the effect.

a square bowl closed by a lid. The bowl contains India ink, and into the hollow stem the pen is passed. When not in use the pen is slipped into the stem, and the lid is closed and kept down by twisting over it the string which hangs from the end of the case, and which is decorated with a ball of agate.

One reason for the excellence of Japanese art is, that the artists, instead of copying from each other, invariably go to nature for their models. They have teachers just as we do, but the great object of these professors is to teach their pupils how to produce the greatest effect with the fewest lines. Book after book may be seen entirely filled with studies for the guidance of the young artists, in which the master has depicted various scenes with as few lines as possible. One of these books is entirely filled with studies of falling rain, and, monotonous as the subject may seem, no two drawings are in the least alike, and a separate and forcible character is given to each sketch. An-

CAPTURE OF THE TRUANTS.

We cannot take leave of this remarkable people without a few remarks upon the state of art among them. The Japanese are evidently an art-loving people. Fond as they are of the grotesque in art, they are capable of appreciating its highest qualities; and, indeed, a Japanese workman can scarcely make any article of ordinary use without producing some agreeable combination of lines in color.

Even the pen, or rather the brush, with which they write is enclosed in an ingenious and decidedly artistic case. The case is made of bronze, and consists of a hollow stem and

other book has nothing but outlines of landscape scenery, while some are entirely filled with grass-blades, some bending in the wind, others beaten down by rain, and others flourishing boldly upright. The bamboo is another favorite subject; and so highly do the Japanese prize the skill displayed by a master, that they will often purchase at a high price a piece of paper with nothing on it but a few strokes of the brush, the harmony of the composition and the balance of the different lines of beauty being thoroughly appreciated by an artistic eye.

Studying as the Japanese do in the school

of nature, they are marvellously apt at expressing attitude, whether of man, beast, or bird. They never have any difficulty in disposing of the arms of their figures, and, no matter what may be the action, there is always an ease about it which betrays the artist's hand even in the rudest figures. Among living objects the crane appears to be the special favorite of the Japanese, its popularity being shared, though not equalled, by the stork and the heron.

These birds are protected both by law and popular opinion, and in consequence are so tame that the native artists have abundant opportunities of studying their attitudes, which they do with a patient love for the subject that is almost beyond praise. No figure is so frequently introduced in Japanese art as the crane, and so thoroughly is the bird understood, that it is scarcely possible to find in all the figures of cranes, whether cast in bronze, drawn on paper, or embossed and painted on articles of furniture, two specimens in which the attitude is exactly the same. With us, even the professional animal painters are apt to take a sketch or two, and copy them over and over again, often repeating errors as well as excellences, while the Japanese artist has too genuine a love for his subject to descend to any such course. Day by day he studies his living models, fills his book with sketches taken rapidly, but truly, and so has always at hand a supply of genuine and original attitudes. In order to show how admirably the Japanese artist can represent the crane, I have introduced below drawings of some beautiful specimens in Sir Hope Grant's collection.

The reader cannot fail to perceive the consummate knowledge of the bird which is displayed in these figures, while the perfection of the work and the delicate finish of the detail are almost beyond praise. Nothing can be more true to nature than the three attitudes there shown. In one case, the bird stands upright and contemplative on one leg, after the manner of its kind. In the second instance, the bird is standing on a tortoise, and, as the neck is thrown into action, both legs are used for support. Then, in the flying bird, whose body serves as a censor, the attitude of the outspread wings and outstretched legs is just as true to nature as the others, all the attitudes having been undoubtedly taken from nature.

The porcelain of the Japanese is singularly beautiful, and sometimes is adorned with ornaments which may be reckoned under the head of "conceits." For instance, a cup will be adorned with a representation of pleasure boats on the river. With a needle the tiny windows of the boats can be raised, when a party of ladies and gentlemen drinking tea are discovered inside the boat. Sometimes a little tortoise may be seen reposing quietly at the bottom of the cup, until the hot tea is poured into it, when the creature rises to the surface, shaking its head and kicking with its legs as if in pain from the hot liquid.

In Japanese pictures certain curious figures may be seen, looking as if human beings had been wrapped in a bundle of rushes. This strange costume is the snow-cloak of the ordinary Japanese. For mere rain the Japanese generally wear a sort of overcoat made of oiled paper, very thin,

CANDLESTICK AND CENSERS. (From Sir Hope Grant's Collection.)

nearly transparent, and very efficient, though it is easily torn. But when a snow-storm comes on, the Japanese endues another garment, which is made in a way equally simple and effective.

A sort of skeleton is made of network, the meshes being about two inches in diameter. Upon each point of the mesh is tied a bunch of vegetable fibre, like very fine grass, the bundles being about as thick as an ordinary pencil where they are tied, and spreading toward the ends. The garment thus made is exceedingly light, and answers its purpose in the most admirable manner. The bunches of fibres overlapping each other like the tiles of a house, keep the snow far from the body, while any snow that may melt simply runs along the fibres and drops to the ground. To wet this snow cloak through is almost impossible, even the jet of a garden engine having little effect upon it except when quite close, while no amount of snow would be able to force a drop of water through the loose texture of the material.

The Japanese silks have long been celebrated, but there is one kind of which scarcely anything is known in England. During Lord Elgin's mission to Japan, a number of rolls of silk were presented to the members of the embassy. They were all in strips about three yards long and one wide, so that they seemed to be useless. They happened, however, to be exceedingly valuable; in fact, absolutely priceless, as no money could buy them. They were made by exiled nobles, who were punished by being sent to the island of Fatsizio, where they spend their time in making these peculiar silks. No one below a certain rank is allowed to wear the silk which has been woven by noble fingers, or even to have the fabric in the house, and in consequence not a piece ever even found its way to the shops.

The subject of Japanese art is most interesting, but we must now close our notice, and proceed to the next people on our list.

CHAPTER CLVIII.

SIAM.

GOVERNMENT — DRESS — RELIGION.

DUPLEX GOVERNMENT—PERSONAL CHARACTER OF THE KING—THE LATE FIRST KING AND HIS ACCOMPLISHMENTS—APPEARANCE OF THE SIAMESE—THE MODE OF ARRANGING THE HAIR—DRESS OF BOTH SEXES—CEREMONIES IN SIAM—AUDIENCE OF A NOBLE—ACTORS AND THEIR COSTUMES—AN ACTRESS IN ROYAL ROBES—THE ARISTOCRATIC ELBOW—PRECAUTIONS AGAINST CRIME—SYSTEM OF PUNISHMENT—RELIGION OF SIAM—THE WHITE ELEPHANT, AND REASON OF THE HONORS THAT ARE PAID TO IT—HAIRS OF THE TAIL—ARCHITECTURE OF SIAM—THE FUNERAL FILE.

IN the empire of SIAM, and its dependent kingdoms, Laos and Cambodia, we find the principle of the duplex rule which we have already seen existing in Japan, though in these cases the distinction between the two kings is merely one of dignity, and has nothing to do with the secular and spiritual element, as in Japan. In Siam, the two kings are mostly near relations, and often brothers; and sometimes, though by no means as a rule, the Second King becomes First King on the death of his superior. Practically, the whole of the royal power is vested in the first King, the secondary ruler being, although enjoying royal rank, nothing more than the first subject in the land.

In China and Japan, the personal character of the king seems to exercise but little influence over the people. This is not the case with Siam, in which country the influence of the king pervades the whole of the realm, and is of infinite importance for good or evil. The Siamese have been very fortunate in the king who lately held the First Throne. As is the custom with the Siamese kings, he spent a series of years in a Buddhist monastery, secluding himself from all society, even from that of his own children. During twenty-seven years he devoted himself to the studies which he thought would fit him for his future office; and when he mounted the throne in 1851, being then about forty-seven years of age, he astonished every one by his learning. He had made himself master of the history and geography of his own country; he was good

enough astronomer to calculate eclipses, and determine the latitude and longitude of a place. He could speak and write English so well, that he was a valued contributor to the scientific journals of Hong Kong, and, on account of his writings, was elected a member of the Asiatic Society. He was a fair Latin and French scholar, was thoroughly acquainted with all the various dialects of Siam and Indo-China, and was also learned in Sanscrit, a language of which he was very fond.

He was always desirous of attracting to him any English people who could give him instruction, and showed his preference for Great Britain by invariably wearing a Glengary cap, except on occasions of ceremony, when he had to wear the heavy national crown; and, strange to say, to judge from several photographic portraits of the King in various costumes, the Glengary cap suits his countenance better than any other head-dress. The full Siamese name of the King was Phra Chomklau chau yu hua; but the Sanscrit form, which he always used, was Somdech Phra Paramendra Maha Mongkut. He generally signed his name as S. P. P. M. Mongkut. His name before he came to the throne was Chau Fa Yai. The death of this wise ruler and accomplished gentleman was a very severe loss to Siam, and was felt even among the scientific societies of Europe.

A portrait of this remarkable man is given on the 1469th page, dressed in the costume which he usually wore. The Glengary cap gives a curiously Europeanized

look to his face; but as, contrary to the habit of the bare-headed Siamese, he constantly wore it, he is drawn with it upon his head. I possess portraits of him in several dresses, but that which he generally wore is selected as being the most characteristic of the man.

His brother, Chau Fa Noi, was by universal consent made the Second King, or Wanqua. When he received the crown, he took the name of Somdetch Piu Klau Chau yu hua. The choice was in both cases an excellent one, the brothers resembling each other in their love of literature, and their anxiety to promote the welfare of their people by the arts of peace, and not of war.

We will now turn to the general appearance of the Siamese.

They are rather small, but well proportioned, and their color is a warm olive. The hair of the men is shaved, except a tuft upon the top of the head, which is kept rather short; and the hair being black and coarse, the tuft looks as if a short brush had been stuck on the head. According to Siamese ideas, the tuft resembles the closed lotus flower. This tuft is held in the highest esteem; and for any one even to give indications of approaching the head-tuft of a great man, is considered either as a deadly insult or a mark of utter ignorance of manners. When a young Siamese comes of age, the head-tuft is shaved with great ceremonies, the relations being called together, priests being invited to recite prayers and wash the head of the young man, and all the family resources being drawn upon for the feast. The exact moment of the shaving is announced by a musket shot. After the tuft is removed, the lad is sent to the pagodas to be taught by the priests, and many of them never leave these quiet retreats, but enter the ranks of the regular priesthood.

Even the women wear the hair-tuft, but in their case the hair is allowed to grow to a greater length, and is carefully oiled and tended. The woman's head-tuft is said to represent the lotus flower opened. The head is seldom covered, the cap worn by King S. Phra Mongkut being quite an exceptional instance. As for clothing, the Siamese care but little for it, though the great people wear the most costly robes on state occasions. But even the highest mandarins content themselves during the warmer months of the year with the single garment called the Pa-nung. This is a wide strip of strong Indian chintz, generally having a pattern of stars upon a ground of dark blue, green, red or chocolate. When worn, "the Siamese place the middle of this, when opened, to the small of the back, bringing the two ends round the body before, and the upper edges, being twisted together, are tucked in between the body and the cloth. The part hanging is folded in large plaits, passed between the legs, and tucked in be-

hind as before." (See Bowring's "Kingdom and People of Siam.")

Sometimes the men have a white cloth hanging loosely over their shoulders, and occasionally throw it over their heads. When walking in the open air, a broad palm-leaf hat is used to keep off the sunbeams, and is worn by both sexes alike.

There is very little difference in the dress of the sexes. When very young, girls wear a light and airy costume of turmeric powder, which gives them a rich yellow hue, and imparts its color to everything with which they come in contact. Up to the age of ten or eleven, they generally wear a slight gold or silver string round the waist, from the centre of which depends a heart-shaped piece of the same metal, and, when they reach adult years, they assume the regular woman's dress. This consists of the chintz or figured silk wrapper, which, however, falls little below the knees, and a piece of lighter stuff thrown over one shoulder and under the other. This latter article of dress is, however, of little importance, and, even when used, it often falls off the shoulder, and is not replaced. Even the Queen of Siam, when in state dress, wears nothing but these two garments. As a rule, the feet are bare, embroidered slippers being only occasionally used by great people.

The appearance of the king in his royal robes may be seen from the portrait of a celebrated actress on the next page. In Siam, as in China, the actors are dressed in the most magnificent style, and wear costumes made on the pattern of those worn by royalty. To all appearance, they are quite as splendid as the real dresses; for gilding can be made to look quite as well as solid gold, and sham jewels can be made larger and more gorgeous than real gems. The reader will notice that upon the fingers the actress wears inordinately long nail-preservers, which are considered as indicating that the nails beneath are of a proportionate length.

The actors in the king's theatre are all his own women, of whom he has some six or seven hundred, together with an average of five attendants to each woman. No male is allowed to enter this department of the palace, which is presided over by ladies chosen from the noblest families in the land. These plays are all in dumb show, accompanied by music, which in Siam is of a much sweeter character than is usual in that part of the world. Besides the chief actors, at least a hundred attendants assist in the play, all being magnificently attired. The play is continued *ad infinitum*. When any of the spectators become wearied, they retire for a while, and then return, and it is thought a compliment to the principal guest to ask him the hour at which he would like the play to be stopped.

The veritable crown is shaped much like the mock ornaments of the actress. The

KING OF SIAM. (See page 1467.)

ARMOR. (See page 1460.)

ACTRESS. (See page 1468.)

King brought for the inspection of Sir J. Bowring the crown used at his coronation. It is very heavy, weighing about four pounds, and is of enormous value, being covered with valuable diamonds, that which terminates the peak being of very great size and splendor. The King also exhibited the sword of state, with its golden scabbard covered with jewels. When the sword is drawn, it is seen to be double, one blade being inserted into the other, as into a second sheath. The inner blade is of steel, and the outer of a softer metal. The handle is of wood, and, like the sheath, is profusely adorned with jewels.

The Siamese are among the most ceremonious people, and in this respect equal, even if they do not surpass, the Chinese and Japanese. Their very language is a series of forms, by which persons of different rank address each other; and, although there may be no distinction of dress between a nobleman and a peasant, the difference of rank is marked far more strongly than could be done by mere dress. It is an essential point of etiquette, for example, that the person of inferior rank should always keep his head below that of his superior.

Should a man of low degree meet a nobleman, the former will stoop at the distance of thirty or forty yards, sink on his knees as his superior approaches, and finally prostrate himself on his face. Should he wish to present anything to his superior, he must do so by pushing it along the ground, and, indeed, must carry out in appearance the formal mode of address in which he likens himself to a worm. Just as the peasants grovel before the nobles, so do the nobles before the king; and if either of them has a petition to offer, he must put it in a jar, and so crawl and push it along the ground as humbly as if he were a mere peasant. Siamese artists are fond of depicting the various modes of approaching a superior, and never forget to indicate the great man by two points. In the first place, he sits erect, while the others crouch; and, in the second, he leans on his left arm, and bends the left elbow inward. This most strange and ungraceful attitude is a mark of high birth and breeding, the children of both sexes being trained to reverse the elbow-joint at a very early age.

As may be expected from the progress of civilization, the Siamese have a tolerably complete code of laws, which are administered by regularly appointed officers. The laws are rather severe, though not much more so than were our own a century ago. Murder, for example, is punished with death; and in every case of murder or suicide, the houses within a circle of eighty yards from the spot on which the crime was committed are considered responsible, and fined heavily. This curious law forces the people to be very

cautious with regard to quarrels, and to check them before the two antagonists become sufficiently irritated to seek each other's life. This respect for human life contrasts strongly with the utter indifference with which it is regarded in China and Japan.

Nobles of very high rank are exempt from capital punishment in one way, *i. e.* their blood may not be shed; but, if guilty of a capital offence, they are put into sacks, and beaten to death with clubs made of sandal wood. Some punishments are meant to inflict ignominy. Such, for example, is that of a bonze, or priest, who is detected in breaking his vow of chastity. He is taken to a public place, stripped of his sacred yellow robe, flogged until the blood streams down his back, and then kept in the king's stables for the rest of his life, employed in cutting grass for the elephants.

Another similar punishment is inflicted on laymen. A cangue is fastened round his neck, his hands and wrists are chained, and he is taken round the city, preceded by drums and cymbals. The worst part of the punishment is, that he is compelled to proclaim his crime aloud as he passes through the streets; and if he ceases to do so, or drops his voice, he is beaten severely with the flat of a sword. Prisoners are mostly employed on public works, and at night they are all fastened together with one long chain.

Of the religion of the Siamese it is impossible to treat, because Buddhism is far too wide and intricate a subject to be discussed in a few pages. There is, however, one modification of this religion which must be mentioned; namely, the divine honors paid to the White Elephant.

By the Siamese, these animals are thought to be the incarnations of some future Buddha, and are accordingly viewed with the deepest respect. The fortunate man who captures a white elephant sends the news to the capital, and in return for the auspicious news is thenceforth freed, with his posterity, from all taxation and liability to military service. A road is cut through the forest, and a magnificent raft is built on the Meinam River, for the reception of the sacred animal. When the elephant reaches the raft, he is taken on board under a splendid canopy, and kept in good temper by gifts of cakes and sweetmeats. Meanwhile, a noble of the highest rank, sometimes even the First King himself, goes in a state barge to meet the elephant, accompanied by a host of boats with flags and music, and escorts the sacred animal to the capital, each boat trying to attach a rope to the raft. When arrived, the animal is taken to the palace, when he receives some lofty title, and is then led to the magnificent house prepared for him, where, to the end of his life, he is petted and pampered and has everything his own way, the king himself deeming it an honor if the sacred beast will condescend to feed out of his hand. On the

head of the elephant is placed a royal crown, his tusks are encircled with precious rings, and a royal umbrella is carried over him when he goes to bathe.

When the animal dies, the hairs of the tail are reserved as relics of a divine incarnation, and the body is buried with royal honors. The hairs of the tail are set in golden handles, profusely adorned with precious stones; and the reader may possibly remember that the First King, Somdetch Phra Mongkut, sent one of these tufts to Queen Victoria, as a priceless proof of the estimation in which he held her. The King also gave the ambassador, Sir J. Bowring, a few hairs from the tail, as a gift about equal to that of the Garter in England, and when, to the great grief of the nation, the elephant died in 1855, the King sent Sir J. Bowring, as a further mark of his favor, a small piece of the skin preserved in spirits of wine.

The color of the elephant is not really white, but a sort of pale, brick-dust red. Albino animals of all kinds are venerated by the Siamese, the white monkey being in rank next to the white elephant. This veneration is so marked that a talapoin—a sort of preaching fakir—who will not condescend to salute the King himself, bows humbly if he should see even a white cock, much more a white monkey.

The architecture of Siam deserves a brief notice. It possesses some of the characteristics of Chinese, Japanese, and Burmese, but has an aspect that belongs peculiarly to itself. Ordinary houses are of comparatively small dimensions, but the temples are often of enormous size, and in their way are exceedingly beautiful. They are full of lofty and gabled roofs, five or six of which often rise above each other, in fantastic beauty, so as to lead the eye upward to the central tower. This is always a sort of spire or pinnacle, which is made of a succession of stories, and is terminated by the slender emblem of sovereignty, namely, an ornament that looks like a series of spread umbrellas placed over each other, and become less and less as they approach the summit. The whole of the tower is profusely adorned with grotesque

statues in strange attitudes, and there is scarcely a square foot which is undecorated in some way or other.

The palaces are built on much the same model, and their gates are often guarded by gigantic figures carved in stone. At the door of the Hall of Audience at Bangkok are two figures made of granite. They are sixty feet in height, and represent men with the tails of fish projecting from the spine. In fact, they are almost exact reproductions of the Assyrian Dagon, as it is represented on the Nineveh sculptures.

The funeral pile on (or rather in) which is burned the body of a king or any of the royal family, is built on the same principle as the temples, and is in fact a temple, though made of combustible materials. There is before me a photograph of the funeral pile which was made for the body of the First King's son, and another of a pile erected for the purpose of consuming the body of his wife. They are very similar in appearance, being temples made of wood and canvas, covered with gilt paper. They are about a hundred and twenty feet in height, and on the photograph, where the nature of the material is not shown, look like magnificent specimens of Siamese architecture.

The central spire, terminated with its royal emblem, rises in the centre, and round it are clustered gables, roofs, pinnacles, and pillars, in bewildering profusion.

The door is guarded by two gigantic statues, and the body lies in the centre of the building, hidden by curtains. On account of the flimsiness of the materials, to all the pinnacles are attached slight ropes, which are fastened firmly to the ground, so that they act like the "stays" of a ship's mast. Inflammable as are the wood, paper, and canvas of which the edifice is made, they are rendered still more so by being saturated with oil, tar, and similarly combustible substances. Vast, therefore, as is the building, a very short time suffices to consume it, and the intense heat reduces the corpse to a mere heap of ashes, which are gathered together, and solemnly placed in the temple dedicated to that purpose.

CHAPTER CLIX.

ANCIENT EUROPE.

THE SWISS LAKE-DWELLERS.

DISCOVERY OF THE DWELLINGS AND RELICS—MODE OF BUILDING THE HOUSES—POPULATION OF THE LAKES—GENERAL CHARACTER OF THE RELICS.

MANY of my readers may be aware of the remarkable discovery that was made in 1853-4, showing that even in Europe there lived, at one time, a race of men having exactly the same habits as the swamp-dwellers of New Guinea, or the lake-dwellers of Maracaibo on the Amazon. During the winter months of those two years, the weather in Switzerland was very dry and very cold, so that the rivers did not receive their usual supplies of water. Consequently, the water in the lakes fell far below its usual level, and this disclosed the remarkable fact that in those lakes had once been assemblages of human habitations, built upon piles driven into the bed of the lake.

These houses, appropriately called "Pfahlbauten," or Pile-buildings, were, as their name implies, built upon piles; and it is a most interesting fact, that not only have the piles been discovered, on which the houses were built, but also fragments of the walls of those houses; many specimens of the weapons and implements of the inhabitants, their ornaments, and even their food, have been brought to light, after having been buried for centuries beneath the water.

The resemblance, not to say the identity, between many articles found under the waters of the Swiss lakes and those which are still used by savage tribes of the Western hemisphere is absolutely startling; and not the least remarkable point about the relics which have just been discovered is, that several of them are identical with inventions which we fondly deem to be modern.

The chief part of these lake-dwellings was constructed during the Stone period, *i. e.* a period when axes, spear-heads, etc., were made of stone, the use of fire being unknown. This is proved by the quantity

of stone weapons and implements which have been found in the lakes. That various improvements have been made in the architecture is also shown by the difference in details of construction.

From the relics that have been discovered, it is easy to see what these lake-dwellings must have been. They were built on a scaffolding made of piles driven into the bed of the lake, and connected with cross-beams, so as to make the foundation for a platform. Upon this platform the huts themselves were built. They were mostly circular, and the walls were made of wattle, rendered weather-tight by the clay which could be obtained in any quantity from the bed of the lake.

The reason for building these edifices is analogous to the feeling which induces military engineers to surround their forts with moats filled with water. In those primitive times, man waged an unequal war against the wild animals, such as the bear, the wolf, and the boar, and in consequence, these lacustrine habitations proved to be strongholds which such enemies could not assault. It is natural, also, that persons thus threatened should congregate together, and in consequence we find that in one lake alone, that of Neufchâtel, a population of some five thousand had congregated.

A vast number of relics of this bygone age have been recovered from the lakes, and are of absorbing interest to the anthropologist. In the first place, the original piles have been discovered, still standing, and several have been drawn, in order to ascertain the depth to which they were driven. Portions of the wattled walls of the huts have also been found, together with great numbers of stone implements, denoting a very early age. Great quantities

of pottery have also been found, the crescent being a favorite ornament, and several utensils of a crescentic shape having been discovered.

Then, as time went on, men improved upon their earlier works, and took to metal instead of stone, as examples of which may be mentioned the wonderful series of metallic objects that have been found in the lakes. There are axes, spears and arrow-heads, necklaces, bracelets, and hair-pins, and — most remarkable — there is the very article that was patented some years since as the "Safety Pin" for nurseries.

As to the food which these people ate, we have abundant evidence in the way of bones

belonging to various animals, and — strangest of all — specimens of bread have been discovered. As may be supposed, the bread in question was of the coarsest possible character, the grains of corn being roasted, slightly ground, and then pressed into lumps, which may by courtesy be termed cakes. Even fruits have been found ready cut and prepared for consumption, the apple being the most plentiful of these fruits. Seeds of different fruits, such as the plum, the raspberry, and the blackberry, have been found, together with the shells of hazel and beech-nuts, showing that all these different fruits were used for food in the olden times now so long passed away.
